

# TLV906xS 10MHz, RRIO, CMOS Operational Amplifiers for Cost-Sensitive Systems

## 1 Features

- Rail-to-rail input and output
- Low input offset voltage:  $\pm 0.3\text{mV}$
- Unity-gain bandwidth: 10MHz
- Low broadband noise:  $10\text{nV}/\sqrt{\text{Hz}}$
- Low input bias current: 0.5pA
- Low quiescent current: 538 $\mu\text{A}$
- Unity-gain stable
- Internal RFI and EMI filter
- Operational at supply voltages as low as 1.8V
- Easier to stabilize with higher capacitive load due to resistive open-loop output impedance
- Shutdown version: TLV906xS
- Extended temperature range:  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$

## 2 Applications

- [E-bikes](#)
- [Smoke detectors](#)
- [HVAC: heating, ventilating, and air conditioning](#)
- [Motor control: AC induction](#)
- [Refrigerators](#)
- [Wearable devices](#)
- [Laptop computers](#)
- [Washing machines](#)
- [Sensor signal conditioning](#)
- [Power modules](#)
- [Barcode scanners](#)
- [Active Filters](#)
- [Low-side current sensing](#)

## 3 Description

The TLV9061 (single), TLV9062 (dual), and TLV9064 (quad) are single-, dual-, and quad- low-voltage, 1.8V to 5.5V operational amplifiers, op amps) with rail-to-rail input and output swing capabilities.

These devices are highly cost-effective options for applications where low-voltage operation, a small footprint, and high capacitive load drive are required.

Although the capacitive load drive of the TLV906x is 100pF, the resistive open-loop output impedance makes stabilizing with higher capacitive loads simpler. These op amps are designed specifically for low-voltage operation (1.8V to 5.5V), with performance specifications similar to the OPAx316 and TLVx316 devices.

The TLV906xS devices include a shutdown mode that allow the amplifiers to switch into standby mode with typical current consumption less than 1 $\mu\text{A}$ .

The TLV906xS family helps simplify system design, because the family is unity-gain stable, integrates the RFI and EMI rejection filter, and provides no phase reversal in overdrive condition.

*Micro* size packages, such as X2SON and X2QFN, are offered for all the channel variants (single, dual and quad), along with industry-standard packages, such as SOIC, MSOP, SOT-23, and TSSOP.

### Device Information

PART NUMBER <sup>(3)</sup>	PACKAGE <sup>(1)</sup>	BODY SIZE (NOM) <sup>(4)</sup>
TLV9061	DBV (SOT-23, 5)	2.90mm × 1.60 mm
	DCK (SC70, 5)	2.00mm × 1.25 mm
	DRL (SOT-553, 5) <sup>(2)</sup>	1.60mm × 1.20 mm
	DPW (X2SON, 5)	0.80mm × 0.80mm
TLV9061S	DBV (SOT-23, 6)	2.90mm × 1.60 mm
	DRY (USON, 6)	1.45mm × 1.00 mm
TLV9062	D (SOIC, 8)	4.90mm × 3.90 mm
	PW (TSSOP, 8)	3.00mm × 4.40 mm
	DGK (VSSOP, 8)	3.00mm × 3.00 mm
	DDF (SOT-23, 8)	2.90mm × 1.60 mm
	DSG (WSON, 8)	2.00mm × 2.00 mm
TLV9062S	DGS (VSSOP, 10)	3.00mm × 3.00 mm
	RUG (X2QFN, 10)	2.00mm × 1.50mm
	YCK (DSBGA, 9)	1.00mm × 1.00mm
TLV9064	D (SOIC, 14)	8.65mm × 3.90 mm
	PW (TSSOP, 14)	5.00mm × 4.40 mm
	RTE (WQFN, 16)	3.00mm × 3.00mm
	RUC (X2QFN, 14)	2.00mm × 2.00mm
TLV9064S	RTE (WQFN, 16)	3.00mm × 3.00mm

- (1) For all available packages, see [Section 10](#).
- (2) Package is preview only.
- (3) See [Device Comparison](#).
- (4) The body size (length × width) is a nominal value and does not include pins.

**TLV9061, TLV9062, TLV9064**

SBOS839L – MARCH 2017 – REVISED SEPTEMBER 2024

$$f_{-3\text{ dB}} = \frac{1}{2\pi R_1 C_1}$$

$$\frac{V_{\text{OUT}}}{V_{\text{IN}}} = \left(1 + \frac{R_F}{R_G}\right) \left(\frac{1}{1 + sR_1 C_1}\right)$$

**Single-Pole, Low-Pass Filter**

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating ambient temperature (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT	
Supply voltage [(V+) – (V–)]		0	6	V	
Signal input pins	Voltage <sup>(2)</sup>	Common-mode	(V–) – 0.5	(V+) + 0.5	V
		Differential	(V+) – (V–) + 0.2		V
	Current <sup>(2)</sup>	–10	10	mA	
Output short-circuit <sup>(3)</sup>		Continuous		mA	
Temperature	Specified, T <sub>A</sub>	–40	125	°C	
	Junction, T <sub>J</sub>		150		
	Storage, T <sub>stg</sub>	–65	150		

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Input pins are diode-clamped to the power-supply rails. Current limit input signals that can swing more than 0.5V beyond the supply rails to 10mA or less.
- (3) Short-circuit to ground, one amplifier per package.

### 5.2 ESD Ratings

		VALUE	UNIT
TLV9061 PACKAGES			
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2500	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1500	
ALL OTHER PACKAGES			
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±4000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1500	

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V <sub>S</sub>	Supply voltage (V <sub>S</sub> = [V+] – [V–])	1.8	5.5	V
V <sub>I</sub>	Input voltage range	(V–) – 0.1	(V+) + 0.1	V
V <sub>O</sub>	Output voltage range	V–	V+	V
V <sub>SHDN_IH</sub>	High level input voltage at shutdown pin (amplifier enabled)	1.1	V+	V
V <sub>SHDN_IL</sub>	Low level input voltage at shutdown pin (amplifier disabled)	V–	0.2	V
T <sub>A</sub>	Specified temperature	–40	125	°C

### 5.4 Thermal Information: TLV9061

$R_{\theta JC(bot)}$	Junction-to-case(bottom) thermal resistance	23.8	°C/W

(1) For more information about traditional and new thermal metrics, see [Semiconductor and IC Package Thermal Metrics](#).

## 5.10 Electrical Characteristics

For  $V_S$  (Total Supply Voltage) =  $(V+) - (V-) = 1.8V$  to  $5.5V$  at  $T_A = 25^\circ C$ ,  $R_L = 10\text{ k}\Omega$  connected to  $V_S / 2$ ,  $V_{CM} = V_S / 2$ , and  $V_{OUT} = V_S / 2$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>OFFSET VOLTAGE</b>						
$V_{OS}$	Input offset voltage	$V_S = 5V$		$\pm 0.3$	$\pm 1.6$	mV
		$V_S = 5V, T_A = -40^\circ C$ to $125^\circ C$			$\pm 2$	
$dV_{OS}/dT$	Drift	$V_S = 5V, T_A = -40^\circ C$ to $125^\circ C$		$\pm 0.53$		$\mu V/^\circ C$
PSRR	Power-supply rejection ratio	$V_S = 1.8V - 5.5V, V_{CM} = (V-)$		$\pm 7$	$\pm 80$	$\mu V/V$
	Channel separation, DC	At DC		100		dB
<b>INPUT VOLTAGE RANGE</b>						
$V_{CM}$	Common-mode voltage range	$V_S = 1.8V$ to $5.5V$	$(V-) - 0.1$		$(V+) + 0.1$	V
CMRR	Common-mode rejection ratio	$V_S = 5.5V, (V-) - 0.1V < V_{CM} < (V+) - 1.4V, T_A = -40^\circ C$ to $125^\circ C$	80	103		dB
		$V_S = 5.5V, V_{CM} = -0.1V$ to $5.6V, T_A = -40^\circ C$ to $125^\circ C$	57	87		
		$V_S = 1.8V, (V-) - 0.1V < V_{CM} < (V+) - 1.4V, T_A = -40^\circ C$ to $125^\circ C$		88		
		$V_S = 1.8V, V_{CM} = -0.1V$ to $1.9V, T_A = -40^\circ C$ to $125^\circ C$		81		
<b>INPUT BIAS CURRENT</b>						
$I_B$	Input bias current			$\pm 0.5$		pA
$I_{OS}$	Input offset current			$\pm 0.05$		pA
<b>NOISE</b>						
$E_n$	Input voltage noise (peak-to-peak)	$V_S = 5V, f = 0.1\text{ Hz}$ to $10\text{ Hz}$		4.77		$\mu V_{PP}$
$e_n$	Input voltage noise density	$V_S = 5V, f = 10\text{ kHz}$		10		$nV/\sqrt{Hz}$

## 6 Detailed Description

### 6.1 Overview

The TLV906x devices are a family of low-power, rail-to-rail input and output op amps. These devices operate from 1.8V to 5.5V, are unity-gain stable, and are designed for a wide range of general-purpose applications. The input common-mode voltage range includes both rails and allows the TLV906x series to be used in virtually any single-supply application. Rail-to-rail input and output swing significantly increases dynamic range, especially in low-supply applications. The high bandwidth enables this family to drive the sample-and-hold circuitry of analog-to-digital converters (ADCs).

### 6.2 Functional Block Diagram

## 6.3 Feature Description

### 6.3.1 Rail-to-Rail Input

The input common-mode voltage range of the TLV906x family extends 100mV beyond the supply rails for the full supply voltage range of 1.8V to 5.5V. This performance is achieved with a complementary input stage: an N-channel input differential pair in parallel with a P-channel differential pair, as shown in the [Functional Block Diagram](#). The N-channel pair is active for input voltages close to the positive rail, typically  $(V+) - 1.4V$  to 200mV above the positive supply, whereas the P-channel pair is active for inputs from 200mV below the negative supply to approximately  $(V+) - 1.4V$ . There is a small transition region, typically  $(V+) - 1.2V$  to  $(V+) - 1V$ , in which both pairs are on. This 200-mV transition region can vary up to 200mV with process variation. Thus, the transition region (with both stages on) can range from  $(V+) - 1.4V$  to  $(V+) - 1.2V$  on the low end, and up to  $(V+) - 1V$  to  $(V+) - 0.8V$  on the high end. Within this transition region, PSRR, CMRR, offset voltage, offset drift, and THD can degrade compared to device operation outside this region.

### 6.3.2 Rail-to-Rail Output

Designed as a low-power, low-voltage operational amplifier, the TLV906x series delivers a robust output drive capability. A class AB output stage with common-source transistors achieves full rail-to-rail output swing capability. For resistive loads of 10kΩ, the output swings to within 15mV of either supply rail, regardless of the applied power-supply voltage. Different load conditions change the ability of the amplifier to swing close to the rails.

### 6.3.3 EMI Rejection

The TLV906x uses integrated electromagnetic interference (EMI) filtering to reduce the effects of EMI from sources such as wireless communications and densely-populated boards with a mix of analog signal chain and digital components. EMI immunity can be improved with circuit design techniques; the TLV906x benefits from these design improvements. Texas Instruments has developed the ability to accurately measure and quantify the immunity of an operational amplifier over a broad frequency spectrum extending from 10MHz to 6GHz. [Figure 6-1](#) shows the results of this testing on the TLV906x. [Table 6-1](#) lists the EMIRR IN+ values for the TLV906x at particular frequencies commonly encountered in real-world applications. See [EMI Rejection Ratio of Operational Amplifiers application note](#) for more information.

**Figure 6-1. EMIRR Testing**

**Table 6-1. TLV906x EMIRR IN+ For Frequencies of Interest**

FREQUENCY	APPLICATION or ALLOCATION	EMIRR IN+
400MHz	Mobile radio, mobile satellite, space operation, weather, radar, ultra-high frequency (UHF) applications	59.5dB
900MHz	Global system for mobile communications (GSM) applications, radio communication, navigation, GPS (to 1.6GHz), GSM, aeronautical mobile, UHF applications	68.9dB
1.8 GHz	GSM applications, mobile personal communications, broadband, satellite, L-band (1GHz to 2GHz)	77.8dB
2.4GHz	802.11b, 802.11g, 802.11n, Bluetooth®, mobile personal communications, industrial, scientific and medical (ISM) radio band, amateur radio and satellite, S-band (2GHz to 4GHz)	78.0dB

**Table 6-1. TLV906x EMIRR IN+ For Frequencies of Interest (continued)**

FREQUENCY	APPLICATION or ALLOCATION	EMIRR IN+
3.6GHz	Radiolocation, aero communication and navigation, satellite, mobile, S-band	88.8dB
5GHz	802.11a, 802.11n, aero communication and navigation, mobile communication, space and satellite operation, C-band (4GHz to 8GHz)	87.6dB

### 6.3.4 Overload Recovery

Overload recovery is defined as the time required for the operational amplifier output to recover from a saturated state to a linear state. The output devices of the operational amplifier enter a saturation region when the output voltage exceeds the rated operating voltage, because of the high input voltage or the high gain. After the device enters the saturation region, the charge carriers in the output devices require time to return to the linear state. After the charge carriers return to the linear state, the device begins to slew at the specified slew rate. Therefore, the propagation delay (in case of an overload condition) is the sum of the overload recovery time and the slew time. The overload recovery time for the TLV906x family is approximately 200ns.

### 6.3.5 Shutdown Function

The TLV906xS devices feature  $\overline{\text{SHDN}}$  pins that disable the op amp, placing the op amp into a low-power standby mode. In this mode, the op amp typically consumes less than 1 $\mu\text{A}$ . The  $\overline{\text{SHDN}}$  pins are active-low, meaning that shutdown mode is enabled when the input to the  $\overline{\text{SHDN}}$  pin is a valid logic low.

The  $\overline{\text{SHDN}}$  pins are referenced to the negative supply voltage of the op amp. The threshold of the shutdown feature lies around 800mV (typical) and does not change with respect to the supply voltage. Hysteresis has been included in the switching threshold to ensure smooth switching characteristics. To ensure optimal shutdown behavior, the  $\overline{\text{SHDN}}$  pins should be driven with valid logic signals. A valid logic low is defined as a voltage between  $V_-$  and  $V_- + 0.2\text{V}$ . A valid logic high is defined as a voltage between  $V_- + 1.2\text{V}$  and  $V_+$ . The shutdown pin must either be connected to a valid high or a low voltage or driven, and not left as an open circuit. There is **no** internal pull-up to enable the amplifier.

The  $\overline{\text{SHDN}}$  pins are high-impedance CMOS inputs. Dual op amp versions are independently controlled, and quad op amp versions are controlled in pairs with logic inputs. For battery-operated applications, this feature may be used to greatly reduce the average current and extend battery life. The enable time is 10 $\mu\text{s}$  for full shutdown of all channels; disable time is 6 $\mu\text{s}$ . When disabled, the output assumes a high-impedance state. This architecture allows the TLV906xS to operate as a gated amplifier (or to have the device output multiplexed onto a common analog output bus). Shutdown time ( $t_{\text{OFF}}$ ) depends on loading conditions and increases as load resistance increases. To ensure shutdown (disable) within a specific shutdown time, the specified 10k $\Omega$  load to midsupply ( $V_S / 2$ ) is required. If using the TLV906xS without a load, the resulting turnoff time is significantly increased.

## 6.4 Device Functional Modes

The TLV906x family are operational when the power-supply voltage is between 1.8V ( $\pm 0.9\text{V}$ ) and 5.5V ( $\pm 2.75\text{V}$ ). The TLV906xS devices feature a shutdown mode and are shut down when a valid logic low is applied to the shutdown pin.

## 7 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 7.1 Application Information

The TLV906x family features 10MHz bandwidth and 6.5V/ $\mu$ s slew rate with only 538 $\mu$ A of supply current per channel, providing good AC-performance at very low power consumption. DC applications are well served with a very low input noise voltage of 10nV/ $\sqrt{\text{Hz}}$  at 10kHz, low input bias current, and a typical input offset voltage of 0.3mV.

### 7.2 Typical Applications

#### 7.2.1 Typical Low-Side Current Sense Application

Figure 7-1 shows the TLV906x configured in a low-side current-sensing application.

**Figure 7-1. TLV906x in a Low-Side, Current-Sensing Application**

#### 7.2.2 Design Requirements

The design requirements for this design are:

- Load current: 0A to 1A
- Output voltage: 4.95V
- Maximum shunt voltage: 100mV

### 7.2.3 Detailed Design Procedure

The transfer function of the circuit in [Figure 7-1](#) is given in [Equation 1](#).

$$V_{OUT} = I_{LOAD} \times R_{SHUNT} \times GAIN \quad (1)$$

The load current ( $I_{LOAD}$ ) produces a voltage drop across the shunt resistor ( $R_{SHUNT}$ ). The load current is set from 0A to 1A. To keep the shunt voltage below 100mV at maximum load current, the largest shunt resistor is defined using [Equation 2](#).

$$R_{SHUNT} = \frac{V_{SHUNT\_MAX}}{I_{LOAD\_MAX}} = \frac{100mV}{1A} = 100m\Omega \quad (2)$$

Using [Equation 2](#),  $R_{SHUNT}$  equals 100m $\Omega$ . The voltage drop produced by  $I_{LOAD}$  and  $R_{SHUNT}$  is amplified by the TLV906x to produce an output voltage of approximately 0V to 4.95V. [Equation 3](#) calculates the gain required for the TLV906x to produce the required output voltage.

$$Gain = \frac{(V_{OUT\_MAX} - V_{OUT\_MIN})}{(V_{IN\_MAX} - V_{IN\_MIN})} \quad (3)$$

Using [Equation 3](#), the required gain equals 49.5V/V, which is set with the  $R_F$  and  $R_G$  resistors. [Equation 4](#) sizes the  $R_F$  and  $R_G$ , resistors to set the gain of the TLV906x to 49.5V/V.

$$Gain = 1 + \frac{(R_F)}{(R_G)} \quad (4)$$

Selecting  $R_F$  to equal 165k $\Omega$  and  $R_G$  to equal 3.4k $\Omega$  provides a combination that equals approximately 49.5V/V. [Figure 7-2](#) shows the measured transfer function of the circuit shown in [Figure 7-1](#). Notice that the gain is only a function of the feedback and gain resistors. This gain is adjusted by varying the ratio of the resistors and the actual resistor values are determined by the impedance levels that the designer wants to establish. The impedance level determines the current drain, the effect that stray capacitance has, and a few other behaviors. There is no optimal impedance selection that works for every system, you must choose an impedance that is ideal for your system parameters.

### 7.2.4 Application Curve

**Figure 7-2. Low-Side, Current-Sense, Transfer Function**

## 7.3 Power Supply Recommendations

The TLV906x series is specified for operation from 1.8V to 5.5V ( $\pm 0.9V$  to  $\pm 2.75V$ ); many specifications apply from  $-40^{\circ}C$  to  $125^{\circ}C$ . The [Typical Characteristics](#) section presents parameters that can exhibit significant variance with regard to operating voltage or temperature.

**CAUTION**

Supply voltages larger than 6V can permanently damage the device; see the [Absolute Maximum Ratings](#) table.

Place 0.1µF bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement, see the [Layout](#) section.

**7.3.1 Input and ESD Protection**

The TLV906x series incorporates internal ESD protection circuits on all pins. For input and output pins, this protection primarily consists of current-steering diodes connected between the input and power-supply pins. These ESD protection diodes provide in-circuit, input overdrive protection, as long as the current is limited to 10mA, as shown in the [Absolute Maximum Ratings](#) table. [Figure 7-3](#) shows how a series input resistor can be added to the driven input to limit the input current. The added resistor contributes thermal noise at the amplifier input and the value must be kept to a minimum in noise-sensitive applications.

**Figure 7-3. Input Current Protection**

## 7.4 Layout

### 7.4.1 Layout Guidelines

For best operational performance of the device, use good printed circuit board (PCB) layout practices, including:

- Noise can propagate into analog circuitry through the power pins of the circuit as a whole and of the op amp itself. Bypass capacitors are used to reduce the coupled noise by providing low-impedance power sources local to the analog circuitry.
  - Connect low-ESR, 0.1  $\mu$ F ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V+ to ground is adequate for single-supply applications.
- Separate grounding for analog and digital portions of circuitry is one of the simplest and most-effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes. A ground plane helps distribute heat and reduces electromagnetic interference (EMI) noise pickup. Take care to physically separate digital and analog grounds, paying attention to the flow of the ground current. For more detailed information, see [Circuit Board Layout Techniques](#).
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If these traces cannot be kept separate, crossing the sensitive trace at a 90 degree angle is much better as opposed to running the traces in parallel with the noisy trace.
- Place the external components as close to the device as possible. As illustrated in [Figure 7-5](#), keeping R<sub>F</sub> and R<sub>G</sub> close to the inverting input minimizes parasitic capacitance on the inverting input.
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring can significantly reduce leakage currents from nearby traces that are at different potentials.
- Cleaning the PCB following board assembly is recommended for best performance.
- Any precision integrated circuit can experience performance shifts resulting from moisture ingress into the plastic package. Following any aqueous PCB cleaning process, baking the PCB assembly is recommended to remove moisture introduced into the device packaging during the cleaning process. A low-temperature, post-cleaning bake at 85°C for 30 minutes is sufficient for most circumstances.

• Added industry standard package names to <i>Device Comparison Table</i> .....	3
• Added note to packages with thermal pads, specifying that the thermal pads need to be connected to V–.....	4
• Added link to <i>Shutdown Function</i> section in $\overline{\text{SHDN}}$ pin function rows.....	4
• Added <i>EMI Rejection</i> section to the <i>Feature Description</i> section.....	21
• Changed <i>Shutdown Function</i> section to add more clarification .....	22

**Changes from Revision H (April 2019) to Revision I (May 2019) Page**

• Added DDF (SOT-23) thermal information to replace TBDs.....	10
---	----

**Changes from Revision G (December 2018) to Revision H (April 2019) Page**

• Added (SOT-23, 8) information to <i>Device Information</i> .....	1
• Added DDF package column to <i>Device Comparison Table</i> .....	3
• Added DDF (SOT-23) package, to <i>Pin Functions</i> .....	4
• Added DDF (SOT-23) package to <i>Thermal Information</i> .....	10

**Changes from Revision F (September 2018) to Revision G (December 2018) Page**

• Changed TLV9064 RUC package name from: (WQFN, 14) to: (X2QFN, 14) in <i>Device Information</i> table.....	1
• Added RUC (X2QFN) package, pinout information to Pin Functions: TLV9064 table.....	4
• Added TLV9064 RUC (X2QFN) pinout drawing to <i>Pin Configuration and Functions</i> section.....	4
• Added RUC (X2QFN) to Thermal Information: TLV9064 table.....	11

**Changes from Revision E (July 2018) to Revision F (September 2018) Page**

• Deleted Shutdown part numbers from data sheet header .....	1
• Deleted (X2QFN, 10) package from TLV9062 <i>Device Information</i> table.....	1
• Added references to shutdown part numbers in Description section .....	1
• Changed TLV906xS series to TLV906xS family throughout data sheet.....	1
• Added Shutdown devices to Device Comparison Table .....	3
• Changed pin namings for all pinout drawings to reflect updated nomenclature .....	4
• Added TLV9061S Thermal Information Table.....	10
• Added TLV9064S Thermal Information Table.....	11
• Deleted Partial Shutdown Amplifier Enable Time.....	12
• Added clarification on selecting resistors for a current sensing application in the Typical Applications Section .....	24
• Changed wording of third bullet in Layout Guidelines.....	26

**Changes from Revision D (June 2018) to Revision E (July 2018) Page**

• Added TLV9061S device to <i>Device Information</i> table.....	1
• Added TLV9064S device to <i>Device Information</i> table.....	1
• Added RUC and RUG packages to the <i>Device Comparison</i> table.....	3

• Added TLV9061S DBV (SOT-23) pinout drawing to <i>Pin Configuration and Functions</i> section.....	4
• Added TLV9061S DBV (SOT-23) package, pinout information to <i>Pin Functions: TLV9061S</i> table.....	4
• Added TLV9062S RUG (VSSOP) package, pinout drawing to <i>Pin Configuration and Functions</i> section.....	4
• Added TLV9064 RTE pinout information to <i>Pin Functions: TLV9064</i> table.....	4
• Added TLV9064S RTE (WQFN) pinout drawing to <i>Pin Configuration and Functions</i> section .....	4
• Added TLV9062S RUG (VSSOP) package, pinout information to <i>Pin Functions: TLV9062S</i> table.....	4
• Added TLV9064 RTE (WQFN) pinout drawing to <i>Pin Configuration and Functions</i> section .....	4

<b>Changes from Revision C (March 2018) to Revision D (June 2018)</b>	<b>Page</b>
---	-------------

• Added shutdown suffix to "TLV906x" to document title.....	1
• Added "Shutdown Version" bullet to <i>Features</i> list .....	1
• Added TLV9062S device to <i>Device Information</i> table.....	1
• Added shutdown text to <i>Description (continued)</i> section.....	1
• Added " $V_S = [V+] - [V-]$ " supply voltage parameter in <i>Absolute Maximum Ratings</i> table.....	9
• Added "input voltage range" and "output voltage range" parameters and values to <i>Recommended Operating Conditions</i> table.....	9
• Added shutdown pin recommended operating conditions in <i>Recommended Operating Conditions</i> table.....	9
• Added " $T_A$ " symbol to "specified temperature" parameter to <i>Recommended Operating Conditions</i> table .....	9
• Added <i>Thermal Information: TLV9062S</i> thermal table data.....	11
• Added shutdown section to <i>Electrical Characteristics: <math>V_S</math> (Total Supply Voltage) = (V+) - (V-) = 1.8V to 5.5V</i> table.....	12
• Added <i>Shutdown Function</i> section .....	22

<b>Changes from Revision B (October 2017) to Revision C (March 2018)</b>	<b>Page</b>
--	-------------

• Changed device status from Production Data/Mixed Status to Production Data .....	1
• Deleted package preview note from TLV9061 (DPW, X2SON) package in <i>Device Information</i> table .....	1
• Deleted package, preview note from TLV9061 DPW (X2SON) package, pinout drawing .....	4
• Changed formatting of <i>ESD Ratings</i> table to show different results for all packages .....	9
• Deleted package preview note from DPW (X2SON) package in <i>Thermal Information: TLV9061</i> table .....	10
• Deleted package preview note from DPW (X2SON) package in <i>Thermal Information: TLV9061</i> table .....	10

<b>Changes from Revision A (June 2017) to Revision B (October 2017)</b>	<b>Page</b>
---	-------------

• Added 8-pin PW package, to <i>Pin Configuration and Functions</i> section .....	4
• Added DSG (WSON) package to <i>Thermal Information</i> table.....	10
• Added PW (TSSOP) to TLV9062 <i>Thermal Information</i> table .....	10
• Changed maximum input offset voltage value from $\pm 1.6\text{mV}$ to $2\text{mV}$ .....	12
• Changed maximum input offset voltage value from $\pm 1.5$ to $\pm 1.6\text{mV}$ .....	12
• Changed minimum common-mode rejection ratio input voltage range from 86dB to 80dB .....	12
• Changed typical input current noise density value from 10 to $23\text{fA}/\sqrt{\text{Hz}}$ .....	12
• Changed THD + N test conditions from $V_S = 5\text{V}$ to $V_S = 5.5\text{V}$ .....	12
• Added $V_{CM} = 2.5\text{V}$ test condition to THD + N parameter in <i>Electrical Characteristics</i> table .....	12
• Added maximum output voltage swing value from $25\text{mV}$ to $60\text{mV}$ .....	12
• Changed maximum output voltage swing value from $15\text{mV}$ to $20\text{mV}$ .....	12

<b>Changes from Revision * (March 2017) to Revision A (June 2017)</b>	<b>Page</b>
---	-------------

• Changed device status from Advance Information to Production Data .....	1
---	---

## 10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated devices. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

**YCK0009-C01**

**PACKAGE OUTLINE**  
**DSBGA - 0.33 mm max height**

DIE SIZE BALL GRID ARRAY

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.

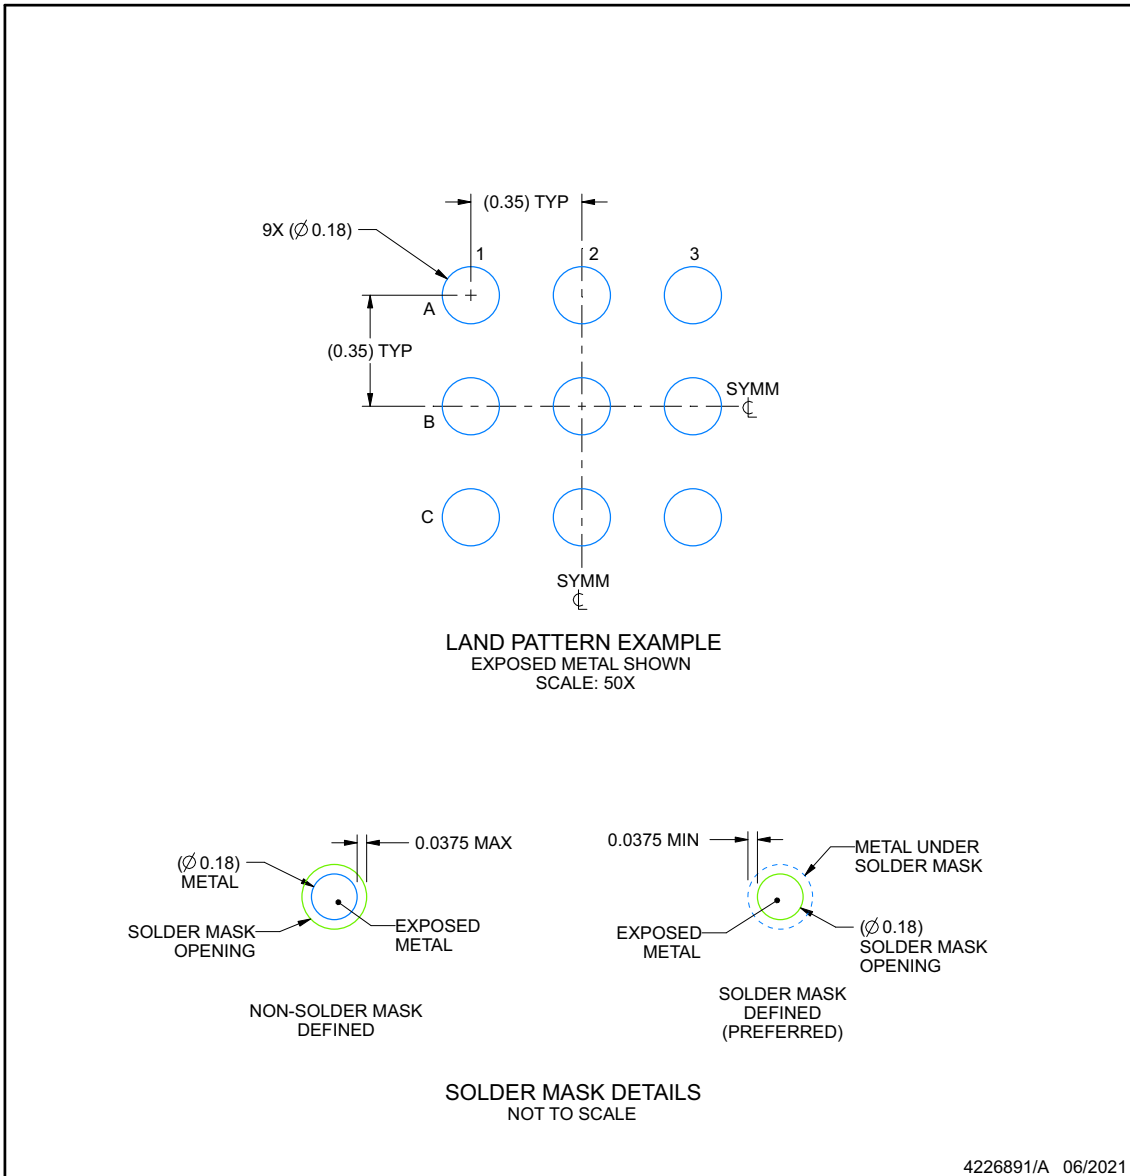

## EXAMPLE BOARD LAYOUT

**YCK0009-C01**

**DSBGA - 0.33 mm max height**

DIE SIZE BALL GRID ARRAY

NOTES: (continued)

- Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints. See Texas Instruments Literature No. SNVA009 ([www.ti.com/lit/snva009](http://www.ti.com/lit/snva009)).

## EXAMPLE STENCIL DESIGN

**YCK0009-C01**

**DSBGA - 0.33 mm max height**

DIE SIZE BALL GRID ARRAY

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**OTHER QUALIFIED VERSIONS OF TLV9061, TLV9062, TLV9064 :**

## SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

4220718/A 09/2016

### NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm, per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.43 mm, per side.
5. Reference JEDEC registration MS-012, variation AB.

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
7. Board assembly site may have different recommendations for stencil design.

RUG (R-PQFP-N10)

PLASTIC QUAD FLATPACK

4208528-3/B 04/2008

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. QFN (Quad Flatpack No-Lead) package configuration.
  - D. This package complies to JEDEC MO-288 variation X2EFD.

RUG (R-PQFP-N10)

4210299-3/A 06/09

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.
  - E. Maximum stencil thickness 0,127 mm (5 mils). All linear dimensions are in millimeters.
  - F. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - G. Side aperture dimensions over-print land for acceptable area ratio > 0.66. Customer may reduce side aperture dimensions if stencil manufacturing process allows for sufficient release at smaller opening.
