

# TAS5828M 50-W Stereo, Digital Input, High Efficiency Closed-Loop Class-D Amplifier with Hybrid-Pro Algorithm

## 1 Features

- Flexible audio I/O:
  - Supports 32, 44.1, 48, 88.2, 96, 192-kHz sample rates
  - I<sup>2</sup>S, LJ, RJ, TDM, SDOUT for audio monitoring, sub-channel or echo cancellation
  - Supports 3-wire digital audio interface (no MCLK required)
- High-efficiency Class-D modulation
  - > 90% power efficiency, 90 mΩ R<sub>DS(on)</sub>
- Supports multiple output configurations
  - 2 × 50 W, 2.0 Mode (4-Ω, 23 V, THD+N=1%)
  - 2 × 40 W, 2.0 Mode (6-Ω, 24 V, THD+N=1%)
  - 1 × 100 W, 1.0 Mode (2-Ω, 23 V, THD+N=1%)
  - 1 × 80 W, 1.0 Mode (3-Ω, 24 V, THD+N=1%)
- Excellent audio performance:
  - THD+N ≤ 0.03% at 1 W, 1 kHz, PVDD = 12 V
  - SNR ≥ 110 dB (A-weighted), ICN ≤ 40 μVRMS
- Flexible processing features
  - 3-Band advanced DRC +2 BQs + AGL + 2 BQs
  - 12 BQs per channel, level meter
  - 96-kHz, 192-kHz processor sampling
  - Mixer, volume, dynamic EQ, output cross bar
  - PVDD sensing and hybrid-pro algorithm audio signal tracking
- Flexible power supply configurations
  - PVDD: 4.5 V to 26.4 V
  - DVDD and I/O: 1.8 V or 3.3 V
- Excellent integrated self-protection:
  - Over-current error (OCE)
  - Cycle-by-cycle current limit
  - Over-temperature warning (OTW)
  - Over-temperature error (OTE)
  - Under and over-voltage lock-out (UVLO/OVLO)
  - PVDD voltage drop detection
- Easy system integration
  - I<sup>2</sup>C Software or [Hardware Control Mode](#)
  - Fewer passive required compared with open-loop devices

## 2 Applications

- [Battery-powered speaker](#)
- [Wireless, bluetooth speakers](#)
- [Soundbars and subwoofers](#)
- [Heat or efficiency sensitive audio system](#)

## 3 Description

The TAS5828M is a stereo high-performance, closed-loop Class-D with integrated audio processor with up to 192-kHz architecture.

After startup with Software Control Mode, TAS5828M not only implements classic BQs, 3-Band DRC, AGL, but also a proprietary algorithm called Hybrid-Pro. The Hybrid-Pro algorithm detects the upcoming audio power demand and provides a PWM format control signal for the former DC-DC converter via the Hybrid-Pro feedback pin (HPFB). The TAS5828M supports up to 4 ms of delay buffer of audio signal for predictable envelop tracking, which significantly helps to prevent audio clipping due to DC-DC voltage adjustment.

While setting into Hardware control mode, TAS5828M supports switching frequency, analog gain, BTL/PBTL mode and cycle by cycle current limit threshold through pin configuration. This mode is especially designed to eliminate end system software driver integration efforts.

### Device Information

PART NUMBER	PACKAGE <sup>(1)</sup>	BODY SIZE (NOM)
TAS5828M	TSSOP (32) DAD	11.00 mm × 6.20 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Pin Configuration and Functions

Figure 5-1. DAD (TSSOP) Package, 32-Pin PadUp, Software Mode, Top View

Table 5-1. Pin Functions - Software Mode

PIN		TYPE <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
AGND	1	G	Analog ground.
AVDD	2	P	Internally regulated 5-V analog supply voltage. This pin must not be used to drive external devices.
GVDD	3	P	Gate drive internal regulator output. This pin must not be used to drive external devices.
$\overline{\text{PDN}}$	4	DI	Power down, active-low. $\overline{\text{PDN}}$ place the amplifier in Shutdown, turn off all internal regulators.
SCL	5	DI	I <sup>2</sup> C serial control clock input.
SDA	6	DI/O	I <sup>2</sup> C serial control data interface input/output.
SDIN	7	DI	Data line to the serial data port.
BCLK	8	DI	Bit clock for the digital signal that is active on the input data line of the serial data port.
LRCLK	9	DI	Word select clock for the digital signal that is active on the serial port's input data line. In I <sup>2</sup> S, LJ and RJ, this corresponds to the left channel and right channel boundary. In TDM mode, this corresponds to the frame sync boundary.
GPIO2	10	DI/O	General-purpose input/output, function of this pin can be programmed by register (Register Address 0x60h and 0x62h). Can be configured to be open drain output or push-pull output.
GPIO1	11	DI/O	General-purpose input/output, function of this pin can be programmed by register (Register Address 0x60h and 0x61h). Can be configured to be open drain output or push-pull output.
GPIO0	12	DI/O	General-purpose input/output, function of this pin can be programmed by register (Register Address 0x60h and 0x63h). Can be configured to be open drain output or push-pull output.
ADR	13	AI	A table of resistor value (Pull down to GND) decides the device I2C address. See Table 8-7.
VR_DIG	14	P	Internally regulated 1.5-V digital supply voltage. This pin must not be used to drive external devices.

**Table 5-1. Pin Functions - Software Mode (continued)**

PIN		TYPE <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
DVDD	15	P	3.3-V or 1.8-V digital power supply.
DGND	16	G	Digital ground.
PVDD	17	P	PVDD voltage input.
	18	P	
	31	P	
	32	P	
PGND	21	G	Ground reference for power device circuitry. Connect this pin to system ground.
	22	G	
	27	G	
	28	G	
OUT_A+	19	O	Positive pin for differential speaker amplifier output A.
BST_A+	20	P	Connection point for the OUT_A+ bootstrap capacitor which is used to create a power supply for the high-side gate drive for OUT_A+.
OUT_A-	23	O	Negative pin for differential speaker amplifier output A.
BST_A-	24	P	Connection point for the OUT_A- bootstrap capacitor which is used to create a power supply for the high-side gate drive for OUT_A-.
BST_B-	25	P	Connection point for the OUT_B- bootstrap capacitor which is used to create a power supply for the high-side gate drive for OUT_B-.
OUT_B-	26	O	Negative pin for differential speaker amplifier output B.
BST_B+	29	P	Connection point for the OUT_B+ bootstrap capacitor which is used to create a power supply for the high-side gate drive for OUT_B+.
OUT_B+	30	O	Positive pin for differential speaker amplifier output B.
PowerPAD™		P	Ground, connect to grounded heat sink for best system performance.

(1) AI = Analog input, AO = Analog output, DI = Digital Input, DO = Digital Output, DI/O = Digital Bi-directional (input and output), P = Power, G = Ground (0 V)

**Figure 5-2. DAD (TSSOP) Package, 32-Pin PadUp, Hardware Mode, Top View**

**Table 5-2. Pin Functions - Hardware Mode**

PIN		TYPE <sup>1</sup>	DESCRIPTION
NAME	NO.		
AGND	1	G	Analog ground.
AVDD	2	P	Internally regulated 5-V analog supply voltage. This pin must not be used to drive external devices.
GVDD	3	P	Gate drive internal regulator output. This pin must not be used to drive external devices.
PDN	4	DI	Power down, active-low. PDN place the amplifier in Shutdown, turn off all internal regulators.
HW_SEL0	5	DI	Analog gain and BTL/PBTL mode selection in Hardware Mode . Pull up to DVDD or Pull down to ground with different resistor. See <a href="#">Table 8-6</a> .
HW_SEL1	6	DI	PWM Switching Frequency and Spread Spectrum Enable/Disable selection in Hardware Mode. Pull up to DVDD or Pull down to ground with different resistor. See <a href="#">Table 8-5</a> .
SDIN	7	DI	Data line to the serial data port.
BCLK	8	DI	Bit clock for the digital signal that is active on the input data line of the serial data port.
LRCLK	9	DI	Word select clock for the digital signal that is active on the serial port's input data line. In I <sup>2</sup> S, LJ and RJ, this corresponds to the left channel and right channel boundary. In TDM mode, this corresponds to the frame sync boundary.
MUTE	10	DI	Speaker amplifier Mute. Which must be pulled low (connect to DGND) to MUTE the device and pulled high (connected to DVDD) to exit MUTE state. In Mute state, device output keep in Hi-Z state.
FAULT	11	DO	Fault terminal, which is pulled LOW when an internal fault occurs.
PD_DET	12	DO	PVDD Drop detection, which is pulled LOW when the PVDD drop below 8V.
HW_MODE	13	AI	Connect to DVDD directly to ensure device enter into Hardware Control Mode.
VR_DIG	14	P	Internally regulated 1.5-V digital supply voltage. This pin must not be used to drive external devices.
DVDD	15	P	3.3-V or 1.8-V digital power supply.
DGND	16	G	Digital ground.

**Table 5-2. Pin Functions - Hardware Mode (continued)**

PIN		TYPE <sup>1</sup>	DESCRIPTION
NAME	NO.		
PVDD	17	P	PVDD voltage input.
	18	P	
	31	P	
	32	P	
PGND	21	G	Ground reference for power device circuitry. Connect this pin to system ground.
	22	G	
	27	G	
	28	G	
OUT_A+	19	O	Positive pin for differential speaker amplifier output A.
BST_A+	20	P	Connection point for the OUT_A+ bootstrap capacitor which is used to create a power supply for the high-side gate drive for OUT_A+.
OUT_A-	23	O	Negative pin for differential speaker amplifier output A.
BST_A-	24	P	Connection point for the OUT_A- bootstrap capacitor which is used to create a power supply for the high-side gate drive for OUT_A-.
BST_B-	25	P	Connection point for the OUT_B- bootstrap capacitor which is used to create a power supply for the high-side gate drive for OUT_B-.
OUT_B-	26	O	Negative pin for differential speaker amplifier output B.
BST_B+	29	P	Connection point for the OUT_B+ bootstrap capacitor which is used to create a power supply for the high-side gate drive for OUT_B+.
OUT_B+	30	O	Positive pin for differential speaker amplifier output B.
PowerPAD™		P	Ground, connect to grounded heat sink for best system performance.

1. AI = Analog input, AO = Analog output, DI = Digital Input, DO = Digital Output, DI/O = Digital Bi-directional (input and output), P = Power, G = Ground (0 V)

## 6 Specifications

### 6.1 Absolute Maximum Ratings

Free-air room temperature 25°C (unless otherwise noted) <sup>(1)</sup>

		MIN	MAX	UNIT
DVDD	Low-voltage digital supply	-0.3	3.9	V
PVDD	PVDD supply	-0.3	30	V
V <sub>I(DigIn)</sub>	DVDD referenced digital inputs <sup>(2)</sup>	-0.5	V <sub>DVDD</sub> + 0.5	V
V <sub>I(SPK_OUTxx)</sub>	Voltage at speaker output pins	-0.3	32	V
T <sub>A</sub>	Ambient operating temperature	-40	85	°C
T <sub>J</sub>	Operating junction temperature	-40	150	°C
T <sub>stg</sub>	Storage temperature	-40	125	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) DVDD referenced digital pins include: ADR/FAULT, LRCLK, SCLK, SDIN, SDOOUT, SCL, SDA, PDN

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V <sub>(POWER)</sub>	Power supply inputs	PVDD	4.5		26.4	V
		DVDD	1.62		3.63	V
R <sub>SPK</sub>	Minimum Speaker Load	4.5V-24V Operating PVDD Range, BTL Mode	3.2			Ω
		4.5V-24V Operating PVDD Range, PBTL Mode	1.6			Ω
V <sub>IH(DigIn)</sub>	Input logic high for DVDD referenced digital inputs		0.9 × V <sub>DVDD</sub>		DVDD	V
V <sub>IL(DigIn)</sub>	Input logic low for DVDD referenced digital inputs				0.1 × V <sub>DVDD</sub>	V
L <sub>OUT</sub>	Minimum inductor value in LC filter under short-circuit condition		1			μH

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TAS5828M - TSSOP32 (DAD) - 32 PINS	UNIT
		JEDEC STANDARD 4-LAYER PCB	
R <sub>θJA(top)</sub>	Junction-to-case (top) thermal resistance	1.2	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	1.2	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	21	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics

Free-air room temperature 25°C, 1SPW Mode, LC filter=10uH+0.68uF, Fsw=384kHz, Class D Bandwidth=80kHz, (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>Digital I/O</b>						
IIH	Input logic high current level for DVDD referenced digital input pins	$V_{IN(Digin)} = V_{DVDD}$			10	uA
IIL	Input logic low current level for DVDD referenced digital input pins	$V_{IN(Digin)} = 0\text{ V}$			-10	uA
$V_{IH(Digin)}$	Input logic high threshold for DVDD referenced digital inputs		70%			$V_{DVDD}$
$V_{IL(Digin)}$	Input logic low threshold for DVDD referenced digital inputs				30%	$V_{DVDD}$
$V_{OH(Digin)}$	Output logic high voltage level	$I_{OH} = 4\text{ mA}$	80%			$V_{DVDD}$
$V_{OL(Digin)}$	Output logic low voltage level	$I_{OH} = -4\text{ mA}$			20%	$V_{DVDD}$
<b>I<sup>2</sup>C CONTROL PORT</b>						
$C_L(I2C)$	Allowable load capacitance for each I <sup>2</sup> C Line				400	pF
$f_{SCL(fast)}$	Support SCL frequency	No wait states, fast mode			400	kHz
$f_{SCL(slow)}$	Support SCL frequency	No wait states, slow mode			100	kHz
<b>SERIAL AUDIO PORT</b>						
$t_{DLY}$	Required LRCLK/FS to SCLK rising edge delay		5			ns
$D_{SCLK}$	Allowable SCLK duty cycle		40%		60%	
$f_s$	Supported input sample rates		32		192	kHz
$f_{SCLK}$	Supported SCLK frequencies		32		64	$f_s$
$f_{SCLK}$	SCLK frequency				24.576	MHz
<b>AMPLIFIER OPERATING MODE AND DC PRAMETERS</b>						
$I_{CC}$	Quiescent supply current of DVDD	$\overline{PDN} = 2\text{ V}$ , DVDD = 3.3 V, Play mode, General Audio Process flow with full DSP running		23		mA
$I_{CC}$	Quiescent supply current of DVDD	$\overline{PDN} = 2\text{ V}$ , DVDD = 3.3 V, Sleep mode		1		mA
$I_{CC}$	Quiescent supply current of DVDD	$\overline{PDN} = 2\text{ V}$ , DVDD = 3.3 V, Deep Sleep mode		1		mA
$I_{CC}$	Quiescent supply current of DVDD	$\overline{PDN} = 0.8\text{ V}$ , DVDD = 3.3 V, Shutdown mode		16		uA
$I_{CC}$	Quiescent supply current of PVDD	$\overline{PDN} = 2\text{ V}$ , PVDD = 18 V, No Load, LC filter = 10 $\mu\text{H}$ + 0.68 $\mu\text{F}$ , FSW = 384 kHz, 1SPW Modulation, Play Mode		39		mA
$I_{CC}$	Quiescent supply current of PVDD	$\overline{PDN} = 2\text{ V}$ , PVDD = 18 V, No Load, LC filter = 10 $\mu\text{H}$ + 0.68 $\mu\text{F}$ , FSW = 384 kHz, Output Hiz Mode		11		mA
$I_{CC}$	Quiescent supply current of PVDD	$\overline{PDN} = 2\text{ V}$ , PVDD = 18 V, No Load, LC filter = 10 $\mu\text{H}$ + 0.68 $\mu\text{F}$ , FSW = 384 kHz, Sleep Mode		7.5		mA
$I_{CC}$	Quiescent supply current of PVDD	$\overline{PDN} = 2\text{ V}$ , PVDD = 18 V, No Load, LC filter = 10 $\mu\text{H}$ + 0.68 $\mu\text{F}$ , FSW = 384 kHz, Deep Sleep Mode		10		uA
$I_{CC}$	Quiescent supply current of PVDD	$\overline{PDN} = 2\text{ V}$ , PVDD = 18 V, No Load, LC filter = 10 $\mu\text{H}$ + 0.68 $\mu\text{F}$ , FSW = 384 kHz, Shutdown Mode		10		uA
$A_{V(SP\_AMP)}$	Programmable Gain	Value represents the "peak voltage" disregarding clipping due to lower PVDD Measured at 0 dB input(1FS)	13.75		29.4	dBV
$\Delta A_{V(SP\_AMP)}$	Amplifier gain error	Gain = 26.4dBV		0.5		dB

## 6.5 Electrical Characteristics (continued)

Free-air room temperature 25°C, 1SPW Mode, LC filter=10uH+0.68uF, Fsw=384kHz, Class D Bandwidth=80kHz, (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT			
f <sub>SPK_AMP</sub>	Switching frequency of the speaker amplifier.	Software Mode	384			kHz		
			480			kHz		
			768			kHz		
	Hardware Mode	480			kHz			
		768			kHz			
R <sub>DS(on)</sub>	Drain-to-source on resistance of the individual output MOSFETs	FET + Metallization. V <sub>PVDD</sub> =24V, I <sub>(OUT)</sub> =500mA, T <sub>J</sub> =25°C			90	mΩ		
<b>PROTECTION</b>								
OCE <sub>THRES</sub>	Over-Current Error Threshold (Speaker current)	Speaker Output Current (Post LC filter), Speaker current, LC Filter=10uH+0.68uF, BTL Mode			7.5	8	8.5	A
UVE <sub>THRES(PVDD)</sub>	PVDD under voltage error threshold				3.7	4	4.2	V
OVE <sub>THRES(PVDD)</sub>	PVDD over voltage error threshold				27	28.1	29.2	V
DCE <sub>THRES</sub>	Output DC Error protection threshold	Class D Amplifier's output DC voltage cross speaker load to trigger Output DC Fault protection				1.7		V
T <sub>DCDET</sub>	Output DC Detect time	Class D Amplifier's output remain at or above DCE <sub>THRES</sub>				570		ms
OTE <sub>THRES</sub>	Over temperature error threshold					165		°C
OTE <sub>Hysteresis</sub>	Over temperature error hysteresis					10		°C
OTW <sub>THRES</sub>	Over temperature warning level	Read by register 0x73 bit0				112		°C
OTW <sub>THRES</sub>	Over temperature warning level	Read by register 0x73 bit1				122		°C
OTW <sub>THRES</sub>	Over temperature warning level	Read by register 0x73 bit2				134		°C
OTW <sub>THRES</sub>	Over temperature warning level	Read by register 0x73 bit3				146		°C

## 6.5 Electrical Characteristics (continued)

Free-air room temperature 25°C, 1SPW Mode, LC filter=10uH+0.68uF, Fsw=384kHz, Class D Bandwidth=80kHz, (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
<b>AUDIO PERFORMANCE (STEREO BTL)</b>						
V <sub>OS</sub>	Amplifier offset voltage	Measured differentially with zero input data, programmable gain configured with 29.4dBV analog gain, V <sub>PVDD</sub> range:12V~24V		-5	5	mV
P <sub>O(SPK)</sub>	Output Power (Per Channel)	V <sub>PVDD</sub> = 18 V, LC Filter=10uH+0.68uF, R <sub>SPK</sub> = 4 Ω, f = 1 KHz, THD+N = 10%			43	W
		V <sub>PVDD</sub> = 18 V, LC Filter=10uH+0.68uF, R <sub>SPK</sub> = 4 Ω, f = 1 KHz, THD+N = 1%			35	W
		V <sub>PVDD</sub> = 18 V, LC Filter=10uH+0.68uF, R <sub>SPK</sub> = 6 Ω, f = 1 KHz, THD+N = 10%			31	W
		V <sub>PVDD</sub> = 18 V, LC Filter=10uH+0.68uF, R <sub>SPK</sub> = 6 Ω, f = 1 KHz, THD+N = 1%			25	W
		V <sub>PVDD</sub> = 21 V, LC Filter=10uH+0.68uF, R <sub>SPK</sub> = 4 Ω, f = 1 KHz, THD+N = 10%			55	W
		V <sub>PVDD</sub> = 21 V, LC Filter=10uH+0.68uF, R <sub>SPK</sub> = 4 Ω, f = 1 KHz, THD+N = 1%			44	W
		V <sub>PVDD</sub> = 24 V, LC Filter=10uH+0.68uF, R <sub>SPK</sub> = 6 Ω, f = 1 KHz, THD+N = 10%			54	W
		V <sub>PVDD</sub> = 24 V, LC Filter=10uH+0.68uF, R <sub>SPK</sub> = 6 Ω, f = 1 KHz, THD+N = 1%			43	W
THD+N <sub>SPK</sub>	Total harmonic distortion and noise (P <sub>O</sub> = 1 W, f = 1 KHz)	V <sub>PVDD</sub> = 18 V, LC Filter=10uH+0.68uF, Load=4Ω			0.08	%
		V <sub>PVDD</sub> = 24 V, LC Filter=10uH+0.68uF, Load=6Ω			0.06	%
ICN <sub>(SPK)</sub>	Idle channel noise(Aweighted, AES17)	V <sub>PVDD</sub> = 18 V, LC Filter=10uH+0.68uF, Load=4 Ω, Fsw=768kHz, BD Modulation			40	μVrms
		V <sub>PVDD</sub> = 18 V, LC Filter=10uH+0.68uF, Load=4 Ω, Fsw=384kHz, 1SPW Modulation			35	μVrms
		V <sub>PVDD</sub> = 24 V, LC Filter=10uH+0.68uF, Load=6 Ω, Fsw=768kHz, BD Modulation			35	μVrms
		V <sub>PVDD</sub> = 24 V, LC Filter=10uH+0.68uF, Load=6 Ω, Fsw=384kHz, 1SPW Modulation			35	μVrms
DR	Dynamic range	A-Weighted, -60 dBFS method. V <sub>PVDD</sub> = 24 V, Load=6Ω Analog Gain = 29.4dBV			111	dB
SNR	Signal-to-noise ratio	A-Weighted, referenced to 1% THD+N Output Level, V <sub>PVDD</sub> =24V, load=6Ω			111	dB
		A-Weighted, referenced to 1% THD+N Output Level, V <sub>PVDD</sub> =18V, Load=4Ω			106	dB
PSRR	Power supply rejection ratio	Injected Noise = 1 KHz, 1 Vrms, V <sub>PVDD</sub> = 24 V, input audio signal = digital zero			72	dB
X-talk <sub>SPK</sub>	Cross-talk (worst case between left-to-right and right-to-left coupling)	f = 1 KHz, based on Inductor (DFEG7030D-4R7) from Murata			100	dB

## 6.5 Electrical Characteristics (continued)

Free-air room temperature 25°C, 1SPW Mode, LC filter=10uH+0.68uF, Fsw=384kHz, Class D Bandwidth=80kHz, (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
<b>AUDIO PERFORMANCE (MONO PBTL)</b>

## 6.6 Timing Requirements

		MIN	NOM	MAX	UNIT
<b>Serial Audio Port Timing - Target Mode</b>					
$f_{SCLK}$	SCLK frequency	1.024			MHz
$t_{SCLK}$	SCLK period	40			ns
$t_{SCLKL}$	SCLK pulse width, low	16			ns
$t_{SCLKH}$	SCLK pulse width, high	16			ns
$t_{SL}$	SCLK rising to LRCLK/FS edge	8			ns
$t_{LS}$	LRCK/FS Edge to SCLK rising edge	8			ns
$t_{SU}$	Data setup time, before SCLK rising edge	8			ns
$t_{DH}$	Data hold time, after SCLK rising edge	8			ns
$t_{DFS}$	Data delay time from SCLK falling edge			15	ns
<b>I<sup>2</sup>C Bus Timing – Standard</b>					
$f_{SCL}$	SCL clock frequency			100	kHz
$t_{BUF}$	Bus free time between a STOP and START condition	4.7			μs
$t_{LOW}$	Low period of the SCL clock	4.7			μs
$t_{HI}$	High period of the SCL clock	4			μs
$t_{RS-SU}$	Setup time for (repeated) START condition	4.7			μs
$t_{S-HD}$	Hold time for (repeated) START condition	4			μs
$t_{D-SU}$	Data setup time	250			ns
$t_{D-HD}$	Data hold time	0		3450	ns
$t_{SCL-R}$	Rise time of SCL signal	$20 + 0.1C_B$		1000	ns
$t_{SCL-R1}$	Rise time of SCL signal after a repeated START condition and after an acknowledge bit	$20 + 0.1C_B$		1000	ns
$t_{SCL-F}$	Fall time of SCL signal	$20 + 0.1C_B$		1000	ns
$t_{SDA-R}$	Rise time of SDA signal	$20 + 0.1C_B$		1000	ns
$t_{SDA-F}$	Fall time of SDA signal	$20 + 0.1C_B$		1000	ns
$t_{P-SU}$	Setup time for STOP condition	4			μs
$C_b$	Capacitive load for each bus line			400	pf
<b>I<sup>2</sup>C Bus Timing – Fast</b>					
$f_{SCL}$	SCL clock frequency			400	kHz
$t_{BUF}$	Bus free time between a STOP and START condition	1.3			μs
$t_{LOW}$	Low period of the SCL clock	1.3			μs
$t_{HI}$	High period of the SCL clock	600			ns
$t_{RS-SU}$	Setup time for (repeated)START condition	600			ns
$t_{RS-HD}$	Hold time for (repeated)START condition	600			ns
$t_{D-SU}$	Data setup time	100			ns
$t_{D-HD}$	Data hold time	0		900	ns
$t_{SCL-R}$	Rise time of SCL signal	$20 + 0.1C_B$		300	ns
$t_{SCL-R1}$	Rise time of SCL signal after a repeated START condition and after an acknowledge bit	$20 + 0.1C_B$		300	ns
$t_{SCL-F}$	Fall time of SCL signal	$20 + 0.1C_B$		300	ns
$t_{SDA-R}$	Rise time of SDA signal	$20 + 0.1C_B$		300	ns
$t_{SDA-F}$	Fall time of SDA signal	$20 + 0.1C_B$		300	ns
$t_{P-SU}$	Setup time for STOP condition	600			ns
$t_{SP}$	Pulse width of spike suppressed			50	ns
$C_b$	Capacitive load for each bus line			400	pf

## 6.7 Typical Characteristics

### 6.7.1 Bridge Tied Load (BTL) Configuration Curves with BD Modulation

Free-air room temperature 25°C (unless otherwise noted). Measurements were made using Audio Precision System 2722 with Analog Analyzer filter set to 20-kHz brickwall filter. All measurements taken with audio frequency set to 1 kHz and device PWM frequency set to 384kHz, 80 kHz Class D Amplifier Loop Bandwidth, LC filter with 10µH / 0.68 µF, unless otherwise noted.

## 7 Parameter Measurement Information

**Figure 7-1. Serial Audio Port Timing in Target Mode**

**Figure 7-2. I<sup>2</sup>C Communication Port Timing Diagram**

## 8 Detailed Description

### 8.1 Overview

The TAS5828M device combines 4 main building blocks into a single cohesive device that maximizes sound quality, flexibility, and ease of use. The 4 main building blocks are listed as follows:

- A stereo digital to PWM modulator.
- An Audio DSP subsystem.
- A flexible close-loop amplifier capable of operating in stereo or mono, at several different switching frequencies, and with a variety of output voltages and loads.
- An I<sup>2</sup>C control port for communication with the device

The device requires only two power supplies for proper operation. A DVDD supply is required to power the low voltage digital circuitry. Another supply, called PVDD, is required to provide power to the output stage of the audio amplifier. Two internal LDOs convert PVDD to 5 V for GVDD and AVDD and to 1.5 V for DVDD respectively.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 Power Supplies

For system design, TAS5828M needs a 3.3-V or 1.8-V supply in addition to the (typical) 12 V or 24 V power-stage supply. Two internal voltage regulators provide suitable voltage levels for the gate drive circuitry and internal circuitry. The external pins are provided only as a connection point for off-chip bypass capacitors to filter the supply. Connecting external circuitry to these regulator outputs may result in reduced performance and damage to the device. Additionally, all circuitry requiring a floating voltage supply, that is, the high-side gate drive, is accommodated by built-in bootstrap circuitry requiring only a few external capacitors. To provide good electrical and acoustical characteristics, the PWM signal path for the output stage is designed as identical, independent half-bridges. For this reason, each half-bridge has separate bootstrap pins (BST\_x). The gate drive voltages (GVDD) are derived from the PVDD voltage. Special attention should be paid to placing all decoupling capacitors as close to their associated pins as possible. In general, inductance between the power-supply pins and decoupling capacitors must be avoided. For a properly functioning bootstrap circuit, a small ceramic

capacitor must be connected from each bootstrap pin (BST\_x) to the power-stage output pin (OUT\_x). When the power-stage output is low, the bootstrap capacitor is charged through an internal diode connected between the gate-drive regulator output pin (GVDD) and the bootstrap pin. When the power-stage output is high, the bootstrap capacitor potential is shifted above the output potential and thus provides a suitable voltage supply for the high-side gate driver.

### 8.3.2 Device Clocking

The TAS5828M devices have flexible systems for clocking. Internally, the device requires a number of clocks, mostly at related clock rates to function correctly. All of these clocks can be derived from the Serial Audio Interface.

**Figure 8-1. Audio Flow with Respective Clocks**

Figure 8-1 shows the basic data flow and clock Distribution.

The Serial Audio Interface typically has 3 connection pins which are listed as follows:

- SCLK (Bit Clock)
- LRCLK/FS (Left/Right Word Clock or Frame Sync)
- SDIN (Input Data)

The device has an internal PLL that is used to take SCLK and create the higher rate clocks required by the DSP and the DAC clock.

The TAS5828M device has an audio sampling rate detection circuit that automatically senses which frequency the sampling rate is operating. Common audio sampling frequencies of 32 kHz, 44.1kHz – 48 kHz, 88.2 kHz – 96 kHz, 176.4 kHz – 192 kHz are supported. The sampling frequency detector sets the clock for DAC and DSP automatically.

If the input LRCLK/SCLK stopped during music playing, the TAS5828M DSP switches to sleep state and waiting for the clock recovery (Class D output switches to Hiz automatically ), once LRCLK/SCLK recovered, TAS5828M auto recovers to the play mode. There is no need to reload the DSP code.

### 8.3.3 Serial Audio Port – Clock Rates

The serial audio interface port is a 3-wire serial port with the signals LRCLK/FS , SCLK , and SDIN. SCLK is the serial audio bit clock, used to clock the serial data present on SDIN into the serial shift register of the audio interface. Serial data is clocked into the TAS5828M device with SCLK. The LRCLK/FS pin is the serial audio left/right word clock or frame sync when the device is operated in TDM Mode.

**Table 8-1. Audio Data Formats, Bit Depths and Clock Rates**

FORMAT	DATA BITS	MAXIMUM LRCLK/FS FREQUENCY (kHz)	SCLK RATE (f <sub>s</sub> )
I <sup>2</sup> S/LJ/RJ	32, 24, 20, 16	32 to 192	64, 32
TDM	32, 24, 20, 16	32	128
		44.1,48	128,256,512
		96	128,256
		192	128

When Clock halt, non-supported SCLK to LRCLK(FS) ratio is detected, the device reports Clock Error in Register 113 (Register Address 0x71).

### 8.3.4 Clock Halt Auto-recovery

As some of host processor will Halt the I<sup>2</sup>S clock when there is no audio playing. When Clock halt, the device puts all channels into the Hi-Z state and reports Clock Error in Register 113 (Register Address 0x71). After audio clocks recovery, the device automatically returns to the previous state.

### 8.3.5 Sample Rate on the Fly Change

TAS5828M supports LRCLK(FS) rate on the fly change. For example, change LCRLK from 32kHz to 48kHz or 96kHz or 192kHz, Host processor needs to put the LRCLK(FS)/SCLK to Halt state at least 100us before changing to the new sample rate.

### 8.3.6 Serial Audio Port - Data Formats and Bit Depths

The device supports industry-standard audio data formats, including standard I2S, left-justified, right-justified and TDM/DSP data. Data formats are selected via Register (Register Address 0x33h -D[5:4]). If the high width of LRCLK/Fs in TDM/DSP mode is less than 8 cycles of SCLK, the register (Register Address 0x33h -D[3:2]) should set to 01. All formats require binary two's complement, MSB-first audio data; up to 32-bit audio data is accepted. All the data formats, word length and clock rate supported by this device are shown in Table 1. The data formats are detailed in Figure 8-2 through Figure 8-6. The word length are selected via Register (Register Address 0x33h -D[1:0]). The offsets of data are selected via Register (Register Address 0x33h -D[7]) and Register (Register Address 0x34h -D[7:0]). Default setting is I2S and 24 bit word length.

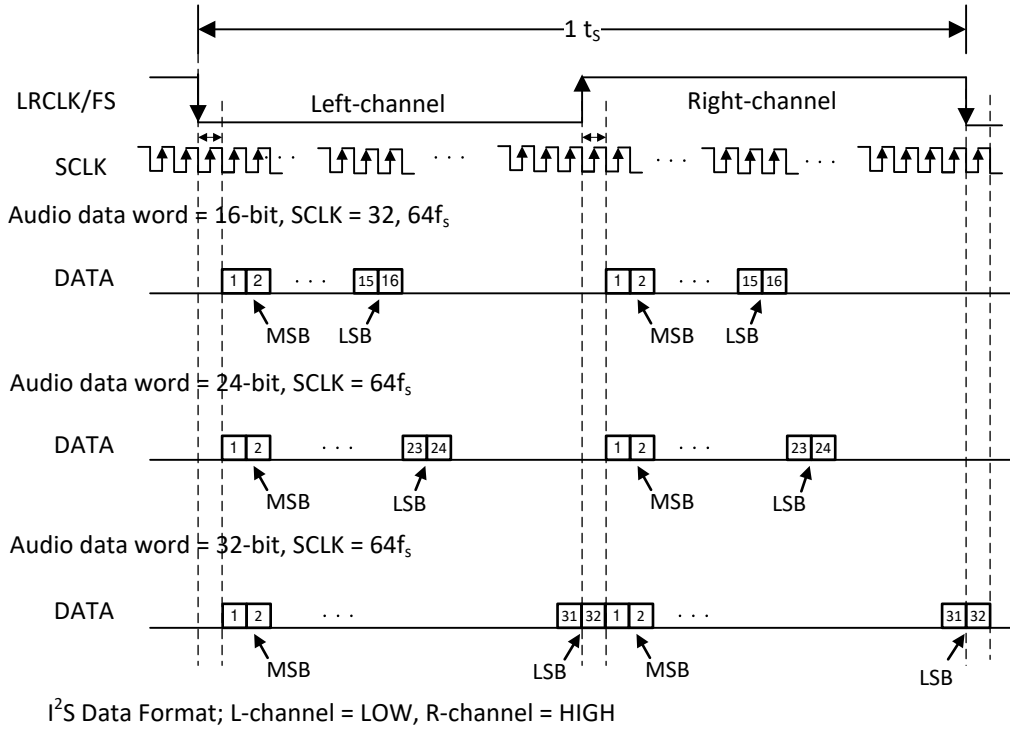

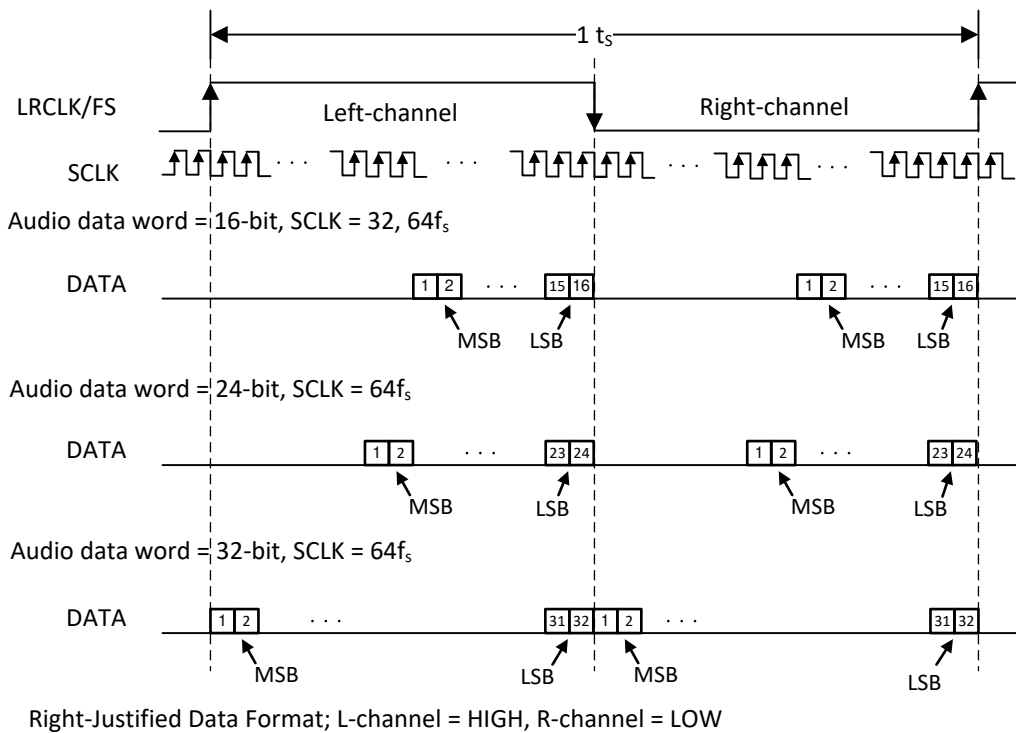

Figure 8-2. Left Justified Audio Data Format

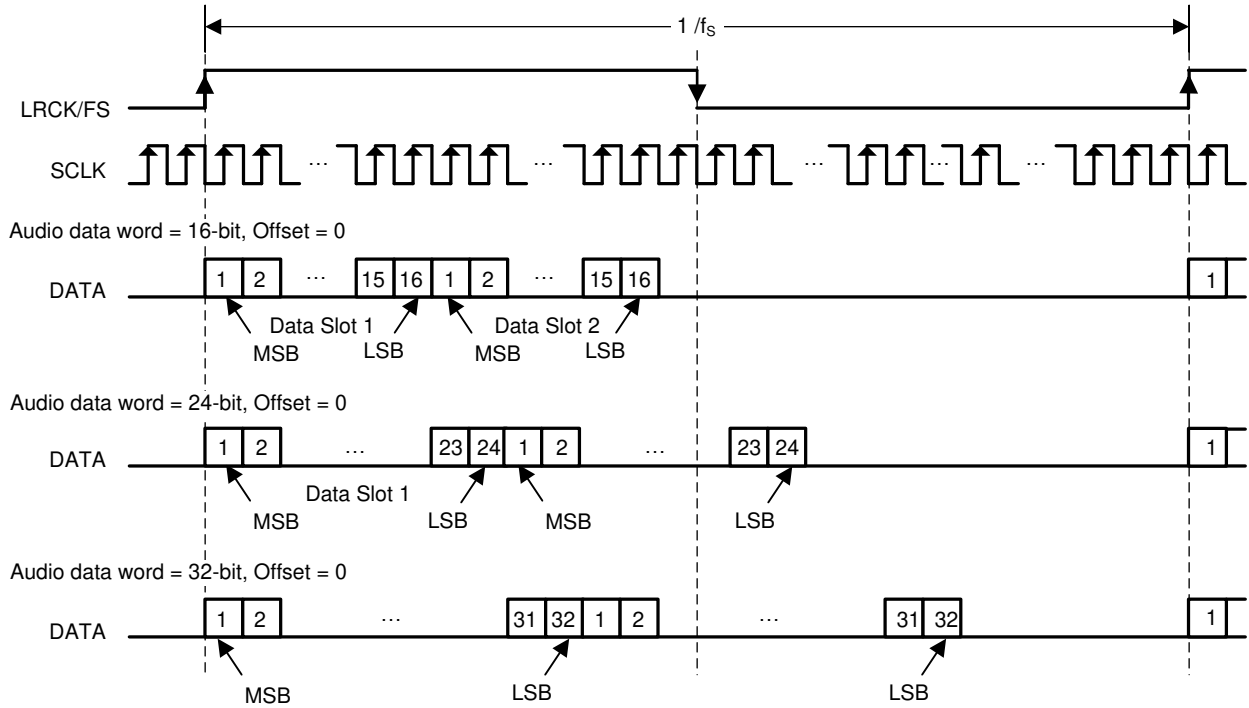

I<sup>2</sup>S Data Format; L-channel = LOW, R-channel = HIGH

**Figure 8-3. I<sup>2</sup>S Audio Data Format**

Right Justified Data Format; L-channel = HIGH, R-channel = LOW

**Figure 8-4. Right Justified Audio Data Format**

TDM Data Format with OFFSET = 0

In TDM Modes, Duty Cycle of LRCK/FS should be 1x SCLK at minimum. Rising edge is considered frame start.

**Figure 8-5. TDM 1 Audio Data Format**

TDM Data Format with OFFSET = 1

In TDM Modes, Duty Cycle of LRCK/FS should be 1x SCLK at minimum. Rising edge is considered frame start.

**Figure 8-6. TDM 2 Audio Data Format**

### 8.3.7 Digital Audio Processing

TAS5828M digital audio processing includes three main functions: basic audio tuning blocks, Hybrid-Pro algorithm and advanced features.

Basic audio tuning blocks are SRC (sample rate converter), stereo channel Input Mixer, 15 BQs for each channel, pop click free Volume, multi-bands DRC, and AGL. Detailed introduction of each block can be found with [TAS5825M Process Flows](#).

Hybrid-Pro can be used in conjunction with [Hybrid Modulation](#), which is an innovative Class-D internal PWM modulation scheme to improve efficiency even more without compromising THD+N performance. Hybrid-Pro goes beyond Hybrid PWM modulation from system efficiency perspective, by tracking audio signal envelope with advanced look-ahead DSP structure, controlling the external PVDD supply voltage rail, and maintaining just enough margin to provide high dynamic range without clipping distortion to save as much power as possible. Refer [TAS5828M User Guide](#) for more configurable options:

- Optional 8 steps 384 kHz PWM format or 16 steps 192 kHz PWM format Hybrid-Pro control waveform for external DC-DC converter.
- Configurable max 4 ms look-ahead audio signal delay buffer, which provides capability to fit various applications systems' DC-DC bandwidth and power supply coupling capacitance.
- Max 512 samples audio signal peak hold to optimize power supply voltage rail transition from large audio input to small level, which is useful to avoid clipping distortion.
- Hybrid-Pro Margin automatically adjusts audio signal trigger level and each step level. Fine tune it to achieve the balance between efficiency and envelope tracking speed.

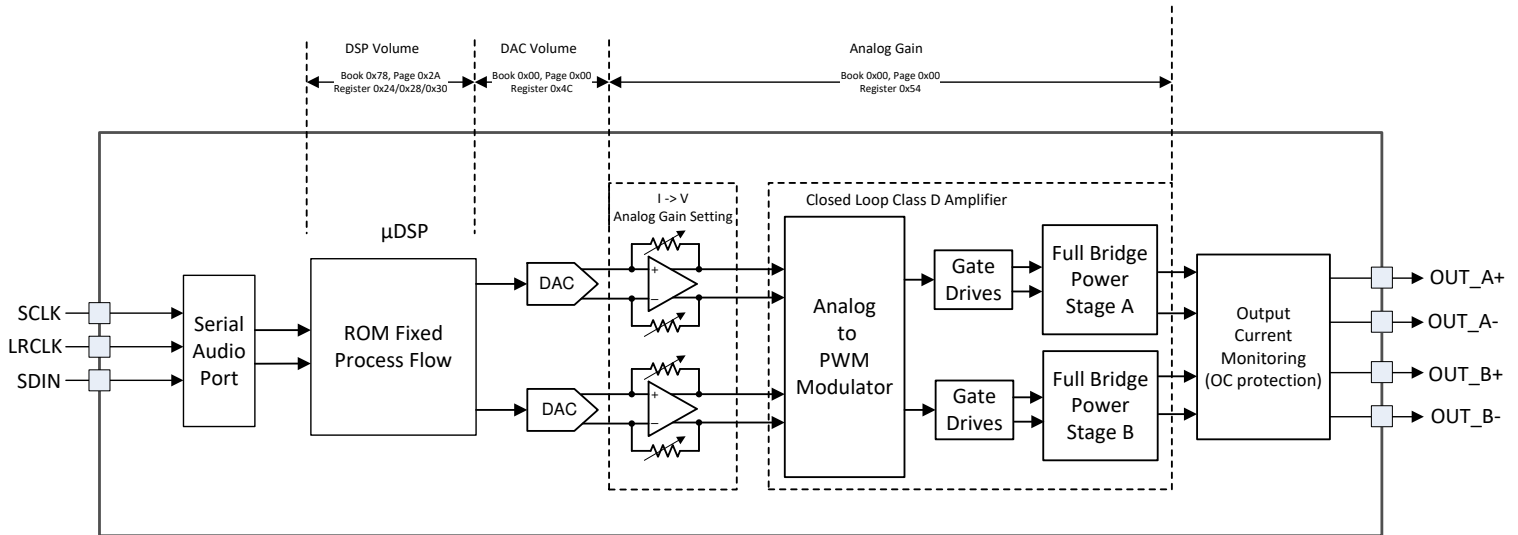

Advanced features include PVDD Sensing (Dynamic Headroom Tracking), Thermal Foldback and Hybrid PWM modulation. They are implemented based on integrated 8-bit PVDD sense ADC and 4 level temperature sensor. Refer to application note: [TAS5825M Advanced Features](#).

### 8.3.8 Class D Audio Amplifier

Following the digital clipper, the interpolated audio data is next sent to the Closed Loop Class-D amplifier, whose first stage is Digital to PWM Conversion (DPC) block. In this block, the stereo audio data is translated into two pairs of complimentary pulse width modulated (PWM) signals which are used to drive the outputs of the speaker amplifier. Feedback loops around the DPC ensure constant gain across supply voltages, reduce distortion, and increase immunity to power supply injected noise and distortion. The analog gain is also applied in the Class-D amplifier section of the device. The gain structures are discussed in detail below for both [Figure 8-7](#) and [Table 8-2](#). The switching rate of the amplifier is configurable by register (Register Address 0x02h -D[6:4])

#### 8.3.8.1 Speaker Amplifier Gain Select

A combination of digital gain and analog gain is used to provide the overall gain of the speaker amplifier. As seen in [Figure 8-7](#), the audio path of the TAS5828M consists of a digital audio input port, a digital audio path, a digital to PWM converter (DPC), a gate driver stage, a Class D power stage, and a feedback loop which feeds the output information back into the DPC block to correct for distortion sensed on the output pins. The total amplifier gain is comprised of digital gain, shown in the digital audio path and the analog gain from the input of the analog modulator to the output of the speaker amplifier power stage.

**Figure 8-7. Speaker Amplifier Gain**

As shown in [Figure 8-7](#), the first gain stage for the speaker amplifier is present in the digital audio path. It consists of the volume control and the digital boost block. The volume control is set to 0 dB by default, it does not change. For all settings of the register 0x54, AGAIN[4:0], the digital boost block remains at 0 dB. These gain settings ensure that the output signal is not clipping at different PVDD levels. 0dBFS output is 29.5-V peak output voltage

**Table 8-2. Analog Gain Setting**

AGAIN <4:0>	GAIN (dBFS)	AMPLIFIER OUTPUT PEAK VOLTAGE (V <sub>P</sub> /FS)	AMPLIFIER OUTPUT PEAK VOLTAGE (dBV <sub>P</sub> /FS)
00000	0	29.5	29.4
00001	-0.5	27.85	28.9
00010	-1.0	26.29	28.4
00011	-1.5	24.82	27.9
.....	.....	.....	.....
11111	-15.5	4.95	13.9

**8.3.8.2 Class D Loop Bandwidth and Switching Frequency Setting**

TAS5828M closed loop structure provides Loop bandwidth setting option (Setting by register 83 -Register address 0x53h-D[6-5]) to co-work with different switching frequency (Setting by register 2 -Register address 0x02h-D[6-4] ). [Table 8-3](#) shows recommended settings for the Loop Bandwidth and Switching Frequency selection. Same Fsw, Better THD+N performance with higher BW.

**Table 8-3. Loop Bandwidth and Switching Frequency Setting**

Modulation Scheme	Fsw	BW (Loop Band Width)	Notes
Hybrid, 1SPW	384kHz	80kHz	Principle: Fsw (Switching Frequency) ≥ 4.2 × Loop Bandwidth
	480kHz	80kHz, 100kHz	
	576kHz	80kHz, 100kHz, 120kHz	
	768kHz	80kHz, 100kHz, 120kHz, 175kHz	
BD	384kHz	80kHz, 100kHz, 120kHz	Principle: Fsw (Switching Frequency) ≥ 3 × Loop Bandwidth
	480kHz	80kHz, 100kHz, 120kHz	
	576kHz	80kHz, 100kHz, 120kHz, 175kHz	
	768kHz	80kHz, 100kHz, 120kHz, 175kHz	

## 8.4 Device Functional Modes

### 8.4.1 Software Control

The TAS5828M device is configured via an I<sup>2</sup>C communication port.

The I<sup>2</sup>C Communication Protocol is detailed in the [I<sup>2</sup>C Communication Port section](#). The I<sup>2</sup>C timing requirements are described in the [Timing Requirements - I<sup>2</sup>C Bus Timing](#).

### 8.4.2 Speaker Amplifier Operating Modes

The TAS5828M device can be configured as two different amplifier configurations through Register 0x02h -D[2]:

- BTL Mode
- PBTL Mode

#### 8.4.2.1 BTL Mode

In BTL mode, the TAS5828M amplifies two independent signals, which represent the left and right portions of a stereo signal. The amplified left signal is presented on differential output pair shown as OUT\_A+ and OUT\_A-, the amplified right signal is presented on differential output pair shown as OUT\_B+ and OUT\_B-.

#### 8.4.2.2 PBTL Mode

The PBTL mode of operation is used to describe operation in which the two outputs of the device are placed in parallel with one another to increase the power sourcing capabilities of the device. On the output side of the TAS5828M device, the summation of the devices can be done before the filter in a configuration called Pre-Filter Parallel Bridge Tied Load (PBTL). However, the two outputs can be required to merge together after the inductor portion of the output filter. Doing so does require two additional inductors, but allows smaller, less expensive inductors to be used because the current is divided between the two inductors. The process is called Post-Filter PBTL. On the input side of the TAS5828M device, the input signal to the PBTL amplifier is left frame of I2S or TDM data.

### 8.4.3 Low EMI Modes

TAS5828M employs several modes to minimize EMI during playing audio, and they can be used based on different applications.

#### 8.4.3.1 Spread Spectrum

Spread spectrum is used in some inductor free or inductor less case to minimize EMI noise. The TAS5828M supports Spread Spectrum with triangle mode.

User need configure register SS\_CTRL0 (0x6B) to Enable triangle mode and enable spread spectrum, select spread spectrum frequency and range with SS\_CTRL1 (0x6C). For 768kHz F<sub>SW</sub> which configured by DEVICE\_CTRL1 (0x02), the spread spectrum frequency and range are described in [Table 8-4](#).

**Table 8-4. Triangle Mode Spread Spectrum Frequency and Range Selection**

SS_TRI_CTRL[3:0]	0	1	2	3	4	5	6	7
Triangle Freq	24k				48k			
Spread Spectrum Range	5%	10%	20%	25%	5%	10%	20%	25%

User Application example: Central Switching Frequency is 768kHz, Triangle Frequency is 48kHz.

Register 0x02 = 0x41 // 768kHz Fsw, BTL Mode, 1SPW mode.

Register 0x6b = 0x03 // Enable Spread Spectrum

Register 0x6c = 0x03 // SS\_CTRL[3:0]=0011, Triangle Frequency = 48kHz, Spread Spectrum Range should be 10% (729kHz~807kHz)

### 8.4.3.2 Channel to Channel Phase Shift

This device supports channel to channel 180-degree PWM phase shift to minimize the EMI. Bit 0 of Register 0x53 can be used to disable or enable the phase shift.

### 8.4.3.3 Multi-Devices PWM Phase Synchronization

TAS5828M support up to 4 phases selection for the multi devices application system. For example, when a system integrated 4 TAS5828M devices, user can select phase0/1/2/3 for each device by register PHASE\_CTRL(0x6A), which means there is a 45 degree phase shift between each device to minimize the EMI.

There are two methods for Multi-Device PWM phase synchronization. Phase Synchronization With I<sup>2</sup>S Clock In Startup Phase or Phase Synchronization With GPIO.

#### 8.4.3.3.1 Phase Synchronization With I<sup>2</sup>S Clock In Startup Phase

1. Step 1, Halt I<sup>2</sup>S clock.
2. Step 2, Configure each device phase selection and enable the phase synchronization. For example: Register 0x6A=0x03 for device 0; Register 0x6A=0x07 for device 1; Register 0x6A=0x0B for device 2; Register 0x6A=0x0F for device 3.
3. Step 3, Configure each device into HIZ mode.
4. Step 4, Provide I<sup>2</sup>S to each device. Phase synchronization for all 4 devices is automatically done by internal sequence.
5. Step 5, Initialize the DSP code (This step can be skipped if only need to do the Phase Synchronization).
6. Step 6, Device to Device PWM phase shift should be fixed with 45 degree.

#### 8.4.3.3.2 Phase Synchronization With GPIO

1. Step 1, Connect GPIOx pin of each device to the SOC GPIO pin on PCB.
2. Step 2, Configure each device GPIOx as phase sync input usage by registers GPIO\_CTRL (0x60) and GPIO\_INPUT\_SEL (0x64).
3. Step 3, Select different phase for each device and enable phase synchronization by register PHASE\_CTRL (0x6A).
4. Step 4, Configure each device into PLAY mode by register DEVICE\_CTRL2 (0x03) and monitor the POWER\_STATE register (0x68) until device changed to HIZ state.
5. Step 5, Give a 0 to 1 toggle on SOC GPIO. Then all 4 devices nter into PLAY mode, and device-to-device PWM phase shift should be fixed with 45 degree.
6. Step 6, Phase Synchronization has been finished. Configure the GPIOx pin to other function based on the application.

#### 8.4.4 Thermal Foldback

The Thermal Foldback (TFB) is designed to protect TAS5828M from excessive die temperature increases, in case the device operates beyond the recommended temperature/power limit, or with a weaker thermal system design than recommended. It allows the TAS5828M to play as loud as possible without triggering unexpected thermal shutdown. When the die temperature triggers the over-temperature warning (OTW) level (TAS5828M has four different temperature threshold, each threshold is indicated in I<sup>2</sup>C register 0x73 bits 0,1,2 and 3 ), an internal AGL (Automatic Gain Limiter) reduces the digital gain gradually, lower value of OTW, smaller attenuation added, with the OTW warning goes higher, more attenuation added. Once the die temperature drops below the OTW, the device's digital gain gradually returns to the former setting. Both the attenuation gain and adjustable rate are programmable. The TFB gain regulation speed (attack rate and release rate) settings are the same as a regular AGL, which is also configurable with TAS5828M App in PurePath™ Console3.

#### 8.4.5 Device State Control

Except Shutdown Mode, TAS5828M has other 4 states for different power dissipation which listed in the *Electrical Characteristics Table*.

- Deep Sleep Mode. Register 0x03h -D[1:0]=00, Device stays in Deep Sleep Mode. In this mode, I<sup>2</sup>C block keep works. This mode can be used to extend the battery life time in some portable speaker application case, once the host processor stopped playing audio for a long time, TAS5828M can be set to Deep Sleep Mode to minimize power dissipation until host processor start playing audio again. Device returns back to Play Mode by setting Register 0x03h -D[1:0] to 11. Compare with Shutdown Mode (Pull  $\overline{\text{PDN}}$  Low), enter or exit Deep Sleep Mode, DSP keeps active.
- Sleep Mode. Register 0x03h -D[1:0]=01, Device stays in Sleep Mode. In this mode, I<sup>2</sup>C block, Digital core, DSP Memory , 5 V Analog LDO keep works. Compare with Shutdown Mode (Pull  $\overline{\text{PDN}}$  Low), enter or exit Sleep Mode, DSP keeps active.
- Output Hiz Mode. Register 0x03h -D[1:0]=10, Device stays in Hiz Mode. In this mode, Only output driver set to be Hiz state, all other block work normally.
- Play Mode. Register 0x03h -D[1:0]=11, Device stays in Play Mode.

### 8.4.6 Device Modulation

TAS5828M has 3 modulation schemes: BD modulation, 1SPW modulation and Hybrid modulation. Select modulation schemes for TAS5828M with Register 0x02 [1:0]-DAMP\_MOD.

#### 8.4.6.1 BD Modulation

This is a modulation scheme that allows operation without the classic LC reconstruction filter when the amp is driving an inductive load with short speaker wires. Each output is switching from 0 volts to the supply voltage. The OUTPx and OUTNx are in phase with each other with no input so that there is little or no current in the speaker. The duty cycle of OUTPx is greater than 50% and OUTNx is less than 50% for positive output voltages. The duty cycle of OUTPx is less than 50% and OUTNx is greater than 50% for negative output voltages. The voltage across the load sits at 0 V throughout most of the switching period, reducing the switching current, which reduces any  $I^2R$  losses in the load.

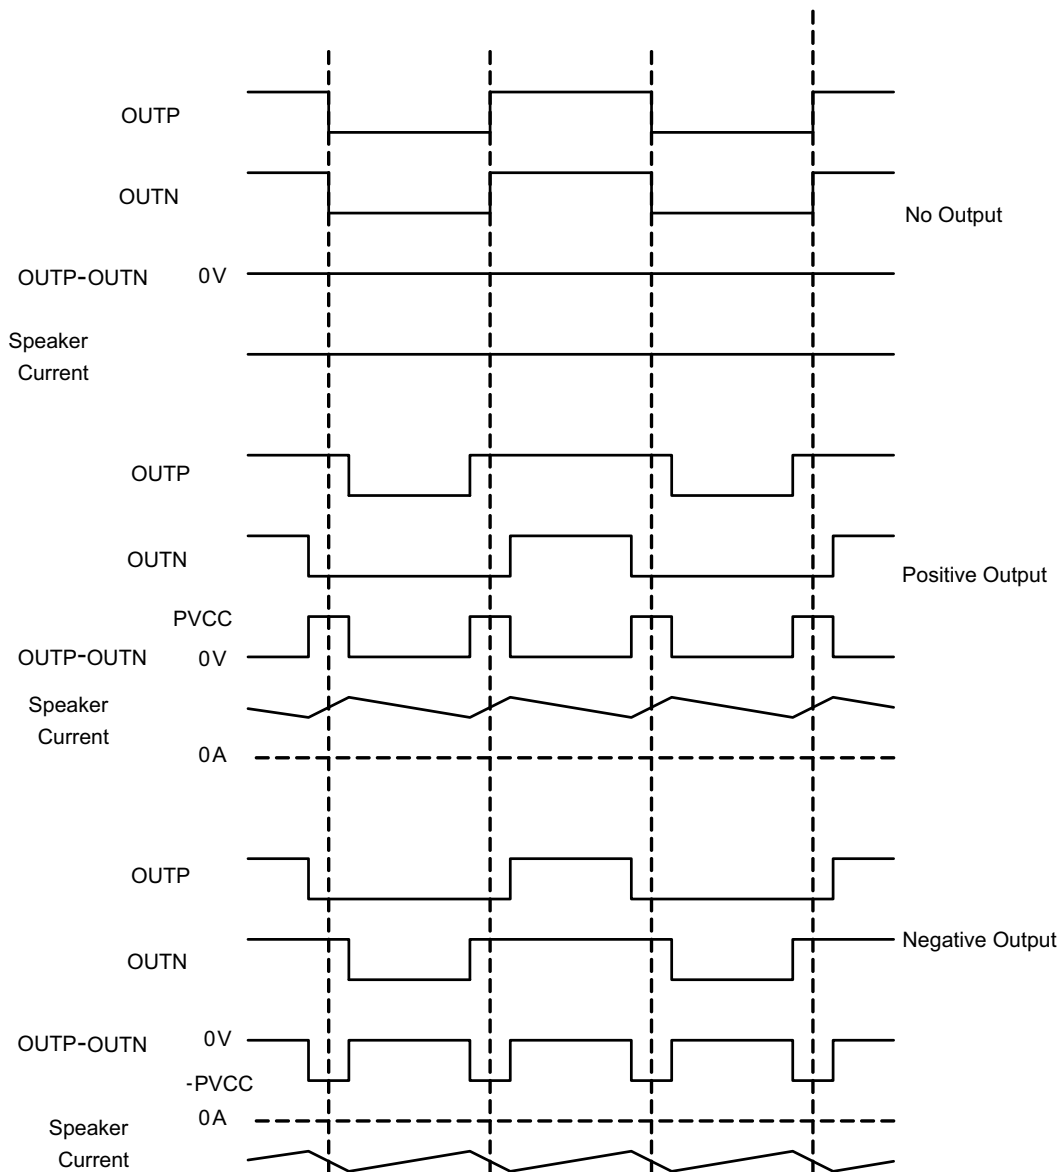

Figure 8-8. BD Mode Modulation

### 8.4.6.2 1SPW Modulation

The 1SPW mode alters the normal modulation scheme in order to achieve higher efficiency with a slight penalty in THD degradation and more attention required in the output filter selection. In Low Idle Current mode the outputs operate at ~17% modulation during idle conditions. When an audio signal is applied, one output decreases and one increases. The decreasing output signal rails to GND. At this point all the audio modulation takes place through the rising output. The result is that only one output is switching during a majority of the audio cycle. Efficiency is improved in this mode due to the reduction of switching losses.

**Figure 8-9. 1SPW Mode Modulation**

### 8.4.6.3 Hybrid Modulation

Hybrid Modulation is designed for minimized power loss without compromising the THD+N performance, and is optimized for battery-powered applications. With Hybrid modulation, TAS5828M detects the input signal level and adjust PWM duty cycle dynamically based on PVDD. Hybrid modulation achieves ultra low idle current and maintains the same audio performance level as the BD Modulation.

### Note

As Hybrid Modulation need the internal DSP to detect the input signal level and adjust PWM duty cycle dynamically. To use the Hybrid Modulation, users need to select the corresponding process flows which support Hybrid Modulation in TAS5828M PPC3 App. Look into TAS5828M PPC3 App for more information about TAS5828M flexible audio process flows.

## 8.5 Programming and Control

### 8.5.1 I<sup>2</sup>C Serial Communication Bus

The device has a bidirectional serial control interface that is compatible with I<sup>2</sup>C bus protocol and supports 100 and 400-kHz data transfer rates for random and sequential write and read operations as a target device. Because the TAS5828M register map and DSP memory spans multi pages, the user should change from page to page before writing individual register or DSP memory. Changing from page to page is accomplished via register 0 on each page. This register value selects the page address, from 0 to 255. All registers listed in TAS5828M Datasheet belongs to Page 0

### 8.5.2 Hardware Control Mode

For the system which does not require the advanced flexibility of the I<sup>2</sup>C registers control or does not have an available I<sup>2</sup>C host controller, the TAS5828M can be used in Hardware Control Mode. Then the device operates in Hardware mode default configurations and any change is accomplished via the Hardware control pins. The audio performance between Hardware and Software Control mode with same configuration is identical, however more features are accessible under Software Control Mode through registers.

Several I/O's on the TAS5828M need to be taken into consideration during schematic design for desired startup settings. The method going into Hardware Control Mode is to pull high HW\_MODE pin13 to DVDD.

The TAS5828M default Hardware configuration with optimized audio, thermal and BOM is BTL mode, 768-kHz switching frequency, 1 SPW mode, 175 kHz Class D amplifier loop bandwidth, 29.5 V<sub>p</sub>/FS analog gain, CBC threshold with 80% of OCP threshold. It requires the HW\_SEL0 pin 5 and HW\_SEL1 pin 6 directly tied low GND.

**Table 8-5. Hardware Control - HW\_SEL0 Pin5**

Pin Configuration	Analog Gain	H-Bridge Output Configuration
0 Ω to GND	29.5 V <sub>p</sub> /FS	BTL
1 kΩ to GND	20.9 V <sub>p</sub> /FS	BTL
4.7 kΩ to GND	14.7 V <sub>p</sub> /FS	BTL
15 kΩ to GND	7.4 V <sub>p</sub> /FS	BTL
33 kΩ to DVDD	7.4 V <sub>p</sub> /FS	PBTL
6.8 kΩ to DVDD	14.7 V <sub>p</sub> /FS	PBTL
1.5 kΩ to DVDD	20.9 V <sub>p</sub> /FS	PBTL
0 Ω to DVDD	29.5 V <sub>p</sub> /FS	PBTL

**Table 8-6. Hardware Control - HW\_SEL1 Pin6**

Pin Configuration	F <sub>SW</sub> &Class D Loop Bandwidth	Cycle By Cycle Current Limit Threshold	Spread Spectrum	Modulation
0 Ω to GND	768 kHz F <sub>SW</sub> , 175 kHz BW	CBC Threshold = 80% OCP	Disable	1SPW
1 kΩ to GND	768 kHz F <sub>SW</sub> , 175 kHz BW	CBC Disable	Disable	1SPW
4.7 kΩ to GND	768 kHz F <sub>SW</sub> , 175 kHz BW	CBC Threshold = 40% OCP	Disable	1SPW
15 kΩ to GND	768 kHz F <sub>SW</sub> , 175 kHz BW	CBC Threshold = 60% OCP	Disable	1SPW
33 kΩ to DVDD	480 kHz F <sub>SW</sub> , 100 kHz BW	CBC Disable	Enable	BD
6.8 kΩ to DVDD	480 kHz F <sub>SW</sub> , 100 kHz BW	CBC Threshold = 80% OCP	Enable	BD

**Table 8-6. Hardware Control - HW\_SEL1 Pin6 (continued)**

Pin Configuration	F <sub>SW</sub> &Class D Loop Bandwidth	Cycle By Cycle Current Limit Threshold	Spread Spectrum	Modulation
1.5 kΩ to DVDD	480 kHz F <sub>SW</sub> , 100 kHz BW	CBC Threshold = 40% OCP	Enable	BD
0 Ω to DVDD	480 kHz F <sub>SW</sub> , 100 kHz BW	CBC Threshold = 60% OCP	Enable	BD

**Example 1:**

BTL Mode, F<sub>SW</sub> = 768 kHz, 1 SPW Modulation, 175 kHz Loop Bandwidth, CBC Threshold = 80% OCP, Analog Gain = 29.5 V<sub>p</sub>/FS, Spread spectrum disable.

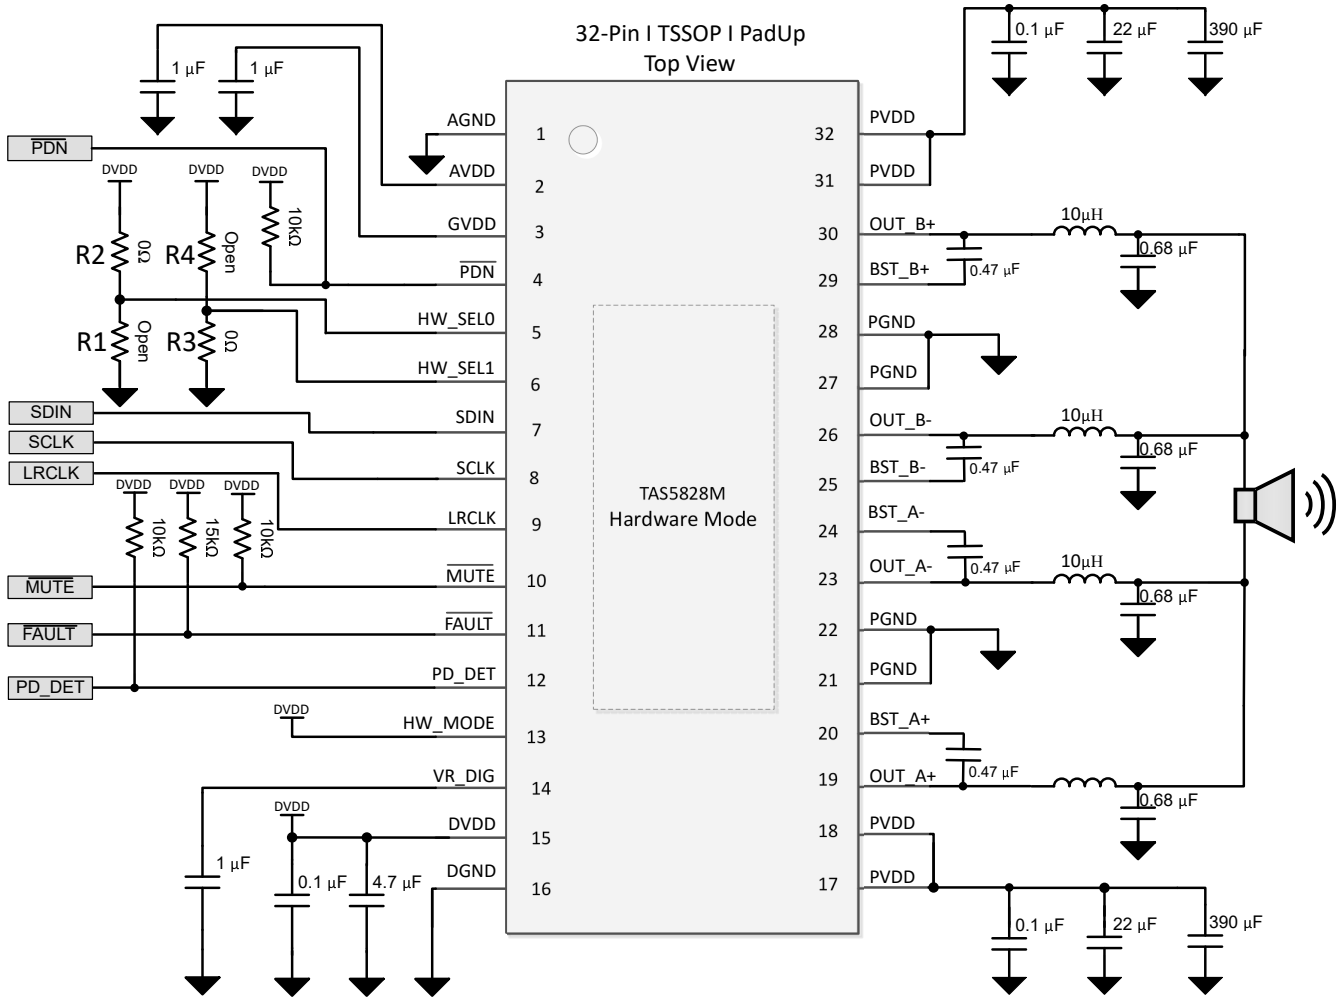

**Figure 8-10. Typical Hardware Control Mode Application Schematic-BTL Mode**

**Example 2:**

PBTL Mode, FSW = 768 kHz, 1 SPW Modulation, 175 kHz Loop Bandwidth, CBC Threshold = 80% OCP, Analog Gain = 29.5 V<sub>p</sub>/FS, Spread spectrum disable.

**Figure 8-11. Typical Hardware Control Mode Application Schematic-PBTL Mode**

**8.5.3 I<sup>2</sup>C Target Address**

The TAS5828M device has 7 bits for the target address. The user-defined address through ADR pin is listed in [Table 8-7](#).

**Table 8-7. I<sup>2</sup>C Target Address Configuration**

ADR PIN Configuration	MSBs				User Define			LSB
0 Ω to GND	1	1	0	0	0	0	0	R/ $\bar{W}$
1kΩ to GND	1	1	0	0	0	0	1	R/ $\bar{W}$
4.7kΩ to GND	1	1	0	0	0	1	0	R/ $\bar{W}$
15kΩ to GND	1	1	0	0	0	1	1	R/ $\bar{W}$
33kΩ to DVDD	1	1	0	0	1	0	0	R/ $\bar{W}$
6.8kΩ to DVDD	1	1	0	0	1	0	1	R/ $\bar{W}$

### 8.5.3.1 Random Write

As shown in Figure 8-12, a single-byte data-write transfer begins with the controller device transmitting a start condition followed by the I<sup>2</sup>C device address and the read/write bit. The read/write bit determines the direction of the data transfer. For a write data transfer, the read/write bit is a 0. After receiving the correct I<sup>2</sup>C device address and the read/write bit, the device responds with an acknowledge bit. Next, the controller transmits the address byte corresponding to the internal memory address being accessed. After receiving the address byte, the device again responds with an acknowledge bit. Next, the controller device transmits the data byte to be written to the memory address being accessed. After receiving the data byte, the device again responds with an acknowledge bit. Finally, the controller device transmits a stop condition to complete the single-byte data-write transfer.

**Figure 8-12. Random Write Transfer**

### 8.5.3.2 Sequential Write

A sequential data-write transfer is identical to a single-byte data-write transfer except that multiple data bytes are transmitted by the controller to the device as shown in Figure 8-13. After receiving each data byte, the device responds with an acknowledge bit and the I<sup>2</sup>C subaddress is automatically incremented by one.

**Figure 8-13. Sequential Write Transfer**

### 8.5.3.3 Random Read

As shown in Figure 8-14, a single-byte data-read transfer begins with the controller device transmitting a start condition followed by the I<sup>2</sup>C device address and the read/write bit. For the data-read transfer, both a write followed by a read are actually done. Initially, a write is done to transfer the address byte of the internal memory address to be read. As a result, the read/write bit is a 0. After receiving the address and the read/write bit, the device responds with an acknowledge bit. In addition, after sending the internal memory address byte, the controller device transmits another start condition followed by the address and the read/write bit again. This time the read/write bit is a 1, indicating a read transfer. After receiving the address and the read/write bit, the device again responds with an acknowledge bit. Next, the device transmits the data byte from the memory address being read. After receiving the data byte, the controller device transmits a not-acknowledge followed by a stop condition to complete the single-byte data-read transfer.

**Figure 8-14. Random Read Transfer**

### 8.5.3.4 Sequential Read

A sequential data-read transfer is identical to a single-byte data-read transfer except that multiple data bytes are transmitted by the device to the controller device as shown in Figure 8-15. Except for the last data byte, the controller device responds with an acknowledge bit after receiving each data byte and automatically increments the I<sup>2</sup>C sub address by one. After receiving the last data byte, the controller device transmits a not-acknowledge followed by a stop condition to complete the transfer.

**Figure 8-15. Sequential Read Transfer**

### 8.5.3.5 DSP Memory Book, Page and BQ update

On Page 0x00 of each book, Register 0x7f is used to change the book. Register 0x00 of each page is used to change the page. To change a Page first write 0x00 to Register 0x00 to switch to Page 0 then write the book number to Register 0x7f on Page 0. To switch between pages in a book, simply write the page number to register 0x00.

All the Biquad Filters coefficients are addressed in book 0xAA. The five coefficients of every Biquad Filter should be written entirely and sequentially from the lowest address to the highest address. The address of all Biquad Filters can be found in Register Maps

All DSP/Audio Process Flow Related Register are listed in Application Note, [TAS5825M Process Flows](#)

### 8.5.3.6 Checksum

This device supports two different check sum schemes, a cyclic redundancy check (CRC) checksum and an Exclusive (XOR) checksum. Register reads do not change checksum, but writes to even nonexistent registers changes the checksum. Both checksums are 8-bit checksums and both are available together simultaneously. The checksums can be reset by writing a starting value (eg. 0x 00 00 00 00) to their respective 4-byte register locations.

#### 8.5.3.6.1 Cyclic Redundancy Check (CRC) Checksum

The 8-bit CRC checksum used is the 0x7 polynomial (CRC-8-CCITT I.432.1; ATM HEC, ISDN HEC and cell delineation,  $(1 + x^1 + x^2 + x^8)$ ). A major advantage of the CRC checksum is that it is input order sensitive. The CRC supports all I<sup>2</sup>C transactions, excluding book and page switching. The CRC checksum is read from register 0x7E on page0 of any book (B\_x, Page\_0, Reg\_126). The CRC checksum can be reset by writing 0x00 to the same register locations where the CRC checksum is valid.

#### 8.5.3.6.2 Exclusive or (XOR) Checksum

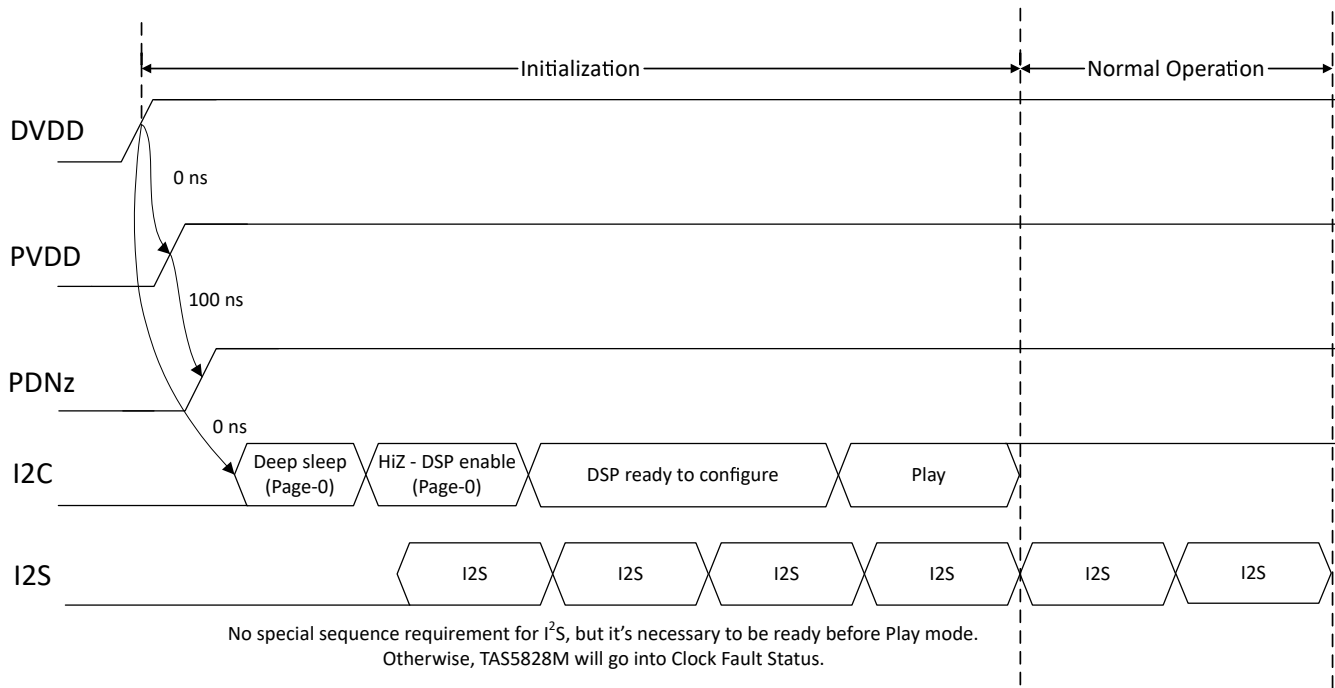

The Xor checksum is a simpler checksum scheme. It performs sequential XOR of each register byte write with the previous 8-bit checksum register value. XOR supports only Book 0x8C, and excludes page switching and all registers in Page 0x00 of Book 0x8C. XOR checksum is read from location register 0x7D on page 0x00 of book 0x8C (B\_140, Page\_0, Reg\_125). The XOR Checksum can be reset by writing 0x00 to the same register location where it is read.

### 8.5.4 Control via Software

- Startup Procedures
- Shutdown Procedures

#### 8.5.4.1 Startup Procedures

1. Configure ADR pin with proper setting for I<sup>2</sup>C device address or Hardware Mode with proper HW\_SEL0 and HW\_SEL1 settings.
2. Bring up power supplies (it does not matter if PVDD or DVDD comes up first).
3. Once power supplies are stable, wait at least 100 μs, bring up  $\overline{\text{PDN}}$  to High to enable internal LDO.
4. I<sup>2</sup>C control port to configure desired settings. This process includes Deep Sleep to HiZ, register map configurations, DSP coefficients, and set into Play mode. Hardware Mode does not need this step I<sup>2</sup>C writing.
5. Once I<sup>2</sup>S clocks are stable, TAS5828M is going to normal operation music playing.

**Figure 8-16. TAS5828M Startup Sequence**

### 8.5.4.2 Shutdown Procedures

1. The device is in normal operation.
2. Configure the Register 0x03h -D[1:0]=10 (Hiz) via the I<sup>2</sup>C control port or Pull  $\overline{\text{PDN}}$  low.
3. Wait at least 6ms (this time depends on the LRCLK rate ,digital volume and digital volume ramp down rate).
4. Bring down power supplies.
5. The device is now fully shutdown and powered off.

- Before PVDD/DVDD power down, Class D Output driver needs to be disabled by  $\overline{\text{PDN}}$  or by I<sup>2</sup>C.
- At least 6ms delay needed based on LRCLK (Fs) = 48kHz, Digital volume ramp down update every sample period, decreased by 0.5dB for each update, digital volume = 24dB. Change the value of register 0x4C and 0x4E or change the LRCLK rate, the delay changes.

**Figure 8-17. Power-Down Sequence**

## 8.5.5 Protection and Monitoring

### 8.5.5.1 Overcurrent Limit (Cycle-By-Cycle)

In stead of direct Overcurrent Shutdown to mute audio output, TAS5828M also provides CBC current limiting protection. The purpose is to reduce output current ahead of Overcurrent Shutdown level by insert pulse into PWM switching, and the threshold (list in [Electrical Characteristics - OCE<sub>THRES</sub>](#)) is configurable through Register 0x77h -D[4:3] Reg\_CBC\_Level\_Sel.

The overall effect on the audio is quite similar a voltage-clipping, which temporarily limits music signal peak power to maintain continues music playing without disruption on removal of the overload.

### 8.5.5.2 Overcurrent Shutdown (OCSD)

If there is severe short-circuit event, such as output short to PVDD or ground, the TAS5828M starts shutdown process less than 100ns once peak-current detector is over Overcurrent Threshold (list in [Electrical Characteristics - OCE<sub>THRES</sub>](#) ). The shutdown speed depends on a number of factors, such as the impedance of the short circuit, supply voltage, and switching frequency.

If an OCSD event occurs, the fault GPIO is pulled low and I<sup>2</sup>C fault register fault status is reported, then outputs transfer to high impedance Hiz status, signifying a fault. This is a latched error, and the user needs to restart output via I<sup>2</sup>C clear fault operation.

### 8.5.5.3 DC Detect Error

If the TAS5828M detects a DC offset in the output voltage cross speaker over DC error protection threshold DCR<sub>THRES</sub>, and this status period is over T<sub>DCDET</sub> (list in [Electrical Characteristics - Protection](#)), the FAULTZ line is pulled low and the OUTxx outputs transition to high impedance, signifying a fault. This latched DC Protection error requires I<sup>2</sup>C clear fault operation to restart audio output.

#### **8.5.5.4 Overtemperature Shutdown (OTSD)**

The TAS5828M device continuously monitors die temperature to ensure it does not exceed the over temperature threshold specified in [Electrical Characteristics -  \$OCE\_{THRES}\$](#) . If an OTE event occurs, the fault GPIO is pulled low and I<sup>2</sup>C fault status is reported, then audio output transfers to high impedance Hiz mode, signifying a fault. This is a latched error, and it requires I<sup>2</sup>C clear fault operation to restart audio playing.

#### **8.5.5.5 PVDD Overvoltage and Undervoltage Error**

If the voltage presented on the PVDD supply rises over the  $OVE_{THRES(PVDD)}$  or drops below the  $UVE_{THRES(PVDD)}$  listed in [Electrical Characteristics - Protection](#), the fault GPIO is pulled to low and I<sup>2</sup>C fault status is reported, then audio output transfers to high impedance Hiz mode. These are self-clearing error, which means that once PVDD level is back to normal operation, the device resumes audio playing.

#### **8.5.5.6 PVDD Drop Detection**

TAS5828M not only provides PVDD Undervoltage Shutdown protection, but also optional PVDD drop detection. Based on internal PVDD real-time sensing voltage, TAS5828M is able to be configured to expected behavior, which could toggle pin10 PD\_DET from high to low to indicate PVDD drops below specific level (default 8 V), and whether TAS5828M automatically goes into Hiz mode to shutdown audio output. All these settings is accessible through Register 0x04h and 0x05h.

The purpose is to feedback PVDD voltage drop information through GPIO to user product control system, which is able to implement flexible protection strategy. For example, SOC could starts audio volume fade out process once PD\_DET pin goes to low. This process could provide effective pop-click free control shutdown.

#### **8.5.5.7 Clock Fault**

When a clock error is detected on incoming data clock, the TAS5828M device switches to an internal oscillator and continues to the driving DAC, which attenuating the data from the last known value. Once this process is completed, the DAC output is hard muted to ground and audio output stops. This non-latched clock fault status is reported I<sup>2</sup>C fault status, and device automatically returns to play mode once correct clock is back.

## 8.6 Register Maps

### 8.6.1 CONTROL PORT Registers

Table 8-8 lists the memory-mapped registers for the CONTROL PORT. All register offset addresses not listed in Table 8-8 should be considered as reserved locations and the register contents should not be modified.

**Table 8-8. CONTROL PORT Registers**

Offset	Acronym	Register Name	Section
1h	RESET_CTRL	Register 1	<a href="#">Section 8.6.1.1</a>

## 9 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Application Information

This section details the information required to configure the device for several popular configurations and provides guidance on integrating the TAS5828M device into the larger system.

#### 9.1.1 Inductor Selections

It is required that the peak current is smaller than the OCP (Over current protection) value which is 7.5 A, there are 3 cases which cause high peak current flow through inductor.

1. During power up (idle state, no audio input), the duty cycle increases from 0 to  $\theta$ . There is a start-up current which flow through inductor to set up the common mode voltage ( $PVDD \times \theta$ ).

### Note

$\theta = 0.5$  (BD Modulation),  $0.14$  (1 SPW Modulation),  $0.14$  (Hybrid Modulation)

2. During music playing, some audio burst signal (high frequency) with very hard PVDD clipping causes PWM duty cycle increase dramatically. This is the worst case and it rarely happens.

$$I_{peak\_clipping} \approx PVDD \times (1 - \theta) / (F_{sw} \times L) \tag{1}$$

3. Peak current due to Max output power. Ignore the ripple current flow through capacitor here.

$$I_{peak\_output\_power} \approx \sqrt{2 \times Max\_Output\_Power / R_{speaker\_Load}} \tag{2}$$

It is suggested that inductor saturation current  $I_{sat}$ , is larger than the amplifier peak current during power-up and play audio.

$$I_{SAT} \geq \max(I_{peak\_power\_up}, I_{peak\_clipping}, I_{peak\_output\_power}) \tag{3}$$

**Table 9-1. Inductor Requirements**

PVDD (V)	Switching Frequency (kHz)	Minimum Inductance (L) (µH)
≤ 12	384	4.7
> 12	384	10

For higher switching frequencies ( $F_{sw}$ ), select the inductors with minimum inductance to be  $384 \text{ kHz} / F_{sw} \times L$ . Same PVDD and switching frequency, larger inductance means smaller idle current for lower power dissipation.

### 9.1.2 Bootstrap Capacitors

The output stage of the TAS5828M uses a high-side NMOS driver, rather than a PMOS driver. To generate the gate driver voltage for the high-side NMOS, a bootstrap capacitor for each output terminal acts as a floating power supply for the switching cycle. Use 0.47- $\mu$ F capacitors to connect the appropriate output pin (OUT\_X) to the bootstrap pin (BST\_X). For example, connect a 0.47- $\mu$ F capacitor between OUT\_A and BST\_A for bootstrapping the A channel. Similarly, connect another 0.47- $\mu$ F capacitor between the OUT\_B and BST\_B pins for the B channel inverting output.

### 9.1.3 Power Supply Decoupling

To ensure high efficiency, low THD, and high PSRR, proper power supply decoupling is necessary. Noise transients on the power supply lines are short duration voltage spikes. These spikes can contain frequency components that extend into the hundreds of megahertz. The power supply input must be decoupled with some good quality, low ESL, Low ESR capacitors larger than 22  $\mu$ F. These capacitors bypasses low frequency noise to the ground plane. For high frequency decoupling, place 1- $\mu$ F or 0.1- $\mu$ F capacitors as close as possible to the PVDD pins of the device.

### 9.1.4 Output EMI Filtering

The device is often used with a low-pass filter, which is used to filter out the carrier frequency of the PWM modulated output. This filter is frequently referred to as the L-C Filter, due to the presence of an inductive element L and a capacitive element C to make up the 2-pole filter.

The L-C filter removes the carrier frequency, reducing electromagnetic emissions and smoothing the current waveform which is drawn from the power supply. The presence and size of the L-C filter is determined by several system level constraints. In some low-power use cases that have no other circuits which are sensitive to EMI, a simple ferrite bead or a ferrite bead plus a capacitor can replace the tradition large inductor and capacitor that are commonly used. In other high-power applications, large toroid inductors are required for maximum power and film capacitors can be used due to audio characteristics. Refer to the application report Class-D LC Filter Design (SLOA119) for a detailed description on the proper component selection and design of an L-C filter based upon the desired load and response.

For EMI performance and EMI Design consideration, reference to application report: [TAS5825M Design Considerations for EMC](#).

## 9.2 Typical Applications

### 9.2.1 2.0 (Stereo BTL) System

In the 2.0 system, two channels are presented to the amplifier via the digital input signal. These two channels are amplified and then sent to two separate speakers. In some cases, the amplified signal is further separated based upon frequency by a passive crossover network after the L-C filter. Even so, the application is considered 2.0.

Most commonly, the two channels are a pair of signals called a stereo pair, with one channel containing the audio for the left channel and the other channel containing the audio for the right channel. While certainly the two channels can contain any two audio channels, such as two surround channels of a multi-channel speaker system, the most popular occurrence in two channels systems is a stereo pair.

Figure 9-1 shows the 2.0 (Stereo BTL) system application.

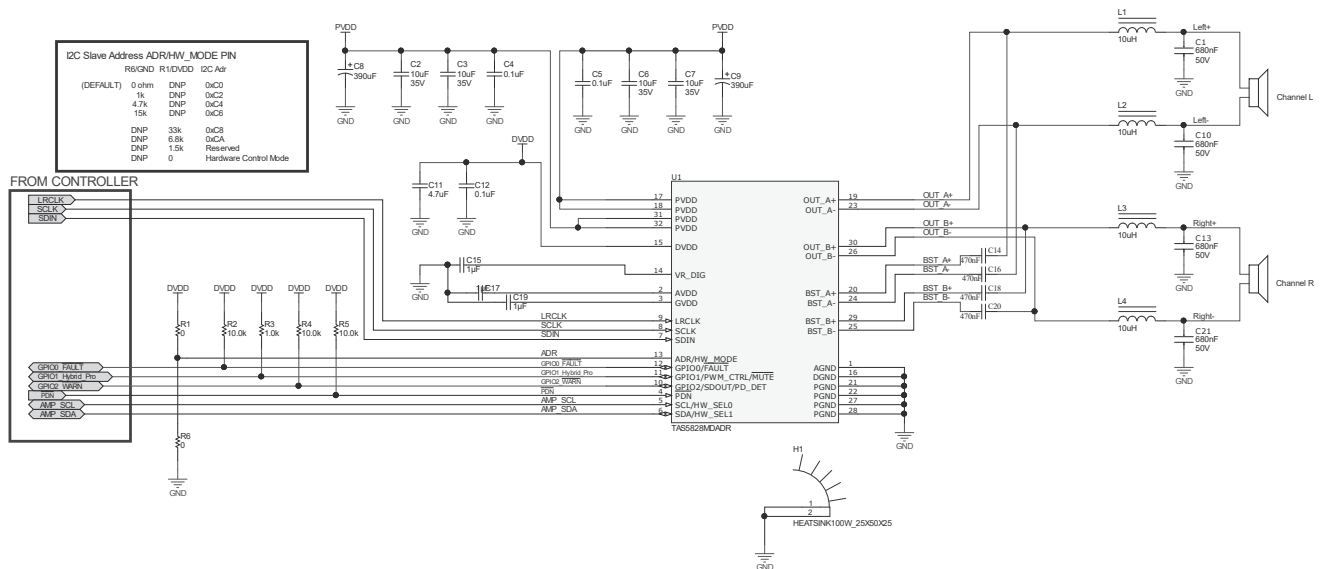

Figure 9-1. 2.0 (Stereo BTL) System Application Schematic

## 9.2.2 Design Requirements

- Power supplies:
  - 3.3-V supply
  - 5-V to 24-V supply
- Communication: host processor serving as I<sup>2</sup>C compliant controller
- External memory (such as EEPROM and FLASH) used for coefficients.

The requirements for the supporting components for the TAS5828M device in a Stereo 2.0 (BTL) system is provide in [Table 9-2](#).

**Table 9-2. Supporting Component Requirements for Stereo 2.0 (BTL) Systems**

## 9.2.3 Detailed Design procedures

This Design procedures can be used for both Stereo 2.0, Advanced 2.1 and Mono Mode.

### 9.2.3.1 Step One: Hardware Integration

- Using the Typical Application Schematic as a guide, integrate the hardware into the system schematic.
- Following the recommended component placement, board layout, and routing given in the example layout above, integrate the device and its supporting components into the system PCB file.
  - The most critical sections of the circuit are the power supply inputs, the amplifier output signals, and the high-frequency signals, all of which go to the serial audio port. Constructing these signals to ensure they are given precedent as design trade-offs are made is recommended.
  - For questions and support go to the E2E forums ([e2e.ti.com](http://e2e.ti.com)). If deviating from the recommended layout is necessary, go to the E2E forum to request a layout review.

### 9.2.3.2 Step Two: Hardware Integration

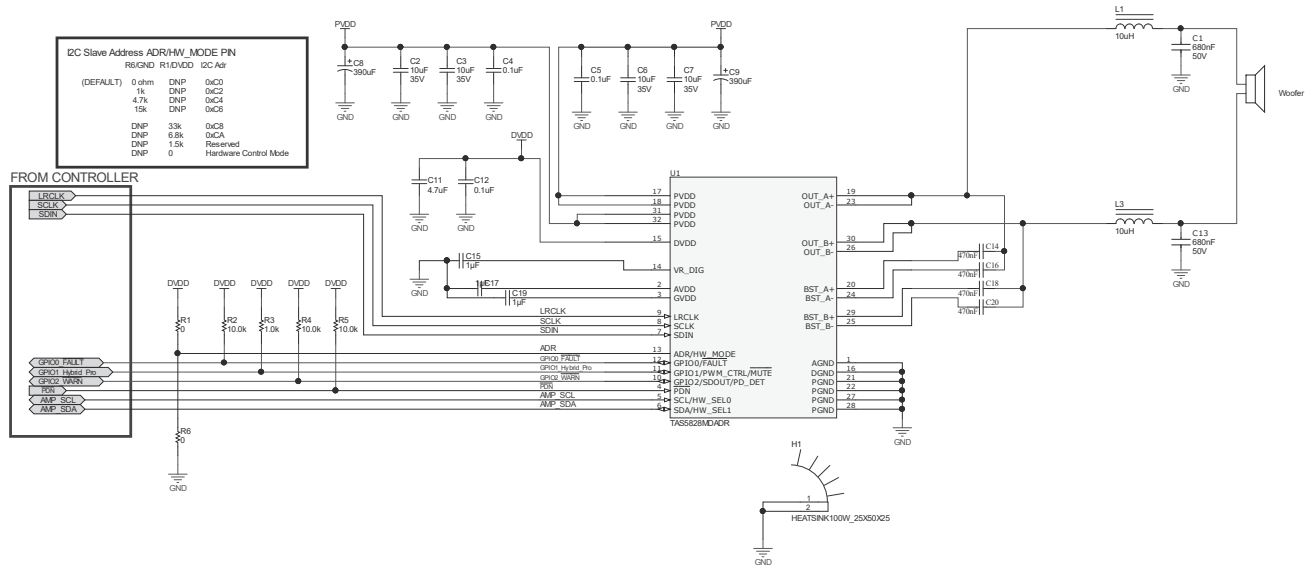

Using the TAS5828MEVM evaluation module and the PPC3 app to configure the desired device settings.

### 9.2.3.3 Step Three: Software Integration

- Using the End System Integration feature of the PPC3 app to generate a baseline configuration file.
- Generate additional configuration files based upon operating modes of the end-equipment and integrate static configuration information into initialization files.
- Integrate dynamic controls (such as volume controls, mute commands, and mode-based EQ curves) into the main system program.

### 9.2.4 MONO (PBTL) Systems

In MONO mode, TAS5828M can be used as PBTL mode to drive sub-woofer with more output power.

**Figure 9-2. Sub-woofer (PBTL) Application Schematic**

**Table 9-3. Supporting Component Requirements for Sub-woofer (PBTL) Systems**

**TAS5828M**

SLASEX7A – JUNE 2021 – REVISED DECEMBER 2021

**9.2.5 Advanced 2.1 System (Two TAS5828M Devices)**

In higher performance systems, the subwoofer output can be enhanced using digital audio processing as was done in the high-frequency channels. To accomplish this, two TAS5828M devices are used - one for the high frequency left and right speakers and one for the mono subwoofer speaker. In this system, the audio signal can be sent from the TAS5828M device through the SDOUT pin. Alternatively, the subwoofer amplifier can accept the same digital input as the stereo, which might come from a central systems processor. **Figure 9-3** shows the 2.1 (Stereo BTL with Two TAS5828M devices) system application.

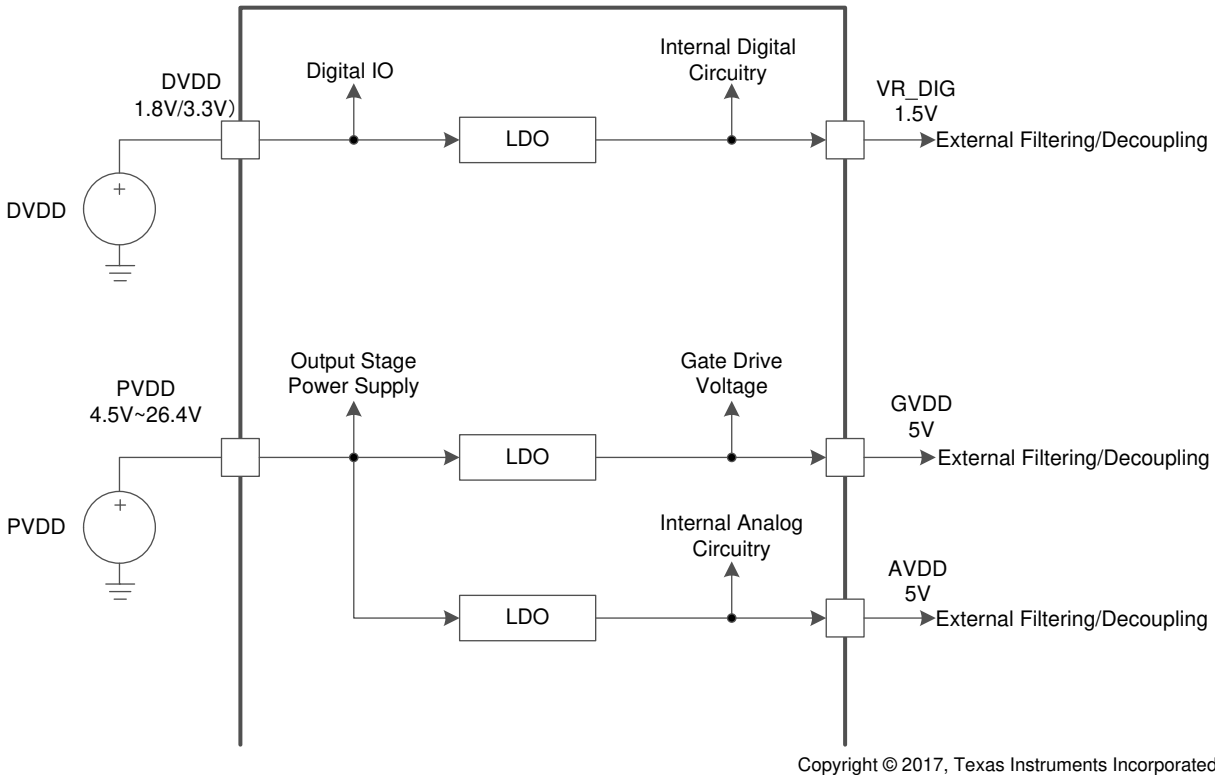

**Figure 9-3. 2.1 (2.1 CH with Two TAS5828M Devices) Application Schematic**

## 10 Power Supply Recommendations

The TAS5828M device requires two power supplies for proper operation. A high-voltage supply calls PVDD is required to power the output stage of the speaker amplifier and its associated circuitry. Additionally, one low-voltage power supply which is calls DVDD is required to power the various low-power portions of the device. The allowable voltage range for both PVDD and DVDD supply are listed in the *Recommended Operating Conditions* table. The two power supplies do not have a required powerup sequence. The power supplies can be powered on in any order.

**Figure 10-1. Power Supply Function Block Diagram**

### 10.1 DVDD Supply

The DVDD supply that is required from the system is used to power several portions of the device. As shown in [Figure 10-1](#), it provides power to the DVDD pin. Proper connection, routing and decoupling techniques are highlighted in the [Application and Implementation](#) section and the [Layout Example](#) section and must be followed as closely as possible for proper operation and performance.

Some portions of the device also require a separate power supply that is a lower voltage than the DVDD supply. To simplify the power supply requirements for the system, the TAS5828M device includes an integrated low dropout (LDO) linear regulator to create this supply. This linear regulator is internally connected to the DVDD supply and its output is presented on the DVDD\_REG pin, providing a connection point for an external bypass capacitor. It is important to note that the linear regulator integrated in the device has only been designed to support the current requirements of the internal circuitry, and should not be used to power any additional external circuitry. Additional loading on this pin could cause the voltage to sag, negatively affecting the performance and operation of the device.

### 10.2 PVDD Supply

The output stage of the speaker amplifier drives the load using the PVDD supply. This is the power supply which provides the drive current to the load during playback. Proper connection, routing, and decoupling techniques are highlighted in the TAS5828MEVM and must be followed as closely as possible for proper operation and performance. Due to the high-voltage switching of the output stage, it is particularly important to

properly decouple the output power stages in the manner described in the TAS5828M device [Application and Implementation](#). Lack of proper decoupling, like that shown in the [Application and Implementation](#), results in voltage spikes which can damage the device.

A separate power supply is required to drive the gates of the MOSFETs used in the output stage of the speaker amplifier. This power supply is derived from the PVDD supply via an integrated linear regulator. A GVDD pin is provided for the attachment of decoupling capacitor for the gate drive voltage regulator. It is important to note that the linear regulator integrated in the device has only been designed to support the current requirements of the internal circuitry, and should not be used to power any additional external circuitry. Additional loading on this pin could cause the voltage to sag, negatively affecting the performance and operation of the device.

Another separate power supply is derived from the PVDD supply via an integrated linear regulator is AVDD. AVDD pin is provided for the attachment of decoupling capacitor for the TAS5828M internal circuitry. It is important to note that the linear regulator integrated in the device has only been designed to support the current requirements of the internal circuitry, and should not be used to power any additional external circuitry. Additional loading on this pin could cause the voltage to sag, negatively affecting the performance and operation of the device.

## 11 Layout

### 11.1 Layout Guidelines

#### 11.1.1 General Guidelines for Audio Amplifiers

Audio amplifiers which incorporate switching output stages must have special attention paid to their layout and the layout of the supporting components used around them. The system level performance metrics, including thermal performance, electromagnetic compliance (EMC), device reliability, and audio performance are all affected by the device and supporting component layout.

Ideally, the guidance provided in the applications section with regard to device and component selection can be followed by precise adherence to the layout guidance shown in the [Layout Example](#) section. These examples represent exemplary baseline balance of the engineering trade-offs involved with laying out the device. These designs can be modified slightly as needed to meet the needs of a given application. In some applications, for instance, solution size can be compromised to improve thermal performance through the use of additional contiguous copper near the device. Conversely, EMI performance can be prioritized over thermal performance by routing on internal traces and incorporating a via picket-fence and additional filtering components. In all cases, it is recommended to start from the guidance shown in the [Layout Example](#) section and work with TI field application engineers or through the E2E community to modify it based upon the application specific goals.

#### 11.1.2 Importance of PVDD Bypass Capacitor Placement on PVDD Network

Placing the bypassing and decoupling capacitors close to supply has long been understood in the industry. This applies to DVDD, AVDD, GVDD and PVDD. However, the capacitors on the PVDD net for the TAS5828M device deserve special attention.

The small bypass capacitors on the PVDD lines of the DUT must be placed as close to the PVDD pins as possible. Not only does placing these devices far away from the pins increase the electromagnetic interference in the system, but doing so can also negatively affect the reliability of the device. Placement of these components too far from the TAS5828M device can cause ringing on the output pins that can cause the voltage on the output pin to exceed the maximum allowable ratings shown in the *Absolute Maximum Ratings* table, damaging the device. For that reason, the capacitors on the PVDD net must be no further away from their associated PVDD pins than what is shown in the example layouts in the [Layout Example](#) section.

#### 11.1.3 Optimizing Thermal Performance

Follow the layout example shown in the [Figure 11-1](#) to achieve the best balance of solution size, thermal, audio, and electromagnetic performance. In some cases, deviation from this guidance can be required due to design constraints which cannot be avoided. In these instances, the system designer should ensure that the heat can get out of the device and into the ambient air surrounding the device. Fortunately, the heat created in the device naturally travels away from the device and into the lower temperature structures around the device.

##### 11.1.3.1 Device, Copper, and Component Layout

Primarily, the goal of the PCB design is to minimize the thermal impedance in the path to those cooler structures. These tips should be followed to achieve that goal:

- Avoid placing other heat producing components or structures near the amplifier (including above or below in the end equipment).
- If possible, use a higher layer count PCB to provide more heat sinking capability for the TAS5828M device and to prevent traces and copper signal and power planes from breaking up the contiguous copper on the top and bottom layer.
- Place the TAS5828M device away from the edge of the PCB when possible to ensure that the heat can travel away from the device on all four sides.
- Avoid cutting off the flow of heat from the TAS5828M device to the surrounding areas with traces or via strings. Instead, route traces perpendicular to the device and line up vias in columns which are perpendicular to the device.
- Unless the area between two pads of a passive component is large enough to allow copper to flow in between the two pads, orient it so that the narrow end of the passive component is facing the TAS5828M device.

- Because the ground pins are the best conductors of heat in the package, maintain a contiguous ground plane from the ground pins to the PCB area surrounding the device for as many of the ground pins as possible.

### 11.1.3.2 Stencil Pattern

The recommended drawings for the TAS5828M device PCB foot print and associated stencil pattern are shown at the end of this document in the package addendum. Additionally, baseline recommendations for the via arrangement under and around the device are given as a starting point for the PCB design. This guidance is provided to suit the majority of manufacturing capabilities in the industry and prioritizes manufacturability over all other performance criteria. In elevated ambient temperature or under high-power dissipation use-cases, this guidance may be too conservative and advanced PCB design techniques may be used to improve thermal performance of the system.

---

#### Note

The customer must verify that deviation from the guidance shown in the package addendum, including the deviation explained in this section, meets the customer's quality, reliability, and manufacturability goals.

---

#### 11.1.3.2.1 PCB footprint and Via Arrangement

The PCB footprint (also known as a symbol or land pattern) communicates to the PCB fabrication vendor the shape and position of the copper patterns to which the TAS5828M device is soldered. This footprint can be followed directly from the guidance in the package addendum at the end of this data sheet. It is important to make sure that the thermal pad, which connects electrically and thermally to the PowerPAD™ of the TAS5828M device, be made no smaller than what is specified in the package addendum. This ensures that the TAS5828M device has the largest interface possible to move heat from the device to the board.

The via pattern shown in the package addendum provides an improved interface to carry the heat from the device through to the layers of the PCB, because small diameter plated vias (with minimally-sized annular rings) present a low thermal-impedance path from the device into the PCB. Once into the PCB, the heat travels away from the device and into the surrounding structures and air. By increasing the number of vias, as shown in the [Layout Example](#) section, this interface can benefit from improved thermal performance.

---

#### Note

Vias can obstruct heat flow if they are not constructed properly.

---

More notes on the construction and placement of vias are as follows:

- Remove thermal reliefs on thermal vias, because they impede the flow of heat through the via.
- Vias filled with thermally conductive material are best, but a simple plated via can be used to avoid the additional cost of filled vias.
- The diameter of the drill must be 8 mm or less. Also, the distance between the via barrel and the surrounding planes should be minimized to help heat flow from the via into the surrounding copper material. In all cases, minimum spacing should be determined by the voltages present on the planes surrounding the via and minimized wherever possible.
- Vias should be arranged in columns, which extend in a line radially from the heat source to the surrounding area. This arrangement is shown in the [Layout Example](#) section.
- Ensure that vias do not cut off power current flow from the power supply through the planes on internal layers. If needed, remove some vias that are farthest from the TAS5828M device to open up the current path to and from the device.

#### 11.1.3.2.2 Solder Stencil

During the PCB assembly process, a piece of metal called a stencil on top of the PCB and deposits solder paste on the PCB wherever there is an opening (called an aperture) in the stencil. The stencil determines the quantity and the location of solder paste that is applied to the PCB in the electronic manufacturing process. In most cases, the aperture for each of the component pads is almost the same size as the pad itself. However, the thermal pad on the PCB is large and depositing a large, single deposition of solder paste would lead to

manufacturing issues. Instead, the solder is applied to the board in multiple apertures, to allow the solder paste to outgas during the assembly process and reduce the risk of solder bridging under the device. This structure is called an aperture array, and is shown in the [Layout Example](#) section. It is important that the total area of the aperture array (the area of all of the small apertures combined) covers between 70% and 80% of the area of the thermal pad itself.

## 11.2 Layout Example

## 12 Device and Documentation Support

### 12.1 Device Support

#### 12.1.1 Device Nomenclature

The glossary section is a general glossary with commonly used acronyms and words which are defined in accordance with a broad TI initiative to comply with industry standards such as JEDEC, IPC, IEEE, and others. The glossary provided in this section defines words, phrases, and acronyms that are unique to this product and documentation, collateral, or support tools and software used with this product. For any additional questions regarding definitions and terminology, please see the [e2e Audio Amplifier Forum](#).

**Bridge tied load (BTL)** is an output configuration in which one terminal of the speaker is connected to one half-bridge and the other terminal is connected to another half-bridge.

**DUT** refers to a *device under test* to differentiate one device from another.

**Closed-loop architecture** describes a topology in which the amplifier monitors the output terminals, comparing the output signal to the input signal and attempts to correct for non-linearities in the output.

**Dynamic controls** are those which are changed during normal use by either the system or the end-user.

**GPIO** is a general purpose input/output pin. It is a highly configurable, bi-directional digital pin which can perform many functions as required by the system.

**Host processor (also known as System Processor, Scalar, Host, or System Controller)** refers to device which serves as a central system controller, providing control information to devices connected to it as well as gathering audio source data from devices upstream from it and distributing it to other devices. This device often configures the controls of the audio processing devices (like the TAS5828M) in the audio path in order to optimize the audio output of a loudspeaker based on frequency response, time alignment, target sound pressure level, safe operating area of the system, and user preference.

**Maximum continuous output power** refers to the maximum output power that the amplifier can continuously deliver without shutting down when operated in a 25°C ambient temperature. Testing is performed for the period of time required that their temperatures reach thermal equilibrium and are no longer increasing

**Parallel bridge tied load (PBTL)** is an output configuration in which one terminal of the speaker is connected to two half-bridges which have been placed in parallel and the other terminal is connected to another pair of half bridges placed in parallel

$r_{DS(on)}$  is a measure of the on-resistance of the MOSFETs used in the output stage of the amplifier.

**Static controls/Static configurations** are controls which do not change while the system is in normal use.

**Vias** are copper-plated through-hole in a PCB.

## 12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## 12.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TAS5828MDADR	ACTIVE	HTSSOP	DAD	32	2000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 85	TAS 5828M	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**

**QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TAS5828MDADR	HTSSOP	DAD	32	2000	330.0	24.4	8.6	11.5	1.6	12.0	24.0	Q1

**TAPE AND REEL BOX DIMENSIONS**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TAS5828MDADR	HTSSOP	DAD	32	2000	350.0	350.0	43.0

Images above are just a representation of the package family, actual package may vary.  
Refer to the product data sheet for package details.

DAD0032A

# PACKAGE OUTLINE

PowerPAD™ TSSOP - 1.15 mm max height

PLASTIC SMALL OUTLINE

4222646/B 02/2020

PowerPAD is a trademark of Texas Instruments.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. Reference JEDEC registration MO-153.

# EXAMPLE BOARD LAYOUT

DAD0032A

PowerPAD™ TSSOP - 1.15 mm max height

PLASTIC SMALL OUTLINE

LAND PATTERN EXAMPLE  
SCALE:8X

SOLDER MASK DETAILS  
NOT TO SCALE

4222646/B 02/2020

NOTES: (continued)

- 5. Publication IPC-7351 may have alternate designs.
- 6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# EXAMPLE STENCIL DESIGN

DAD0032A

PowerPAD™ TSSOP - 1.15 mm max height

PLASTIC SMALL OUTLINE

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL  
SCALE:8X

4222646/B 02/2020

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
