

TPS6505xx 5-Channel Power Management IC With Two Step-Down Converters and Three Low-Input Voltage LDOs

1 Features

- Up To 95% Efficiency
- Output Current for DC-DC Converters:
 - TPS65053: DCDC1 = 1 A; DCDC2 = 0.6 A
 - TPS650531, TPS650532: DCDC1 = 1 A; DCDC2 = 1 A
 - TPS65058: DCDC1 = 0.6 A; DCDC2 = 1 A
- TPS65053, TPS650531, TPS650532: DC-DC Converters Externally Adjustable
- TPS65058: DCDC1 Fixed at 3.3V, DCDC2 selectable between 1.8V and 1.2V with Dynamic Voltage Scaling for Core Processor Supply
- V_{IN} Range for DC-DC Converters From 2.5 V to 6 V
- 2.25-MHz Fixed Frequency Operation
- Power Save Mode at Light Load Current
- 180° Out-of-Phase Operation
- Output Voltage Accuracy in PWM Mode $\pm 1\%$
- Total Typical 32- μ A Quiescent Current for Both DC-DC Converters
- 100% Duty Cycle for Lowest Dropout
- One General-Purpose 400-mA LDO
- Two General-Purpose 200-mA LDOs
- V_{IN} Range for LDOs from 1.5 V to 6.5 V
- Output Voltage for LDOs:
 - TPS65053 / TPS650531 / TPS650532: VLDO1 and VLDO2 Externally Adjustable, VLDO3 = 1.3 V / 1.2 V / 1.5 V
 - TPS65058: VLDO1 = 3.3 V, VLDO2 selectable between 1.8V and 1.2V, VLDO2 selectable between 1.8V and 1.3V

2 Applications

- Cell Phones, Smart Phones
- WLAN
- PDAs, Pocket PCs, GPS
- OMAP™ and Low-Power DSP Supply
- Portable Media Players
- Digital Cameras
- Satellite Radio Modules

3 Description

The TPS6505xx family of devices are integrated power management ICs for applications powered by one Li-Ion or Li-Polymer cell, which require multiple power rails. The TPS6505xx devices provide two highly efficient, 2.25-MHz step-down converters targeted at providing the core voltage and I/O voltage in a processor-based system. Both step-down converters enter a low power mode at light load for maximum efficiency across the widest possible range of load currents. For low noise applications the devices can be forced into fixed frequency PWM mode by pulling the MODE pin high. The TPS6505xx devices also integrate one 400-mA LDO and two 200-mA LDO voltage regulators. Each LDO operates with an input voltage range between 1.5 V and 6.5 V allowing them to be supplied from one of the step-down converters or directly from the main battery.

Device Information⁽¹⁾

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
|-------------|-----------|-------------------|
| TPS65053 | VQFN (24) | 4.00 mm x 4.00 mm |
| TPS650531 | | |
| TPS650532 | | |
| TPS65058 | | |

(1) For all available packages, see the orderable addendum at the end of the datasheet.

Pin Functions

| NAME | PIN | | I/O | DESCRIPTION |
|------------|--------------------------------------|----------|-----|--|
| | TPS65053, TPS650531, TPS650532 | TPS65058 | | |
| AGND | 24 | 24 | I | Analog GND, connect to PGND and PowerPAD™ |
| DEF_DCDC2 | — | 5 | I | Switches output voltage at DCDC2, logic HIGH = 1.8V, logic LOW = 1.2V |
| DEF_LDO | — | 4 | I | Switches output voltage at LDO2, logic HIGH = 1.8V, logic LOW = 1.2V |
| | | | | Switches output voltage at LDO3, logic HIGH = 1.8V, logic LOW = 1.3V |
| EN_DCDC1 | 20 | 20 | I | Enable Input for converter 1, active high |
| EN_DCDC2 | 21 | 21 | I | Enable Input for converter 2, active high |
| EN_LDO1 | 22 | 22 | I | Enable input for LDO1. Logic high enables the LDO, logic low disables the LDO. |
| EN_LDO2 | 11 | 11 | I | Enable input for LDO2. Logic high enables the LDO, logic low disables the LDO. |
| EN_LDO3 | 12 | 12 | I | Enable input for LDO3. Logic high enables the LDO, logic low disables the LDO. |
| FB_DCDC1 | 19 | 19 | I | Input to adjust output voltage of converter 1 between 0.6 V and V_I . Connect external resistor divider between VOUT1, this pin and GND. |
| FB_DCDC2 | 13 | 13 | I | Input to adjust output voltage of converter 2 between 0.6V and V_{IN} . Connect external resistor divider between VOUT2, this pin and GND. |
| FB_LDO1 | 4 | — | I | Feedback input for the external voltage divider. |
| FB_LDO2 | 6 | — | I | Feedback input for the external voltage divider. |
| L1 | 17 | 17 | O | Switch pin of converter 1. Connected to Inductor |
| L2 | 15 | 15 | O | Switch Pin of converter 2. Connected to Inductor. |
| MODE | 23 | 23 | I | Select between Power Save Mode and forced PWM Mode for DCDC1 and DCDC2. In Power Save Mode, PFM is used at light loads, PWM for higher loads. If PIN is set to high level, forced PWM Mode is selected. If Pin has low level, then the device operates in Power Save Mode. |
| PGND1 | 18 | 18 | I | GND for converter 1 |
| PGND2 | 14 | 14 | I | GND for converter 2 |
| PowerPAD™ | — | — | — | Connect to GND |
| V_{CC} | 1 | 1, 6 | I | Power supply for digital and analog circuitry of DCDC1, DCDC2 and LDOs. This pin must be connected to the same voltage supply as VINDCDC1/2. |
| VINDCDC1/2 | 16 | 16 | I | Input voltage for VDCDC1 and VDCDC2 step-down converter. This must be connected to the same voltage supply as V_{CC} . |
| VINLDO1 | 2 | 2 | I | Input voltage for LDO1 |
| VINLDO2/3 | 8 | 8 | I | Input voltage for LDO2 and LDO3 |
| VLDO1 | 3 | 3 | O | Output voltage of LDO1 |
| VLDO2 | 7 | 7 | O | Output voltage of LDO2 |
| VLDO3 | 9 | 9 | O | Output voltage of LDO3 |
| THRESHOLD | 5 | — | I | Reset input |
| RESET | 10 | 10 | O | Open drain active low reset output, 100 ms reset delay time. |

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

| | | MIN | MAX | UNIT |
|------------------|--|------|-----------------------|------|
| V _I | Input voltage on all pins except AGND, PGND, and EN_LDO1 pins with respect to AGND | -0.3 | 7 | V |
| | Input voltage on EN_LDO1 pin with respect to AGND | -0.3 | V _{CC} + 0.5 | V |
| I _I | Current at VINDCDC1/2, L1, PGND1, L2, PGND2 | 1800 | 1800 | mA |
| | Current at all other pins | 1000 | 1000 | mA |
| V _O | Output voltage for LDO1, LDO2 and LDO3 | -0.3 | 4.0 | V |
| T _A | Operating free-air temperature | -40 | 85 | °C |
| T _J | Maximum junction temperature | | 125 | °C |
| T _{stg} | Storage temperature | -65 | 150 | °C |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

| | | VALUE | UNIT |
|--------------------|-------------------------|--|-------|
| V _(ESD) | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾ | ±2000 |
| | | Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾ | ±500 |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions.

6.3 Recommended Operating Conditions

| | | MIN | NOM | MAX | UNIT |
|--|--|-----|--------------|----------------------|------|
| V _{INDCDC1/2} | Input voltage range for step-down converters | 2.5 | | 6 | V |
| V _{DCDC1} | Output voltage range for VDCDC1 step-down converter for externally adjustable versions | 0.6 | | V _{INDCDC1} | V |
| V _{DCDC2} | Output voltage range for VDCDC2 step-down converter for externally adjustable versions | 0.6 | | V _{INDCDC2} | V |
| V _{INLDO1} , V _{INLDO2/3} | Input voltage range for LDOs | 1.5 | | 6.5 | V |
| V _{LDO1-2} | Output voltage range for LDO1 and LDO2 for externally adjustable versions | 1 | | 3.6 | V |
| | Output voltage for LDO1 on TPS65058 | | 3.3 | | V |
| | Output voltage for LDO2 on TPS65058 (DEF_LDO = 1 / 0) | | 1.8 / 1.2 | | V |
| V _{LDO3} | Output voltage for LDO3 on TPS65053 | | 1.3 | | V |
| | Output voltage for LDO3 on TPS650531 | | 1.2 | | |
| | Output voltage for LDO3 on TPS650532 | | 1.5 | | |
| | Output voltage for LDO3 on TPS65058 (DEF_LDO = 1 / 0) | | 1.8 / 1.3 | | V |
| I _{OUTDCDC1} | Output current at L1 for TPS65053, TPS650531, TPS650532 | | | 1000 | mA |
| | Output current at L1 for TPS65058 | | | 600 | mA |
| L1 | Inductor at L1 ⁽¹⁾ | 1.5 | 2.2 | | μH |
| C _{INDCDC1/2} | Input capacitor at V _{INDCDC1/2} ⁽¹⁾ | 22 | | | μF |
| C _{OUTDCDC1} | Output capacitor at V _{DCDC1} ⁽¹⁾ | 10 | 22 | | μF |
| I _{OUTDCDC2} | Output current at L2 for TPS65053 | | | 600 | mA |
| | Output current at L2 for TPS650531, TPS650532, TPS65058 | | | 1000 | |

- (1) See the *Application Information* section of this data sheet for more details.

Recommended Operating Conditions (continued)

| | | MIN | NOM | MAX | UNIT |
|-----------------------|--|-----|-----|-----|------|
| L2 | Inductor at L2 ⁽¹⁾ | 1.5 | 2.2 | | μH |
| C _{OUTDCDC2} | Output capacitor at V _{DCDC2} ⁽¹⁾ | 10 | 22 | | μF |
| C _{VCC} | Input capacitor at VCC ⁽¹⁾ | 1 | | | μF |
| C _{in1-2} | Input capacitor at VINLDO1, VINLDO2/3 ⁽¹⁾ | 2.2 | | | μF |
| C _{OUT1} | Output capacitor at VLDO1 ⁽¹⁾ | 4.7 | | | μF |
| C _{OUT2-3} | Output capacitor at VLDO2-3 ⁽¹⁾ | 2.2 | | | μF |
| I _{LDO1} | Output current at VLDO1 | | | 400 | mA |
| I _{LDO2,3} | Output current at VLDO2,3 | | | 200 | mA |
| T _A | Operating ambient temperature range | -40 | | 85 | °C |
| T _J | Operating junction temperature range | -40 | | 125 | °C |
| R _{CC} | Resistor from battery voltage to V _{CC} used for filtering ⁽²⁾ | | 1 | 10 | Ω |

(2) Up to 2 mA can flow into V_{CC} when both converters are running in PWM, this resistor causes the UVLO threshold to be shifted accordingly.

6.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | TPS65053 | UNIT |
|-------------------------------|--|----------|------|
| | | VQFN | |
| | | 24 PINS | |
| R _{θJA} | Junction-to-ambient thermal resistance | 31.4 | °C/W |
| R _{θJC(top)} | Junction-to-case (top) thermal resistance | 29.0 | |
| R _{θJB} | Junction-to-board thermal resistance | 8.2 | |
| ψ _{JT} | Junction-to-top characterization parameter | 0.3 | |
| ψ _{JB} | Junction-to-board characterization parameter | 8.2 | |
| R _{θJC(bot)} | Junction-to-case (bottom) thermal resistance | 1.6 | |

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Dissipation Ratings

| PACKAGE | R _{θJA} ⁽¹⁾ | T _A ≤ 25°C POWER RATING | DERATING FACTOR ABOVE T _A = 25°C | T _A = 70°C POWER RATING | T _A = 85°C POWER RATING |
|---------|---------------------------------|---------------------------------------|--|---------------------------------------|---------------------------------------|
| RGE | 35 K/W | 2.8 W | 28 mW/K | 1.57 W | 1.14 W |

(1) The thermal resistance junction to case of the RGE package is 2 K/W measured on a high K board.

6.6 Electrical Characteristics

$V_{CC} = V_{INDCDC1/2} = 3.6V$, $EN = V_{CC}$, $MODE = GND$, $L = 2.2\mu H$, $C_{OUT} = 22\mu F$, $T_A = -40^\circ C$ to $85^\circ C$ typical values are at $T_A = 25^\circ C$ (unless otherwise noted).

| PARAMETER | | TEST CONDITIONS | | MIN | TYP | MAX | UNIT | |

7 Detailed Description

7.1 Overview

The TPS6505xx include two synchronous step-down converters. The converters operate with 2.25 MHz fixed frequency pulse width modulation (PWM) at moderate to heavy load currents. At light load currents the converters automatically enter Power Save Mode and operate with PFM (Pulse Frequency Modulation).

During PWM operation the converters use a unique fast response voltage mode controller scheme with input voltage feed-forward to achieve good line and load regulation allowing the use of small ceramic input and output capacitors. At the beginning of each clock cycle initiated by the clock signal, the P-channel MOSFET switch is turned on and the inductor current ramps up until the comparator trips and the control logic turns off the switch. The current limit comparator will also turn off the switch in case the current limit of the P-channel switch is exceeded. After the adaptive dead time prevents shoot through current, the N-channel MOSFET rectifier is turned on and the inductor current ramps down. The next cycle is initiated by the clock signal again turning off the N-channel rectifier and turning on the P-channel switch.

The two DC-DC converters operate synchronized to each other, with converter 1 as the master. A 180 ° phase shift between Converter 1 and Converter 2 decreases the input RMS current. Therefore smaller input capacitors can be used.

The converters output voltage is set by an external resistor divider connected to FB_DCDC1 or FB_DCDC2, respectively. See [Application and Implementation](#) for more details.

7.2 Functional Block Diagrams

Figure 19. TPS65053 Functional Block Diagram

Functional Block Diagrams (continued)

Figure 20. TPS65058 Functional Block Diagram

7.3 Feature Description

7.3.1 Power Save Mode

The Power Save Mode is enabled with Mode Pin set to low. If the load current decreases, the converters will enter Power Save Mode operation automatically. During Power Save Mode the converters operate with reduced switching frequency in PFM mode and with a minimum quiescent current to maintain high efficiency. The converter will position the output voltage typically 1% above the nominal output voltage. This voltage positioning feature minimizes voltage drops caused by a sudden load step.

In order to optimize the converter efficiency at light load the average current is monitored and if in PWM mode the inductor current remains below a certain threshold, then Power Save Mode is entered. The typical threshold can be calculated according to:

Average output current threshold to enter PFM mode:

$$I_{\text{PFM_enter}} = \frac{V_{\text{IN_DCDC}}}{32\Omega} \quad (1)$$

Average output current threshold to leave PFM mode:

$$I_{\text{PFM_leave}} = \frac{V_{\text{IN_DCDC}}}{24\Omega} \quad (2)$$

During the Power Save Mode the output voltage is monitored with a comparator. As the output voltage falls below the skip comparator threshold (skip comp) of $V_{\text{OUTnominal}} + 1\%$, the P-channel switch will turn on and the converter effectively delivers a constant current as defined above. If the load is below the delivered current then the output voltage will rise until the same threshold is crossed again, whereupon all switching activity ceases, hence reducing the quiescent current to a minimum until the output voltage has dropped below the threshold again. If the load current is greater than the delivered current then the output voltage will fall until it crosses the skip comparator low (Skip Comp Low) threshold set to 1% below nominal V_{out} , whereupon Power Save Mode is exited and the converter returns to PWM mode.

These control methods reduce the quiescent current typically to 12µA per converter and the switching frequency to a minimum thereby achieving the highest converter efficiency. The PFM mode operates with very low output voltage ripple. The ripple depends on the comparator delay and the size of the output capacitor; increasing capacitor values will make the output ripple tend to zero.

The Power Save Mode can be disabled by driving the MODE pin high. Both converters will operate in fixed PWM mode. Power Save Mode Enable/Disable applies to both converters.

7.3.1.1 Dynamic Voltage Positioning

This feature reduces the voltage under/overshoots at load steps from light to heavy load and vice versa. It is activated in Power Save Mode operation when the converter runs in PFM Mode. It provides more headroom for both the voltage drop at a load step increase and the voltage increase at a load throw-off. This improves load transient behavior.

At light loads, in which the converters operate in PFM Mode, the output voltage is regulated typically 1% higher than the nominal value. In case of a load transient from light load to heavy load, the output voltage will drop until it reaches the skip comparator low threshold set to -1% below the nominal value and enters PWM mode. During a load throw off from heavy load to light load, the voltage overshoot is also minimized due to active regulation turning on the N-channel switch.

Feature Description (continued)

Figure 21. Dynamic Voltage Positioning

7.3.1.2 Soft Start

The two converters have an internal soft start circuit that limits the inrush current during start-up. During soft start, the output voltage ramp up is controlled as shown in Figure 22.

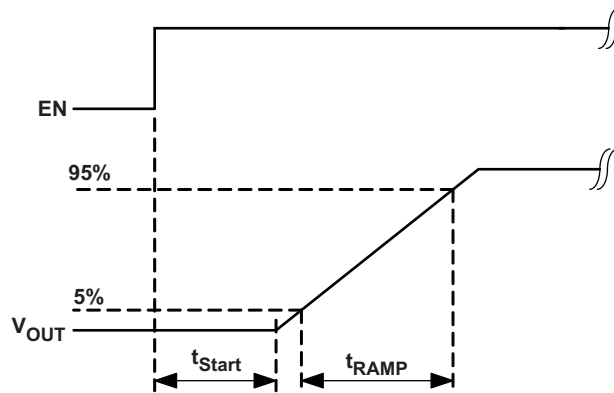

Figure 22. Soft Start

7.3.1.3 100% Duty Cycle Low Dropout Operation

The converters offer a low input to output voltage difference while still maintaining operation with the use of the 100% duty cycle mode. In this mode the P-channel switch is constantly turned on. This is particularly useful in battery-powered applications to achieve longest operation time by taking full advantage of the whole battery voltage range, i.e. The minimum input voltage to maintain regulation depends on the load current and output voltage and can be calculated as:

$$V_{in_min} = V_{out_max} + I_{out_max} \times (R_{DS(on)_max} + R_L)$$

where

- I_{out_max} = maximum output current plus inductor ripple current
- $R_{DS(on)_max}$ = maximum P-channel switch $r_{DS(on)}$
- R_L = DC resistance of the inductor
- V_{out_max} = nominal output voltage plus maximum output voltage tolerance (3)

With decreasing load current, the device automatically switches into pulse skipping operation in which the power stage operates intermittently based on load demand. By running cycles periodically the switching losses are minimized and the device runs with a minimum quiescent current maintaining high efficiency.

In power save mode the converter only operates when the output voltage trips below its nominal output voltage. It ramps up the output voltage with several pulses and goes again into power save mode once the output voltage exceeds the nominal output voltage.

Feature Description (continued)

7.3.1.4 Undervoltage Lockout

The undervoltage lockout circuit prevents the device from malfunctioning by disabling the converter at low input voltages and from excessive discharge of the battery. The undervoltage lockout threshold is typically 1.8 V, max 2 V.

7.3.2 Mode Selection

The MODE pin allows mode selection between forced PWM Mode and power Save Mode for both converters. Connecting this pin to GND enables the automatic PWM and power save mode operation. The converters operate in fixed frequency PWM mode at moderate to heavy loads and in the PFM mode during light loads, maintaining high efficiency over a wide load current range.

Pulling the MODE pin high forces both converters to operate constantly in the PWM mode even at light load currents. The advantage is the converters operate with a fixed frequency that allows simple filtering of the switching frequency for noise sensitive applications. In this mode, the efficiency is lower compared to the power save mode during light loads. For additional flexibility it is possible to switch from power save mode to forced PWM mode during operation. This allows efficient power management by adjusting the operation of the converter to the specific system requirements.

7.3.3 Enable

The devices have a separate enable pin for each of the DCDC converters and for each of the LDO to start up independently. If EN_DCDC1, EN_DCDC2, EN_LDO1, EN_LDO2, EN_LDO3 are set to high, the corresponding converter starts up with soft start as previously described.

Pulling the enable pin low forces the device into shutdown, with a shutdown quiescent current as defined in the electrical characteristics. In this mode, the P and N-Channel MOSFETs are turned-off, and the entire internal control circuitry is switched-off. If disabled, the outputs of the LDOs are pulled low by internal 350-Ω resistors, actively discharging the output capacitor. For proper operation the enable pins must be terminated and must not be left unconnected.

7.3.4 Dynamic Output Voltage Scaling

The TPS65058 has the feature: dynamic voltage scaling intended for core processor supply. The voltage scaling can be used for any application or to simply select the output voltage. The following description applies only to TPS65058.

The output voltage of the DCDC Converter 2 can be selected by a logic level on pin DEF_DCDC2. The output voltage can be changed dynamically during operation. The slew rate of the change of output voltage is controlled on DCDC2 to be 9.6mV/μs.

The output voltages on the LDOs can also be changed dynamically between two voltages by changing the logic level on pin DEF_LDO.

The output voltage options are:

Table 2. Output Voltage Selection

| DEF_LDO | 1 | 0 |
|-----------|-------|-------|
| LDO1 | 3.3 V | 3.3 V |
| LDO2 | 1.8 V | 1.2 V |
| LDO3 | 1.8 V | 1.3 V |
| DEF_DCDC2 | 1 | 0 |
| DCDC2 | 1.8 V | 1.2 V |

7.3.5 $\overline{\text{RESET}}$ on the TPS65053x

The TPS65053x contain circuitry that can generate a reset pulse for a processor with a 100 ms delay time. The input voltage at a comparator is sensed at an input called THRESHOLD. When the voltage exceeds the 1V threshold, the output goes high after a 100 ms delay time. This circuitry is functional as soon as the supply voltage at Vcc exceeds the undervoltage lockout threshold. The RESET circuitry is active even if all DCDC converters and LDOs are disabled.

Figure 23. $\overline{\text{RESET}}$ Pulse Circuit for TPS65053x

7.3.6 $\overline{\text{RESET}}$ Generation and Output Monitoring on the TPS65058

The TPS65058 contains a monitor circuitry that monitors the outputs of the DCDC converters and applies a reset pulse to the $\overline{\text{RESET}}$ pin. As soon as the supply voltage on the VCC pin is above the undervoltage lockout threshold, the $\overline{\text{RESET}}$ pin is pulled low. After the enabling of both DCDC converters, the output voltages are monitored. When both outputs are within 95% of the desired output voltage, the reset timer is started and after a delay of 100ms the Reset output is switched to high impedance. If one of the output voltages is outside of the regulation band (90% of the desired value) the $\overline{\text{RESET}}$ pin remains to be pulled to ground. After both outputs are back in regulation, the 100ms timer is started, and after 100ms the $\overline{\text{RESET}}$ output is again switched to high impedance.

Figure 24. $\overline{\text{RESET}}$ Pulse Circuit for TPS65058

7.3.7 Short-Circuit Protection

All outputs are short circuit protected with a maximum output current as defined in the [Electrical Characteristics](#).

7.3.8 Thermal Shutdown

As soon as the junction temperature, T_j , exceeds typically 150°C for the DCDC converters, the device goes into thermal shutdown. In this mode, the P and N-Channel MOSFETs are turned-off. The device continues its operation when the junction temperature falls below the thermal shutdown hysteresis again. A thermal shutdown for one of the DCDC converters will disable both converters simultaneously.

The thermal shutdown temperature for the LDOs are set to typically 140°C. Therefore a LDO which may be used to power an external voltage will never heat up the chip high enough to turn off the DCDC converters. If one LDO exceeds the thermal shutdown temperature, all LDOs will turn off simultaneously.

7.4 Device Functional Modes

This device has only one functional mode which is ON. The device enters this state if the device is within the operational VIN range on the VCC pin. The converters and LDOs can be enabled and/or disabled in this state.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

This device integrates two step-down converters and three LDOs which can be used to power the voltage rails needed by a processor or any other application. The PMIC can be controlled via the ENABLE and MODE pins or sequenced from the VIN using RC delay circuits. There is a logic output, $\overline{\text{RESET}}$, provide the application processor or load a logic signal indicating power good or reset.

8.2 Typical Application

Figure 25. Typical Application Schematic

Typical Application (continued)

8.2.1 Design Requirements

The TPS6505x has only a few design requirements. The check list below lists the design requirements across all application uses of the device.

- 1-μF Bypass cap on VCC, located as close as possible to the VCC pin to ground.
- VCC and VINDCDC1/2 must be connected to the same voltage supply with minimal voltage difference.
- Input capacitors must be present on the VINDCDC1/2, VIN_LDO1, and VIN_LDO2/3 supplies if used.
- Output filters must be used on the outputs of the DCDC converters if used.
- Output capacitors must be used on the outputs of the LDOs if used.

8.2.2 Detailed Design Procedure

The TPS6505x requires design for each regulator whether DCDC or LDO. First, the output voltage must be selected or set. Then, each DCDC converter requires an output filter, input capacitor, and feedback circuit and each LDO requires an output capacitor and input capacitor. The following sections discuss the procedure for designing for output voltages, DCDCs, and LDOs.

8.2.2.1 DCDC Output Voltage Setting

The output voltage of the DCDC converters can be set by an external resistor network and can be calculated to:

$$V_{OUT} = V_{REF} \times \left(1 + \frac{R1}{R2}\right) \quad (4)$$

with an internal reference voltage V_{ref} , 0.6 V (typical).

It is recommended to set the total resistance of $R1 + R2$ to less than 1 MΩ. The resistor network connects to the input of the feedback amplifier; therefore, need some small feedforward capacitor in parallel to R1. A typical value of 47 pF is sufficient.

$$R1 = R2 \times \left(\frac{V_{OUT}}{V_{FB_DCDC1}}\right) - R2 \quad (5)$$

Table 3. Typical Resistor Values

| OUTPUT VOLTAGE | R1 | R2 | NOMINAL VOLTAGE | TYPICAL CFF |
|----------------|--------|--------|-----------------|-------------|
| 3.3 V | 680 kΩ | 150 kΩ | 3.32 V | 47 pF |
| 3.0 V | 510 kΩ | 130 kΩ | 2.95 V | 47 pF |
| 2.85 V | 560 kΩ | 150 kΩ | 2.84 V | 47 pF |
| 2.5 V | 510 kΩ | 160 kΩ | 2.51 V | 47 pF |
| 1.8 V | 300 kΩ | 150 kΩ | 1.80 V | 47 pF |
| 1.6 V | 200 kΩ | 120 kΩ | 1.60 V | 47 pF |
| 1.5 V | 300 kΩ | 200 kΩ | 1.50 V | 47 pF |
| 1.2 V | 330 kΩ | 330 kΩ | 1.20 V | 47 pF |

8.2.2.2 LDO Output Voltage Setting

The output voltage of LDO1 and LDO2 can be set by an external resistor network and can be calculated to:

$$V_{OUT} = V_{REF} \times \left(1 + \frac{R5}{R6}\right) \quad (6)$$

with an internal reference voltage, V_{REF} , typical 1 V.

It is recommended to set the total resistance of $R5 + R6$ to less than 1 MΩ. Typically, there is no feedforward capacitor needed at the voltage dividers for the LDOs.

$$V_{OUT} = V_{FB_LDOx} \times \frac{R5 + R6}{R6} \quad R5 = R6 \times \left(\frac{V_{OUT}}{V_{FB_LDOx}}\right) - R6 \quad (7)$$

Typical Application (continued)

Table 4. Typical Resistor Values

| OUTPUT VOLTAGE | R5 | R6 | NOMINAL VOLTAGE |
|----------------|--------|--------|-----------------|
| 3.3 V | 300 kΩ | 130 kΩ | 3.31 V |
| 3 V | 300 kΩ | 150 kΩ | 3.00 V |
| 2.85 V | 240 kΩ | 130 kΩ | 2.85 V |
| 2.80 V | 360 kΩ | 200 kΩ | 2.80 V |
| 2.5 V | 300 kΩ | 200 kΩ | 2.50 V |
| 1.8 V | 240 kΩ | 300 kΩ | 1.80 V |
| 1.5 V | 150 kΩ | 300 kΩ | 1.50 V |
| 1.3 V | 36 kΩ | 120 kΩ | 1.30 V |
| 1.2 V | 100 kΩ | 510 kΩ | 1.19 V |
| 1.1 V | 33 kΩ | 330 kΩ | 1.1 V |

8.2.2.3 Low Dropout Voltage Regulators

The low dropout voltage regulators are designed to be stable with low value ceramic input and output capacitors. They operate with input voltages down to 1.5 V. The LDOs offer a maximum dropout voltage of 280mV at rated output current. Each LDO supports a current limit feature. The LDOs are enabled by the EN_LDO1, EN_LDO2, and EN_LDO3 pin. The output voltage of LDO1 and LDO2 is set using an external resistor divider whereas LDO3 has a fixed output voltage of 1.30 V for TPS65053, 1.20 V for TPS650531 and 1.50 V for TPS650532.

The minimum input capacitor on VIN_LDO1 and on VIN_LDO2/3 is 2.2 μF minimum. LDO1 is designed to be stable with an output capacitor of 4.7 μF minimum; whereas, LDO2 and LDO3 are stable with a minimum capacitor value of 2.2 μF.

8.2.2.4 DCDC Output Filter Design (Inductor and Output Capacitor)

8.2.2.4.1 Inductor Selection

The two converters operate typically with 2.2-μH output inductor. Larger or smaller inductor values can be used to optimize the performance of the device for specific operation conditions. For output voltages higher than 2.8 V, an inductor value of 3.3 μH minimum should be selected, otherwise the inductor current will ramp down too fast causing imprecise internal current measurement and therefore increased output voltage ripple under some operating conditions in PFM mode.

The selected inductor has to be rated for its DC resistance and saturation current. The DC resistance of the inductance will influence directly the efficiency of the converter. Therefore an inductor with lowest DC resistance should be selected for highest efficiency.

[Equation 8](#) calculates the maximum inductor current under static load conditions. The saturation current of the inductor should be rated higher than the maximum inductor current as calculated with [Equation 8](#). This is recommended because during heavy load transient the inductor current will rise above the calculated value.

$$\Delta I_L = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f} \quad I_{Lmax} = I_{outmax} + \frac{\Delta I_L}{2}$$

where

- f = Switching Frequency (2.25-MHz typical)
 - L = Inductor Value
 - Δ I_L = Peak-to-peak inductor ripple current
 - I_{Lmax} = Maximum Inductor current
- (8)

The highest inductor current occurs at maximum Vin. Open core inductors have a soft saturation characteristic, and they can normally handle higher inductor currents versus a comparable shielded inductor.

A more conservative approach is to select the inductor current rating just for the maximum switch current of the corresponding converter. It must be considered, that the core material from inductor to inductor differs and will have an impact on the efficiency especially at high switching frequencies. Refer to [Table 5](#) and the typical applications for possible inductors.

Table 5. Tested Inductors

| INDUCTOR TYPE | INDUCTOR VALUE | SUPPLIER |
|---------------|----------------|-----------|
| LPS3010 | 2.2 µH | Coilcraft |
| LPS3015 | 3.3 µH | Coilcraft |
| LPS4012 | 2.2 µH | Coilcraft |
| VLF4012 | 2.2 µH | TDK |

8.2.2.4.2 Output Capacitor Selection

The advanced Fast Response voltage mode control scheme of the two converters allow the use of small ceramic capacitors with a typical value of 10 µF, without having large output voltage under and overshoots during heavy load transients. Ceramic capacitors having low ESR values result in lowest output voltage ripple and are therefore recommended. See the recommended components in [Table 4](#).

If ceramic output capacitors are used, the capacitor RMS ripple current rating will always meet the application requirements. Just for completeness, the RMS ripple current is calculated as:

$$I_{RMS\text{Cout}} = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f} \times \frac{1}{2 \times \sqrt{3}} \tag{9}$$

At nominal load current, the inductive converters operate in PWM mode and the overall output voltage ripple is the sum of the voltage spike caused by the output capacitor ESR plus the voltage ripple caused by charging and discharging the output capacitor:

$$\Delta V_{out} = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f} \times \left(\frac{1}{8 \times C_{out} \times f} + ESR \right) \tag{10}$$

Where the highest output voltage ripple occurs at the highest input voltage V_{in} .

At light load currents, the converters operate in Power Save Mode and the output voltage ripple is dependent on the output capacitor value. The output voltage ripple is set by the internal comparator delay and the external capacitor. The typical output voltage ripple is less than 1% of the nominal output voltage.

8.2.2.5 DCDC Input Capacitor Selection

Because of the nature of the buck converter, having a pulsating input current, a low ESR input capacitor is required for best input voltage filtering and minimizing the interference with other circuits caused by high input voltage spikes. The converters need a ceramic input capacitor of 10 µF. The input capacitor can be increased without any limit for better input voltage filtering.

Table 6. Possible Capacitors For DCDC Converters and LDOS

| CAPACITOR VALUE | SIZE | SUPPLIER | TYPE |
|-----------------|------|---------------------------|---------|
| 2.2 µF | 0805 | TDK C2012X5R0J226MT | Ceramic |
| 2.2 µF | 0805 | Taiyo Yuden JMK212BJ226MG | Ceramic |
| 10 µF | 0805 | Taiyo Yuden JMK212BJ106M | Ceramic |
| 10 µF | 0805 | TDK C2012X5R0J106M | Ceramic |

8.2.2.6 Sequencing and Output Logic Signal RESET

To sequence the TPS6505x, the regulators can be sequenced by using the enable pins on each DCDC and LDO. A sequencer could be used but, simply looping back the output voltages of the preceeding rail to the enable input of the following rail can sequence the PMIC with minimal cost and solution area. Simple and small RC delay circuits could be added to create timing delays for enabling if needed.

Use the THRESHOLD and $\overline{\text{RESET}}$ feature to provide a logic signal to the application or processor. THRESHOLD requires a voltage divider if the signal being monitored is desired to trigger $\overline{\text{RESET}}$ at a point higher than 1V.

8.2.3 Application Curves

9 Power Supply Recommendations

Any supply between 2.5 V and 6 V will work as long as the power supply can supply enough current at the VIN voltage that the application demands.

10 Layout

10.1 Layout Guidelines

- The input capacitors for the DCDC converters should be placed as close as possible to the VINDCDC1/2 pin and the PGND1 and PGND2 pins.
- The inductor of the output filter should be placed as close as possible to the device to provide the shortest switch node possible, reducing the noise emitted into the system and increasing the efficiency.
- Sense the feedback voltage from the output at the output capacitors to ensure the best DC accuracy. Feedback should be routed away from noisy sources such as the inductor. If possible route on the opposing side as the switch node and inductor and place a GND plane between the feedback and the noisy sources or keepout underneath them entirely.
- Place the output capacitors as close as possible to the inductor to reduce the feedback loop as much as possible. This will ensure best regulation at the feedback point.
- Place the device as close as possible to the the most demanding or sensitive load. The output capacitors should be placed close to the input of the load. This will ensure the best AC performance possible.
- The input and output capacitors for the LDOs should be placed close to the device for best regulation performance.
- The use a one common ground plane is recommended for the device layout. The AGND can be separated from the PGND but, a large low parasitic PGND is required to connect the PGNDx pins to the CIN and external PGND connections.

11.3 Trademarks

OMAP, PowerPAD are trademarks of Texas Instruments.
 All other trademarks are the property of their respective owners.

11.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

| Orderable part number | Status (1) | Material type (2) | Package Pins | Package qty Carrier | RoHS (3) | Lead finish/ Ball material (4) | MSL rating/ Peak reflow (5) | Op temp (°C) | Part marking (6) |
|-------------------------------|---------------|----------------------|-----------------|-----------------------|-------------|--------------------------------------|-----------------------------------|--------------|---------------------|
| TPS650531RGER | Active | Production | VQFN (RGE) 24 | 3000 LARGE T&R | Yes | NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | TPS 650531 |
| TPS650531RGER.B | Active | Production | VQFN (RGE) 24 | 3000 LARGE T&R | Yes | NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | TPS 650531 |
| TPS650531RGET | Active | Production | VQFN (RGE) 24 | 250 SMALL T&R | Yes | NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | TPS 650531 |
| TPS650531RGET.B | Active | Production | VQFN (RGE) 24 | 250 SMALL T&R | Yes | NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | TPS 650531 |
| TPS650532RGER | Active | Production | VQFN (RGE) 24 | 3000 LARGE T&R | Yes | NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | TPS 650532 |
| TPS650532RGER.B | Active | Production | VQFN (RGE) 24 | 3000 LARGE T&R | Yes | NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | TPS 650532 |
| TPS650532RGET | Active | Production | VQFN (RGE) 24 | 250 SMALL T&R | Yes | NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | TPS 650532 |
| TPS650532RGET.B | Active | Production | VQFN (RGE) 24 | 250 SMALL T&R | Yes | NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | TPS 650532 |

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

GENERIC PACKAGE VIEW

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4204104/H

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

LAND PATTERN EXAMPLE
SCALE: 20X

4219016 / A 08/2017

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations..

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#), [TI's General Quality Guidelines](#), or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
