

## UC1843A-SP QML class V, radiation hardened current-mode PWM controller

### 1 Features

- QML Class V (QMLV) Qualified, SMD 5962-86704
- 5962P8670409Vxx:
  - Radiation Hardness Assurance (RHA) up to 30-krad(Si) Total Ionizing Dose (TID)
  - Passes Functional and Specified Post-Radiation Parametric Limits at 45 krad at LDR (10 mrad(Si)/s) per 1.5x Over Test as Defined in MIL-STD-883 Test Method 1019.9 Paragraph 3.13.3.b
  - Exhibits Low-Dose Rate Sensitivity but Remains Within the Pre-Radiation Electrical Limits at 30-krad Total Dose Level, as Allowed by MIL-STD-883, TM1019
- Optimized for Offline and DC-to-DC Converters
- Low Start-Up Current (< 0.5 mA)
- Trimmed Oscillator Discharge Current
- Automatic Feed Forward Compensation
- Pulse-by-Pulse Current Limiting
- Enhanced Load Response Characteristics
- Undervoltage Lockout (UVLO) With Hysteresis
- Double-Pulse Suppression
- High-Current Totem-Pole Output
- Internally-Trimmed Bandgap Reference
- 500-kHz Operation
- Low  $R_O$  Error Amplifier

### 2 Applications

- DC-DC Converters
- Supports Various Topologies:
  - Flyback, Forward, Buck, Boost
  - Push-Pull, Half-Bridge, Full-Bridge With External Interface Circuit
- Available in Military Temperature Range (−55°C to 125°C)

### 3 Description

The UC1843A-SP control IC is a radiation hardened pin-for-pin compatible version of the UC184x family. Providing the necessary characteristics to control current-mode switched-mode power supplies, this device has improved features. Start-up current is specified to be less than 0.5 mA and oscillator discharge is trimmed to 8.3 mA. During UVLO, the output stage can sink at least 10 mA at less than 1.2 V for  $V_{CC}$  over 5 V.

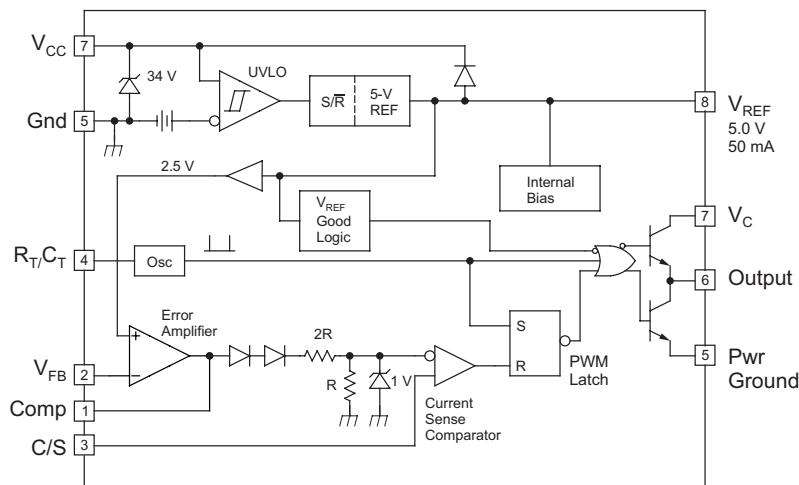

The *Device Comparison Table* shows the difference between members of this family. Reference the individual product data sheets for ordering the radiation-improved version if available.

## 6 Pin Configuration and Functions

### Pin Functions

NAME	PIN			I/O	DESCRIPTION
	CDIP	LCCC	CFP		
Comp	1	2	1	I	Error amplifier output.
V <sub>FB</sub>	2	5	2	I	Voltage feedback input to error amplifier.
I <sub>SENSE(C/S)</sub>	3	7	3	I	Current sense comparator input pin.
R <sub>T/C<sub>T</sub></sub>	4	10	4	I	RC time constant input to oscillator.
NC	—	1, 3, 4, 6, 8, 9, 11, 14, 16, 19	5, 6	—	No connect.
Pwr Gnd	—	12	—	—	Output section ground.
Gnd	5	13	7	—	Ground.
Output	6	15	8	O	Regulated output.
V <sub>C</sub>	—	17	—	—	Output section supply voltage.
V <sub>CC</sub>	7	18	9	—	Unregulated supply voltage.
V <sub>REF</sub>	8	20	10	O	5-V internally generated reference.

## 7 Specifications

### 7.1 Absolute Maximum Ratings<sup>(1)(2)</sup>

over operating free-air temperature (unless otherwise noted)

		MIN	MAX	UNIT
V <sub>CC</sub>	Supply voltage, low-impedance source		30	V
V <sub>I</sub>	Input voltage (V <sub>FB</sub> , I <sub>SENSE</sub> )	-0.3	6.3	V
	Supply current	Self limiting		
I <sub>O</sub>	Output current		±1	A
	Error amplifier output sink current		10	mA
	Output energy (capacitive load)		5	μJ
P <sub>D</sub>	Power dissipation (T <sub>A</sub> = 25°C)		1	W
T <sub>stg</sub>	Storage temperature	-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltages are with respect to ground. Currents are positive in, negative out of the specified terminal.

### 7.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±4000	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (T<sub>A</sub> = T<sub>J</sub> = -55°C to 125°C), unless otherwise noted

		MIN	MAX	UNIT
V <sub>CC</sub>	Supply voltage	12	25	V
	Sink/source output current (continuous or time average)	0	200	mA
	Reference load current	0	20	mA

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>	UC1843A-SP			UNIT	
	JG (CDIP)	FK (LCCC)	HKU (CFP)		
	8 PINS	20 PINS	10 PINS		
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	103	—	51.9	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	9.6	9.0	6.6	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	69.2	—	31.5	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	13.9	—	5.42	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	73	—	31	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

## 7.5 Electrical Characteristics

$V_{CC} = 15 \text{ V}^{(1)}$ ,  $R_T = 10 \text{ k}\Omega$ ,  $C_T = 3.3 \text{ nF}$ ,  $T_A = T_J = -55^\circ\text{C}$  to  $125^\circ\text{C}$  (unless otherwise noted)

Open-loop voltage gain	$V_O = 2$ to $4 \text{ V}$	65	90		dB	
Unity-gain bandwidth	$T_J = 25^\circ\text{C}^{(2)}$	0.7	1		MHz	
PSRR	$V_{CC} = 12$ to $25 \text{ V}$	60	70		dB	
Output sink current	$V_{FB} = 2.7 \text{ V}$ , $V_{Comp} = 1.1 \text{ V}$	2	6		mA	
Output source current	$V_{FB} = 2.3 \text{ V}$ , $V_{Comp} = 5 \text{ V}$	-0.5	-0.8		mA	
High-level output voltage	$V_{FB} = 2.3 \text{ V}$ , $R_L = 15 \text{ k}\Omega$ to ground	5	6		V	
Low-level output voltage	$V_{FB} = 2.7 \text{ V}$ , $R_L = 15 \text{ k}\Omega$ to $V_{REF}$		0.7	1.1	V	
<b>CURRENT SENSE</b>						
Gain <sup>(6)(7)</sup>		2.85	3	3.15	V/V	
Maximum input signal	$V_{Comp} = 5 \text{ V}^{(6)}$	0.9	1	1.1	V	
PSRR	$V_{CC} = 12$ to $25 \text{ V}^{(6)}$		70		dB	
Input bias current			-2	-10	$\mu\text{A}$	
Delay to output	$V_{ISENSE} = 0$ to $2 \text{ V}^{(2)}$		150	300	ns	

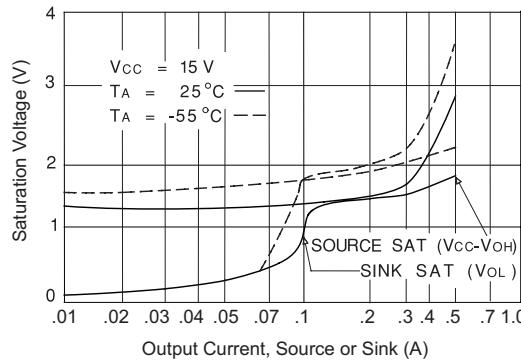

- (1) Adjust  $V_{CC}$  above the start threshold before setting at 15 V.
- (2) Parameters ensured by design and/or characterization, if not production tested.
- (3) Temperature stability, sometimes referred to as average temperature coefficient, is described by the equation:  
Temperature Stability =  $V_{REF}$  (max) –  $V_{REF}$  (min) /  $T_J$  (max) –  $T_J$  (min).  $V_{REF}$  (max) and  $V_{REF}$  (min) are the maximum and minimum reference voltage measured over the appropriate temperature range. Note that the extremes in voltage do not necessarily occur at the extremes in temperature.
- (4) Output frequency equals oscillator frequency for the UC1842A-SP and UC1843A-SP.
- (5) This parameter is measured with  $R_T = 10 \text{ k}\Omega$  to  $V_{REF}$ . This contributes approximately 300  $\mu\text{A}$  of current to the measurement. The total current flowing into the  $R_T$  or  $C_T$  pin will be approximately 300  $\mu\text{A}$  higher than the measured value.
- (6) Parameter measured at trip point of latch with  $V_{FB} = 0 \text{ V}$ .
- (7) Gain defined as:  $G = \Delta V_{Comp} / \Delta V_{ISENSE}$ ;  $V_{ISENSE} = 0$  to 0.8 V.

## Electrical Characteristics (continued)

$V_{CC} = 15 \text{ V}^{(1)}$ ,  $R_T = 10 \text{ k}\Omega$ ,  $C_T = 3.3 \text{ nF}$ ,  $T_A = T_J = -55^\circ\text{C}$  to  $125^\circ\text{C}$  (unless otherwise noted)

## 8 Detailed Description

### 8.1 Overview

The UC1843A-SP control IC is a pin-for-pin compatible improved version of the UC184x family. Providing the necessary characteristics to control current-mode switched-mode power supplies, this device has improved features. Start-up current is specified to be less than 0.5 mA and oscillator discharge is trimmed to 8.3 mA. During UVLO, the output stage can sink at least 10 mA at less than 1.2 V for  $V_{CC}$  over 5 V.

### 8.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

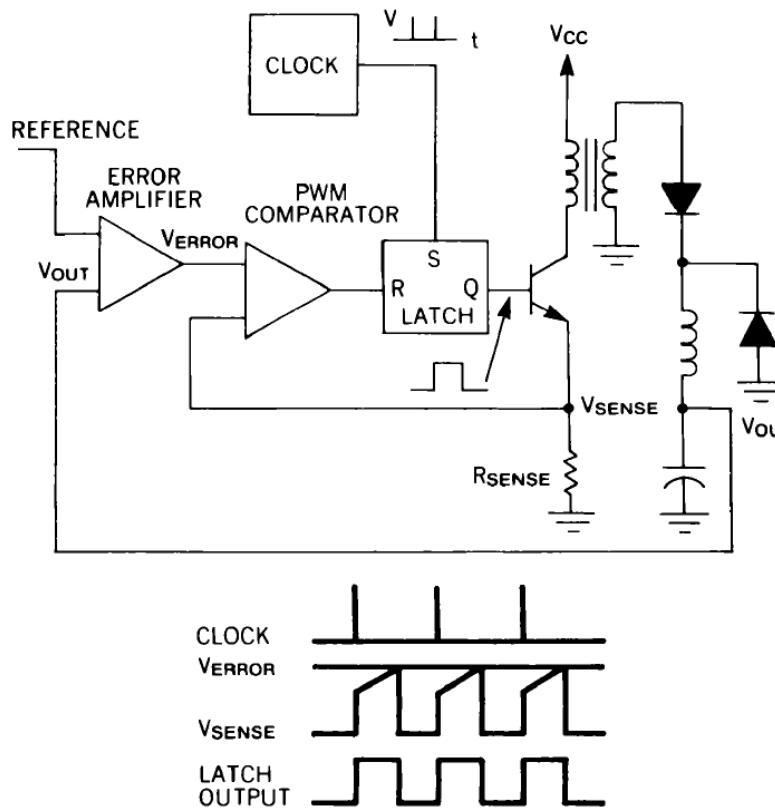

### 8.3 Feature Description

UC1843A-SP is a current mode controller, used to support various topologies such as forward, flyback, buck, boost and using an external interface circuit will also support half-bridge, full-bridge, and push-pull configurations.

Figure 2 shows the two-loop current-mode control system in a typical buck regulator application. A clock signal initiates power pulses at a fixed frequency. The termination of each pulse occurs when an analog of the inductor current reaches a threshold established by the error signal. In this way, the error signal actually controls peak inductor current. This contrasts with conventional schemes in which the error signal directly controls pulse width without regard to inductor current.

Several performance advantages result from the use of current-mode control. First, an input voltage feed-forward characteristic is achieved; that is, the control circuit instantaneously corrects for input voltage variations without using up any of the error amplifier's dynamic range. Therefore, line regulation is excellent and the error amplifier can be dedicated to correcting for load variations exclusively.

## Feature Description (continued)

0019-1

**Figure 2. Two-Loop Current-Mode Control System**

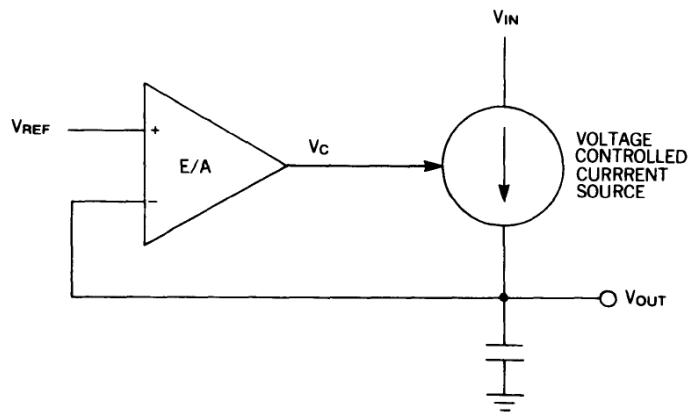

For converters in which inductor current is continuous, controlling peak current is nearly equivalent to controlling average current. Therefore, when such converters employ current-mode control, the inductor can be treated as an error-voltage-controlled-current-source for the purposes of small-signal analysis (see [Figure 3](#)). The two-pole control-to-output frequency response of these converters is reduced to a single-pole (filter capacitor in parallel with load) response. One result is that the error amplifier compensation can be designed to yield a stable closed-loop converter response with greater gain bandwidth than would be possible with pulse-width control, giving the supply improved small-signal dynamic response to changing loads. A second result is that the error amplifier compensation circuit becomes simpler, as shown in [Figure 4](#).

Capacitor  $C_i$  and resistor  $R_i$ , in [Figure 4\(A\)](#), add a low-frequency zero, which cancels one of the two control-to-output poles of non-current-mode converters. For large signal load changes, in which converter response is limited by inductor slew rate, the error amplifier saturates while the inductor is catching up with the load. During this time,  $C_i$  charges to an abnormal level. When the inductor current reaches its required level, the voltage on  $C_i$  causes a corresponding error in supply output voltage. The recovery time is  $R_{iz}C_i$ , which may be long. However, the compensation network of [Figure 4\(B\)](#) can be used where current-mode control has eliminated the inductor pole. Large-signal dynamic response is then greatly improved due to the absence of  $C_i$ .

Current limiting is greatly simplified with current-mode control. Pulse-by-pulse limiting is, of course, inherent in the control scheme. Furthermore, an upper limit on the peak current can be established by simply clamping the error voltage. Accurate current limiting allows optimization of magnetic and power semiconductor elements while ensuring reliable supply operation.

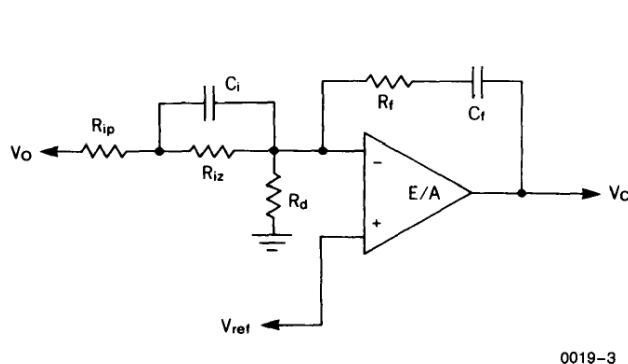

Finally, current-mode controlled power stages can be operated in parallel with equal current sharing. This opens the possibility of a modular approach to power supply design.

### 8.3.1 UVLO

The UVLO circuit ensures that  $V_{CC}$  is adequate to make the UC1843A-SP fully operational before enabling the output stage. Figure 5 shows that the UVLO turnon and turnoff thresholds are fixed internally at 16 V and 10 V, respectively. The 6-V hysteresis prevents  $V_{CC}$  oscillations during power sequencing.

Figure 6 shows supply current requirements. Start-up current is  $< 1$  mA for efficient bootstrapping from the rectified input of an off-line converter, as shown in Figure 7. During normal circuit operation,  $V_{CC}$  is developed from auxiliary winding,  $WAux$ , with  $D_1$  and  $C_{IN}$ . However, at start-up,  $C_{IN}$  must be charged to 16 V through  $R_{IN}$ . With a start-up current of 1 mA,  $R_{IN}$  can be as large as 100 k $\Omega$  and still charge  $C_{IN}$  when  $V_{AC} = 90$ -V RMS (low line). Power dissipation in  $R_{IN}$  would then be less than 350 mW even under high line ( $V_{AC} = 130$ -V RMS) conditions.

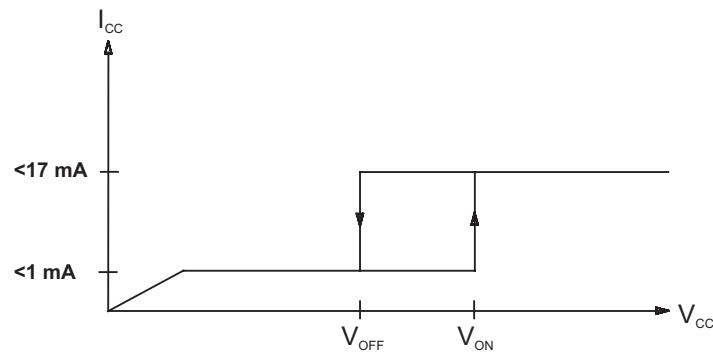

During UVLO, the output driver is in a low state. While it does not exhibit the same saturation characteristics as normal operation, it can easily sink 1 mA, enough to ensure the MOSFET is held off.

**Figure 7. Providing Power to the UC1843A-SP**

## Feature Description (continued)

### 8.3.2 Reference

As highlighted in the [Functional Block Diagram](#), UC1843A-SP incorporates a 5-V internal reference regulator with  $\pm 2\%$  set point variation over temperature.

### 8.3.3 Totem-Pole Output

The UC1843A-SP PWM has a single totem-pole output which can be operated to  $\pm 1$ -A peak for driving MOSFET gates, and a +200 mA average current for bipolar power U-100A transistors. Cross conduction between the output transistors is minimal, the average added power with  $V_{IN} = 30$  V is only 80 mW at 200 kHz.

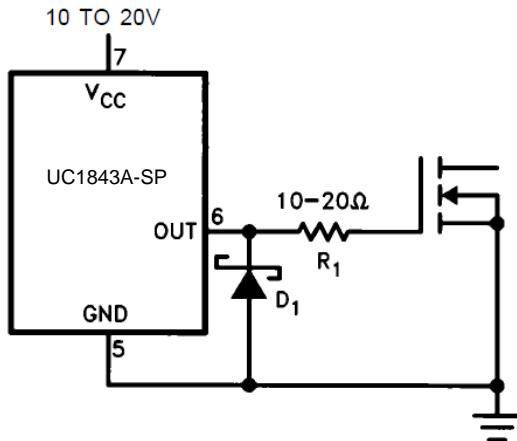

Limiting the peak current through the IC is accomplished by placing a resistor between the totem-pole output and the gate of the MOSFET. The value is determined by dividing the totem-pole collector voltage  $V_C$  by the peak current rating of the IC's totem-pole. Without this resistor, the peak current is limited only by the  $dV/dT$  rate of the totem-pole switching and the FET gate capacitance.

The use of a Schottky diode from the PWM output to ground prevents the output voltage from going excessively below ground, causing instabilities within the IC. To be effective, the diode selected should have a forward drop of less than 0.3 V at 200 mA. Most 1- to 3-A Schottky diodes exhibit these traits above room temperature. Placing the diode as physically close to the PWM as possible enhances circuit performance. Implementation of the complete drive scheme is shown in [Figure 8](#) through [Figure 10](#). Transformer-driven circuits also require the use of the Schottky diodes to prevent a similar set of circumstances from occurring on the PWM output. The ringing below ground is greatly enhanced by the transformer leakage inductance and parasitic capacitance, in addition to the magnetizing inductance and FET gate capacitance. Circuit implementation is similar to the previous example.

[Figure 8](#) through [Figure 10](#) show suggested circuits for driving MOSFETs and bipolar transistors with the UC1843A-SP output. The simple circuit of [Figure 8](#) can be used when the control IC is not electrically isolated from the MOSFET turnon and turnoff to  $\pm 1$  A. It also provides damping for a parasitic tank circuit formed by the FET input capacitance and series wiring inductance. Schottky diode,  $D_1$ , prevents the output of the IC from going far below ground during turnoff.

[Figure 9](#) shows an isolated MOSFET drive circuit which is appropriate when the drive signal must be level shifted or transmitted across an isolation boundary. Bipolar transistors can be driven efficiently with the circuit of [Figure 10](#). Resistors  $R_1$  and  $R_2$  fix the on-state base current while capacitor  $C_I$  provides a negative base current pulse to remove stored charge at turnoff.

Because the UC1843A-SP series has only a single output, an interface circuit is needed to control push-pull, half-bridge, or full-bridge topologies. The UC1706 dual output driver with internal toggle flip-flop performs this function. [Typical Application](#) shows a typical application for these two ICs. Increased drive capability for driving numerous FETs in parallel, or other loads can be accomplished using one of the UC1705/6/7 driver ICs.

## 8.4 Device Functional Modes

The UC1843A-SP uses fixed frequency, peak current mode control. An internal oscillator initiates the turn on of the driver to high-side power switch. The external power switch current is sensed through an external resistor and is compared via internal comparator. The voltage generated at the COMP pin is stepped down via internal resistors (as shown in the functional block diagram). When the sensed current reaches the stepped down COMP voltage, the high-side power switch is turned off.

## 9 Application and Implementation

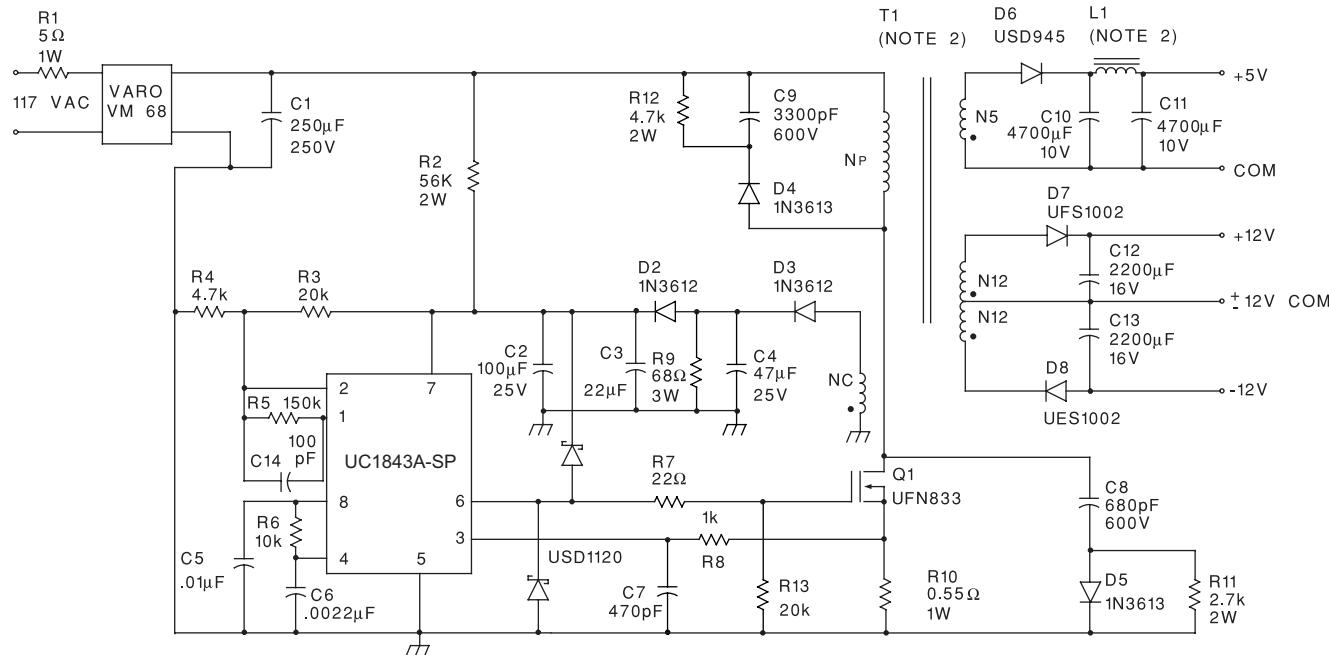

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

UC1843A-SP can be used as a controller to design various topologies such as buck, boost, flyback, and forward. Using an external interphase circuit can also support push-pull, half-bridge and full-bridge topologies.

### 9.2 Typical Application

(1) See [Figure 11](#) for reference.

Peak Current ( $I_p$ ) is determined by the formula:

$$I_{S\text{MAX}}, \frac{1.0 \text{ V}}{R_S}$$

A small RC filter may be required to suppress switch transients.

**Figure 12. Current-Sense Circuit**

Copyright © 2016, Texas Instruments Incorporated

NOTE: A fraction of the oscillator ramp can be resistively summed with the current sense signal to provide slope compensation for converters requiring duty cycles over 50%.

Capacitor, C, forms a filter with R2 to suppress the leading edge switch spikes.

**Figure 13. Slope Compensation**

### 9.2.2.1 *Oscillator*

The UC1843A-SP oscillator is programmed as shown in [Figure 15](#). Timing capacitor  $C_T$  is charged from VREF (5 V) through the timing resistor  $R_T$ , and discharged by an internal current source. The first step in selecting the oscillator components is to determine the required circuit dead time. Once obtained, [Figure 16](#) is used to pinpoint the nearest standard value of  $C_T$  for a given dead time. Next, the appropriate  $R_T$  value is interpolated using the parameters for  $C_T$  and oscillator frequency. [Figure 17](#) shows the  $R_T/C_T$  combinations versus oscillator frequency. The timing resistor can be calculated from the following formula.

$$f_{\text{osc}} \text{ (kHz)} = \frac{1.72}{RT \text{ (k}\Omega\text{)} \times CT \text{ (}\mu\text{F)}} \quad (1)$$

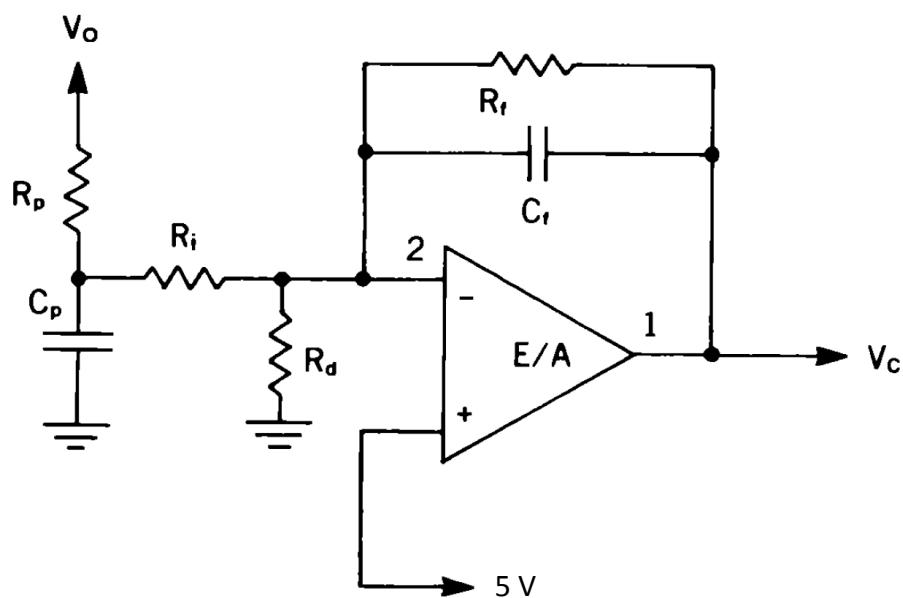

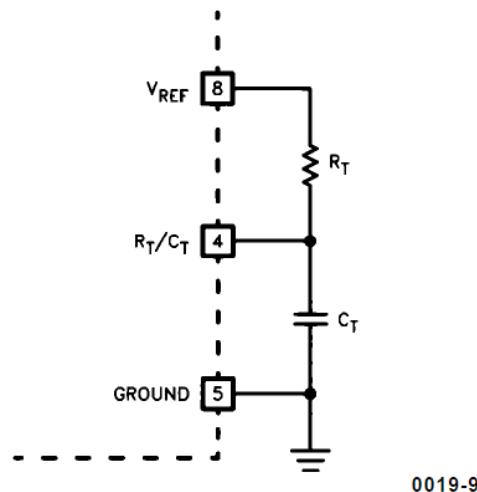

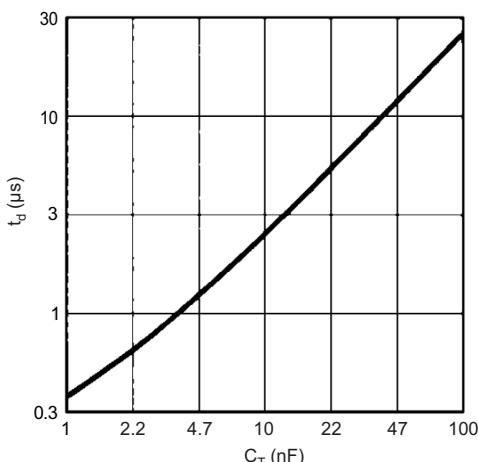

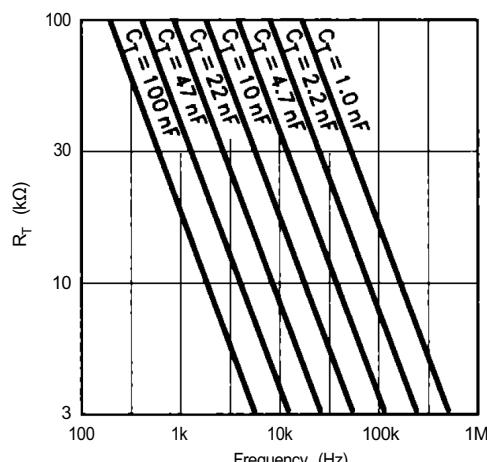

Figure 14. E/A Compensation Circuit for Continuous Boost and Flyback Topologies

The UC1843A-SP has an internal divide-by-two flip-flop driven by the oscillator for a 50% maximum duty cycle. Therefore, their oscillators must be set to run at twice the desired power supply switching frequency.

**Figure 15. Oscillator Programming**

**Figure 16. Dead Time vs  $C_T$  ( $R_T > 5 \text{ k}\Omega$ )**

**Figure 17. Timing Resistance vs Frequency**

### 9.2.2.2 Current Sensing and Limiting

The UC1843A-SP current sense input is configured as shown in [Figure 18](#). Current-to-voltage conversion is done externally with ground-referenced resistor  $R_S$ . Under normal operation, the peak voltage across  $R_S$  is controlled by the E/A according to the following relation:

$$I_P = \frac{V_C - 1.4 \text{ V}}{3 R_S}$$

where

- $V_C$  = Control voltage = E/A output voltage

(2)

$R_S$  can be connected to the power circuit directly or through a current transformer, as [Figure 18](#) shows. While a direct connection is simpler, a transformer can reduce power dissipation in  $R_S$ , reduce errors caused by the base current, and provide level shifting to eliminate the restraint of ground-referenced sensing. The relation between  $V_C$  and peak current in the power stage is given by:

$$i_{(pk)} = N \left( \frac{V_{R_S(pk)}}{R_S} \right) = \frac{N}{3 R_S} (V_C - 1.4 \text{ V})$$

where

- $N$  = Current sense transformer turns ratio = 1 when transformer not used.

(3)

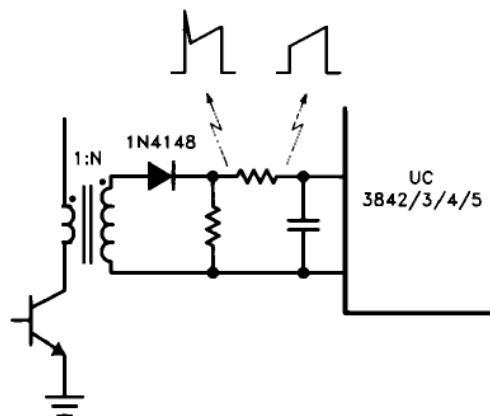

For purposes of small-signal analysis, the control-to-sensed-current gain is:

$$\frac{i_{(pk)}}{V_C} = \frac{N}{3 R_S}$$
(4)

When sensing current in series with the power transistor, as shown in [Figure 18](#), the current waveform often has a large spike at its leading edge. This spike is due to rectifier recovery and/or inter-winding capacitance in the power transformer. If unattenuated, this transient can prematurely terminate the output pulse. As shown, a simple RC filter is usually adequate to suppress this spike. The RC time constant should be approximately equal to the current spike duration (usually a few hundred nanoseconds).

The inverting input to the UC1843A-SP current-sense comparator is internally clamped to 1 V ([Figure 18](#)). Current limiting occurs if the voltage at pin 3 reaches this threshold value, that is, the current limit is defined by:

$$i_{max} = \frac{N \times 1 \text{ V}}{R_S}$$
(5)

0019-13

Figure 18. Transformer-Coupled Current Sensing

### 9.2.2.3 Error Amplifier

The error amplifier (E/A) configuration is shown in [Figure 19](#). The non-inverting input is not brought out to a pin, but is internally biased to  $5\text{ V} \pm 2\%$ . The E/A output is available at pin 1 for external compensation, allowing the user to control the converter's closed-loop frequency response.

[Figure 20](#) shows an E/A compensation circuit suitable for stabilizing any current-mode controlled topology except for flyback and boost converters operating with inductor current. The feedback components add a pole to the loop transfer function at  $f_p = \frac{1}{2} \pi R_F C_F$ .  $R_F$  and  $C_F$  are chosen so that this pole cancels the zero of the output filter capacitor ESR in the power circuit.  $R_I$  and  $R_F$  fix the low-frequency gain. They are chosen to provide as much gain as possible while still allowing the pole formed by the output filter capacitor and load to roll off the loop gain to unity (0 dB) at  $f \approx f_{SWITCHING} / 4$ . This technique ensures converter stability while providing good dynamic response.

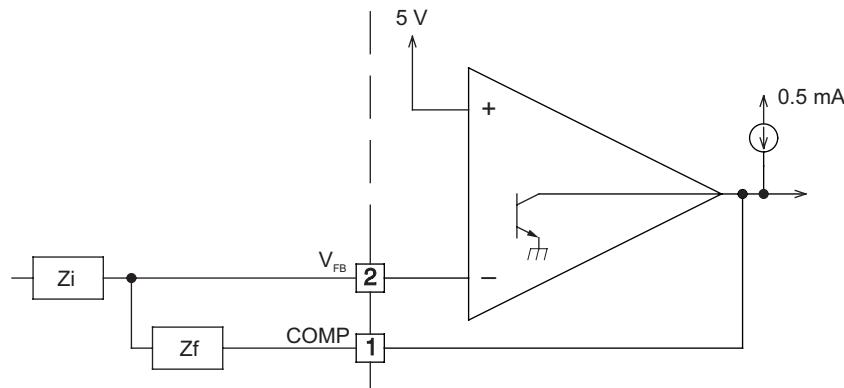

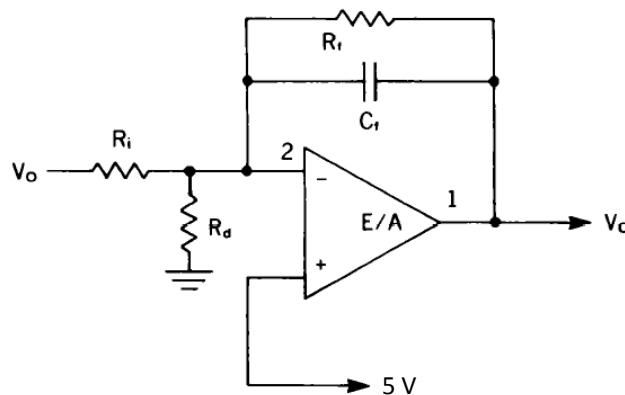

Figure 19. E/A Configuration

0019-15

**Figure 20. Compensation**

The E/A output sources 0.5 mA and sinks 2 mA. A lower limit for RF is given by:

$$R_{F(MIN)} \approx \frac{V_{EA\ OUT\ (MAX)} - 2.5\ V}{0.5\ mA} = \frac{6\ V - 2.5\ V}{0.5\ mA} = 7\ k\Omega \quad (6)$$

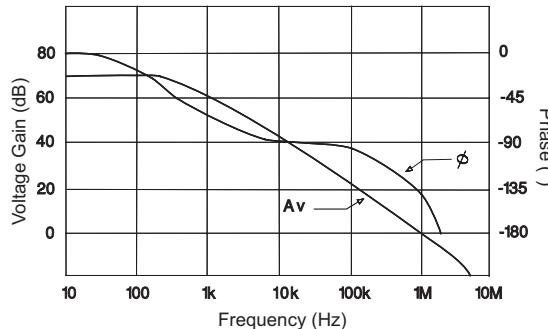

E/A input bias current (2- $\mu$ A max) flows through  $R_i$ , resulting in a DC error in output voltage ( $V_O$ ) given by:

$$\Delta V_{O(MAX)} = (2\ \mu A) R_i \quad (7)$$

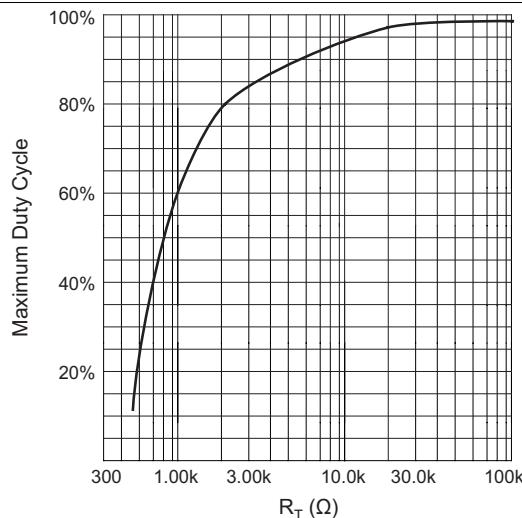

Therefore, the designer should keep the value of  $R_i$ , as low as possible.

**Figure 21** shows the open-loop frequency response of the UC1843A-SP E/A. The gain represents an upper limit on the gain of the compensated E/A. Phase lag increases rapidly as frequency exceeds 1 MHz due to second-order poles at about 10 MHz and above.

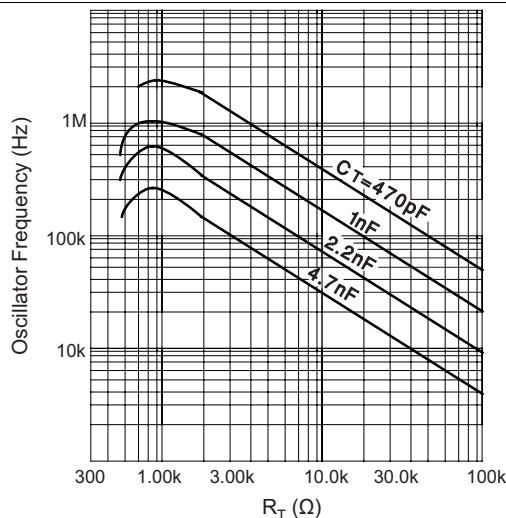

Continuous-inductor-current boost and flyback converters each have a right-half-plane zero in their transfer function. An additional compensation pole is needed to roll off loop gain at a frequency less than that of the RHP zero.  $R_P$  and  $C_P$  in the circuit of **Figure 14** provide this pole.

**Figure 21. Error Amplifier Open-Loop Frequency Response**

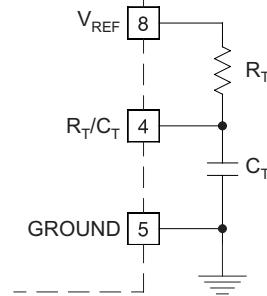

### 9.2.3 Application Curves

## 10 Power Supply Recommendations

The devices are designed to operate from an input voltage supply range between 8 V and 40 V. This input supply should be well regulated. If the input supply is located more than a few inches from the UC1843A-SP converter, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. A tantalum capacitor with a value of 47  $\mu$ F is a typical choice; however, this may vary depending upon the output power being delivered.

Copyright © 2016, Texas Instruments Incorporated

### Power supply specifications:

1. Input voltage: 95 VAC to 130 VAC (50 Hz/60 Hz)
2. Line isolation: 3750 V
3. Switching frequency: 40 kHz
4. Efficiency full load: 70%
5. Output voltage:
  - a. +5 V,  $\pm 5\%$ ; 1- to 4-A load, ripple voltage: 50 mVPP-P max
  - b. +12 V,  $\pm 3\%$ ; 0.1- to 0.3-A load, ripple voltage: 100 mVPP-P max
  - c. -12 V,  $\pm 3\%$ ; 0.1- to 0.3-A load, ripple voltage: 100 mVPP-P max

**Figure 25. Offline Flyback Regulator**

## 11 Layout

### 11.1 Layout Guidelines

Always try to use a low-EMI inductor with a ferrite-type closed core. Some examples would be toroid and encased E core inductors. Open core can be used if they have low-EMI characteristics and are located a farther away from the low-power traces and components. Make the poles perpendicular to the PCB as well if using an open core. Stick cores usually emit the most unwanted noise.

## Layout Guidelines (continued)

### 11.1.1 Feedback Traces

Try to run the feedback trace as far as possible from the inductor and noisy power traces. The designer should also make the feedback trace as direct as possible and somewhat thick. These two guidelines sometimes involve a trade-off, but keeping the trace away from inductor EMI and other noise sources is the more critical guideline. Run the feedback trace on the side of the PCB opposite of the inductor with a ground plane separating the two.

### 11.1.2 Input/Output Capacitors

When using a low-value ceramic input filter capacitor, locate it as close as possible to the VIN pin of the IC. This eliminates as much trace inductance effects as possible and gives the internal IC rail a cleaner voltage supply. Some designs require the use of a feed-forward capacitor connected from the output to the feedback pin as well, usually for stability reasons. In this case, it should also be positioned as close as possible to the IC. Using surface mount capacitors also reduces lead length and lessens the chance of noise coupling into the effective antenna created by through-hole components.

### 11.1.3 Compensation Components

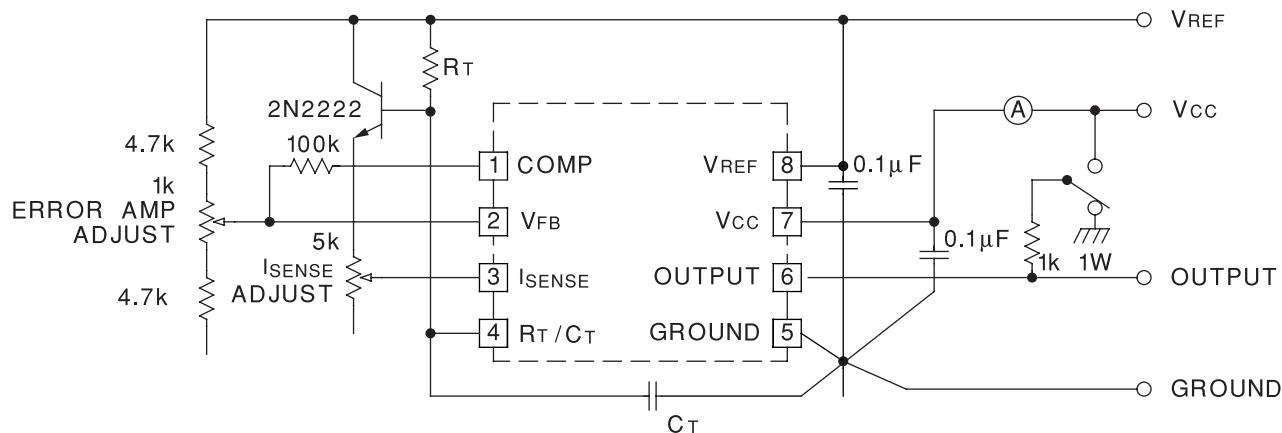

External compensation components for stability should also be placed close to the IC. TI recommends to also use surface mount components for the same reasons discussed for the filter capacitors. These should not be located very close to the inductor either.

### 11.1.4 Traces and Ground Planes

Make all of the power (high-current) traces as short, direct, and thick as possible. It is good practice on a standard PCB to make the traces an absolute minimum of 15 mils (0.381 mm) per ampere. The inductor, output capacitors, and output diode should be as close as possible to each other. This helps reduce the EMI radiated by the power traces due to the high-switching currents through them. This also reduces lead inductance and resistance, which in turn reduces noise spikes, ringing, and resistive losses that produce voltage errors. The grounds of the IC, input capacitors, output capacitors, and output diode (if applicable) should be connected close together directly to a ground plane. It would also be a good idea to have a ground plane on both sides of the PCB. This reduces noise by reducing ground loop errors and absorbing more of the EMI radiated by the inductor.

For multi-layer boards with more than two layers, a ground plane can be used to separate the power plane (where the power traces and components are) and the signal plane (where the feedback and compensation and components are) for improved performance. On multi-layer boards, vias are required to connect traces and different planes. It is a good practice to use one standard via per 200 mA of current if the trace needs to conduct a significant amount of current from one plane to the other. Arrange the components so that the switching current loops curl in the same direction. Due to the way switching regulators operate, there are two power states: one state when the switch is on and one when the switch is off. During each state there is a current loop made by the power components that are currently conducting. Place the power components so that during each of the two states the current loop is conducting in the same direction. This prevents magnetic field reversal caused by the traces between the two half-cycles and reduces radiated EMI.

## 11.2 Layout Example

High peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin 5 in a single point ground. The transistor and 5k potentiometer are used to sample the oscillator waveform and apply an adjustable ramp to pin 3.

**Figure 26. Open-Loop Laboratory Test Fixture**

## 12 Device and Documentation Support

### 12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 12.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At [e2e.ti.com](http://e2e.ti.com), you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 12.3 Trademarks

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

### 12.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 12.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

**(4) Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**(5) MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

**(6) Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

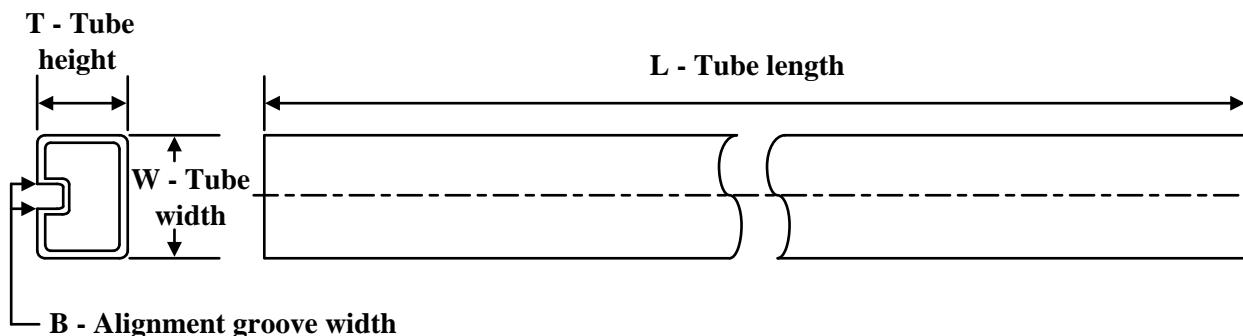

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
