

AM387x Sitara ARM Microprocessors (MPUs)

Technical Reference Manual

Literature Number: SPRUGZ7E
14 October 2011–Revised July 2015

Preface	127
1 Chip Level Resources	130
1.1 ARM® Cortex™-A8 Microprocessor Unit (MPU) Subsystem Overview	131
1.1.1 ARM Cortex-A8 RISC Processor	131
1.1.2 Embedded Trace Module (ETM).....	132
1.1.3 ARM Cortex-A8 Interrupt Controller (AINTC)	132
1.1.4 ARM Cortex-A8 PLL (PLL_ARM).....	132
1.1.5 ARM MPU Interconnect.....	132
1.2 Media Controller Subsystem	133
1.2.1 Dual Cortex-M3 MPU Subsystem Overview	133
1.2.2 Dual Cortex-M3 MPU Subsystem Integration	134
1.2.3 Dual Cortex-M3 MPU Subsystem Functional Description	137
1.2.4 Shared Cache	139
1.2.5 Shared Cache MMU.....	139
1.2.6 L2 MMU	140
1.2.7 Registers	141
1.3 C674x DSP	155
1.3.1 Introduction	155
1.3.2 TMS320C674x Megamodule	156
1.3.3 Memory Map	158
1.3.4 Advanced Event Triggering (AET).....	158
1.4 System MMU	159
1.4.1 MMU Overview	159
1.4.2 MMU Integration	159
1.4.3 MMU Functional Description	160
1.4.4 MMU Low-level Programming Models	173
1.4.5 MMU Registers.....	176
1.5 SGX530 Graphics Subsystem	189
1.5.1 SGX Overview.....	189
1.5.2 SGX Integration	192
1.5.3 SGX Functional Description	194
1.5.4 SGX Register Manual	196
1.6 Device Interrupts and EDMA Events	211
1.6.1 Interrupt Controllers	211
1.6.2 Interrupt Requests to Cortex-A8 MPU INTC	212
1.6.3 Interrupt Requests to C674x INTC	215
1.6.4 Interrupt Requests to Media Controller INTC	219
1.6.5 EDMA Channel Synchronization Events.....	223
1.7 Inter-Processor Communication	226
1.7.1 Reset Requirements.....	226
1.7.2 Features.....	226
1.7.3 Overview and Strategy	227
1.7.4 IPC Component Configuration	229
1.8 Mailbox	230
1.8.1 Overview	230

1.8.2	System Mailbox Integration.....	230
1.8.3	Functional Description.....	232
1.8.4	Programming Guide	236
1.8.5	Mailbox Registers.....	240
1.9	Bus Interconnect	259
1.9.1	Interconnect Overview	259
1.9.2	L3 Interconnect.....	263
1.9.3	L4 Interconnects	343
2	Power, Reset, and Clock Management (PRCM) Module	397
2.1	Introduction	398
2.1.1	Device Power-Management Architecture Building Blocks	398
2.1.2	Module-Level Clock Management	399
2.1.3	Clock Domain	402
2.1.4	Power Management	404
2.2	Power Reset Clock Management Structure	407
2.2.1	Introduction	407
2.3	Clock Generation and Management.....	409
2.3.1	Types of Clocks	409
2.3.2	Clock Structure.....	409
2.3.3	Main PLL Clock Structure.....	412
2.3.4	USB PLL Clock Structure.....	414
2.3.5	DDR PLL Clock Structure.....	415
2.3.6	SERDES and Ethernet Clock Structure.....	415
2.3.7	Video PLL Clock Structure	416
2.3.8	Audio PLL Clock Structure	418
2.3.9	Timer Clock Structure	421
2.3.10	Device Clocking from External Sources	423
2.3.11	Clock Output Pin.....	424
2.4	Oscillator	425
2.5	DPLLs.....	426
2.5.1	DPLLs Frequency Range	427
2.5.2	DPLLs Fractional M-divider Programming	427
2.5.3	DPLLs Clock Functions.....	427
2.5.4	DPLLs Frequency Factors	428
2.6	DPLLJ.....	428
2.6.1	DPLLJ Fractional M-divider Programming	430
2.6.2	DPLLJ Clock Functions.....	430
2.6.3	DPLLJ Frequency Range (MHz)	431
2.6.4	DPLLJ Frequency Factors	431
2.6.5	Mode of Operations	431
2.6.6	BYPASS Mode.....	432
2.6.7	M2 & N2 Change On-the-Fly	433
2.6.8	Gating and Power Down of Output Clocks	433
2.6.9	M2PWDNZ / CLKDCOLDOPWDNZ bits.....	433
2.6.10	Connected Outputs of DPLLs	434
2.6.11	Connected Outputs of DPLLJ	434
2.7	Reset Management.....	434
2.7.1	Overview	434
2.7.2	Reset Concepts and Definitions	434
2.7.3	Power On Reset (PORz)	436
2.7.4	External Warm Reset (RESETz).....	436
2.7.5	Emulation Cold Reset (ICEPICK POR)	436
2.7.6	Emulation Warm Reset	436

2.7.7	Reset Requestor	436
2.7.8	Software Controlled Reset.....	436
2.7.9	Test Reset (TRSTz)	436
2.7.10	Reset Priority	437
2.7.11	Reset Characteristics	437
2.7.12	Trace Functionality Across Reset	437
2.7.13	Reset Isolation	438
2.7.14	Reset Output (RSTOUT_WD_OUT)	438
2.7.15	Power-on-Reset (PORz) Sequence	439
2.7.16	RESETz Sequence	439
2.7.17	Power-Up/Down Sequence.....	440
2.7.18	IO State	440
2.7.19	MPU Subsystem POR Sequence	440
2.7.20	MPU Subsystem Warm Sequence	441
2.7.21	HDVICP Power-On Reset Sequence	442
2.7.22	HDVICP Software Warm Reset Sequence.....	444
2.7.23	C674x DSP Power-On Reset Sequence	444
2.7.24	C674x DSP Warm Reset Sequence	445
2.7.25	Media Controller Power-On Reset Sequence.....	445
2.7.26	Media Controller Warm Reset Sequence	447
2.8	Voltage and Power Domains	447
2.8.1	Voltage Domains.....	448
2.8.2	Power Domains	449
2.8.3	Device Modules and Power Management Attribute List.....	450
2.8.4	Power Domain Power-Down Sequence	450
2.8.5	Power Domain Power-Up Sequence.....	450
2.9	Voltage Management Functional Description	452
2.9.1	Overview	452
2.9.2	Internal LDOs Control	453
2.10	PRCM Registers	453
2.10.1	PLLSS Registers.....	455
2.10.2	PRM_DEVICE Registers	642
2.10.3	CM_DEVICE Registers	645
2.10.4	OCP_SOCKET_PRM Registers	647
2.10.5	CM_DPLL Registers.....	648
2.10.6	CM_ACTIVE Registers.....	668
2.10.7	CM_DEFAULT Registers	670
2.10.8	CM_HDVICP Registers	678
2.10.9	CM_ISP Registers	682
2.10.10	CM_DSS Registers	686
2.10.11	CM_SGX Registers	689
2.10.12	PRM_ACTIVE Registers	691
2.10.13	PRM_DEFAULT Registers.....	696
2.10.14	PRM_HDVICP Registers.....	701
2.10.15	PRM_ISP Registers.....	706
2.10.16	PRM_DSS Registers	710
2.10.17	PRM_SGX Registers	715
2.10.18	CM_ALWON Registers.....	720
2.10.19	PRM_ALWON Registers	783
3	Control Module.....	786
3.1	Control Module	787
3.1.1	MMR_LOCK Register (Locked/Unlocked States)	787
3.1.2	Pin Multiplexing (Pin Mux)	788

3.1.3	BOOT Status	789
3.1.4	DSP / EDMA Memory Management Unit Configuration	789
3.1.5	Interrupt and DMA Controller Crossbars	789
3.1.6	Device Level Peripheral Configuration	790
3.1.7	Reset Isolation	790
3.2	CONTROL_MODULE Registers	791
3.2.1	CONTROL_REVISION Register (offset = 0h) [reset = 40000000h]	797
3.2.2	CONTROL_HWINFO Register (offset = 4h) [reset = 0h]	798
3.2.3	CONTROL_SYSCONFIG Register (offset = 10h) [reset = 0h]	799
3.2.4	CONTROL_STATUS Register (offset = 40h) [reset = 0h]	800
3.2.5	BOOTSTAT Register (offset = 44h) [reset = 0h]	802
3.2.6	DSPBOOTADDR Register (offset = 48h) [reset = 800000h]	803
3.2.7	MMR_LOCK0 Register (offset = 60h) [reset = 1A1C8144h]	804
3.2.8	MMR_LOCK1 Register (offset = 64h) [reset = FDF45530h]	805
3.2.9	MMR_LOCK2 Register (offset = 68h) [reset = 1AE6E320h]	806
3.2.10	MMR_LOCK3 Register (offset = 6Ch) [reset = 2FFA927Ch]	807
3.2.11	MMR_LOCK4 Register (offset = 70h) [reset = 143F832Ch]	808
3.2.12	CONTROL_SEC_CTRL Register (offset = 100h) [reset = 1Bh]	809
3.2.13	DEVOSC Register (offset = 468h) [reset = 0h]	810
3.2.14	AUXOSC Register (offset = 46Ch) [reset = 2h]	811
3.2.15	PCIE_CFG Register (offset = 480h) [reset = 0h]	812
3.2.16	DEVICE_ID Register (offset = 600h) [reset = B8F202Eh]	813
3.2.17	DEV_FEATURE Register (offset = 604h) [reset = 0h]	814
3.2.18	INIT_PRIORITY_0 Register (offset = 608h) [reset = 0h]	816
3.2.19	INIT_PRIORITY_1 Register (offset = 60Ch) [reset = 0h]	817
3.2.20	MMU_CFG Register (offset = 610h) [reset = 80h]	818
3.2.21	TPTC_CFG Register (offset = 614h) [reset = AAh]	819
3.2.22	DSP_IDLE_CFG Register (offset = 61Ch) [reset = 28h]	820
3.2.23	USB_CTRL0 Register (offset = 620h) [reset = 3C006007h]	821
3.2.24	USB_STS0 Register (offset = 624h) [reset = 0h]	823
3.2.25	USB_CTRL1 Register (offset = 628h) [reset = 3C006007h]	824
3.2.26	USB_STS1 Register (offset = 62Ch) [reset = 0h]	826
3.2.27	MAC_ID0_LO Register (offset = 630h) [reset = 0h]	827
3.2.28	MAC_ID0_HI Register (offset = 634h) [reset = 0h]	828
3.2.29	MAC_ID1_LO Register (offset = 638h) [reset = 0h]	829
3.2.30	MAC_ID1_HI Register (offset = 63Ch) [reset = 0h]	830
3.2.31	SW_REVISION Register (offset = 640h) [reset = 0h]	831
3.2.32	DCAN_RAMINIT Register (offset = 644h) [reset = 0h]	832
3.2.33	AUD_CTRL Register (offset = 64Ch) [reset = 0h]	833
3.2.34	GMII_SEL Register (offset = 650h) [reset = 0h]	834
3.2.35	OCMEM_PWRDN Register (offset = 654h) [reset = 0h]	835
3.2.36	MEDIA_CONTROLLER_MEM_PWRDN Register (offset = 65Ch) [reset = 0h]	836
3.2.37	SD_DAC_CTRL Register (offset = 670h) [reset = 18800C6h]	837
3.2.38	SD_DAC0_CAL Register (offset = 674h) [reset = 0h]	839
3.2.39	SD_DAC1_CAL Register (offset = 678h) [reset = 0h]	840
3.2.40	SD_DAC0_REGCTRL Register (offset = 67Ch) [reset = 0h]	841
3.2.41	SD_DAC0_REGSTATUS Register (offset = 680h) [reset = 0h]	842
3.2.42	SD_DAC1_REGCTRL Register (offset = 684h) [reset = 0h]	843
3.2.43	SD_DAC1_REGSTATUS Register (offset = 688h) [reset = 0h]	844
3.2.44	EMIF_CLK_GATE Register (offset = 694h) [reset = 0h]	845
3.2.45	SMRT_CTRL Register (offset = 6A0h) [reset = 0h]	846
3.2.46	ARM_CORTEX_A8_HW_DBG_SEL Register (offset = 6A4h) [reset = 0h]	847
3.2.47	ARM_CORTEX_A8_HW_DBG_INFO Register (offset = 6A8h) [reset = 0h]	848

3.2.48	PRCM_DEBUG_ALWON_DEFAULT Register (offset = 6B0h) [reset = 3F7B0010h]	849
3.2.49	PRCM_DEBUG_PD_DOMAIN_STATUS Register (offset = 6B4h) [reset = 871C7180h]	851
3.2.50	PCIE_PLLCFG0 Register (offset = 6D8h) [reset = 40007000h]	854
3.2.51	PCIE_PLLCFG1 Register (offset = 6DCh) [reset = 0h]	856
3.2.52	PCIE_PLLCFG2 Register (offset = 6E0h) [reset = 0h]	857
3.2.53	PCIE_PLLCFG3 Register (offset = 6E4h) [reset = 4000000h]	858
3.2.54	PCIE_PLLCFG4 Register (offset = 6E8h) [reset = 0h]	860
3.2.55	PCIE_PLLSTATUS Register (offset = 6ECh) [reset = 0h]	862
3.2.56	PCIE_RXSTATUS Register (offset = 6F0h) [reset = 0h]	863
3.2.57	PCIE_TXSTATUS Register (offset = 6F4h) [reset = 0h]	864
3.2.58	SATA_PLLCFG0 Register (offset = 720h) [reset = C0007160h]	865
3.2.59	SATA_PLLCFG1 Register (offset = 724h) [reset = 812C0000h]	866
3.2.60	SATA_PLLCFG2 Register (offset = 728h) [reset = 0h]	867
3.2.61	SATA_PLLCFG3 Register (offset = 72Ch) [reset = 4000000h]	868
3.2.62	SATA_PLLCFG4 Register (offset = 730h) [reset = 0h]	871
3.2.63	SATA_TXSTATUS Register (offset = 73Ch) [reset = 0h]	873
3.2.64	SATA_TESTCFG Register (offset = 740h) [reset = 0h]	874
3.2.65	VDD_MPU_OPP_050 Register (offset = 770h) [reset = 0h]	875
3.2.66	VDD_MPU_OPP_100 Register (offset = 774h) [reset = 0h]	876
3.2.67	VDD_MPU_OPP_120 Register (offset = 778h) [reset = 0h]	877
3.2.68	VDD_MPU_OPP_166 Register (offset = 77Ch) [reset = 0h]	878
3.2.69	VDD_C674x_DSP_OPP_050 Register (offset = 788h) [reset = 0h]	879
3.2.70	VDD_C674x_DSP_OPP_100 Register (offset = 78Ch) [reset = 0h]	880
3.2.71	VDD_C674x_DSP_OPP_120 Register (offset = 790h) [reset = 0h]	881
3.2.72	VDD_C674x_DSP_OPP_166 Register (offset = 794h) [reset = 0h]	882
3.2.73	VDD_HDVICP_OPP_050 Register (offset = 7A0h) [reset = 0h]	883
3.2.74	VDD_HDVICP_OPP_100 Register (offset = 7A4h) [reset = 0h]	884
3.2.75	VDD_HDVICP_OPP_120 Register (offset = 7A8h) [reset = 0h]	885
3.2.76	VDD_HDVICP_OPP_166 Register (offset = 7ACh) [reset = 0h]	886
3.2.77	VDD_CORE_OPP_050 Register (offset = 7B8h) [reset = 0h]	887
3.2.78	VDD_CORE_OPP_100 Register (offset = 7BCh) [reset = 0h]	888
3.2.79	VDD_CORE_OPP_120 Register (offset = 7C0h) [reset = 0h]	889
3.2.80	VDD_CORE_OPP_166 Register (offset = 7C4h) [reset = 0h]	890
3.2.81	BB_SCALE Register (offset = 7D0h) [reset = 0h]	891
3.2.82	USB_VID_PID Register (offset = 7F4h) [reset = 0h]	892
3.2.83	PCIE_VID_PID Register (offset = 7F8h) [reset = 0h]	893
3.2.84	PINCNTL[270:1] Register (offset = 800h) [reset = 40000h]	894
3.2.85	MLBP_SIG_IO_CTRL Register (offset = E18h) [reset = 38h]	895
3.2.86	MLBP_DAT_IO_CTRL Register (offset = E1Ch) [reset = 38h]	896
3.2.87	SERDES_REFCLK_CTL Register (offset = E24h) [reset = 3h]	897
3.2.88	DSP_INTMUX_15_18 Register (offset = F00h) [reset = 0h]	898
3.2.89	DSP_INTMUX_19_22 Register (offset = F04h) [reset = 0h]	899
3.2.90	DSP_INTMUX_23_26 Register (offset = F08h) [reset = 0h]	900
3.2.91	DSP_INTMUX_27_30 Register (offset = F0Ch) [reset = 0h]	901
3.2.92	DSP_INTMUX_31_34 Register (offset = F10h) [reset = 0h]	902
3.2.93	DSP_INTMUX_35_38 Register (offset = F14h) [reset = 0h]	903
3.2.94	DSP_INTMUX_39_42 Register (offset = F18h) [reset = 0h]	904
3.2.95	DSP_INTMUX_43_46 Register (offset = F1Ch) [reset = 0h]	905
3.2.96	DSP_INTMUX_47_50 Register (offset = F20h) [reset = 0h]	906
3.2.97	DSP_INTMUX_51_54 Register (offset = F24h) [reset = 0h]	907
3.2.98	DSP_INTMUX_55_58 Register (offset = F28h) [reset = 0h]	908
3.2.99	DSP_INTMUX_59_62 Register (offset = F2Ch) [reset = 0h]	909
3.2.100	DSP_INTMUX_63_66 Register (offset = F30h) [reset = 0h]	910

3.2.101	DSP_INTMUX_67_70 Register (offset = F34h) [reset = 0h]	911
3.2.102	DSP_INTMUX_71_74 Register (offset = F38h) [reset = 0h]	912
3.2.103	DSP_INTMUX_75_78 Register (offset = F3Ch) [reset = 0h]	913
3.2.104	DSP_INTMUX_79_82 Register (offset = F40h) [reset = 0h]	914
3.2.105	DSP_INTMUX_83_86 Register (offset = F44h) [reset = 0h]	915
3.2.106	DSP_INTMUX_87_90 Register (offset = F48h) [reset = 0h]	916
3.2.107	DSP_INTMUX_91_94 Register (offset = F4Ch) [reset = 0h]	917
3.2.108	DSP_INTMUX_95 Register (offset = F50h) [reset = 0h]	918
3.2.109	Media_Controller_INTMUX_0_3 Register (offset = F54h) [reset = 0h]	919
3.2.110	Media_Controller_INTMUX_4_7 Register (offset = F58h) [reset = 0h]	920
3.2.111	Media_Controller_INTMUX_8_11 Register (offset = F5Ch) [reset = 0h]	921
3.2.112	Media_Controller_INTMUX_12_15 Register (offset = F60h) [reset = 0h]	922
3.2.113	Media_Controller_INTMUX_16_19 Register (offset = F64h) [reset = 0h]	923
3.2.114	Media_Controller_INTMUX_20_23 Register (offset = F68h) [reset = 0h]	924
3.2.115	Media_Controller_INTMUX_24_27 Register (offset = F6Ch) [reset = 0h]	925
3.2.116	Media_Controller_INTMUX_28_31 Register (offset = F70h) [reset = 0h]	926
3.2.117	Media_Controller_INTMUX_32_35 Register (offset = F74h) [reset = 0h]	927
3.2.118	Media_Controller_INTMUX_36_39 Register (offset = F78h) [reset = 0h]	928
3.2.119	Media_Controller_INTMUX_40_43 Register (offset = F7Ch) [reset = 0h]	929
3.2.120	Media_Controller_INTMUX_44_47 Register (offset = F80h) [reset = 0h]	930
3.2.121	Media_Controller_INTMUX_48_51 Register (offset = F84h) [reset = 0h]	931
3.2.122	Media_Controller_INTMUX_52_55 Register (offset = F88h) [reset = 0h]	932
3.2.123	Media_Controller_INTMUX_56 Register (offset = F8Ch) [reset = 0h]	933
3.2.124	EDMA3CC_EVTMUX_0_3 Register (offset = F90h) [reset = 0h]	934
3.2.125	EDMA3CC_EVTMUX_4_7 Register (offset = F94h) [reset = 0h]	935
3.2.126	EDMA3CC_EVTMUX_8_11 Register (offset = F98h) [reset = 0h]	936
3.2.127	EDMA3CC_EVTMUX_12_15 Register (offset = F9Ch) [reset = 0h]	937
3.2.128	EDMA3CC_EVTMUX_16_19 Register (offset = FA0h) [reset = 0h]	938
3.2.129	EDMA3CC_EVTMUX_20_23 Register (offset = FA4h) [reset = 0h]	939
3.2.130	EDMA3CC_EVTMUX_24_27 Register (offset = FA8h) [reset = 0h]	940
3.2.131	EDMA3CC_EVTMUX_28_31 Register (offset = FACH) [reset = 0h]	941
3.2.132	EDMA3CC_EVTMUX_32_35 Register (offset = FB0h) [reset = 0h]	942
3.2.133	EDMA3CC_EVTMUX_36_39 Register (offset = FB4h) [reset = 0h]	943
3.2.134	EDMA3CC_EVTMUX_40_43 Register (offset = FB8h) [reset = 0h]	944
3.2.135	EDMA3CC_EVTMUX_44_47 Register (offset = FBCh) [reset = 0h]	945

13-51. Ri Command Register (RI_CMD) Field Descriptions	1778
13-52. Ri Line Start Register (RI_START) Field Descriptions	1778
13-53. Ri From RX Register (Low) (RI_RX_L) Field Descriptions	1779
13-54. Ri From RX Registers (High) (RI_RX_H) Field Descriptions	1779
13-55. Ri Debug Registers (RI_DEBUG) Field Descriptions.....	1780
13-56. VIDEO DE Delay Register (DE_DLY) Field Descriptions.....	1780
13-57. VIDEO DE Control Register (DE_CTRL) Field Descriptions	1781
13-58. VIDEO DE Top Register (DE_TOP) Field Descriptions.....	1782
13-59. VIDEO DE Count Register (DE_CNTL) Field Descriptions.....	1782
13-60. VIDEO DE Count Register (DE_CNTH) Field Descriptions	1782
13-61. VIDEO DE Line Register (DE_LINL) Field Descriptions	1783
13-62. VIDEO DE Line Register (DE_LINH_1) Field Descriptions.....	1783
13-63. Video H Resolution Register (HRES_L) Field Descriptions	1784
13-64. Video H Resolution Register (HRES_H) Field Descriptions.....	1784
13-65. Video V Resolution Low Register (VRES_L) Field Descriptions	1785
13-66. Video V Resolution Register (VRES_H) Field Descriptions	1785
13-67. Video Interlace Adjustment Register (IADJUST) Field Descriptions	1786
13-68. Video SYNC Polarity Detection Register (POL_DETECT) Field Descriptions	1787
13-69. Video Hbit to HSYNC Register (HBIT_2HSYNC1) Field Descriptions	1788
13-70. Video Hbit to HSYNC Register (HBIT_2HSYNC2) Field Descriptions	1788
13-71. Video Field2 HSYNC Offset Register (FLD2_HS_OFSTL) Field Descriptions.....	1789
13-72. Video Field2 HSYNC Offset Register (FLD2_HS_OFSTH) Field Descriptions	1789
13-73. Video HSYNC Length Register (HWIDTH1) Field Descriptions.....	1790

13-74. Video HSYNC Length Register (HWIDTH2) Field Descriptions.....	1790
13-75. Video Vbit to VSYNC Register (VBIT_TO_VSYNC) Field Descriptions	1791
13-76. Video VSYNC Length Register (VWIDTH) Field Descriptions	1791
13-77. Video Control Register (VID_CTRL) Field Descriptions.....	1792
13-78. Video Action Enable Register (VID_ACEN) Field Descriptions	1793
13-79. Video Mode1 Register (VID_MODE) Field Descriptions	1794
13-80. Video Blanking Registers (VID_BLANK1) Field Descriptions	1795
13-81. Video Blanking Register (VID_BLANK2) Field Descriptions.....	1795
13-82. Video Blanking Register (VID_BLANK3) Field Descriptions.....	1795
13-83. Deep Color Header Register (DC_HEADER) Field Descriptions	1796
13-84. Video Mode2 Register (VID_DITHER) Field Descriptions	1797
13-85. RGB_2_xvYCC control Register (RGB2XYCC_CTL) Field Descriptions.....	1798
13-86. RGB_2_xvYCC Conversion R_2_Y Register (R2Y_COEFF_LOW) Field Descriptions	1799
13-87. RGB_2_xvYCC Conversion R_2_Y Register (R2Y_COEFF_UP) Field Descriptions.....	1799
13-88. RGB_2_xvYCC Conversion G_2_Y Register (G2Y_COEFF_LOW) Field Descriptions	1800
13-89. RGB_2_xvYCC Conversion G_2_Y Register (G2Y_COEFF_UP) Field Descriptions	1800
13-90. RGB_2_xvYCC Conversion B_2_Y Register (B2Y_COEFF_LOW) Field Descriptions.....	1801
13-91. RGB_2_xvYCC Conversion B_2_Y Register (B2Y_COEFF_UP) Field Descriptions	1801
13-92. RGB_2_xvYCC Conversion R_2_Cb Register (R2CB_COEFF_LOW) Field Descriptions.....	1802
13-93. RGB_2_xvYCC Conversion R_2_Cb Register (R2CB_COEFF_UP) Field Descriptions	1802
13-94. RGB_2_xvYCC Conversion G_2_Cb Register (G2CB_COEFF_LOW) Field Descriptions	1803
13-95. RGB_2_xvYCC Conversion G_2_Cb Register (G2CB_COEFF_UP) Field Descriptions.....	1803
13-96. RGB_2_xvYCC Conversion B_2_Cb Register (B2CB_COEFF_LOW) Field Descriptions	1804
13-97. RGB_2_xvYCC Conversion B_2_Cb Register (B2CB_COEFF_UP) Field Descriptions	1804
13-98. RGB_2_xvYCC Conversion R_2_Cr Register (R2CR_COEFF_LOW) Field Descriptions	1805
13-99. RGB_2_xvYCC Conversion R_2_Cr Register (R2CR_COEFF_UP) Field Descriptions	1805
13-100. RGB_2_xvYCC Conversion G_2_Cr Register (G2CR_COEFF_LOW) Field Descriptions	1806
13-101. RGB_2_xvYCC Conversion G_2_Cr Register (G2CR_COEFF_UP) Field Descriptions.....	1806
13-102. RGB_2_xvYCC Conversion B_2_Cr Register (B2CR_COEFF_LOW) Field Descriptions	1807
13-103. RGB_2_xvYCC Conversion B_2_Cr Register (B2CR_COEFF_UP) Field Descriptions	1807
13-104. RGB_2_xvYCC RGB Input Offset Register (RGB_OFFSET_LOW) Field Descriptions.....	1808
13-105. RGB_2_xvYCC RGB Input Offset Register (RGB_OFFSET_UP) Field Descriptions	1808
13-106. RGB_2_xvYCC Conversion Y Output Offset Register (Y_OFFSET_LOW) Field Descriptions	1809
13-107. RGB_2_xvYCC Conversion Y Output Offset Register (Y_OFFSET_UP) Field Descriptions.....	1809
13-108. RGB_2_xvYCC Conversion CbCr Output Offset Register (CBCR_OFFSET_LOW) Field Descriptions ...	1810
13-109. RGB_2_xvYCC Conversion CbCr Output Offset Register (CBCR_OFFSET_UP) Field Descriptions	1810
13-110. Interrupt State Register (INTR_STATE) Field Descriptions	1810
13-111. Interrupt Source Register (INTR1) Field Descriptions	1811
13-112. Interrupt Source Register (INTR2) Field Descriptions	1812
13-113. Interrupt Source Register (INTR3) Field Descriptions	1813
13-114. Interrupt Source Register (INTR4) Field Descriptions	1814
13-115. Interrupt Unmask Register (INT_UNMASK1) Field Descriptions	1815
13-116. Interrupt Unmask Register (INT_UNMASK2) Field Descriptions	1816
13-117. Interrupt Unmask Register (INT_UNMASK3) Field Descriptions	1817
13-118. Interrupt Unmask Register (INT_UNMASK4) Field Descriptions	1818
13-119. Interrupt Control Register (INT_CTRL) Field Descriptions	1819
13-120. xvYCC_2_RGB Control Register (XYCC2RGB_CTL) Field Descriptions	1820
13-121. xvYCC_2_RGB Conversion Y_2_R Register (Y2R_COEFF_LOW) Field Descriptions.....	1821
13-122. xvYCC_2_RGB Conversion Y_2_R Register (Y2R_COEFF_UP) Field Descriptions	1821

13-123. xvYCC_2_RGB Conversion Cr_2_R Register (CR2R_COEFF_LOW) Field Descriptions.....	1822
13-124. xvYCC_2_RGB Conversion Cr_2_R Register (C2R2R_COEFF_UP) Field Descriptions.....	1822
13-125. xvYCC_2_RGB Conversion Cb_2_B Register (CB2B_COEFF_LOW) Field Descriptions.....	1823
13-126. xvYCC_2_RGB Conversion Cb_2_B Register (CB2B_COEFF_UP) Field Descriptions.....	1823
13-127. CR2G_COEFF_LOW Field Descriptions.....	1824
13-128. xvYCC_2_RGB Conversion Cr_2_G Register (CR2G_COEFF_UP) Field Descriptions.....	1824
13-129. xvYCC_2_RGB Conversion Cb_2_G Register (CB2G_COEFF_LOW).....	1825
13-130. xvYCC_2_RGB Conversion Cb_2_G Register (CB2G_COEFF_UP) Field Descriptions.....	1825
13-131. xvYCC_2_RGB Conversion Y Offset Register (YOFFSET1_LOW) Field Descriptions.....	1826
13-132. xvYCC_2_RGB Conversion Y Offset Register (YOFFSET1_UP) Field Descriptions.....	1826
13-133. xvYCC_2_RGB Conversion Offset1 Register (OFFSET1_LOW) Field Descriptions.....	1827
13-134. xvYCC_2_RGB Conversion Offset1 Register (OFFSET1_MID) Field Descriptions.....	1827
13-135. xvYCC_2_RGB Conversion Offset1 Register (OFFSET1_UP) Field Descriptions.....	1827
13-136. xvYCC_2_RGB Conversion Offset2 Register (OFFSET2_LOW) Field Descriptions.....	1828
13-137. xvYCC_2_RGB Conversion Offset2 Register (OFFSET2_UP) Field Descriptions.....	1828
13-138. xvYCC_2_RGB Conversion DC Level Register (DCLEVEL_LOW) Field Descriptions.....	1829
13-139. xvYCC_2_RGB Conversion DC Level Register (DCLEVEL_UP) Field Descriptions.....	1829
13-140. DDC I2C Manual Register (DDC_MAN) Field Descriptions.....	1830
13-141. DDC I2C Target Slave Address Register (DDC_ADDR) Field Descriptions.....	1831
13-142. DDC I2C Target Segment Address Register (DDC_SEGM) Field Descriptions.....	1831
13-143. DDC I2C Target Offset Address Register (DDC_OFFSET) Field Descriptions.....	1831
13-144. DDC I2C Data Count Register (DDC_COUNT1) Field Descriptions.....	1832
13-145. DDC I2C Data Count Register (DDC_COUNT2) Field Descriptions.....	1832
13-146. DDC I2C Status Register (DDC_STATUS) Field Descriptions.....	1833
13-147. DDC I2C Command Register (DDC_CMD) Field Descriptions.....	1834

16-20. Digital Mode Control Register (DITCTL) Field Descriptions	2056
16-21. Receiver Global Control Register (RGBLCTL) Field Descriptions	2057
16-22. Receive Format Unit Bit Mask Register (RMASK) Field Descriptions	2058
16-23. Receive Bit Stream Format Register (RFMT) Field Descriptions	2059
16-24. Receive Frame Sync Control Register (AFSRCTL) Field Descriptions	2061
16-25. Receive Clock Control Register (ACLKRCTL) Field Descriptions	2062
16-26. Receive High-Frequency Clock Control Register (AHCLKRCTL) Field Descriptions	2063
16-27. Receive TDM Time Slot Register (RTDM) Field Descriptions.....	2064
16-28. Receiver Interrupt Control Register (RINTCTL) Field Descriptions.....	2065
16-29. Receiver Status Register (RSTAT) Field Descriptions	2066
16-30. Current Receive TDM Time Slot Registers (RSLOT) Field Descriptions	2067
16-31. Receive Clock Check Control Register (RCLKCHK) Field Descriptions	2068
16-32. Receiver DMA Event Control Register (REVTCTL) Field Descriptions	2069
16-33. Transmitter Global Control Register (XGBLCTL) Field Descriptions	2070
16-34. Transmit Format Unit Bit Mask Register (XMASK) Field Descriptions	2071
16-35. Transmit Bit Stream Format Register (XFMT) Field Descriptions	2072
16-36. Transmit Frame Sync Control Register (AFSXCTL) Field Descriptions	2074
16-37. Transmit Clock Control Register (ACLKXCTL) Field Descriptions.....	2075
16-38. Transmit High-Frequency Clock Control Register (AHCLKXCTL) Field Descriptions.....	2076
16-39. Transmit TDM Time Slot Register (XTDM) Field Descriptions	2077
16-40. Transmitter Interrupt Control Register (XINTCTL) Field Descriptions.....	2078
16-41. Transmitter Status Register (XSTAT) Field Descriptions	2079
16-42. Current Transmit TDM Time Slot Register (XSLOT) Field Descriptions	2080
16-43. Transmit Clock Check Control Register (XCLKCHK) Field Descriptions	2081
16-44. Transmitter DMA Event Control Register (XEVTCTL) Field Descriptions	2082
16-45. Serializer Control Registers (SRCTL _n) Field Descriptions.....	2083
16-46. Write FIFO Control Register (WFIFOCTL) Field Descriptions	2086
16-47. Write FIFO Status Register (WFIFOSTS) Field Descriptions	2087
16-48. Read FIFO Control Register (RFIFOCTL) Field Descriptions	2088
16-49. Read FIFO Status Register (RFIFOSTS) Field Descriptions.....	2089
17-1. Phases, Words and Bits Per Frame Control Bits	2096
17-2. Effects of DLB and ALB Bits on Clock Modes	2101
17-3. Channels, Block, Partitions	2111
17-4. Eight Partitions – Receive Channel Assignment and Control	2112
17-5. Eight Partitions – Transmit Channel Assignment and Control	2112
17-6. Selecting a Transmit Multichannel Selection Mode with the XMCM Bit Field.....	2115
17-7. McBSP Channel Control Options	2115
17-8. Analysis of the Receiver Smart Idle Behavior	2121
17-9. Input Clock Selection for Sample Rate Generator	2123
17-10. How to Calculate the Length of the Receive Frame	2127
17-11. Example: Use of RJUST Bit Field with 12-Bit Data Value ABCh	2128
17-12. Example: Use of RJUST Bit Field with 20-Bit Data Value ABCDE	2128
17-13. FSRM and GSYNC Effects on Frame-Synchronization Signal and McBSP.FSR Pin	2129

17-14. CLKRM Effect on Receive Clock Signal and McBSP.CLKR Pin	2131
17-15. How to Calculate the Length of the Transmit Frame	2135
17-16. How FSXM and FSGM Select the Source of Transmit Frame-Synchronization Pulses	2137
17-17. CLKXM Bit Effect on Transmit Clock and McBSP.CLKX Pin	2139
17-18. Using McBSP Pins for General-Purpose I/O	2142
17-19. McBSP Registers.....	2143
17-20. Revision Number Register (REVNB) Field Descriptions	2145
17-21. System Configuration Register (SYSCONFIG_REG) Field Descriptions	2146
17-22. End of Interrupt Register (EOI) Field Descriptions.....	2147
17-23. Interrupt Status Raw Register (IRQSTATUS_RAW) Field Descriptions	2148
17-24. Interrupt Status Register (IRQSTATUS) Field Descriptions	2150
17-25. Interrupt Enable Set Register (IRQENABLE_SET) Field Descriptions.....	2152
17-26. Interrupt Enable Clear Register (IRQENABLE_CLR) Field Descriptions	2154
17-27. DMA Rx Enable Set Register (DMARXENABLE_SET) Field Descriptions.....	2156
17-28. DMA Tx Enable Set Register (DMATXENABLE_SET) Field Descriptions	2156
17-29. DMA Rx Enable Clear Register (DMARXENABLE_CLR) Field Descriptions	2157
17-30. DMA Tx Enable Clear Register (DMATXENABLE_CLR) Field Descriptions.....	2157
17-31. DMA Rx Wake Enable Register (DMARXWAKE_EN) Field Descriptions	2158
17-32. DMA Tx Wake Enable Register (DMATXWAKE_EN) Field Descriptions.....	2160
17-33. McBSP_DRR_REG Field Descriptions.....	2162
17-34. McBSP_DXR_REG Field Descriptions	2162
17-35. McBSP_SPCR2_REG Field Descriptions.....	2163
17-36. McBSP_SPCR1_REG Field Descriptions.....	2164
17-37. McBSP_RCR2_REG Field Descriptions	2165
17-38. McBSP_RCR1_REG Field Descriptions	2166
17-39. McBSP_XCR2_REG Field Descriptions	2167
17-40. McBSP_XCR1_REG Field Descriptions	2168
17-41. McBSP_SRGR2_REG Field Descriptions	2169
17-42. McBSP_SRGR1_REG Field Descriptions	2170
17-43. McBSP_MCR2_REG Field Descriptions	2171
17-44. McBSP_MCR1_REG Field Descriptions	2173

21-10. BIST Active FIS Register (BISTAFR) Field Descriptions	2465
21-11. BIST Control Register (BISTCR) Field Descriptions.....	2466
21-12. BIST FIS Count Register (BISTFCTR) Field Description	2468
21-13. BIST Status Register (BISTSR) Field Description	2468
21-14. BIST DWORD Error Count Register (BISTDECR) Field Description.....	2469
21-15. BIST DWORD Error Count Register (TIMER1MS) Field Description	2469
21-16. Global Parameter 1 Register (GPARAM1R) Field Descriptions	2470
21-17. Global Parameter 2 Register (GPARAM2R) Field Descriptions	2471
21-18. Port Parameter Register (PPARAMR) Field Descriptions	2472
21-19. Version Register (VERSIONR) Field Description	2473
21-20. ID Register (IDR) Field Description	2473
21-21. Port Command List Base Address Register (P0CLB) Field Description	2474
21-22. Port FIS Base Address Register (P0FB) Field Description	2474
21-23. Port Interrupt Status Register (P0IS) Field Descriptions	2475
21-24. Port Interrupt Enable Register (P0IE) Field Descriptions	2477
21-25. Port Command Register (P0CMD) Field Descriptions	2478
21-26. Port Task File Data Register (P0TFD) Field Descriptions	2480
21-27. Port Signature Register (P0SIG) Field Description	2481
21-28. Port Serial ATA Status Register (P0SSTS) Field Descriptions	2481
21-29. Port Serial ATA Control Register (P0SCTL) Field Descriptions.....	2483
21-30. Port Serial ATA Error Register (P0SERR) Field Descriptions.....	2484
21-31. Port Serial ATA Active Register (P0SACT) Field Description	2486
21-32. Port Command Issue Register (P0CI) Field Description	2486
21-33. Port Serial ATA Notification Register (P0SNTF) Field Description	2487
21-34. Port DMA Control Register (P0DMACR) Field Description	2488
21-35. Idle Register (IDLE) Field Description	2490
21-36. PHY Configuration Receive 0 Register Field Descriptions	2491
21-37. PHY Configuration Receive 1 Register (CFGRX1) Field Descriptions.....	2493
21-38. PHY Configuration Receive 2 Register (CFGRX2) Field Descriptions.....	2494
21-39. PHY Configuration Receive 3 Register (CFGRX3) Field Descriptions.....	2495
21-40. PHY Configuration Receive 4 Register (CFGRX4) Field Descriptions.....	2497
21-41. Receive Bus PHY-to-Controller Status Register Field Descriptions.....	2498
21-42. PHY Configuration Transmit 0 Register (CFGTX0) Field Descriptions	2499
21-43. PHY Configuration Transmit 1 Register (CFGTX1) Field Descriptions	2502
21-44. PHY Configuration Transmit 2 Register (CFGTX2) Field Descriptions	2504
21-45. PHY Configuration Transmit 2 Register (CFGTX3) Field Descriptions	2506
21-46. PHY Configuration Transmit 2 Register (CFGTX4) Field Descriptions	2507
21-47. Transmit Bus Controller-to-PHY Status Register Field Descriptions	2507

21-48. SATA PLL Controller Registers	2508
21-49. SATA PLL Configuration 0 Register (SATA_PLLCFG0) Field Description	2508
21-50. SATA PLL Configuration 1 Register (SATA_PLLCFG1) Field Description	2510
21-51. SATA PLL Configuration 2 Register (SATA_PLLCFG2) Field Description	2511
21-52. SATA PLL Configuration 3 Register (SATA_PLLCFG3) Field Description	2512
21-53. SATA PLL Configuration 4 Register (SATA_PLLCFG4) Field Description	2513
21-54. SATA PLL Status (SATA_PLLSTATUS) Field Description	2515
21-55. SATA Receive Status (SATA_RXSTATUS) Field Description	2515
21-56. SATA Transmit Status (SATA_TXSTATUS) Field Description	2516
21-57. SATA TEST Configuration (SATA_TESTCFG) Field Description	2516
21-58. SATA Subsystem Controller Registers	2517
21-59. Clock Domain Power Control Register (CM_DEFAULT_L3_MED_CLKSTCTRL) Field Descriptions	2517
21-60. Clock Domain SATA Control Register (CM_DEFAULT_SATA_CLKCTRL) Field Descriptions	2518
22-1. SPI Interface Pins	2521
22-2. Phase and Polarity Combinations	2525
22-3. Chip Select ↔ Clock Edge Delay Depending on Configuration	2535
22-4. CLKSPPIO High/Low Time Computation	2536
22-5. Clock Granularity Examples	2536
22-6. FIFO Writes, Word Length Relationship	2537
22-7. SPI Receive Mode Initialization	2555
22-8. SPI Transmit Mode Initialization	2555
22-9. SPI Transmit-and-Receive Mode Initialization	2555
22-10. Receive-Only Procedure – Polling Method	2556
22-11. Receive-Only Procedure – Interrupt Method	2556
22-12. Transmit-Only Procedure – Polling Method	2556
22-13. Transmit-and-Receive Procedure – Polling Method	2557
22-14. Receive-Only Procedure With Word Count – Polling Method	2557
22-15. Transmit-Only Procedure Without Word Count – Polling Method	2557
22-16. Transmit-Only Procedure With Word Count – Interrupt Method	2557
22-17. Transmit-and-Receive Procedure With Word Count – Polling Method	2558
22-18. Transmit-and-Receive Procedure With Word Count – Interrupt Method	2558
22-19. Transmit-and-Receive Procedure Without Word Count – Polling Method	2558
22-20. SPI Registers	2559
22-21. McSPI IP Revision Register (MCSPI_HL_REV) Field Descriptions	2560
22-22. McSPI IP Hardware Information Register (MCSPI_HL_HWINFO) Field Descriptions	2561
22-23. McSPI IP System Configuration Register (MCSPI_HL_SYSCONFIG) Field Descriptions	2562
22-24. McSPI Revision Register (MCSPI_REVISION) Field Descriptions	2563
22-25. McSPI System Configuration Register (MCSPI_SYSCONFIG) Field Descriptions	2564
22-26. McSPI System Status Register (MCSPI_SYSSTATUS) Field Descriptions	2565
22-27. McSPI Interrupt Status Register (MCSPI_IRQSTATUS) Field Descriptions	2566
22-28. McSPI Interrupt Enable Register (MCSPI_IRQENABLE) Field Descriptions	2569
22-29. McSPI Wakeup Enable Register (MCSPI_WAKEUPENABLE) Field Descriptions	2571
22-30. McSPI System Test Register (MCSPI_SYST) Field Descriptions	2572
22-31. McSPI Module Control Register (MCSPI_MODULCTRL) Field Descriptions	2574
22-32. McSPI Channel (i) Configuration Register (MCSPI_CH(i)CONF) Field Descriptions	2576
22-33. Data Lines Configurations	2579
22-34. McSPI Channel (i) Status Register (MCSPI_CH(i)STAT) Field Descriptions	2580
22-35. McSPI Channel (i) Control Register (MCSPI_CH(i)CTRL) Field Descriptions	2581
22-36. McSPI Channel (i) Transmit Register (MCSPI_TX(i)) Field Descriptions	2582

22-37. McSPI Channel (<i>i</i>) Receive Register (MCSPI_RX(<i>i</i>)) Field Descriptions	2582
22-38. McSPI Transfer Levels Register (MCSPI_XFERLEVEL) Field Descriptions	2583
22-39. DMA Address Aligned FIFO Transmitter Register (MCSPI_DAFTX) Field Descriptions	2584
22-40. DMA Address Aligned FIFO Receiver Register (MCSPI_DAFRX) Field Descriptions	2584
23-1. Timer Resolution and Maximum Range	2587
23-2. Prescaler Functionality	2591
23-3. Prescaler Clock Ratios Value	2594
23-4. Value and Corresponding Interrupt Period	2594
23-5. OCP Error Reporting	2595

About This Manual

This Technical Reference Manual (TRM) details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the device.

The TRM should not be considered a substitute for the data manual, rather a companion guide that should be used alongside the device-specific data manual to understand the details to program the device. The primary purpose of the TRM is to abstract the programming details of the device from the data manual. This allows the data manual to outline the high-level features of the device without unnecessary information about register descriptions or programming models.

Notational Conventions

This document uses the following conventions.

- Hexadecimal numbers may be shown with the suffix h or the prefix 0x. For example, the following number is 40 hexadecimal (decimal 64): 40h or 0x40
- Registers in this document are shown in figures and described in tables.
 - Each register figure shows a rectangle divided into fields that represent the fields of the register. Each field is labeled with its bit name, its beginning and ending bit numbers above, and its read/write properties with default reset value below. A legend explains the notation used for the properties.
 - Reserved bits in a register figure can have one of multiple meanings:
 - Not implemented on the device
 - Reserved for future device expansion
 - Reserved for TI testing
 - Reserved configurations of the device that are not supported
 - Writing non-default values to the Reserved bits could cause unexpected behavior and should be avoided.

Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

1.1 ARM® Cortex™-A8 Microprocessor Unit (MPU) Subsystem Overview

The ARM® Cortex™-A8 Subsystem is designed to allow the ARM Cortex-A8 master control of the device. In general, the ARM Cortex-A8 is responsible for configuration and control of the various subsystems, peripherals, and external memories.

The ARM Cortex-A8 Subsystem includes the following features:

- ARM Cortex-A8 RISC processor:
 - ARMv7 ISA plus Thumb2™, JazelleX™, and Media Extensions
 - Neon™ Floating-Point Unit
 - Enhanced Memory Management Unit (MMU)
 - Little Endian
 - 32K-Byte L1 Instruction Cache
 - 32K-Byte L1 Data Cache
 - 256K-Byte L2 Cache with ECC
- CoreSight Embedded Trace Module (ETM)
- ARM Cortex-A8 Interrupt Controller (AINTC)
- Embedded PLL Controller (PLL_ARM)
- Internal RAM
- Internal ROM

Figure 1-1 shows the ARM Cortex-A8 Subsystem for the device.

1.1.1 ARM Cortex-A8 RISC Processor

The ARM Cortex-A8 processor is a member of ARM Cortex family of general-purpose microprocessors. This processor is targeted at multi-tasking applications where full memory management, high performance, low die size, and low power are all important. The ARM Cortex-A8 processor supports the ARM debug architecture and includes logic to assist in both hardware and software debug. The ARM Cortex-A8 processor has a Harvard architecture and provides a complete high-performance subsystem, including:

- ARM Cortex-A8 Integer Core
- Superscalar ARMv7 Instruction Set
- Thumb-2 Instruction Set
- Jazelle RCT Acceleration
- CP14 Debug Coprocessor
- CP15 System Control Coprocessor
- NEON™ 64-/128-bit Hybrid SIMD Engine for Multimedia
- Enhanced VFPv3 Floating-Point Coprocessor

- Enhanced Memory Management Unit (MMU)
- Separate Level-1 Instruction and Data Caches
- Integrated Level-2 Cache
- 128-bit Interconnect with Level 3 Fast (L3) System Memories and Peripherals
- Embedded Trace Module (ETM).

1.1.2 Embedded Trace Module (ETM)

To support real-time trace, the ARM Cortex-A8 processor provides an interface to enable connection of an embedded trace module (ETM). The ETM consists of two parts:

- The Trace port which provides real-time trace capability for the ARM Cortex-A8.
- Triggering facilities that provide trigger resources, which include address and data comparators, counter, and sequencers.

The ARM Cortex-A8 trace port is not pinned out and is, instead, only connected to the system-level Embedded Trace Buffer (ETB). The ETB has a 32KB buffer memory. ETB enabled debug tools are required to read/interpret the captured trace data.

1.1.3 ARM Cortex-A8 Interrupt Controller (AINTC)

The ARM Cortex-A8 subsystem contains an interrupt controller (AINTC) that prioritizes all service requests from the system peripherals and generates either IRQ or FIQ to the ARM Cortex-A8 processor.

1.1.4 ARM Cortex-A8 PLL (PLL_ARM)

The ARM Cortex-A8 subsystem contains an embedded PLL Controller (PLL_ARM) for generating the subsystem's clocks from the device Clock input.

1.1.5 ARM MPU Interconnect

The ARM Cortex-A8 processor is connected through the arbiter to the L3 interconnect port. The L3 interconnect port is 128-bits wide and provides access to the other device modules.

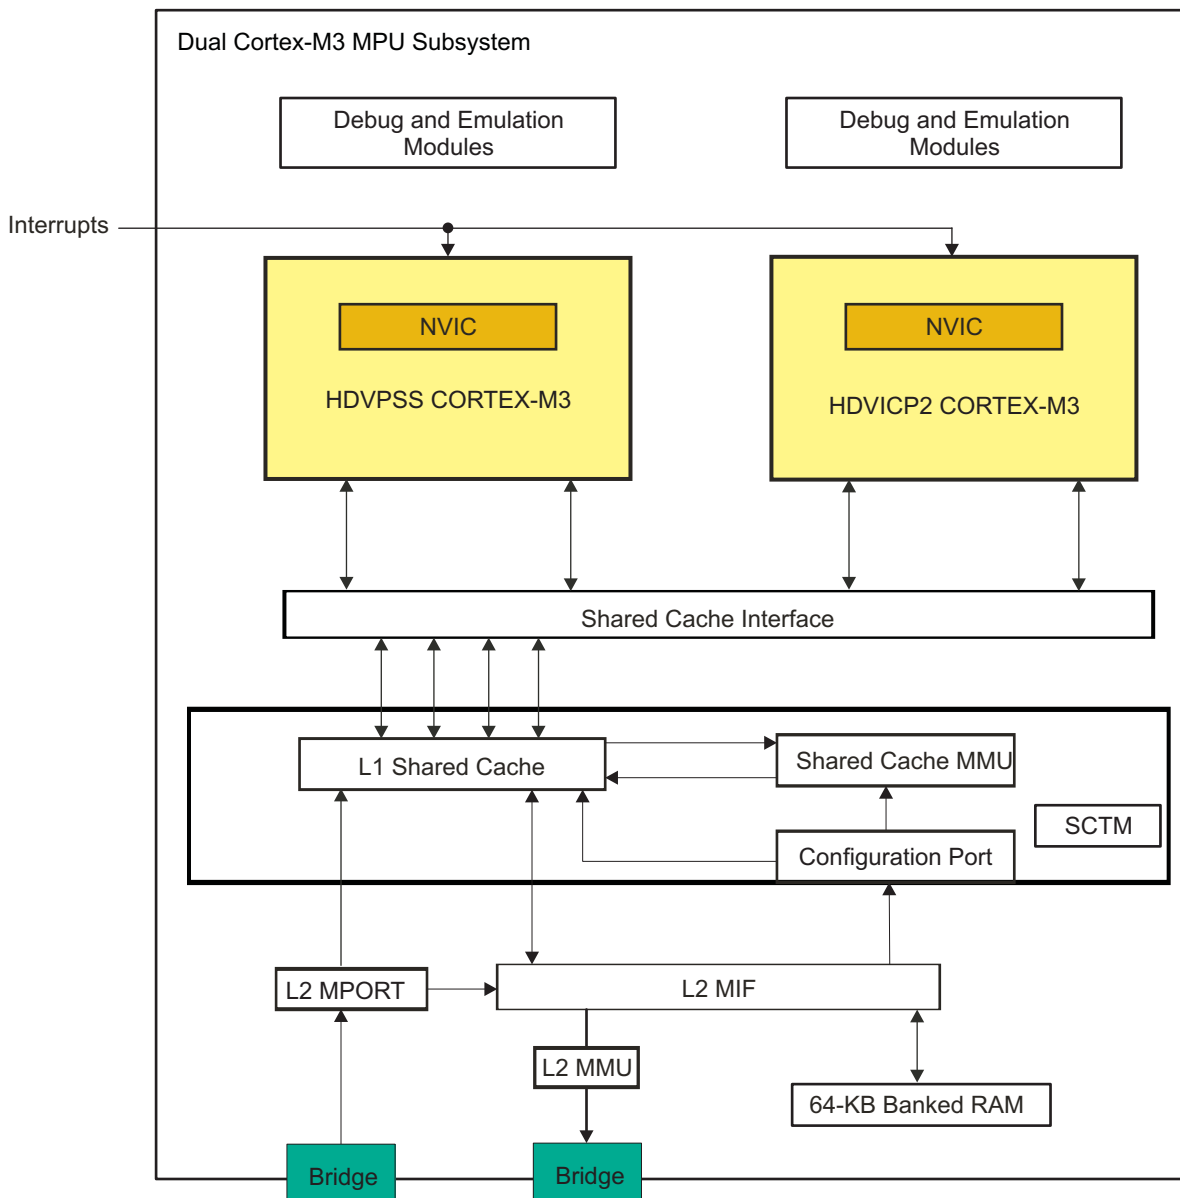

1.2 Media Controller Subsystem

1.2.1 Dual Cortex-M3 MPU Subsystem Overview

1.2.1.1 Introduction

The Dual Cortex™-M3 MPU subsystem controls and manages the HDVPSS and HDVICP2 subsystems. It contains two ARM® Cortex-M3 processors (CPUs) that share a common L1 cache - Shared cache. The two processors are referred to as HDVPSS Cortex-M3 and HDVICP2 Cortex-M3. The two cores are named for legacy reasons. In this device, the HDVPSS Cortex-M3 typically controls the HDVPSS IP. This device does not include the HDVICP2 IP, but the name is retained for the HDVICP2 Cortex-M3. [Figure 1-2](#) is a high-level block diagram of the dual Cortex-M3 MPU subsystem.

Figure 1-2. Dual Cortex-M3 MPU Subsystem Overview

1.2.1.2 Features

The dual Cortex-M3 MPU subsystem integrates the following:

- Two ARM Cortex-M3 microprocessor:
 - ARMv7-M and Thumb®-2 instruction set architecture
 - Hardware division and single-cycle multiplication computational acceleration
 - Integrated nested vector interrupt controller (NVIC)
 - Integrated bus matrix
 - Registers:
 - Thirteen general-purpose 32-bit registers
 - Link register (LR)
 - Program counter (PC)
 - Program status register, xPSR
 - Two banked SP registers
 - Integrated power management
 - Extensive debug capabilities
- Shared cache interface:
 - Instruction and data interface
 - Supports paralleled accesses
- L2 MIF (Master Interface) – splitter for access to memory or configuration port
- Configuration port - used for shared cache maintenance and shared cache MMU configuration
- Shared cache
 - 32KB divided into 16 banks
 - 4-way
 - Cache configuration – lock/freeze/preload
 - Internal MMU (memory management unit):
 - 16-entry region-based address translation
 - Read/write control and access type control
 - Execute Never (XN) MMU protection policy
 - Little-endian format
- SCTM - Counter Timer Module
- Banked RAM memory
- Emulation/debug: Emulation feature embedded in Cortex-M3
- L2 MMU: 32 entries with walking table logic
- Power management

1.2.2 Dual Cortex-M3 MPU Subsystem Integration

[Figure 1-3](#) shows the signals that interface with other modules.

Figure 1-3. Dual Cortex-M3 MPU Subsystem Integration Overview

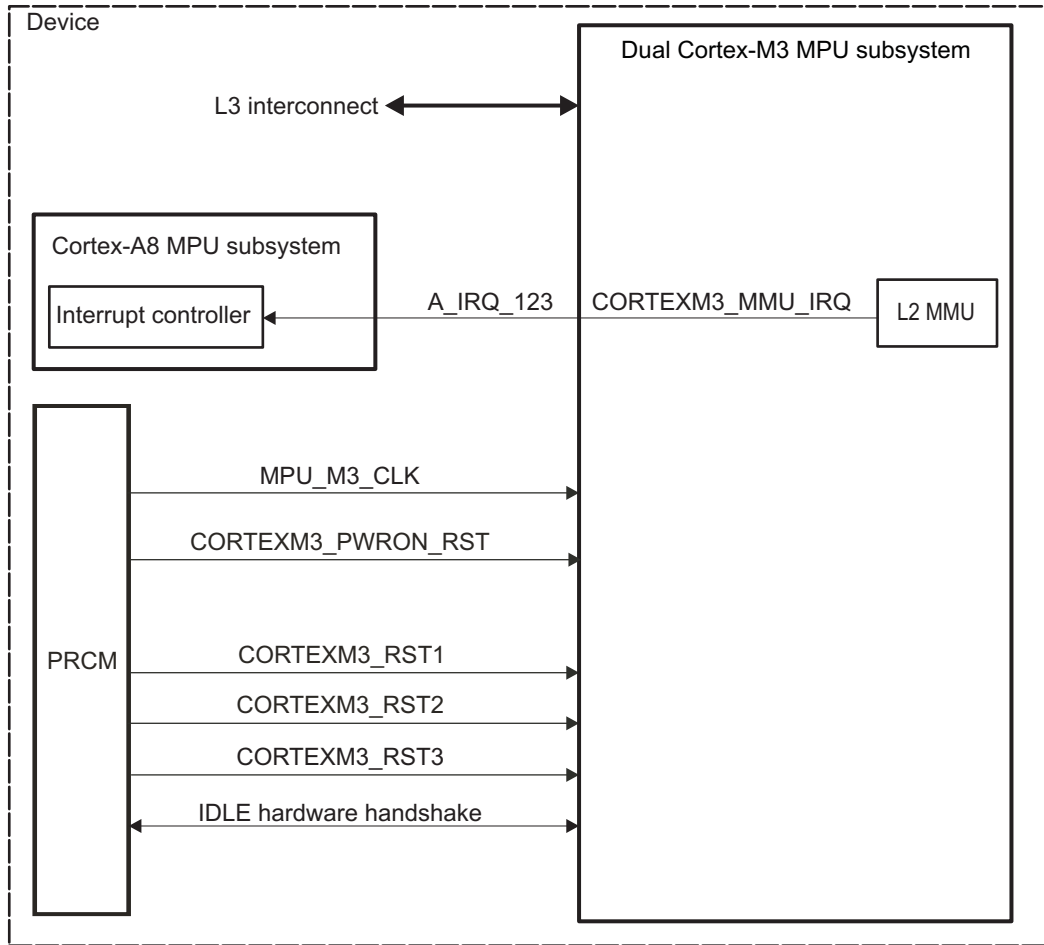

Table 1-1 and Table 1-4 summarize the integration of the module in the device.

Table 1-1. Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
CORTEXM3	PD_ALWAYS_ON	L3

Table 1-2. Hardware Requests

Interrupt Requests				
Module Instance	Source Signal Name	Destination Signal Name	Destination	Description
L2MMU	CORTEXM3_MMU_IRQ	A_IRQ_123	Cortex-A8 MPU INTC	L2 MMU Fault Interrupt

Table 1-3. Clocks

Module Instance	Source Signal Name	Destination Signal Name	Source	Description
CORTEXM3	MPU_M3_CLK	MPU_M3_CLK	PRCM module	Interface and Functional Clock

Table 1-4. Resets

Module Instance	Source Signal Name	Destination Signal Name	Source	Description
CORTEXM3	CORTEXM3_PWRON_RST	CORTEXM3_PWRON_RST	PRCM module	Power-on reset, used to reset the whole Media Controller Subsystem
	CORTEXM3_RST1	CORTEXM3_RST1	PRCM module	Reset signal to the HDVPSS
	CORTEXM3_RST2	CORTEXM3_RST2	PRCM module	Reset signal to the HDVICP2
	CORTEXM3_RST3	CORTEXM3_RST3	PRCM module	Reset signal to the shared cache and L2 MMU

1.2.2.1 Dual Cortex-M3 MPU Subsystem Clock and Reset Distribution

1.2.2.1.1 Clock Distribution

The dual Cortex-M3 subsystem receives only one clock, MPU_M3_CLK, which is divided in two for each ARM Cortex-M3 processor, RAM memory and the L2 MMU module. The shared cache and the L2 MIF are directly clocked by the MPU_M3_CLK, without any division.

Figure 1-4 shows the clocking scheme of the MPU subsystem.

Figure 1-4. Dual Cortex-M3 MPU Subsystem Clocking Scheme

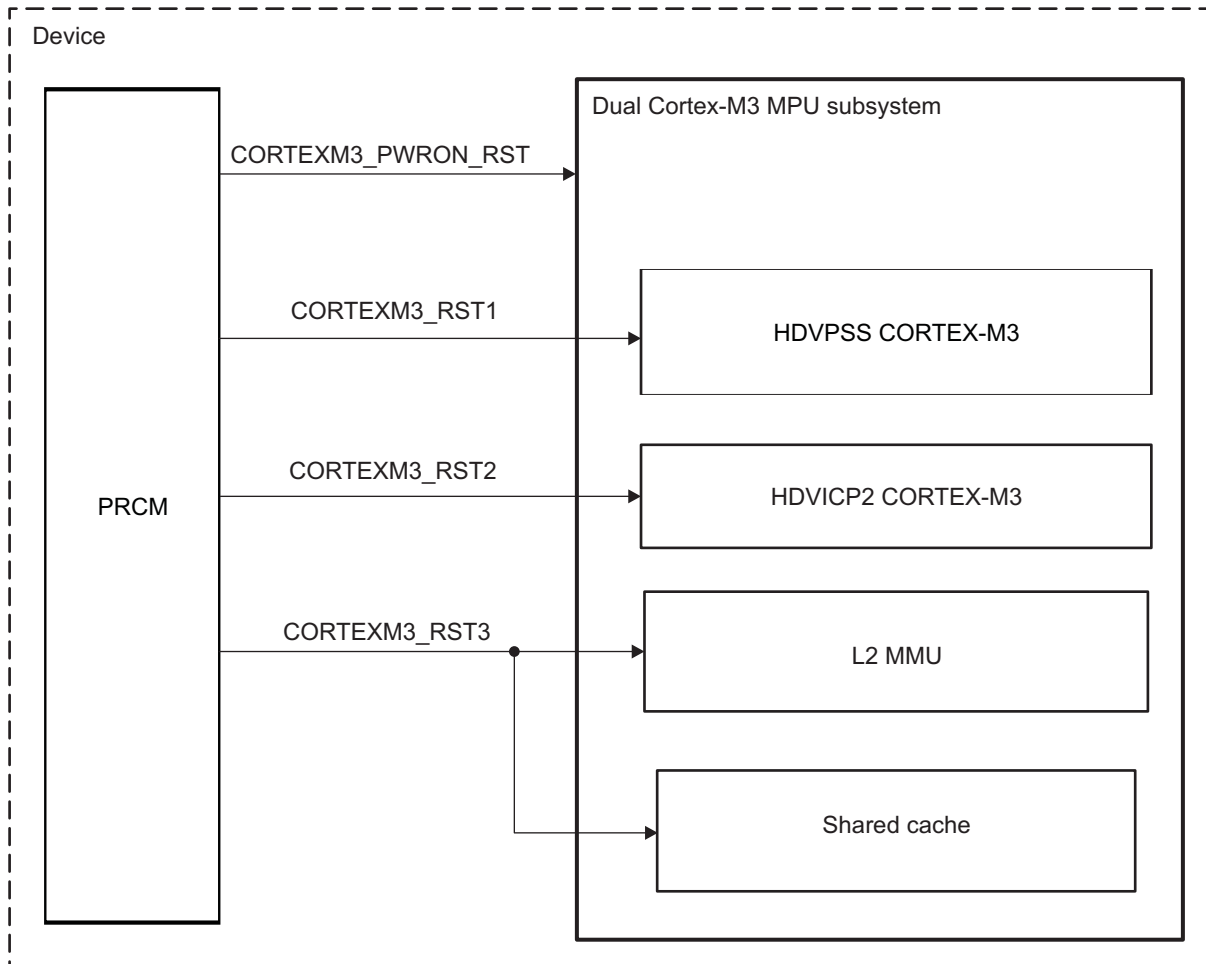

1.2.2.1.2 Reset Distribution

Three reset signals controlled by the power, reset, and clock management (PRCM) module let the two ARM Cortex-M3 processors and the rest of the dual Cortex-M3 MPU subsystem be reset independently. These three reset signals are: CORTEXM3_RST1, CORTEXM3_RST2, and CORTEXM3_RST3.

Figure 1-5 shows the reset scheme of the MPU subsystem.

Figure 1-5. Dual Cortex-M3 MPU Subsystem Reset Scheme

1.2.3 Dual Cortex-M3 MPU Subsystem Functional Description

1.2.3.1 Dual Cortex-M3 MPU Subsystem Block Diagram

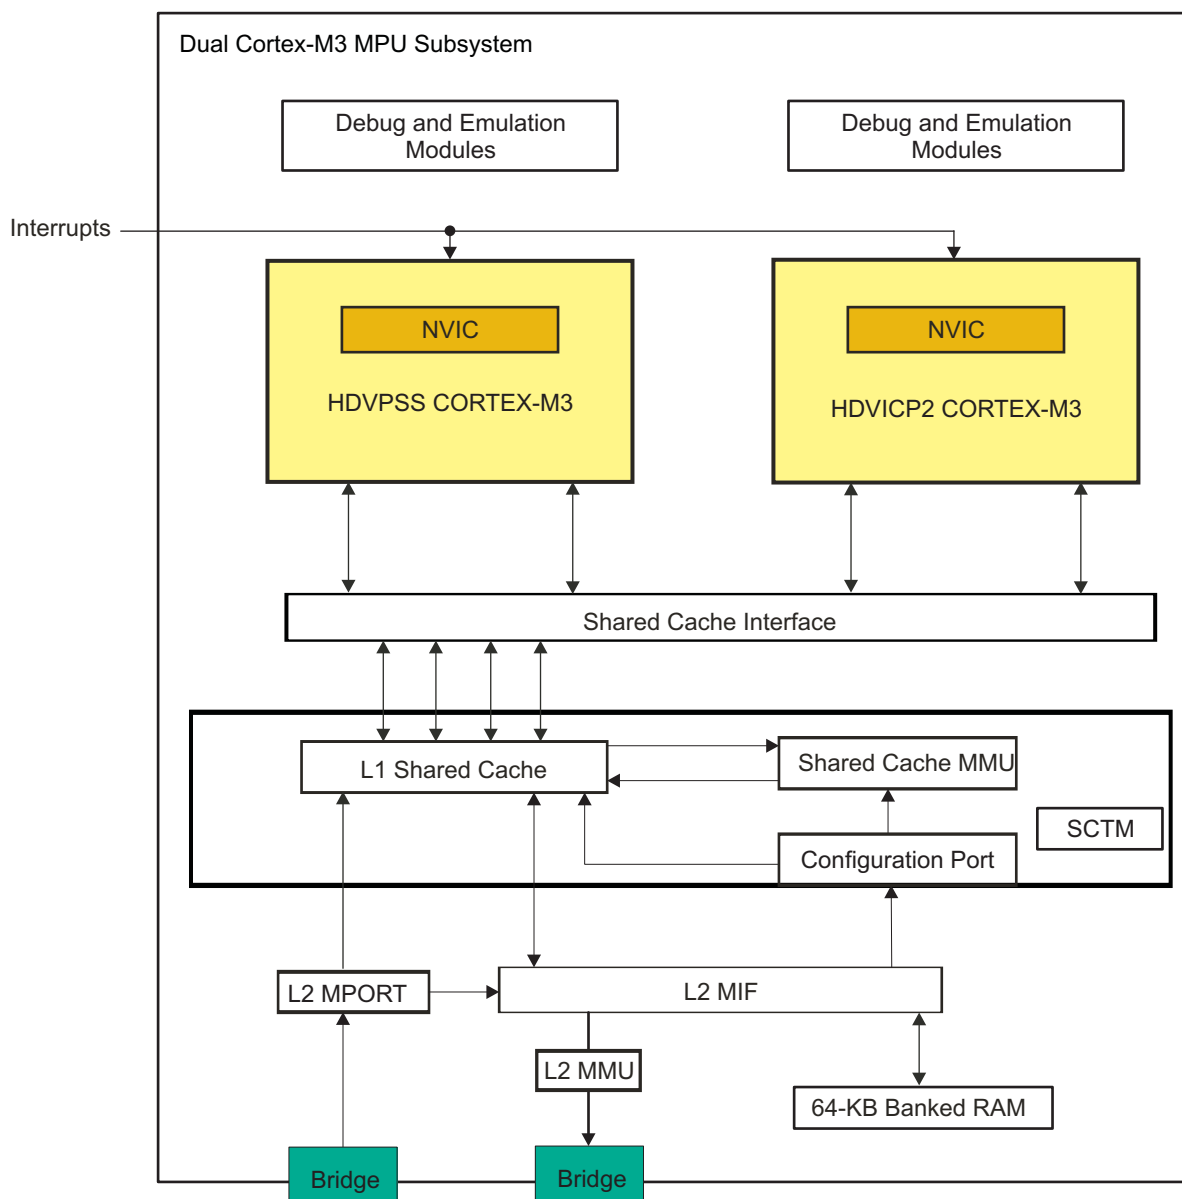

The dual Cortex-M3 MPU subsystem integrates the following group of submodules:

- Two ARM Cortex-M3 processors: Two cores, one core dedicated to HDVPSS and the other core dedicated to HDVICP2. For a description of the ARM Cortex-M3 processor, see the ARM Cortex-M3 Technical Reference Manual, available through your TI representative.
- Interrupt controller (NVIC): To facilitate parallel processing, the interrupt mapping is the same for the two cores. Each Cortex-M3 receives the same interrupts except for a few internal interrupts.
- Shared cache interface: The cache interface converts the data between the different protocols in the subsystem. Four ports are required to support the four buses from the ARM Cortex-M3 processors (two for each processor). The instruction and data connections from each ARM Cortex-M3 are multiplexed, but the ARM Cortex-M3 prevents conflicts on this connection. Default cache policies are provided through the sideband signals and are not used to access the cache. Cache ability is provided through the MMU inside the cache.
- Shared cache: Allows basic maintenance operations, which are performed through a dedicated interface: preload, lock, clean (write out dirty lines, but do not invalidate directly), and invalidate.
- Shared cache MMU: Provides the multi-access cache with region-based address translation, read/write control, access type control, and multilevel cache maintenance. Access to the shared cache MMU is done only under privilege mode. The shared cache MMU can be programmed by the Cortex-A8 MPU subsystem through the Cortex-M3 slave port.

- **SCTM:** Counter Timer Module, embedded in the Shared cache. Interconnect configuration port: Cache maintenance and MMU configuration are done through an interconnect slave port. Accesses must be performed to a noncacheable area that must be defined within the shared cache MMU. Interconnect accesses are generated from the L2 MIF.
- **L2 MMU:** Provides address translation for all the accesses done from the Cortex-M3 to the level 3 (L3) interconnect. The L2 MMU can be programmed by the Cortex-A8 MPU subsystem through the Cortex-M3 slave port.
- **L3 interconnect port:** Allows access to the system memories and peripherals. For the address mapping of the modules in the dual Cortex-M3 MPU subsystem, see the Memory Map section of the device data manual.
- **Banked RAM memory.** The address range of the on-chip banked RAM memory is from 0x5502 0000 to 0x5503 FFFF.

Figure 1-6 shows the block diagram of the dual Cortex-M3 MPU subsystem.

Figure 1-6. Dual Cortex-M3 MPU Subsystem

1.2.4 Shared Cache

Table 1-5 describes the shared cache configuration in the dual Cortex-M3 MPU subsystem platform.

Table 1-5. Shared Cache Configuration

Parameter	Value
Way	4
Size	32KB
Bank Elements	32b
Bank Number	16
Slave Interface Data Size	32b
Master Interface Data Size	64b
Line size	256b
MMU lookup	Included
Number of slaves	4
Number of masters	1
Number of fill/prefetch buffers	4 prefetch buffers
Slave Types	Shared cache interface

Shared cache allows basic maintenance operations, which are performed through a dedicated interface:

1. Preload
2. Lock
3. Clean
4. Invalidate

Maintenance of the cache is performed between the start and end addresses. This allows for direct control of memory regions. All maintenance operations occur in the background and can generate an interrupt when they complete. Such operations are protected by software semaphore, because only one operation at a time can be performed. The maintenance operations can also be performed using MMU small entries.

1.2.5 Shared Cache MMU

The MMU for the shared cache provides the multi-access cache with region-based address translation, read/write control, access type control, and multilevel cache maintenance. Table 1-6 describes the MMU configuration in the dual Cortex-M3 MPU subsystem.

Table 1-6. Shared Cache MMU Configuration

Parameter	Hardware Configurable
Number of large pages	4 entries
Size of large pages	32MB or 512MB
Number of medium pages	2 entries
Size of medium pages	128KB or 256KB
Number of small pages	10 entries
Size of small pages	4KB or 16KB
Number of patch pages	Not included
Size of line pages	256-bit
Number of comparison interfaces	4
Number of comparator sets	1
Write pipeline data comparison	Disabled
Number of unicache maintenance interfaces	3
Size of entry address	32-bit

1.2.6 L2 MMU

An additional MMU provides address translation for the accesses done from the dual Cortex-M3 MPU subsystem to the L3 interconnect. The main characteristics of this MMU are:

- 32 entries
- Compatible with ARMv6 architecture MMU translation tables (protection bits not used)
- Page-based or access-based endianness conversion
- 2-level descriptor hierarchy
- One intermediate page table
- Four page sizes (16MB, 1MB, 64KB, 4KB)
- Page table alignment on 128-byte boundary for ARM11™ compatibility

The configuration of the MMU can be done from one of the Cortex-M3 cores or from the L3 interconnect slave port. The accesses done to configure the MMU cannot be part of a burst access. When an MMU fault occurs, an interrupt is generated. This interrupt is connected to the Cortex-M3 cores, but it is generated outside of the dual Cortex-M3 MPU subsystem and is connected to the dual Cortex™-A8 MPU subsystem. When an MMU fault occurs, no other access can be done through the L2 MMU; the current faulty access is stalled, thereby stalling one or both Cortex-M3 cores. The dual Cortex-A8 MPU that received the MMU fault must clean up the fault to resume the execution of the code (or reset Cortex-M3).

1.2.7 Registers

Table 1-7. Registers

CACHE_MMU_MMUCONFIG	RW	MMU Configuration Register	0000 0CB8h

1.2.7.1 Configuration Registers (CACHE_CFG)

The Configuration Registers (CACHE_CFG) is described in docato-extra-info-title Configuration Registers (CACHE_CFG) Field Descriptions [Table 1-8](#) .

Table 1-8. Configuration Registers (CACHE_CFG) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:2	Reserved	Reserved	R	0
1	BYPASS	bypass cache 0x0: everything is non-cacheable 0x1: everything is cacheable	RW	0
0	Reserved	Reserved	R	0

1.2.7.2 Interrupt Register (CACHE_INT)

The Interrupt Register (CACHE_INT) is described in [Table 1-9](#).

Table 1-9. Interrupt Register (CACHE_INT) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:9	Reserved	Reserved	R	0
8:5	PORT	slave interface number that has recorded an error	RW W1toClr	0
4	READ	interface read response error	RW W1toClr	0
3	WRITE	interface write response error	RW W1toClr	0
2	MAINT	maintenance is completed	RW W1toClr	0
1	PAGEFAULT	AMMU page fault	RW W1toClr	0
0	CONFIG	configuration error	RW W1toClr	0

1.2.7.3 Interface Configuration Register (CACHE_OCP)

The Interface Configuration Register (CACHE_OCP) is described in [Table 1-10](#).

Table 1-10. Interface Configuration Register (CACHE_OCP) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:6	Reserved	Reserved	R	0
5	CLEANBUF	clean write and prefetch buffers in cache 0x0: do not clean 0x1: clean	RW	0
4	PREFETCH	always prefetch data 0x0: follow MMU policies 0x1: always prefetch	RW	0
3	CACHED	follow cacheable sideband signals 0x0: reads always not allocated, writes write through if cached 0x1: slave sideband signals determine policy	RW	1
2	WRALLOCATE	follow write allocate sideband signals 0x0: no writes are allocated independent to sideband 0x1: follow sideband	RW	0

Table 1-10. Interface Configuration Register (CACHE_OCP) Field Descriptions (continued)

Bits	Field Name	Description	Type	Reset
1	WRBUFFER	write throughs and write back no allocate are buffered	RW	0
		0x0: write throughs and write back no allocated are not buffered		
		0x1: write throughs and write back no allocated are buffered		
0	WRAP	OCF wrap mode (critical word first)	RW	0
		0x0: disabled		
		0x1: enabled		

1.2.7.4 Maintenance Configuration Register (CACHE_MAINT)

The Maintenance Configuration Register (CACHE_MAINT) is described in [Table 1-11](#).

Table 1-11. Maintenance Configuration Register (CACHE_MAINT) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:6	Reserved	Reserved	R	0
5	INTERRUPT	generate interrupt when maintenance operation is complete	RW	0
		0x0: do not generate interrupt		
		0x1: generate interrupt		
4	INVALIDATE	invalidate lines in region defined by maintenance start/end addresses	RW	0
		0x0: do nothing		
		0x1: invalidate		
3	CLEAN	evict dirty lines in region defined by maintenance start/end addresses	RW	0
		0x0: do nothing		
		0x1: clean		
2	UNLOCK	unlock region defined by maintenance start/end addresses	RW	0
		0x0: do nothing		
		0x1: unlock		
1	LOCK	lock region defined by maintenance start/end addresses	RW	0
		0x0: do nothing		
		0x1: lock		
0	PRELOAD	preload region defined by maintenance start/end addresses	RW	0
		0x0: do nothing		
		0x1: preload		

1.2.7.5 Maintenance Start Configuration Register (CACHE_MTSTART)

The Maintenance Start Configuration Register (CACHE_MTSTART) is described in [Table 1-12](#).

Table 1-12. Maintenance Start Configuration Register (CACHE_MTSTART) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:0	START_ADDR	start address of maintenance operations, reset to 0 when finished	RW	0

1.2.7.6 Maintenance End Configuration Register (CACHE_MTEND)

The Maintenance End Configuration Register (CACHE_MTEND) is described in [Table 1-13](#).

Table 1-13. Maintenance End Configuration Register (CACHE_MTEND) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:0	END_ADDR	end address of maintenance operations, reset to 0 when finished	RW	0

1.2.7.7 Cache Test Address Register (CACHE_CTADDR)

The Cache Test Address Register (CACHE_CTADDR) is described in [Table 1-14](#).

Table 1-14. Cache Test Address Register (CACHE_CTADDR) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:0	ADDRESS	address of cache visibility when read CTDATA register, autoincrements	RW	0

1.2.7.8 Cache Test Data Register (CACHE_CTDATA)

The Cache Test Data Register (CACHE_CTDATA) is described in [Table 1-15](#).

Table 1-15. Cache Test Data Register (CACHE_CTDATA) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:0	DATA	cache data at address of CTADDR register, CTADDR autoincrements each time CTDATA is read	RW	0

1.2.7.9 Counter Timer Control Register (CACHE_SCTM_CTCNTL)

The Counter Timer Control Register (CACHE_SCTM_CTCNTL) is described in [Table 1-16](#).

Table 1-16. Counter Timer Control Register (CACHE_SCTM_CTCNTL) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:26	NUMSTM	Number of timers that can export via STM	R	0
25:18	NUMINPT	Number of event input signals	R	1Fh
17:13	NUMTIMR	Number of timers in the module	R	2
12:7	NUMCNTR	Number of counters in the module	R	8
6:3	REVISION	Revision ID of SCTM	R	TI internal data
2:1	IDLEMODE	Idle mode control	RW	2
		0x0: Force Idle mode		
		0x1: The SCTM will acknowledge the idle request, but never transition to the idle state		
		0x2: The SCTM uses the smart idle protocol. This is the default mode		
0	ENBL	SCTM global enable	RW	0
		0x0: This mode is disable. Only the configuration interface is functional. All other logic is reset		
		0x1: The module is enabled and individual counter/timers can be configured		

1.2.7.10 Counter Timer STM Control Register (CACHE_SCTM_CTSTMCNTL)

The Counter Timer STM Control Register (CACHE_SCTM_CTSTMCNTL) is described in [Table 1-17](#).

Table 1-17. Counter Timer STM Control Register (CACHE_SCTM_CTSTMCNTL) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:11	Reserved	Reserved	R	0
10	XPORTACT	Indicates if a frame is currently being written to the STM	R	0
9:5	NUMXPORT	The total number of counters designated for export. This will be used as the count in the CSM and CCM headers. The value written should be the total number of counters designated for export -1	RW	0
4	CCMXPORT	SW control of CCM message export	RW	0
3	CCMVAIL	SCTM supports CCM export	R	0
2	CSMXPORT	SW control of CSM message export	RW	0
1	SENDOVR	Send overflow data in CSM frame	RW	1
0	ENBL	STM global enable	RW	0
		Read 0x0: The STM function of the SCTM is disabled		
		Read 0x1: The STM function of the SCTM is enabled		

1.2.7.11 Counter Timer STM Master ID Register (CACHE_SCTM_CTSTMMSTID)

The Counter Timer STM Master ID Register (CACHE_SCTM_CTSTMMSTID) is described in [Table 1-18](#).

Table 1-18. Counter Timer STM Master ID Register (CACHE_SCTM_CTSTMMSTID) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:7	Reserved	Reserved	R	0
6:0	MASTID	HW Master ID for this module.	RW	0

1.2.7.12 Counter Timer STM Interval Register (CACHE_SCTM_CTSTMINTVL)

The Counter Timer STM Interval Register (CACHE_SCTM_CTSTMINTVL) is described in [Table 1-19](#).

Table 1-19. Counter Timer STM Interval Register (CACHE_SCTM_CTSTMINTVL) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:16	Reserved	Reserved	R	0
15:0	INTERVAL	Periodic export interval	RW	0

1.2.7.13 Counter Timer STM Count Select Register 0 (CACHE_SCTM_CTSTMSEL0)

The Counter Timer STM Count Select Register 0(CACHE_SCTM_CTSTMSEL0) is described in [Table 1-20](#).

Table 1-20. Counter Timer STM Count Select Register 0(CACHE_SCTM_CTSTMSEL0) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:0	COUNTSEL	The counter selection bit-field	RW	0

1.2.7.14 Counter Timer Interval Number Debug Event Register (CACHE_SCTM_TINTVL_R_i)

The Counter Timer Interval Number Debug Event Register (CACHE_SCTM_TINTVL_R_i) is described in [Table 1-21](#).

Table 1-21. Counter Timer Interval Number Debug Event Register (CACHE_SCTM_TINTVL_R_i) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:0	INTERVAL	Interval match value for the timers in the SCTM	RW	0

1.2.7.15 Counter Timer Number Debug Event Register (CACHE_SCTM_CTDBGNUM)

The Counter Timer Number Debug Event Register (CACHE_SCTM_CTDBGNUM) is described in [Table 1-22](#).

Table 1-22. Counter Timer Number Debug Event Register (CACHE_SCTM_CTDBGNUM) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:3	Reserved	Reserved	R	0
2:0	NUMEVT	Number of input selectors for debug events	R	0

1.2.7.16 Counter Timer Global Enable Register 0 (CACHE_SCTM_CTGNBL0)

The Counter Timer Global Enable Register 0 (CACHE_SCTM_CTGNBL0) is described in [Table 1-23](#).

Table 1-23. Counter Timer Global Enable Register 0(CACHE_SCTM_CTGNBL0) Field Description

Bits	Field Name	Description	Type	Reset
31:8	Reserved	Reserved	R	0
7:0	ENABLE	The counter enable bit-field	RW	0

1.2.7.17 Counter Timer Global Reset Register 0 (CACHE_SCTM_CTGRST0)

The Counter Timer Global Reset Register 0 (CACHE_SCTM_CTGRST0) is described in [Table 1-24](#).

Table 1-24. Counter Timer Global Reset Register 0(CACHE_SCTM_CTGRST0) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:8	Reserved	Reserved	R	0
7:0	RESET	The counter reset bit-field	RW	0

1.2.7.18 Counter Timer Control Register 0-31 (CACHE_SCTM_CTCRWT_i)

The Counter Timer Control Register 0-31 (CACHE_SCTM_CTCRWT_i) is described in [Table 1-25](#).

Table 1-25. Counter Timer Control Register 0-31(CACHE_SCTM_CTCRWT_i) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:21	Reserved	Reserved	R	0
20:16	INPSEL	Counter Timer input selection	RW	0
15:11	Reserved	Reserved	R	0
10	RESTART	Restart the timer after an interval match	RW	0
9	DBG	Signal debug logic on interval match	RW	0
8	INT	Generate interrupt on interval match	RW	0
7	Reserved	Reserved	R	0
6	OVRFLW	Counter has wrapped since it was last read	R	0
5	IDLE	Counter ignores processor IDLE state	RW	0
4	FREE	Counter ignores processor debug halt state	RW	0
3	DURMODE	Counter is in duration or occurrence mode	RW	0
2	CHAIN	Counter is chained to an adjacent counter	RW	0
1	RESET	Counter reset control	RW	0
0	ENBL	Counter enable control	RW	0

1.2.7.19 Counter Timer Count Register 0-31 (CACHE_SCTM_CTCNTR_k)

The Counter Timer Count Register 0-31 (CACHE_SCTM_CTCNTR_k) is described in [Table 1-26](#).

Table 1-26. Counter Timer Count Register 0-31(CACHE_SCTM_CTCNTR_k) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:0	COUNT	Counter value	R	0

1.2.7.20 Large Page Address (CACHE_MMU_LARGE_ADDR_I)

The Large Page Address (CACHE_MMU_LARGE_ADDR_I) is described in [Table 1-27](#).

Table 1-27. Large Page Address (CACHE_MMU_LARGE_ADDR_I) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:28	ADDRESS	logical source address	RW	0
27:0	Reserved	Reserved	R	0

1.2.7.21 Large Page Translated Address (CACHE_MMU_LARGE_XLTE_I)

The Large Page Translated Address (CACHE_MMU_LARGE_XLTE_I) is described in [Table 1-28](#).

Table 1-28. Large Page Translated Address (CACHE_MMU_LARGE_XLTE_I) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:28	ADDRESS	logical Destination address or translated address	RW	0
27:0	Reserved	Reserved	R	0

1.2.7.22 Large Page Policy (CACHE_MMU_LARGE_POLY_I)

The Large Page Policy (CACHE_MMU_LARGE_POLY_I) is described in [Table 1-29](#).

Table 1-29. Large Page Policy (CACHE_MMU_LARGE_POLY_I) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:24	Reserved	Reserved	R	0
23	L2_WR_POLICY	L2 write policy	RW	0
		0x0: write through		
		0x1: write back		
22	L2_ALLOCATE	L2 allocate policy	RW	0
		0x0: no writes are allocated		
		0x1: follow sideband		
21	L2_POSTED	L2 posted policy	RW	0
		0x0: not posted		
		0x1: posted		
20	L2_CACHEABLE	L2 cache policy	RW	0
		0x0: non-cacheable		
		0x1: cacheable		
19	L1_WR_POLICY	L1 write policy	RW	0
		0x0: write through		
		0x1: write back		
18	L1_ALLOCATE	L1 allocate policy	RW	0
		0x0: no writes are allocated		
		0x1: follow sideband		
17	L1_POSTED	L1 posted policy	RW	0
		0x0: not posted		
		0x1: posted		
16	L1_CACHEABLE	L1 cache policy	RW	0
		0x0: non-cacheable		
		0x1: cacheable		
15:8	Reserved	Reserved	R	0
7	EXCLUSION	cache exclusion	RW	0
		0x0: do not send exclusion sideband		
		0x1: send exclusion sideband		

Table 1-29. Large Page Policy (CACHE_MMU_LARGE_POLY_I) Field Descriptions (continued)

Bits	Field Name	Description	Type	Reset
6	PRELOAD	preload region	RW	0
		0x0: do not preload		
		0x1: preload		
5	READ	read only	RW	0
4	EXECUTE	execute only	RW	0
3	VOLATILE	volatile qualifier,	RW	0
		0x0: do not follow volatile qualifier		
		0x1: follow volatile qualifier		
2	RESERVED	RESERVED	R	0
1	SIZE	size of page	RW	0
		0: 32 MB		
		1: 512 MB		
0	ENABLE	enable page	RW	0
		0x0: page not enabled		
		0x1: page enabled		

1.2.7.23 Medium Page Address (CACHE_MMU_MED_ADDR_m)

The Medium Page Address (CACHE_MMU_MED_ADDR_m) is described in [Table 1-30](#).

Table 1-30. Medium Page Address (CACHE_MMU_MED_ADDR_m) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:17	ADDRESS	Logical source address	RW	0
16:0	Reserved	Reserved	R	0

1.2.7.24 Medium Page Translated Address (CACHE_MMU_MED_XLTE_m)

The Medium Page Translated Address (CACHE_MMU_MED_XLTE_m) is described in [Table 1-31](#).

Table 1-31. Medium Page Translated Address (CACHE_MMU_MED_XLTE_m) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:17	ADDRESS	Logical Destination address	RW	0
16:0	Reserved	Reserved	R	0

1.2.7.25 Medium Page Policy (CACHE_MMU_MED_POLY_m)

The Medium Page Policy (CACHE_MMU_MED_POLY_m) is described in [Table 1-32](#).

Table 1-32. Medium Page Policy (CACHE_MMU_MED_POLY_m) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:24	Reserved	Reserved	R	0
23	L2_WR_POLICY	L2 write policy	RW	0
		0x0: write through		
		0x1: write back

		1: 256 KB		
0	ENABLE	enable page	RW	0
		0x0: page not enabled		
		0x1: page enabled		

1.2.7.29 Small Page Maintenance Configuration (CACHE_MMU_SMALL_MAINT_n)

The Small Page Maintenance Configuration (CACHE_MMU_SMALL_MAINT_n) is described in [Table 1-36](#).

Table 1-36. Small Page Maintenance Configuration (CACHE_MMU_SMALL_MAINT_n) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:5	Reserved	Reserved	R	0
4	INTERRUPT	generate interrupt when maintenance operation is complete	RW	0
3	INVALIDATE	invalidate page	RW	0
2	CLEAN	evict page	RW	0
1	LOCK	lock page	RW	0
0	PRELOAD	preload page	RW	0

1.2.7.30 MMU Start/End Maintenance Config Register (CACHE_MMU_MAINT)

The MMU Start/End Maintenance Config Register (CACHE_MMU_MAINT) is described in [Table 1-37](#).

Table 1-37. MMU Start/End Maintenance Config Register (CACHE_MMU_MAINT) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:11	Reserved	Reserved	R	0
10	G_FLUSH	Global flush bit	RW	0
		0x0: do nothing, global flush done		
		0x1: invalidate L1+L2		

Table 1-37. MMU Start/End Maintenance Config Register (CACHE_MMU_MAINT) Field Descriptions (continued)

Bits	Field Name	Description	Type	Reset
9	L2_CACHE	do maintenance operation in L2 Cache.	RW	0
		Note: Hardware ensures that the maintenance operations are done in L1 first and then in L2		
		0x0: do nothing		
		0x1: perform maintenance operation selected by the maintenance bits		
8	L1_CACHE2	do maintenance operation in L1 Cache 2	RW	0
		0x0: do nothing		
		0x1: perform maintenance operation selected by the maintenance bits		
7	L1_CACHE1	do maintenance operation in L1 Cache1	RW	0
		0x0: do not perform maintenance operation		
		0x1: perform maintenance operation selected by the maintenance bits		
6	CPU_INTERRUPT	generate interrupt to cpu when maintenance operation initiated by CPU is complete	RW	0
		0x0: do not generate interrupt		
		0x1: generate interrupt		
5	HOST_INTERRUPT	generate interrupt when maintenance operation is complete	RW	0
		0x0: do not generate interrupt		
		0x1: generate interrupt		
4	INVALIDATE	invalidate lines in region defined by maintenance start/end addresses	RW	0
		0x0: do nothing		
		0x1: invalidate		
3	CLEAN	evict dirty lines in region defined by maintenance start/end addresses	RW	0
		0x0: do nothing		
		0x1: clean		
2	UNLOCK	unlock region defined by maintenance start/end addresses	RW	0
		0x0: do nothing		
		0x1: unlock		
1	LOCK	lock region defined by maintenance start/end addresses	RW	0
		0x0: do nothing		
		0x1: lock		
0	PRELOAD	preload region defined by maintenance start/end addresses	RW	0
		0x0: do nothing		
		0x1: preload		

1.2.7.31 Maintenance Start Address Register (CACHE_MMU_MTSTART)

The Maintenance Start Address Register (CACHE_MMU_MTSTART) is described in [Table 1-38](#).

Table 1-38. Maintenance Start Address Register (CACHE_MMU_MTSTART) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:0	BEGIN_ADDRESS	Start address of maintenance operations, resets to 0 when finished	RW	0

1.2.7.32 Maintenance End Address Register (CACHE_MMU_MTEND)

The Maintenance End Address Register (CACHE_MMU_MTEND) is described in [Table 1-39](#).

Table 1-39. Maintenance End Address Register (CACHE_MMU_MTEND) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:0	END_ADDRESS	End address of maintenance operations, resets to 0 when finished	RW	0

1.2.7.33 Maintenance Status Register (CACHE_MMU_MAINTST)

The Maintenance Status Register (CACHE_MMU_MAINTST) is described in [Table 1-40](#).

Table 1-40. Maintenance Status Register (CACHE_MMU_MAINTST) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:1	Reserved	Reserved	R	0
0	STATUS	status bit	R	0
		Read 0x0: do nothing, maintenance completed		
		Read 0x1: maintenance ongoing		

1.2.7.34 MMU Configuration Register (CACHE_MMU_MMUCONFIG)

The MMU Configuration Register (CACHE_MMU_MMUCONFIG) is described in [Table 1-41](#).

Table 1-41. MMU Configuration Register (CACHE_MMU_MMUCONFIG) Field Descriptions

Bits	Field Name	Description	Type	Reset
31:2	Reserved	Reserved	R	0
1	PRIVILEGE	Privilege bit. once this bit is set, only global flush, debugger, or hardware reset can clear	RW	0
		0x0: CPU can access everything		
		0x1: CPU can only access maintenance, and DMA can not access MMU at all		
0	Reserved	Reserved	R	0

1.3 C674x DSP

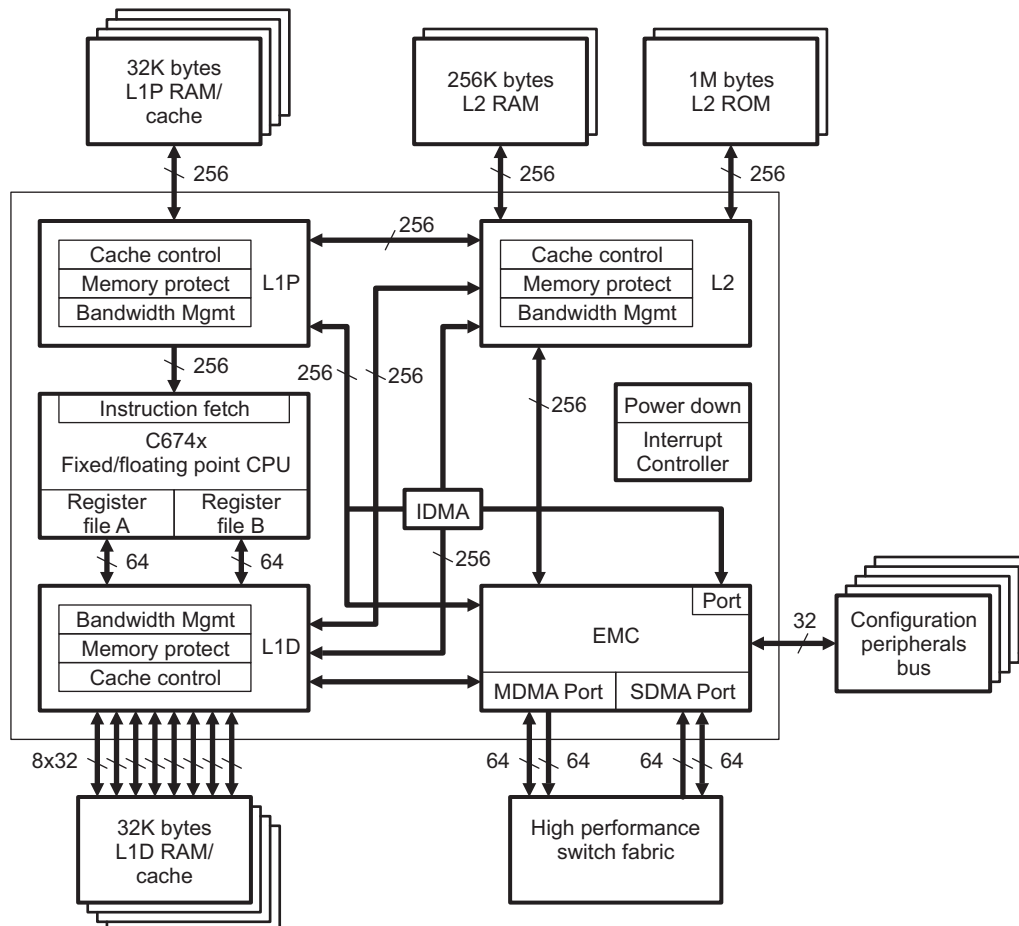

1.3.1 Introduction

The DSP subsystem (Figure 1-7) includes TI's standard TMS320C674x megamodule and several blocks of internal memory (L1P, L1D, and L2). This chapter provides an overview of the DSP subsystem and the following considerations associated with it:

- Memory mapping
- Interrupts
- Power management

For more information on the TMS320C674x megamodule, see the *TMS320C674x DSP Megamodule Reference Guide* (SPRUFK5), the *TMS320C674x DSP CPU and Instruction Set Reference Guide* (SPRUF8), and the *TMS320C674x DSP Cache User's Guide* (SPRUG82).

Figure 1-7. TMS320C674x Megamodule Block Diagram

1.3.2 TMS320C674x Megamodule

The C674x megamodule (Figure 1-7) consists of the following components:

- TMS320C674x CPU
- Internal memory controllers:
 - Level 1 program memory controller (PMC)
 - Level 1 data memory controller (DMC)
 - Level 2 unified memory controller (UMC)
 - Extended memory controller (EMC)
 - Internal direct memory access (IDMA) controller
- Internal peripherals:
 - Interrupt controller (INTC)
 - Power-down controller (PDC)
 - Bandwidth manager (BWM)
- Advanced event triggering (AET)

For more information about each of these controllers, see the *TMS320C674x DSP Megamodule Reference Guide* ([SPRUFK5](#)).

1.3.2.1 Internal Memory Controllers

The C674x megamodule implements a two-level internal cache-based memory architecture with external memory support. Level 1 memory (L1) is split into separate program memory (L1P memory) and data memory (L1D memory). L1 memory is accessible to the CPU without stalls. Level 2 memory (L2) can also be split into L2 RAM (normal addressable on-chip memory) and L2 cache for caching external memory locations. The internal direct memory access controller (IDMA) manages DMA among the L1P, L1D, and L2 memories.

1.3.2.2 Internal Peripherals

The C674x megamodule includes the following internal peripherals:

- DSP interrupt controller (INTC)
- DSP power-down controller (PDC)
- Bandwidth manager (BWM)
- Internal DMA (IDMA) controller

This section briefly describes the INTC, PDC, BWM, and IDMA controller. For more information on these internal peripherals, see the *TMS320C674x DSP Megamodule Reference Guide* ([SPRUFK5](#)).

1.3.2.2.1 Interrupt Controller (INTC)

The C674x megamodule includes an interrupt controller (INTC) to manage CPU interrupts. The INTC maps DSP device events to 12 CPU interrupts. All DSP device events are listed in [Section 1.6.3](#). The INTC is fully described in the *TMS320C674x DSP Megamodule Reference Guide* ([SPRUFK5](#)).

1.3.2.2.1.1 Interrupt Controller Registers

For more information on the DSP interrupt controller (INTC) registers, see the *TMS320C674x DSP Megamodule Reference Guide* ([SPRUFK5](#)).

1.3.2.2.2 Power-Down Controller (PDC)

The C674x megamodule includes a power-down controller (PDC). The PDC can power-down all of the following components of the C674x megamodule and internal memories of the DSP subsystem:

- C674x CPU
- Level 1 program memory controller (PMC)
- Level 1 data memory controller (DMC)
- Level 2 unified memory controller (UMC)
- Extended memory controller (EMC)
- Internal direct memory access (IDMA) controller
- L1P memory
- L1D memory
- L2 memory

This device supports the static power-down feature from the C674x megamodule. The *TMS320C674x DSP Megamodule Reference Guide* ([SPRUFK5](#)) describes the power-down control in more detail.

- Static power-down: The PDC initiates power-down (clock gating) of the entire C674x megamodule and all internal memories immediately upon command from software.

Static power-down (clock gating) affects all components of the C674x megamodule and all internal memories. Software can initiate static power-down by way of a register bit in the power-down controller command register (PDCCMD) of the PDC. For more information on the PDC, see the *TMS320C674x DSP Megamodule Reference Guide* ([SPRUFK5](#)).

1.3.2.2.3 Bandwidth Manager (BWM)

The bandwidth manager (BWM) provides a programmable interface for optimizing bandwidth among the requesters for resources, which include the following:

- EDMA3-initiated DMA transfers (and resulting coherency operations)
- DSP subsystem IDMA-initiated transfers (and resulting coherency operations)
- Programmable cache coherency operations
 - Block based coherency operations
 - Global coherency operations
- CPU direct-initiated transfers
 - Data access (load/store)
 - Program access

The resources include the following:

- L1P memory
- L1D memory
- L2 memory
- Resources outside of the C674x megamodule: external memory, on-chip peripherals, registers

Since any given requestor could potentially block a resource for extended periods of time, the bandwidth manager is implemented to assure fairness for all requesters.

The bandwidth manager implements a weighted-priority-driven bandwidth allocation. Each requestor (EDMA3, DSP subsystem IDMA, CPU, etc.) is assigned a priority level on a per-transfer basis. The programmable priority level has a single meaning throughout the system. There are a total of nine priority levels, where priority zero is the highest priority and priority eight is the lowest priority. When requests for a single resource contend, access is granted to the highest-priority requestor. When the contention occurs for multiple successive cycles, a contention counter assures that the lower-priority requestor gets access to the resource every 1 out of n arbitration cycles, where n is programmable. A priority level of -1 represents a transfer whose priority has been increased due to expiration of the contention counter or a transfer that is fixed as the highest-priority transfer to a given resource.

1.3.2.2.4 Internal DMA (IDMA) Controller

The IDMA controller performs fast block transfers between any two memory locations local to the C674x megamodule. Local memory locations are defined as those in Level 1 program (L1P), Level 1 data (L1D), and Level 2 (L2) memories, or in the external peripheral configuration (CFG) port. The IDMA cannot transfer data to or from the internal DSP memory-mapped register space. The IDMA is fully described in the *TMS320C674x DSP Megamodule Reference Guide* ([SPRUFK5](#)).

1.3.3 Memory Map

Refer to your device-specific data manual for the addresses of the memory-map registers.

1.3.3.1 DSP Internal Memory

See the *System Memory* chapter for a description of the DSP internal memory.

1.3.3.2 External Memory

See the *System Interconnect* chapter and the *System Memory* chapter for a description of the additional memory and peripherals that the DSP has access to.

1.3.4 Advanced Event Triggering (AET)

The C674x megamodule supports advanced event triggering (AET). This capability can be used to debug complex problems as well as understand performance characteristics of user applications. AET provides the following capabilities:

- Hardware Program Breakpoints: specify addresses or address ranges that can generate events such as halting the processor or triggering the trace capture.
- Data Watchpoints: specify data variable addresses, address ranges, or data values that can generate events such as halting the processor or triggering the trace capture.
- Counters: count the occurrence of an event or cycles for performance monitoring.
- State Sequencing: allows combinations of hardware program breakpoints and data watchpoints to precisely generate events for complex sequences.

1.4 System MMU

1.4.1 MMU Overview

A memory management unit (MMU) is a hardware component responsible for handling accesses to memory requested by a processing unit, DMA controller, or other bus requestor. MMU functions include translation of virtual addresses to physical addresses (that is, virtual memory management).

The device contains the following MMUs:

- System MMU for: C674x™ (via its MDMA Port), EDMA Transfer Controller 0 (TPTC0), and EDMA Transfer Controller 1 (TPTC1).
- L1 Shared cache MMU and L2 MMU in Media Controller Subsystem
- ARM® Cortex™-A8 MMU
- SGX530™ MMU

This user guide provides a detailed description of System MMU and L2 MMU present in the Media Controller Subsystem. For more details on Cortex A8 MMU, see the ARM® Cortex™-A8 Core Technical Reference Manual (contact your TI representative). For more details on the L1 Shared cache MMU present in the Media Controller subsystem, please refer to the *Media Controller Subsystem* section.

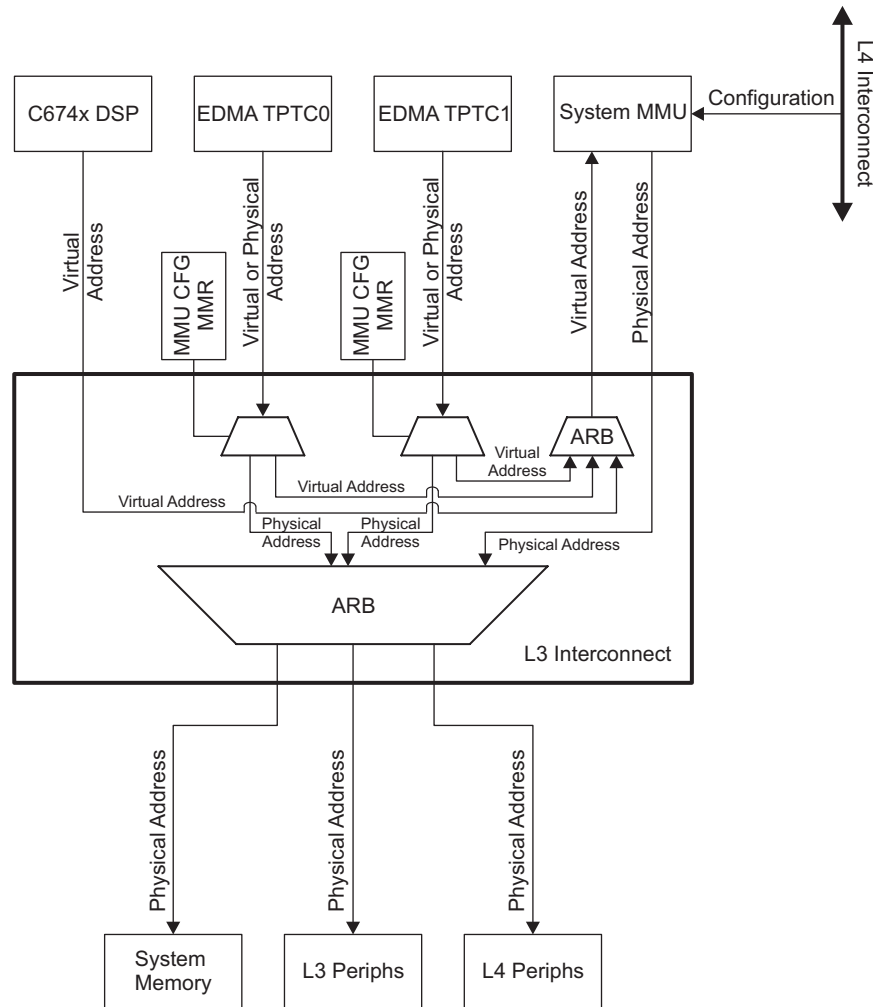

1.4.2 MMU Integration

The MMU communicates accesses from the requestor (e.g., C674x MDMA bus requests) to the L3 main interconnect, performing virtual to physical address translation. The MMU will assert an interrupt when a translation fault occurs; or for other error conditions. For MMU interrupt details, refer to the device datasheet.

[Figure 1-8](#) shows the System MMU integration. Requests initiated by the EDMA Transfer Controllers 0 and 1 (TPTC0, and TPTC1) can optionally be routed through the System MMU. These requestors' use (or not) of the MMU is independently controllable via the Control Module MMU_CFG register bitfields (TC0MMU and TC1MMU, respectively). The C674x DSP MDMA port accesses will always be routed through the MMU so no configuration bit is instantiated in the MMU_CFG register for C674x DSP. It is recommended that this register is set during system initialization and remain static.

If the MMU loopback path is enabled for a given requestor, requests will be routed via the L3 interconnect to the MMU and will again go through the L3 interconnect to the requested physical address. If the MMU loopback path is disabled for a given requestor, those bus requests go directly through the L3 interconnect to the requested physical address, thus minimizing bus request latency as illustrated in [Figure 1-8](#).

Figure 1-8. MMU Intergration

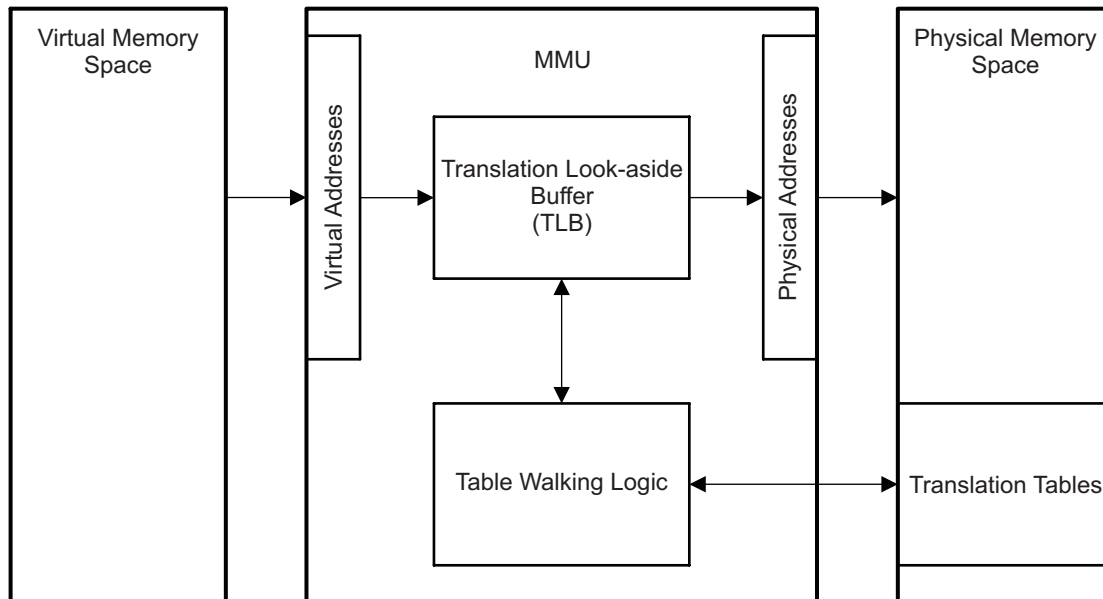

1.4.3 MMU Functional Description

1.4.3.1 MMU Block Diagram

The MMU manages the virtual to physical address translation for external addresses. The MMU can be programmed through the L4 interconnect.

Figure 1-9. MMU Block Diagram

Each table entry describes the translation of one contiguous memory region. For a description of the structure of these tables, see Translation Tables.

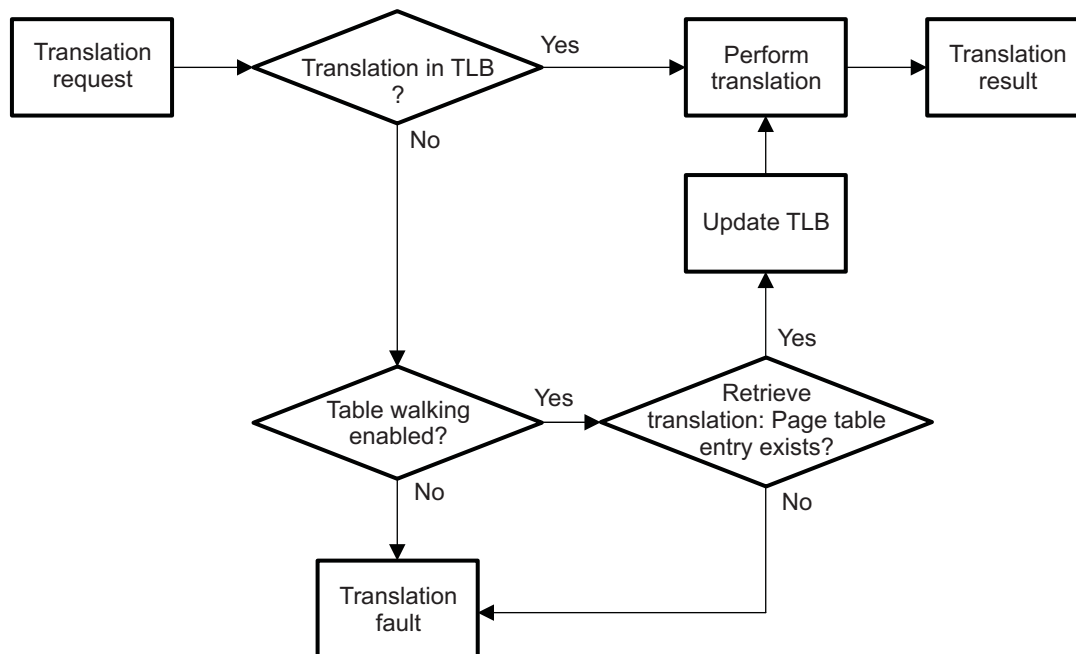

Two major functional units exist in the MMU to provide address translation automatically based on the table entries:

- The table walker automatically retrieves the correct translation table entry for a requested translation. If two-level translation is used (for the translation of small memory pages), the table walker also automatically reads the required second-level translation table entry. The two-level translation is described later in the chapter.
- The translation look-aside buffer (TLB) stores recently used translation entries, acting like a cache of the translation table.

1.4.3.1.1 MMU Address Translation Process

Whenever an address translation is requested (that is, for every access with the MMU enabled), the MMU first checks whether the translation is contained in the TLB, which acts like a cache storing recent translations. The TLB can also be programmed manually to ensure that time-critical data can be translated without delay.

If the requested translation is not in the TLB, the table-walking logic retrieves this translation from the translation table(s), and then updates the TLB. The address translation is then performed. [Figure 1-10](#) summarizes the process.

Figure 1-10. MMU Address Translation Process

1.4.3.1.2 Translation Tables

The translation of virtual to physical addresses is based on entries in translation tables that define the following properties:

- Address translation, that is, the correspondence between virtual and physical addresses
- Size of the memory region the entry translates

The virtual addresses index the translation tables. Each virtual address corresponds to exactly one entry in the translation table.

1.4.3.1.2.1 Translation Table Hierarchy

When developing a table-based address translation scheme, one of the most important design parameters is the memory page size described by each translation table entry. MMU instances support 4KB and 64KB pages, a 1MB section, and a 16MB supersection. Using bigger page sizes means a smaller translation table.

Using a smaller page size greatly increases the efficiency of dynamic memory allocation and defragmentation. That is why many operating systems (OSs) can operate on memory blocks as small as 4KB; however, the smaller size implies a more complex table structure.

A quick calculation shows that using 4KB memory pages with one translation table would require one million entries to span the entire 4GB address range. The table itself would be 32MB, a size that is not feasible.

However, using bigger pages reduces the flexibility of the typical OS memory management. Implementing a two-level hierarchy reconciles these two requirements. Within this hierarchy, one first-level translation table describes the translation properties based on 1MB memory regions.

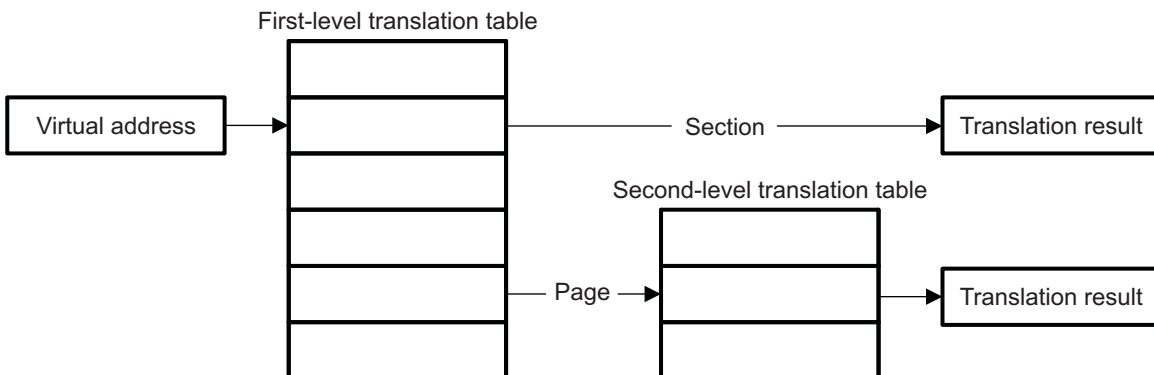

Each of the entries in this first-level translation table can specify the following:

- The translation properties for a big memory section. This memory section can be either 1MB (section) or 16MB (supersection). In this case, all translation parameters are specified in the first-level translation table entry.
- A pointer to a second-level translation table that specifies individual translation properties based on

smaller pages within the 1MB page of memory. These pages can be either 64KB (large page) or 4KB (small page). In this case, the actual translation parameters are specified in the second-level translation table entry. The first-level translation table entry specifies only the base address of the second-level translation table.

This hierarchical approach means that additional translation information for smaller pages must be provided only when the pages are actually used.

Figure 1-11. Translation Hierarchy

The structure of the first and second-level translation tables and their entries are described in more detail in First-Level Translation Table and Two-Level Translation.

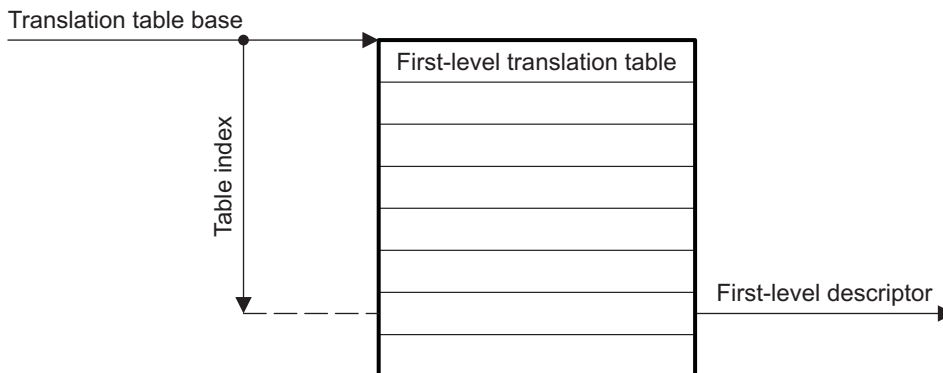

1.4.3.1.2.2 First-Level Translation Table

The first-level translation table describes the translation properties for 1MB sections. To describe a 4GB address range requires 4096 32-bit entries (so-called first-level descriptors).

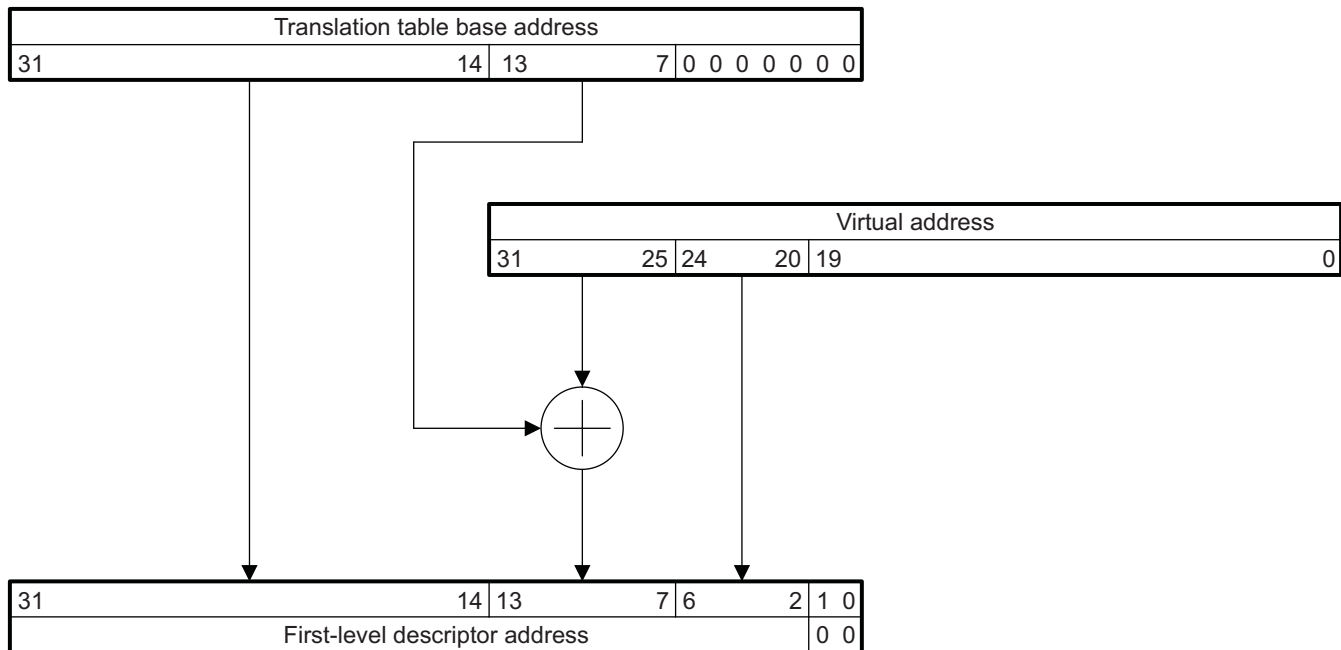

The first-level translation table start address must be aligned on a multiple of the table size with a 128-byte minimum. Consequently, an alignment of at least 16K bytes is required for a complete 4096-entry table; that is, at least the last fourteen address bits must be zero.

The start address of the first-level translation table is specified by the so-called translation table base. The table is indexed by the upper 12-bits of the virtual address.

Figure 1-12. First-Level Descriptor Address Calculation

To summarize, the translation table base and the translation table index together define the first-level descriptor address. The precise mechanism used to calculate this address is shown below.

Figure 1-13. Detailed First-Level Descriptor Address Calculation

As an example of this mechanism, consider a translation table base address of 0x8000:0000 and a virtual address of 0x1234:5678. In this case, the first-level descriptor address is:

$$0x8000:0000 + (0x1234 \ll 2) = 0x8000:048C.$$

1.4.3.1.2.3 First-Level Descriptor Format

Each first-level descriptor provides either the complete address translation for 1MB or 16MB sections or provides a pointer to a second-level translation table for 4KB or 64KB pages.

Table 1-42. First-Level Descriptor Format

31:24	23:2 0	19	18	17	16	15	14:1 2	11:1 0	9:2	1	0		
X										0	0	Fault	
Second-level Translation Table Base Address										X	0	1	Page
Section Base Address		X	0	M	X	E	X	ES	X	1	0	Section	
Super Section base Address		X	1	M	X	E	X	ES	X	1	0	Supersecti on	
X										1	1	Fault	

M = Mixed region: Don't care when E=0. Set to 0 to ensure future compatibility.

E = Endianness: Set to 0 for little-endian. Big-endian mode is not supported.

ES = Element Size: Don't care when E=0. Set to 00 to ensure future compatibility.

X = Don't care. Set to 0 to ensure future compatibility.

1.4.3.1.2.4 First-Level Page Descriptor Format

If a translation granularity smaller than 1MB is required, a two-level translation process is used. In this case, the first-level block descriptor specifies only the start address of a second-level translation table. The second-level translation table entries specify the actual translation properties.

1.4.3.1.2.5 First-Level Section Descriptor Format

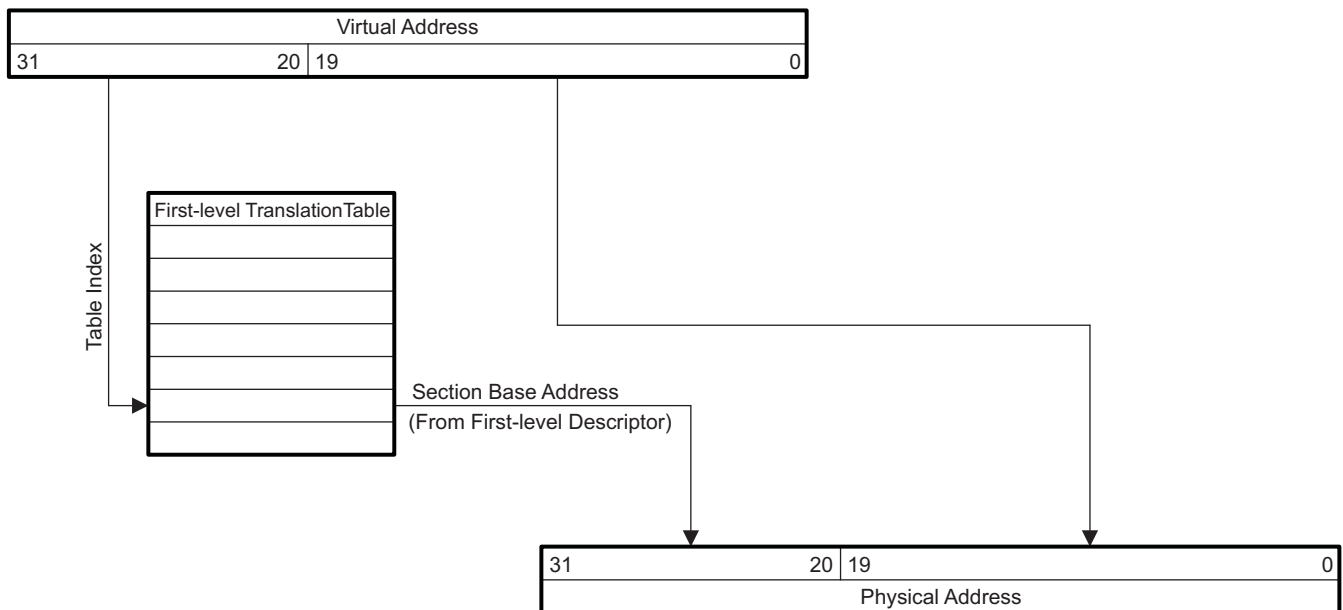

Each section descriptor in the first-level translation table specifies the complete translation properties for a 1MB section or a 16MB supersection.

NOTE: Supersection descriptors must be repeated 16 times, because each descriptor in the first-level translation table describes 1MB of memory. If an access points to a descriptor that is not initialized, the MMU will behave in an unpredictable way.

1.4.3.1.2.6 Section Translation Summary

Sections and supersections can be translated based solely on the information in the first-level translation table.

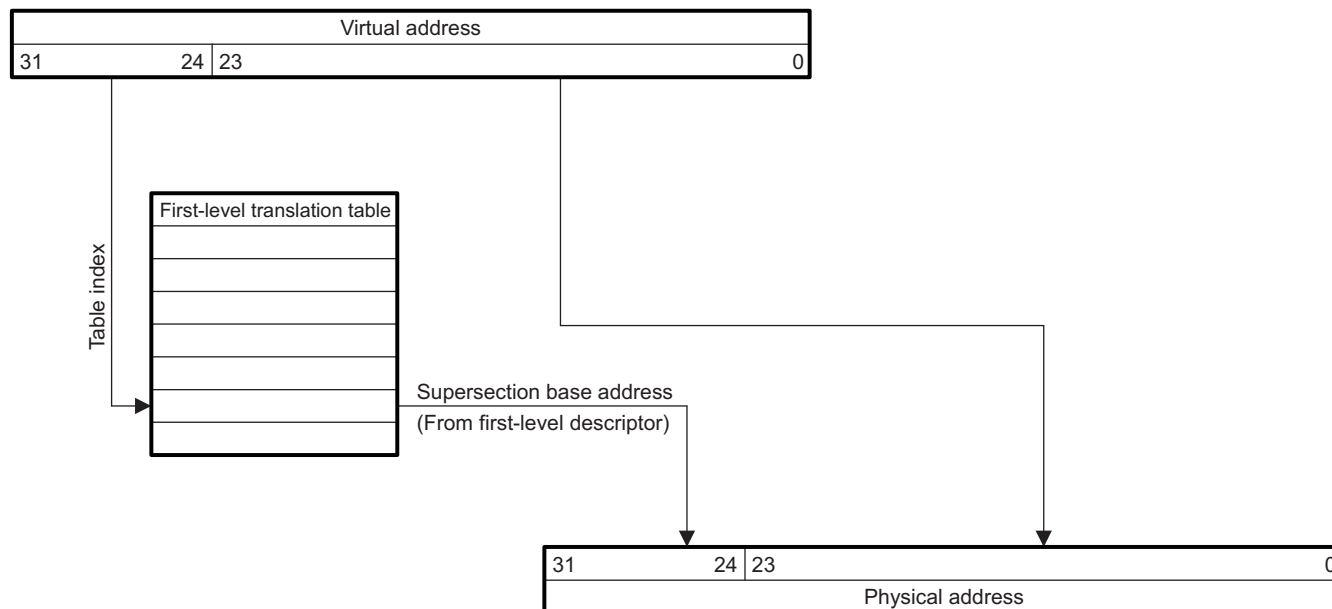

Figure 1-14. Section Translation Summary

1.4.3.1.2.7 Supersection Translation Summary

The translation of a supersection is similar to the translation of a section. The difference is that for a supersection only bits 31 to 24 index into the first-level translation table. The last four bits of the table index are implicitly assumed to be zero as there are 16 identical consecutive entries for a supersection.

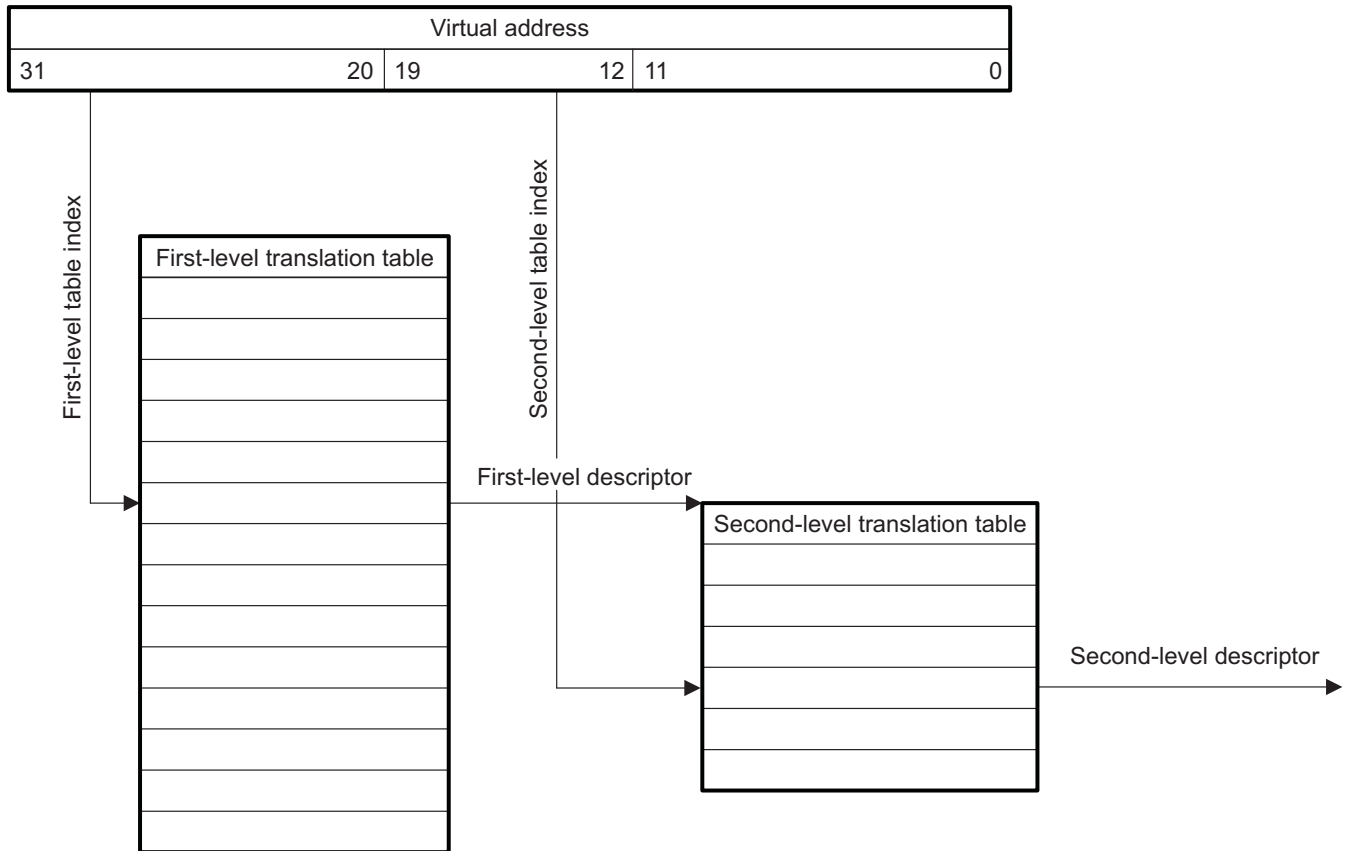

Figure 1-15. Supersection Translation Summary

1.4.3.1.2.8 Two-Level Translation

Two-level translation is used when fine-grain granularity is required, that is, when memory sections smaller than 1MB are needed. In this case, the first-level descriptor provides a pointer to the base address of a second-level translation table. This second-level table is indexed by bits 19 to 12 of the virtual address.

Figure 1-16. Two-Level Translation

Each second-level translation table describes the translation of 1MB of address space in pages of 64KB (large page) or 4KB (small page). It consists of 256 second-level descriptors describing 4KB each.

NOTE: In the case of a large page, the same descriptor must be repeated 16 times. If an access points to a descriptor that is not initialized, the MMU will behave in an unpredictable way."

1.4.3.1.2.9 Second-Level Descriptor Format

Similar to first-level section descriptors, second-level descriptors provide all of the necessary information for the translation of a large or small page. The translation parameters (endianness, element size, and mixed region) have the same meaning as those for sections.

Table 1-43. Second-Level Descriptor Format

31:16	15:12	11	10	9	8:6	5:4	3:2	1	0		
X									0	0	Fault
Large Page Base Address		X	M	X	E	X	ES	X	0	1	Large Page
Small Page Base Address			M	X	E	X	ES	X	1	X	Small Page

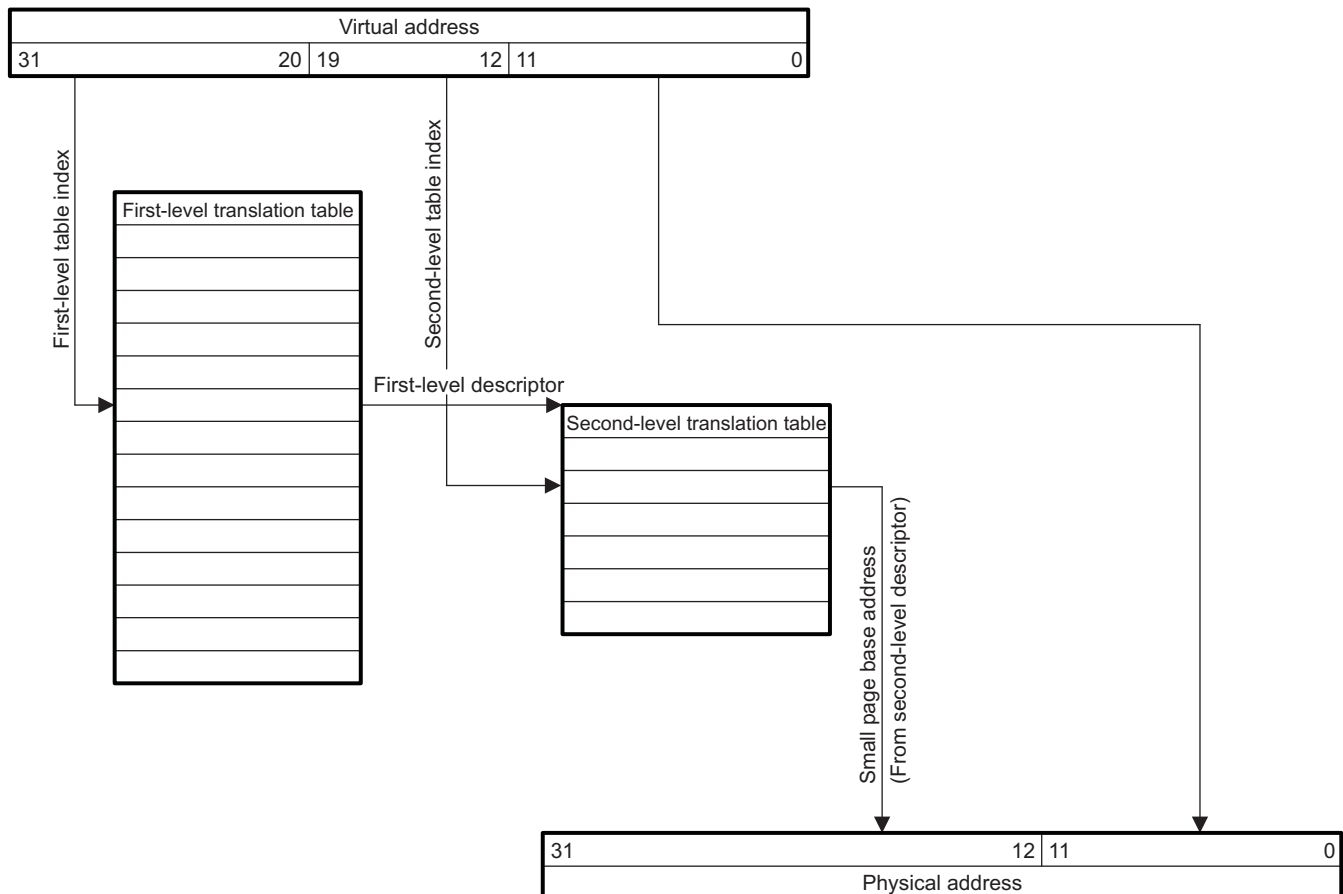

M = Mixed region: Don't care when E=0. Set to 0 to ensure future compatibility.

E = Endianness: Set to 0 for little-endian. Big-endian mode is not supported.

ES = Element Size: Don't care when E=0. Set to 00 to ensure future compatibility.

X = Don't care. Set to 0 to ensure future compatibility.

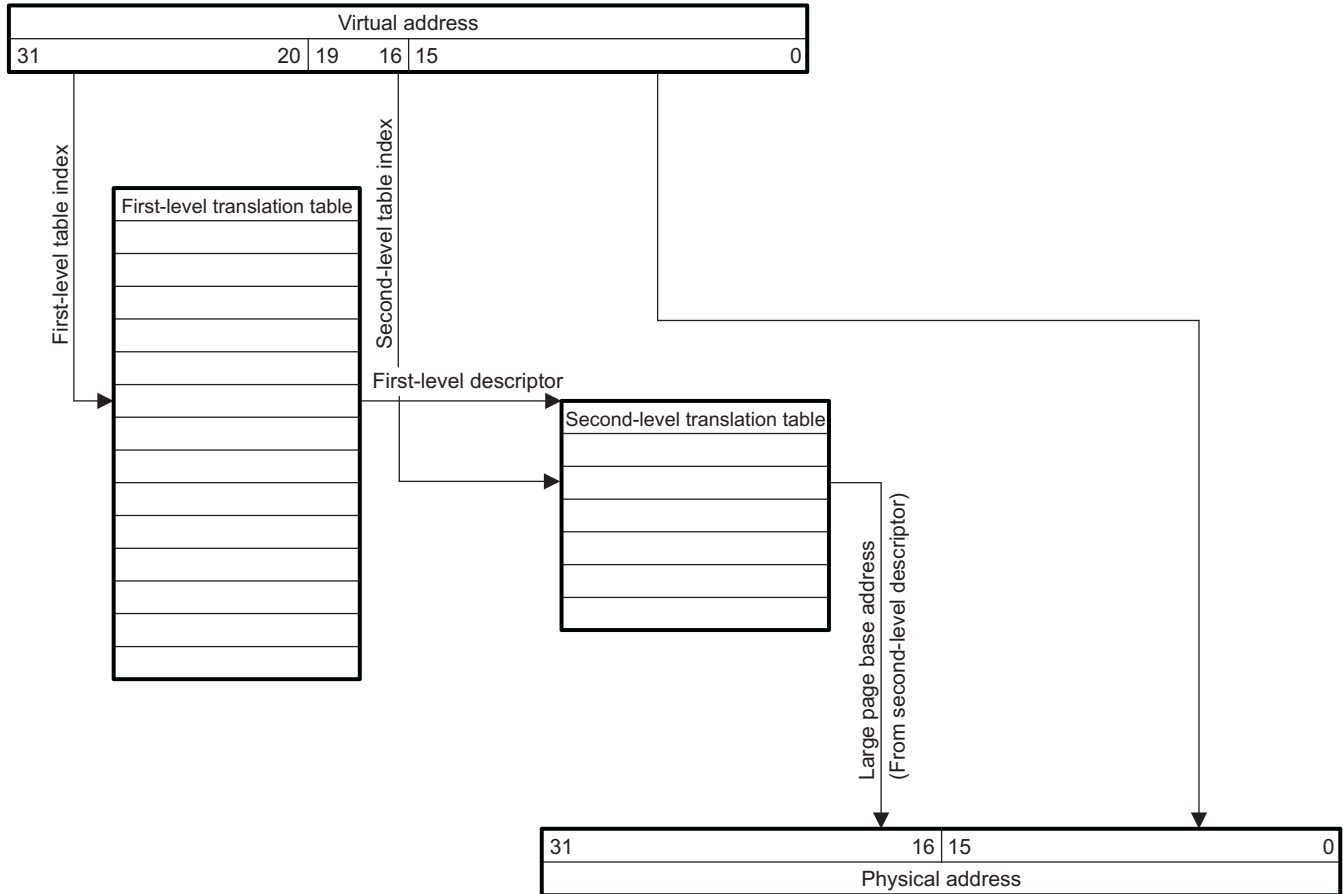

Figure 1-17. Small Page Translation Summary

1.4.3.1.2.10 Large Page Translation Summary

The translation of a large page is similar to the translation of a small page. The difference is that, for a large page, only bits 19 to 16 index into the second-level translation table. The last four bits of the table index are implicitly assumed to be zero as there are 16 identical consecutive entries for a large page.

Figure 1-18. Large Page Translation Summary

1.4.3.1.3 Translation Lookaside Buffer

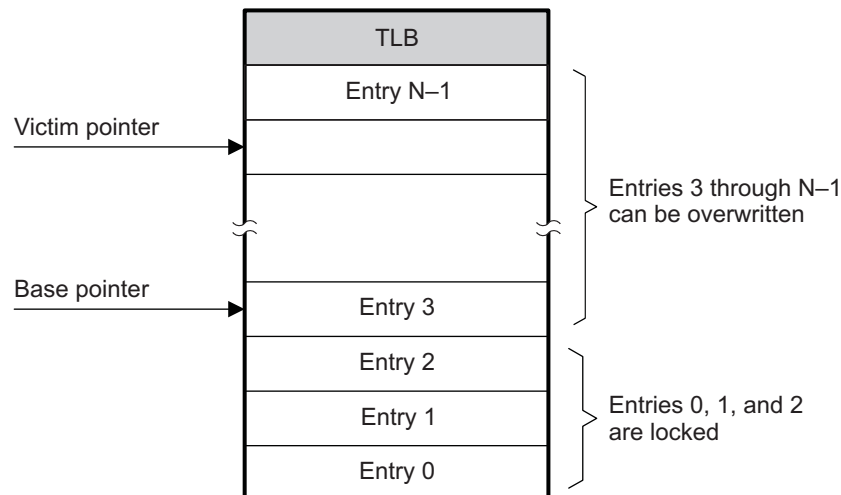

Translating virtual addresses to physical addresses is required for each memory access in systems using an MMU. To accelerate this translation process, a cache, or TLB, holds the result of recent translations.

For every translation, the MMU internal logic first checks whether the requested translation is already cached in the TLB. If the translation is cached, this translation is used; otherwise the translation is retrieved from the translation tables and the TLB is updated. If the TLB is full, one of its entries must be replaced. This entry is selected on a random basis.

The first n TLB entries, where $n < \text{Total Number } N \text{ of TLB Entries}$, can be protected (locked) against being overwritten by setting the TLB base pointer to n . When this mechanism is used, only unprotected entries can be overwritten. The victim pointer indicates the next TLB entry to be written. [Figure 1-19](#) shows an example of the TLB with N TLB entries (ranging from 0 to $N-1$). The base pointer contains the value "3" protecting Entry 0, Entry 1, and Entry 2 and the victim pointer points to the next TLB entry to be updated.

NOTE: The last TLB entry (Entry $N-1$) always remains unprotected.

Figure 1-19. TLB-Entry Lock Mechanism

The table walking logic automatically writes the TLB entries. The entries can also be manually written, which is done typically to ensure that the translation of time-critical data accesses is already present in the TLB so that they execute as fast as possible. The entries must be locked to prevent them from being overwritten.

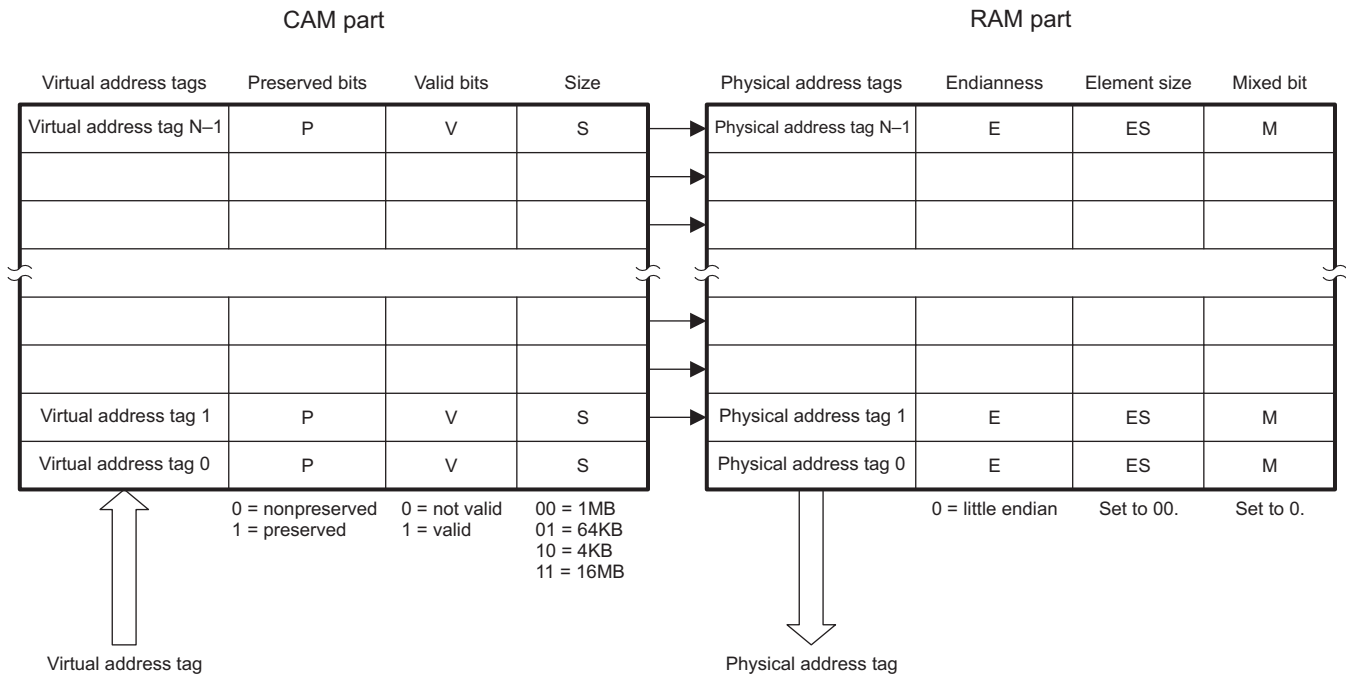

1.4.3.1.3.1 TLB Entry Format

TLB entries consist of two parts:

- The CAM part contains the virtual address tag used to determine if a virtual address translation is in the TLB. The TLB acts like a fully associative cache addressed by the virtual address tag. The CAM part also contains the section/page size, as well as the preserved and the valid parameters. See the register table for more details.
- The RAM part contains the address translation that belongs to the virtual address tag as well as the endianness, element size, and mixed parameters described in First-Level Translation Table. See the MMU_RAM register table for more details.

The valid parameter specifies whether an entry is valid or not. The preserved parameter determines the behavior of an entry in the event of a TLB flush. If an entry is set as preserved, it is not deleted when a TLB is flushed, that is, when [0] GLOBALFLUSH is set to 1. Preserved entries must be deleted manually.

Figure 1-20. TLB-Entry Structure

1.4.3.2 MMU Clock Configuration

There are two clock domains: The functional clock domain for the MMU, which is synchronous to the clock for the interconnect slave and master access ports; and the clock domain for the interconnect slave configuration port. As these clocks are matched, there is a single input clock with enables for each of the clock domains. If a clock domain should run at the same frequency as the input clock, that enable can be tied high.

Two clock enable signals exist, one to enable the interconnect data master and slave ports, and the other to enable the clock on the configuration L3 interconnect port. The clock signals are configured through the MMU_SYSCONFIG register. This is a system configuration register that controls the various parameters of the L3 interface.

1.4.3.3 MMU Software Reset

This section describes the software reset feature of the module. The MMU instances are reset together with their respective reset domains. See the Clocks and Resets tables for information about the reset domains of the different MMU instances.

To perform a software reset, write 1 in the MMU_SYSCONFIG[1] SOFTRESET bit. The MMU_SYSSTATUS[0] RESETDONE bit indicates that the software reset is complete when its value is 1. When the software reset completes, the MMU_SYSCONFIG[1] SOFTRESET bit is automatically reset. The software must ensure that the software reset completes before doing MMU operations. When an MMU instance is released from reset, its TLB is empty and the MMU is disabled.

1.4.3.4 MMU Power Management

As part of the device system-wide power management scheme, each MMU instance supports a communication protocol with the PRCM module that allows the PRCM module to request an MMU instance to enter a low-power state. When the MMU instance acknowledges a low-power mode request from the PRCM module, the clock to the instance is gated off at the PRCM clock generator. Because the clock is disabled at the source, the low-power mode offers lower power consumption than the internal clock gating method in the local power management.

1.4.3.5 MMU Local Power Management Features

Table 1-44. MMU Local Power Management Features

Feature	Register
Idle modes	MMU_SYSCONFIG[4:3] IDLEMODE
Clock activity	MMU_SYSCONFIG[9:8] CLOCKACTIVITY
Clock autogating	MMU_SYSCONFIG[0] AUTOIDLE

NOTE: The MMU_SYSCONFIG[9:8] CLOCKACTIVITY bits are read only.

1.4.3.6 MMU Interrupt Requests

Table 1-45. Events

Event Flag	Event Mask	Description
MMU_IRQSTATUS[4] MULTIHITFAULT	MMU_IRQENABLE[4] MULTIHITFAULT	Error due to multiple matches in the TLB
MMU_IRQSTATUS[3] TABLEWALKFAULT	MMU_IRQENABLE[3] TABLEWALKFAULT	Error due to error response received during a Table Walk
MMU_IRQSTATUS[2] EMUMISS	MMU_IRQENABLE[2] EMUMISS	
MMU_IRQSTATUS[1] TRANSLATIONFAULT	MMU_IRQENABLE[1] TRANSLATIONFAULT	Error due to invalid descriptor in the translation tables (translation fault)
MMU_IRQSTATUS[0] TLBMISS	MMU_IRQENABLE[0] TLBMISS	Error due to unrecoverable TLB miss (hardware TWL disabled)

1.4.3.7 MMU Error Handling

Table 1-46. Error Handling

Item	Condition	Action
1	Table-walk read has an error response.	Treat generally the same as a translation fault, but set the TableWalkFault interrupt status bit to aid in diagnosis
2	MMU is disabled during table-walk.	Not permitted; can result in loss of the current transaction but must not deadlock the MMU. Avoid this condition by first disabling the table-walk logic and then polling the TWLRunning bit to ensure that no table walk is pending.
3	MMU is disabled during an address translation.	Not permitted; can result in access to an unintended location, but must not deadlock MMU. This condition should be avoided by ensuring that no accesses are pending.
4	TLB is accessed during an address translation or a table walk.	Reading permitted; write should be done with care to ensure that the TLB is self-consistent at all times that a translation can occur.
5	TLB is flushed during address translation or a table walk.	Permitted; the flush is processed first, followed by the TWL update.
6	MMU is disabled while an interrupt is pending.	Not permitted; all pending interrupts should be processed before disabling the MMU.

1.4.4 MMU Low-level Programming Models

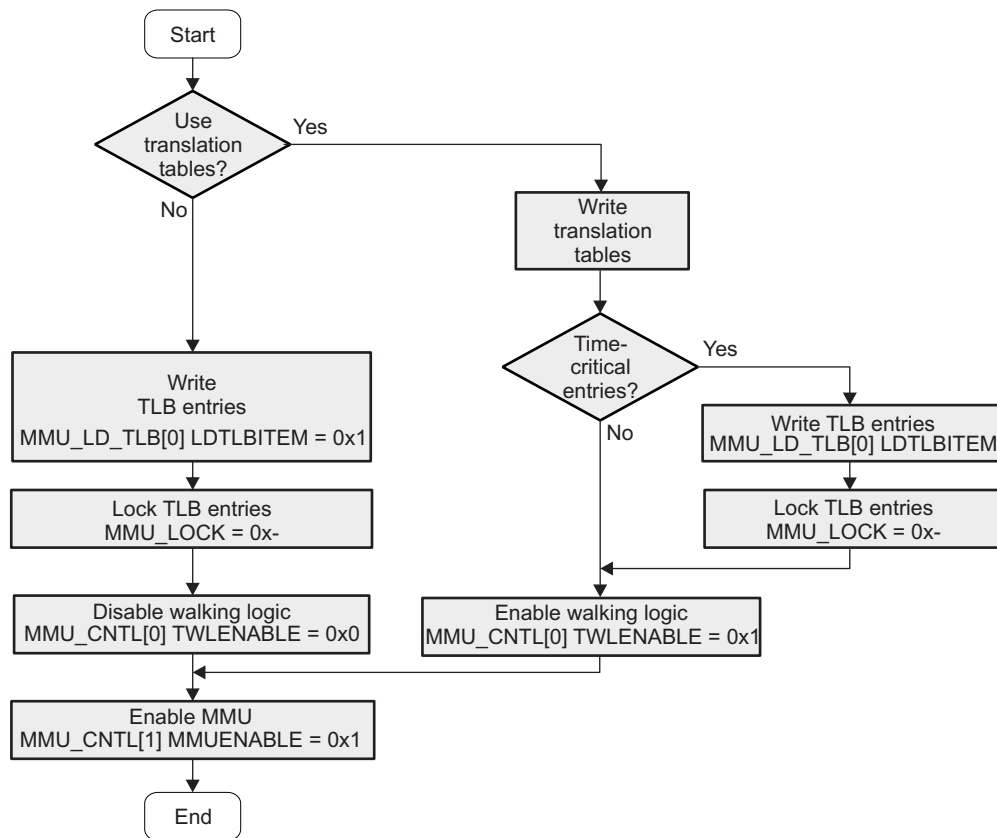

This section covers the low-level hardware programming sequences for configuration and usage of the module.

1.4.4.1 MMU Global Initialization

1.4.4.1.1 Main Sequence - MMU Global Initialization

The System MMU can be enabled or disabled in MMU_CFG register (refer to the *Control Module* chapter). [Figure 1-21](#) shows the procedure to initialize the MMU after a power-on or software reset.

Figure 1-21. MMU Global Initialization

1.4.4.1.2 Subsequence - Configure a TLB entry

Table 1-47. Configure a TLB Entry

Step	Registe/Bitfield/Programming Model	Value
Load the Virtual Address Tag	MMU_CAM[31:12] VATAG	0x-
Protect the TLB entry against flush	MMU_CAM[3] P	0x1
Validate the TLB entry	MMU_CAM[2] V	0x1
Define the page size	MMU_CAM[1:0] PAGESIZE	0x-

1.4.4.2 Operational Modes Configuration

1.4.4.2.1 Main Sequence - Writing TLB Entries Statically

Writing TLB entries statically avoids the need to write translation tables in memory and is commonly used for relatively small address spaces. This method ensures that the translation of time-critical data accesses execute as fast as possible with entries already present in the TLB. These entries must be locked to prevent them from being overwritten.

Table 1-48. MMU Writing TLB Entries Statically

Step	Register/ Bitfield / Programming Model	Value
Execute software reset	MMU_SYSCONFIG[1] SOFTRESET	0x1
Wait for reset to complete	MMU_SYSSTATUS[0] RESETDONE	=0x1
Enable power saving via automatic interface clock gating	MMU_SYSCONFIG[0] AUTOIDLE	0x1
Configure TLB entries	Refer to table Configure a TLB Entry	
Load the physical Address of the page	MMU_RAM[31:12] PHYSICALADDRESS	0x-
Define the endianness of the page (little endian or big endian)	MMU_RAM[9] ENDIANNESS	0x-
Select the element size	MMU_RAM[8:7] ELEMENTSIZE	0x-
Define mixed page attribute	MMU_RAM[6] MIXED	0x-
Specify the TLB entry you want to write	MMU_LOCK[8:4] CURRENTVICTIM	0x-
Load the specified entry in the TLB	MMU_LD_TLB[0] LDTLBITEM	0x1
Enable multihit fault and TLB miss	MMU_IRQENABLE[4] MULTIHITFAULT	0x1
	MMU_IRQENABLE[0] TLBMISS	0x1
Enable memory translations	MMU_CNTL[1] MMUENABLE	0x1

1.4.4.2.2 Main Sequence - Protecting TLB Entries

The first n TLB entries (with n < total number of TLB entries) can be protected from being overwritten with new translations. This is useful to ensure that certain commonly used or time-critical translations are always in the TLB and do not require retrieval using the table walking process.

Table 1-49. Protecting TLB Entries

Step	Register/Bitfield/Programming Model	Value
Locks the TLB entries	MMU_LOCK[14:10] BASEVALUE	0x-

1.4.4.2.3 Main Sequence - Deleting TLB Entries

Two mechanisms exist to delete TLB entries. All unpreserved TLB entries, that is, TLB entries written with the preserved bit set to zero, can be deleted by invoking a TLB flush. The preserved bit should only be used on protected TLB entries, as it does not prevent replacement by the table walking logic.

Table 1-50. Deleting TLB Entries

Step	Register/Bitfield/Programming Model	Value
Flush all nonprotected TLB entries	MMU_GFLUSH[0] GLOBALFLUSH	0x1
Flush all TLB entries specified by the CAM register	MMU_FLUSH_ENTRY[0] FLUSHENTRY	0x1

1.4.4.2.4 Main Sequence - Read TLB Entries

TLB entries can be read by the programmer to determine the TLB content at runtime.

Table 1-51. Read TLB Entries

Step	Register/Bitfield/Programming Model	Value
Set the current victim pointer	MMU_LOCK[8:4] CURRENTVICTIM	0x-
Read RAM parts of the TLB entry	MMU_READ_RAM	
Read CAM parts of the TLB entry	MMU_READ_CAM	

1.4.5 MMU Registers

1.4.5.1 MMU Instance Summary

Table 1-52. MMU Instance Summary

Module Name	Size
System MMU	4KB

1.4.5.2 MMU Registers

Table 1-53. MMU Registers

Register Name	Type	Register Width (Bits)	Address Offset
MMU_REVISION	R	32	00h
MMU_SYSCONFIG	RW	32	10h
MMU_SYSSTATUS	R	32	14h
MMU_IRQSTATUS	RW	32	18h
MMU_IRQENABLE	RW	32	1Ch
MMU_WALKING_ST	R	32	40h
MMU_CNTL	RW	32	44h
MMU_FAULT_AD	R	32	48h
MMU_TTB	RW	32	4Ch
MMU_LOCK	RW	32	50h
MMU_LD_TLB	RW	32	54h
MMU_CAM	RW	32	58h
MMU_RAM	RW	32	5Ch
MMU_GFLUSH	RW	32	60h
MMU_FLUSH_ENTRY	RW	32	64h
MMU_READ_CAM	R	32	68h
MMU_READ_RAM	R	32	6Ch
MMU_EMU_FAULT_AD	R	32	70h
MMU_FAULT_PC	R	32	80h

1.4.5.2.1 MMU_REVISION

The MMU_REVISION register is shown in [Figure 1-22](#) and described in [Table 1-54](#).

Figure 1-22. MMU_REVISION

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-54. MMU_REVISION Field Descriptions

Bit	Field	Value	Description
31-0	REVISION	0	IP Revision.

1.4.5.2.2 MMU_SYSCONFIG

The MMU_SYSCONFIG register is shown in [Figure 1-23](#) and described in [Table 1-55](#).

Figure 1-23. MMU_SYSCONFIG

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-55. MMU_SYSCONFIG Field Descriptions

Bit	Field	Value	Description
31-10	Reserved	0	Write 0's for future compatibility. Reads returns 0.
9-8	CLOCKACTIVITY	0	Clock activity during wake-up mode 00 Functional and Interconnect clocks can be switched off.
7-5	Reserved	0	Write 0's for future compatibility. Reads returns 0
4-3	IDLEMODE		Idle Mode
		0	Force-idle. An idle request is acknowledged unconditionally.
		1h	No-idle. An idle request is never acknowledged.
		2h	Smart-idle. Acknowledgment to an idle request is given based on the internal activity of the module.
3h	Reserved do not use.		
2	Reserved	0	Write 0's for future compatibility. Reads returns 0.
1	SOFTRESET	1-0	Software reset. This bit is automatically reset by the hardware. During reads, it always return 0.
			Read 0x0: always return 0
			Write 0x0: no functional effect
			Write 0x1: The module is reset
			Read 0x1: never happens
0	AUTOIDLE		Internal interconnect clock gating strategy.
		0	Interconnect clock is free-running.
		1	Automatic interconnect clock gating strategy is applied, based on the interconnect interface activity.

1.4.5.2.3 MMU_SYSSTATUS

The MMU_SYSSTATUS register is shown in [Figure 1-24](#) and described in [Table 1-56](#).

Figure 1-24. MMU_SYSSTATUS

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-56. MMU_SYSSTATUS Field Descriptions

Bit	Field	Value	Description
31-1	Reserved	0	Reads returns 0.
0	RESETDONE	0	Internal reset monitoring.
		0	Internal module reset in on-going.
		1	Reset completed.

1.4.5.2.4 MMU_IRQSTATUS

The MMU_IRQSTATUS register is shown in [Figure 1-25](#) and described in [Table 1-57](#).

Figure 1-25. MMU_IRQSTATUS

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-57. MMU_IRQSTATUS Field Descriptions

Bit	Field	Value	Description
31-5	Reserved	0	Write 0's for future compatibility read returns 0.
4	MULTIHITFAULT	1-0	Error due to multiple matches in the TLB.
			Read 0x0: MultiHitFault false.
			Write 0x0: MultiHitFault status bit unchanged.
			Write 0x1: MultiHitFault status bit is reset.
3	TABLEWALKFAULT	1-0	Error response received during a Table Walk.
			Read 0x0: TableWalkFault false.
			Write 0x0: TableWalkFault status bit unchanged.
			Write 0x1: TableWalkFault status bit is reset.
2	EMUMISS	1-0	Unrecoverable TLB miss during debug (hardware TWL disabled).
			Read 0x0: EMUMiss false.
			Write 0x0: EMUMiss status bit unchanged.
			Write 0x1: EMUMiss status bit is reset.
1	TRANSLATIONFAULT	1-0	Invalid descriptor in translation tables (translation fault).
			Read 0x0: TranslationFault false.
			Write 0x0: TranslationFault status bit unchanged.
			Write 0x1: TranslationFault status bit is reset.
0	TLBMISS	1-0	Unrecoverable TLB miss (hardware TWL disabled).
			Read 0x0: TLBMiss false.
			Write 0x0: TLBMiss status bit unchanged.
			Write 0x1: TLBMiss status bit is reset.
			Read 0x1: TLBMiss is true ("pending").

1.4.5.2.5 MMU_IRQENABLE

The MMU_IRQENABLE register is shown in [Figure 1-26](#) and described in [Table 1-58](#).

Figure 1-26. MMU_IRQENABLE

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-58. MMU_IRQENABLE Field Descriptions

Bit	Field	Value	Description
31-5	Reserved	0	Write 0's for future compatibility read returns 0.
4	MULTIHITFAULT	0	Error due to multiple matches in the TLB.
		0	MultiHitFault is masked.
		1	MultiHitFault event generates an interrupt if occurs.
3	TABLEWALKFAULT	0	Error response received during a Table Walk.
		0	TableWalkFault is masked.
		1	TableWalkFault event generates an interrupt if occurs.
2	EMUMISS	0	Unrecoverable TLB miss during debug (hardware TWL disabled).
		0	EMUMiss interrupt is masked.
		1	EMUMiss event generates an interrupt when it occurs.
1	TRANSLATIONFAULT	0	Invalid descriptor in translation tables (translation fault).
		0	TranslationFault is masked.
		1	TranslationFault event generates an interrupt if occurs.
0	TLBMISS	0	Unrecoverable TLB miss (hardware TWL disabled).
		0	TLBMiss interrupt is masked.
		1	TLBMiss event generates an interrupt when if occurs.

1.4.5.2.6 MMU_WALKING_ST

The MMU_WALKING_ST register is shown in [Figure 1-27](#) and described in [Table 1-59](#).

Figure 1-27. MMU_WALKING_ST

31	1	0
Reserved	TWLRUNNING	
R-0	R-0	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-59. MMU_WALKING_ST Field Descriptions

Bit	Field	Value	Description
31-1	Reserved	0	Reads return 0.
0	TWLRUNNING	0	Table Walking Logic is running.
		0	TWL Completed.
		1	TWL Running.

1.4.5.2.7 MMU_CNTL

The MMU_CNTL register is shown in [Figure 1-28](#) and described in [Table 1-60](#).

Figure 1-28. MMU_CNTL

31	4	3	2	1	0
Reserved	EMUTLBUPDA TE	TWLENABLE	MMUENABLE	Reserved	
R-0	R/W-0	R/W-0	R/W-0	R-0	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-60. MMU_CNTL Field Descriptions

Bit	Field	Value	Description
31-4	Reserved	0	Write 0's for future compatibility Reads return 0.
3	EMUTLBUPDATE	0	Enable TLB update on emulator table walk.
		0	Emulator TLB update disabled.
		1	Emulator TLB update enabled.
2	TWLENABLE	0	Table Walking Logic enable.
		0	TWL disabled.
		1	TWL enabled.
1	MMUENABLE	0	MMU enable.
		0	MMU disabled.
		1	MMU enabled.
0	Reserved	0	Write 0's for future compatibility Reads return 0.

1.4.5.2.8 MMU_FAULT_AD

The MMU_FAULT_AD register is shown in [Figure 1-29](#) and described in [Table 1-61](#).

Figure 1-29. MMU_FAULT_AD

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-61. MMU_FAULT_AD Field Descriptions

Bit	Field	Value	Description
31-0	FAULTADDRESS	0-FFFF FFFFh	Virtual address of the access that generated a fault.

1.4.5.2.9 MMU_TTB

The MMU_TTB register is shown in [Figure 1-30](#) and described in [Table 1-62](#).

Figure 1-30. MMU_TTB

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-62. MMU_TTB Field Descriptions

Bit	Field	Value	Description
31-7	TTBADDRESS	0-3FF FFFFh	Translation Table Base Address.
6-0	Reserved	0	Write 0's for future compatibility Reads return 0.

1.4.5.2.10 MMU_LOCK

The MMU_LOCK register is shown in [Figure 1-31](#) and described in [Table 1-63](#).

Figure 1-31. MMU_LOCK

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-63. MMU_LOCK Field Descriptions

Bit	Field	Value	Description
31-15	Reserved	0	Write 0's for future compatibility Reads return 0.
14-10	BASEVALUE	0-1Fh	Locked entries base value.
9	Reserved	0	Write 0's for future compatibility Reads return 0.
8-4	CURRENTVICTIM	0-1Fh	Current entry to be updated either by the TWL or by the SW Write value : TLB entry to be updated by software, Read value : TLB entry that will be updated by table walk logic.
3-0	Reserved	0	Write 0's for future compatibility Reads return 0.

1.4.5.2.11 MMU_LD_TLB

The MMU_LD_TLB register is shown in [Figure 1-32](#) and described in [Table 1-64](#).

Figure 1-32. MMU_LD_TLB

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-64. MMU_LD_TLB Field Descriptions

Bit	Field	Value	Description
31-1	Reserved	0	Write 0's for future compatibility Reads return 0.
0	LDTLBITEM	1-0	Write (load) data in the TLB.
			Read 0x0: Always return 0.
			Write 0x0: No functional effect.
			Write 0x1: Load TLB data.
			Read 0x1: Never happens.

1.4.5.2.12 MMU_CAM

The MMU_CAM register is shown in [Figure 1-33](#) and described in [Table 1-65](#).

Figure 1-33. MMU_CAM

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-65. MMU_CAM Field Descriptions

Bit	Field	Value	Description
31-12	VATAG	0-F FFFFh	Virtual address tag.
11-4	Reserved	0	Write 0's for future compatibility Reads return 0.
3	P	0 1	Preserved bit.
			TLB entry may be flushed.
			TLB entry is protected against flush.
2	V	0 1	Valid bit.
			TLB entry is invalid.
			TLB entry is valid.
1-0	PAGESIZE	0 1 2h 3h	Page size.
			Section (1MB).
			Large page (64KB).
			Small page (4KB).
			Supersection (16MB).

1.4.5.2.13 MMU_RAM

The MMU_RAM register is shown in [Figure 1-34](#) and described in [Table 1-66](#).

Figure 1-34. MMU_RAM

31	12	11	10	9	8	7	6	5	0
PHYSICALADDRESS		Reserved		ENDIANNESS	ELEMENTSIZE		MIXED	Reserved	
R/W-0		R-0		R/W-0	R/W-0		R/W-0	R-0	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-66. MMU_RAM Field Descriptions

Bit	Field	Value	Description
31-12	PHYSICALADDRESS	0-F FFFFh	Physical address of the page.
11-10	Reserved	0	Write 0's for future compatibility Reads return 0.
9	ENDIANNESS	0	Endianness of the page. Little Endian.
		1	Reserved.
8-7	ELEMENTSIZE		Element size of the page (8, 16, 32, no translation)
		0	Value is don't care when ENDIANNESS is set to 0 (Little Endian). Should set to 0 to ensure future compatibility.
		1	Though value is don't care, not recommended. Value should be set to 0x0 to ensure future compatibility.
		2h	Though value is don't care, not recommended. Value should be set to 0x0 to ensure future compatibility.
		3h	Though value is don't care, not recommended. Value should be set to 0x0 to ensure future compatibility.
6	MIXED	0	Mixed page attribute (use CPU element size). Value is don't care when ENDIANNESS is set to 0 (Little Endian). Should set to 0 to ensure future compatibility.
		1	Though value is don't care, not recommended. Value should be set to 0 to ensure future compatibility.
5-0	Reserved	0	Write 0's for future compatibility Reads return 0.

1.4.5.2.14 MMU_GFLUSH

The MMU_GFLUSH register is shown in [Figure 1-35](#) and described in [Table 1-67](#).

Figure 1-35. MMU_GFLUSH

31	1	0
Reserved		GLOBALFLUSH
R-0		R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-67. MMU_GFLUSH Field Descriptions

Bit	Field	Value	Description
31-1	Reserved	0	Write 0's for future compatibility Reads return 0.
0	GLOBALFLUSH	1-0	Flush all the non-protected TLB entries when set.
			Read 0x0: always return 0.
			Write 0x0: no functional effect.
			Write 0x1: flush all the non-protected TLB entries.
			Read 0x1: never happens.

1.4.5.2.15 MMU_FLUSH_ENTRY

The MMU_FLUSH_ENTRY register is shown in [Figure 1-36](#) and described in [Table 1-68](#).

Figure 1-36. MMU_FLUSH_ENTRY

31	Reserved	1	0
			FLUSHENTRY
			R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-68. MMU_FLUSH_ENTRY Field Descriptions

Bit	Field	Value	Description
31-1	Reserved	0	Write 0's for future compatibility Reads return 0.
0	FLUSHENTRY	1-0	Flush the TLB entry pointed by the virtual address (VATag) in MMU_CAM register, even if this entry is set protected.
			Read 0x0: always return 0.
			Write 0x0: no functional effect.
			Write 0x1: flush all the TLB entries specified by the CAM register.
			Read 0x1: never happens.

1.4.5.2.16 MMU_READ_CAM

The MMU_READ_CAM register is shown in [Figure 1-37](#) and described in [Table 1-69](#).

Figure 1-37. MMU_READ_CAM

31	12	11	4	3	2	1	0
VATAG		Reserved		P	V	PAGESIZE	
R-0		R-0		R-0	R-0	R-0	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-69. MMU_READ_CAM Field Descriptions

Bit	Field	Value	Description
31-12	VATAG	0-F FFFFh	Virtual address tag.
11-4	Reserved	0	Reads return 0.
3	P		Preserved bit.
		0	TLB entry may be flushed.
		1	TLB entry is protected against flush.
2	V		Valid bit.
		0	TLB entry is invalid.
		1	TLB entry is valid.
1-0	PAGESIZE		Page size.
		0	Section (1MB).
		1	Large page (64KB).
		2h	Small page (4KB).
		3h	Supersection (16MB).

1.4.5.2.17 MMU_READ_RAM

The MMU_READ_RAM register is shown in [Figure 1-38](#) and described in [Table 1-70](#).

Figure 1-38. MMU_READ_RAM

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-70. MMU_READ_RAM Field Descriptions

Bit	Field	Value	Description
31-12	PHYSICALADDRESS	0-F FFFFh	Physical address of the page.
11-10	Reserved	0	Reads return 0.
9	ENDIANNESS	0 1	Endianness of the page. Little Endian. Big endian.
8-7	ELEMENTSIZE	0 1 2h 3h	Element size of the page (8, 16, 32, no translation) 8-bits 16-bits 32-bits No translation
6	MIXED	0 1	Mixed page attribute (use CPU element size). Use TLB element size. Use CPU element size.
5-0	Reserved	0	Reads return 0.

1.4.5.2.18 MMU_EMU_FAULT_AD

The MMU_EMU_FAULT_AD register is shown in [Figure 1-39](#) and described in [Table 1-71](#).

Figure 1-39. MMU_EMU_FAULT_AD

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-71. MMU_EMU_FAULT_AD Field Descriptions

Bit	Field	Value	Description
31-0	EMUFAULTADDRESS	0-FFFF FFFFh	Virtual address of the last emulator access that generated a fault.

1.4.5.2.19 MMU_FAULT_PC

The MMU_FAULT_PC register is shown in [Figure 1-40](#) and described in [Table 1-72](#).

Figure 1-40. MMU_FAULT_PC

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-72. MMU_FAULT_PC Field Descriptions

Bit	Field	Value	Description
31-0	PC	0-FFFF FFFFh	CPU program counter value where cause MMU fault.
			The address value is captured at MMU_EMU_FAULT_AD[31:0] EMUFAULTADDRESS bit field.
			Data-Read-access : corresponding PC.
			Data-write-access : not perfect accuracy due to Posted-write.

1.5 SGX530 Graphics Subsystem

This chapter describes the 2D/3D graphics accelerator (SGX) for the device.

NOTE: The SGX subsystem is a Texas Instruments instantiation of the POWERVR® SGX530 core from Imagination Technologies Ltd.

This document contains materials that are ©2003-2007 Imagination Technologies Ltd.

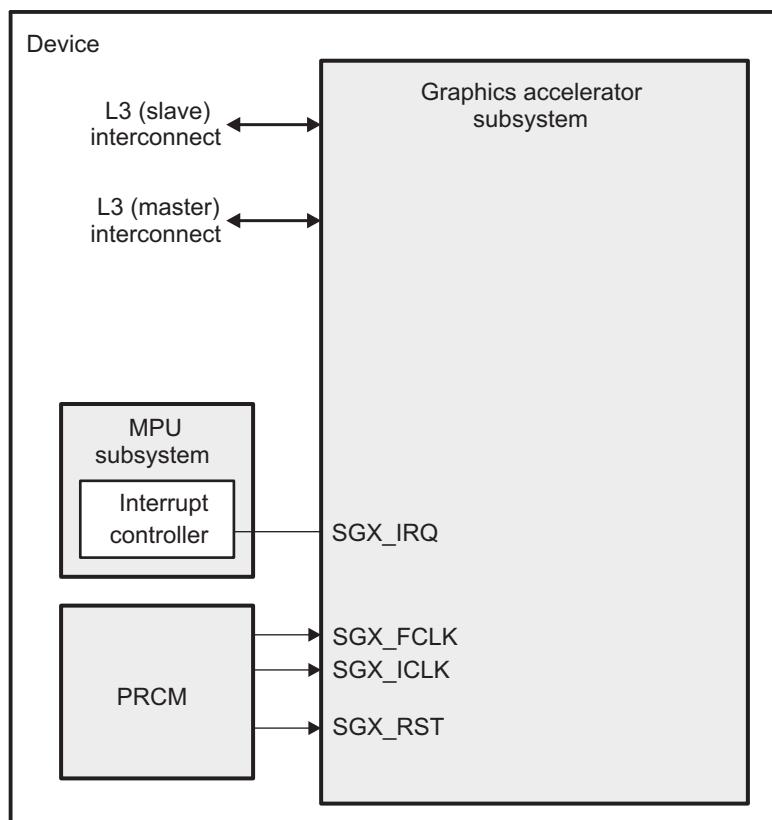

POWERVR® and USSE™ are trademarks or registered trademarks of Imagination Technologies Ltd.

1.5.1 SGX Overview

The 2D/3D graphics accelerator (SGX) subsystem accelerates 2-dimensional (2D) and 3-dimensional (3D) graphics applications. The SGX subsystem is based on the POWERVR® SGX core from Imagination Technologies. SGX is a new generation of programmable POWERVR graphic cores. The POWERVR SGX530 v1.2.5 architecture is scalable and can target all market segments from mainstream mobile devices to high-end desktop graphics. Targeted applications include feature phone, PDA, and hand-held games.

Figure 1-41 shows the SGX subsystem in the device.

Figure 1-41. Graphics Accelerator Highlight

sgx-001

The SGX graphics accelerator can simultaneously process various multimedia data types:

- Pixel data
- Vertex data
- Video data
- General-purpose processing

This is achieved through a multithreaded architecture using two levels of scheduling and data partitioning enabling zero-overhead task switching.

The SGX subsystem is connected to the L3 interconnect by a 128-bit master and a 32-bit slave interface.

1.5.1.1 POWERVR SGX Main Features

- 2D graphics, 3D graphics, vector graphics, and programming support for GP-GPU functions
- Tile-based architecture
- Universal scalable shader engine (USSE™) – multithreaded engine incorporating pixel and vertex shader functionality
- Advanced shader feature set – in excess of Microsoft VS3.0, PS3.0, and OpenGL2.0
- Industry-standard API support – Direct3D Mobile, OpenGL ES 1.1 and 2.0, OpenVG v1.0.1
- Fine-grained task switching, load balancing, and power management
- Advanced geometry direct memory access (DMA) driven operation for minimum CPU interaction
- Programmable high-quality image anti-aliasing
- POWERVR SGX core MMU for address translation from the core virtual address to the external physical address (up to 4GB address range)
- Fully virtualized memory addressing for OS operation in a unified memory architecture
- Advanced and standard 2D operations [e.g., vector graphics, BLTs (block level transfers), ROPs (raster operations)]
- 32K stride support

1.5.1.2 SGX 3D Features

- Deferred pixel shading
- On-chip tile floating point depth buffer
- 8-bit stencil with on-chip tile stencil buffer
- 8 parallel depth/stencil tests per clock
- Scissor test
- Texture support:
 - Cube map
 - Projected textures
 - 2D textures
 - Nonsquare textures
- Texture formats:
 - RGBA 8888, 565, 1555
 - Monochromatic 8, 16, 16f, 32f, 32int
 - Dual channel, 8:8, 16:16, 16f:16f
 - Compressed textures PVR-TC1, PVR-TC2, ETC1
 - Programmable support for all YUV formats
- Resolution support:
 - Frame buffer maximum size = 2048 x 2048
 - Texture maximum size = 2048 x 2048
- Texture filtering:
 - Bilinear, trilinear, anisotropic
 - Independent minimum and maximum control
- Antialiasing:
 - 4x multisampling
 - Up to 16x full scene anti-aliasing

- Programmable sample positions
- Indexed primitive list support
 - Bus mastered
- Programmable vertex DMA
- Render to texture:
 - Including twiddled formats
 - Auto MipMap generation
- Multiple on-chip render targets (MRT).

Note: Performance is limited when the on-chip memory is not available.

1.5.1.3 Universal Scalable Shader Engine (USSE) – Key Features

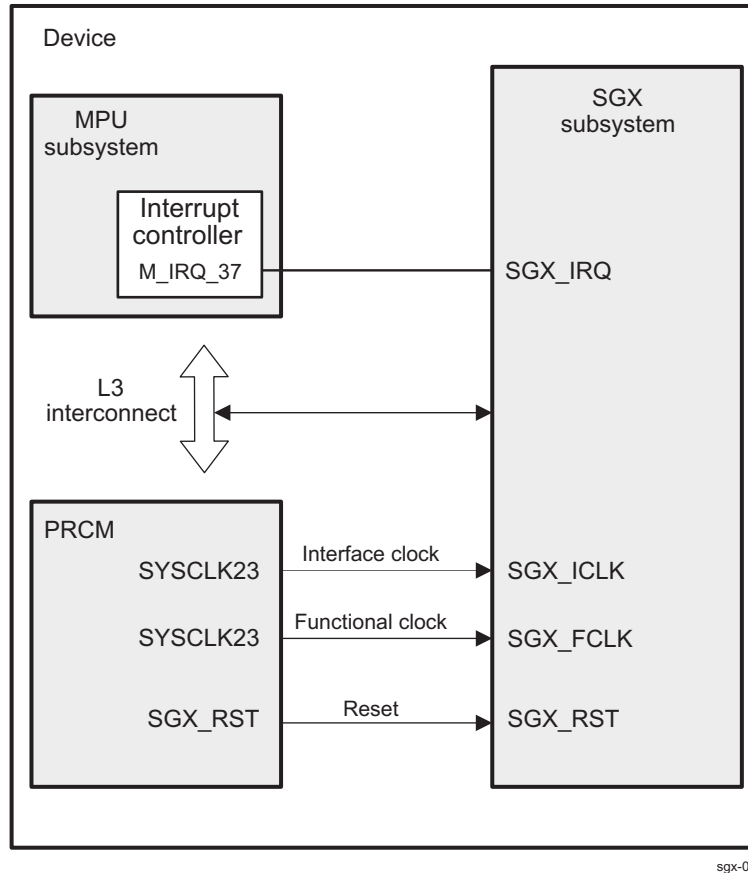

The USSE is the engine core of the POWERVR SGX architecture and supports a broad range of instructions.

- Single programming model:
 - Multithreaded with 16 simultaneous execution threads and up to 64 simultaneous data instances
 - Zero-cost swapping in, and out, of threads
 - Cached program execution model
 - Dedicated pixel processing instructions
 - Dedicated video encode/decode instructions
- SIMD execution unit supporting operations in:
 - 32-bit IEEE float
 - 2-way 16-bit fixed point
 - 4-way 8-bit integer
 - 32-bit bit-wise (logical only)
- Static and dynamic flow control:
 - Subroutine calls
 - Loops
 - Conditional branches
 - Zero-cost instruction predication
- Procedural geometry:
 - Allows generation of primitives
 - Effective geometry compression
 - High-order surface support
- External data access:
 - Permits reads from main memory using cache
 - Permits writes to main memory
 - Data fence facility
 - Dependent texture reads

1.5.2 SGX Integration

Figure 1-42 highlights the SGX subsystem integration in the device.

Figure 1-42. SGX Subsystem Integration

1.5.2.1 Clocking, Reset, and Power-Management Scheme

1.5.2.1.1 Clocks

The SGX subsystem operates from two clocks: an interface clock (SGX_ICLK) and a functional clock (SYSCLK23). The power, reset, and clock management (PRCM) module generates and distributes both clocks inside the device.

Table 1-73. Clock Descriptions

Functional Name	Signal Name	I/O ⁽¹⁾	Description
SGX_FCLK	SYSCLK23	I	Functional clock → Functional clock domain
SGX_ICLK	SYSCLK23	I	Interface clock → Interface clock domain

⁽¹⁾ I =Input; O=Output

- SGX_ICLK interface clock manages the data transfer on the L3 master and slave ports.
- SGX_FCLK is the functional clock and is used inside the SGX subsystem to generate SGX 2D and 3D domain clock signals.

To Enable the SGX Functional and Interface Clock

Program the PRCM.CM_SGX_CLKSTCTRL.CTLKTRCTRL to 0x2
 Program the PRCM.CM_SGX_SGX_CLKCTRL.MODULEMODE to 0x2
 Poll for the PRCM.CM_SGX_SGX_CLKCTRL.IDLEST to be 0x0

To Disable the SGX Functional and Interface Clock

Program the PRCM.CM_SGX_SGX_CLKCTRL.MODULEMODE to 0x0
 Program the PRCM.CM_SGX_CLKSTCTRL.CTLKTRCTRL to 0x0

The SGX_ICLK and SGX_FLCK are sourced from SYSCLK23 Depending on the DPLL_SGX and the PRCM.CM_SYSCLK23_CLKSEL[CLKSEL] settings, SGX can support a frequency up to 200 MHz. SGX530 Clocks can be divided from the original DPLL_SGX frequency. The divider can be programmed from /1../8 using the PRCM.CM_SYSCLK23_CLKSEL[CLKSEL] bits

1.5.2.1.2 Resets

The SGX subsystem has its own reset domain. Global reset of the SGX is performed by activating the SGX_RST signal in the SGX_RST domain. Software controls the release of SGX_RST using the PRCM.RM_SGX_RSTCTRL[0] SGX_RST bit.

1.5.2.1.3 Power Management

The SGX subsystem has its own power domain (SGX power domain). See the *Power, Reset, and Clock Management* chapter for additional information about the SGX power domain.

As described in the *SGX Integration* chapter, the SGX subsystem receives two clock signals from the PRCM module. The functional clock is used inside the SGX to generate clock signals to the multiple internal module SGX clock domains. The division ratio depends on the PRCM registers setting. For more information, see the *Power, Reset, and Clock Management* chapter.

Three power-management modes are defined:

- Deep power sleep (All clocks are gated.)
- Idle (2D and 3D clocks are gated.)
- 3D (No clock is gated.)

The SGX handles the automatic clock gating performed on the multiple internal module clock domains. SGX is in the same voltage domain as that of the Core logic. For more information refer to the *Power, Reset, Clock Management* chapter.

1.5.2.2 Hardware Requests

1.5.2.2.1 Interrupt Request

The SGX subsystem can generate one interrupt (SGX_IRQ) to the MPU subsystem interrupt controller mapped on M_IRQ_37.

1.5.3 SGX Functional Description

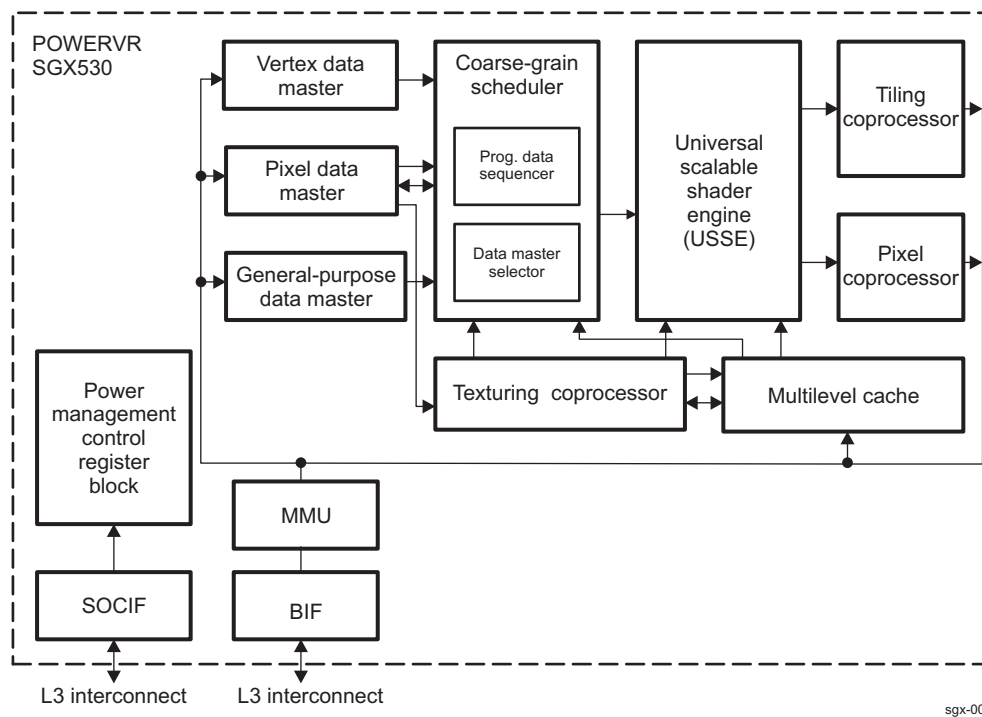

1.5.3.1 SGX Block Diagram

The SGX subsystem is based on the POWERVR® SGX530 core from Imagination Technologies. The architecture uses programmable and hard coded pipelines to perform various processing tasks required in 2D, 3D, and video processing. The SGX architecture comprises the following elements:

- Coarse grain scheduler
 - Programmable data sequencer (PDS)
 - Data master selector (DMS)
- Vertex data master (VDM)
- Pixel data master (PDM)
- General-purpose data master
- USSE
- Tiling coprocessor
- Pixel coprocessor
- Texturing coprocessor
- Multilevel cache

Figure 1-43 shows a block diagram of the SGX cores.

Figure 1-43. SGX Block Diagram

sgx-003

1.5.3.2 SGX Elements Description

The coarse grain scheduler (CGS) is the main system controller for the POWERVR SGX architecture. It consists of two stages, the DMS and the PDS. The DMS processes requests from the data masters and determines which tasks can be executed given the resource requirements. The PDS then controls the loading and processing of data on the USSE.

There are three data masters in the SGX core:

- The VDM is the initiator of transform and lighting processing within the system. The VDM reads an

input control stream, which contains triangle index data and state data. The state data indicates the PDS program, size of the vertices, and the amount of USSE output buffer resource available to the VDM. The triangle data is parsed to determine unique indices that must be processed by the USSE. These are grouped together according to the configuration provided by the driver and presented to the DMS.

- The PDM is the initiator of rasterization processing within the system. Each pixel pipeline processes pixels for a different half of a given tile, which allows for optimum efficiency within each pipe due to locality of data. It determines the amount of resource required within the USSE for each task. It merges this with the state address and issues a request to the DMS for execution on the USSE.
- The general-purpose data master responds to events within the system (such as end of a pass of triangles from the ISP, end of a tile from the ISP, end of render, or parameter stream breakpoint event). Each event causes either an interrupt to the host or synchronized execution of a program on the PDS. The program may, or may not cause a subsequent task to be executed on the USSE.

The USSE is a user-programmable processing unit. Although general in nature, its instructions and features are optimized for three types of task: processing vertices (vertex shading), processing pixels (pixel shading), and video/imaging processing.

The multilevel cache is a 2-level cache consisting of two modules: the main cache and the mux/arbitrer/demux/decompression unit (MADD). The MADD is a wrapper around the main cache module designed to manage and format requests to and from the cache, as well as providing Level 0 caching for texture and USSE requests. The MADD can accept requests from the PDS, USSE, and texture address generator modules. Arbitration, as well as any required texture decompression, are performed between the three data streams.

The texturing coprocessor performs texture address generation and formatting of texture data. It receives requests from either the iterators or USSE modules and translates these into requests in the multilevel cache. Data returned from the cache are then formatted according to the texture format selected, and sent to the USSE for pixel-shading operations.

To process pixels in a tiled manner, the screen is divided into tiles and arranged as groups of tiles by the tiling coprocessor. An inherent advantage of tiling architecture is that a large amount of vertex data can be rejected at this stage, thus reducing the memory storage requirements and the amount of pixel processing to be performed.

The pixel coprocessor is the final stage of the pixel-processing pipeline and controls the format of the final pixel data sent to the memory. It supplies the USSE with an address into the output buffer and then USSE returns the relevant pixel data. The address order is determined by the frame buffer mode. The pixel coprocessor contains a dithering and packing function.

1.5.4 SGX Register Manual

CAUTION

All SGX registers are limited to 32-bit data accesses, 8- and 16-bit accesses are not allowed because they can corrupt register content.

1.5.4.1 SGX OCP Register Summary

Table 1-74. SGX Registers Mapping Summary

Offset	Acronym	Register Description	Section

1.5.4.1.1 OCP Revision Register (OCP_REVISION)

The OCP Revision Register (OCP_REVISION) is shown in [Figure 1-44](#) and described in [Table 1-75](#).

Figure 1-44. OCP Revision Register (OCP_REVISION)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-75. OCP Revision Register (OCP_REVISION) Field Descriptions

Bit	Field	Value	Description
31-0	REVISIONID	0-FFFF FFFFh	Revision value.

1.5.4.1.2 Hardware Implementation Information Register (OCP_HWINFO)

The Hardware Implementation Information Register (OCP_HWINFO) is shown in [Figure 1-45](#) and described in [Table 1-76](#).

Figure 1-45. Hardware Implementation Information Register (OCP_HWINFO)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-76. Hardware Implementation Information Register (OCP_HWINFO) Field Descriptions

Bit	Field	Value	Description
31-3	Reserved	0	Reserved.
2	MEM_BUS_WIDTH H	0	Memory bus width is 64 bits.
		1	Memory bus width is 128 bits
1-0	SYS_BUS_WIDTH	0	System bus width is 32 bits.
		1	System bus width is 64 bits.
		2h	System bus width is 128 bits.
		3h	Reserved.

1.5.4.1.3 System Configuration Register (OCP_SYSCONFIG)

The System Configuration Register (OCP_SYSCONFIG) is shown in [Figure 1-46](#) and described in [Table 1-77](#).

Figure 1-46. System Configuration Register (OCP_SYSCONFIG)

31	6	5	4	3	2	1	0

Bit	Field	Value	Description
31-1	Reserved	0	Reserved.
0	TARGET_SINTERRUPT_S TATUS		Interrupt 1 - slave port status event.
		0	Read: No event pending.
		1	Read: Event pending and interrupt enabled.
		0	Write: No action.
		1	Write: Clear event.

1.5.4.1.10 Enable Interrupt 0 Register (OCP_IRQENABLE_SET_0)

The Enable Interrupt 0 Register (OCP_IRQENABLE_SET_0) is shown in [Figure 1-53](#) and described in [Table 1-84](#).

Figure 1-53. Enable Interrupt 0 Register (OCP_IRQENABLE_SET_0)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-84. Enable Interrupt 0 Register (OCP_IRQENABLE_SET_0) Field Descriptions

Bit	Field	Value	Description
31-1	Reserved	0	Reserved.
0	INIT_MINTERRUPT_ENABLE		Enable interrupt 0 - master port.
		0	Read: Interrupt is enabled.
		1	Read: Interrupt is disabled.
		0	Write: No action.
		1	Write: Enable interrupt.

1.5.4.1.11 Enable Interrupt 1 Register (OCP_IRQENABLE_SET_1)

The Enable Interrupt 1 Register (OCP_IRQENABLE_SET_1) is shown in [Figure 1-54](#) and described in [Table 1-85](#).

Figure 1-54. Enable Interrupt 1 Register (OCP_IRQENABLE_SET_1)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Bit	Field	Value	Description
31-1	Reserved	0	Reserved.
0	TARGET_SINTERRUPT_DISABLE		Disable interrupt 1 - slave port.
		0	Read: Interrupt is enabled.
		1	Read: Interrupt is disabled.
		0	Write: No action.
		1	Write: Disable interrupt.

1.5.4.1.15 Disable Interrupt 2 Register (OCP_IRQENABLE_CLR_2)

The Disable Interrupt 2 Register (OCP_IRQENABLE_CLR_2) is shown in [Figure 1-58](#) and described in [Table 1-89](#).

Figure 1-58. Disable Interrupt 2 Register (OCP_IRQENABLE_CLR_2)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-89. Disable Interrupt 2 Register (OCP_IRQENABLE_CLR_2) Field Descriptions

Bit	Field	Value	Description
31-1	Reserved	0	Reserved.
0	THALIA_IRQ_DISABLE		Disable interrupt 2 - Thalia (core) interrupt.
		0	Read: Interrupt is enabled.
		1	Read: Interrupt is disabled.
		0	Write: No action.
		1	Write: Disable interrupt.

1.5.4.1.16 Configure Memory Page Register (OCP_PAGE_CONFIG)

The Configure Memory Page Register (OCP_PAGE_CONFIG) is shown in [Figure 1-58](#) and described in [Table 1-89](#).

Figure 1-59. Configure Memory Page Register (OCP_PAGE_CONFIG)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

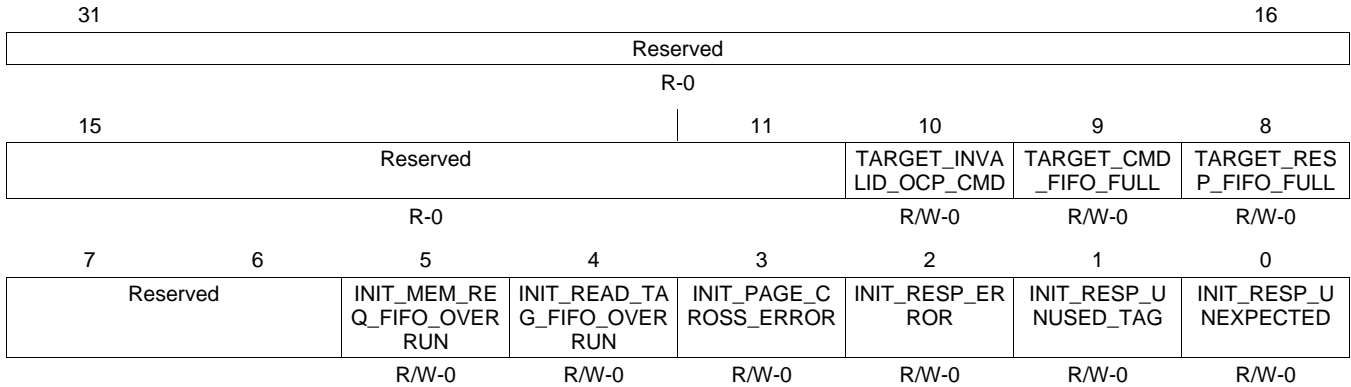

Table 1-90. Configure Memory Page Register (OCP_PAGE_CONFIG) Field Descriptions

Bit	Field	Value	Description
31-5	Reserved	0	Reserved.
4-3	OCP_PAGE_SIZE	0 1h 2h 3h	Defines the page size on OCP memory interface. Page size is 4 KB. Page size is 2 KB. Page size is 1 KB. Page size is 520 B.
2	MEM_PAGE_CHECK_EN	0 1	Enable page boundary checking. Page boundary checking disabled. Page boundary checking enabled.
1-0	MEM_PAGE_SIZE	0 1h 2h 3h	Defines the page size on internal memory interface. Page size is 4 KB. Page size is 2 KB. Page size is 1 KB. Page size is 520 B.

1.5.4.1.17 Interrupt Events Register (OCP_INTERRUPT_EVENT)

The Interrupt Events Register (OCP_INTERRUPT_EVENT) is shown in [Figure 1-60](#) and described in [Table 1-91](#).

Figure 1-60. Interrupt Events Register (OCP_INTERRUPT_EVENT)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-91. Interrupt Events Register (OCP_INTERRUPT_EVENT) Field Descriptions

Bit	Field	Value	Description
31-11	Reserved	0	Reserved.
10	TARGET_INVALID_OCP_CMD	0	Invalid command from OCP
		0	Read: No event pending.
		1	Read: Event pending.
		0	Write: Clear the event.
9	TARGET_CMD_FIFO_FULL	1	Write: Set event and interrupt if enabled (debug only).
		0	Command FIFO full.
		0	Read: No event pending.
		1	Read: Event pending.
7-6	Reserved	0	Write: Clear the event.
		1	Write: Set event and interrupt if enabled (debug only).
		0	Reserved.
		0	Reserved.
5	INIT_MEM_REQ_FIFO_OVERRUN	1	Memory request FIFO overrun.
		0	Read: No event pending.
		1	Read: Event pending.
		0	Write: Clear the event.
4	INIT_READ_TAG_FIFO_OVERRUN	1	Write: Set event and interrupt if enabled (debug only).
		0	Read tag FIFO overrun.
		0	Read: No event pending.
		1	Read: Event pending.
3	INIT_PAGE_CROSS_ERROR	0	Write: Clear the event.
		1	Write: Set event and interrupt if enabled (debug only).
		0	Memory page had been crossed during a burst.
		1	Read: Event pending.
2	INIT_RESP_ERROR	0	Read: No event pending.
		1	Read: Event pending.
		0	Receiving error response.

Table 1-91. Interrupt Events Register (OCP_INTERRUPT_EVENT) Field Descriptions (continued)

Bit	Field	Value	Description
		0	Write: Clear the event.
		1	Write: Set event and interrupt if enabled (debug only).
1	INIT_RESP_UNUSED_TAG		Receiving response on an unused tag.
		0	Read: No event pending.
		1	Read: Event pending.
		0	Write: Clear the event.
		1	Write: Set event and interrupt if enabled (debug only).
0	INIT_RESP_UNEXPECTED		Receiving response when not expected.
		0	Read: No event pending.
		1	Read: Event pending.
		0	Write: Clear the event.
		1	Write: Set event and interrupt if enabled (debug only).

1.5.4.1.18 Configuration of Debug Modes Register (OCP_DEBUG_CONFIG)

The Configuration of Debug Modes Register (OCP_DEBUG_CONFIG) is shown in [Figure 1-61](#) and described in [Table 1-92](#).

Figure 1-61. Configuration of Debug Modes Register (OCP_DEBUG_CONFIG)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-92. Configuration of Debug Modes Register (OCP_DEBUG_CONFIG) Field Descriptions

Bit	Field	Value	Description
31	THALIA_INT_BYPASS	0 1	Bypass OCP IPG interrupt logic. Don't Bypass. Bypass core interrupt to IO pin, ie disregard the interrupt enable setting in IPG register.
30-6	Reserved	0	Reserved.
5	SELECT_INIT_IDLE	0 1	To select which idle the disconnect protocol should act on 0. Whole SGX Idle. OCP initiator idle only
4	FORCE_PASS_DATA	0 1	Forces the initiator to pass data independent of disconnect protocol. Normal mode. Don't force. Never fence request to OCP.
3-2	FORCE_INIT_IDLE	0 1h 2h 3h	Forces the OCP master port to Idle. Normal mode. No force. Force port to be always Idle. Forces target port to never be in Idle mode. Normal mode. No force.
1-0	FORCE_TARGET_IDLE	0 1h 2h 3h	Forces the OCP target port to Idle. Normal mode. No force. Force port to be always Idle. Forces target port to never be in Idle mode. Normal mode. No force.

1.5.4.1.19 Debug Status Register (OCP_DEBUG_STATUS)

The Debug Status Register (OCP_DEBUG_STATUS) is shown in [Figure 1-62](#) and described in [Table 1-93](#).

Figure 1-62. Debug Status Register (OCP_DEBUG_STATUS)

31	30	29	28	27	26	25	24

Table 1-93. Debug Status Register (OCP_DEBUG_STATUS) Field Descriptions

Bit	Field	Value	Description
31	CMD_DEBUG_STATE	0 1	Target command state machine Idle. Accept command.
30	CMD_RESP_DEBUG_STATE	0 1	Target response state machine. Send accept. Wait accept.
29	TARGET_IDLE	0-1	Target idle.
28	RESP_FIFO_FULL	0-1	Target response FIFO full.
27	CMD_FIFO_FULL	0-1	Target command FIFO full.
26	RESP_ERROR	0-1	Respond to OCP with error, which could be caused by either address misalignment or invalid byte enable.
25-21	WHICH_TARGET_REGISTER	0-1Fh	Indicates which OCP target registers to read.
20-18	TARGET_CMD_OUT	0 1h 2h 3h 4h 5h 6h 7h	Command received from OCP. Command WRSYS received. Command RDSYS received. Command WR_ERROR received. Command RD_ERROR received. Command CHK_WRADDR_PAGE received. Not used. Command CHK_RDADDR_PAGE received. Not used. Command TARGET_REG_WRITE received. Command TARGET_REG_READ received.
17	INIT_MSTANDBY	1-0	Status of init_MStandby signal.
16	INIT_MWAIT	1-0	Status of init_MWait signal.
15-14	INIT_MDISCREQ	0 1h	Disconnect status of the OCP interface. State is FUNCT. State is SLEEP TRANS

Table 1-93. Debug Status Register (OCP_DEBUG_STATUS) Field Descriptions (continued)

Bit	Field	Value	Description
		2h	Reserved.
		3h	State is IDLE.
13	INIT_MDISCACK	0	Memory request FIFO full. Read: No event pending.
		1	Read: Event pending.
		0	Write: Clear the event.
		1	Write: Set the event and interrupt if enabled (debug only)
12	INIT_SCONNECT2	0	Defines whether to wait in M_WAIT state for MConnect FSM. Skip M_WAIT state.
		1	Wait in M_WAIT state.
11	INIT_SCONNECT1	0	Defines the busy-ness state of the slave. Slave is drained.
		1	Slave is loaded.
10	INIT_SCONNECT0	0	Disconnect from slave. Disconnect request from slave.
		1	Connect request from slave.
9-8	INIT_MCONNECT	0	Initiator MConnect state. State is M_OFF.
		1h	State is M_WAIT.
		2h	State is M_DISC.
		3h	State is M_CON.
7-6	TARGET_SIDLEACK	0	Acknowledge the SidleAck state machine. State is FUNCT.
		1h	State is SLEEP TRANS.
		2h	Reserved.
		3h	State is IDLE.
5-4	TARGET_SDISCACK	0	Acknowledge the SDiscAck state machine. State is FUNCT.
		1h	State is SLEEP TRANS.
		2h	Reserved.
		3h	State is IDLE.
3	TARGET_SIDLEREQ	0	Request the target to go idle. Don't go idle, or go active.
		1	Go idle.
2	TARGET_SCONNECT	0	Target SConnect state. Disconnect interface.
		1	Connect OCP interface.
1-0	TARGET_MCONNECT	0	Target MConnect state. Target is in M_OFF state.
		1h	Target is in M_WAIT disconnect state.
		2h	Target is in M_DISC state.
		3h	Target is in M_CON state.

1.6 Device Interrupts and EDMA Events

1.6.1 Interrupt Controllers

The device has a large number of interrupts to service the needs of its many peripherals and subsystems. The ARM Cortex-A8, C674x DSP, and Media Controller are capable of servicing these interrupts via their integrated interrupt controllers. In addition, the C674x DSP and Media Controller interrupt controllers are preceded by an Interrupt Controller Crossbar that provides flexibility in mapping the device interrupts to processor interrupts. For more information about crossbars, see the *Control Module* chapter.

Cortex™-A8 MPU Subsystem Interrupt Controller

The ARM Cortex-A8 Interrupt Controller (AINTC) is responsible for prioritizing all service requests from the system peripherals and generating either IRQs or FIQs to the Cortex-A8. The AINTC has the capability to handle up to 128 requests, and the priority of the interrupt inputs is programmable. [Table 1-94](#) lists the interrupt sources for the AINTC.

For detailed information about this module, see the *ARM Interrupt Controller (AINTC)* chapter.

DSP subsystem (DSPSS) Interrupt Controller

The C674x DSPx interrupt controller combines up to 128 interrupts into 12 prioritized interrupts presented to the CPU. The default sources of the 128 interrupts are shown in [Table 1-95](#). In addition, device interrupts 15 through 95 can alternatively be sourced through the DSP's Interrupt Crossbar from one of the 31 multiplexed device interrupts shown in [Table 1-96](#). The DSP_INTMUX_x registers in the Control Module are used to select between the default interrupt and the multiplexed interrupt. The interrupt controller also controls the generation of the CPU exceptions, NMI, and emulation interrupts.

For detailed information about this module, refer to Chapter 7 of the [TMS320C674x DSP Megamodule](#).

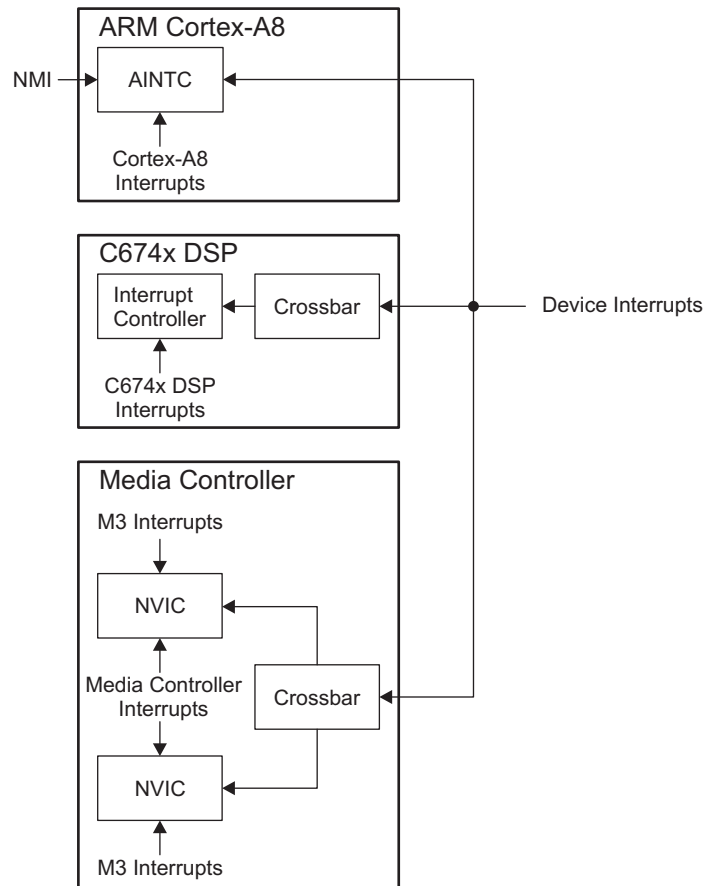

Media Controller Interrupt Controllers

A Nested Vectored Interrupt Controller (NVIC) is integrated within each Cortex-M3. The interrupt mapping is the same for the two cores to facilitate parallel processing. The default sources of the 79 interrupts are shown in [Table 1-97](#). In addition, device interrupts 23 through 79 can alternatively be sourced through the Media Controller's Interrupt Crossbar from one of the 63 multiplexed device interrupts shown in [Table 1-98](#). The Media_Controller_INTMUX_x registers in the Control Module are used to select between the default interrupt and the multiplexed interrupt. The NVIC supports:

- 64 external interrupts (in addition to 16 Cortex-M3 internal interrupts), which are dynamically prioritized with 16 levels of priority defined for each core
- Low-latency exception and interrupt handling
- Prioritization and handling of exceptions
- Control of the local power management
- Debug accesses to the processor core

For detailed information about this module, refer to *ARM Cortex-M3 Technical Reference Manual* (available at infocenter.arm.com/help/index.jsp).

[Figure 1-63](#) shows the top-level block diagram of the interrupt controllers in this device.

Figure 1-63. Device Interrupt Controllers

1.6.2 Interrupt Requests to Cortex-A8 MPU INTC

Table 1-94 shows the Cortex-A8 MPU INTC interrupt mapping.

Table 1-94. Cortex-A8 MPU INTC Interrupt Mapping

Interrupt Number	Interrupt Event	Interrupt Source	Description
0	EMUINT	CORTEX-A8	Cortex-A8 Emulation Interrupt
1	COMMTX	CORTEX-A8	Cortex-A8 Emulation Interrupt
2	COMMRX	CORTEX-A8	Cortex-A8 Emulation Interrupt
3	BENCH	CORTEX-A8	Cortex-A8 Emulation Interrupt
4	ELM_IRQ	ELM	ELM Error Location Process Completion Interrupt
5	Reserved	Reserved	Reserved
6	Reserved	Reserved	Reserved
7	NMI	External Pin	NMI Pin Interrupt
8	Reserved	Reserved	Reserved
9	L3DEBUG	L3	L3 Debug Error Interrupt
10	L3APPINT	L3	L3 Application Error Interrupt
11	TINT8	Timer8	Timer8 Interrupt
12	EDMA3CC_INT0	EDMA TPCC (EDMA3CC)	EDMA3CC Region 0 DMA Completion Interrupt
13	EDMA3CC_MPINT	EDMA3CC	EDMA3CC Memory Protection Error Interrupt

Table 1-94. Cortex-A8 MPU INTC Interrupt Mapping (continued)

Interrupt Number	Interrupt Event	Interrupt Source	Description
14	EDMA3CC_ERRINT	EDMA3CC	EDMA3CC Error Interrupt
15	WDTINT	WDTIMER0	Watchdog Timer 0 Interrupt
16	SATAINT	SATA	SATA Module Interrupt
17	USBSSINT	USBSS	USBSS Queue MGR or CPPI Completion Interrupt
18	USBINT0	USBSS	USB0 RX/TX DMA, Endpoint Ready/Error Interrupt

1.6.5 EDMA Channel Synchronization Events

The EDMA channel controller supports up to 64 channels which service peripherals and memory. Each EDMA channel is mapped to a default EDMA synchronization event as shown in Table 1-99. In addition, each EDMA channel can alternatively be mapped through a crossbar to one of the 31 multiplexed EDMA synchronization events shown in Table 1-100. The EDMA3CC_EVTMUX_x registers in the Control Module are used to select between the default event and the multiplexed events for each channel.

For more detailed information on the EDMA module and how EDMA events are enabled, captured, processed, linked, chained, cleared, and more, see the *Enhanced Direct Memory Access Controller* chapter.

Figure 1-64 shows the top-level block diagram of the EDMA channel synchronization events.

1.7 Inter-Processor Communication

This SoC is a heterogeneous multi-core device, which requires software to efficiently manage and communicate between the cores. The following are the main features that need to be implemented by any such software:

1. Device management of the slave processors from the host processor.
2. Inter-processor communication between the cores for transfer and exchange of information between them.

In this SoC, the host processor is usually the Cortex A8. This processor is responsible for boot-loading the slave processors (Video-M3, VPSS-M3).

Boot-loading includes power management of the slaves (power-up/down and other power management), reset control (reset/release of the slave processor) and setting the entry point of the slave executable into the appropriate register.

For implementing efficient Inter-Processor Communication between the multiple cores on the device, certain hardware features are provided:

- Mailbox interrupts
- Hardware Spinlocks

1.7.1 Reset Requirements

This SoC has a power on reset (POR) and warm reset. For the POR reset, the A8 is taken out of reset and it boots from its boot ROM. Once booted, the A8 will boot load the VPSS M3 and Video M3.

1.7.2 Features

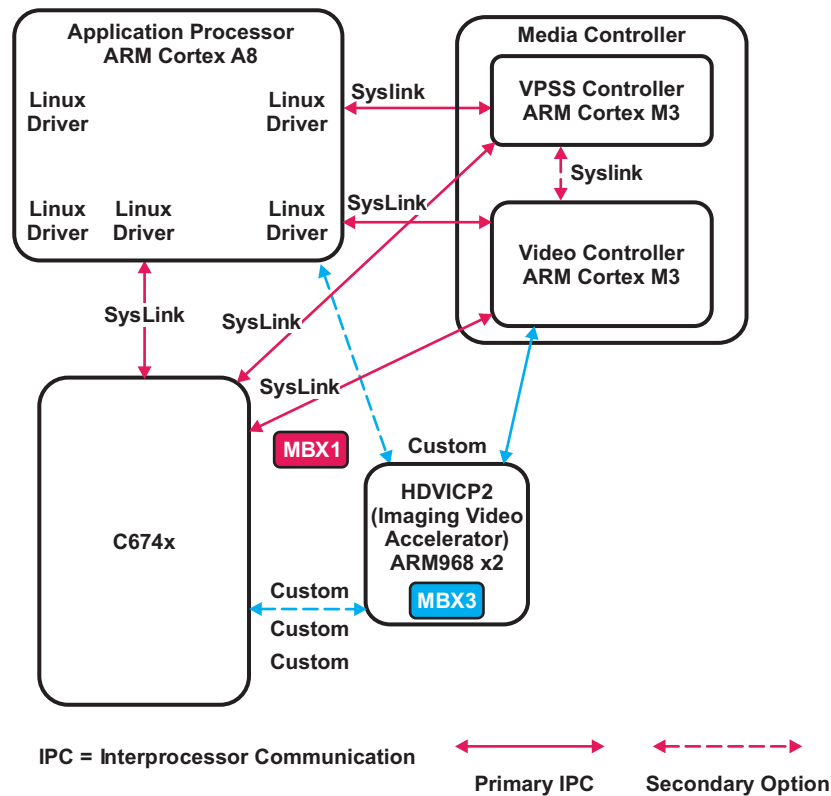

Different methods of IPC are used between the various processing elements in the SoC:

- Custom IPC – This is an IPC that doesn't use any standard IPC software.
- SysLink – This is a new implementation of the BIOS Link that allows communication between the processors in the SoC. SysLink includes ProcMgr module for device management of the slave cores (Video-M3, VPSS-M3, C674x™). The Notify method is the API for responding to interrupts. SysLink also incorporates full IPC features including MessageQ, RingIO, and FrameQ.

1.7.3 Overview and Strategy

Figure 1-65 depicts the processing elements that are part of the SoC.

Figure 1-65. IPC Overview Diagram

The SoC contains Mailbox and Spinlock hardware to facilitate the IPC mechanism.

Mailboxes provide a mechanism for one processor to write a value to a register and send an interrupt to another processor. One system level mailbox is provided for the IPCs between the A8, the C674x™, and the Media M3s. The HDVICP2 has its own mailbox within its IP module. The SoC shall provide Spinlocks to facilitate Mutexes for access to shared resources in the system.

Mailboxes and Spinlocks will be discussed in more detail later in this document.

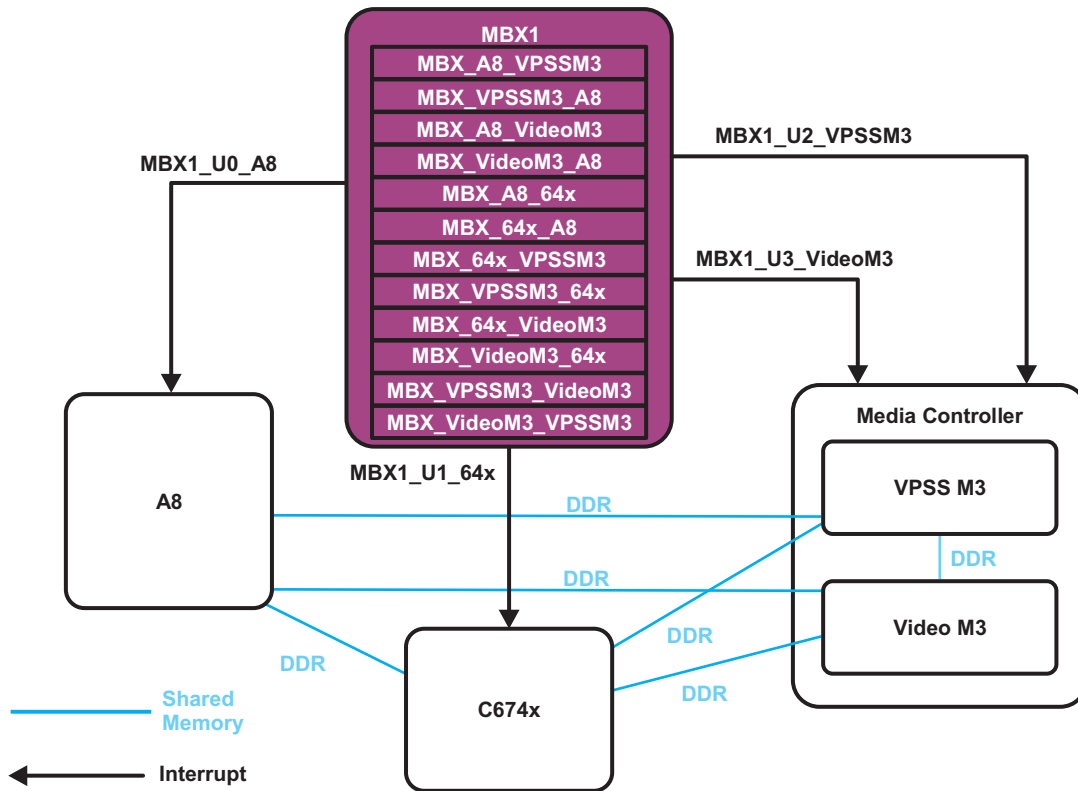

It is intended that the following IPC mechanisms shall be used between various processors:

- SysLink / IPC
 - A8 to C674x™
 - A8 to Video M3
 - A8 to VPSS M3
 - Video M3 to VPSS M3
 - C674x™ to VideoM3
 - C674x™ to VPSS M3
- Custom
 - Video M3 to HDVICP2

1.7.3.1 System IPCs

Figure 1-66 depicts how Mailbox 1 (MBX1) will be used for system IPCs. Four interrupts are generated from the mailbox that allows the A8, C674x™, VPSS M3, and Video M3 to communicate. DDR is used as the shared memory interface. An IPC can be created between any of the processors listed. The A8 will communicate to the C674x™, Video M3 and VPSS M3 using SysLink.

Figure 1-66. System IPCs

1.7.4 IPC Component Configuration

1.7.4.1 Shared Memory

Shared memory will be used as necessary for the IPCs of the system and it is important that cache coherency is maintained.

1.7.4.2 IPC Interrupt Module - Mailboxes

Interrupts used by IPCs are generated from mailbox modules.

All mailboxes use interrupts with both an active high level and active low level. The appropriate type of interrupt is connected to each processor based on the characteristics of that processor.

Each mailbox provides two messages per mailbox submodule.

1.7.4.3 Hardware Spinlocks

Spinlocks are pared down semaphores designed to provide direct access mutex support without the need for interrupt generator or queues. Spinlocks can be used very effectively as a mechanism to protect data structures in shared memory space that might be accessed by multiple processing cores simultaneously. They can be utilized if the following conditions apply:

1. The time to hold the lock is predictable and small. (How small is a hardware/software system design consideration. For example a maximum hold time of less than 200 CPU cycles may be acceptable).
2. The locking task cannot be preempted or suspended or interrupted while holding the lock. (This would make the hold time large and unpredictable).
3. The lock is lightly contended, i.e., the chance of any other process (or processor) trying to acquire the lock while it is held is small.

If these conditions hold, then the locking code can retry a failed attempt to acquire the lock until success.

The spin lock unit is responsible for providing hardware assistance for synchronizing the processes running on multiple processors in the device:

- The application processor (ARM Cortex-A8)
- C674x™

Note that the HDVICP2 can't access the L3/L4 switch fabric, so IPCs to the HDVICP2 can't use spinlocks.

Hardware spinlocks are used by SysLink and IPC products to provide multi-core mutual-exclusion between the processors on this SoC. This is used to protect access to control structures in shared memory. In addition spinlocks can provide a mutual exclusion mechanism that could be used in a system level resource manager.

This SoC has 128 spinlocks for the system.

Table 1-101. Hardware Spinlock Configuration

Hardware Spinlocks	Name	Configuration
0..127	SPINLOCK_0 .. SPINLOCK_127	No configurable options

1.8 Mailbox

1.8.1 Overview

Communication between the on-chip processors of the device uses a queued mailbox-interrupt mechanism.

The queued mailbox-interrupt mechanism allows the software to establish a communication channel between two processors through a set of registers and associated interrupt signals by sending and receiving messages (mailboxes).

There are two mailbox module instances in the device:

- System mailbox - used for Cortex-A8 microprocessor unit (Cortex-A8 MPU) and digital signal processor (DSP) communications.
- HDVICP2 mailbox - used for communication between one internal to the HDVICP2 subsystem user (imaging controller 1 - iCont1, or imaging controller 2 - iCont2) and three external to the HDVICP2 subsystem users (Cortex-A8 MPU, DSP and Video M3). This communication is insured through three pairs of mailboxes.

The mailbox module includes the following features:

- Four users for the system mailbox instance (Cortex-A8 MPU, DSP and Media Controller Subsystem) or four users for the HDVICP2 mailbox instance (iCont1/iCont2, Cortex-A8 MPU, DSP and Video-M3 MPU)
- Four mailbox message queues for the system mailbox instance/six mailbox message queues for the HDVICP2 mailbox instance
- Flexible assignment of receiver and sender for each mailbox through interrupt configuration
- Four interrupts (one per user) for the system mailbox instance/four interrupts (one per user) for the HDVICP2 mailbox instance
- 32-bit message width
- Four-message FIFO depth for each message queue
- Message reception and queue-not-full notification using interrupts
- Support of 16-/32-bit addressing scheme
- Power management support

1.8.2 System Mailbox Integration

This section describes the system mailbox integration in the device, including information about clocks, resets, and hardware requests. [Figure 1-67](#) shows the system mailbox integration.

[Table 1-102](#) through [Table 1-104](#) summarize the system mailbox integration in the device.

Figure 1-67. System Mailbox Integration

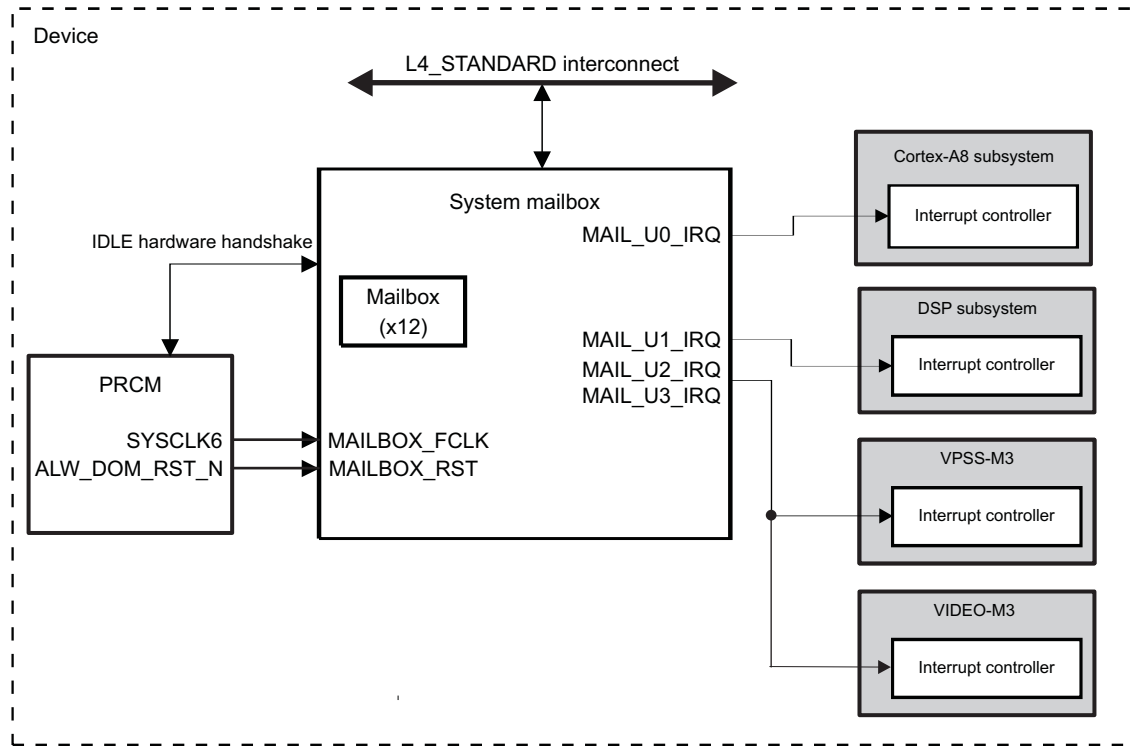

Table 1-102. Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect
SYSTEM_MAILBOX	PD_ALWAYS_ON	L4_STANDARD

Table 1-103. Clocks and Resets

Clocks				
Module Instance	Destination Signal Name	Source Signal	Source	Description
SYSTEM_MAILBOX	MAILBOX_FCLK	SYSCLK6	PRCM	Mailbox interface clock. This clock is used for all interface and functional operations.
Resets				
Module Instance	Destination Signal Name	Source Signal	Source	Description
SYSTEM_MAILBOX	MAILBOX_RST	ALW_DOM_RST_N	PRCM	Mailbox hardware reset. This reset is asynchronously applied to the Mailbox registers

Table 1-104. Hardware Requests

Table 1-104. Hardware Requests (continued)

Module Instance	Source Signal Name	Destination Signal	Destination	Description
	MAIL_U1_IRQ	D_IRQ_56	DSP	System Mailbox user 1 interrupt

1.8.3 Functional Description

This device has the following mailbox instances:

- System mailbox
- HDVICP2 mailbox

Table 1-105 shows Mailbox Implementation in this device, where u is the user number and m is the mailbox number.

Table 1-105. Mailbox Implementation

Mailbox Type	User Number(u)	Mailbox Number(m)	Messages per Mailbox
System mailbox	0 to 3	0 to 11	4
HDVICP2 mailbox	0 to 3	0 to 5	4

The mailbox module provides a means of communication through message queues among the users (depending on the mailbox module instance). The individual mailbox modules (12 for the system mailbox instance, six for the HDVICP2 mailbox instance), or FIFOs, can associate (or de-associate) with any of the processors using the MAILBOX_IRQENABLE_SET_u (or MAILBOX_IRQENABLE_CLR_u) register.

The system mailbox module includes the following user subsystems:

- User 0: Cortex-A8 MPU subsystem (u = 0)
- User 1: DSP subsystem (u = 1)

The HDVICP2 mailbox module includes the following user subsystems, where x=0,1,2.:

- User 0: Cortex-A8 MPU subsystem (u = 0)
- User 1: DSP subsystem (u = 1)
- User 2: HDVICP2 subsystem - only available to the HDVICP2 mailbox instance (u = 3)

Each user has a dedicated interrupt signal from the corresponding mailbox module instance and dedicated interrupt enabling and status registers. Each MAILBOX_IRQSTATUS_RAW_u/MAILBOX_IRQSTATUS_CLR_u interrupt status register corresponds to a particular user.

For the system mailbox instance, a user can query its interrupt status register through the L4_STANDARD interconnect.

For the HDVICP2 mailbox instance, a user can query its interrupt status register as follows:

- Cortex-A8 MPU and DSP - through the L3 interconnect
- iCont1/iCont2 and DSP - private access (directly through the HDVICP2 and DSP local interconnect respectively)

1.8.3.1 Mailbox Block Diagram

Figure 1-68 shows the mailbox block diagram.

Figure 1-68. Mailbox Block Diagram

1.8.3.2 Software Reset

The mailbox module supports a software reset through the MAILBOX_SYSCONFIG[0].SOFTRESET bit. Setting this bit to 1 enables an active software reset that is functionally equivalent to a hardware reset. Reading the MAILBOX_SYSCONFIG[0] SOFTRESET bit gives the status of the software reset:

- Read 1: the software reset is on-going
- Read 0: the software reset is complete

The software must ensure that the software reset completes before doing mailbox operations.

1.8.3.3 Power Management

Table 1-106 describes power-management features available for the mailbox module.

Table 1-106. Local Power Management Features

Feature	Registers	Description
Clock autogating	NA	Feature not available
Slave idle modes	MAILBOX_SYSCONFIG[3:2].SIDLEMODE	Force-idle, no-idle and smart-idle modes are available
Clock activity	NA	Feature not available
Master standby modes	NA	Feature not available
Global wake-up enable	NA	Feature not available
Wake-up sources enable	NA	Feature not available

The mailbox module can be configured using the MAILBOX_SYSCONFIG[3:2] SIDLEMODE bit field to one of the following acknowledgment modes:

- Force-idle mode (SIDLEMODE = 0x0): The mailbox module immediately enters the idle state on receiving a low-power-mode request from the PRCM module. In this mode, the software must ensure that there are no asserted output interrupts before requesting this mode to go into the idle state.
- No-idle mode (SIDLEMODE = 0x1): The mailbox module never enters the idle state.
- Smart-idle mode (SIDLEMODE = 0x2): After receiving a low-power-mode request from the PRCM module, the mailbox module enters the idle state only after all asserted output interrupts are acknowledged.

1.8.3.4 Interrupt Requests

An interrupt request allows the user of the mailbox to be notified when a message is received or when the message queue is not full. There is one interrupt per user. [Table 1-107](#) lists the event flags, and their mask, that can cause module interrupts.

Table 1-107. Interrupt Events

Non-Maskable Event Flag ⁽¹⁾	Maskable Event Flag	Event Mask Bit	Event Unmask Bit	Description
MAILBOX_IRQSTATUS_RAW_u[0+m*2].NEWMMSGSTATUSUUMBm	MAILBOX_IRQSTATUS_CLR_u[0+m*2].NEWMMSGSTATUSUUMBm	MAILBOX_IRQENABLE_CLR_u[0+m*2].		
MAILBOX_IRQSTATUS_RAW_u[0+m*2].NEWMMSGSTATUSUUMBm	MAILBOX_IRQSTATUS_CLR_u[0+m*2].NEWMMSGSTATUSUUMBm	MAILBOX_IRQENABLE_CLR_u[0+m*2]. NEWMMSGSTATUSUUMBm	MAILBOX_IRQENABLE_SET_u[0+m*2]. NEWMMSGSTATUSUUMBm	Mailbox m receives a new message
MAILBOX_IRQSTATUS_RAW_u[1+m*2].NOTFULLSTATUSUMBm	MAILBOX_IRQSTATUS_CLR_u[1+m*2].NOTFULLSTATUSUMBm	MAILBOX_IRQENABLE_CLR_u[1+m*2]. NOTFULLSTATUSUMBm	MAILBOX_IRQENABLE_SET_u[1+m*2]. NOTFULLSTATUSUMBm	Mailbox m message queue is not full

⁽¹⁾ MAILBOX.MAILBOX_IRQSTATUS_RAW_u register is mostly used for debug purposes.

CAUTION

Once an event generating the interrupt request has been processed by the software, it must be cleared by writing a logical 1 in the corresponding bit of the MAILBOX_IRQSTATUS_CLR_u register. Writing a logical 1 in a bit of the MAILBOX_IRQSTATUS_CLR_u register will also clear to 0 the corresponding bit in the appropriate MAILBOX_IRQSTATUS_RAW_u register.

An event can generate an interrupt request when a logical 1 is written to the corresponding unmask bit in the MAILBOX_IRQENABLE_SET_u register. Events are reported in the appropriate MAILBOX_IRQSTATUS_CLR_u and MAILBOX_IRQSTATUS_RAW_u registers.

An event stops generating interrupt requests when a logical 1 is written to the corresponding mask bit in the MAILBOX_IRQENABLE_CLR_u register. Events are only reported in the appropriate MAILBOX_IRQSTATUS_RAW_u register.

In case of the MAILBOX_IRQSTATUS_RAW_u register, the event is reported in the corresponding bit even if the interrupt request generation is disabled for this event.

1.8.3.5 Assignment

1.8.3.5.1 Description

To assign a receiver to a mailbox, set the new message interrupt enable bit corresponding to the desired mailbox in the MAILBOX_IRQENABLE_SET_u register. The receiver reads the MAILBOX_MESSAGE_m register to retrieve a message from the mailbox.

An alternate method for the receiver that does not use the interrupts is to poll the MAILBOX_FIFOSTATUS_m and/or MAILBOX_MSGSTATUS_m registers to know when to send or retrieve a message to or from the mailbox. This method does not require assigning a receiver to a mailbox. Because this method does not include the explicit assignment of the mailbox, the software must avoid having multiple receivers use the same mailbox, which can result in incoherency.

To assign a sender to a mailbox, set the queue-not-full interrupt enable bit of the desired mailbox in the MAILBOX_IRQENABLE_SET_u register, where u is the number of the sending user. However, direct allocation of a mailbox to a sender is not recommended because it can cause the sending processor to be constantly interrupted.

It is recommended that register polling be used to:

- Check the status of either the MAILBOX_FIFOSTATUS_m or MAILBOX_MSGSTATUS_m registers
- Write the message to the corresponding MAILBOX_MESSAGE_m register, if space is available

The sender might use the queue-not-full interrupt when the initial mailbox status check indicates the mailbox is full. In this case, the sender can enable the queue-not-full interrupt for its mailbox in the appropriate MAILBOX_IRQENABLE_SET_u register. This allows the sender to be notified by interrupt only when a FIFO queue has at least one available entry.

Reading the MAILBOX_IRQSTATUS_CLR_u register determines the status of the new message and the queue-not-full interrupts for a particular user. Writing 1 to the corresponding bit in the MAILBOX_IRQSTATUS_CLR_u register acknowledges, and subsequently clears, an interrupt.

CAUTION

Assigning multiple senders or multiple receivers to the same mailbox is not recommended.

1.8.3.6 Sending and Receiving Messages

1.8.3.6.1 Description

When a 32-bit message is written to the MAILBOX_MESSAGE_m register, the message is appended into the FIFO queue. This queue holds four messages. If the queue is full, the message is discarded. Queue overflow can be avoided by first reading the MAILBOX_FIFOSTATUS_m register to check that the mailbox message queue is not full before writing a new message to it. Reading the MAILBOX_MESSAGE_m register returns the message at the beginning of the FIFO queue and removes it from the queue. If the FIFO queue is empty when the MAILBOX_MESSAGE_m register is read, the value 0 is returned. The new message interrupt is asserted when at least one message is in the mailbox message FIFO queue. To determine the number of messages in the mailbox message FIFO queue, read the MAILBOX_MSGSTATUS_m register.

1.8.3.7 16-Bit Register Access

1.8.3.7.1 Description

So that 16-bit processors can access the mailbox module, the module allows 16-bit register read and write access, with restrictions for the MAILBOX_MESSAGE_m registers. The 16-bit half-words are organized in little endian fashion; that is, the least-significant 16 bits are at the low address and the most-significant 16 bits are at the high address (low address + 0x02). All mailbox module registers can be read or written to directly using individual 16-bit accesses with no restriction on interleaving, except the MAILBOX_MESSAGE_m registers, which must always be accessed by either single 32-bit accesses or two consecutive 16-bit accesses.

CAUTION

When using 16-bit accesses to the MAILBOX_MESSAGE_m registers, the order of access must be the least-significant half-word first (low address) and the most-significant half-word last (high address). This requirement is because of the update operation by the message FIFO of the MAILBOX_MSGSTATUS_m registers. The update of the FIFO queue contents and the associated status registers and possible interrupt generation occurs only when the most-significant 16 bits of a MAILBOX_MESSAGE_m are accessed.

1.8.4 Programming Guide

1.8.4.1 Low-level Programming Models

This section covers the low-level hardware programming sequences for configuration and usage of the mailbox module.

1.8.4.1.1 Global Initialization

1.8.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the mailbox module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration of the mailbox.

See [Section 1.8.2](#) for further information.

Table 1-108. Global Initialization of Surrounding Modules for System Mailbox

Surrounding Modules	Comments
PRCM	Mailbox functional/interface clock must be enabled.
Interrupt Controllers	Cortex-A8 MPU or DSP interrupt controller must be configured to enable the interrupt request generation to the Cortex-A8 MPU or DSP subsystem.

Table 1-109. Global Initialization of Surrounding Modules for HDVICP2 Mailbox

Surrounding Modules	Comments
PRCM	Mailbox functional/interface clock must be enabled.
Interrupt Controllers	Cortex-A8 MPU or DSP or iCont1/iCont2 of HDVICP2 Subsystem interrupt controller must be configured to enable the interrupt request generation to the Cortex-A8 MPU or DSP subsystem or HDVICP2 Subsystem

Table 1-110. Global Initialization of Surrounding Modules for HDVICP2-1 Mailbox

Surrounding Modules	Comments
PRCM	Mailbox functional/interface clock must be enabled.
Interrupt Controllers	Cortex-A8 MPU or DSP or iCont1/iCont2 of HDVICP2-1 Subsystem interrupt controller must be configured to enable the interrupt request generation to the Cortex-A8 MPU or DSP subsystem or HDVICP2-1 Subsystem

Table 1-111. Global Initialization of Surrounding Modules for HDVICP2-2 Mailbox

Surrounding Modules	Comments
PRCM	Mailbox functional/interface clock must be enabled.
Interrupt Controllers	Cortex-A8 MPU or DSP or iCont1/iCont2 of HDVICP2-2 Subsystem interrupt controller must be configured to enable the interrupt request generation to the Cortex-A8 MPU or DSP subsystem or HDVICP2-2 Subsystem

1.8.4.1.1.2 Mailbox Global Initialization

1.8.4.1.1.2.1 Main Sequence - Mailbox Global Initialization

This procedure initializes the mailbox module after a power-on or software reset.

Table 1-112. Mailbox Global Initialization

	Register/Bitfield/Programming Model	Value
Perform a software reset	MAILBOX_SYSCONFIG[0].SOFTRESET	1
Wait until reset is complete	MAILBOX_SYSCONFIG[0].SOFTRESET	0
Set idle mode configuration	MAILBOX_SYSCONFIG[3:2].SIDLEMODE	0x-

1.8.4.1.2 Operational Modes Configuration

1.8.4.1.2.1 Main Sequence - Sending a Message (Polling Method)

Table 1-113. Sending a Message (Polling Method)

Step	Register/Bitfield/Programming Model	Value
IF : Is FIFO full ?	MAILBOX_FIFOSTATUS_m[0].FIFOFULL MB	=1h
Wait until at least one message slot is available	MAILBOX_FIFOSTATUS_m[0].FIFOFULL MB	=0h
ELSE		
Write message	MAILBOX_MESSAGE_m[31:0].MESSAG EVALUEMBM	----h
ENDIF		

1.8.4.1.2.2 Main Sequence - Sending a Message (Interrupt Method)

Table 1-114. Sending a Message (Interrupt Method)

Step	Register/Bitfield/Programming Model	Value
IF : Is FIFO full ?	MAILBOX_FIFOSTATUS_m[0].FIFOFULL MB	=1h
Enable interrupt event	MAILBOX_IRQENABLE_SET_u[1+ m*2]	1h
User(processor) can perform another task until interrupt occurs		
ELSE		
Write message	MAILBOX_MESSAGE_m[31:0].MESSAG EVALUEMBM	----h
ENDIF		

1.8.4.1.2.3 Main Sequence - Receiving a Message (Polling Method)

Table 1-115. Receiving a Message (Polling Method)

Step	Register/Bitfield/Programming Model	Value
IF : Number of messages is not equal to 0	MAILBOX_MSGSTATUS_m[2:0].NBOFM SGMB	!=0h
Read message	MAILBOX_MESSAGE_m[31:0].MESSAG EVALUEMBM	----h
ENDIF		

1.8.4.1.2.4 Main Sequence - Receiving a Message (Interrupt Method)

Table 1-116. Receiving a Message (Interrupt Method)

Step	Register/Bitfield/Programming Model	Value
Enable interrupt event	MAILBOX_IRQENABLE_SET_u[0 + m*2]	1h
User(processor) can perform anothr task until interrupt occurs		

1.8.4.1.3 Events Servicing

1.8.4.1.3.1 Sending Mode

Table 1-117 describes the events servicing in sending mode.

Table 1-117. Events Servicing in Sending Mode

Step	Register/Bitfield/Programming Model	Value
Read interrupt status bit	MAILBOX_IRQSTATUS_CLR_u[1 + m*2]	1
Write message	MAILBOX_MESSAGE_m[31:0].MESSAG EVALUEMBM	----h
Write 1 to acknowledge interrupt	MAILBOX_IRQSTATUS_CLR_u[1 + m*2]	1

1.8.4.1.3.2 Receiving Mode

Table 1-118 describes the events servicing in receiving mode.

Table 1-118. Events Servicing in Receiving Mode

Step	Register/Bitfield/Programming Model	Value
Read interrupt status bit	MAILBOX_IRQSTATUS_CLR_u[0 + m*2]	1
IF : Number of messages is not equal to 0 ?	MAILBOX_MSGSTATUS_m[2:0].NBOFM SGMB	!=0h
Read message	MAILBOX_MESSAGE_m[31:0].MESSAG EVALUEMBM	----h
ELSE		
Write 1 to acknowledge interrupt	MAILBOX_IRQSTATUS_CLR_u[0 + m*2]	1
ENDIF		

1.8.5 Mailbox Registers

[Table 1-119](#) lists the Mailboxes available on the device. The previous register set is applicable to these mailboxes. See the device-specific data manual for the memory address of these mailboxes.

Table 1-119. Mailboxes

Mailbox Type	User Number(u)	Mailbox Number(m)	Messages per Mailbox
System Mailbox	0 to 3	0 to 11	4
HDVICP2-1 Mailbox	0 to 3	0 to 5	4
HDVICP2-2 Mailbox	0 to 3	0 to 5	4

[Table 1-120](#) lists the memory-mapped registers for the Mailbox Registers. See the device-specific data manual for the memory address of these registers.

Table 1-120. Mailbox Registers Mapping Summary

Offset	Acronym	Register Description	Section
0000h	MAILBOX_REVISION	Mailbox Revision Register	Section 1.8.5.1
0010h	MAILBOX_SYSCONFIG	Mailbox System Configuration Register	Section 1.8.5.2
0040h + (4h * m)	MAILBOX_MESSAGE_m (1)	Mailbox Message Register	Section 1.8.5.3
0080h + (4h * m)	MAILBOX_FIFOSTATUS_m (1)	Mailbox FIFO Status Register	Section 1.8.5.4
00C0h + (4h * m)	MAILBOX_MSGSTATUS_m (1)	Mailbox Message Status Register	Section 1.8.5.5
0100h + (10h * u)	MAILBOX_IRQSTATUS_RAW_u (2)	Mailbox IRQ RAW Status Register	Section 1.8.5.6
0104h + (10h * u)	MAILBOX_IRQSTATUS_CLR_u (2)	Mailbox IRQ Clear Status Register	Section 1.8.5.7
0108h + (10h * u)	MAILBOX_IRQENABLE_SET_u (2)	Mailbox IRQ Enable Set Register	Section 1.8.5.8
010Ch + (10h * u)	MAILBOX_IRQENABLE_CLR_u (2)	Mailbox IRQ Enable Clear Register	Section 1.8.5.9
0140h	RESERVED	Reserved	

1.8.5.1 Revision Register (MAILBOX_REVISION)

This register contains the IP revision code. The Mailbox Revision Register (MAILBOX_REVISION) is shown in [Figure 1-69](#) described in [Table 1-121](#).

Figure 1-69. Revision Register (MAILBOX_REVISION)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-121. Revision Register (MAILBOX_REVISION) Field Descriptions

Bit	Field	Value	Description
31-0	REVISION	0-FFFF FFFFh	IP Revision

1.8.5.2 System Configuration Register (MAILBOX_SYSCONFIG)

This register controls the various parameters of the communication interface. The Mailbox System Configuration Register (MAILBOX_SYSCONFIG) is shown in [Figure 1-70](#) and described in [Table 1-122](#).

Figure 1-70. System Configuration Register (MAILBOX_SYSCONFIG)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-122. System Configuration Register (MAILBOX_SYSCONFIG) Field Descriptions

Bit	Field	Value	Description
31-4	Reserved	0	Reserved
3-2	SIDLEMODE	0	Force-idle. An idle request is acknowledged unconditionally
		1	No-idle. An idle request is never acknowledged
		2	Smart-idle. Acknowledgment to an idle request is given based on the internal activity of the module based on the internal activity of the module
		3	Reserved do not use
1	Reserved	0	Reserved
0	SOFTRESET	0	Soft/Hard reset done.
		1	Reset is ongoing.
		0	No action.
		1	Start the soft reset sequence.

1.8.5.3 Message Register (MAILBOX_MESSAGE_m)

The message register stores the next to be read message of the mailbox. Reads remove the message from the FIFO queue. The Mailbox Message Register (MAILBOX_MESSAGE_m) is shown in [Figure 1-71](#) and described in [Table 1-123](#).

Figure 1-71. Message Register (MAILBOX_MESSAGE_m)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-123. Message Register (MAILBOX_MESSAGE_m) Field Descriptions

Bit	Field	Value	Description
31-0	MESSAGEVALU EMBM	0-FFFF FFFFh	Message in Mailbox. The message register stores the next to be read message of the mailbox. Reads remove the message from the FIFO queue.

1.8.5.4 FIFO Status Register (MAILBOX_FIFOSTATUS_m)

The FIFO status register has the status related to the mailbox internal FIFO. The Mailbox FIFO Status Register (MAILBOX_FIFOSTATUS_m) is shown in [Figure 1-72](#) and described in [Table 1-124](#).

Figure 1-72. FIFO Status Register (MAILBOX_FIFOSTATUS_m)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-124. FIFO Status Register (MAILBOX_FIFOSTATUS_m) Field Descriptions

Bit	Field	Value	Description
31-1	MESSAGEVALU EMBM	0-7FFFF FFFFh	Message in Mailbox. The message register stores the next to be read message of the mailbox. Reads remove the message from the FIFO queue.
0	FIFOFULLMBM	0	Mailbox FIFO is not full
		1	Mailbox FIFO is full

1.8.5.5 Message Status Register (MAILBOX_MSGSTATUS_m)

The message status register has the status of the messages in the mailbox. The Mailbox Message Status Register (MAILBOX_FIFOSTATUS_m) is shown in [Figure 1-73](#) and described in [Table 1-125](#).

Figure 1-73. Message Status Register (MAILBOX_MSGSTATUS_m)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 1-125. Message Status Register (MAILBOX_MSGSTATUS_m) Field Descriptions

Bit	Field	Value	Description
31-3	Reserved	0	Reserved.
2-0	NBOFMSGMBM	0-7h	Number of unread messages in Mailbox. Limited to four messages per mailbox.

1.8.5.6 IRQ RAW Status Register (MAILBOX_IRQSTATUS_RAW_u)

The interrupt status register has the raw status for each event that may be responsible for the generation of an interrupt to the corresponding user - write 1 to a given bit sets this bit. This register is mainly used for debug purpose. The Mailbox IRQ RAW Status Register (MAILBOX_IRQSTATUS_RAW_u) is shown in Figure 1-74 and described in Table 1-126.

Figure 1-74. IRQ RAW Status Register (MAILBOX_IRQSTATUS_RAW_u)

		1	Write: Set the event (for debug)

1.8.5.7 IRQ Clear Status Register (MAILBOX_IRQSTATUS_CLR_u)

The interrupt status register has the status combined with irq-enable for each event that may be responsible for the generation of an interrupt to the corresponding user - write 1 to a given bit resets this bit. The Mailbox IRQ Clear Status Register (MAILBOX_IRQSTATUS_CLR_u) is shown in Figure 1-75 and described in Table 1-127.

1.8.5.8 IRQ Enable Set Register (MAILBOX_IRQENABLE_SET_u)

The interrupt enable register enables to unmask the module internal source of interrupt to the corresponding user. This register is write 1 to set. The Mailbox IRQ Enable Set Register (MAILBOX_IRQENABLE_SET_u) is shown in Figure 1-76 and described in Table 1-128.

1.9 Bus Interconnect

1.9.1 Interconnect Overview

NOTE: The L3 interconnect is instantiation of the NoC interconnect from Arteris, Inc. Arteris® is a registered trademark of Arteris, Inc.

This document contains materials that are ©Arteris, Inc., and that constitute proprietary information of Arteris, Inc.

All materials and trademarks are used under license from Arteris, Inc. For additional information, see the Arteris Reference manuals, or contact Arteris, Inc.

NoC is an abbreviation for Network On Chip.

NOTE: The L4 interconnects are instantiations of the Sonics3220™ interconnect from Sonics, Inc.

This document contains materials that are ©2003-2009 Sonics, Inc., and that constitute proprietary information of Sonics, Inc.

SonicsMX™ and Sonics3220, are trademarks or registered trademarks of Sonics, Inc. All such materials and trademarks are used under license from Sonics, Inc. For additional information, see the SonicsMX or Sonics3220 Reference manuals, or contact Sonics, Inc.

SMX is an abbreviation for SonicsMX.

1.9.1.1 Terminology

The following terminology is critical to understanding the interconnect:

- **Initiator:** Module able to initiate read and write requests to the chip interconnect (typically: processors, DMA, etc.).
- **Target:** Unlike an initiator, a target module cannot generate read/write requests to the chip interconnect, but it can respond to these requests. However, it may generate interrupts or a DMA request to the system (typically: peripherals, memory controllers).

NOTE: A module can have several separate ports; therefore, a module can be an initiator and a target.

- **Agent:** Each connection of one module to one interconnect is done using an agent, which is an adaptation (sometimes configurable) between the module and the interconnect. A target module is connected by a target agent (TA), and an initiator module is connected by an initiator agent (IA).
- **Interconnect:** The decoding, routing, and arbitration logic that enables the connection between multiple initiator modules and multiple target modules connected on it.
- **Register target (RT):** Special TA used to access the interconnect internal configuration registers
- **Data-flow signal:** Any signal that is part of a clearly identified transfer or data flow (typically: command, address, byte enables, etc.). Signal behavior is defined by the protocol semantics.
- **Sideband signal:** Any signal whose behavior is not associated to a precise transaction or data flow.

- Out-of-band error: Any signal whose behavior is associated to a device error-reporting scheme, as opposed to in-band errors.

NOTE: Interrupt requests and DMA requests are not routed by the interconnect in the device.

- Firewall: A programmable feature integrated in a target agent or L4 interconnect to prevent unauthorized access to or from a module. A firewall can be configured using three criteria:
 - Initiator requesting access
 - Address space access
 - Type of access
- ConnID: Any transaction in the system interconnect is tagged by an in-band qualifier ConnID, which uniquely identifies the initiator at a given interconnect point. A ConnID is transmitted in band with the request and is used for firewall and error-logging mechanism.
- Firewall comparison mechanism: A comparison made in the firewall between access in-band qualifiers and access permissions that are programmed in the firewall configuration registers. If the comparison is successful, access is allowed; otherwise, access is denied.
- MCcmd qualifier: Command bus that indicates the type of transfer requested. [Table 1-130](#) lists the commands encoded.

Table 1-130. MCcmd Qualifier Description

MCcmd[2:0]	Transaction Type
0 0 0	Idle
0 0 1	Write
0 1 0	Read
0 1 1	ReadEx
1 0 0	Read link
1 0 1	Write nonposted
1 1 0	Write conditional
1 1 1	Write broadcast

- MReqInfo qualifier: Four MReqInfo qualifiers describe the access during the use of the firewall comparison mechanism, as described in [Table 1-131](#).

Table 1-131. MReqInfo Qualifier Description

Qualifiers	Description
MReqType	0: Data access
	1: Opcode fetch
MReqSupervisor	0: User mode
	1: Supervisor mode
MReqDebug	0: Functional access
	1: Debug access

- Register that configures the combination of the MReqInfo, allowing access permission to the TM based on the MReqInfo in-band qualifier values.
- SError: Target that indicates an error condition to the initiator.
- SResp qualifier: Response from the target to the initiator concerning the transaction, as described in [Table 1-132](#).

Table 1-132. SResp Qualifier Description

SResp[1:0]	Description
0 0	No response
0 1	Data valid/accept
1 0	Not used
1 1	Error

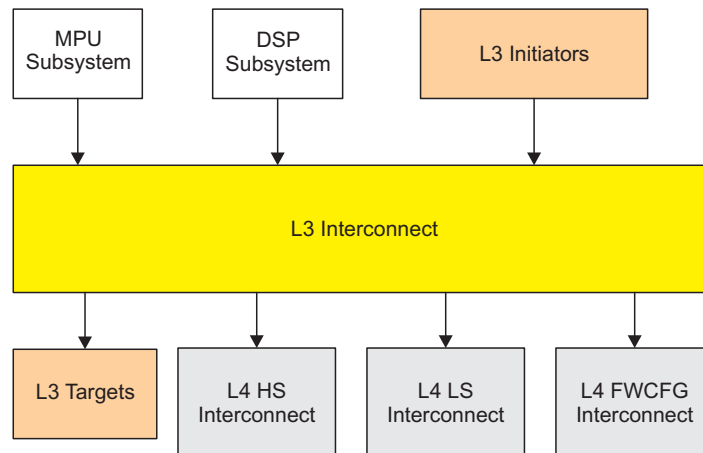

1.9.1.2 Architecture Overview

The device memory hierarchy includes four levels:

- L1 is internal to the CPUs. It concerns data exchange with the internal Level1 cache memory subsystem, and it is the closest memory to the microprocessor unit (MPU) core.
- L2 is included in the DSP subsystem and the MPU subsystem.
- The chip-level interconnect consists of one L3 interconnect and three L4 interconnects. It enables communication among the modules and subsystems in the device.

Figure 1-78 shows an overview of the L3 and L4 interconnect architecture.

Figure 1-78. Interconnect Overview

- L3 handles many types of data transfers, especially exchanges with system-on-chip/external memories. L3 transfers data with a maximum width of 64 bits from the initiator to the target. The L3 interconnect is a little-endian platform
- The L4 is composed of the following:
 - L4 HS: Includes the majority of the configuration interface for level 3 (L3) system modules and peripheral interconnect
 - L4 LS : Includes the main peripherals that require enhanced direct memory access (EDMA) access
 - L4 FWCFG: Includes peripherals attached to the WKUP power domain.

Modules are connected to the interconnect through an IA for the initiator module and a TA for target modules. Each module/subsystem connection is statically configured to tune the access, depending on the characteristics of the module.

To unauthorize a module or L4 interconnect access, some TAs include configurable firewalls (FWs). A firewall restricts or filters the accesses allowed to an initiator according to different access criteria. The firewalls can usually be configured by software.

The L3 and L4 interconnect default settings are fully functional; they enable all possible functional data paths and a minimal default protection setting. However, the interconnect parameters can be modified to fit user expectations.

1.9.2 L3 Interconnect

This section describes the L3 interconnect and its components. With the exception of register points, each component includes functions for the request and response networks.

1.9.2.1 L3 Interconnect Overview

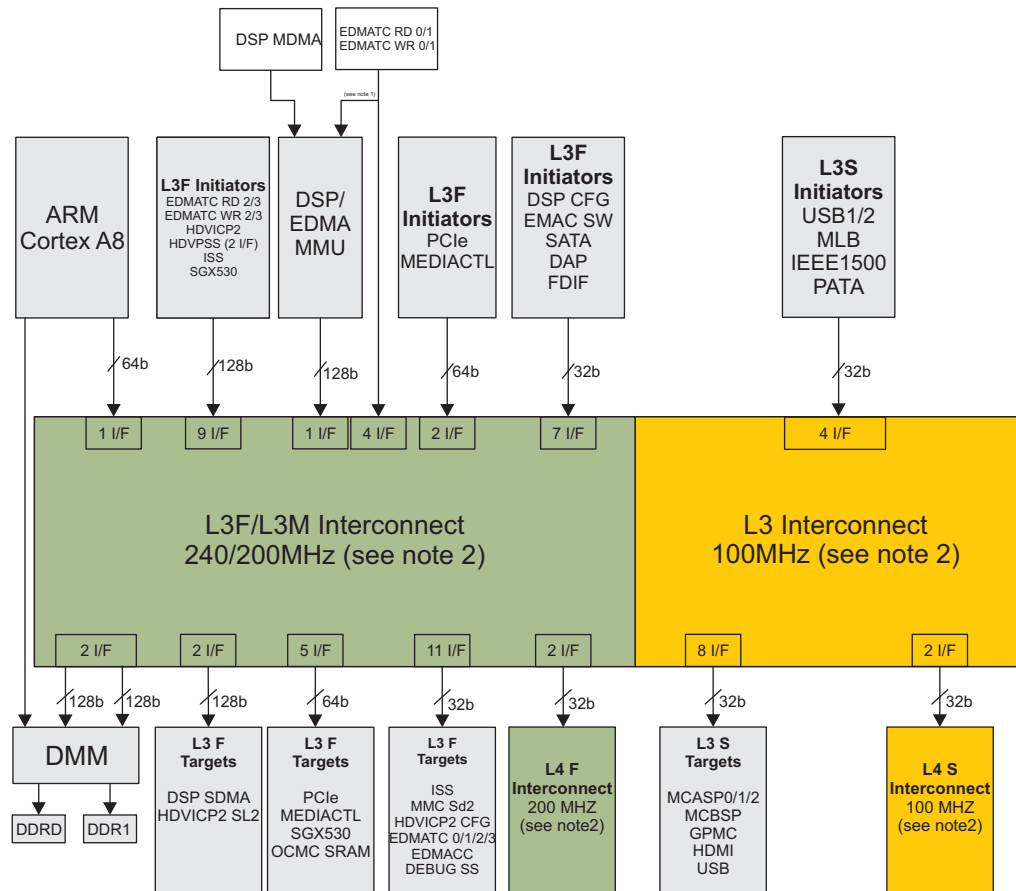

The L3 interconnect links cores in a flexible topology that couples low power with high performance. Innovative physical structures and advanced protocols ensure bandwidth and latency to individual IP cores, providing dedicated connections between IP cores and logical connections over a shared interconnect.

The main features of the L3 interconnects are:

- Network interface units (NIUs): Master NIUs for the initiator agents (IAs) and slave NIUs for the target agents (TAs)
- True little-endian platform
- Transaction errors tracking and logging registers
- All signaling support for chip-level power-management infrastructure
- One interrupt line signaling transaction error
- One interrupt line for reporting statistical events on the L3 interconnect

[Figure 1-79](#) is an overview of the L3 interconnect and the peripherals attached to it.

Figure 1-79. L3 Interconnect Overview

1.9.2.2 L3 Interconnect Integration

Table 1-133 through Table 1-134 summarize the integration of the module in the device.

Table 1-133. Integration Attributes

Module Instance	Attributes
	Power Domain
L3	Always On power domain

Table 1-134. Clocks and Resets

Clocks			
Module Instance	Destination Signal Name	Source	Description
L3	L3_220M_ICLK	PRCM	Root clock for L3F clock domain
L3	L3_110M_ICLK	PRCM	Root clock for L3S clock domain
L3	L3_200M_ICLK	PRCM	Root clock for L3M debug clock domain
Resets			
Module Instance	Destination Signal Name	Source	Description
L3	L3_220M_RST	PRCM	Reset to L3F clock domain
L3	L3_110M_RST	PRCM	Reset to L3Sclock domain
L3	L3_200M_RST	PRCM	Reset to L3M debug clock domain

1.9.2.3 L3 Interconnect Functional Description

1.9.2.3.1 Module Use in L3 Interconnect

The L3 interconnect network components have ConnID values for each master NIU or slave NIU. The ID uniquely identifies the master NIU or the slave NIU for an interconnect transfer. The interconnect uses ConnIDs for a number of purposes, including the following:

- Slave NIUs for error logging
- Power disconnect slave NIU for error logging
- FLAGMUX to mask interrupts: Three, one for each clock domain
- STATCOLL for configuring and monitoring: The STATCOLL components compute the traffic statistics within a user-defined window and periodically report to the user through the debug interface.
- Bandwidth regulator for configuration.
- Some rate adapters for control of throughput ratio

1.9.2.3.2 Module Distribution

Master NIUs and slave NIUs provide the interface to connect the different modules to their associated interconnect.

[Table 1-135](#) and [Table 1-136](#) list all the modules and subsystems with their associated agents. The agents are listed for each L3 interconnect domain.

1.9.2.3.2.1 L3 Interconnect Agents

Any initiator or target core is connected to the L3 interconnect through an NIU. NIUs act as entry points to the L3 interconnect, and also include various programming registers. [Table 1-135](#) lists the supported master NIU ports.

Table 1-135. Master NIUs

Master NIU	Description
L3_MN_MPU	Cortex A8 microprocessor subsystem unit 128-bit port
L3_MN_HDVICP	HDVICP subsystem port 1 128-bit initiator port
L3_MN_ISS	Imaging subsystem 128-bit initiator port
L3_MN_MMU	Memory management unit 128-bit initiator port
L3_MN_DSP1	DSP subsystem 128-bit initiator port1 (GEM MDMA)
L3_MN_EXPSLOT0	Expansion slot 0 128-bit initiator port
L3_MN_TPTC_RD1/2/3/4	TPTC 128-bit read initiator ports
L3_MN_TPTC_WR1/2/3/4	TPTC 128-bit write initiator ports
L3_MN_HDVPSS1	Display subsystem port 1 - 128-bit initiator
L3_MN_HDVPSS2	Display subsystem port 2 - 128-bit initiator
L3_MN_DSP2	DSP subsystem 128-bit initiator port 2 (GEM CFG)
L3_MN_SGX	SGX 530 2D graphics accelerator 128-bit initiator port
L3_MN_MEDIACONTROLLER	Media Controller 64-bit initiator port
L3_MN_PCIE	PCIe 64-bit initiator port
L3_MN_3PGSW	3PGSW 32-bit initiator port
L3_MN_FDIF	Face Detection Interface 32-bit initiator port
L3_MN_SATA	SATA controller 32-bit initiator port
L3_MN_DAP	Debug access point 32-bit initiator port

L3_SN_L4 Firewall	L3 Firewalls target port
L3_SN_MCBSP	McBSP 32-bit target port

1.9.2.3.2.2 L3 Connectivity Matrix

The L3 interconnect is divided into two main clock domains plus one small domain dedicated to DRAM performance monitoring:

- L3F clock domain (220 MHz)
- L3S clock domain (110 MHz)
- L3M clock domain (200MHz clock domain for performance monitoring)

The two main clock domains (L3F and L3S) are synchronous and balanced to each other. The third clock domain L3M, dedicated to performance monitoring is asynchronous to all other domains.

1.9.2.3.2.2.1 Clock Domain Mapping of the L3 Interconnect Modules

Each clock domain (L3F, L3S, and L3M) has its own host, flag mux, slave NIUs, and bandwidth regulators.

Table 1-137. L3 Clock Domains and Elements

1.9.2.3.2.3 Master NIU Identification

An master NIU ID (ConnID) is assigned to every module in the device. The ID uniquely identifies the master NIU for an interconnect transfer (see [Table 1-138](#)). The interconnect uses ConnID values for a number of purposes, including:

- Master source identification for the protection mechanism
- Response route generation
- Firewall error logging
- L3 interconnect error logging

Table 1-138. ConnID Values

4 Bit ConnID Value (security) (hex)	6 Bit ConnID Value (debug) (hex)	Master NIU

1.9.2.3.3 Bandwidth Regulators

The bandwidth regulators prevent master NIUs from consuming too much bandwidth of a link, or a slave NIU that is shared between several data flows: packets are then transported at a slower rate. The value of a bandwidth can be programmed in the bandwidth regulator. When the bandwidth is below the programmed value, the pressure bit is set to 1, giving priority to this master. When the bandwidth is above the programmed value, the pressure bit is set to 0 and the concerned master has the same weight as others.

The bandwidth registers regulate the packet flow by applying flow control on the RX port, thus ensuring that the traffic does not exceed the allocated bandwidth. The next packet is sent only when an internal timer expires. The registers in this group are:

- L3_BW_REGULATOR_WATERMARK: Gives the amount of data allowed to exceed the average bandwidth during a short time period
- L3_BW_REGULATOR_PRESS: Describes the pressure applied to outgoing packets
- L3_BW_REGULATOR_CLEARHISTORY: Resets the traffic counter when set to 1. It is used after an update in the L3_BW_REGULATOR_BANDWIDTH and L3_BW_REGULATOR_WATERMARK registers (see [Section 1.9.2.5.1.4, L3 BW Regulator Register Summary and Description](#)).

Bandwidth regulators are mainly used to give priority to the following masters: HDVICP, TPTC_RD2/4, TPTC_WR2/4, MMU, ISS and SGX.

1.9.2.3.4 Flag Muxing

The flag mux generator collects information such as errors and interrupts from slave NIUs and the interconnect firewall. The result signals are then sent to the MPU interrupt controller without interfering with the interconnect traffic. Flag mux unit contains software registers that are able to eventually mask some interrupts in order to prevent the unit from seeing them and to help with debug.

There are four registers in this group:

- One register to mask application error sources
- One status register to check which application error sources are active
- One register to mask debug error sources
- One status register to check which debug error source are active

By default none of the flags are masked.

There are four flag muxes in Centaurus L3 Interconnect, one per each clock domain plus additional flag mux collecting flags from the three previous ones. In consequence L3 will generate two flags: APPLICATION error and DEBUG error.

The unit-specific registers (MASK bit 0 or bit 1 of the flag inputs, and L3_FLAGMUX_REGERR bit 0 or bit 1) are used to read the input errors. Each register is dedicated to reporting the bit corresponding to the register number. Flag mux inputs for the different sources can be see in [Table 1-191](#).

1.9.2.3.5 Statistic Collectors Group

Statistic collectors are internal masters that share the same master address as the master NIUs. These components compute the traffic statistics within a defined window and periodically report through the DEBUG interface. The key features of the statistic collector are:

- Nonintrusive monitoring
- Programmable filters and counters
- Collects results at a programmable time interval

Event detectors are programmed through the L3_STCOL_REQEVT and L3_STCOL_RSPEVT configuration registers for request and response ports, respectively. The following events can be identified:

- Word transfer
- WAIT cycles
- Flow control
- Payload transfers
- Latency measurements

Performance monitoring is enabled through the L3_STCOL_EN register. The L3_STCOL_SOFTEN register enables software to monitor the performance. Event muxes are programmed through the L3_STCOL_EVTMUX_SEL0 configuration register, which determines which port will be monitored by a filter configured by the filter registers (see [Table 1-229](#)).

Filters are programmed through the [Table 1-229](#) configuration register, along with additional selection criteria programmed through the mask/match registers (see [Table 1-211](#)). A filter can be configured to accept or reject:

- Read operations
- Write operations
- Errors
- Addresses

Filter operation is programmed through the L3_STCOL_OP registers (see [Table 1-211](#)).

There are five statistic collectors embedded in Centaurus L3, one dedicated to DRAM load monitoring and four statistic collectors dedicated to master latency monitoring.

1.9.2.3.6 L3 Interconnect Error Handling

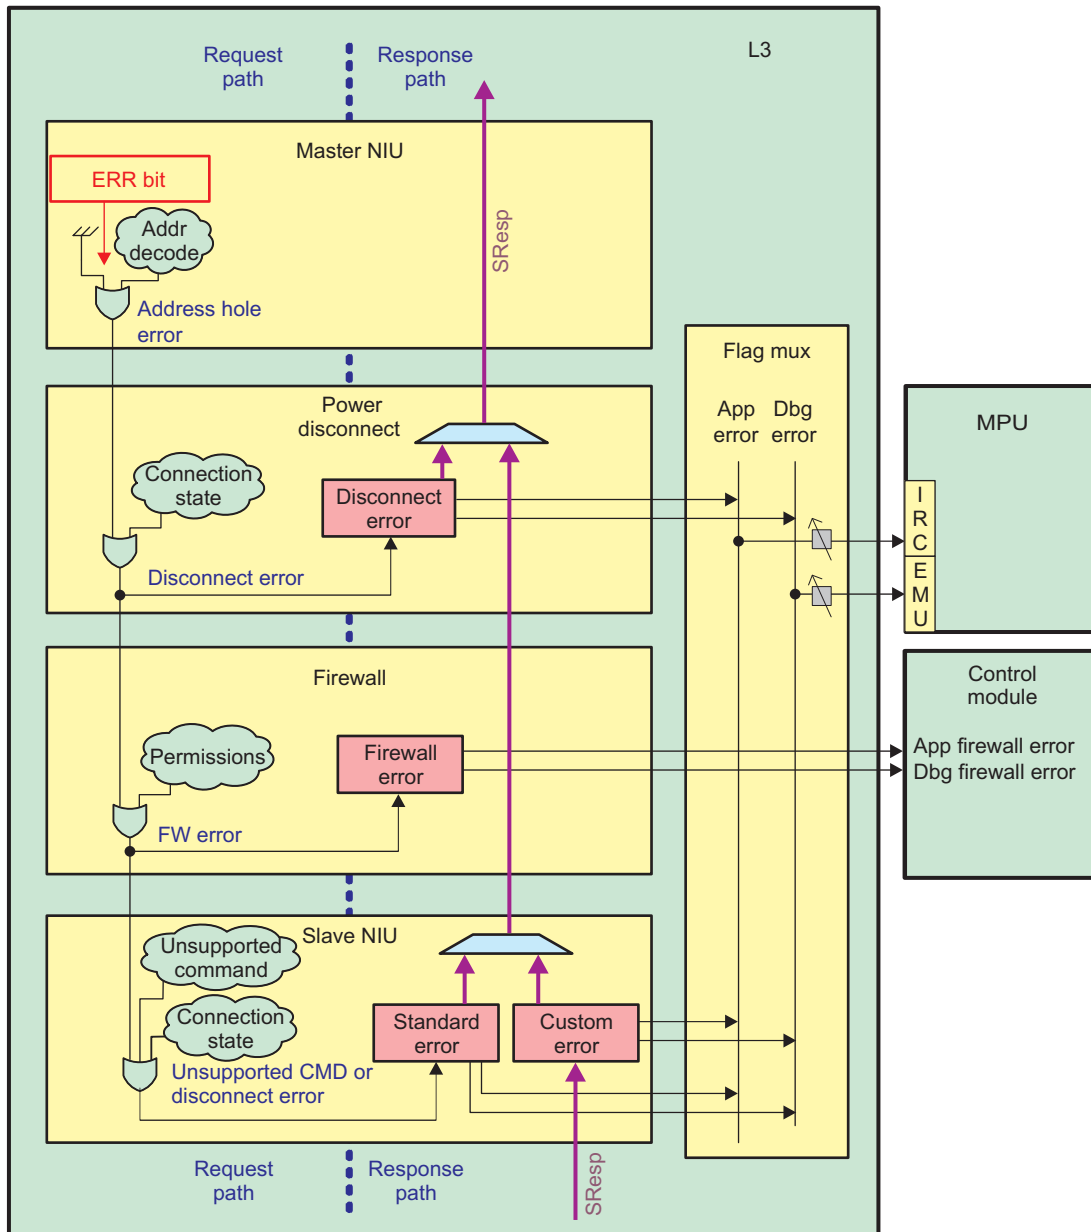

Error logging is enabled in the L3 interconnect. The three major types of errors are:

- Slave NIU errors
- Firewall errors (see , *L3Firewall Error Logging*)
- Flag mux errors

1.9.2.3.6.1 Global Error-Routing Scheme

[Figure 1-81](#) shows the L3 global error-routing scheme.

Figure 1-81. L3 Global Error-Routing Scheme

13-005

1.9.2.3.6.2 Slave NIU Error Logging

Error logging is implemented only at slave NIUs. Because the interconnect does not support master NIU error logging, an erroneous packet must be created and sent to one of the slave NIUs. The slave NIU that receives an erroneous packet is predictable but can change per master (see [Table 1-139](#)).

Table 1-139. L3 Connectivity and Holes Error Routing

Master	Connectivity and Holes Errors Logged Into Slave NIUs
DAP	GPMC
Dual Cortex M3 (Media Controller)	
Expansion slot	
JTag interface (IEEE1500)	
MMU	
MPU (Modena)	
PCIe	
SATA	
MLB	
SGX	
TPTC_RD1/2/3/4	
TPTC_WR1/2/3/4	
USB2

HDVPSS1/2	
HDVICP	
FACEDTECT	
PATA	
DSP (GEM_CFG)	USB Targ
DSP (GEM_MDMA)	MMU Targ
USB1	DSP (GEM_SDMA)

The slave NIU can be configured to report standard errors (errors generated within the interconnect):

- Firewall error: Protection violation; this error indicates that a request was rejected by a firewall and is reported to the control module.
- Address hole: This error reports an unknown address for a request. The address map is local to each master NIU; therefore, an address hole error is reported each time a master NIU requests an access to a slave NIU to which it is not logically connected, even if this address exists in the global L3address map. This error is detected only once per burst.
- Unsupported commands: This error reports that the master NIU sent a command that cannot be processed, because the slave NIU cannot accept it and no conversion to another command is possible. This error is detected only once per burst.
- Report custom errors: Basically, when the slave answer is SResp = ERR
- Report severity level, for standard error and custom errors:
 - None: Error logging for this type of error is disabled.
 - Error: Error is logged for this type of error.
 - Fault: Error is logged and interrupt is generated for this type of error.
- Generate interrupt on 2 bits depending on the MReqDebug qualifier:
 - Application error - Fault[0]
 - Debug error - Fault[1]

By default, all slave NIUs are configured with standard and custom error levels set to FAULT, active high. The errors are reported on the two flag muxes (see [Figure 1-81](#)), depending on the access type, application or debug. For more information, see [Section 1.9.2.3.6.3, Flag Mux Error Logging](#).

The slave NIU power-disconnect component also has error logging enabled. By nature, this component can generate only standard errors. By default, it is configured with the error level set to FAULT.

Wake up on demand: If an error packet reaches a slave NIU that is set with MDiscBehave = 1 (wake up on demand), then the active signal is asserted and L3 processes the error generation when the slave is awake. This is inefficient but it simplifies NIU implementation and should not be a problem,

because errors are supposed to occur only during software debug.

1.9.2.3.6.3 Flag Mux Error Logging

All fault signals are sent to a flag mux component. There are four important FLAGMUX registers:

- L3_FLAGMUX_MASK0: Masks application error sources
- L3_FLAGMUX_MASK1: Masks debug error sources
- L3_FLAGMUX_REGERR0: Checks which application error sources are active
- L3_FLAGMUX_REGERR1: Checks which debug error sources are active

The two L3_FLAGMUXMASK registers mask bit 0 or bit 1 of the flag inputs, and the L3_FLAGMUX_REGERR registers read input errors. Each register is dedicated to reporting the bit corresponding to the register number.

[Table 1-140](#) describes the mapping of the flags to the corresponding sources.

Table 1-140. Interconnect Flag Mapping

	Flag Mux Input	Source

1.9.2.3.6.4 Severity Level of Standard and Custom Errors

The slave NIU registers are important for error logging.

- The L3_TARG_STDERRLOG_SVRTSTDLVL register shows the severity level for standard errors. According to the severity level, error logging is disabled, enabled with level ERROR, or enabled with level ERROR and flag FAULT.
- The L3_TARG_STDERRLOG_SVRTCUSTOMLVL register shows the severity level for custom errors (see [Table 1-152](#)).
- The L3_TARG_STDERRLOG_MAIN register is the main register for error-logging management. It shows the validity of the logged information, standard or custom.
- The L3_TARG_STDERRLOG_HDR register stores packets in case of a standard error.
- The L3_TARG_STDERRLOG_MSTADDR register returns the MSTADDR field of the logged packet.
- The L3_TARG_STDERRLOG_SLVADDR register returns the SLVADDR field of the stored packet.
- The L3_TARG_STDERRLOG_INFO register saves the information field of the logged packet.

1.9.2.4 L3 Interconnect Programming Guide

1.9.2.4.1 L3 Interconnect Low-Level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L3 interconnect module.

1.9.2.4.1.1 Global Initialization

1.9.2.4.1.1.1 Global Initialization of Surrounding Modules

This section identifies the requirements for initializing the surrounding modules when the L3 interconnect module is to be used for the first time after a device reset. The initialization of surrounding modules is based on the integration and environment of the L3interconnect. For more information, see [Section 1.9.2.2, L3 Interconnect Integration](#) .

Table 1-141. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	For information about the configuration of the PRCM module, see the <i>PRCM</i> chapter.
Control module	For information about the configuration of the control module, see the <i>Control Module</i> chapter.
MPU INTC	The MPU INTC must be configured to enable interrupts from the L3 interconnect module. See the <i>ARM Interrupt Controller (AINTC)</i> chapter.
EDMA	For information about the configuration of the EDMA, see the <i>EDMA</i> chapter.
L3 interconnect	For information about the configuration of the interconnect, see the <i>L3 Interconnect</i> section.

1.9.2.4.2 Operational Modes Configuration

1.9.2.4.2.1 L3 Interconnect Error Analysis Mode

1.9.2.4.2.1.1 Main Sequence: L3 Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

[Figure 1-82](#) shows the software sequence required in most cases.

Figure 1-82. Typical Error Analysis Sequence

I3-013

Table 1-142 lists the subprocess call summary for error analysis mode in the main sequence.

Table 1-142. Subprocess Call Summary for Main Sequence – Error Analysis Mode

Subprocess	Cross-Reference
L4 interconnect error analysis	See Section 1.9.2.4.2.1, L4 Interconnect Error Analysis Mode.
L3 interconnect protection violation error identification	See Section 1.9.2.4.2.1.1.2, Subsequence: L3 Interconnect Protection Violation Error Identification.
L3 interconnect unsupported command/address hole error identification	See Section 1.9.2.4.2.1.1.3, Subsequence: L3 Interconnect Unsupported Command/Address Hole Error Identification.
L3 interconnect reset FLAGMUX and module	See Section 1.9.2.4.2.1.1.4, Subsequence: L3 Interconnect Reset FLAGMUX and Module.

1.9.2.4.2.1.1 Subsequence: L3 Custom Error Identification

The procedure listed in [Table 1-143](#) describes custom error identification.

Table 1-143. Custom Error Identification

Step	Register/Bit Field/Programming Model	Value
IF: Is custom error detected?	L3_TARG_STDERRLOG_MAIN[1] STDERRLOG_MAIN_ERRTYPE	=0x1
Read info field of the response packet.	L3_TARG_STDERRLOG_CUSTOMINFO_INFO[7:0] STDERRLOG_CUSTOMINFO_INFO	xxx
Read the address of the initiator that caused error.	L3_TARG_STDERRLOG_CUSTOMINFO_MSTADDR[5:0] STDERRLOG_CUSTOMINFO_MSTADDR	xxx
Read the type of operation (read/write).	L3_TARG_STDERRLOG_CUSTOMINFO_OPCODE[1:0] STDERRLOG_CUSTOMINFO_OPCODE	xxx
ENDIF		

1.9.2.4.2.1.1.2 Subsequence: L3 Interconnect Protection Violation Error Identification

The procedure listed in [Table 1-144](#) describes protection violation error identification and where it is logged in the control module registers. Two types of errors are logged: application errors and debug errors.

Table 1-144. Protection Violation Error Identification

Step	Register/Bit Field/Programming Model	Value
Read the burst violation.	ERROR_LOG_k[23] 2D_BURST_VIOLATION	xxx
Read the initiator ID.	ERROR_LOG_k[3:0] ConnID	xxx
Read the command that caused the error.	ERROR_LOG_k[7] MCMD	xxx
Read the address of the request that caused the error.	ERROR_LOG_k[31:12] SLVOFS_LOGICAL	xxx
IF: Is it an application error?	L3_FLAGMUX_REGERR0 [10:0] REGERROR0	0x0
Clear the status bit.	L3_TARG_STDERRLOG_MAIN [31] STDERRLOG_MAIN_CLRLOG	0x0
ELSE IF	L3_FLAGMUX_REGERR1[10:0] REGERROR1	= 0x1
Clear the status bit.	L3_TARG_STDERRLOG_MAIN[31] STDERRLOG_MAIN_CLRLOG	0x0
ENDIF		
Clear the burst violation.	ERROR_LOG_k[23] 2D_BURST_VIOLATION	0x0
Clear the error status.	ERROR_LOG_k[21:17] REGION_START_ERRLOG	0x00

1.9.2.4.2.1.1.3 Subsequence: L3 Interconnect Standard Error Identification

The procedure listed in [Table 1-145](#) describes the identification of standard errors inside the L3 interconnect. The standard errors are: unsupported command, address hole, and disconnect.

Table 1-145. L3 Standard Error Identification

Step	Register/Bit Field/Programming Model	Value
IF: Is an error detected?	L3_TARG_STDERRLOG_MAIN[18] STDERRLOG_MAIN_ERRCNT	= 0x1
Read the corresponding flag.	L3_FLAGMUX_REGERR0[10:0] REGERROR0	xxx
Read the corresponding flag.	L3_FLAGMUX_REGERR1[10:0] REGERROR1	xxx
Localize the slave NIU that generated the error.	See Table 1-140 , <i>Interconnect Flag Mapping</i> .	
ELSE		
Clear the error log.	L3_TARG_STDERRLOG_MAIN[31] STDERRLOG_MAIN_CLRLOG	0x0
Clear the severity error status.	L3_TARG_STDERRLOG_SVRTSTDLVL[1:0] STDERRLOG_SVRTSTDLVL_0	0x2
ENDIF		

1.9.2.4.2.1.1.4 Subsequence: L3 Interconnect FLAGMUX Configuration

The procedure listed in [Table 1-146](#) gives information about the configuration of FLAGMUX masks.

Table 1-146. FLAGMUX Configuration

Step	Register/Bit Field/Programming Model	Value
Set the FLAGMUX masks to mask an event.	L3_FLAGMUX_MASK0[10:0] MASK0 L3_FLAGMUX_MASK1[10:0] MASK1	xxx
Read the REGERR bits to see if an error is recorded.	L3_FLAGMUX_REGERR0[10:0] REGERR0 L3_FLAGMUX_REGERR1[10:0] REGERR1	xxx
Clear the slave NIU error log and the FLAGMUX error.	L3_TARG_STDERRLOG_MAIN[31] STDERRLOG_SVRTSTDLVL_0	0x1

1.9.2.5 L3 Interconnect Register Manual

1.9.2.5.1 L3 Register Group Summary

The registers in the L3 interconnect are divided into eight groups:

- HOST registers (See [Table 1-148](#))
- TARG registers (See [Table 1-167](#))
- FLAGMUX registers (See [Table 1-192](#))
- BW registers (See [Table 1-202](#))
- STATCOLL registers (See [Table 1-211](#))

1.9.2.5.1.1 L3 Host Register Summary and Description

Table 1-147. HOST Instance Summary

Module Name	Base Address	Size
L3F	0x4400 0000	8MB
L3M	0x4440 0000	8MB
L3S	0x44800 0000	8MB

1.9.2.5.1.2.2 L3 TARG Registers Description
Table 1-174. L3_TARG_STDHOSTHDR_COREREG

Address Offset	0x0000 0000	Instance	See Table 1-167 through Table 1-173
Physical Address	See Table 1-167 through Table 1-173		
Description			
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								STDHOSTHDR_COREREG_CORECODE								RESERVED								STDHOSTHDR_COREREG_VENDORCODE							

Bits	Field Name	Description	Type	Reset
31:22	RESERVED		R	0x000
21:16	STDHOSTHDR_COREREG_CORECODE	The Core Code field is a constant reporting a vendor-specific core generator code. Type: Constant. Reset value: 0x13.	R	0x13
15:1	RESERVED		R	0x0000
0	STDHOSTHDR_COREREG_VENDORCODE	The Vendor Code field is a constant reporting the core generator vendor code. Type: Constant. Reset value: 0x1. Read 0x0: Third-party vendor. Read 0x1:	R	1

Table 1-175. L3_TARG_STDHOSTHDR_VERSIONREG

Address Offset	0x0000 0004		
Physical Address	See Table 1-167 through Table 1-173	Instance	See Table 1-167 through Table 1-173
Description			
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
STDHOSTHDR_VERSIONREG_REVISIONID								STDHOSTHDR_VERSIONREG_COREPARAMSCHECKSUM																							

Bits	Field Name	Description	Type	Reset
31:24	STDHOSTHDR_VERSIONREG_REVISIONID	The Revision Identifier field is a constant reporting the core generator revision number. Type: Constant. Reset value: 0x0.	R	0x00
23:0	STDHOSTHDR_VERSIONREG_COREPARAMSCHECKSUM	Reserved. Type: Reserved. Reset value: Reserved.	R	0x000000

Table 1-176. L3_TARG_STDHOSTHDR_MAINCTLREG

Address Offset	0x0000 0008		
Physical Address	See Table 1-167 through Table 1-173	Instance	See Table 1-167 through Table 1-173
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																RESERVED	STDHOSTHDR_MAINCTLREG_CM	STDHOSTHDR_MAINCTLREG_FLT	RESERVED	STDHOSTHDR_MAINCTLREG_EN											

Bits	Field Name	Description	Type	Reset
31:5	RESERVED	Reserved	R	0x0000000
4	RESERVED	Reserved	R	0
3	STDHOSTHDR_MAINCTLREG_CM	Reserved for internal testing. Must be set to 0. Type: Control. Reset value: 0x0.	R	0
2	STDHOSTHDR_MAINCTLREG_FLT	Asserted when a Fault condition is detected: if the unit includes Error Logging, Flt is asserted when the FltCnt register field indicates a Fault, and deasserted when FltCnt is reset. If no Error Logging is implemented, this bit becomes unit-dependent. In all cases, Flt bit and Flt pin (service network) have the same logical level. Type: Status. Reset value: X.	R	0
1	RESERVED	Reserved	R	0
0	STDHOSTHDR_MAINCTLREG_EN	Sets the global core enable. Note: A disabled master does not generate any NTP requests, and a disabled slave replies with an error packet to any request it receives. Type: Control. Reset value: 0x1.	RW	1

Table 1-177. L3_TARG_STDHOSTHDR_NTPADDR_0

Address Offset	0x0000 0010	Instance	See Table 1-167 through Table 1-173
Physical Address	See Table 1-167 through Table 1-173		See Table 1-167 through Table 1-173
Description			
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																STDHOSTHDR_NTPADDR_0															

Bits	Field Name	Description	Type	Reset
31:6	RESERVED	Reserved	R	0x0000000
5:0	STDHOSTHDR_NTPADDR_0	Sets the RX port address. Type: Control. Reset value: 0x15.	R	0x03

Table 1-178. L3_TARG_STDERRLOG_SVRTSTDLVL

Address Offset	0x0000 0040		
Physical Address	See Table 1-167 through Table 1-173	Instance	See Table 1-167 through Table 1-173
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																STDERRLOG_SVRTSTDLVL_0															

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Reserved	R	0x0000 0000
1:0	STDERRLOG_SVRTSTDLVL_0	Severity level parameters Type: Control. Reset value: 0x2. 0x0: Error logging is disabled. 0x1: Errors are logged with severity level Error. 0x2: Errors are logged with severity level Fault.	RW	0x2

Table 1-179. L3_TARG_STDERRLOG_SVRTCUSTOMLVL

Address Offset	0x0000 0044		
Physical Address	See Table 1-167 through Table 1-173	Instance	See Table 1-167 through Table 1-173
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																STDERRLOG_SVRTCUSTOMLVL_0															

Bits	Field Name	Description	Type	Reset
31:2	RESERVED	Reserved	R	0x0000 0000
1:0	STDERRLOG_SVRTCUSTOML VL_0	Severity level parameters Type: Control. Reset value: 0x2. 0x0: Error logging is disabled. 0x1: Errors are logged with severity level Error. 0x2: Errors are logged with severity level Fault.	RW	0x2

Table 1-180. L3_TARG_STDERRLOG_MAIN

Address Offset	0x0000 048		
Physical Address	See Table 1-167 through Table 1-173	Instance	See Table 1-167 through Table 1-173
Description			
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
STDERRLOG_MAIN_CLRLOG	RESERVED												STDERRLOG_MAIN_FLTCNT	STDERRLOG_MAIN_ERRCNT	RESERVED												STDERRLOG_MAIN_ERRTYPE	STDERRLOG_MAIN_ERRLOGVLD			

Bits	Field Name	Description	Type	Reset
31	STDERRLOG_MAIN_CLRLOG	Clears Error Logging Valid bit when written to 1. Type: Give_AutoCleared. Reset value: 0x0.	RW	0
30:20	RESERVED	Reserved	R	0x000
19	STDERRLOG_MAIN_FLTCNT	Asserted when at least one error with severity level FAULT is detected. Reset when written to 1. Type: Take. Reset value: 0x0.	RW	0
18	STDERRLOG_MAIN_ERRCNT	Asserted when at least one error with severity level ERROR is detected. Reset when written to 1. Type: Take. Reset value: 0x0.	RW	0
17:2	RESERVED	Reserved	R	0x0000
1	STDERRLOG_MAIN_ERRTYPE	Indicates logging type. Type: Status. Reset value: X. Read 0x0: Logged Error format is standard (header and necker recorded). Read 0x1: Logged Error format is module dependent. CustomInfo register(s) may be implemented to store additional information.	R	0
0	STDERRLOG_MAIN_ERRLOGVLD	Error Logging Valid. Asserted when logging information is valid(indicates that an error has been logged). Type: Status. Reset value: X.	R	0

Table 1-181. L3_TARG_STDERRLOG_HDR

Address Offset	0x0000 004C	Instance	See Table 1-167 through Table 1-173
Physical Address	See Table 1-167 through Table 1-173		
Description			
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								STDERRLOG_HDR_LEN1								RESERVED		STDERRLOG_HDR_STOPOFSWRPSZ		STDERRLOG_HDR_ERR		RESERVED		STDERRLOG_HDR_PRESSURE		RESERVED		STDERRLOG_HDR_OPCODE			

Bits	Field Name	Description	Type	Reset
31:26	RESERVED	Reserved	R	0x00
25:18	STDERRLOG_HDR_LEN1	This field contains the number of payload cell(s) minus one of the logged packet. Type: Status. Reset value: X.	R	0x00
17:16	RESERVED	Reserved	R	0x0
15:12	STDERRLOG_HDR_STOPOFSWRPSZ	StopOfs or WrapSize field of the logged packet (meaning depends on Wrp bit of logged opcode). Type: Status. Reset value: X.	R	0x0
11	STDERRLOG_HDR_ERR	Err bit of the logged packet. Type: Status. Reset value: X.	R	0
10:8	RESERVED	Reserved	R	0x0
7:6	STDERRLOG_HDR_PRESSURE	Pressure field of the logged packet. Type: Status. Reset value: X.	R	0
5:4	RESERVED	Reserved	R	0x0
3:0	STDERRLOG_HDR_OPCODE	Opcode of the logged packet. Type: Status. Reset value: X.	R	0x0

Table 1-182. L3_TARG_STDERRLOG_MSTADDR

1.9.2.5.1.5.2 L3 STATCOLL Register Description

Table 1-213. L3_STCOL_STDHOSTHDR_COREREG

Address Offset	See Table 1-211 .		
Physical Address	See Table 1-211 and Table 1-212	Instance	See Table 1-211 and Table 1-212
Description			
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								STDHOSTHDR_COREREG_CORECODE								RESERVED								STDHOSTHDR_COREREG_VENDORCODE							

Bits	Field Name	Description	Type	Reset
31:22	RESERVED	Reserved	R	0x000
21:16	STDHOSTHDR_COREREG_CORECODE	The Core Code field is a constant reporting a vendor-specific core generator code. Type: Constant. Reset value: 0x3A. (When the instance is CLK3_FLAGMUX_STATCOLL reset value is 0x37)	R	0x3A
15:1	RESERVED	Reserved	R	0x0000
0	STDHOSTHDR_COREREG_VENDORCODE	The Vendor Code field is a constant reporting the core generator vendor code. Type: Constant. Reset value: 0x1. Read 0x0: Third-party vendor. Read 0x1:	R	1

1.9.3 L4 Interconnects

This section details the device L4 interconnects.

1.9.3.1 L4 Interconnect Overview

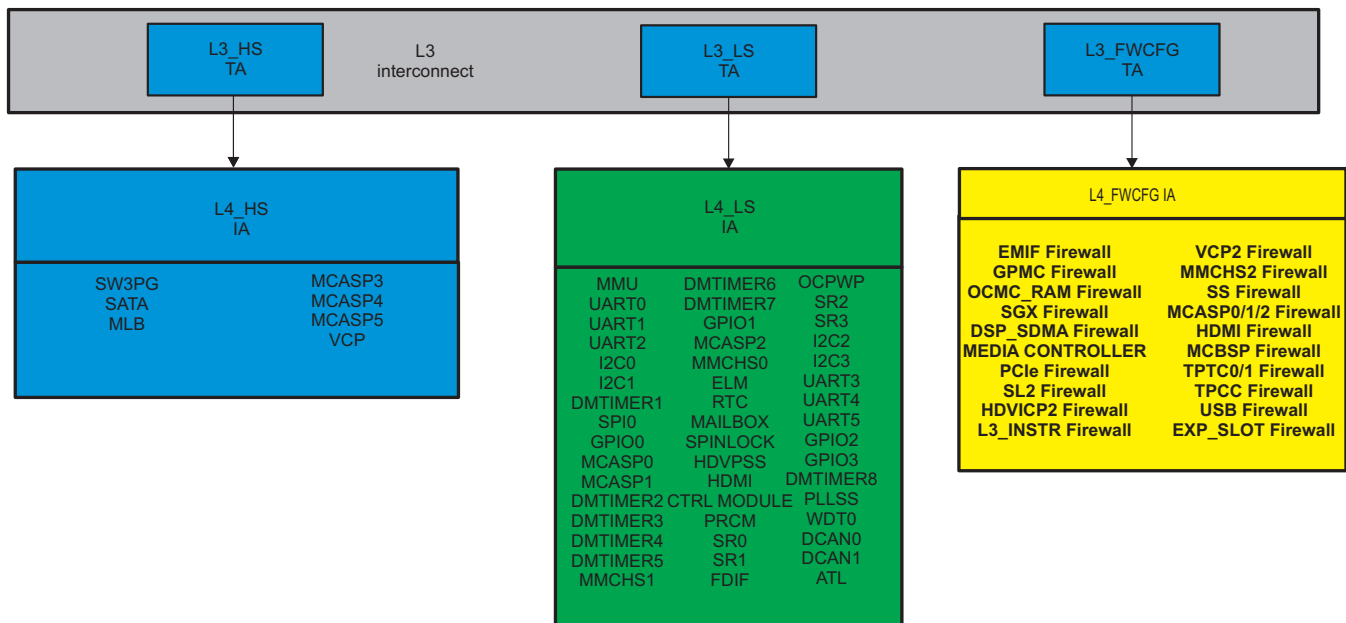

The device uses two separate L4 interconnect structures to connect peripheral modules, and one additional L4 interconnect for the firewalls. All L4s handle transfers with peripherals but are located in distinct power domains.

Figure 1-83 is an overview of the L4 interconnects and the peripherals attached to them.

The L4 interconnect is composed of the following interconnects:

- L4_HS: Configuration peripheral interconnect, for configuration of high speed masters. Located in the 220MHz clock domain.
- L4_LS: Main peripheral interconnect for peripherals that require DMA accesses. This is a configuration interconnect for the low speed masters, located in the 110 MHz clock domain.
- L4_FWCFG: Firewall configuration interconnect located in the 110 MHz clock domain.

Figure 1-83. L4 Interconnect Overview

The main features of the L4 interconnects are:

- From one to two 32-bit initiator ports for each L4 interconnect instance.
- 8-, 16-, or 32-bit data, single, or burst transactions
- Little endian
- Nonblocking architecture with fair arbitration between threads
- Target interfaces: Fully synchronous or divided synchronous
- Protection logic that provides user-configurable access control to targets by each initiator
- L4LS and L4HS are each with its own PRCM interface
- All peripherals are protected by firewall

1.9.3.2 L4 Interconnect Integration

Table 1-251 and Table 1-252 summarize the integration of the module in the device.

Table 1-251. Integration Attributes

Module Instance	Attributes
	Power Domain
L4_HS	Always on power domain
L4_LS	Always on power domain
L4_FWCFG	Always on power domain

Table 1-252. Clocks and Resets

Clocks			
Module Instance	Destination Signal Name	Source	Description
L4_HS	L4HS_CLK	PRCM module	Functional and interface clock
L4_LS	L4LS_CLK	PRCM module	Functional and interface clock
L4_FWCFG	L4FWCFG_CLK	PRCM module	Functional and interface clock
Resets			
Module Instance	Destination Signal Name	Source	Description
L4_HS	L4HS_RST	PRCM module	Reset of L4_HS interconnect
L4_LS	L4LS_RST	PRCM module	Reset of L4_LS interconnect
L4_FWCFG	L4FWCFG_RST	PRCM module	Reset of L4_FWCFG interconnect

1.9.3.3 L4 Interconnect Functional Description

1.9.3.3.1 Module Distribution

IAs and TAs provide the interface to connect the different modules to their associated interconnect.

[Table 1-253](#) through [Table 1-258](#) list all the modules and subsystems with their associated agents. The agents are listed for each L4 interconnect domain.

1.9.3.3.1.1 L4_HS Interconnect Agents

[Table 1-253](#) lists the L4 HS TAs.

Table 1-253. L4 HS TAs

Module Target Name	Description
L4HS_TA_SW3PG	SW3PG L4 HS target port
L4HS_TA_SATA	SATA L4 HS target port
L4HS_TA_MLB	MLB L4 HS target port
L4HS_TA_MCASP3	MCASP3 L4 HS target port
L4HS_TA_MCASP4	MCASP4 L4 HS target port
L4HS_TA_MCASP5	MCASP5 L4 HS target port
L4HS_TA_VCP	VCP L4 HS target port

Two ports communicate between L3 and the L4 HS interconnect to allow L3 Initiators to access L4HS targets. [Table 1-254](#) lists the L4HS initiator TAs.

For the list of initiators authorized to access the L4 peripheral peripherals, see *Connectivity Matrix*.

Table 1-254. L4 HS IAs

Module Initiator Name	Description
L4HS_IA_0	L3 enhanced direct memory access (EDMA) RD interconnect port
L4HS_IA_1	L3 EDMA WR interconnect port

1.9.3.3.1.2 L4_LS Interconnect Agents

The L4_LS interconnect handles only transfers to peripherals in the core power domain. [Table 1-255](#) lists the TAs.

Table 1-255. L4_LS TAs

Module Target Name	Description
L4LS_TA_MMU	System MMU L4LS target port
L4LS_TA_UART0	UART0 L4LS target port
L4LS_TA_UART1	UART1 L4LS target port
L4LS_TA_UART2	UART2 L4LS target port
L4LS_TA_I2C0	I2C0 L4LS target port
L4LS_TA_I2C1	I2C1 L4 LS target port
L4LS_TA_DMTIMER1	TIMER1 L4 LS target port
L4LS_TA_SPI0	SPI0 L4LS target port
L4LS_TA_GPIO0	GPIO0 L4LS target port
L4LS_TA_MCASP0	MCASP0 L4LS target port
L4LS_TA_MCASP1	MCASP1 L4LS target port
L4LS_TA_DMTIMER2	TIMER2 L4LS target port
L4LS_TA_DMTIMER3	TIMER3 L4LS target port

Table 1-255. L4_LS TAs (continued)

Module Target Name	Description
L4LS_TA_DMTIMER4	TIMER4 L4LS target port
L4LS_TA_DMTIMER5	TIMER5 L4LS target port
L4LS_TA_DMTIMER6	TIMER6 L4LS target port

L4LS_TA_GPIO1	GPIO1 L4LS target port
L4LS_TA_MCASP2	MCASP2 L4LS target port
L4LS_TA_MMCHS0	MMCHS0 L4LS target port
L4LS_TA_ELM	ELM L4LS target port
L4LS_TA_RTC	RTC L4LS target port
L4LS_TA_MAILBOX	MAILBOX L4LS target port
L4LS_TA_SPINLOCK	SPINLOCK L4LS target port
L4LS_TA_HDVPSS	HDVPSS L4LS target port
L4LS_TA_HDMIPHY	HDMIPHY L4LS target port
L4LS_TA_CONTROL	Control Module L4LS target port
L4LS_TA_PRCM	PRCM L4LS target port
L4LS_TA_SR0	Smart Reflex 0 L4LS target port
L4LS_TA_SR1	Smart Reflex 1 L4 LS target port
L4LS_TA_OCPWP	OCPWP L4 LS target port
L4LS_TA_SR2	Smart Reflex 2 L4 LS target port
L4LS_TA_SR3	Smart Reflex 3 L4 LS target port
L4LS_TA_I2C2	I2C2 L4 LS target port
L4LS_TA_I2C3	I2C3 L4 LS target port
L4LS_TA_SPI1	SPI1 L4 LS target port
L4LS_TA_SPI2	SPI2 L4 LS target port
L4LS_TA_SPI3	SPI3 L4 LS target port
L4LS_TA_UART3	UART3 L4 LS target port
L4LS_TA_UART4	UART4 L4 LS target port
L4LS_TA_UART5	UART5 L4 LS target port
L4LS_TA_GPIO2	GPIO2 L4 LS target port
L4LS_TA_GPIO3	GPIO3 L4 LS target port
L4LS_TA_DMTIMER8	TIMER8 L4 LS target port
L4LS_TA_PLLSS	PLL Subsystem L4 LS target port
L4LS_TA_WDT0	Watchdog timer 0 L4 LS target port
L4LS_TA_DCAN0	DCAN0 L4 LS target port
L4LS_TA_DCAN1	DCAN1 L4 LS target port
L4LS_TA_ATL	ATL L4 LS target port
L4LS_TA_FDIF	FDIF L4 LS target port
L4LS_TA_MMCHS1	MMCHS1 L4 LS target port

For the list of initiators authorized to access the L4_LS peripherals, see *Connectivity Matrix*.

Table 1-256. L4_LS IAs

Module Initiator Name	Description
L4LS_IA_0	L3 interconnect port
L4LS_IA_1	L3 interconnect port

1.9.3.3.1.3 L4_FWCFG Interconnect Agents

The L4 FWCFG interconnect handles transfers only to peripherals in the FWCFG. [Table 1-257](#) lists the TAs. [Table 1-258](#) lists the L4FWCFG initiator agents.

Table 1-257. L4 FWCFG TAs

Module Target Name	Description
L4FWCFG_TA_EMIF	EMIF firewall
L4FWCFG_TA_GPMC	GPMC firewall
L4FWCFG_TA_OCMC_RAM	OCMC RAM firewall
L4FWCFG_TA_SGX	SGX firewall
L4FWCFG_TA_DSP_SDMA	DSP SDMA firewall
L4FWCFG_TA_MEDIA_CONTROLLER	Media Controller firewall
L4FWCFG_TA_PCIE	PCIe firewall
L4FWCFG_TA_SL2	HDVICP2-0 SL2 firewall
L4FWCFG_TA_HDVICP2	HDVICP2-0 CFG firewall
L4FWCFG_TA_VCP2	VCP2 firewall
L4FWCFG_TA_MMCHS2	MMCHS2 firewall
L4FWCFG_TA_ISS	ISS firewall
L4FWCFG_TA_MCASP0/1/2	MCASP0/1/2 firewall
L4FWCFG_TA_HDMI	HDMI firewall
L4FWCFG_TA_MCBSP	MCBSP firewall
L4FWCFG_TA_TPTC0/1	TPTC0/1 firewall
L4FWCFG_TA_TPCC	TPCC firewall
L4FWCFG_TA_USB	USB firewall
L4FWCFG_TA_EXP_SLOT	Expansion slot firewall
L4FWCFG_TA_L3_INSTR	L3 Instrumentation firewall

Table 1-258. L4_FWCFG IAs

Module Initiator Name	Description
L4FWCFG_IA_0	L3 interconnect port

1.9.3.3.2 Power Management

Each L4 has a single power management interface connected to a power control bridge. Power control bridge is managing the different internal power interfaces. It has an external slave interface to the PRCM, an internal master interface to L4 power interface and one interface to each power bridge. The power disconnect bridge is responsible for returning OCP responses or asking for target wake up. The bridge is under the control of the PRCM.

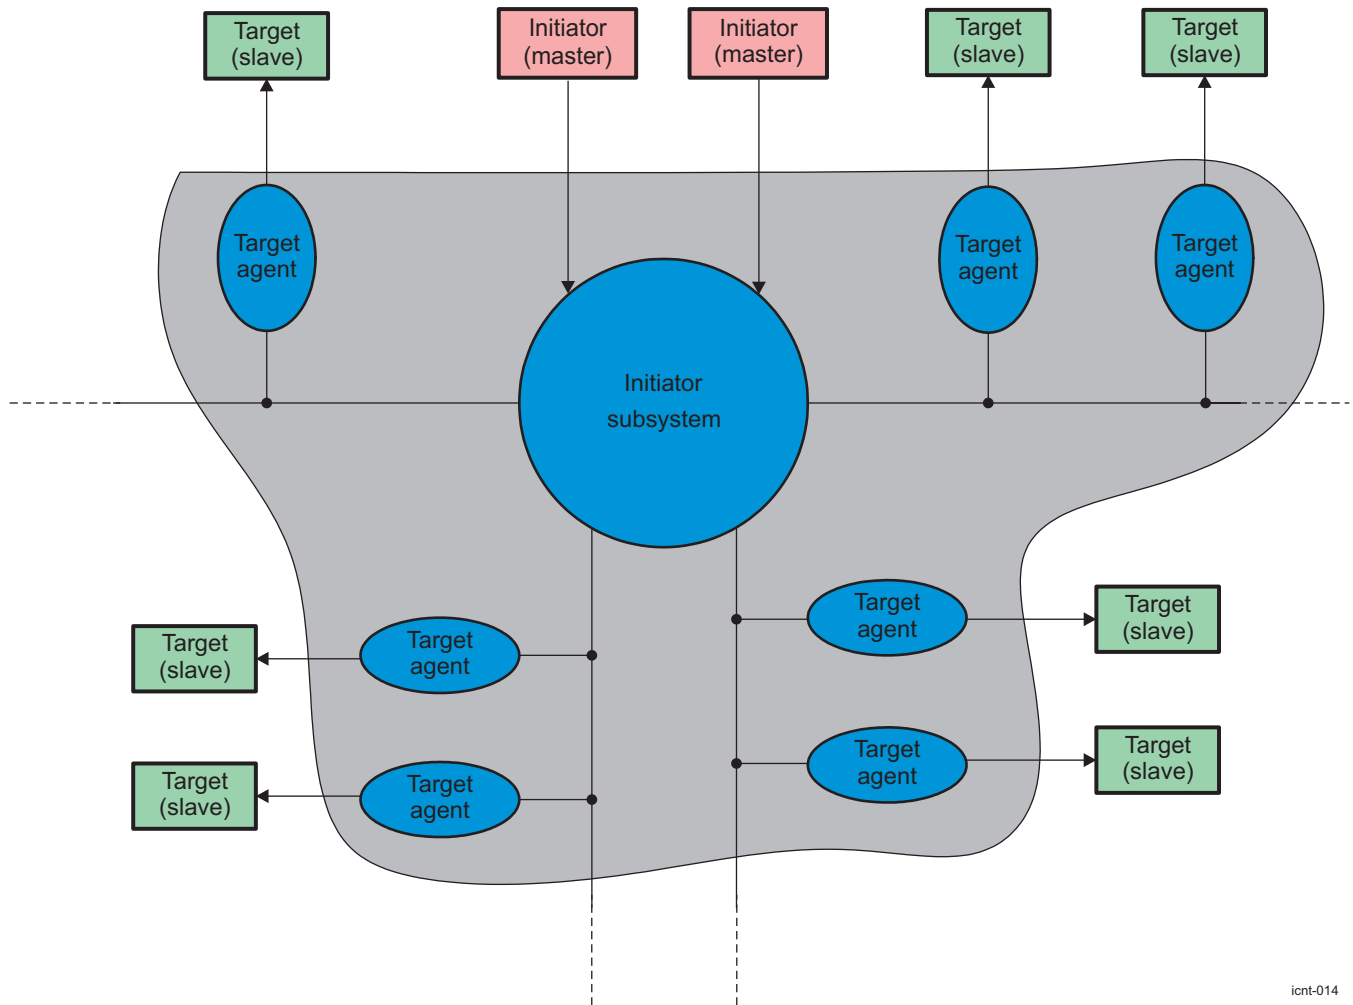

As part of the Always On power domain L4 interconnects do not support idle state or retention.

For more information about L4 interconnects power management, clocking and resets see *Chapter: Power Reset and Clock management*.

1.9.3.3.3 L4 Firewalls

[Figure 1-84](#) is an internal view of the L4 interconnects in the overall interconnect. This architecture, with one initiator subsystem centralizing all initiator master requests and distributing them to all target modules (peripherals), enables the L4 interconnect firewall functions to be centralized at the L4 initiator subsystem level. The L4 firewall filters the accesses based on the configurable protection groups defined in the L4 address protection (AP) registers. Each module or TA is assigned to a protection group. The configuration is also defined in the L4 AP and is programmable on a module-per-module basis.

Figure 1-84. L4 Initiator-Target Connectivity

icnt-014

NOTE: As Figure 1-84 shows, targets are attached to branches. Branches do not impact the function of the L4 interconnect but are present to simplify timing closure and reduce active power consumption.

Because of the large address spaces and the number of peripherals connected to an L4 interconnect, two parameters are used to set up access permission:

- Programmable groups for initiators
 - Eight protection groups for L4_HS and L4_LS interconnect
- Segments divided into regions of 4KB
 - 29 regions for the L4_HS interconnect
 - 128 regions for the L4_LS interconnect
 - 47 regions for the L4_FWCFG interconnect.

Protection group members are TAs with the same protection settings. A region is programmed to allow access to a unique selectable protection group. For better protection, different regions are grouped into protection group regions and associated with a protection group member.

All L4 interconnect information, such as numbers of protection groups, regions, and segments, is available in the L4_LA_INITIATOR_INFO_L register.

1.9.3.3.3.1 Protection Group

A protection group is defined by its initiators and REQ_INFO is allowed. Two registers define these two settings:

- The CONNID_BIT_VECTOR field L4_AP_PROT_GROUP_MEMBERS_k_L is a 1-bit vector that defines which initiator belongs to a group. A protection group is accessible by an initiator when the bit position corresponding to its ConnID is set to 1 in the CONNID_BIT_VECTOR field. [Table 1-259](#) lists all the ConnID available at the L4 levels.
- The ENABLE field L4_AP_PROT_GROUP_ROLES_k_L lists all possible REQ_INFO combinations associated with the L4_AP_PROT_GROUP_MEMBERS_k_L register. Setting a Req bit in this register determines the initiators type of access. Two REQ_INFOS are used in L4 interconnects: MReqDebug and MReqSupervisor.

NOTE: Permissions are identical for read and write accesses in L4 interconnect.

k indicates the protection group number.

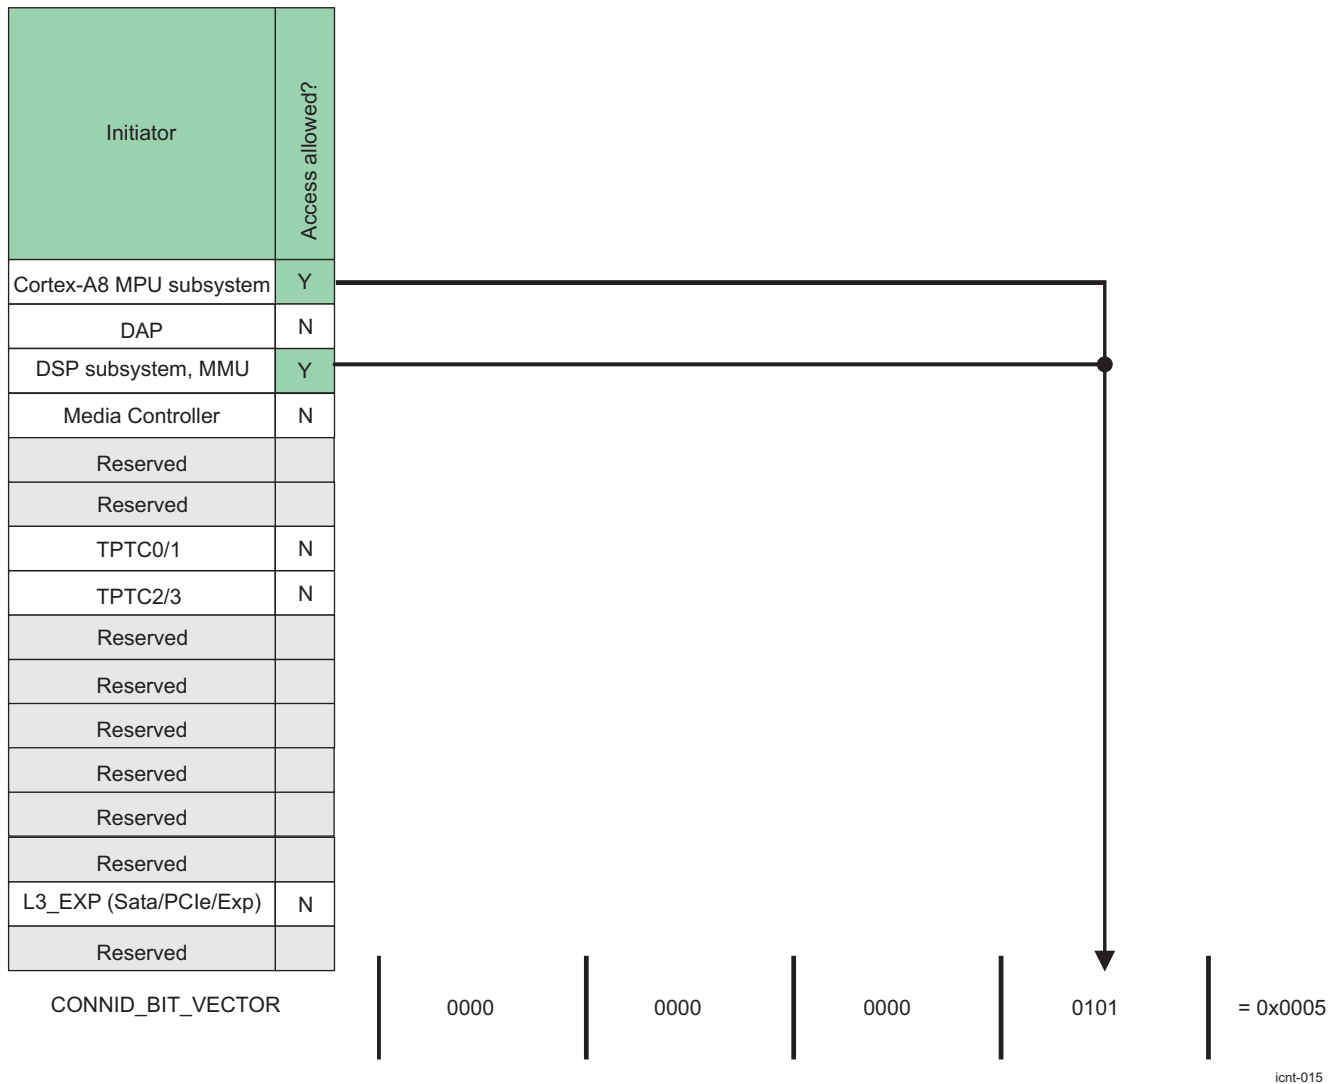

L indicates the region number.

Table 1-259. L4 ConnID Definition

ConnID	Initiator
0	Modena MPU Cortex A8
1	DAP/ IEEE1500
2	DSP (GEM_MDMA, GEM_CFG), MMU
3	Media Controller
4	Reserved
5	Reserved
6	TPTC0/1
7	TPTC2/3
8	Reserved
9	Reserved
A	Reserved
B	Reserved
C	Reserved
D	Reserved
E	L3_EXP (Sata/PCIe/Exp)
F	Reserved

Figure 1-85 is an example of CONNID_BIT_VECTOR.

Figure 1-85. Example of CONNID_BIT_VECTOR L4_AP_PROT_GROUP_MEMBERS_k

Setting bits 0 and 2 in the PROT_GROUP_ID_1 register defines a group initiator that can access targets in protection group 1, and includes the following:

- Cortex-A8 MPU subsystem
- DSP subsystem

Protection group 1 can be applied to multiple protection regions with no limitation. Each protection region that is configured with protection group 1 enables permission access only to the two initiators.

The L4_AP_REGION_I_H.PROT_GROUP_ID field determines the region to which the protection group member is attached.

The values of CONNID_BIT_VECTOR and ENABLE fields are exported by the control module at reset or are user writable (see Figure 1-85 for more information).

Table 1-260 and Table 1-262 list the default configuration of the various groups for each L4 interconnect. For each group, some modules/regions are associated with it with default initiator members.

Table 1-260. L4_LS AP Registers Default Configuration

Group	Default Modules Associated With Group	Register	Modifiability	Default Value
Group 0 AP registers	AP registers	L4_AP_PROT_GROUP_ROL ES_0_L	No	Exported
		L4_AP_PROT_GROUP_MEM BERS_0_L	No	Exported

		L4_AP_PROT_GROUP_MEM BERS_0_L	No	Exported
Group 1	Reserved	L4_AP_PROT_GROUP_ROL ES_1_L	No	Exported
		L4_AP_PROT_GROUP_MEM BERS_1_L	No	Exported
Group 2-7	FWCFG peripherals	L4_AP_PROT_GROUP_ROL ES_k_L	No	0xFFFF FFFF (all)
		L4_AP_PROT_GROUP_MEM BERS_k_L	No	0xFFFF (all)

1.9.3.3.3.2 Segments and Regions

The protection mechanism for L4 interconnects is based on a hierarchical segmentation, as shown in [Figure 1-86](#). By default, some regions are attached to specific protection group members. This specificity lets users set up the permission access to certain types of modules requiring the same access protection without managing region allocation.

Figure 1-86. L4 Segmentation

icnt-016

All interconnect address spaces are covered by regions. Table 1-263 through Table 1-265 list the module mapping with their addresses, region numbers, and default protection group allocated to them.

NOTE: Module refers to the configuration registers of the module.

TA refers to the interconnect configuration registers of the TA associated with the module.

1.9.3.3.3 L4 Address and Protection Register Settings

Table 1-266 lists the settings of the AP registers relative to an L4 interconnect firewall. These values are computed based on the physical implementation of each L4 interconnect.

Table 1-266. L4 Address and Protection Register Description Overview

Register Type	Register Name	Bits	Field	Description
Segment	L4_AP_SEGMENT_i_L ⁽¹⁾	23:0	BASE	Segment base address
	L4_AP_SEGMENT_i_H ⁽¹⁾	4:0	SIZE	Segment size equals to 2 ^{SIZE}
Protection groups	L4_AP_PROT_GROUP_MEMBERS_k_L ⁽²⁾	15:0	CONNID_BIT_VECTOR	For L4ConnID, see Table 1-259.
	L4_AP_PROT_GROUP_ROLES_k_L ⁽²⁾	31:0	ENABLE	See for REQ_INFO description ⁽³⁾
	L4_AP_PROT_GROUP_ROLES_k_H	31:0	ENABLE	See for REQ_INFO description ⁽³⁾
Region setting	L4_AP_REGION_l_L ⁽⁴⁾	23:0	BASE	Defines the base address of region with respect to its segment base address
	L4_AP_REGION_l_H ⁽⁴⁾	31:28	MADDRSPACE	Target OCP MAddrSpace value
		26:24	SEGMENT_ID	Segment ID number of the region
		22:20	PROT_GROUP_ID	Protection group member attached to the region
		18:17	BYTE_DATA_WIDTH_EXP	Determines the number of byte in an access
		14:8	PHY_TARGET_ID	Physical target ID
		6:1	SIZE	Size of the region equals to 2 ^{SIZE}
0	ENABLE	Enables the region protection		

⁽¹⁾ i = 0 to 1 for HS_AP
i = 0 to 2 for LS_AP

⁽²⁾ k = 0 to 7 for HS_AP
k = 0 to 7 for LS_AP

⁽³⁾ For L4 interconnects, only MReqDebug and MReqSupervisor are available.

⁽⁴⁾ l = 0 to 28 for HS_AP
l = 0 to 127 for LS_AP

The value of L4_AP_PROT_GROUP_ROLES_k is exported at the chip boundary. Those values are latched in the register at reset or by using the load firewall mechanism, which allows to latch exported values simply by writing into a register of the control module, this avoids resetting the interconnect in this case. The values of the other protection registers can be modified on the fly.

1.9.3.3.4 L4 Error Detection and Reporting

1.9.3.3.4.1 IA and TA Error Detection and Logging

The L4 interconnect provides mechanisms for handling internally detected errors or errors reported by modules attached to the L4 target ports.

NOTE: L4_IA denotes the IA for all L4 interconnects: L4_LS, L4_HS and FWCFG.
L4_TA denotes the TA for all L4 interconnects: L4_LS, L4_HS and FWCFG.

The L4 interconnects handle four types of errors:

- No target core found or address hole, detected and logged at IA
- Unsupported command, detected and logged at IA
- Protection violation, detected and logged at IA (see [Section 1.9.3.3.3, L4 Firewalls](#))
- Target does not service a request before a time-out expires. The error is detected and logged at TA (see [Section 1.9.3.3.4.2, Time-Out](#)).

[Table 1-267](#) lists the value of the L4_IA_ERROR_LOG_L[25:24] CODE bit field stored when an error occurs.

Table 1-267. L4 CODE Bit Field Definition

CODE (bits 1:0)	Error Type	REQ_INFO	Secondary	ConnID	CMD
0	No error				
1	Unsupported command	x	x	x	x
2	Address hole	x	x	x	x
3	Protection violation	x		x	x

- **No target core found/address hole:** This error indicates that a request was addressed to a hole in the L4 address map. When this error occurs, an in-band error response is returned to the L3 level. The error is also logged into the L4_IA_AGENT_STATUS_L[27] INBAND_ERROR bit. Additionally, an address hole error code is logged to the L4_IA_ERROR_LOG_L[25:24] CODE bit field.
- **Unsupported command:** This error indicates that the command type of the request is not supported by the accessed target register. The error is logged into the L4_IA_AGENT_STATUS_L[27] INBAND_ERROR bit. An unsupported command error code is written to the L4_IA_ERROR_LOG_L[25:24] CODE bit field for the initiator interface.
- **Protection violation:** This error indicates that a request is not issued from an allowed initiator member or is issued with the inappropriate ReqInfo qualifiers associated with the target region. This error is reported using an in-band error and is written to the L4_IA_AGENT_STATUS_L[27] INBAND_ERROR bit. A protection violation error code is saved into the L4_IA_ERROR_LOG_L[25:24] CODE bit field for the same initiator interface. A protection violation is also logged in the L4_IA_AGENT_STATUS_L[31] PROT_ERROR_SECONDARY or [30] PROT_ERROR_PRIMARY bit when in debug or applicative mode, respectively.

The L4_IA_ERROR_LOG_L[30] SECONDARY bit indicates whether the error occurred in application or debug.

The L4_IA_ERROR_LOG_H[15:0] REQ_INFO bit field returns the type access (REQ_INFO qualifier) that caused the error.

The L4_IA_ERROR_LOG_L[13:8] CONNID bit field returns the ID of the initiator that caused the error.

The L4_IA_ERROR_LOG_ADDR_L[31:0] register logs the address for error conditions.

A L4_IA_ERROR_LOG_L[31] MULTI bit is asserted when multiple errors are detected. In this case, the error code corresponds to the first error that occurs.

1.9.3.3.4.2 Time-Out

A time-out mechanism can be enabled at the interconnect level and on a per-target basis. If the mechanism is enabled for a TA and interconnect and commands are not accepted or responses are not returned within the expected delay, the L4 interconnect generates an error event.

The error is logged in the L4_TA_AGENT_STATUS_L[10:8] REQ_TIMEOUT bit. The affected TA enters an error state that causes it to send an error response to any new request targeted at it. To recover from this state, the TA must be reset by the system software. The time-out is counted starting from the moment a command is presented to the target, regardless of the target response to this command.

The L4 interconnect implements a centralized time-base circuit that broadcasts a set of four periodic pulse signals to all connected TAs. The time-base circuit offers four possible sets of four time-base signals. Selection is done by programming the L4_LA_NETWORK_CONTROL_L[10:8] TIMEOUT_BASE bit field.

The selected time-base signals are available at any TA. Each TA can be programmed to refer to one of these four time-base signals, using the L4_TA_AGENT_CONTROL_L[10:8] REQ_TIMEOUT bit field. These four signals are referred to as 1X time-base, 4X time-base, 16X time-base, and 64X time-base.

Table 1-268 lists all values in number of L4 clock cycles.

Table 1-268. L4 Time-Out Link and TA Programming

		L4_TA_AGENT_CONTROL_L REQ_TIMEOUT[2:0]			
L4_LA_NETWORK_CONTROL_L TIMEOUT_BASE[2:0]	0	1	2	3	4
0	All L4 time-out features are disabled.				
1	Locally disabled	64	256	1024	4096
2		256	1024	4096	16,384
3		1024	4096	16,384	65,536
4		4096	16,384	65,536	262,144

The default reset value is 0x2 for REQ_TIMEOUT and 0x4 for TIMEOUT_BASE, implying 16,384 clock cycles.

A time-out condition is detected when the command acceptance or the response is not received after a delay of one to three time-base periods.

On detection of a time-out condition, the TA logs the error in L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT bit, and it also reports the error to the corresponding IA, which forward it to the L3 interconnects.

After the time-out is detected and logged, the behavior of the attached module is ignored. A new request targeting the module arriving at the timed-out TA receives an error response. If the request is addressed to the agent internal registers, it is processed normally.

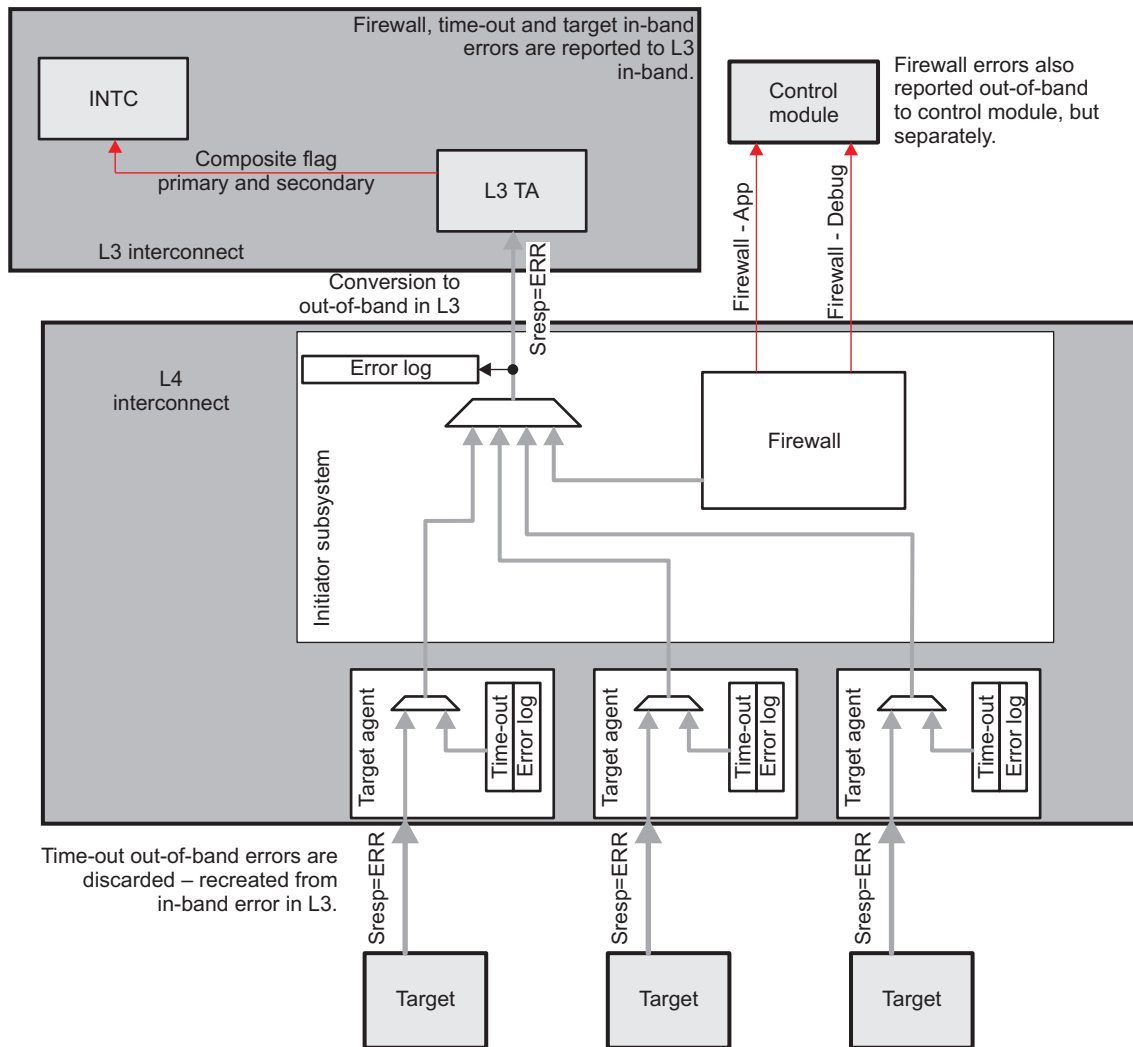

To recover from a time-out error, software is assumed to first reset the faulty module and then the TA using the L4_TA_AGENT_CONTROL_L[0] OCP_RESET bit.

1.9.3.3.4.3 Error Reporting

Figure 1-87 shows the error-reporting scheme used in the L4 interconnects. All L4 in-band errors are reported to L3 Interconnect with SRESP = ERR, as well as being stored in the appropriate registers. Any target error response is send back to the initiator via L3 interconnect.

Protection errors are always reported out-of-band to the Control Module. This asynchronous reporting uses separate flags for debug requests and for non-debug reuquests. Out-of-band firewall error reporting can be disabled by software from the L4_IA_AGENT_CONTROL register.

By setting the register L4_LA_FLAG_MASK_i_L registers errors comming form different initiator ports can be masked independently. The default settings of these registers are 0x3 so that all errors can be reported. In case of error, the L4_LA_FLAG_STATUS_i_L registers can be read to determine the error source.

Figure 1-87. L4 Error Reporting

icnt-017

1.9.3.3.4.4 Error Recovery

Writing 1 to the L4_TA_AGENT_CONTROL_L[0] OCP_RESET bit initiates the software reset period. Software reset must be asserted for at least 16 cycles of the target module interface clock, which can be a divided clock with respect to the L4 clock.

During the software reset period:

- Requests sent to the target module receive error responses. Therefore, if the faulty request is part of a DMA transfer, it is necessary to stop the DMA to prevent unwanted errors.
- Requests sent to the TA register block are processed as usual.
- The L4_TA_AGENT_STATUS_L[8] REQ_TIMEOUT status bit is cleared.

Writing 0 to the L4_TA_AGENT_CONTROL_L[0] OCP_RESET bit terminates the software reset period.

The attached module must then be reset to complete the recovery.

1.9.3.4 L4 Interconnect Programming Guide

1.9.3.4.1 L4 Interconnect Low-level Programming Models

This section describes the low-level hardware programming sequences for configuring and using the L4 interconnect module.

1.9.3.4.1.1 Global Initialization

1.9.3.4.1.1.1 Surrounding Modules Global Initialization

This section identifies the requirements of initializing the surrounding modules when the L4 interconnect module is to be used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the L4 interconnect. For more information, see [Section 1.9.3.2, L4 Interconnect Integration](#).

Table 1-269. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	For more information about the configuration of the module, see the <i>PRCM</i> chapter.
Control module	For more information about the configuration of the module, see the <i>Control Module</i> chapter.
MPU INTC	The MPU INTC must be configured to enable the interrupts from L4 interconnect module. See the <i>ARM Interrupt Controller (AINTC)</i> chapter.
EDMA	For more information about the configuration of the EDMA, see the <i>EDMA</i> chapter.
L3 interconnect	For more information about the interconnect configuration, see the <i>L3 Interconnect</i> section.

1.9.3.4.1.2 Operational Modes Configuration

1.9.3.4.1.2.1 L4 Interconnect Error Analysis Mode

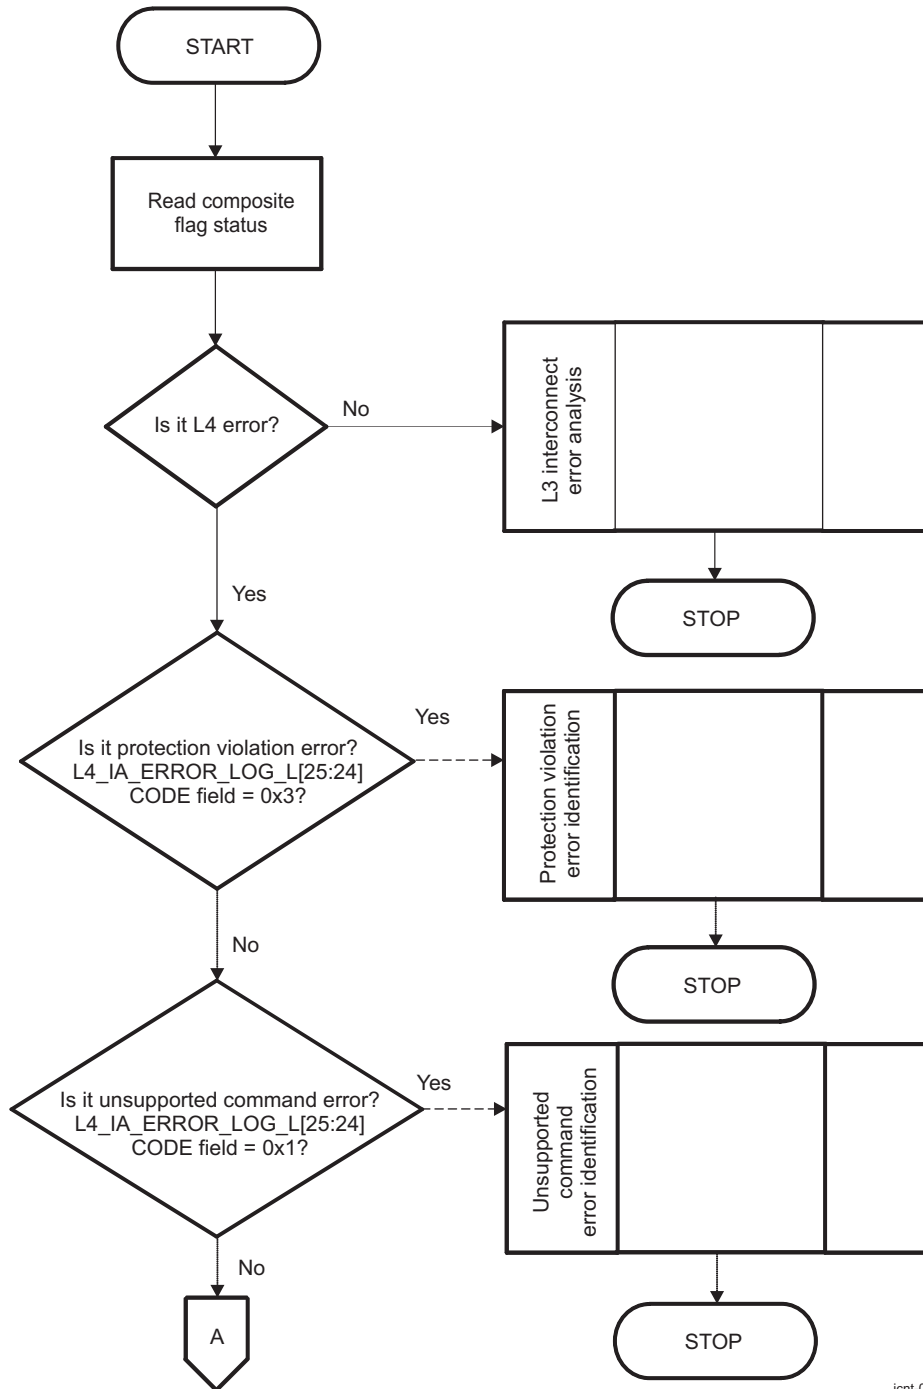

1.9.3.4.1.2.1.1 Main Sequence: L4 Interconnect Error Analysis Mode

The information required to analyze an error source is logged in several registers. The number of registers to access depends on the error source.

[Figure 1-88](#) and [Figure 1-89](#) show the software sequence required in most cases.

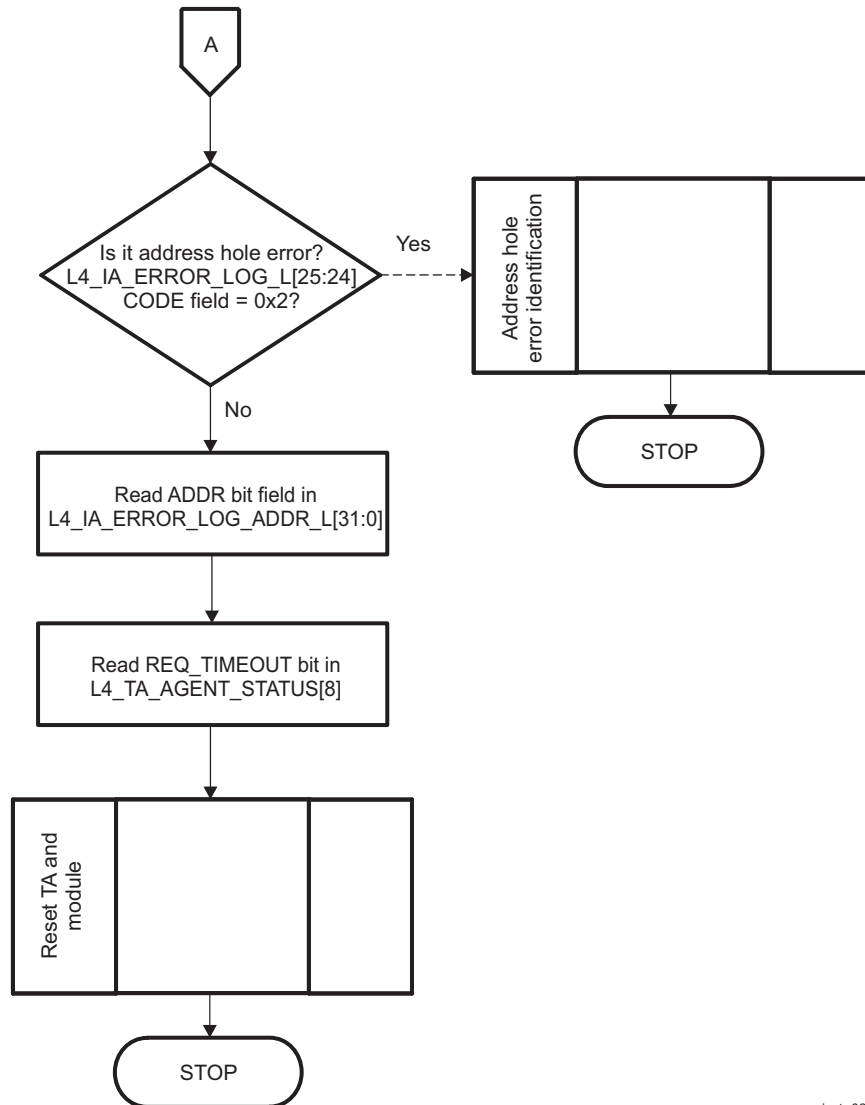

[Table 1-270](#) and [Table 1-271](#) show the main sequence for error analysis mode and its subprocess call summary, respectively.

Figure 1-88. Typical Error Analysis Sequence

icnt-019

Figure 1-89. Typical Error Analysis Sequence

icnt-020

Table 1-270. Main Sequence – Error Analysis Mode

Register Name	Register Name	Register Name
L4_IA_ERROR_LOG_L	L4_IA_ERROR_LOG_ADDR_L	L4_IA_AGENT_STATUS_L
L4_IA_AGENT_CONTROL_L	L4_TA_AGENT_STATUS_L	

Table 1-271. Subprocess Call Summary for Main Sequence – Error Analysis Mode

Subprocess	Cross-Reference
L3 interconnect error analysis	, L3 Interconnect Error Handling
L4 interconnect protection violation error identification	Section 1.9.3.4.1.2.1.2, Subsequence: L4 Interconnect Protection Violation Error Identification
L4 interconnect unsupported command/address hole error identification	Section 1.9.3.4.1.2.1.3, Subsequence: L4 Interconnect Unsupported Command/Address Hole Error Identification
L4 interconnect reset TA and module	Section 1.9.3.4.1.2.1.4, Subsequence: L4 Interconnect Reset TA and Module

1.9.3.4.1.2.1.2 Subsequence: L4 Interconnect Protection Violation Error Identification

This procedure describes the protection violation error identification (see [Table 1-272](#)).

Table 1-272. Protection Violation Error Identification

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	
Read initiator ID.	L4_IA_ERROR_LOG_L[13:8] CONNID	
Read command that cause the error.	L4_IA_ERROR_LOG_L[3:0] CMD	
Read address of request that caused the error.	L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR	
IF: Is it a primary error?	L4_IA_AGENT_STATUS_L[30] PROT_ERROR_PRIMARY	=0x1
Write 1 to clear IA status bit.	L4_IA_AGENT_STATUS_L[30] PROT_ERROR_PRIMARY	0x1
ELSE		
Write 1 to clear IA status bit	L4_IA_AGENT_STATUS_L[31] PROT_ERROR_SECONDARY	0x1
ENDIF		
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear in-band error status.	L4_IA_AGENT_STATUS_L[27] INBAND_ERROR	0x1

1.9.3.4.1.2.1.3 Subsequence: L4 Interconnect Unsupported Command/Address Hole Error Identification

This procedure describes the identification of unsupported command/address hole error (see [Table 1-273](#)).

Table 1-273. Unsupported Command/Address Hole Error Identification

Step	Register/Bit Field/Programming Model	Value
Read multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	
Read initiator ID.	L4_IA_ERROR_LOG_L[13:8] CONNID	
Read command that caused the error.	L4_IA_ERROR_LOG_L[3:0] CMD	
Read address of request that caused the error.	L4_IA_ERROR_LOG_ADDR_L[31:0] ADDR	
Read secondary status.	L4_IA_ERROR_LOG_L[30] SECONDARY	
Write 1 to clear secondary status.	L4_IA_ERROR_LOG_L[30] SECONDARY	0x1
Write 1 to clear multiple errors detection.	L4_IA_ERROR_LOG_L[31] MULTI	0x1
Write 1 to clear inband error status.	L4_IA_AGENT_STATUS_L[27] INBAND_ERROR	0x1

1.9.3.4.1.2.1.4 Subsequence: L4 Interconnect Reset TA and Module

This procedure resets the TA and module (see [Table 1-274](#)).

Table 1-274. Reset TA and Module

Step	Register/Bit Field/Programming Model	Value
Reset TA.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x1
Wait until target module clock = 16 cycles.		
Write 0 to clear TA time - out status.	L4_TA_AGENT_CONTROL_L[10:8] REQ_TIMEOUT	0x0
Write 0 to clear TA reset.	L4_TA_AGENT_CONTROL_L[0] OCP_RESET	0x0
Reset the attached module. ⁽¹⁾		

⁽¹⁾ For more information, see the respective module chapter.

1.9.3.4.1.2.2 L4 Interconnect Time-Out Configuration Mode

1.9.3.4.1.2.2.1 Main Sequence: L4 Interconnect Time-Out Configuration Mode

This procedure describes the time-out configuration sequence (see [Table 1-275](#)).

Table 1-275. Time-Out Configuration

Step	Register/Bit Field/Programming Model	Value
Disable time-out.	L4_LA_NETWORK_CONTROL_L[10:8] TIMEOUT_BASE	0x0
Clear TA time-out error status. ⁽¹⁾	L4_TA_AGENT_STATUS_L[10:8] REQ_TIMEOUT	0x1
Set time-out at TA level. ⁽¹⁾	L4_TA_AGENT_CONTROL_L[10:8] REQ_TIMEOUT	xxx
Set time-out base.	L4_LA_NETWORK_CONTROL_L[10:8] TIMEOUT_BASE	xxx

⁽¹⁾ Must be done for each TA.

1.9.3.4.1.2.3 L4 Interconnect Firewall Configuration Mode

1.9.3.4.1.2.3.1 Main Sequence: L4 Interconnect Firewall Configuration Mode

This procedure describes the firewall configuration sequence (see [Table 1-276](#)).

Table 1-276. Firewall Configuration

Step	Register/Bit Field/Programming Model	Value
Define the members of protection group k. ⁽¹⁾	L4_AP_PROT_GROUP_MEMBERS_k_L[15:0] CONNID_BIT_VECTOR	xxx
Define the access type of a protection group k. ⁽¹⁾	L4_AP_PROT_GROUP_ROLES_k_L[15:0] ENABLE	xx
Set region affiliation to protection group. ⁽²⁾	L4_AP_REGION_I_L[22:20] PROT_GROUP_ID	xxx

⁽¹⁾ Must be done for each protection group.

⁽²⁾ Must be done for each region.

1.9.3.5 L4 Interconnects Register Manual

Table 1-277 and Table 1-278 list all L4 register blocks for IA, TA, AP, and LA. Each module instance is shown with the module register mapping and bit and bit field definitions.

1.9.3.5.1 L4 Interconnects Instance Summary

1.9.3.5.2.2 L4 Initiator Agent (L4 IA) Register Description

through describe the L4 IA registers.

Table 1-280. L4_IA_COMPONENT_L

Address Offset	0x0000 0000
Physical Address	0x4800 1000 0x4A00 1000
Description	COMPONENT register identifies the component to which this register block belongs. The register contains a component code and revision, which are used to identify the hardware of the component. The COMPONENT register is read-only.
Type	R

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CODE																REV															

Bits	Field Name	Description	Type	Reset
31:16	CODE	Interconnect code	R	See ⁽¹⁾ .
15:0	REV	Component revision code	R	See ⁽¹⁾ .

⁽¹⁾ TI Internal Data

Table 1-281. L4_IA_COMPONENT_H

Address Offset	0x0000 0004
Physical Address	0x4800 1004 0x4A00 1004
Description	COMPONENT register identifies the component to which this register block belongs. The register contains a component code and revision, which are used to identify the hardware of the component. The COMPONENT register is read-only.
Type	R

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																															

Bits	Field Name	Description	Type	Reset
31:0	RESERVED	Read returns 0.	R	0x0000

Table 1-282. L4_IA_CORE_L

Address Offset	0x0000 0018
Physical Address	0x4800 1018 0x4A00 1018
Description	Provide information about the core initiator
Type	R

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CORE_CODE																CORE_REV															

Bits	Field Name	Description	Type	Reset
31:16	CORE_CODE	Interconnect core code	R	See ⁽¹⁾ .
15:0	CORE_REV	Component revision code code	R	See ⁽¹⁾ .

⁽¹⁾ TI Internal Data

Table 1-283. L4_IA_CORE_H

Address Offset	0x0000 001C
Physical Address	0x4800 101C 0x4A00 101C
Description	Provide information about the core initiator
Type	R

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																VENDOR_CODE

Table 1-284. L4_IA_AGENT_CONTROL_L

Address Offset	0x0000 0020
Physical Address	0x4800 1020 0x4A00 1020
Description	Enable error reporting on an initiator interface. The error reporting mechanism is enabled when the INBAND_ERROR_REP bit field is set to 1. The out-of-band OCP MError reporting mechanism is enabled when the MERROR_REP bit field is set to 1.
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PROT_ERROR_SECONDARY_REP	PROT_ERROR_PRIMARY_REP	RESERVED	INBAND_ERROR_REP	RESERVED	MERROR_REP	RESERVED											RESERVED														

Bits	Field Name	Description	Type	Reset
31	PROT_ERROR_SECONDARY_REP	Out-of-band reporting of protection mechanism secondary errors	RW	1
30	PROT_ERROR_PRIMARY_REP	Out-of-band reporting of protection mechanism primary errors	RW	1
29:28	RESERVED	Read returns 0.	R	0x0
27	INBAND_ERROR_REP	Setting this field to 1 reports on in-band errors using the INBAND_ERROR log bit of IA.AGENT_STATUS register.	RW	1
26:25	RESERVED	Read returns 0.	R	0x0
24	MERROR_REP	OCP MError reporting control	R	0
23:0	RESERVED	Read returns 0.	R	0x0

Table 1-285. L4_IA_AGENT_CONTROL_H

Address Offset	0x0000 0024
Physical Address	0x4800 1024 0x4A00 1020
Description	Enable error reporting on an initiator interface.
Type	R

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																															

Bits	Field Name	Description	Type	Reset
31:0	RESERVED	Read returns 0.	R	0x0000 0000

Table 1-286. L4_IA_AGENT_STATUS_L

Address Offset	0x0000 0028
Physical Address	0x4800 1028 0x4A00 1028
Description	Stores status information for an initiator. The INBAND_ERROR and MERROR fields are read/write and are implemented as log bits.
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PROT_ERROR_SECONDARY	PROT_ERROR_PRIMARY	RESERVED	RESERVED	INBAND_ERROR	RESERVED	RESERVED	MERROR	RESERVED																							

Bits	Field Name	Description	Type	Reset
63:32	RESERVED	Read returns 0s	R	0x0000 0000
31	PROT_ERROR_SECONDARY	Protection error status. MErrorSteer indicates a secondary error.	RW W1toClr	0
30	PROT_ERROR_PRIMARY	Protection error status. MErrorSteer indicates a primary error (or is not enabled).	RW W1toClr	0
29:28	RESERVED	Read returns 0s	R	0x0
27	INBAND_ERROR	Error status	RW W1toClr	0
26:25	RESERVED	Read returns 0s	R	0x0
24	MERROR	Value of the OCP MError signal	R	0
23:0	RESERVED	Read returns 0s	R	0x00 0000

Table 1-287. L4_IA_AGENT_STATUS_H

Address Offset	0x0000 002C
Physical Address	0x4800 102C 0x4A00 102C
Description	Stores status information for an initiator.
Type	R

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 1-288. L4_IA_ERROR_LOG_L

Address Offset	0x0000 0058
Physical Address	0x4800 1058 0x4A00 1058
Description	Log information about error conditions. The CODE field logs any protection violation or address hole errors detected by the initiator subsystem while decoding a request.
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MULTI		SECONDARY		RESERVED				CODE	RESERVED								CONNID				RESERVED				CMD						

Bits	Field Name	Description	Type	Reset
31	MULTI	Multiple errors detected	RW W1toClr	0
30	SECONDARY	Indicates whether protection violation was a primary or secondary error	RW W1toClr	0
29:26	RESERVED	Read returns 0.	R	0x0
25:24	CODE	The error code of an initiator request. 0x00: No errors 0x01: Reserved 0x10: Address hole 0x11: Protection violation	RW W1toClr	0x0
23:14	RESERVED	Read returns 0.	R	0x000
13:8	CONNID	ConnID of request causing the error, refer to Table 1-259	R	0x00
7:3	RESERVED	Read returns 0.	R	0x00
2:0	CMD	Command that caused error	R	0x0

Table 1-289. L4_IA_ERROR_LOG_H

Address Offset	0x0000 005C
Physical Address	0x4800 105C 0x4800 105C
Description	Log information about error conditions.
Type	R

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																REQ_INFO															

Bits	Field Name	Description	Type	Reset
31:16	RESERVED	Read returns 0.	R	0x0000
15:0	REQ_INFO	MReqInfo bits of request that caused the error REQ_INFO[0] = supervisor, REQ_INFO[1] = Debug	R	0x0000

Table 1-290. L4_IA_ERROR_LOG_ADDR_L

Address Offset	0x0000 0060
Physical Address	0x4800 1060 0x4A00 1060
Description	Extended error log (address information)
Type	R

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDR																															

Bits	Field Name	Description	Type	Reset
31:0	ADDR	Address of request that caused the error. N is the number MAddr bits.	R	0x0000 0000

SEGMENTS	0x3	0x2

Table 1-324. L4_LA_INITIATOR_INFO_H

Address Offset	0x0000 001C
Physical Address	See Table 1-317
Description	Contain initiator subsystem information.
Type	R

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								THREADS				RESERVED	CONNID_WIDTH				RESERVED	BYTE_DATA_WIDTH_EXP				RESERVED	ADDR_WIDTH								

Bits	Field Name	Description	Type	Reset
31:19	RESERVED	Read returns 0.	R	0x0000
18:16	THREADS	The THREADS field specifies the number of initiator threads connected to the interconnect. The field contains read-only configuration information for the initiator subsystem.	R	0x2
15	RESERVED	Read returns 0.	R	0
14:12	CONNID_WIDTH	The initiator subsystem ConnID width. The CONNID_WIDTH field contains read-only configuration information for the initiator subsystem.	R	0x4
11	RESERVED	Read returns 0.	R	0
10:8	BYTE_DATA_WIDTH_EXP	This field specifies the initiator subsystem data width. The BYTE_DATA_WIDTH_EXP field contains read-only configuration information for the initiator subsystem. 0x1: 16-bit data width is specified 0x2: 32-bit data width is specified	R	0x2
7:6	RESERVED	Read returns 0.	R	0x0

Bits	Field Name	Description	Type	Reset
5:0	ADDR_WIDTH	This field specifies the initiator subsystem address width. The ADDR_WIDTH field contains read-only configuration information for the initiator subsystem.	R	0x18

Table 1-325. L4_LA_NETWORK_CONTROL_L

Address Offset	0x0000 0020
Physical Address	See Table 1-317
Description	Control interconnect minimum timeout values.
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																TIMEOUT_BASE		RESERVED													

Bits	Field Name	Description	Type	Reset
31:11	RESERVED	Read returns 0.	R	0x000000
10:8	TIMEOUT_BASE	The TIMEOUT_BASE field indicates the time-out period (that is, base cycles) for the highest frequency time-base signal sent from the L4 initiator subsystem to all target agents that have time-out enabled. Values for the field are: 0 - Time-out disabled 1 - L4 interconnect clock cycles divided by 64 2 - L4 interconnect clock cycles divided by 256 3 - L4 interconnect clock cycles divided by 1024 4 - L4 interconnect clock cycles divided by 4096	RW	0x4
7:0	RESERVED	Read returns 0.	R	0x00

Table 1-326. L4_LA_NETWORK_CONTROL_H

Address Offset	0x0000 0024
Physical Address	See Table 1-317
Description	Control interconnect global power control
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								CLOCK_GATE_DISABLE	RESERVED		THREAD0_PRI	RESERVED										EXT_CLOCK	RESERVED								

Bits	Field Name	Description	Type	Reset
31:25	RESERVED	Read returns 0.	R	0x00
24	CLOCK_GATE_DISABLE	When set to 1 this field disables all clock gating.	RW	0
23:21	RESERVED	Read returns 0.	R	0x0

Bits	Field Name	Description	Type	Reset
20	THREAD0_PRI	Sets thread priority. If the field is set to 0, the default, all initiator threads are treated the same. Setting the THREAD0_PRI field to 1 assigns a higher arbitration priority to thread 0 of the first initiator OCP interface. To avoid starvation, arbitration is imposed by the initiator subsystem. When multiple requests from different initiator threads are dispatched to targets simultaneously, the oldest request is dispatched first. If thread 0 is assigned a higher priority, a request on thread 0 always wins arbitration. Assigning thread 0 of the first initiator OCP the highest priority on a request or response can result in the starvation of other threads.	R	0
19:9	RESERVED	Read returns 0.	R	0x000
8	EXT_CLOCK	When set to 1, the ext_clk_off_i signal on the initiator subsystem instructs the entire L4 to shut off.	R	1
7:0	RESERVED	Read returns 0.	R	0x00

Table 1-327. L4_LA_FLAG_MASK_i_L

BASE																															

Bits	Field Name	Description	Type	Reset
31:0	BASE	The base address of the segment (with 0s from bit 0 to bit SIZE-1).	R	see Table 1-336

Table 1-335. L4_AP_SEGMENT_i_H

Address Offset	0x104 + (0x08*i)
Physical address	0x4800 0104 + (0x08*i) 0x4A00 0104 + (0x08*i)
Description	Define the size of each segments
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																SIZE															

Bits	Field Name	Description	Type	Reset
31:6	RESERVED	Read returns 0.	R	0x00000000
5:0	SIZE	Segment size is a power of 2, where 2 ^{SIZE} is the byte size of a segment (all segment registers use the same size).	R	0x14

Table 1-336. Reset Value for L4_AP_SEGMENT_i

i	L4LS		L4HS	
	BASE	SIZE	BASE	SIZE
0	0x0000 0000	0x14	0x0000 0000	0x14
1	0x0010 0000	0x14	0x0010 0000	0x14
2	0x0020 0000	0x14	-	-

Table 1-337. L4_AP_PROT_GROUP_MEMBERS_k_L

Address Offset	0x200 + (0x08*k)	Index
Physical address	0x4800 0200 + (0x08*k) 0x4A00 0200 + (0x08*k)	
Description	Define ConnID bit vectors for a protection group.	
Type	R	

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CONNID_BIT_VECTOR															

Bits	Field Name	Description	Type	Reset
31:16	Reserved	Reserved	R	0x000000000000
15:0	CONNID_BIT_VECTOR	Specifies protection group members N is 2**W, where W is the connID width	RW	0xFFFF

Table 1-338. L4_AP_PROT_GROUP_MEMBERS_k_H

Address Offset	0x204 + (0x08*k)																														
Physical address	0x4800 0204 + (0x08*k) 0x4A00 0204 + (0x08*k)																														
Description	Define ConnID bit vectors for a protection group.																														
Type	R																														

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved																															

Bits	Field Name	Description	Type	Reset
31:0	Reserved	Read returns 0's	R	0x0000 0000

Table 1-339. L4_AP_PROT_GROUP_ROLES_k_L

Address Offset	0x200 + (0x08*k)	Index	k = 0 to 7 for L4LS_AP k = 0 to 7 for L4HS_AP	
Physical address	0x4800 0280 + (0x08*k) 0x4A00 0280 + (0x08*k)			
Description	Define MReqInfo bit vectors for a protection group.			
Type	R			

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ENABLE																															

Bits	Field Name	Description	Type	Reset
31:0	ENABLE	Enabled bits N is 2**W, where W (W is less than or equal to 6) is the number of MReqInfo bits configured for role checking	R	0xFFFF FFFF

Table 1-340. L4_AP_PROT_GROUP_ROLES_k_H

Address Offset	0x204 + (0x08*k)	Index	k = 0 to 7 for L4LS_AP k = 0 to 7 for L4HS_AP	
Physical address	0x4800 0284 + (0x08*k) 0x4A00 0284 + (0x08*k)			
Description	Define ConnID bit vectors for a protection group.			
Type	R			

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ENABLE																															

Bits	Field Name	Description	Type	Reset
31:0	ENABLE	Enabled bits N is 2**W, where W (W is less than or equal to 6) is the number of MReqInfo bits configured for role checking	R	0xFFFF FFFF

Table 1-341. L4_AP_REGION_I_L

Address Offset	0x300 + (0x08*I)
Physical address	0x4800 0300 + (0x08*I) 0x4A00 0300 + (0x08*I)
Description	Define the base address of the region in respect to the segment it belongs to.
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved										BASE																					

Bits	Field Name	Description	Type	Reset
31:20	Reserved	Read returns 0.	R	0x00
19:0	BASE	Sets the base address of the region relative to its segment base.	R	See Table 1-343 to Table 1-344

Table 1-342. L4_AP_REGION_I_H

Address Offset	0x304 + (0x08*I)
Physical address	0x4800 0304 + (0x08*I) 0x4A00 0304 + (0x08*I)
Description	Define the size, protection group and segment ID of the region
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MADDRSPACE				RESERVED	SEGMENT_ID			RESERVED	PROT_GROUP_ID			RESERVED	BYTE_DATA_WIDTH_EXP			RESERVED	PHY_TARGET_ID						RESERVED	SIZE				ENABLE			

Bits	Field Name	Description	Type	Reset
31:28	MADDRSPACE	Target OCP MAddrSpace value	R	See Table 1-343 and Table 1-344 .
27	RESERVED	Read returns 0.	R	0x0
26:24	SEGMENT_ID	The segment associated to the region.	R	See Table 1-343 and Table 1-344 .
23	RESERVED	Read returns 0.	R	0
22:20	PROT_GROUP_ID	The protection group associated to the region.	RW	See Table 1-343 and Table 1-344 .
19	RESERVED	Read returns 0.	R	0
18:17	BYTE_DATA_WIDTH_EXP	The target data byte width is $2^{\text{BYTE_DATA_WIDTH_EXP}}$ bytes.	R	See Table 1-343 and Table 1-344 .
16:15	Reserved	Read returns 0.	R	0x0
14:8	PHY_TARGET_ID	Physical target ID	R	See Table 1-343 and Table 1-344 .
7	RESERVED	Read returns 0.	R	0
6:1	SIZE	Define the size of the region in bytes. 2^{SIZE} equals the region.	R	See Table 1-343 and Table 1-344 .
0	ENABLE	0x0: Disable the region, no access allows 0x1: Enable the region, with access as define in registers	R	0x1

2.1 Introduction

The device power-management architecture ensures maximum performance and operation time for user satisfaction (audio/video support) while offering versatile power-management techniques for maximum design flexibility, depending on application requirements. This section contains the following information:

- Power-management architecture building blocks for the device.
- State-of-the-art power-management techniques supported by the power-management architecture of the device.

2.1.1 Device Power-Management Architecture Building Blocks

To provide a versatile architecture supporting multiple power-management techniques, the power-management framework is built with three levels of resource management: clock, power, and voltage management.

These management levels are enforced by defining the managed entities or building blocks of the power-management architecture, called the clock, power, and voltage domains. A domain is a group of modules or subsections of the device that share a common entity (for example, common clock source, common voltage source, or common power switch). The group forming the domain is managed by a policy manager. For example, a clock for a clock domain is managed by a dedicated clock manager within the power, reset, and clock management (PRCM) module. The clock manager considers the joint clocking constraints of all the modules belonging to that clock domain (and, hence, receiving that clock).

2.1.1.1 Clock Management

The PRCM module manages the gating (that is, switching off) and enabling of the clocks to the device modules. The clocks are managed based on the requirement constraints of the associated modules. The following sections identify the module clock characteristics, management policy, clock domains, and clock domain management.

Each module within the device has specific clock input characteristic requirements. Based on the characteristics of the clocks delivered to the modules, the clocks are divided into two categories: interface clocks and functional clocks.

The interface clocks have the following characteristics:

- They ensure proper communication between any module/subsystem and the interconnect.
- In most cases, they supply the system interconnect interface and registers of the module.
- A typical module has one interface clock, but modules with multiple interface clocks may also exist (that is, when connected to multiple interconnect buses).
- Interface clock management is done at the device level.
- From the standpoint of the PRCM module, an interface clock is identified by an `_ICLK` suffix.

Functional clocks have the following characteristics:

- They supply the functional part of a module or subsystem.
- A module can have one or more functional clocks. Some functional clocks are mandatory, while others are optional. A module needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the module activity.
- From the standpoint of the PRCM module, a functional clock is distributed directly to the related modules through a dedicated clock tree. It is identified with an `_FCLK` suffix.

[Figure 2-1](#) provides a representation of the functional and interface clocks.

Figure 2-1. Functional and Interface Clocks

2.1.2 Module-Level Clock Management

Each module in the device may also have specific clock requirements. Certain module clocks must be active when operating in specific modes, or may be gated otherwise. Globally, the activation and gating of the module clocks are managed by the PRCM module. Hence, the PRCM module must be aware of when to activate and when to gate the module clocks. The PRCM module differentiates the clock-management behavior for device modules based on whether the module can initiate transactions on the device interconnect (called master module or initiators) or cannot initiate transactions and only responds to the transactions initiated by the master (called slave module or targets). Thus, two hardware-based power-management protocols are used:

- Master standby protocol: Clock-management protocol between the PRCM and master modules
- Slave idle protocol: Clock-management protocol between the PRCM and slave modules

2.1.2.1 Master Standby Protocol

This protocol is used to indicate that a master module must initiate a transaction on the device interconnect and requests specific (functional and interface) clocks for the purpose. The PRCM module ensures that the required clocks are active when the master module requests the PRCM module to enable them. This is called a module wake-up transition and the module is said to be functional after this transition completes. Similarly, when the master module no longer requires the clocks, it informs the PRCM module, which can then gate the clocks to the module. The master module is then said to be in standby mode. Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the module. This is done by setting the module register bit field <Module>_SYSCONFIG.IDLEMODE or <Module>_SYSCONFIG.STANDBYMODE (see Table 2-1). The behavior, identified by standby mode values, must be configured.

Table 2-1. Master Module Standby-Mode Settings

Standby Mode Value	Selected Mode	Description
0	Force-standby	The module unconditionally asserts the standby request to the PRCM module, regardless of its internal operations. The PRCM module may gate the functional and interface clocks to the module. This mode must be used carefully because it does not prevent the loss of data at the time the clocks are gated.
1h	No-standby	The module never asserts the standby request to the PRCM module. This mode is safe from a module point of view because it ensures that the clocks remain active. However, it is not efficient from a power-saving perspective because it never allows the output clocks of the PRCM module to be gated.
2h	Smart-standby	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idled. The PRCM module can then gate the clocks to the module.
3h	Smart-standby wakeup-capable mode	The module asserts the standby request based on its internal activity status. The standby signal is asserted only when all ongoing transactions are complete and the module is idle. The PRCM module can then gate the clocks to the module. The module may generate (master-related) wake-up events when in STANDBY state. The mode is relevant only if the appropriate module mwakeup output is implemented.

The standby status of a master module is indicated by the CM_<Power_domain>_<Module>_CLKCTRL[x].STBYST bit in the PRCM module. [Table 2-2](#) describes the master module standby status.

Table 2-2. Master Module Standby Status

STBYST Bit Value	Description
0	The module is functional.
1	The module is in standby mode.

2.1.2.2 Slave Idle Protocol

This hardware protocol allows the PRCM module to control the state of a slave module. The PRCM module informs the slave module, through assertion of an idle request, when its clocks (interface and functional) can be gated. The slave can then acknowledge the request from the PRCM module and the PRCM module is then allowed to gate the clocks to the module. A slave module is said to be in IDLE state when its clocks are gated by the PRCM module. Similarly, an idled slave module may need to be wakened because of a service request from a master module or as a result of an event (called a wake-up event; for example, interrupt or DMA request) received by the slave module. In this situation the PRCM module enables the clocks to the module and then deasserts the idle request to signal the module to wake up. Although the protocol is completely hardware-controlled, software must configure the clock-management behavior for the slave module. This is done by setting the module register bit field <Module>_SYSCONFIG.SIDLEMODE or <Module>_SYSCONFIG.IDLEMODE (see [Table 2-3](#)). The behavior, listed in the Idle Mode Value column, must be configured by software.

Table 2-3. Module Idle Mode Settings

Idle Mode Value	Selected Mode	Description
0h	Force-idle	The module unconditionally acknowledges the idle request from the PRCM module, regardless of its internal operations. This mode must be used carefully because it does not prevent the loss of data at the time the clock is switched off.
1h	No-idle	The module never acknowledges any idle request from the PRCM module. This mode is safe from a module point of view because it ensures that the clocks remain active. However, it is not efficient from a power-saving perspective because it does not allow the PRCM module output clock to be shut off, and thus the power domain to be set to a lower power state.

Table 2-3. Module Idle Mode Settings (continued)

Idle Mode Value	Selected Mode	Description
2h	Smart-idle	The module acknowledges the idle request basing its decision on its internal activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or direct memory access (DMA) requests are processed. This is the best approach to efficient system power management.
3h	Smart-idle wakeup-capable mode	The module acknowledges the idle request basing its decision on its internal wakeup-capable mode activity. Namely, the acknowledge signal is asserted only when all pending transactions, interrupts, or DMA requests are processed. This is the best approach to efficient system power management. The module may generate (IRQ- or DMA-request-related) wake-up events when in IDLE state. The mode is relevant only if the appropriate module's wakeup output(s) is implemented.

The idle status of a slave module is indicated by the CM_<Powerdomain>_<Module>_CLKCTRL[x] IDLEST bit field in the PRCM module. [Table 2-4](#) lists the possible idle status for a slave module.

Table 2-4. Slave Module Idle Status

IDLEST Bit	Idle Status	Description
0h	Functional	The module is fully functional. The interface and functional clocks are active.
1h	In transition	The module is performing a wake-up or a sleep transition.
2h	Interface idle	The module interface clock is idled. The module may remain functional if using a separate functional clock.
3h	Full idle	The module is fully idle. The interface and functional clocks are gated.

For the idle protocol management on the PRCM module side, the behavior of the PRCM module is configured in the CM_<Powerdomain>_<Module>_CLKCTRL[x] MODULEMODE bit field. Based on the configured behavior, the PRCM module asserts the idle request to the module unconditionally (that is, immediately when the software requests). [Table 2-5](#) describes the configurable behavior of MODULEMODE.

Table 2-5. Slave Module Mode Settings in PRCM

MODULE MODE Bit Value	Selected Mode	Description
0h	Disabled	The PRCM module unconditionally asserts the module idle request. This request applies to the gating of the functional and interface clocks to the module. If acknowledged by the module, the PRCM module can gate all clocks to the module (that is, the module is completely disabled).
1h	Reserved	Reserved
2h	Enabled	This mode applies to a module when the PRCM module manages its interface and functional clocks. The functional clock to the module remains active unconditionally, while the PRCM module automatically asserts/deasserts the module idle request based on the clock-domain transitions. If acknowledged by the module, the PRCM module can gate only the interface clock to the module.
3h	Reserved	Reserved

In addition to the IDLE and STANDBY protocol, PRCM offers also the possibility to manage optional clocks, through a direct software control: "OPTFCLKEN" bit from programming register.

Table 2-6. Module Clock Enabling Condition

Clock Enabling Condition	Condition:	
	AND	OR
Clock associated with STANDBY protocol	Clock domain is ready	MStandby is de-asserted Mwakeup is asserted
Clock associated with IDLE protocol, as interface clock	Clock domain is ready	Idle status = FUNCT Idle status = TRANS SWakeup is asserted
Clock associated with IDLE protocol, as functional clock	Clock domain is ready	Idle status = FUNCT Idle status = TRANS Idle status = IDLE SWakeup is asserted
Optional clock	Clock domain is ready	OPTFCLKEN = Enabled (0x1)

2.1.3 Clock Domain

A clock domain is a group of modules fed by clock signals controlled by the same clock manager in the PRCM module (see [Figure 2-2](#)). By gating the clocks in a clock domain, the clocks to all the modules belonging to that clock domain can be cut to lower their active power consumption (that is, the device is on and the clocks to the modules are dynamically switched to ACTIVE or INACTIVE (GATED) states). Thus, a clock domain allows control of the dynamic power consumption of the device. The device is partitioned into multiple clock domains, and each clock domain is controlled by an associated clock manager within the PRCM module. This allows the PRCM module to individually activate and gate each clock domain of the device.

Figure 2-2. Generic Clock Domain

[Figure 2-2](#) is an example of two clock managers: CM_a and CM_b. Each clock manager manages a clock domain. The clock domain of CM_b is composed of two clocks: a functional clock (FCLK2) and an interface clock (ICLK1), while the clock domain of CM_a consists of a clock (CLK1) that is used by the module as a functional and interface clock. The clocks to Module 2 can be gated independently of the clock to Module 1, thus ensuring power savings when Module 2 is not in use. The PRCM module lets software check the status of the clock domain functional clocks. The CM_<Clock_domain>_CLKSTCTRL[x] CLKACTIVITY_<FCLK/Clock name_FCLK> bit in the PRCM module identifies the state of the functional clock(s) within the clock domain. [Table 2-7](#) shows the possible states of the functional clock.

Table 2-7. Clock Domain Functional Clock States

CLKACTIVITY Bit	Status	Description
0	Gated	The functional clock of the clock domain is inactive
1	Active	The functional clock of the clock domain is running

2.1.3.1 Clock Domain-Level Clock Management

The domain clock manager can automatically (that is, based on hardware conditions) and jointly manage the interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings. A clock domain can switch between three possible states: ACTIVE, IDLE_TRANSITION, and INACTIVE. Figure 2-3 shows the sleep and wake-up transitions of the clock domain between ACTIVE and INACTIVE states.

Figure 2-3. Clock Domain State Transitions

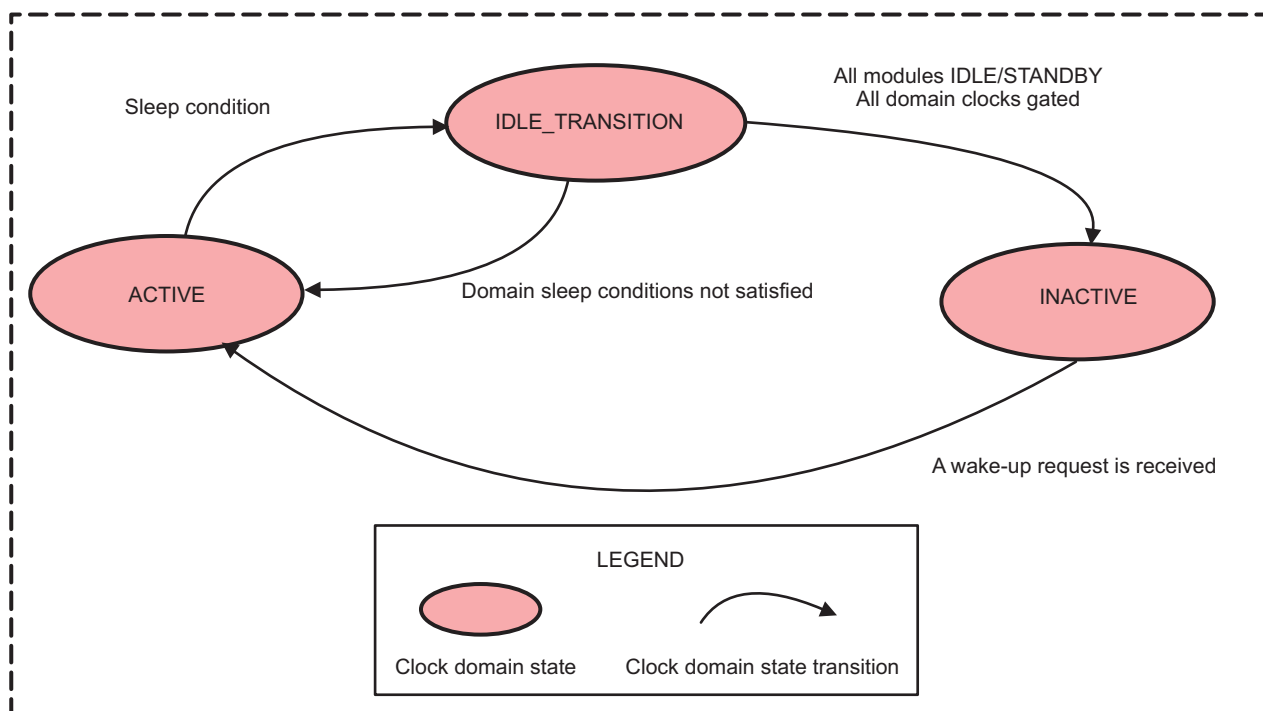

Table 2-8. Clock Domain States

State	Description
ACTIVE	Every nondisabled slave module (that is, those whose MODULEMODE value is not set to disabled) is put out of IDLE state. · All interface clocks to the nondisabled slave modules in the clock domain are provided. All functional and interface clocks to the active master modules (that is, not in STANDBY) in the clock domain are provided. · All enabled optional clocks to the modules in the clock domain are provided.
IDLE_TRANSITION	This is a transitory state. · Every master module in the clock domain is in STANDBY state · Every idle request to all the slave modules in the clock domain is asserted. · The functional clocks to the slave module in enabled state (that is, those whose MODULEMODE values are set to enabled) remain active. · All enabled optional clocks to the modules in the clock domain are provided.
INACTIVE	All clocks within the clock domain are gated. · Every slave module in the clock domain (that is, those whose MODULEMODE is set to disabled or auto) is in IDLE state and set to disabled or auto mode. · Every optional functional clock in the clock domain is gated.

Each clock domain transition behavior is managed by an associated register bit field in the CM_<Clock domain>_CLKSTCTRL[x] CLKTRCTRL PRCM module. [Table 2-9](#) describes the clock transition mode settings in the clock domain.

Table 2-9. Clock Transition Mode Settings

CLKTRCTRL Bit	Selected Mode	Description
0	Reserved	Reserved
1h	SW_SLEEP	A software-forced sleep transition. The transition is initiated when the associated hardware conditions are satisfied
2h	SW_WKUP	A software-forced clock domain wake-up transition is initiated
3h	Reserved	Reserved

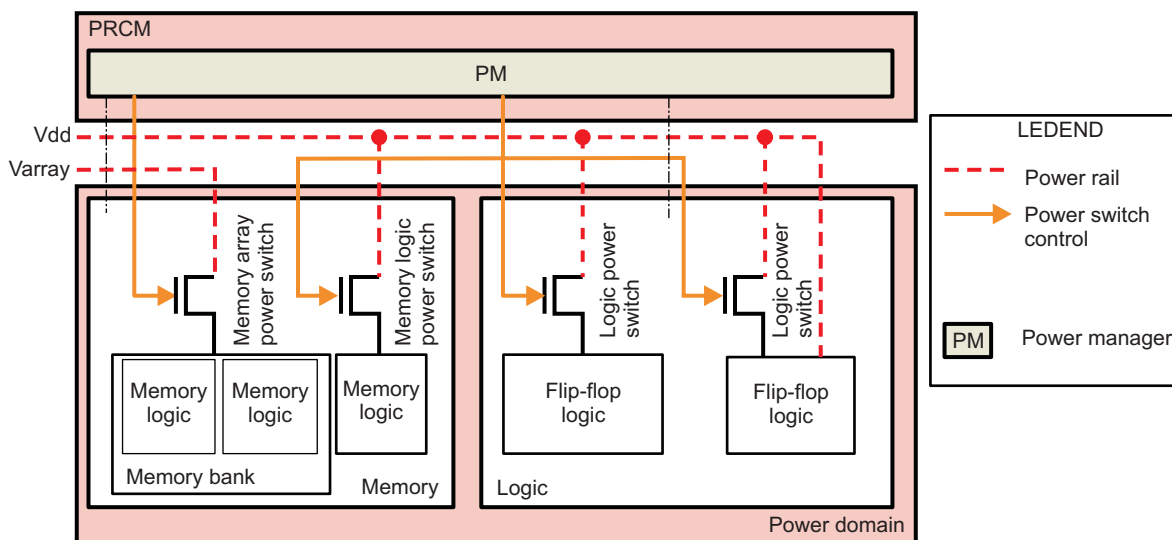

2.1.4 Power Management

The PRCM module manages the switching on and off of the power supply to the device modules. To minimize device power consumption, the power to the modules can be switched off when they are not in use. Independent power control of sections of the device allows the PRCM module to turn on and off specific sections of the device without affecting the others.

2.1.4.1 Power Domain

A power domain is a section (that is, a group of modules) of the device with an independent and dedicated power manager (see [Figure 2-4](#)). A power domain can be turned on and off without affecting the other parts of the device.

Figure 2-4. Power Domain Block Diagram

To minimize device power consumption, the modules are grouped into power domains. A power domain can be split into a logic area (Table 2-11) and a memory area (Table 2-10).

Table 2-10. States of a Memory Area in a Power Domain

State	Description
On	The memory array is powered and fully functional.
Off	The memory array is powered down.

Table 2-11. States of a Logic Area in a Power Domain

State	Description
On	Logic is fully powered
Off	Logic power switches are off. All the logic (DFF) is lost.

2.1.4.2 Power Domain Management

The power manager associated with each power domain is assigned the task of managing the domain power transitions. It ensures that all hardware conditions are satisfied before it can initiate a power domain transition from a source to a target power state.

Table 2-12. Power Domain Control and Status Registers

Register/Bit Field	Type	Description
PM_<Power domain>_PWRSTCTRL[1:0] POWERSTATE	Control	Selects the target power state of the power domain. It is OFF or ON.
PM_<Power domain>_PWRSTST[1:0] POWERSTATEST	Status	Identifies the current state of the power domain. It is OFF or ON.
PM_<Power domain>_PWRSTST[2] LOGICSTATEST	Status	Identifies the current state of the logic area in the power domain. It is OFF or ON.
PM_<Power domain>_PWRSTST[5:4] MEMSTATEST	Status	Identifies the current state of the memory area in the power domain. It is OFF or ON.

2.1.4.3 Power-Management Techniques

The following section describes the state-of-the-art power-management techniques supported by the device.

2.1.4.3.1 Dynamic Voltage and Frequency Scaling

Dynamic voltage and frequency scaling (DVFS) consists of opportunistically reducing the operating frequency of a logic block so that the operating voltage may be reduced accordingly. Dynamic power is related to the supply voltage so it is generally advantageous to reduce frequency and voltage instead of completing task faster and then going idle. The DVFS technique uses dynamic selection of the optimal operating frequency and voltage to allow a task to be performed in the required length of time. This reduces the active power consumption (power consumed while executing a task) of the device while still meeting task requirements.

NOTE: The values in Figure 2-5 are hypothetical. They are ment to clarify the concept only and do not represent valid test results on the device.

Figure 2-5. Comparison of Energy Consumed With/Without DVFS

Figure 2-5 shows the DVFS technique by comparing a process executed at maximum frequency and operating voltage without applying DVFS to the same process executed at optimal frequency and voltage using DVFS, based on the task requirements. If a task that must terminate in 4 seconds is performed at maximum operating frequency (left side of the figure), it terminates in 1 second, and the remaining 3 seconds are spent in idle mode. With DVFS (right side of the figure), the operating frequency is reduced to an optimal level; the task takes the full 4 seconds to complete, but power consumption is reduced. In addition, the voltage can be reduced further to save power so the dynamic and leakage power consumption are reduced.

DVFS requires control over the clock frequency and the operating voltage of the device elements. By intelligently switching the individual elements of the device to their OPPs, the power consumption of the device for a given task can be minimized.

For practical reasons related to device making (flow, tools), DVFS can be used only for a few discrete steps, not over a continuum of voltage and frequency values. Each step, or OPP, is composed of a voltage (V) and frequency (F) pair. For an OPP, the frequency corresponds to the maximum frequency allowed at a voltage, or reciprocally; the voltage corresponds to the minimum voltage allowed for a frequency.

When applying DVFS, a processor or system always runs at the lowest OPP that meets the performance requirement at a given time. The user determines the optimal OPP for a given task and then switches to that OPP to save power.

2.2 Power Reset Clock Management Structure

2.2.1 Introduction

The PRCM is structured using the architectural concepts presented in the 5000x Power Management Framework. This framework provides:

- A set of modular, reusable FSM blocks to be assembled into the full clock and power management mechanism.
- A register set and associated programming model.
- Functional sub-block definitions for clock management, power management, system clock source generation, and master clock generation.

The device supports an enhanced power management scheme based on:

- Six functional power domains:

Generic power domains:

- Active (DSP)
- AlwaysOn
- ISP (ISS)
- HDVICP
- SGX
- DSS

The PRCM provides the following functional features:

- Software configurable for direct, automatic, or a combination thereof, functional power domain state transition control
- Device power-up sequence control
- Device sleep / wake-up sequence control
- Centralized reset generation and management
- Centralized clock generation and management

The PRCM modules implement these general functional interfaces, further described in [Table 2-13](#):

- OCP configuration ports
- Direct interface to device boundary
- Power switch control signals
- Device control signals
- Clocks control signals
- Resets signals
- A set of power management protocol signals for each module to control and monitor standby, idle and wake-up modes (CM and PRM)
- Emulation signals

Table 2-13. PRCM Functional Interfaces

Interface	Description
OCP configuration ports	The OCP port for the PRCM module is used to control power, reset and wake-up Management.
OCP slave	PRCM implements a 32-bit OCP target interface.
Power switch control signals	The device has power domain switches over the device. This interface provides PRCM control over power domain switches and receives responses from the power domains which indicate the switch status. It also controls the isolation signals. The control for power domain switches is latched in the PRCM Status Registers.

Table 2-13. PRCM Functional Interfaces (continued)

Interface	Description
Device control signals	This interface provides PRM management of several device-level features which are not specific to any single power domain. This PRCM interface controls signals to/from the device for global control: <ul style="list-style-type: none"> • Device type coding • I/Os isolation control
Clocks control signals	This interface gathers all clock inputs and outputs managed by PRCM modules.
Resets signals	This interface gathers all resets inputs and outputs managed by PRCM module.
Modules Power Management Control	Modules or subsystems in the device are split over two categories: <ul style="list-style-type: none"> • Initiator: an initiator is a module able to generate traffic on the device interconnects (typically: processors, MMU, eDMA...). The PRCM module handles all initiator modules' power management interfaces: MStandby signal MWait signal. • Target: a target is a module that cannot generate traffic on the device interconnects, but that can generate interrupts or DMA request to the system (typically, peripherals). PRCM handles a power management handshake protocol with each module or subsystem. This protocol allows performing proper clock and power transition, taking into account each module activity or state. PRCM module handles all target modules' power management interfaces: SIdleReq signal, SIdleAck signal, FCLKEN signal. It also handles all target modules' wake-up: SWakeup signal ⁽¹⁾.

⁽¹⁾ Only USB and PCIe support SWakeup.

2.3 Clock Generation and Management

PRCM provides a centralized control for the generation, distribution and gating of most clocks in the device. PRCM gathers externally generated clocks and device internally generated clocks (DPLL clocks) for distribution to the other modules in the device. The PRCM module manages system clock generation.

2.3.1 Types of Clocks

The PRCM produces two types of clocks: interface and functional.

Interface clocks: these clocks primarily provide clocking for the system interconnect modules and the portions of device's functional modules which interface to the system interconnect modules. In most cases, the interface clock supplies the functional module's system interconnect interface and registers. For some modules, the interface clock is also used as functional clock. In this specification, interface clocks are represented by blue lines.

Functional clock: this clock supplies the functional part of a module or a sub-system. In some cases, a module or a subsystem may require several functional clocks: 1 or several main functional clock(s), 1 or several optional clock(s). A module needs its main clock(s) to be operational. Optional clocks are used for specific features and can be shutdown without stopping the module.

2.3.2 Clock Structure

The device has 12 on-chip PLLs at top level, and three additional inside hard macros (two of them in SERDES, one of them in Cortex™-A8 Subsystem). All of the twelve top level DPLLs are DPLLLJ instances which includes bypass feature inside. The Cortex™-A8 Subsystem is a DPLLS instance. [Figure 2-6](#) shows the detailed clock structure of the device.

Figure 2-6. Clock Structure

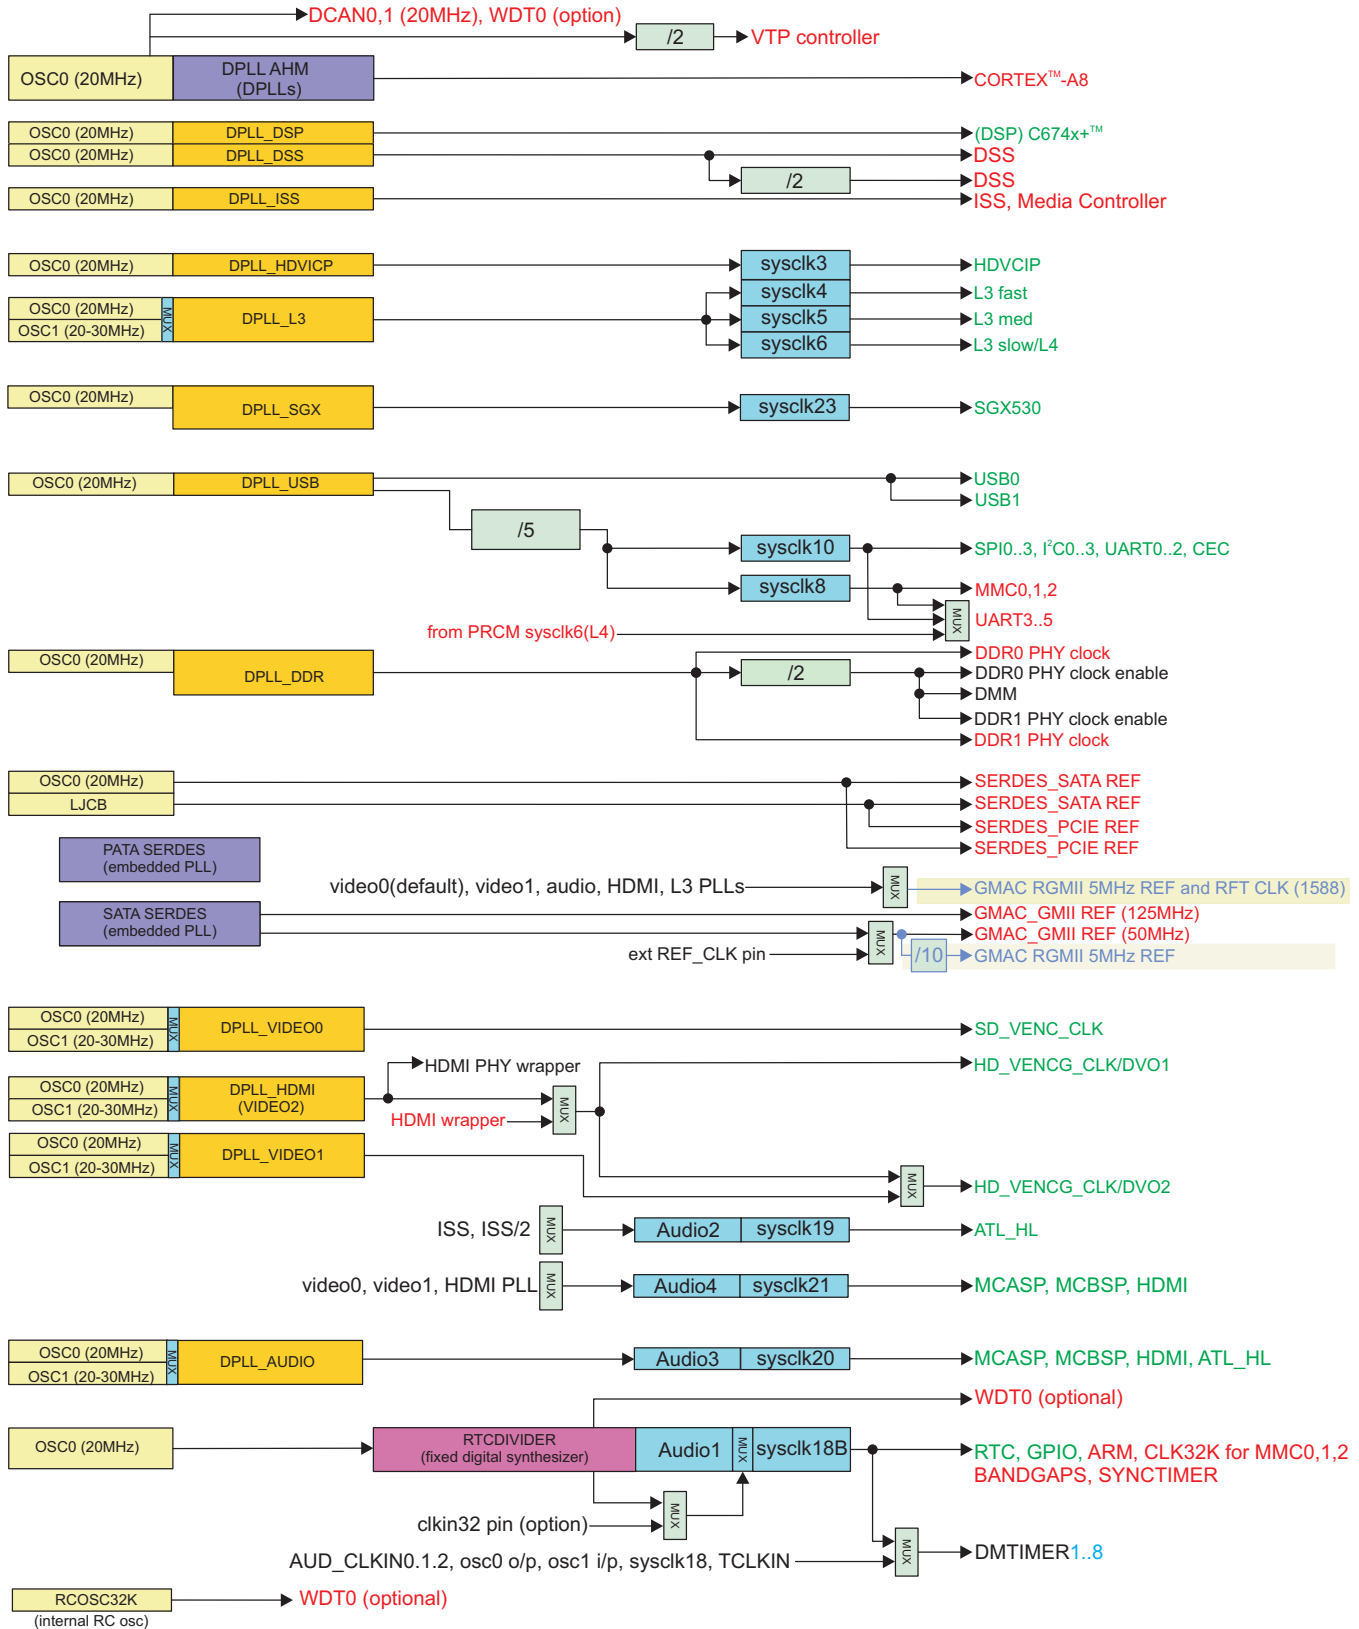

Table 2-14. PLL Names and Types

PLL Name	PLL Type
DPLL_MPU(For Cortex™-A8)	DPLLS
DPLL_DSP	DPLLLJ
DPLL_ISS (DPLL_ISP)	DPLLLJ
DPLL_HDVICP	DPLLLJ
DPLL_L3	DPLLLJ
DPLL_DDR	DPLLLJ
DPLL_USB	DPLLLJ
DPLL_SGX530	DPLLLJ
DPLL_AUDIO	DPLLLJ
DPLL_HDMI	DPLLLJ
DPLL_VIDEO0	DPLLLJ
DPLL_VIDEO1	DPLLLJ
DPLL_DSS	DPLLLJ
DPLL_SATA_SERDES	DPLLLJ
DPLL_PATA_SERDES	DPLLLJ

The device has two reference clocks which are generated by on-chip oscillators or externally. The main oscillator on the device is 20 MHz (DEVOSC). Optionally, if DEVOSC is 20 MHz and a precise audio or video frequency is desired, a second oscillator (AUXOSC) may be utilized for video and/or audio PLLs (e.g., 27, 22.5792 MHz or other frequency between 20-30 MHz). For instance, if a precise audio reference clock is needed, AUXOSC would provide this (e.g., 22.5792 for 44.1k audio) and then the video clock must be derived from Video PLL based on a multiply/divide of 20 MHz (pre-divide in PLL allows precise 27 MHz multiples from 20 MHz reference).

It is also possible to have one off-chip VCXO to supply the AUXOSC reference clock and in this case, the on-chip oscillator is bypassed.

In addition to the DEVOSC (20 MHz) and AUXOSC (20-30 MHz) reference clocks, there are an optional external 100 MHz differential clock input for the PCIe SERDES. The SATA SERDES also provides references for EMAC switch IP (125 MHz for GMII, 50 MHz RMII, 5 MHz RGMII).

A separate 250 MHz reference is used for EMAC RGMII mode, this comes from a mux which also feeds the 1588 reference clock. This clock has multiple options (see SERDES and Ethernet clocking diagram), but defaults to VIDEO0 PLL. Therefore to use reset isolation, the user must use VIDEO0 PLL at 250 MHz, which is also a suitable for 1588 reference clock rate.

There is third clock input for the RTC and GPIO0,1,2,3 and MMC0,1,2 debounce. This is an optional 32768 Hz clock input (no on-chip oscillator). Alternatively a fixed divider of the on-chip 20 MHz oscillator (DEVOSC) may be used to generate the 32768 Hz clock (provided by RTCDIVIDER). The 32k clock (regardless of source: pin or RTCDIVIDER source) is also used as optional reference for the eight timers, a reference clock for memory LDOs and bandgaps, and SYNCTIMER. The direct RTCDIVIDER output is also used as optional clock for WDT0 (Cortex™-A8 watchdog and as an optional clock source for ARM functional clock for very low power mode). By the Control Module MMR bits is provided a glitchless clock gating (enable/disable). This allows the clocks to be turn off when the modules are inactive state with a goal to minimize power consumption. During reset however, free running clock should be allowed such that reset can fully propagate.

NOTE: The ADPLLS in Cortex™-A8 Subsystem and the two ADPLLJ in SERDES could be controlled by Control Module MMR bits through a wrapper which utilizes the direct mode control ports on the DPLLs.

There are four individual clock mux instances that select between the DEVOSC and AUXOSC in the Main/Video/Audio PLL structures. In addition, the Cortex™-A8 subsystem clock has a mux to select between DEVOSC clock and RTCDIVIDER clock. The mux is controlled by the register MPU_CLKSRC.MPU_SOURCE.

CAUTION

“Glitch-free” muxes have an output which is free from any glitches. It requires the previously selected clock and the newly selected clock to both be free-running for switch-over to occur. Switchover could take 1-2 clock cycles of previously selected and newly selected clock to complete. If newly selected clock is idle, a switchover never occurs (previously selected clock continues to pass through the mux). Do not switch to a non-existent clock.

2.3.3 Main PLL Clock Structure

The PLL clock structure includes the DSP, SGX530, HDVICP, L3, ISS, and DSS PLLs. Figure 2-7 shows the clock structure.

Figure 2-7. Main PLL Clock Structure

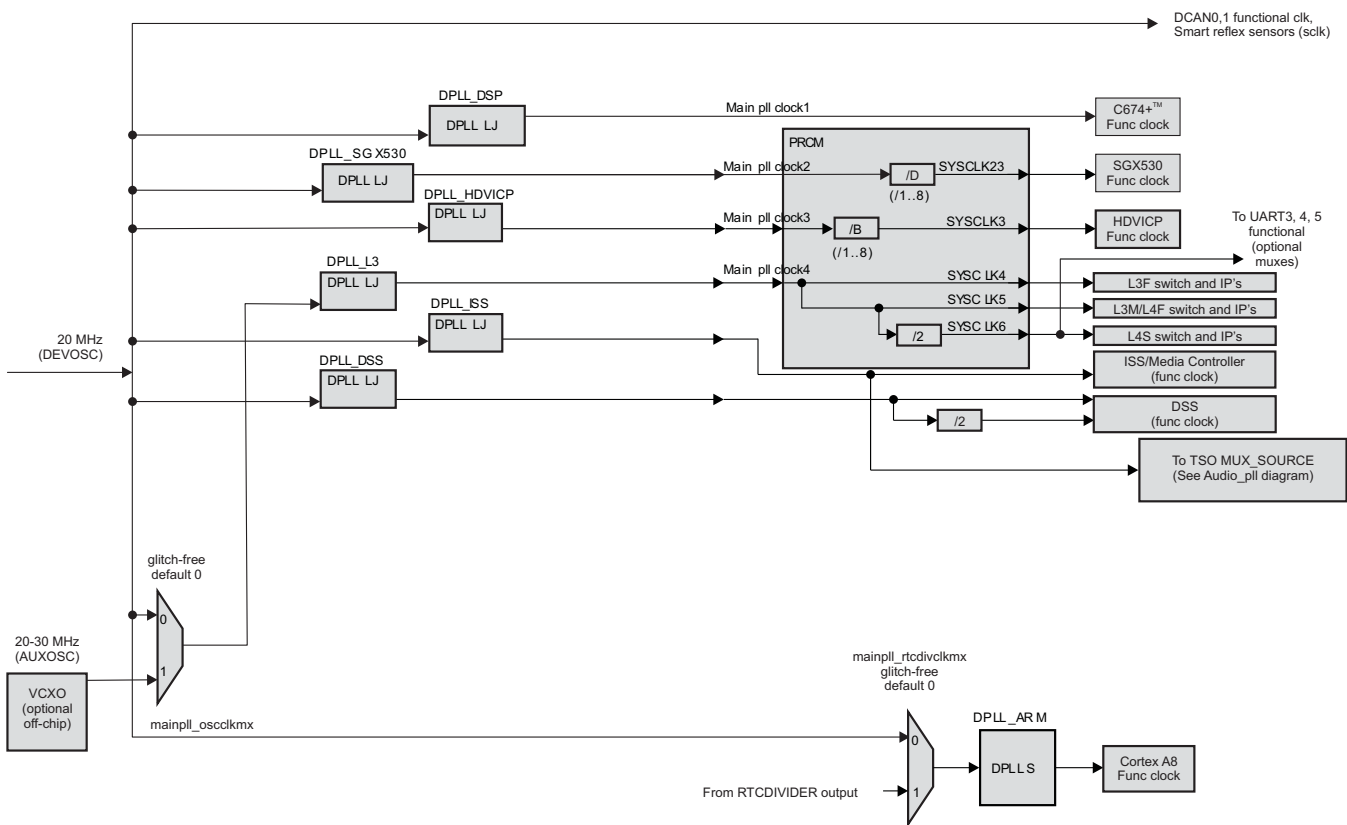

Table 2-15. Main PLL Clock Source

SYSCLK	Source	Destination
-	DPLL_DSP	To C674x+™ SubSystem
SYSCLK23	DPLL_SGX530	SGX530 functional clock (CORECLK)
SYSCLK3	DPLL_HDVICP	To HDVICP

Table 2-15. Main PLL Clock Source (continued)

SYSCLK	Source	Destination
SYSCLK4	DPLL_L3	L3_FAST, OCP clock for Cortex™-A8, HDVICP, expansion slot(master), MMU,C674x+ Subsystem, ISS, TPTCs, C674x+Subsystem, HDVICP SL2, TPCC
		L3_MID, L4_FAST, OCP clock for SGX530 (SYSCLK and MEMCLK), ISS Media Controller, 3PGSW, SATA, PCI ex, VCP2, MLB, FDIF, DAP, OCMC RAM, MMCHS2.
SYSCLK6	DPLL_ISS (DPLL_ISP) DPLL_DSS	L3_SLOW, L4_SLOW, OCP clock for UART0..2,3..5, I2C, SPI, SDIO, TIMER, GPIO, PRCM, McASP, McBSP, GPMC, HDMI, MLB, WDT0, PATA, Mailbox, Spinlock, , USB SS. Func clock for UART3,4,5 (optional), Efuse control, MMU config, P1500, ELM, MMCHS0..1, ATL, FDIF config. ISS/Media Controller DSS (proc, l3) also div2 of this clock (top level divider) goes to DSS proc_d2 and l4 clocks.

As shown in [Table 2-15](#), each of the DPLLs can be configured as appropriate for the desired functional clock of each major core (C674x+ subsystem, HDVICP, ISS, SGX530, DSS, L3/4, A8). They are entirely independent from one another other than the shared reference clock (DEVOSC) except for the DPLL_L3, can optionally choose to use AUXOSC. This is useful as some IPs may use their L4 clock to derive other key frequencies so a slight change to L3/L4 speed could help achieve this while still being in reasonable range for L3/L4 functionality.

The DCAN0..1 functional clocks come from the 20 MHz oscillator to allow fixed rate for baud rate generation and minimal jitter (DEVOSC clock versus PLL clock). Also, the Smart Reflex sensor clock comes from fixed DEVOSC oscillator (20MHz) and the VTP controller clock comes from DEVOSC/2 (fixed /2 divider at top level) such that the frequency of these is the same across all operating points (OPPs).

[Table 2-16](#) lists the divide ratios supported for each of the divider in Main PLL.

Table 2-16. : Main PLL Supported Configurable Dividers

PLL Source	Destination	Control Bit Filed	Divider	Supported Divide Ratios	Default Value
DPLL_HDVICP	HDVICP Clocks	CM_SYSCLK3_CLKSEL.[CLKSEL]	B	1/1, 1/2, 1/3, 1/4, 1/5, 1/6, 1/7, 1/8	1/1
DPLL_SGX530	SGX530 Clocks	CM_SYSCLK23_CLKSEL.[CLKSEL]	D	1/1, 1/2, 1/3, 1/4, 1/5, 1/6, 1/7, 1/8	1/3

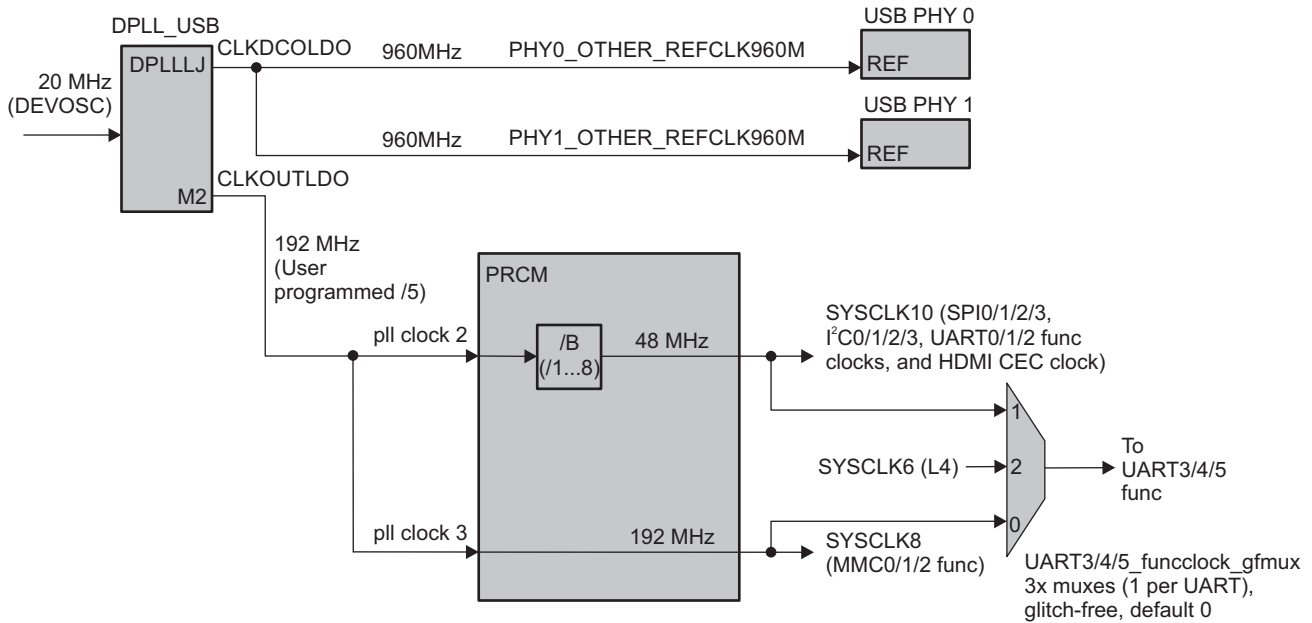

Table 2-17. Clock Multiplexing Used With Main PLLs

Mux	Mux Source 0	Mux Source 1	Control Bit Field
DPLL_L3 Input Clock Mux	DEVOSC	AUXOSC	OSC_SRC. L3_PLL_SOURCE (control module register)
DPLL_MPU Clock Source	DEVOSC	RTC_DIVIDER_OUTPUT	MPU_CLKSRC. MPU_SOURCE

2.3.4 USB PLL Clock Structure

Figure 2-8 shows the clock structure of the USB PHY. The PRCM gets the inputs from the divide by 5 output of the DPLL for clocking the UART, McBSP. These are driven by the DPLL_USB (DPLLLJ), SYSCLK10 which is 48 MHz and goes to SPI0,1,2,3, I2C0,1,2,3, UART0,1,2, UART3,4,5 (optional via glitchless muxes), and the CEC clock of HDMI wrapper. SYSCLK8 is used to generate 192 MHz to UART3,4,5 (optional via glitchless muxes) and MMC0,1,2. Optionally, the PRCM SYSCLK6 (L4 clock) output could optionally source each of UART3,4 or 5 functional clocks (this provides additional baud rate options for UART3,4,5, without affecting MMC0,1,2). This mux is controlled by McBSP_UART_CLKSRC register in the PRCM.

Figure 2-8. USB PLL Clock Structure

NOTE: The /5 divider (M2 post divider) is embedded inside the DPLL_USB module (see Figure 2-19 for details). The /5 divider can be configured in the USBPLL_M2NDIV[22:16] M2 bit field. It is stated as a /5 divider, as the reset (default) value of the M2 bit field is 0x5.

Table 2-18 shows supported divide ratios for dividers in PRCM.

Table 2-18. USB PLL Supported Dividers

PLL Source	Destination	Control Bit Filed	Divider	Supported Divide Ratios	Default Value
PLL_USB	SPI0..3,I2C0..3, UART0..2, HDMI CEC	CM_SYSCLK10_CLKSEL.[CLKSEL]	B	1/1, 1/2, 1/3, 1/4, 1/5, 1/6, 1/7, 1/8	1/1

Table 2-19. Clock Multiplexing used with USB PLL

Mux	Mux Source 0	Mux Source 1	Mux Source 2	Control Bit Field
UART3 clock source	SYSCLK8	SYSCLK10	SYSCLK6	MCBSP_UART_CLKSRC.UART3_CLK_SOURCE
UART4 clock source	SYSCLK8	SYSCLK10	SYSCLK6	MCBSP_UART_CLKSRC.UART4_CLK_SOURCE
UART5 clock source	SYSCLK8	SYSCLK10	SYSCLK6	MCBSP_UART_CLKSRC.UART5_CLK_SOURCE

2.3.5 DDR PLL Clock Structure

Figure 2-9 shows the DDR PLL. The two DDR PHY interfaces (DDR0 or DDR1) share a single PLL. DMM is synchronous to the DDR EMIF controller.

Figure 2-9. : DDR PLL Clock Structure

NOTE: Each EMIF must be configured to the same rate due to the shared PLL (If different memory configurations are used even with same rates, there could be some performance impact through DMM for asymmetrical configurations when interleaving).

PRCM does not provide a clock signal to DDR_PHY.

2.3.6 SERDES and Ethernet Clock Structure

Figure 2-10 shows the SERDES and Ethernet clocking. The SATA SERDES reference input is driven from the 20 MHz on-chip oscillator. The SATA SERDES also provides reference clocks to the Ethernet GMII (125 MHz) and RMII (50 MHz) and RGMII 5 MHz clock. Ethernet clocking provides several options to receive or output the RMII reference clock from a pin. This mux is controlled by the bit RMII_REFCLK_SRC. REFCLK_SOURCE in the PRCM. Also, several clock sources are required for the 1588 reference clock (cpts_rft_clk), also shown in Figure 2-10.

This 1588 reference clock also feeds the RGMII 250 MHz reference clock in case of RGMII. To use reset isolation, the VIDEO0 PLL option must be used for this clock since the clock mux control is not reset-isolated and VIDEO0 is the default clock. Note that 250 MHz is also a suitable frequency for 1588 reference. Also note that the use of this clock also means that VIDEO0 cannot be set to 54 MHz to support AVDAC use, which is a use case limitation. To use AVDAC, lose the reset isolation feature and select another clock.

The PCIe SERDES always requires its reference clock to be sourced from an external 100 MHz reference from the LJCB input pads.

The SATA SERDES could optionally use the external 100 MHz reference as well (same LJCB inputs as used for PCIe). This may be practical if spread spectrum clocking (SSC) is desired to reduce EMI on the SATA interface and especially if such clock is already present due to PCIe usage. If the clock is not present, then using the DEVOSC 20 MHz as reference for SATA SERDES is another solution.

NOTE: The PLL inside of SATA SERDES is isolated from the rest of the SERDES naturally by design. The PLL may remain active while the rest of the SERDES is put in low power mode (feature of SERDES). The control to the PLL within SERDES is located at top level in the control module to allow the ability to keep PLL in its active/configured state for reset-isolation of Ethernet.

Figure 2-10. SERDES and Ethernet Clock Structure

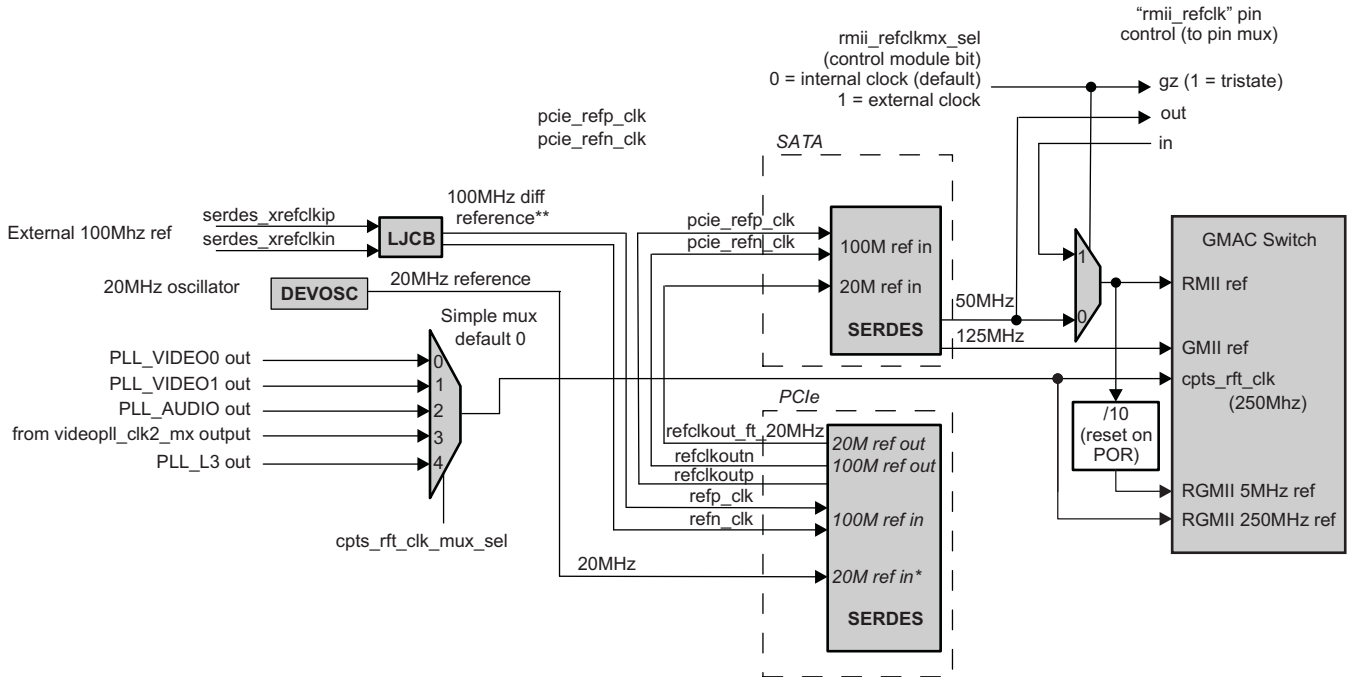

Table 2-20. Clock Multiplexing Used With SERDES PLL

Mux	Mux Source 0	Mux Source 1	Mux Source 2	Mux Source 3	Mux Source 4	Bit Field
Cpts_RFT_CLK source Mux	VIDEO0_PLL_OUT	VIDEO1_PLL_OUT	AUDIO_PLL_OUT	VIDEO_PLL_CLK2	L3_PLL_OUT	RMII_REFCLK_SRC.CPTS_RFT_CLK
RMII Ref Clk Mux	50 MHz SATA SerDes	REFCLK_PIN				RMII_REFCLK_SRC.REFCLK_SOURCE

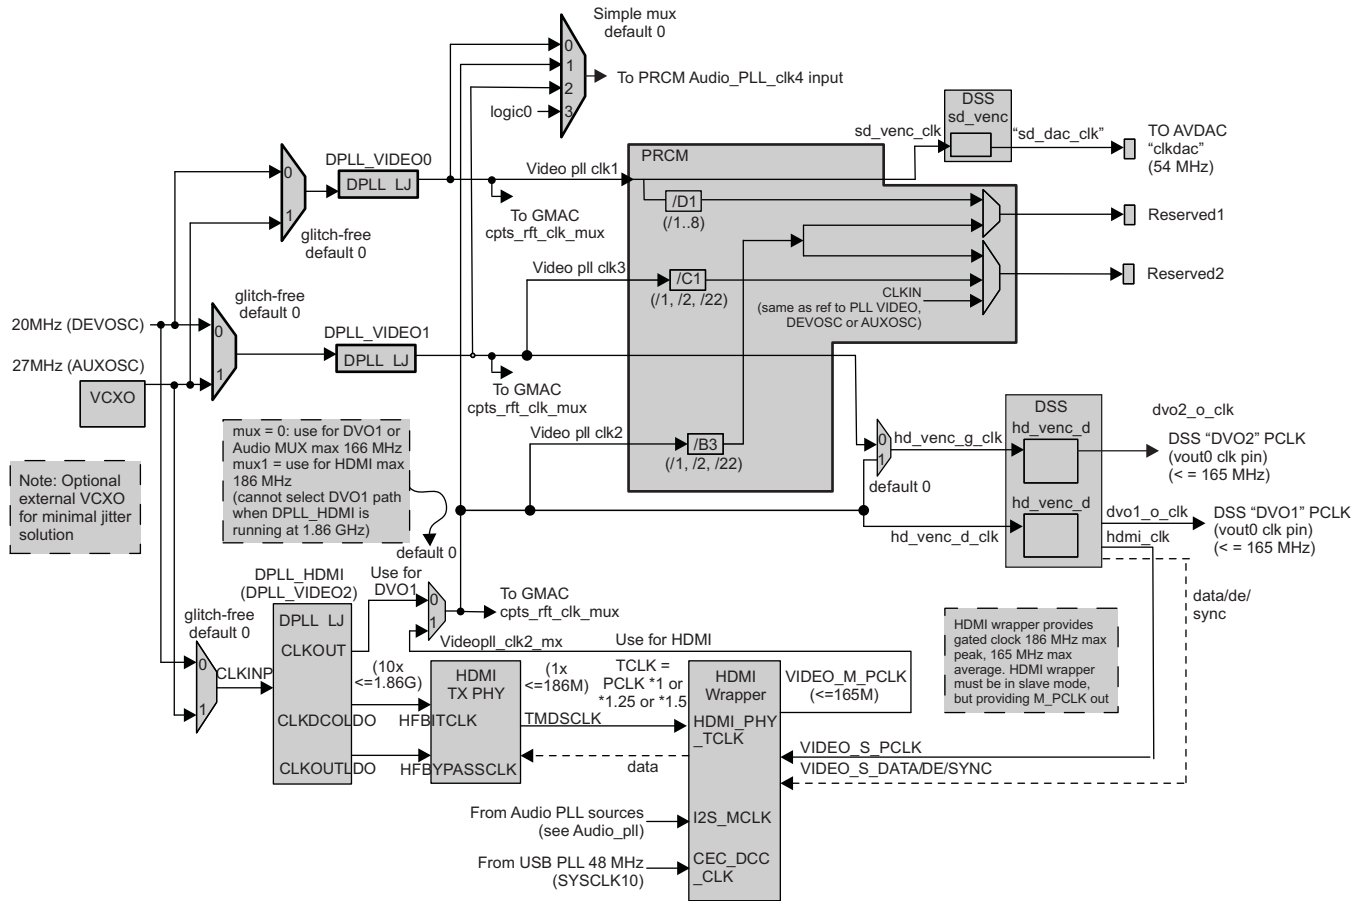

2.3.7 Video PLL Clock Structure

As shown in Figure 2-11, there are three DPLLs for video. Each of the video DPLLs (DPLL_VIDEO0, DPLL_VIDEO1, DPLL_HDMI), can be optionally supply from DEVOSC (20 MHz) or AUXOSC (20-30 MHz osc). Deriving 54/27 MHz clocks from 20 MHz DPLL reference is useful in case it is desired to use AUXOSC instead for an precise audio frequency crystal (e.g., 22.5792). Because the device uses DPLLJ, this is easy to achieve, as the user may pre-divide (e.g., to 1 or 2 MHz) and then multiply up to 27 or 54MHz.

PLL_VIDEO0 supplies the SD VENC clock to display subsystem directly. This clock is always 54 MHz. DPLL_HDMI provides clock to HD_VENC_D_CLK either directly or via HDMI wrapper logic. This clock is used by the display subsystem to derive DVO1 clock (vout1). HD_VENC_D_CLK needs to support 13.5 MHz, 27 MHz, 54 MHz, 74.25 MHz, 148.5 MHz, 162 MHz and 165 MHz frequencies. It supports 1000/1001 times all of these frequencies (e.g., via fractional multiply adjustment). DPLL_VIDEO1 supplies clock to HD_VENC_G_CLK of display subsystem which is used to derive the DVO2 clock (vout0). This clock has similar frequency requirements as HD_VENC_D_CLK.

Optionally the HD_VENC_G_CLK could also be supplied from DPLL_HDMI. HD_VENC_G (DVO2) has similar frequency requirements, and supports independent frequency from HDMI/DVO1. This addresses the requirements for two digital displays on DVO2 and DVO1 with different resolutions and or timings.

Figure 2-11. Video Clock Structure

The device has options for DCXO/VCXO type feature to adjust video frequency on the fly: Use an off-chip VCXO on AUXOSC (can feed clock to AUXOSC_XI pad and run AUXOSC in bypass). This provides the most smooth, low jitter solution.

In each case, software controls the frequency adjustment (via manipulation of off-chip VCXO or other means). There is a 27 or 54 MHz clock generated from each of these PLLs (via PRCM) which is routed back to the STC to generate the error with respect to the clock embedded in the in-coming transport stream.

The HDMI PHY requires a high speed clock (up to 1.85 GHz) from a dedicated DPLL. From this clock a TMDSC clock is derived which is 1/10 the high speed clock and which is driven to the HDMI wrapper. The clock to DSS used to generate PCLK is equal to TMDSC clock /1, /1.25 or /1.5 depending on deep color mode. The HDMI wrapper provides a shaped clock for this purpose. This clock is muxed into the DSS clock inputs.

NOTE: If any of the three video DPLLs are not needed for video, any of these can be optionally used to generate a second audio master frequency, as the sources are muxed and routed to the Audio pll clk4 input of the PRCM and to ATL and McASP 3,4,5 references (see [Figure 2-12](#)).

Table 2-21. Video PLL Supported Dividers

Control Bit Filed	Divider	Supported Divide Ratios	Default Value

2.3.8 Audio PLL Clock Structure

Audio clocking is based on a single dedicated Audio PLL which is a DPLLJ. It provides several options for other sources of audio clocks including directly using AUXOSC input pad (drive clock onto AUXOSC XI pad and use AUXOSC in bypass), external pins (AUD_CLKIN0,1,2) and optionally using any of the video PLLs (PLL_VIDEO0, PLLVIDEO1, PLL_HDMI, and more, if any of these resources are not used for video).

Figure 2-12. Audio Clock Structure

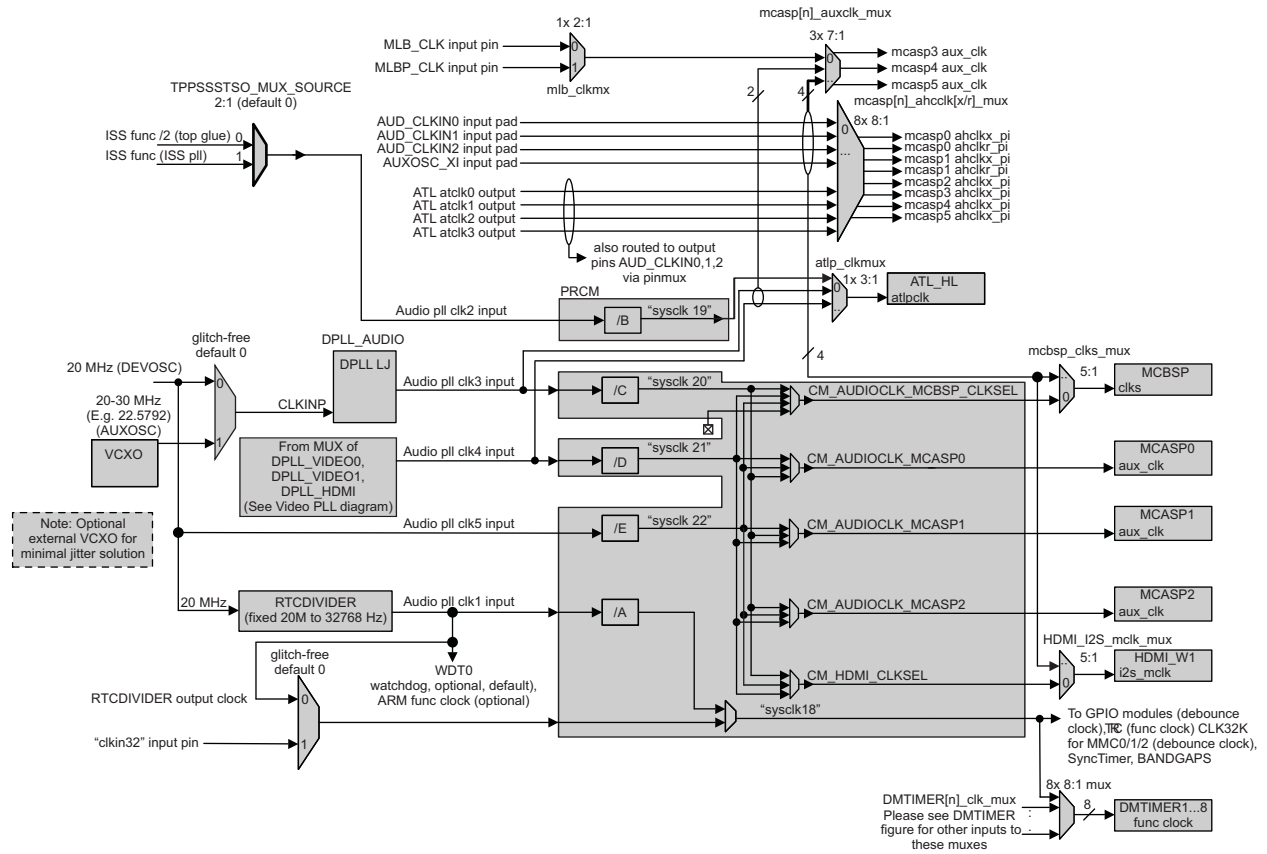

Table 2-23. Audio Frequencies

Sampling Frequency (KHz)	Over-Sample Rate					
	128	256	384	512	768	1024
16	2.0480	4.0960	6.1440	8.1920	12.2880	16.3840

192	24.5760	49.1520	73.7280	98.3040	147.4560	196.6080

Refer back to Figure 2-12 to see the connection of audio clocks to McASP0,1,2, McBSP and HDMI modules. In addition to the mux options provided inside PRCM, top-level muxes provide for McASP3,4,5 and ATL to share any of the audio clock sources as well as to add path from any of the sources to McASP0,1,2, McBSP or HDMI. Notice also that the McASP peripherals also have a setup of clock muxes to feed various clocks to their AHCLKX and AHCLKR inputs. Since there are six McASPs, rather than pin mux all 12 possible AHCLKX and AHCLKR pins, there are three loosely dedicated pins referred to as

AUD_CLKIN0,1,2 which are used as optional sources for all of the McASP AHCLK ports as well as for various other timing functions (e.g., dmtimer, STC, etc). Any function which optionally uses an AUD_CLKIN0,1,2 pin as an input timing reference should use the signal coming off the input pad itself (and not through pin muxing logic). This is because some timing sources are also optionally routed as an output to these pins (e.g., ATL clock out and McASP AHCLKX outputs), in which case another peripheral could use that same pin as an input timing reference.

NOTE: Similar to the video case, there are several options for implementing adjustments to audio clocks. The smoothest is external VCXO (e.g., on AUXOSC For McASPs one can also use the ATL clock outputs as reference which is adjusted via ATL register writes.

Table 2-24. Audio PLL Supported Dividers

Control Bit Filed	Divider	Supported Divide Ratios	Default Value
CM_APA_CLKSEL[CLKSEL]	A	1/1,1/2, 1/3, 1/4, 1/5, 1/6, 1/7, 1/8	1/1

CM_SYSClk22_CLKSEL[CLKSEL]	E	1/1,1/2, 1/3, 1/4, 1/5, 1/6, 1/7, 1/8	1/1

A fixed 32,768 Hz clock frequency is provided on PRCM SYSClk18. This clock has two sources. The Audio PLL Clock1 which is fed from a fixed divider (RTCDIVIDER) on the 20 MHz clock, and the "clkin32" input pin. SYSClk18 provides clock for: RTC, DMTIMER1..8 (optional via mux), BANDGAPS, synctimer and debounce circuit for MMC0,1,2 and GPIO0,1,2,3.

2.3.9 Timer Clock Structure

The output of RTCDIVIDER is also taken directly to optionally feed the WDT0 watchdog (Cortex™-A8 watchdog). The external 32KHz clock is not an option for WDT0. The other option for WDT0 is internal RCOSC32 oscillator. RTCDIVIDER output may also be optionally used as Cortex™-A8 Subsystem functional clock (via mux) for very low power operation (e.g., waiting in loop to bring clocks/system back up to full rate).

The following figures show the optional functional/reference clocks for DMTIMER1..8 and the functional/reference clocks for the watchdog timer (WDT0) and the Synctimer (which is available for generic use).

2.3.10 Device Clocking from External Sources

As shown in [Figure 2-15](#), AUXOSC (20-30MHz) and DEVOSC (20 MHz) crystals are connected to generate the reference clocks. It is also possible to supply AUXOSC using an off-chip VCXO. A 100 MHz external differential clock must be used for PCIe. SATA uses 20 MHz oscillator as a reference.

Output clock SYSCCLK_OUT can deliver clock outputs of each DPLL. The CM_CLKOUT_CTRL register controls the clock selection and division ratios.

Figure 2-15. Device Clocking External Clock Sources

2.3.11 Clock Output Pin

The device has two clock output options. When chosen from the mux, the PLL clocks can be divided further before being exported out. The clock out is controlled by the register CM_CLKOUT_CTRL. The CLKOUT also has an enable option CM_CLKOUT_CTRL.CLKOUTEN.

Figure 2-16. Clock Output Pin Options

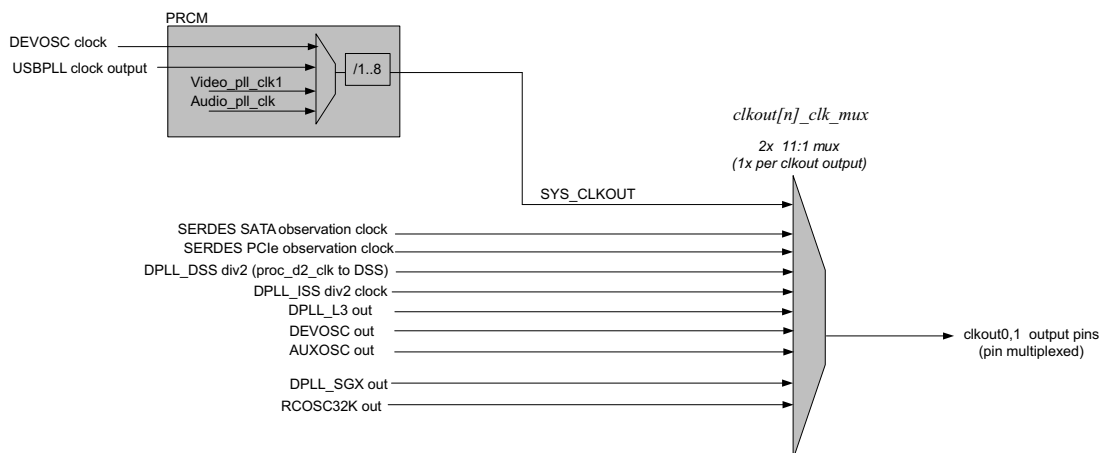

Table 2-27. Clkout Divider Options

Control Bit Filed	Divider	Supported Divide Ratios	Default Value
CM_CLKOUT_CTRL [CLKOUTDIV]	A	1/1, 1/2, 1/3, 1/4, 1/5, 1/6, 1/7, 1/8	1/1

The clock outputs are controlled by two mux options respectively CLKOUT0 and CLKOUT1. Refer to the CLKOUT_MUX register for more details on the options of CLKOUT multiplexing.

2.4 Oscillator

As discussed in previous sections, the device has two conventional on-chip oscillators: DEVOSC and AUXOSC.

Figure 2-17 shows the conventional oscillator connections. DEVOSC is always needed, while AUXOSC is optional for video/audio reference and can run at any desired frequency in range of 20-30 MHz (e.g., typically could be 27 MHz or 22.5792 MHz). Table 2-28 and Table 2-29 show the settings for the two on-chip oscillators.

Figure 2-17. Oscillator Connection

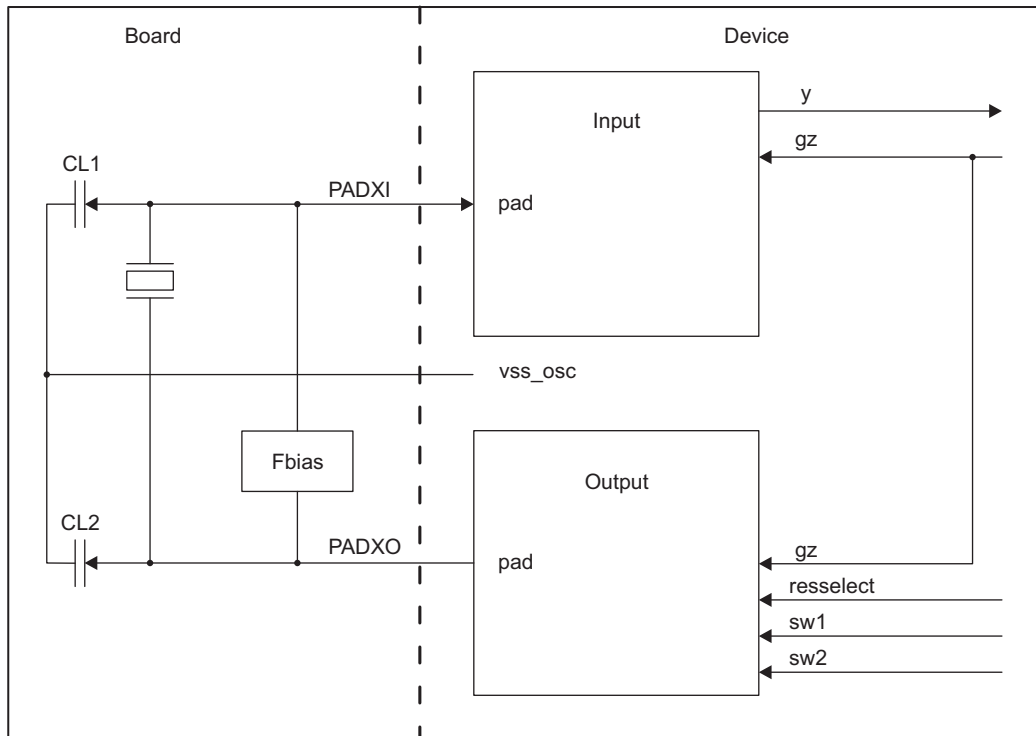

Table 2-28. AUXOSC Oscillator Settings

Pin	Value
sw1	1 (select 15-35 MHz range)
sw2	0 (select 15-35 MHz range)
gz	MMR (Default 0 - Setting this to "1" disable the oscillator)
resselect	MMR (Default 0 - Use internal feedback resistor)

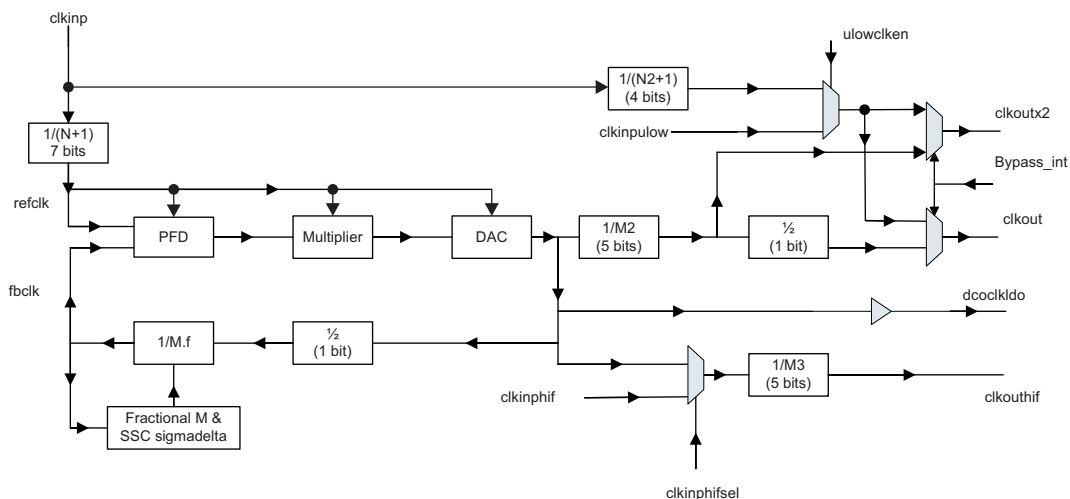

Table 2-29. DEVOSC Oscillator Settings

Pin	Value
sw1	1 (select 15- 20 MHz range)
sw2	0 (select 15-20 MHz range)
gz	Controlled solely by Sleep control logic (Default 0 - sleep control logic sets to "1" to disable the oscillator while in sleep)
reselect	MMR (Default 0 - Use internal feedback resistor)

NOTE: To enter sleep, the software must configure the desired sense of the wakeup (OSC_WAKE pin) and write to AUXOSC.GZ in the control module to force a hardware mechanism to turn off DEVOSC. The DEVOSC is cleanly re-started upon a wakeup event (rising or falling edge on the OSC_WAKE pin depending on configured sense before going into sleep). In case that an external oscillator/vcxo, a clock can directly be connected to XI pin and oscillator is put in bypass mode.

2.5 DPLLS

The DPLLS is a high resolution frequency synthesizer PLL with built in level shifters which allows the generation of frequencies upto 1GHz. DPLLS has a pre-divide feature which allows the user to divide, for instance, a 20 MHz or 27 MHz reference clock to 1 MHz and then multiply up to 1 GHz maximum frequency. All PLLs come up in bypass mode at reset. SW needs to program all the PLL settings appropriately and then wait for PLL to be locked. Once it is locked, then PLLs can be taken out of bypass mode. The Cortex™-A8 PLL is of this type.

Figure 2-18. DPLLS Clocks Structure

The DPLLS has three input clocks:

- CLKINP : Reference input clock
- CLKINPULOW : Low frequency input clock for bypass mode only
- CLKINPHIF : High Frequency Input Clock for post-divider M3
- The DPLLS has four output clocks:
- CLKOUTHIF: High Frequency Output Clock from Post divider M3
- CLKOUTX2: Secondary 2x Output
- CLKOUT: Primary output clock
- DCOCLKLDO: Oscillator(DCO) output clock with no bypass

The DPLL has internal clocks: REFCLK (Internal reference clock) and BCLK.

2.5.1 DPLLS Frequency Range

The internal reference clock, REFCLK, is generated by dividing the input clock CLKINP by the programmed value N+1. The entire loop of the PLL runs on the REFCLK. Here, REFCLK = CLKINP/(N+1).

2.5.2 DPLLS Fractional M-divider Programming

The frequency multiplication factor M can be programmed as fractional. This is achieved by having a sigma delta feedback divider (M). A fractional value (FractionalM) of 18 bits is supported enabling control to an accuracy of 1ppm.

M is the software-configured Integer Feedback Multiplier Value.

N is the software-configured Input Divider Value.

M2 is the software-configured post-divider value

N2 is the software-configured Bypass divider value.

Frac M is software-configured Fractional Feedback Multiplier.

M3 is the software-configured additional divider

For more information for DPLLS programming and detailed descriptions of DPLLS registers see section *PLLSS Registers* in the device TRM.

2.5.3 DPLLS Clock Functions

The DPLL clock functions are shown in the tables [Table 2-30](#):

Table 2-30. Clock Functions

Output Clocks in Locked Condition		
REGM4XEN = '0'		
Pin Name	Frequency	Comments
CLKOUT	$[M / (N+1)] * CLKINP * [1/M2]$	
CLKOUTX2	$2 * [M / (N+1)] * CLKINP * [1/M2]$	
DCOCLKLDO	$2 * [M / (N+1)] * CLKINP$	
CLKOUTHIF	CLKINPHIF / M3	CLKINPHIFSEL = '1'
	$2 * [M / (N+1)] * CLKINP * [1/M3]$	CLKINPHIFSEL = '0'
REGM4XEN = '1'		
Pin Name	Frequency	Comments
CLKOUT	$[4M / (N+1)] * CLKINP * [1/M2]$	
CLKOUTX2	$2 * [4M / (N+1)] * CLKINP * [1/M2]$	
DCOCLKLDO	$2 * [4M / (N+1)] * CLKINP$	
CLKOUTHIF	CLKINPHIF / M3	CLKINPHIFSEL = '1'
	$2 * [4M / (N+1)] * CLKINP * [1/M3]$	CLKINPHIFSEL = '0'
Output Clocks before Lock & during Relock modes		
Pin Name	Frequency	Comments
CLKOUT	CLKINP/(N2+1)	ULOWCLKEN = '0'
	CLKINPULOW	ULOWCLKEN = '1'
CLKOUTX2	CLKINP/(N2+1)	ULOWCLKEN = '0'
	CLKINPULOW	ULOWCLKEN = '1'
DCOCLKLDO	Low	
CLKOUTHIF	CLKINPHIF/M3	CLKINPHIFSEL = '1'
	Low	CLKINPHIFSEL = '0'

NOTE: Since M3 divider is running on the internal LDO domain, in the case when CLKINPHIFSEL='1,' CLKOUTHIF could be active only when internal LDO is ON. Hence, whenever LDOPWDN goes low to high to powerdown LDO (happens when TINITZ activated / when entering slow relock bypass mode), output CLKOUTHIF glitch and stop. To avoid this glitch, it is recommended to gate CLKOUTHIF using control CLKOUTHIFEN before asserting TINITZ entering any slow relock bypass mode.

The Min and Max Values of the Clock generation supported by PLLs across different OPPs.

NOTE: For detailed information about PLL frequency limits at all OPPs see section *PLL Frequency Limits* in the device *Datasheet*.

2.5.4 DPLLS Frequency Factors

The divide values have to be selected with the ranges in the [Table 2-31](#) so as to generate the required CLOCKOUT in the Frequency Ranges mentioned in the previous sections are satisfied.

Table 2-31. Frequency Factors

Feedback Multiplier	M ⁽¹⁾	2 - 2047	0000000010 - 1111111111
Input Divider	N + 1	1 - 128	(0000000 - 1111111) + 1
Bypass Divider	N2 + 1	1 - 16	(0000 - 1111) + 1
Post Divider	M2 ⁽²⁾	0 - 31	00000 - 11111
Additional Divider	M3 ⁽³⁾	1 - 31	00001 - 11111

⁽¹⁾ M = 0 and 1 correspond to MN Bypass mode setting.

⁽²⁾ When M2 = 0, the M2 post divider is bypassed.

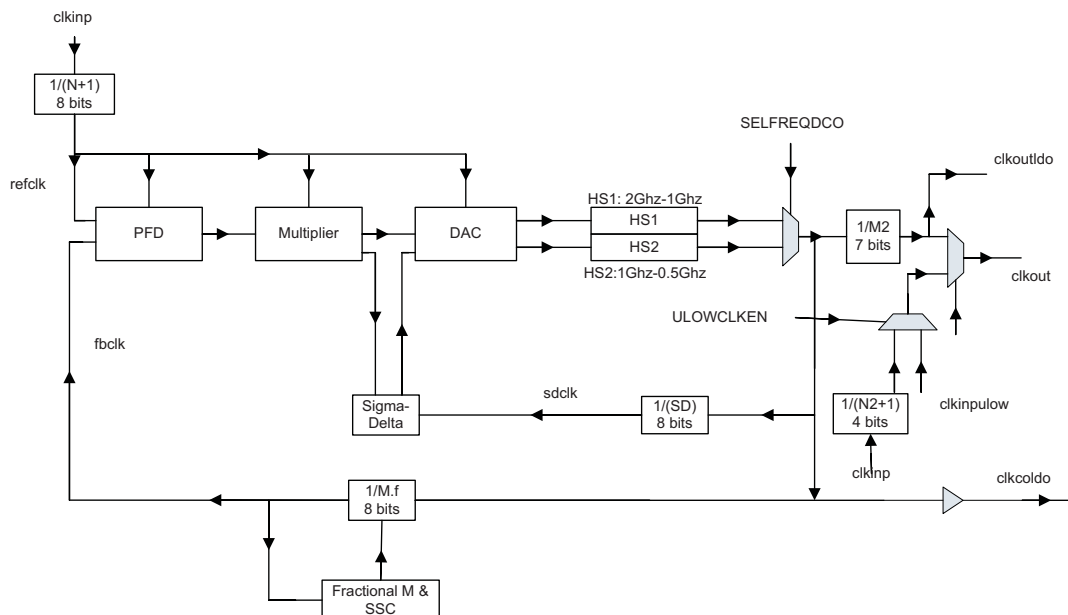

⁽³⁾ M3 = 0 is an invalid setting.

2.6 DPLLLJ

The DPLLLJ is a low-jitter PLL with a 2GHz maximum output. The DPLLLJ has a pre-divide feature which allows users to divide, for instance, a 20 MHz or 27 MHz reference clock to 1 MHz and then multiply up to 2 GHz maximum.

The DPLLLJ also has an 18b fractional multiplier which is useful for configuring very specific frequencies as desired (for example, audio and video).

All PLLs come up in bypass mode at reset. The software needs to program all the DPLL settings appropriately and then wait for the DPLL to be locked. Once the DPLL is locked, then DPLLS can be taken out of bypass mode.

Figure 2-19. DPLLJ Basic Structure

The following PLLs belong to type DPLLJ:

- DSPPLL
- SGXPLL
- HDVICPLL
- L3PLL
- ISSPLL
- DSSPLL
- VIDEO0PLL
- VIDEO1PLL
- HDMIPLL
- AUDIOPLL
- USBPLL
- DDRPLL

The DPLL has two input clocks:

- CLKINP: Reference input clock
- CLKINPULOW: Bypass input clock

The DPLL has two internal clocks: REFCLK (Internal reference clock): This is generated by dividing the input clock CLKINP by the programmed value N+1. The entire loop of the PLL runs on the REFCLK. Here, $REFCLK = CLKINP / (N+1)$

DCOCLK (Internal Oscillator clock.): This is the raw clock directly out of the digitally controlled oscillator (DCO) before the post-divider. The PLL output clock is synthesized by an internal oscillator which is phase locked to the REFCLK. There are two oscillators built within DPLLJ. The oscillators are user selectable based on the synthesized output clock frequency requirement. In locked condition, $DCOCLK = CLKINP * [M / (N+1)]$.

The DPLL has three external output clocks:

- CLKOUTLDO
Primary output clock in VDDLDOOUT domain. Bypass option not available on this output
 $CLKOUTLDO = (M / (N+1)) * CLKINP * (1/M2)$

- **CLKOUT**
Primary output clock on digital core domain
 $CLKOUT = (M / (N+1)) * CLKINP * (1/M2)$
- **CLKDCOLDO**
Oscillator (DCO) output clock before post-division in VDDLDOOUT domain. Bypass option is not available on this output.
 $CLKDCOLDO = (M / (N+1)) * CLKINP$

All clock outputs of the DPLL can be gated. The Control module provides the DPLL with a clock gating control signal to enable or disable the clock, and the DPLL provides the PRCM module with a clock activity status signal to let the PRCM module hardware know when the clock is effectively running or effectively gated. Output clock gating control for various clockouts: CLKOUTEN/CLKOUTLDOEN/CLKDCOLDOEN.

2.6.1 DPLLLJ Fractional M-divider Programming

The frequency multiplication factor M can be programmed as fractional. This is achieved by having a sigma delta feedback divider (M). A fractional value (FractionalM) of 18 bits is supported enabling control to an accuracy of 1ppm.

M is the software-configured Integer feedback multiplier value.

N is the software-configured input divider value.

M2 is the software-configured post-divider value

N2 is the software-configured bypass divider value.

SD is the software-configured Sigma2Delta divider.

Frac M is software-configured fractional feedback multiplier.

For more information for DPLLs programming and detailed descriptions of DPLLSJ registers see section *PLLSS Registers* in the device TRM.

2.6.2 DPLLLJ Clock Functions

The clock functions are shown in [Table 2-32](#) and [Table 2-33](#) the tables below.

Table 2-32. Output Clocks in Locked Condition

PINNAME	FREQUENCY
CLKOUT	$[M / (N+1)] * CLKINP * [1/M2]$
CLKOUTLDO	$[M / (N+1)] * CLKINP * [1/M2]$
CLKDCOLDO	$[M / (N+1)] * CLKINP$

Table 2-33. Output Clocks Before Lock and During Relock Modes

PINNAME	FREQUENCY	Conditions
CLKOUT	CLKINP/N2+1	ULOWCLKEN = '0'
	CLKINPLOW	ULOWCLKEN = '1'
CLKOUTLDO	LOW	
CLKDCOLDO	LOW	

2.6.3 DPLLLJ Frequency Range (MHz)

The Min and Max Values of the Clock generation supported by PLLs across different OPPs.

NOTE: For detailed information about PLL frequency limits at all OPPs see section *PLL Frequency Limits* in the device *Datasheet*.

2.6.4 DPLLLJ Frequency Factors

The divide values have to be selected with the ranges in the [Table 2-34](#) so as to generate the required CLOCKOUT in the Frequency Ranges mentioned in the previous sections are satisfied.

Table 2-34. DPLLLJ Frequency Factors

Multiplier/Divider		Range	
Feedback Multiplier (Integer)	M	2 - 4095	0000000010 – 1111111111
Feedback Multiplier (Fractional)	Frac M		000000000000000000 - 111111111111111111
Input Divider	N+1	1-256	(00000000 – 11111111) + 1
Post Divider	M2 ⁽¹⁾	1-127	0000001 - 1111111
Sigma2Delta Divider	SD	2-255	00000010-11111111
Bypass Divider	N2+1	16-1	(0000 – 1111) + 1

⁽¹⁾ The M2 divider is bypassed when the divisor is equal to 0 or 1.

2.6.5 Mode of Operations

Table 2-35. Modes of Operations

Mode	Control Signal	CLKINP	REFCLK	Digital	Analog Bias	DCO OSC	CLKOUT	CLKDCOLDO(CLKOUTLDO)	FreqLock time (Phaselock time) from specific mode to "Active & Locked mode"
OFF	SYSRESET = 1 or TINITZ = 0	ON or OFF	OFF	ON	OFF	OFF	Bypass clk	LOW	350REFCLKs (500REFCLKs)
Active & Locked	SYSRESET = 0 TINITZ = 1 IDLE = 0	ON	CLKINP / (N+1)	ON	ON	ON	M/(N+1) * CLKINP * (1/M2)	DCOCLK (DCOCLK/M2)	Locked
Idle Bypass low power	SYSRESET = 0 TINITZ = 1 IDLE = 1	ON	OFF	ON	OFF	OFF	Bypass clk	LOW	20REFCLKs (150REFCLKs)
Lossclk – Bypass low power	SYSRESET = 0 TINITZ = 1	OFF	OFF	ON	OFF	OFF	Bypass clk	LOW	20REFCLKs (150REFCLKs)
Standby Retention- Bypass low power	STBYRET= 1 ULOWCLK EN=0/1	ON	OFF	ON	OFF	OFF	Bypass clk	LOW	7.5us+30REFC LKs (7.5us+125 REFCLKs)
MN Bypass	M = 0 or 1	ON	OFF	ON	OFF	OFF	Bypass clk	LOW	350REFCLKs (500REFCLKs)
Retention	Enter into RETENTION from Idle Bypass Mode			OFF	OFF	OFF	Low	LOW	7.5us + 30REFCLKs (7.5us+125 REFCLKs)

TINITZ: TINITZ activation (Low) gives softreset to DPLLJ. TINITZ does not reset the entire digital control logic. It forces the FSM into RESET State so that DPLLJ could restart. DPLLJ starts calibration and lock sequence when TINITZ is disabled (Low to High).

TENABLEDIV: TENABLEDIV rising edge loads the values of M2REG and N2REG into PLL register (PLL_M2NDIV). It is not necessary to recalibrate PLL with the updated values. The change in values of M2REG reflects appropriately in the output clocks CLKOUT and CLKOUTLDO.

OFF MODE: SYSRESET= 1 or TINITZ = 0 PLL is in off mode when SYSRESET/TINITZ is configured to the values SYSRESET= 1 or TINITZ = 0. CLKOUT is bypass clk and CLKOUTLDO, and CLKDCOLDO are low irrespective of the presence of the inputclock.

ACTIVE and Locked Mode: SYSRESET = 0 & TINITZ = 1 , IDLE = '0' PLL is in Active and locked mode when SYSRESET = 0 & TINITZ = 1, IDLE = '0'

- TENABLE rising edge loads the values of MREG and NREG into the ADPLLJ registers.
- TENABLEDIV rising edge loads the values of M2REG and N2REG into the ADPLLJ register.
- ADPLLJ starts calibration and lock sequence begins from the first CLKINP edge when TINITZ is disabled (low to high).
- TINITZ rising edge should follow the TENABLE rising edge, so that ADPLLJ performs the calibration and lock sequence after the loop control values are loaded.
- The change in values of M2REG reflects appropriately in the output clocks CLKOUT and CLKOUTLDO.
- Following this internal calibration sequence is performed followed by locking sequence. ADPLLJ has two lock outputs viz. FREQLOCK and PHASELOCK.
- The FREQLOCK output indicates frequency lock. FREQLOCK is asserted when internally the normal clk frequency is within + 1 / 2% of the final output frequency. The PHASELOCK output indicates phase tracking between output clocks (CLKOUT, CLKOUTLDO and CLKDCOLDO) and input clock (CLKINP). The FREQLOCK, PHASELOCK gets asserted in the ADPLLJ status register. The output clocks CLKOUT, CLKOUTLDO and CLKDCOLDO are generated as per the register values (M, N, M2, N2) values.

IDLE Bypass: TINITZ =1 IDLE =1 The IDLE input signal can force ADPLLJ into bypass mode. Also the internal reference clock REFCLK is gated inside the ADPLLJ digital control logic to save power. In the IDLE mode, the PHASELOCK and FREQLOCK output signals are asserted low. CLKOUT is bypass clk and CLKOUTLDO, CLKDCOLDO are low

2.6.6 BYPASS Mode

After digital power-up and before SYSRESET is active (high), DPLL is in an undefined state. Hence, power-up with SYSRESET active (high). On SYSRESET = '1', VDD should be active, PONIN = '1', PGOODIN = '1' as shown in <MODULE>PLL_PWRCTRL register in PRCM and also the acknowledge signals PONOUT = '1' and PGOODOUT = '1' shown in <MODULE>PLL_STATUS register of PRCM.

CLKOUT is in the bypass mode and would give out bypass clk during and after sysreset.

<MODULE>PLL_CLKCTRL.ULOWCLKEN = '1' – BYPASS CLK = CLKINPULOW

<MODULE>PLL_CLKCTRL.ULOWCLKEN = '0' – BYPASS CLK = CLKINP/(N2+1); N2 =0

The bypass mode CLKOUT could be kept active or inactive during sysreset by controlling the status of <MODULE>PLL_CLKCTRL.CLKOUTEN during SYSRESET = '1'.

<MODULE>PLL_CLKCTRL.CLKOUTEN = '1' during SYSRESET = '1' asynchronously enables CLKOUT. And the acknowledge bit in the register is <MODULE>PLL_STATUS.CLKOUTENACK = '1'

<MODULE>PLL_CLKCTRL.CLKOUTEN = '0' during SYSRESET = '1' asynchronously disables CLKOUT. And the acknowledge bit in the register <MODULE>PLL_STATUS.CLKOUTENACK = '0'

CLKOUTLDO and CLKDCOLDO are low during and after SYSRESET.

Check the status bits CLKOUTENACK, BYPASS, BYPASSACK in the status register <MODULE>PLL_STATUS in the PRCM.

2.6.7 M2 & N2 Change On-the-Fly

The dividers M2 and N2 are designed to change on the fly. The output clock CLKOUT/ CLKOUTLDO perform a clean switch from OLD period to NEW period without any clock period being different from OLD or NEW period.

2.6.8 Gating and Power Down of Output Clocks

The high to low transition of the input signal CLKOUTEN/ CLKOUTLDOEN/ CLKDCOLDOEN performs synchronous gating of the output clock CLKOUT/ CLKOUTLDO/ CLKDCOLDO respectively. The gating acknowledge output CLKOUTENACK/ CLKOUTLDOENACK/CLKDCOLDOENACK is asserted Low once the gating is complete.

The low to high transition of the input signal CLKOUTEN/ CLKOUTLDOEN/ CLKDCOLDOEN performs synchronous enabling of the output clock CLKOUT/ CLKOUTLDO/ CLKDCOLDO. The gating acknowledge output CLKOUTACK/ CLKOUTLDOACK/CLKDCOLDOACK is asserted High once the enabling is complete.

2.6.9 M2PWDNZ / CLKDCOLDOPWDNZ bits

<MODULE>PLL_CLKCTRL. M2PWDNZ active (low) will powerdown the M2 divider. Hence, the output clock CLKOUT is in bypass mode. Also, even after DPLL has locked and <MODULE>PLL_STATUS. FREQLOCK has gone high, and <MODULE>PLL_STATUS. BYPASSACK output continues to remain high. Changing this bit in active locked condition is not supported.

INITIALIZATION should follow the change of these bits <MODULE>PLL_CLKCTRL.CLKDCOLDOPWDNZ / CLKOUTLDOPWDNZ active (low) will powerdown the CLKDCOLDO/CLKOUTLDO output. CLKDCOLDO/CLKOUTLDO is Low in this condition. Changing these bits in active locked condition is not supported. INITIALIZATION should follow change of these bits.

2.7 Reset Management

2.7.1 Overview

The PRCM manages the reset signals to all power domains. And, it manages generation of a single reset output signal through device pin, SYS_RESWARM_RST, for external use. The PRCM has no control over resets generated locally within a module, e.g., via the OCP configuration register bit <IPName>_SYSCONFIG.SOFTRESET.

All PRM reset outputs are asynchronously asserted. These outputs are active-low except for the DPLL resets. Deassertion is synchronous to the clock which runs a counter used to stall, or delay, reset de-assertion upon source deactivation. This clock is SYS_CLK used by all the reset managers. All modules receiving a PRCM generated reset are expected to treat the reset as asynchronous and implement local re-synchronization upon de-activation as needed.

One or more reset managers are required per power domain. Independent management of multiple reset domains is required to meet the reset sequencing requirements of all modules in the power domain.

2.7.2 Reset Concepts and Definitions

The PRCM manages many sources of reset signals with different characteristics. Reset signals are categorized as:

- Scope: Global or Local reset.
 - Global reset: Affects the entire logic of the device; all modules are reset. Generally, occurs when the device powers up or an abnormal operation is detected (the eFuse bad device is detected, etc.).
 - Local reset: Affects one power domain, reset domain, or module. Generally, when a power domain transitions from off mode to active mode, or when a software-reset control bit for a domain is set, only the group of modules within that domain is affected.

- Occurrence: Cold or Warm reset.
 - Cold reset: global reset that affects every module in the device. It usually corresponds to the initial power-on reset.
 - Warm reset: A module may use a warm reset to reset a subset of its logic.
- Source type: Software or Hardware triggered reset
 - Software reset: Triggered by setting a bit in a configuration register of the PRCM module.
 - Hardware reset: Triggered by a signal from a hardware module inside or outside the PRCM module

Each reset source is specified as being a cold or warm type. Cold types sources are applied globally within each receiving entity (i.e., subsystem, module, macro-cell) upon assertion. Cold reset events include: device power-up, power-domain power-up, and E-Fuse programming failures.

Warm reset types are not necessarily applied globally within each receiving entity. This is often done to speed-up reset recovery time, i.e., the time to transition to a safe operating state, compared to the time required upon receipt of a cold reset. Warm reset events include: software initiated per power-domain, watch-dog time-out, externally triggered, and emulation initiated.

Reset sources, warm or cold types, intended for device-wide effect are classified as global sources. Reset sources intended for regional effect are classified as local sources.

Each reset manager provides two reset outputs. One is a cold reset generated from the group of global and local cold reset sources it receives. The other is a warm+cold reset generated from the combined groups of, global and local, cold and warm reset sources it receives.

The reset manager asserts one, or both, of its reset outputs asynchronously upon reset source assertion. Reset deassertion is extended beyond the time the source gets de-asserted. The reset manager will then extend the active period of the reset outputs beyond the release of the reset source, according to the PRCM's internal constraints and device's constraints. Some reset durations can be software-configured. Most (but not all) reset sources are logged by PRCM's reset status registers. The same reset output can generally be activated by several reset sources and the same reset source can generally activate several reset outputs. All the reset signals output of the PRCM are active low. Several conventions are used in this document for signal and port names. They include:

- "_RST" in a signal or port name is used to denote reset signal.
- "_PWRN_RST" in a signal or port name is used to denote a cold reset source

2.7.3 Power On Reset (PORz)

The source of power on reset is the PORz pin on the device. Everything on device is reset with assertion of power on reset. This reset is non-blockable. Power on Reset is also referred to as a cold reset since it is required to be asserted when the device goes through a power-up cycle. However, a device power-up cycle is not required to initiate a Power-on Reset.

2.7.4 External Warm Reset (RESETz)

The source for this reset is the RESETz pin on the device. This signal resets everything except test and emulation logic, and efuse to provide a clean starting stage. This reset is also optionally blocked to the GMAC switch and its reference clock source PLL (controlled in protected control module MMR). This reset DOES reset PLL, PRCM and EMIF. This reset is different from POR as during Warm reset, reset controller can assume that clocks and power to the chip are stable from assertion through deassertion, whereas for POR they can become stable during assertion. This reset source is fully blockable only via emulation.

2.7.5 Emulation Cold Reset (ICEPICK POR)

The source for this reset is on-chip emulation logic. This reset is same as POR reset. Only difference is that ICEPICK POR reset does not affect emulation logic and efuse.

2.7.6 Emulation Warm Reset

The source for this reset is on-chip emulation logic. This reset is same as external Warm reset (RESETz).

2.7.7 Reset Requestor

There is a watchdog timer on the device that can act as a reset requestor. This reset is not blockable. The watchdog is optionally combined with other device-level resets based on bootstrap latch and goes as chip output as board reset on the `RSTOUT_WD_OUT` pin. If `BTMODE[11]` (from `gpmc_ad11` pin) is 0, then `RSTOUT` is asserted when a Watchdog Timer reset, POR, RESET, or Emulation/Software-Global Cold/Warm reset occurs. If `BTMODE[11]` is 1, then the `RSTOUT_WD_OUT` is asserted only when a Watchdog Timer reset occurs. The register `PRM_RSTST` in the PRCM logs the global reset sources. Each bit is set upon release of the domain reset signal. Must be cleared by software.

2.7.8 Software Controlled Reset

The device also has software controlled reset. There is three types of software resets:

- SW Global cold reset (SWGCR)
- SW Global warm reset (SWGWR)
- Local reset (for IPs with CPUs)

2.7.9 Test Reset (TRSTz)

This reset is triggered from TRSTz pin on JTAG interface. This is a non-blockable reset and it resets test and emulation logic.

NOTE: A PORz reset assertion should cause entire device to reset including all test and emulation logic regardless of the state of TRSTz. Therefore, PORz assertion achieves full reset of the device even if TRSTz pin is pulled permanently high and no special toggling of TRSTz pin is required during power ramp to achieve full POR reset to the device. Further, it should also be perfectly acceptable for TRSTz input to be pulled permanently low during normal functional usage of the device in the end-system to ensure that all test and emulation logic is kept in reset.

2.7.10 Reset Priority

If more than one of these reset sources are asserted simultaneously then following priority order should be used:

1. POR
2. TRSTz
3. External Warm reset
4. Emulation
5. Reset requestors
6. Software resets

2.7.11 Reset Characteristics

Table 2-36 shows the characteristics of each reset source.

Table 2-36. Reset Sources

Characteristics	Pin POR (PORz)	SW Global Cold Reset	Emu Cold Reset (Icepick POR)	Bad Device (eFUSE)	Pin Warm Reset (RESETz)	Emu Warm Reset	Watchdog Timer	SW Global Warm Reset	TRSTz
Resets PLLs and enable bypass mode	Y	Y	Y	Y	Y	Y	Y	Y	N
Resets Dividers	Y	Y	Y	Y	Y	Y	Y	Y	N
Resets Fusefarm	Y	N	N	N	N	N	N	N	N
Resets chip functional logic	Y	Y	Y	Y	Y	Y	Y	Y	N
Resets GMAC switch and related chip logic	Y	N ⁽¹⁾	Y	Y	N ⁽¹⁾	N ⁽¹⁾	N ⁽¹⁾	N ⁽¹⁾	N
Resets test and emulation logic	Y	Y	N	N	N	N	N	N	Y
Resets Memory (DDR controller/PHY)	Y	Y	Y	Y	Y	Y	Y	Y	N
Resets power state for each IP	Y	Y	Y	Y	Y	Y	Y	Y	N
Reset source blockable	N	Y	N	N	Y	Y	Y (only emulation)	Y	N
Config pins latched4	Y	N	N	N	Y	N	N	N	N
Puts Ios in tristate	Y	Y	Y ⁽²⁾	Y ⁽²⁾	Y ⁽²⁾	Y ⁽²⁾	Y ⁽²⁾	Y ⁽²⁾	N
Pin mux registers	Y	Y	Y ⁽³⁾	Y ⁽³⁾	Y ⁽³⁾	Y ⁽³⁾	Y ⁽³⁾	Y ⁽³⁾	N
RSTOUTn pin asserted	Y ⁽⁴⁾	Y ⁽⁴⁾	Y ⁽⁴⁾	Y ⁽⁴⁾	Y ⁽⁴⁾	Y ⁽⁴⁾	Y	Y ⁽⁴⁾	N

⁽¹⁾ Only true if GMAC switch reset isolation is enabled in control registers, otherwise is in reset.

⁽²⁾ Some special IOs like test and emulation related is not in reset.

⁽³⁾ Some special IOs like test and emulation related muxing is not in reset.

⁽⁴⁾ RSTOUT_WD_OUT pin asserted only in case BTMODE[11] = 0 (latched from gpmmc_ad11 pin). For pin reset conditions (PORz and RESETz), the pin is asserted only after the bootstrap value is latched (therefore asserts during internal stretched version of the reset, but not during assertion of the external pin).

NOTE: The Bandgap macros for the LDO's is in reset on PORz only.

2.7.12 Trace Functionality Across Reset

Other than POR, TRSTz and SW cold reset, none of the other resets affect trace functionality. This requires that Debug_SS has required reset isolation for the trace logic. Also the IOs and muxing control (if any) for trace IOs should not get affected by any other reset. Since none of the PLLs getting reset with other resets, clocks are any way stable.

2.7.13 Reset Isolation

2.7.13.1 PCIe Reset Isolation

The device supports reset isolation for the PCI Express IP in the limited fashion as described below. It means that the user should be able to control the chip warm reset and PCI express in-band reset independently.

1. RC (Root Complex), PCIE_SS reset and chip not reset

Local reset is asserted to the PCIE_SS from the PRCM. SW needs to make sure that there were no ongoing transactions at this point of time. This can be ensured by first taking the PCIE_SS to IDLE state. After coming out reset the bus enumeration needs to be performed again. Driver SW should behave as if all downstream devices are just connected again

2. RC (Root Complex), PCIESS not reset and chip reset

In Root Complex mode, the chip is master of the PCI Express network. There is no utility of keeping PCIE_SS running if the chip is rebooting. All state information is lost and it is simpler to restart. When resuming, the Root Complex can issue Hot Reset to all downstream devices and start with the bus enumeration stage.

3. EP (Endpoint), PCIE_SS reset and chip not reset

This can happen due to an in-band reset or because of PCIERST getting asserted. PCIE_SS indicates this by interrupting the Cortex™-A8 core. SW should then take the PCIE_SS to IDLE state and then local reset can be asserted to the PCIE_SS.

4. EP (Endpoint), PCIE_SS not reset and chip reset

This is not supported as PCIE is a point to point connection and resetting one endpoint does not impact the complete system. So whenever chip gets reset even PCIE_SS gets reset.

2.7.13.2 EMAC Switch Reset Isolation

The device supports reset isolation for the Ethernet Switch IP by register RESET_ISO[0] ISO_CONTROL in the control module. This allows the device to undergo a warm reset without disrupting the switch or traffic being routed through the switch during the reset condition.

If configured by registers in control module that EMAC reset isolation ISO_CONTROL is active, then behavior is as follows:

Any “Warm” reset source (except the software warm reset) is blocked to the EMAC switch logic in the IP (the IP has two reset inputs to support such isolation) and to PLL (and it’s control bits) which is sourcing the EMAC switch clocks as required by the IP (50 or 125MHz reference clocks). Also, the EMAC switch related IO pins must retain their pin muxing and not glitch (continuously controlled by the EMAC switch IP) by blocking reset to the controlling register bits.

If configured by registers in control module that EMAC reset isolation ISO_CONTROL is NOT active (default state), then the warm reset sources are allowed to propagate as normal including to the EMAC Switch IP (both reset inputs to the IP).

All cold or POR resets are always propagate to the EMAC switch IP as normal (as otherwise defined in this document).

2.7.14 Reset Output ($\overline{RSTOUT_WD_OUT}$)

The device has one pin $\overline{RSTOUT_WD_OUT}$ which reflects chip reset status. This output is always assert asynchronously when any chip watchdog timer reset occurs (any of the 3 chip watchdogs) and if BTMODE[11] bootstrap is 0, then additionally the pin asserts if any of the following reset events occurs:

1. POR (only internal stretched portion of reset event after bootstrap is latched)
2. External Warm reset ($\overline{RSTOUT_WD_OUT}$ pin, only internal stretched portion of reset event after bootstrap is latched)
3. Emulation reset (Cold or warm from ICEPICK)
4. Reset requestor
5. SW Cold/Warm reset

This output remains asserted as long as PRCM keeps reset to the host processor asserted.

NOTE:

- The `RSTOUT_WD_OUT` pin is output only and not bidirectional.
- TRST does not cause `RSTOUT_WD_OUT` assertion

2.7.15 Power-on-Reset (PORz) Sequence

The following is the sequence of actions for PORz:

1. PORz pin at chip boundary gets asserted (goes low).

NOTE: The state of the Reset Output during PORz assertion should be a don't care, it should not affect PORz (only implication is if they are both asserted and `RSTOUT_WD_OUT` is deasserted after PORz gets re-latching of boot config pins and may see warm RESET flag set in PRCM versus POR).

2. All IOs go to tri-state immediately.
3. When power comes-up, PORz value propagates to the PRCM.
4. PRCM fans out reset to the complete chip and all logic which uses async reset gets reset. `RSTOUT_WD_OUT` goes low to indicate reset-in-progress.
5. External clocks start toggling and PRCM propagates these clocks to the chip keeping PLLs in bypass mode.
6. All logic using sync reset gets reset.
7. When power and clocks to the chip are stable, PORz is de-asserted.
8. Boot Config pins are latched upon de-assertion of PORz pin
9. FuseFarm reset is de-asserted to start eFuse scanning.
10. Once eFuse scanning is complete, reset to the host processor and to all other peripherals (peripherals without local processor) is de-asserted.
11. `RSTOUT_WD_OUT` is de-asserted.
12. Once host processors finish booting then all remaining peripherals see reset de-assertion.

NOTE: All IPs with local CPUs have local reset asserted by default at PORz and reset de-assertion requires host processor to write to corresponding registers in PRCM.

2.7.16 RESETz Sequence

The following is the sequence of actions for RESETz:

1. `RSTOUT_WD_OUT` pin at chip boundary gets asserted (goes low).

NOTE: For RESETz sequence to work as described, it is expected that PORz pin is always inactive, otherwise refer to PORz functionality as described in previous section.

2. All IOs (except test and emulation) go to tri-state immediately.
3. PRCM propagates reset to the complete chip and all logic. `RSTOUT_WD_OUT` goes low to indicate reset-in-progress.
4. Chip clocks are not affected as both PLL and dividers are intact.
5. RESETz gets de-asserted after 30 cycles
6. Boot Config pins are latched upon de-assertion of PORz pin
7. PRCM de-asserts reset to the host processor and all other peripherals without local CPUs.
8. Once host processors finish booting then all remaining peripherals see reset de-assertion.

NOTE: All IPs with local CPUs have local reset asserted by default at RESETz and reset de-assertion requires host processor to write to corresponding registers in PRCM.

2.7.17 Power-Up/Down Sequence

The power-up/down sequence is as follows:

1. Each power domain has dedicated warm and cold reset.
2. Warm reset gets asserted each time there is any warm reset source requesting reset. Warm reset is also asserted when power domain moves from ON to OFF state.
3. Cold reset for the domain is asserted in response to cold reset sources. When domain moves from OFF to ON state then also cold reset gets asserted as this is similar to power-up condition for that domain.

2.7.18 IO State

All IOs except for JTAG and Reset output (and any special cases mentioned in pinlist) should have their output drivers tri-state, and internal pulls enabled during assertion of all reset sources. JTAG IO is affected only by TRSTz.

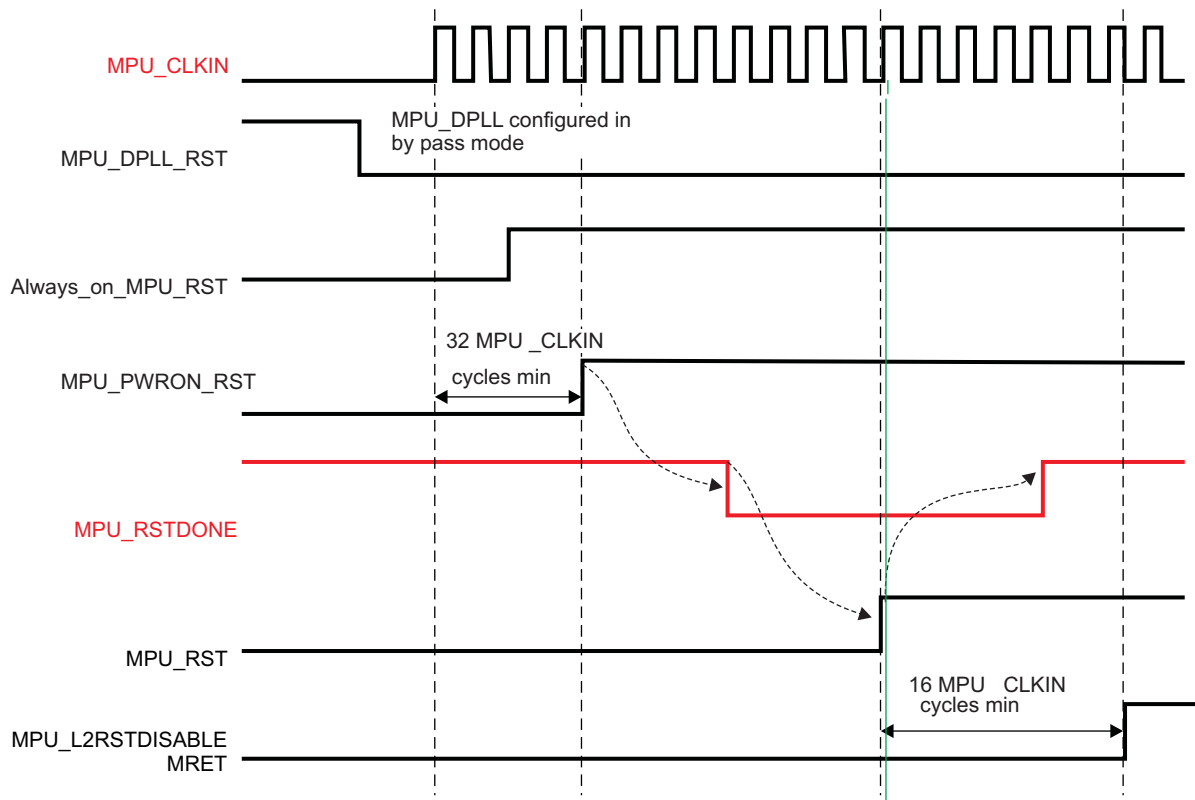

NOTE: The DSP, HDVICP, and Media Controller are held under reset after global warm reset by assertion of software source of reset. Other domains such are held under reset after global warm reset until the MPU software enables their respective interface clock.

2.7.19 MPU Subsystem POR Sequence

The power on reset must be applied when MPU SS is first powered up. Following is the detailed description of MPU power on reset sequence.

1. During the initial power up sequence, the PRCM asynchronously releases the DPLL_MAIN_RST signal for the main PLL. Once the main PLL reset is released, it starts the PLL initialization. The PLL is configured in bypass mode and it provides the bypass output CLK to all the modules inside MPU SS.
2. The PRCM releases the reset to INTC module inside MPUSS i.e. it asynchronously releases the MPU_AO_RST signal to MPUSS.
Before the MPU power on reset is de-asserted, the PRCM must ensure that the MPU CLK is running so that MPU can be reset properly.
3. The PRCM releases MPU_PWRON_RST and it waits until MPUSS power-on Reset is complete. That is, the MPU_PWRON_RSTDONE signal is asserted HIGH by the MPUSS.
4. Following the de-assertion of MPU_PWRON_RST signal, the MPU SS de-asserts the nPORESET signal to the Cortex™-A8 CPU and after sufficient number of MPU CLK cycles MPU SS asserts the MPU_PWRON_RSTDONE signal high to indicate to the PRCM that synchronous power on reset sequence is completed inside MPU SS.
5. Once the PRCM sees that this MPU_PWRON_RSTDONE signal is asserted HIGH, PRCM de-asserts the MPU_RST signal and then the MPU starts booting.

Figure 2-20. MPU SS POR Sequence

2.7.20 MPU Subsystem Warm Sequence

During the warm reset of MPU, the PRCM asserts the MPU_RST signal only and power on reset signal is not asserted.

The MPU_RST is kept asserted for minimum 32 MPU clock cycles, that is, SYS_CLK in this case since during warm the reset of MPU.

Figure 2-21 illustrates the timing diagram for MPU warm reset sequence.

Figure 2-21. MPU Warm Reset Sequence

2.7.21 HDVICP Power-On Reset Sequence

Figure 2-22 illustrates the POR sequence of the HDVICP subsystem.

Figure 2-22. POR Sequence of the HDVICP2

POR to HDVICP is applied when PD_HDVICP is powered up.

Whenever the HDVICP is enabled by software control, the following sequence happens:

- The PRCM module provides the functional clock HDVICP_CLK to the HDVICP SUBSYSTEM
- The POR to HDVICP is de-asserted

After POR de-assertion, the sequence is:

- Software clears the RM_HDVICP_RSTCTRL[2] RST3 bit. This causes the PRCM module to release the HDVICP_PWRN_RST reset, which is used inside HDVICP primarily to reset the emulation logic and the HDVICP_RST reset, which is used to reset all logic inside HDVICP. Then, software can download data into the TCM memory while keeping the sequencer CPUs under reset.
- Software clears the RM_HDVICP_RSTCTRL[0] RST1 bit. This releases the HDVICP_SEQ1_RST reset to the Sequencer1 CPU.
- Software can clear the RM_HDVICP_RSTCTRL[1] RST2 bit. This releases the HDVICP_SEQ2_RST reset to the Sequencer2 CPU.

2.7.22 HDVICP Software Warm Reset Sequence

Figure 2-23 illustrates the software warm reset sequence of the HDVICP.

Figure 2-23. Software Warm Reset Sequence of the HDVICP

Before asserting the software reset to the HDVICP, the MPU software must ensure that:

- The HDVICP sequencer CPUs are in IDLE state (CM_HDVICP_CLKCTRL[17:16] IDLEST).
- The HDVICP2 is in STANDBY state CM_HDVICP_CLKCTRL[[18] STBYST).
- The functional clock to the HDVICP has been gated by the PRCM module (CM_HDVICP_CLKSTCTRL[8] CLKACTIVITY_HDVICP_CLK).

The software reset sequence occurs when the MPU software:

1. Sets the RM_HDVICP_RSTCTRL[2] RST3, RM_HDVICP_RSTCTRL[1] RST2, and RM_HDVICP_RSTCTRL[0] RST1 bits. This causes the PRCM module to assert the HDVICP_RST, HDVICP_SEQ1_RST, and HDVICP_SEQ2_RST resets to the HDVICP2. HDVICP_PWRN_RST remains deasserted.
2. Enables the functional clock to the HDVICP.
3. clears the RM_HDVICP_RSTCTRL[2] RST3 and RM_HDVICP_RSTCTRL[0] RST1 bits. This causes the PRCM module to release the HDVICP_RST and HDVICP_SEQ1_RST resets to the HDVICP.
4. clears the RM_HDVICP_RSTCTRL[1] RST2 bit. This releases the HDVICP_SEQ2_RST reset to the Sequencer2 CPU.

2.7.23 C674x DSP Power-On Reset Sequence

The assumptions about POR de-assertion are:

- The MPU software sets the CM_ACTIVE_GEM_CLKCTRL [1:0] MODULEMODE bit field to enabled.
- The MPU software sets the CM_ACTIVE_GEM_CLKSTCTRL [1:0] CLKTRCTRL bit field to SW_WKUP.
- The PRCM is providing the clocks to C674x DSP.

The POR sequence is:

- The PRCM module releases GEM_POR when the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) reaches its limit.
- The MPU software clears the RM_ACTIVE_RSTCTRL[1] GEM_SW_RST bit in the PRCM module register to release the DSP, MMU, and CACHE interface from reset.

- Once the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the GEM_GRST signal.
- On deassertion of the GEM_GRST signal, the C674x subsystem starts the initialization sequence. During the initialization sequence all the internal registers inside the C674x subsystem are properly reset and the reset for the DSP, MMU, and CACHE interface completes.
- The MPU software must configure the MMU once the MMU is out of reset. After the MMU is configured, the MPU software clears the RM_ACTIVE_RSTCTRL[0] GEM_LRST bit in the PRCM module register.

The PRCM module releases GEM_LRST, which causes the DSP to start booting.

2.7.24 C674x DSP Warm Reset Sequence

The assumptions about WARM reset de-assertion are:

- The DSP is in IDLE state

The sequence is:

1. The MPU software sets the RM_ACTIVE_RSTCTRL[1] GEM_SW_RST and RM_ACTIVE_RSTCTRL[0] GEM_LRST bits.
2. The PRCM module asserts the GEM_GRST and GEM_LRST reset signals. GEM_POR remains deasserted in this case.
3. The MPU software re-enables the C674x DSP Clocks and clears the RM_ACTIVE_RSTCTRL[1] GEM_SW_RST bit in the PRCM module register to reset the DSP, MMU, and CACHE interface. The DSP subsystem starts the partial initialization sequence for the warm reset.
4. The MPU software clears the RM_ACTIVE_RSTCTRL[0] GEM_LRST bit in the PRCM module register.
5. The PRCM module releases GEM_LRST, which causes the DSP to start booting.

2.7.25 Media Controller Power-On Reset Sequence

Figure 2-24. Media Controller Power-On Reset Sequence

The assumptions about POR de-assertion are:

- The Media Controller MPU subsystem is held in reset by the PRCM module and the following are asserted:
 - DSS_PWRN_RST
 - DSS_RST1
 - DSS_RST2
 - DSS_RST3

The POR sequence is:

1. Software enables Media Controller MPU subsystem.
2. Software clears the RM_DEFAULT_RSTCTRL[4] RST3 bit in the PRCM module register to release the Media Controller MPU Cache and MMU from reset.
3. Once the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the DSS_RST3 signal.
4. Upon the deassertion of the DSS_M3_RST3 signal, the Media Controller MPU subsystem starts the CPU and MMU initialization sequence
5. The MPU software must configure the MMU once the MMU is out of reset. After MMU configuration and cache initialization is done, the MPU software clears the RM_DEFAULT_RSTCTRL[3] RST1 bit in the PRCM module register.
6. The PRCM module releases DSS_RST1, which causes the Media Controller MPU Core 1 to start booting.
7. The MPU software can clear the RM_DEFAULT_RSTCTRL[2] RST2 bit in the PRCM module register so that the PRCM module releases DSS_RST2 to the Media Controller MPU Core 2.

2.7.26 Media Controller Warm Reset Sequence

Figure 2-25. Media Controller MPU Subsystem Software Warm Reset Sequence

The assumption about Warm reset assertion is:

- The Media Controller MPU Core2 is in IDLE state.

The sequence is:

1. Media Controller MPU Core 1 software or Cortex™-A8 MPU software sets the RM_DEFAULT_RSTCTRL[3] RST2 bit. The PRCM module asserts the DSS_RST2 reset signal to the Media Controller Core 2.
2. The Cortex™-A8 MPU cuts the MPU_M3_CLK and software sets the RM_DEFAULT_RSTCTRL[4] RST3 and RM_DEFAULT_RSTCTRL[2] RST1 bits.
3. The PRCM module asserts the DSS_RST3, DSS_RET_RST, and the DSS_RST1 reset signals. The DSS_PWRN_RST remains deasserted in this case.
4. The MPU software re-enables the MPU_M3_CLK and the initialization sequence starts inside the Media Controller subsystem. Software clears the RM_DEFAULT_RSTCTRL[4] RST3 bit in the PRCM module register.
5. When the reset sequence in Step 4 completes and the reset manager counter (PRM_RSTTIME[14:10] RSTTIME2) expires, the PRCM module releases the DSS_RST3, and DSS_RST1 reset signals. Media Controller Core 1 starts rebooting.
6. Software clears the RM_DEFAULT_RSTCTRL[3] RST2 bit in the PRCM module register. The PRCM module releases the DSS_RST2 reset signal to the Media Controller Core 2. Core 2 starts to boot.

2.8 Voltage and Power Domains

Table 2-37 shows how the device core logic is partitioned into 4 core logic voltage domains, 4 memory voltage domains and 6 power domains. The table lists which voltage and power domain a functional module belongs. All voltage domains must be supplied during any mode of operation while 5 of the 6 power domains can be turned off by internal switch.

Table 2-37. Volage and Power Domains

Logic Voltage Domain Name	Module
ARM	Cortex™-A8,
CORE	DCAN0, DCAN1, DDR_PHY_LOGIC0, DDR_PHY_LOGIC1, DMM EDMA, ELM, EMIF0, EMIF1, 2 Channel GMAC Switch, GPIO_CNTL0, GPIO_CNTL1, GPIO_CNTL2, GPIO_CNTL3,GPMC, I2C0, I2C1, I2C2, I2C3, Interconnect, IPC, MCASP0, MCASP1, MCASP2, MCASP3, MCASP4, MCASP5, ATL, MCBSP, MLB, OCMC SRAM, PATA, PBIST, PCI, PRCM, RTC, SATA, SCR, SD/MMC0, SD/MMC1, SD/MMC2, SPI0, SPI1, SPI2, SPI3, Switch fabric, Timer1, Timer2, Timer3, Timer4, Timer5, Timer6, Timer7, Timer8, UART0, UART1, UART2, UART3, UART4, UART5, USB0, USB1, WDT0, VCP, XBAR, Debug_SS
	FACEDETECT
	SGX530 Subsystem
	HDD_SS, HDMI, SD-DAC LOGIC
ACTIVE (DSP)	C674x+™ Subsystem. , C674x+™ L2 SRAM,
HDVICP	HDVICP,

2.8.1 Voltage Domains

The PRCM module controls the voltage scaling (that is, switching the voltage in discrete steps or in a continuum within a range of possible values) of the power sources of the device. This allows control of the device power consumption according to the performance criteria defined. Higher performance is ensured with higher voltage and clock frequencies (and hence higher power consumption), while lower performance can be supported with lowered power consumption by reducing or completely gating the power supply to specific areas of the device and gating the associated clocks.

A voltage domain is a section of the device supplied by a dedicated voltage source (that is, an internal LDO or external switched mode power supply [SMPS]). A voltage domain may or may not be controlled by the PRCM module. When a voltage domain is controlled by the PRCM module, a dedicated voltage manager is associated. The voltage manager allows regulation of the voltage level of the source for the voltage domain, independently of other voltage domains of the device.

The core logic is divided into four voltage domains. This division permits the system to scale down voltage to some functional blocks while maintaining highest performance on other blocks.

The voltage managers in the PRCM module can be of two types:

- Hardware controlled to automatically switch the domain voltage levels according to the associated hardware conditions.

Figure 2-26 shows a voltage domain.

Figure 2-26. Generic Voltage Domain

2.8.2 Power Domains

In order to reduce power due to leakage, the core logic supply voltage to six of the device power domains can be turned OFF with internal power switches. The internal power switches are controlled through memory mapped registers in the PRCM. In an use case whereby all the modules within a power domain are not used that power domain can be place in the OFF state.

[Table 2-38](#) shows the allowable combination power domain ON/OFF states and which power domains are switched via internal power switches. At power-on-reset, all domains except always-on are in the power domain OFF state.

Table 2-38. Power Domain State Table

MODE	POWER DOMAIN					
	ALWAYS_ON	ISP (ISS)	GFX	DSS	ACTIVE (DSP)	HDVICP
No Voltage Supply	N/A	N/A	N/A	N/A	N/A	N/A
Power On Reset	ON	OFF	OFF	OFF	OFF	OFF
ALL OTHER FUNCTIONAL MODES	ON	DON'T CARE	DON'T CARE	DON'T CARE	DON'T CARE	DON'T CARE
Internal Power Switch	NO	YES	YES	YES	YES	YES

2.8.3 Device Modules and Power Management Attribute List

The device modules and power management list are described below:

Table 2-39. Device Modules

Power Domain Name	Module
ALWAYS_ON	Cortex™-A8, , DCAN0, DCAN1, DDR_PHY_LOGIC0, DDR_PHY_LOGIC1, DMM EDMA, ELM, EMIF0, EMIF1, 2 Channel GMAC Switch, GPIO_CNTL0, GPIO_CNTL1, GPIO_CNTL2, GPIO_CNTL3, GPMC, I2C0, I2C1, I2C2, I2C3, Interconnect, IPC, MCASP0, MCASP1, MCASP2, MCASP3, MCASP4, MCASP5, ATL, MCBSP, MLB, OCMC SRAM, PATA, PBIST, PCI, PRCM, RTC, SATA, SCR, SD/MMC0, SD/MMC1, SD/MMC2, SPI0, SPI1, SPI2, SPI3, Switch fabric, Timer1, Timer2, Timer3, Timer4, Timer5, Timer6, Timer7, Timer8, UART0, UART1, UART2, UART3, UART4, UART5, USB0, USB1, WDT0, VCP, XBAR, Debug_SS
ISS (ISP)	FACEDETECT, ISS
SGX530	SGX530 Subsystem
DSS	HDD_SS, HDMI, SD-DAC LOGC
ACTIVE (DSP)	C674x+™ Subsystem. , C674x+™ L2 SRAM,
HDVICP	HDVICP, SRSense2

2.8.4 Power Domain Power-Down Sequence

Below is the sequence of steps which happen during power down of a power domain.

All IPs (belonging to a power domain) with STANDBY interface asserts STANDBY. The STANDBY assertion should get triggered by the IP based on its activity on OCP initiator port. The IP should assert STANDBY whenever initiator port is IDLE. Some of the DSPS IPs may not have this feature and they require SW write to standby-mode register to get STANDBY assertion from IP.

1. SW requests all modules in given power domain to go to disable state by programming module control register inside PRCM.
2. PRCM starts and waits for completion of power management handshake with IPs (IdleReq/IdleAck).
3. PRCM gates-off all the clocks to the power domain.
4. SW requests all clock domains in given power domain to go to “force sleep” mode by programming functional clock domain register in PRCM. PRCM has already gated-off clocks and this register programming may look redundant.
5. SW requests PRCM to take this power domain to OFF state by programming PWRSTCTRL register. This step can be skipped if PWRSTCTRL is permanently programmed to OFF state. When this is done, functional clock domain register decides when power domain is taken to OFF state. Only reason not to have OFF state in PWRSTCTRL is to take power domain to just clock gate state without power gating.
6. PSCON specific to this power domain asserts isolation enable for the domain.
7. PRCM asserts warm and cold reset to the power domain.
8. PSCON asserts control signals to switch-off power using on-die switches.
9. On-die switches sends acknowledge back to PSCON.

2.8.5 Power Domain Power-Up Sequence

Below is the sequence of steps during power-up of a power domain. This sequence is not relevant to ALWAYS_ON power domain as this domain never goes to OFF state as long as the device is powered. This sequence is repeated each time a domain is taken to ON state from OFF (including first time power-up).

There can be multiple reasons to start power-up sequence for a domain. For example it can be due to an interrupt from one of the IPs which is powered-up.

1. SW requests required clock domains inside this power domain to go to force wake-up state by programming the functional clock domain register.
2. PRCM enables clocks to the required clock domains.
3. PSCON specific to this power domain asserts control signal to ungate the power.
4. Once power is ungated, on-die switches sends acknowledge back to PSCON.
5. PRCM deasserts cold and warm reset to the power domain.
6. PRCM turns off isolation cells.
7. SW requests PRCM to enable the required module in the power domain by programming the module control register.
8. PRCM initiates and waits for completion of PM protocol to enable the modules (IdleReq/IdleAck).

2.9 Voltage Management Functional Description

This section describes the voltage domains and voltage control architecture. It also explains the interactions between the device and the external power IC.

2.9.1 Overview

The voltage-management architecture of the device is based on voltage sources managed by the PRCM module. They define the voltage domains within the device (see [Section 2.8.1, Voltage Domains](#)). This partition of the voltage domains ensures independent voltage control of each voltage domain through dedicated SMPS or LDO. The following voltage domains are managed by the PRCM module:

- VDD_ARM_L
- VDD_CORE_L
- VDD_DSP_L
- VDD_HDVICP_L
- LDO_ARM_M
- LDO_CORE_M
- LDO_DSP_M
- LDO_HDVICP_M
- LDO_ARM_ABB
- LDO_DSP_ABB
- LDO_HDVICP_ABB

NOTE: See the device *Datasheet* document for device power supply pin association to the power domain.

[Table 2-40](#) lists the supported DVFS OPPs for each voltage domain. The exact values depend on the silicon; for more information, see the device *Datasheet*.

Table 2-40. Supported DVFS OPPs Summary

Voltage Domain	Operating Point	Control
VDD_ARM_L (cvdd_arm)	OPP100	Hardware and software
	OPP120	
	OPP166	
VDD_HDVICP_L (cvdd_hdvicp)	OPP100	Hardware and software
	OPP120	
	OPP166	
VDD_CORE_L (cvdd)	OPP100	Hardware and software
	OPP120	
	OPP166	
VDD_DSP_L (cvdd_dsp)	OPP100	Hardware and software
	OPP120	
	OPP166	

NOTE: For the supported OPPs for each device in the *Davinci* family, see in the device *Datasheet*.

DVFS OPPs Dependencies

For detailed information about DVFS OPP dependencies, see the device *Datasheet*.

2.9.2 Internal LDOs Control

2.9.2.1 Memory LDOs

Embedded SRAM LDOs (that is, LDO_CORE_M, LDO_HDVICP_M, LDO_ARM_M and LDO_DSP_M) are used to supply power to the split-rail memory arrays. The PRM generates the controls used to select LDO operating mode: on-active, or off.

Split-rail type SRAMs are used in the device to implement the larger memories. These SRAMs feature memory array and periphery logic which are on separate supplies to allow independent power management. Proper memory operation, however, requires the SRAM array voltage to never be operated at a level lower than the SRAM periphery logic.

Memory LDO can switch to on, and off mode:

- On mode: 1.2 V is the normal voltage reference used through all functional OPPs, whenever memories must be functional. When logic voltage level VDD_x_L (where x can be ARM, CORE, HDVICP and DSP) becomes higher than the associated memory voltage level VDD_x_M, the LDO operates in the tracking mode and follows its respective the VDD_x_L voltage level.
- Off mode: 0 V is set when the device switches to off mode.

NOTE: The voltage levels associated with the different modes may depend on the device characteristics.

2.9.2.2 ABB LDOs Control

The ABB LDO supports three voltage modes:

- Bypass mode: In this mode the <x>_ABB LDO is bypassed and outputs the VDD_<x>_L voltages (x refers to ARM, DSP, HDVICP). This mode is activated when ABB is not required, or when voltage domain enters low-power mode.
- ABB Set1: This mode is enabled at OPP_166.
- ABB Set2: This mode is enabled at OPP_120.

The Control module provides the SGX_VBBLDO_CTRL, HDVICP_VBBLDO_CTRL, C674x_DSP_VBBLDO_CTRL, ARM_CORTEX_A8_VBBLDO_CTRL registers for configuration with the following controls:

- LDOBYPASSZ – Bypass the ABB power management
- BBSEL – high selects FBB

The register RAMLDO_CTRL in Control module controls RAM LDOs. It provides following controls:

- AIPOFF - Disable LDO and enables IDDQ mode.
- SRAMALLRET - puts VDDAR in retention mode.
- ABBOFF - shorts VDDAR to VNWA.

2.10 PRCM Registers

The following are memory-mapped registers for the PRCM.

Table 2-41. PRCM Memory Mapped Registers

Module Name	Base Address Offset	Size
PRM_DEVICE	0x0000	256 Bytes
CM_DEVICE	0x0100	256 Bytes
OCP_SOCKET_PRM	0x0200	256 Bytes
CM_DPLL	0x0300	256 Bytes
CM_ACTIVE (DSP)	0x0400	256 Bytes
CM_DEFAULT	0x0500	256 Bytes

Table 2-41. PRCM Memory Mapped Registers (continued)

Module Name	Base Address Offset	Size
CM_HDVICP	0x0600	256 Bytes
CM_ISS	0x0700	256 Bytes
CM_DSS	0x0800	256 Bytes
CM_SGX530	0x0900	256 Bytes
PRM_ACTIVE (DSP)	0x0A00	256 Bytes
PRM_DEFAULT	0x0B00	256 Bytes
PRM_HDVICP	0x0C00	256 Bytes
PRM_ISP (ISS)	0x0D00	256 Bytes
PRM_DSS	0x0E00	256 Bytes
PRM_SGX530	0x0F00	256 Bytes
CM_ALWON	0x1400	1 KBytes
PRM_ALWON	0x1800	1 KBytes

2.10.1 PLLSS Registers

Table 2-42 lists the memory-mapped registers for the PLLSS. All register offset addresses not listed in Table 2-42 should be considered as reserved locations and the register contents should not be modified.

Table 2-42. PLLSS REGISTERS

Offset	Acronym	Register Name	Section
0h	CONTROL_REVISION	The CONTROL_REVISION register is a read only register containing the revision number of the Control module. A write to this register has no effect.	Section 3.2.1
4h	CONTROL_HWINFO	The CONTROL_HWINFO register contains information about the module hardware configuration (typically HDL generics, if any).	Section 3.2.2
10h	CONTROL_SYSCONFIG	The CONTROL_SYSCONFIG register implements only a reduced set of the register defined in the OCP Design Guidelines.	Section 3.2.3
40h	PLLSS_MMR_LOCK	The PLLSS_MMR_LOCK Register is used allow/block writes to the registers in address region Start_Address_x -End_Address_x. This register has 2 states LOCKED and UNLOCKED When in LOCKED state all writes to Start_Address_x -End_Address_x is blocked. When in UNLOCKED state all writes to Start_Address_x -End_Address_x is allowed. All reads to Start_Address_x -End_Address_x should not be blocked by the state of PLLSS_MMR_LOCK registers but they should follow the underlying security specified in each section, e.g. Firewall setting, Non Secure Supervisor etc.	Section 2.10.1.4
48h	MPUPLL_PWRCTRL	The MPU PLL Power Control register is used to control the power state of the MPU_PLL.	Section 2.10.1.5
4Ch	MPUPLL_CLKCTRL	The MPU PLL Clock Control register is used to control the different clock control state of the MPU_PLL	Section 2.10.1.6
50h	MPUPLL_TENABLE	The MPU PLL TENABLE register is used to load the M, N dividers of MPU_PLL	Section 2.10.1.7
54h	MPUPLL_TENABLEDIV	The MPU PLL TENABLEDIV register is used to load the M2,N2 dividers of MPU_PLL	Section 2.10.1.8
58h	MPUPLL_M2NDIV	MPU PLL M2NDIV register is for programming M2 and N values of MPU_PLL	Section 2.10.1.9
5Ch	MPUPLL_MN2DIV	MPU PLL MN2DIV register is for programming M and N2 values of MPU_PLL	Section 2.10.1.10
60h	MPUPLL_FRACDIV	The MPU PLL FRACDIV register is for controlling the fractional values of MPU_PLL	Section 2.10.1.11
64h	MPUPLL_BWCTRL	The MPU PLL_BWCTRL register is for controlling the loop bandwidth of MPU_PLL	Section 2.10.1.12
68h	MPUPLL_FRACCTRL	Controls the fractional portion of Modena PLL	Section 2.10.1.13
6Ch	MPUPLL_STATUS	The MPU PLL Status register is for viewing the status of the MPU PLL.	Section 2.10.1.14
70h	MPUPLL_M3DIV	The MPU PLL_M3DIV register is for controlling the M3 divider of MPU_PLL	Section 2.10.1.15
74h	MPUPLL_RAMPCTRL	The MPUPLL_RAMPCTRL register is for controlling the ramping of MPU_PLL	Section 2.10.1.16
80h	DSPPLL_PWRCTRL	The PLL Power Control register is used to control the power state of therespective PLL.	Section 2.10.1.17
84h	DSPPLL_CLKCTRL	The PLL Clock Control register is used to control the different clock control state of the respective PLL	Section 2.10.1.18
88h	DSPPLL_TENABLE	Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLJ.	Section 2.10.1.19
8Ch	DSPPLL_TENABLEDIV	The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL	Section 2.10.1.20

Table 2-42. PLLSS REGISTERS (continued)

Offset	Acronym	Register Name	Section
90h	DSPPLL_M2NDIV	PLL M2NDIV register is for programming M2 and N values of respective PLL	Section 2.10.1.21
94h	DSPPLL_MN2DIV	PLL MN2DIV register is for programming M and N2 values of respective PLL	Section 2.10.1.22
98h	DSPPLL_FRACDIV	The PLL FRACDIV register is for controlling the fractional values of respective PLL	Section 2.10.1.23
9Ch	DSPPLL_BWCTRL	The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL	Section 2.10.1.24
A0h	DSPPLL_FRACCTRL	Controls the fractional portion of respective ADPLLLJ.	Section 2.10.1.25
A4h	DSPPLL_STATUS	The PLL Status register is for viewing the status of the respective PLL.	Section 2.10.1.26
B0h	SGXPLLL_PWRCTRL	The PLL Power Control register is used to control the power state of therespective PLL.	Section 2.10.1.27
B4h	SGXPLL_CLKCTRL	The PLL Clock Control register is used to control the different clock control state of the respective PLL	Section 2.10.1.28
B8h	SGXPLLL_TENABLE	Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.	Section 2.10.1.29
BCh	SGXPLL_TENABLEDIV	The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL	Section 2.10.1.30
C0h	SGXPLL_M2NDIV	PLL M2NDIV register is for programming M2 and N values of respective PLL	Section 2.10.1.31
C4h	SGXPLL_MN2DIV	PLL MN2DIV register is for programming M and N2 values of respective PLL	Section 2.10.1.32
C8h	SGXPLL_FRACDIV	The PLL FRACDIV register is for controlling the fractional values of respective PLL	Section 2.10.1.33
CCh	SGXPLL_BWCTRL	The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL	Section 2.10.1.34
D0h	SGXPLL_FRACCTRL	Controls the fractional portion of respective ADPLLLJ.	Section 2.10.1.35
D4h	SGXPLL_STATUS	The PLL Status register is for viewing the status of the respective PLL.	Section 2.10.1.36
E0h	HDVICPPLL_PWRCTRL	The PLL Power Control register is used to control the power state of therespective PLL.	Section 2.10.1.37
E4h	HDVICPPLL_CLKCTRL	The PLL Clock Control register is used to control the different clock control state of the respective PLL	Section 2.10.1.38
E8h	HDVICPPLL_TENABLE	Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.	Section 2.10.1.39
ECh	HDVICPPLL_TENABLEDIV	The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL	Section 2.10.1.40
F0h	HDVICPPLL_M2NDIV	PLL M2NDIV register is for programming M2 and N values of respective PLL	Section 2.10.1.41
F4h	HDVICPPLL_MN2DIV	PLL MN2DIV register is for programming M and N2 values of respective PLL	Section 2.10.1.42
F8h	HDVICPPLL_FRACDIV	The PLL FRACDIV register is for controlling the fractional values of respective PLL	Section 2.10.1.43
FCh	HDVICPPLL_BWCTRL	The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL	Section 2.10.1.44
100h	HDVICPPLL_FRACCTRL	Controls the fractional portion of respective ADPLLLJ.	Section 2.10.1.45
104h	HDVICPPLL_STATUS	The PLL Status register is for viewing the status of the respective PLL.	Section 2.10.1.46
110h	L3PLL_PWRCTRL	The PLL Power Control register is used to control the power state of therespective PLL.	Section 2.10.1.47
114h	L3PLL_CLKCTRL	The PLL Clock Control register is used to control the different clock control state of the respective PLL	Section 2.10.1.48
118h	L3PLL_TENABLE	Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.	Section 2.10.1.49

Table 2-42. PLLSS REGISTERS (continued)

Offset	Acronym	Register Name	Section
11Ch	L3PLL_TENABLEDIV	The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL	Section 2.10.1.50
120h	L3PLL_M2NDIV	PLL M2NDIV register is for programming M2 and N values of respective PLL	Section 2.10.1.51
124h	L3PLL_MN2DIV	PLL MN2DIV register is for programming M and N2 values of respective PLL	Section 2.10.1.52
128h	L3PLL_FRACDIV	The PLL FRACDIV register is for controlling the fractional values of respective PLL	Section 2.10.1.53
12Ch	L3PLL_BWCTRL	The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL	Section 2.10.1.54
130h	L3PLL_FRACCTRL	Controls the fractional portion of respective ADPLLLJ.	Section 2.10.1.55
134h	L3PLL_STATUS	The PLL Status register is for viewing the status of the respective PLL.	Section 2.10.1.56
140h	ISPPLL_PWRCTRL	The PLL Power Control register is used to control the power state of therespective PLL.	Section 2.10.1.57
144h	ISPPLL_CLKCTRL	The PLL Clock Control register is used to control the different clock control state of the respective PLL	Section 2.10.1.58
148h	ISPPLL_TENABLE	Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.	Section 2.10.1.59
14Ch	ISPPLL_TENABLEDIV	The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL	Section 2.10.1.60
150h	ISPPLL_M2NDIV	PLL M2NDIV register is for programming M2 and N values of respective PLL	Section 2.10.1.61
154h	ISPPLL_MN2DIV	PLL MN2DIV register is for programming M and N2 values of respective PLL	Section 2.10.1.62
158h	ISPPLL_FRACDIV	The PLL FRACDIV register is for controlling the fractional values of respective PLL	Section 2.10.1.63
15Ch	ISPPLL_BWCTRL	The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL	Section 2.10.1.64
160h	ISPPLL_FRACCTRL	Controls the fractional portion of respective ADPLLLJ.	Section 2.10.1.65
164h	ISPPLL_STATUS	The PLL Status register is for viewing the status of the respective PLL.	Section 2.10.1.66
170h	DSSPLL_PWRCTRL	The PLL Power Control register is used to control the power state of therespective PLL.	Section 2.10.1.67
174h	DSSPLL_CLKCTRL	The PLL Clock Control register is used to control the different clock control state of the respective PLL	Section 2.10.1.68
178h	DSSPLL_TENABLE	Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.	Section 2.10.1.69
17Ch	DSSPLL_TENABLEDIV	The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL	Section 2.10.1.70
180h	DSSPLL_M2NDIV	PLL M2NDIV register is for programming M2 and N values of respective PLL	Section 2.10.1.71
184h	DSSPLL_MN2DIV	PLL MN2DIV register is for programming M and N2 values of respective PLL	Section 2.10.1.72
188h	DSSPLL_FRACDIV	The PLL FRACDIV register is for controlling the fractional values of respective PLL	Section 2.10.1.73
18Ch	DSSPLL_BWCTRL	The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL	Section 2.10.1.74
190h	DSSPLL_FRACCTRL	Controls the fractional portion of respective ADPLLLJ.	Section 2.10.1.75
194h	DSSPLL_STATUS	The PLL Status register is for viewing the status of the respective PLL.	Section 2.10.1.76
1A0h	VIDEO0PLL_PWRCTRL	The PLL Power Control register is used to control the power state of therespective PLL.	Section 2.10.1.77
1A4h	VIDEO0PLL_CLKCTRL	The PLL Clock Control register is used to control the different clock control state of the respective PLL	Section 2.10.1.78

Table 2-42. PLLSS REGISTERS (continued)

Offset	Acronym	Register Name	Section
1A8h	VIDEO0PLL_TENABLE	Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.	Section 2.10.1.79
1ACh	VIDEO0PLL_TENABLEDIV	The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL	Section 2.10.1.80
1B0h	VIDEO0PLL_M2NDIV	PLL M2NDIV register is for programming M2 and N values of respective PLL	Section 2.10.1.81
1B4h	VIDEO0PLL_MN2DIV	PLL MN2DIV register is for programming M and N2 values of respective PLL	Section 2.10.1.82
1B8h	VIDEO0PLL_FRACDIV	The PLL FRACDIV register is for controlling the fractional values of respective PLL	Section 2.10.1.83
1BCh	VIDEO0PLL_BWCTRL	The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL	Section 2.10.1.84
1C0h	VIDEO0PLL_FRACCTRL	Controls the fractional portion of respective ADPLLLJ.	Section 2.10.1.85
1C4h	VIDEO0PLL_STATUS	The PLL Status register is for viewing the status of the respective PLL.	Section 2.10.1.86
1D0h	VIDEO1PLL_PWRCTRL	The PLL Power Control register is used to control the power state of therespective PLL.	Section 2.10.1.87
1D4h	VIDEO1PLL_CLKCTRL	The PLL Clock Control register is used to control the different clock control state of the respective PLL	Section 2.10.1.88
1D8h	VIDEO1PLL_TENABLE	Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.	Section 2.10.1.89
1DCh	VIDEO1PLL_TENABLEDIV	The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL	Section 2.10.1.90
1E0h	VIDEO1PLL_M2NDIV	PLL M2NDIV register is for programming M2 and N values of respective PLL	Section 2.10.1.91
1E4h	VIDEO1PLL_MN2DIV	PLL MN2DIV register is for programming M and N2 values of respective PLL	Section 2.10.1.92
1E8h	VIDEO1PLL_FRACDIV	The PLL FRACDIV register is for controlling the fractional values of respective PLL	Section 2.10.1.93
1ECh	VIDEO1PLL_BWCTRL	The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL	Section 2.10.1.94
1F0h	VIDEO1PLL_FRACCTRL	Controls the fractional portion of respective ADPLLLJ.	Section 2.10.1.95
1F4h	VIDEO1PLL_STATUS	The PLL Status register is for viewing the status of the respective PLL.	Section 2.10.1.96
200h	HDMIPLL_PWRCTRL	The PLL Power Control register is used to control the power state of therespective PLL.	Section 2.10.1.97
204h	HDMIPLL_CLKCTRL	The PLL Clock Control register is used to control the different clock control state of the respective PLL	Section 2.10.1.98
208h	HDMIPLL_TENABLE	Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.	Section 2.10.1.99
20Ch	HDMIPLL_TENABLEDIV	The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL	Section 2.10.1.100
210h	HDMIPLL_M2NDIV	PLL M2NDIV register is for programming M2 and N values of respective PLL	Section 2.10.1.101
214h	HDMIPLL_MN2DIV	PLL MN2DIV register is for programming M and N2 values of respective PLL	Section 2.10.1.102
218h	HDMIPLL_FRACDIV	The PLL FRACDIV register is for controlling the fractional values of respective PLL	Section 2.10.1.103
21Ch	HDMIPLL_BWCTRL	The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL	Section 2.10.1.104
220h	HDMIPLL_FRACCTRL	Controls the fractional portion of respective ADPLLLJ.	Section 2.10.1.105
224h	HDMIPLL_STATUS	The PLL Status register is for viewing the status of the respective PLL.	Section 2.10.1.106
230h	AUDIOPLL_PWRCTRL	The PLL Power Control register is used to control the power state of therespective PLL.	Section 2.10.1.107

Table 2-42. PLLSS REGISTERS (continued)

Offset	Acronym	Register Name	Section
234h	AUDIOPLL_CLKCTRL	The PLL Clock Control register is used to control the different clock control state of the respective PLL	Section 2.10.1.108
238h	AUDIOPLL_TENABLE	Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.	Section 2.10.1.109
23Ch	AUDIOPLL_TENABLEDIV	The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL	Section 2.10.1.110
240h	AUDIOPLL_M2NDIV	PLL M2NDIV register is for programming M2 and N values of respective PLL	Section 2.10.1.111
244h	AUDIOPLL_MN2DIV	PLL MN2DIV register is for programming M and N2 values of respective PLL	Section 2.10.1.112
248h	AUDIOPLL_FRACDIV	The PLL FRACDIV register is for controlling the fractional values of respective PLL	Section 2.10.1.113
24Ch	AUDIOPLL_BWCTRL	The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL	Section 2.10.1.114
250h	AUDIOPLL_FRACCTRL	Controls the fractional portion of respective ADPLLLJ.	Section 2.10.1.115
254h	AUDIOPLL_STATUS	The PLL Status register is for viewing the status of the respective PLL.	Section 2.10.1.116
260h	USBPLL_PWRCTRL	The PLL Power Control register is used to control the power state of the respective PLL.	Section 2.10.1.117
264h	USBPLL_CLKCTRL	The PLL Clock Control register is used to control the different clock control state of the respective PLL	Section 2.10.1.118
268h	USBPLL_TENABLE	Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.	Section 2.10.1.119
26Ch	USBPLL_TENABLEDIV	The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL	Section 2.10.1.120
270h	USBPLL_M2NDIV	PLL M2NDIV register is for programming M2 and N values of respective PLL	Section 2.10.1.121
274h	USBPLL_MN2DIV	PLL MN2DIV register is for programming M and N2 values of respective PLL	Section 2.10.1.122
278h	USBPLL_FRACDIV	The PLL FRACDIV register is for controlling the fractional values of respective PLL	Section 2.10.1.123
27Ch	USBPLL_BWCTRL	The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL	Section 2.10.1.124
280h	USBPLL_FRACCTRL	Controls the fractional portion of respective ADPLLLJ.	Section 2.10.1.125
284h	USBPLL_STATUS	The PLL Status register is for viewing the status of the respective PLL.	Section 2.10.1.126
290h	DDRPLL_PWRCTRL	The PLL Power Control register is used to control the power state of the respective PLL.	Section 2.10.1.127
294h	DDRPLL_CLKCTRL	The PLL Clock Control register is used to control the different clock control state of the respective PLL	Section 2.10.1.128
298h	DDRPLL_TENABLE	Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.	Section 2.10.1.129
29Ch	DDRPLL_TENABLEDIV	The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL	Section 2.10.1.130
2A0h	DDRPLL_M2NDIV	PLL M2NDIV register is for programming M2 and N values of respective PLL	Section 2.10.1.131
2A4h	DDRPLL_MN2DIV	PLL MN2DIV register is for programming M and N2 values of respective PLL	Section 2.10.1.132
2A8h	DDRPLL_FRACDIV	The PLL FRACDIV register is for controlling the fractional values of respective PLL	Section 2.10.1.133
2ACh	DDRPLL_BWCTRL	The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL	Section 2.10.1.134
2B0h	DDRPLL_FRACCTRL	Controls the fractional portion of respective ADPLLLJ.	Section 2.10.1.135
2B4h	DDRPLL_STATUS	The PLL Status register is for viewing the status of the respective PLL.	Section 2.10.1.136

Table 2-42. PLLSS REGISTERS (continued)

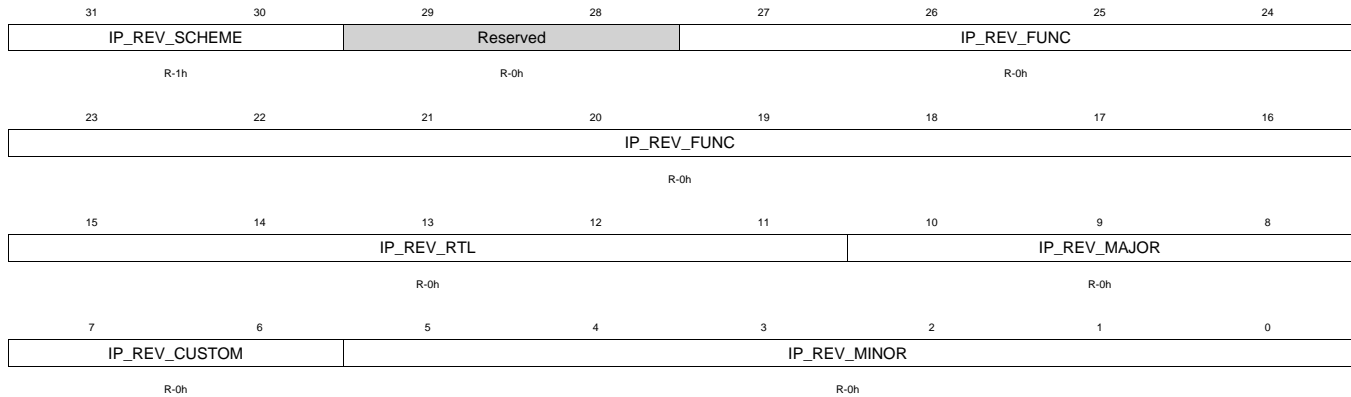

Offset	Acronym	Register Name	Section
2C0h	OSC_SRC	The following groups of PLL needs a selection of clock source of OSC0 or OSC1 o DSPPLL/SGXPPLL/HDVICPPLL/ISPPLL/DSSPLL o VIDEO0PLL o VIDEO1PLL o HDMIPLL o AUDIOPLL o For TEST reasons, the following additional PLLs also have OSC0 vs OSC1 selection: GEM, SGX, HDVICP, ISP, DSS, USB, DDR	Section 2.10.1.137
2C4h	MPU_CLKSRC	Clock source for ARM PLL	Section 2.10.1.138
2C8h	VIDEO_PLL_CLKSRC	Select the clock source for VIDEO PLLs, VENC_G_CLK and audio PLL CLK2 input of PRCM	Section 2.10.1.139
2CCh	MLB_ATL_CLKSRC	MLB and ATL clock source	Section 2.10.1.140
2D0h	McASP345_AUX_CLKSRC	Select the AUX clock source for McASP3/4/5	Section 2.10.1.141
2D4h	McASP_AHCLK_CLKSRC	Select the source of McASP AHCLKX/R	Section 2.10.1.142
2D8h	McBSP_UART_CLKSRC	Select the clock source for UART3/4/5 and MCBSP_CLKS.	Section 2.10.1.143
2DCh	HDMI_I2S_CLKSRC	Select the clock source for HDMI_I2S.	Section 2.10.1.144
2E0h	DMTIMER_CLKSRC	Select the clock source for DMTIMERs 1..8	Section 2.10.1.145
2E4h	CLKOUT_MUX	Control the options for CLKOUT multiplexing. The clock outputs are respectively CLKOUT0 and CLKOUT1.	Section 2.10.1.146
2E8h	RMII_REFCLK_SRC	Control the Cpts_RFT_CLK source mux and RMII_Ref_CLK source mux.	Section 2.10.1.147
2F0h	SYSCLK18_CLKSRC	Select the clock source of SYSCLK18.	Section 2.10.1.148
2F4h	WDT0_CLKSRC	Select the clock source of WDT0.	Section 2.10.1.149
320h	DMTIMER_CLK_CHANGE	This register controls the IDLE REQUEST and logs the IDLE STATUS for DMTIMERs1..8.	Section 2.10.1.150
324h	DEEPSLEEP_CTRL	The DEEPSLEEP control register is not supported on this SoC.	Section 2.10.1.151
328h	DEEPSLEEP_STATUS	The DEEPSLEEP status register logs the internal deepsleep counter value.	Section 2.10.1.152

2.10.1.1 CONTROL_REVISION Register (offset = 0h) [reset = 4000000h]

CONTROL_REVISION is shown in [Figure 3-2](#) and described in [Table 3-4](#).

The CONTROL_REVISION register is a read only register containing the revision number of the Control module. A write to this register has no effect.

Figure 2-27. CONTROL_REVISION Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-43. CONTROL_REVISION Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	IP_REV_SCHEME	R	1h	Used to distinguish register scheme 0x0: Legacy (ASP or WTBU) scheme 0x1: Highlander 0.8 scheme
29-28	Reserved	R	0h	
27-16	IP_REV_FUNC	R	0h	Function indicates a software compatible module family. If there is no level of software compatibility a new Func number (and hence REVISION) should be assigned.
15-11	IP_REV_RTL	R	0h	RTL Version (R), maintained by IP design owner.
10-8	IP_REV_MAJOR	R	0h	Major Revision (X), maintained by IP specification owner.
7-6	IP_REV_CUSTOM	R	0h	Indicates a special version for a particular device. Consequence of use may avoid use of standard Chip Support Library (CSL) / Drivers
5-0	IP_REV_MINOR	R	0h	Minor Revision (Y), maintained by IP specification owner.

2.10.1.2 CONTROL_HWINFO Register (offset = 4h) [reset = 0h]

CONTROL_HWINFO is shown in [Figure 3-3](#) and described in [Table 3-5](#).

The CONTROL_HWINFO register contains information about the module hardware configuration (typically HDL generics, if any).

Figure 2-28. CONTROL_HWINFO Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-44. CONTROL_HWINFO Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	IP_HWINFO	R	0h	IP Module dependent

2.10.1.3 CONTROL_SYSCONFIG Register (offset = 10h) [reset = 2Ah]

CONTROL_SYSCONFIG is shown in [Figure 3-4](#) and described in [Table 3-6](#).

The CONTROL_SYSCONFIG register implements only a reduced set of the register defined in the OCP Design Guidelines.

Figure 2-29. CONTROL_SYSCONFIG Register

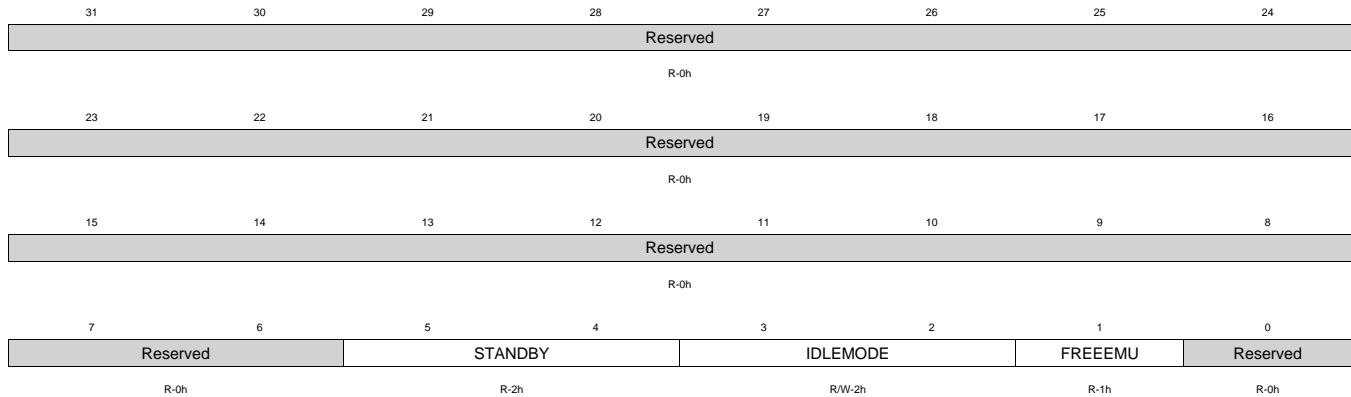

Table 2-45. CONTROL_SYSCONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5-4	STANDBY	R	2h	Configure local initiator state management. Reserved in Control Module since it has no local initiator. 0x0 = 00: Force Standby 0x1 = 01: No Standby Mode 0x2 = 10: Smart Standby 0x3 = 11: Smart Standby wakeup capable
3-2	IDLEMODE	R/W	2h	Configure local target state management 0x0 = 00: Force Idle 0x1 = 01: No Idle 0x2 = 10: Smart Idle 0x3 = 11: Smart Idle wakeup capable
1	FREEEMU	R	1h	Sensitivity to Emulation suspend input. 0x0: Module is sensitive to EMU suspend 0x1: Module not sensitive to EMU suspend
0	Reserved	R	0h	

2.10.1.4 PLLSS_MMR_LOCK Register (offset = 40h) [reset = 1F125B64h]

PLLSS_MMR_LOCK is shown in [Figure 2-30](#) and described in [Table 2-46](#).

The PLLSS_MMR_LOCK Register is used allow/block writes to the registers in address region Start_Address_x -End_Address_x. This register has 2 states LOCKED and UNLOCKED When in LOCKED state all writes to Start_Address_x -End_Address_x is blocked. When in UNLOCKED state all writes to Start_Address_x -End_Address_x is allowed. All reads to Start_Address_x -End_Address_x should not be blocked by the state of PLLSS_MMR_LOCK registers but they should follow the underlying security specified in each section, e.g. Firewall setting, Non Secure Supervisor etc.

Figure 2-30. PLLSS_MMR_LOCK Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-46. PLLSS_MMR_LOCK Register Field Descriptions

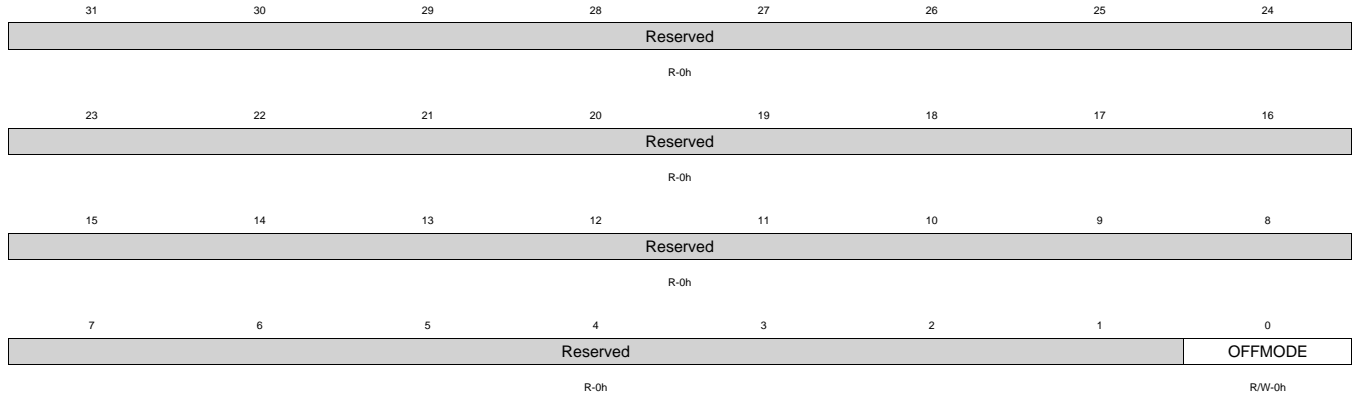

Bit	Field	Type	Reset	Description
31-0	MMR_LOCK	R/W	1F125B64h	Lock/Unlock register for region 0x0008 - 0x0FFF 517622845 = UNLOCKED : All writes to 0x0008 - 0x0FFF is allowed. 521296740 = LOCKED : All writes to 0x0008 - 0x0FFF is blocked.

2.10.1.5 MPUPLL_PWRCTRL Register (offset = 48h) [reset = 0h]

MPUPLL_PWRCTRL is shown in [Figure 2-31](#) and described in [Table 2-47](#).

The MPU PLL Power Control register is used to control the power state of the MPU _PLL.

Figure 2-31. MPUPLL_PWRCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-47. MPUPLL_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

2.10.1.6 MPUPLL_CLKCTRL Register (offset = 4Ch) [reset = 91E818h]

MPUPLL_CLKCTRL is shown in [Figure 2-32](#) and described in [Table 2-48](#).

The MPU PLL Clock Control register is used to control the different clock control state of the MPU_PLL

Figure 2-32. MPUPLL_CLKCTRL Register

Table 2-48. MPUPLL_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLES_LIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	Reserved	R	0h	
28-24	NWELLTRIM	R/W	0h	Trim values for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low power
22	Reserved	R	0h	
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0: synchronously disables CLKOUT 0x1: synchronously enables CLKOUT
19	Reserved	R	0h	
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0: When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 0x1: When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0: Asynchronous power down for M2 divider 0x1: M2 divider is functional

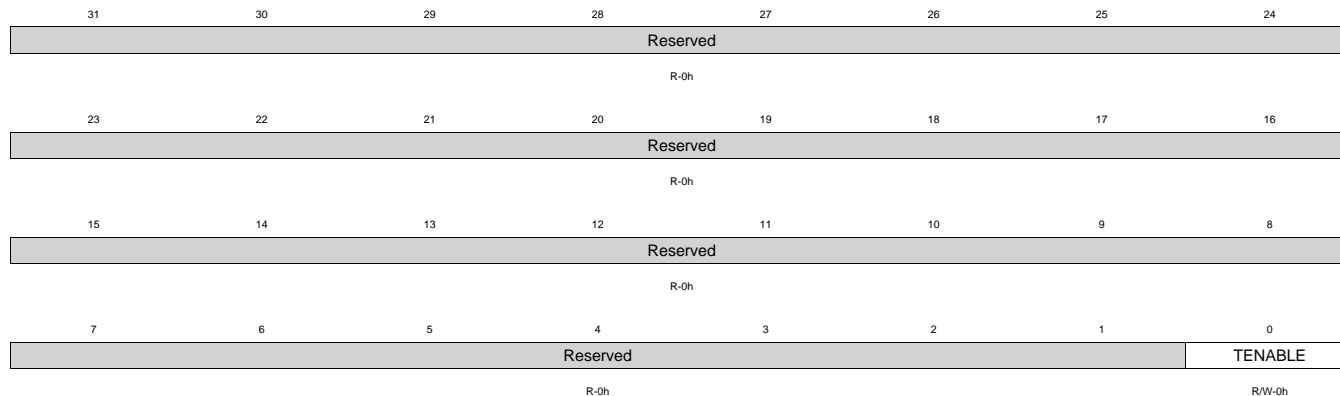

Table 2-48. MPUPLL_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15	M3PWDNZ	R/W	1h	M3 divider power down mode 0x0 : Asynchronous power down for M3 divider 0x1 : M3 divider is functional
14	STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	LOWCURRSTDBY	R/W	1h	When in Lossclk/Stbyret/Idle 0x0 : Fast relock 0x1 : Slow relock
12	LPMODE	R/W	0h	Can be set to 1 in cases with CLKINP/(N+1) less than or equal 1MHz and CLKINP*M/(N+1) less than or equal 100MHz
11	DRIFTGUARDEN	R/W	1h	When RECAL status flag is asserted.1 Enables recalibration
10	REGM4XEN	R/W	0h	Enable REGM*4 (Active High). Can be set to 1 only for CLKOUT*M2 greater than 150MHz when LPMODE = 0 and CLKOUT*M2 greater than 60MHz when LPMODE = 1 . This bit should not be changed on the fly in locked condition. INITIALIZATION should follow change of this bit.
9	Reserved	R	0h	
8	RELAXED_LOCK	R/W	0h	Decides when FREQLOCK asserted 0x0 : FREQLOCK asserted when DC frequency error less than 1% 0x1 : FREQLOCK asserted when DC frequency error less than 2%
7-1	Reserved	R	Ch	
0	TINITZ	R/W	0h	PLL core soft reset

2.10.1.7 MPUPLL_TENABLE Register (offset = 50h) [reset = 0h]

MPUPLL_TENABLE is shown in [Figure 2-33](#) and described in [Table 2-49](#).

The MPU PLL TENABLE register is used to load the M, N dividers of MPU_PLL

Figure 2-33. MPUPLL_TENABLE Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-49. MPUPLL_TENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLE	R/W	0h	M, N latch (active rise edge)

2.10.1.8 MPUPLL_TENABLEDIV Register (offset = 54h) [reset = 0h]

MPUPLL_TENABLEDIV is shown in [Figure 2-34](#) and described in [Table 2-50](#).

The MPU PLL TENABLEDIV register is used to load the M2,N2 dividers of MPU_PLL

Figure 2-34. MPUPLL_TENABLEDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-50. MPUPLL_TENABLEDIV Register Field Descriptions

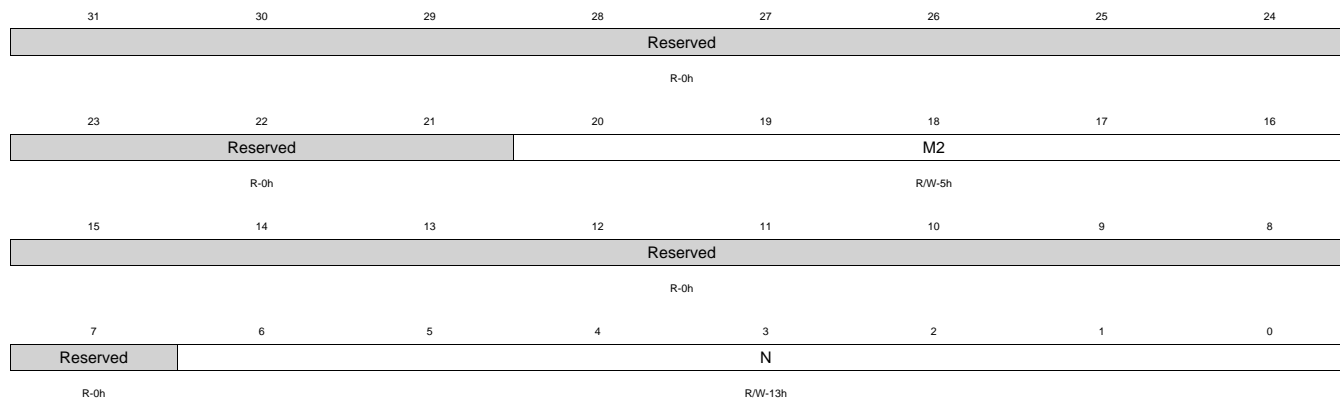

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLEDIV	R/W	0h	M2 and N2 latch (active rise edge)

2.10.1.9 MPUPLL_M2NDIV Register (offset = 58h) [reset = 50013h]

MPUPLL_M2NDIV is shown in [Figure 2-35](#) and described in [Table 2-51](#).

MPU PLL M2NDIV register is for programming M2 and N values of MPU _PLL

Figure 2-35. MPUPLL_M2NDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-51. MPUPLL_M2NDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	Reserved	R	0h	
20-16	M2	R/W	5h	Post-divider is REGM2
15-7	Reserved	R	0h	
6-0	N	R/W	13h	Pre-divider is REGN+1

2.10.1.10 MPUPLL_MN2DIV Register (offset = 5Ch) [reset = 1F4h]

 MPUPLL_MN2DIV is shown in [Figure 2-36](#) and described in [Table 2-52](#).

MPU PLL MN2DIV register is for programming M and N2 values of MPU _PLL

Figure 2-36. MPUPLL_MN2DIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

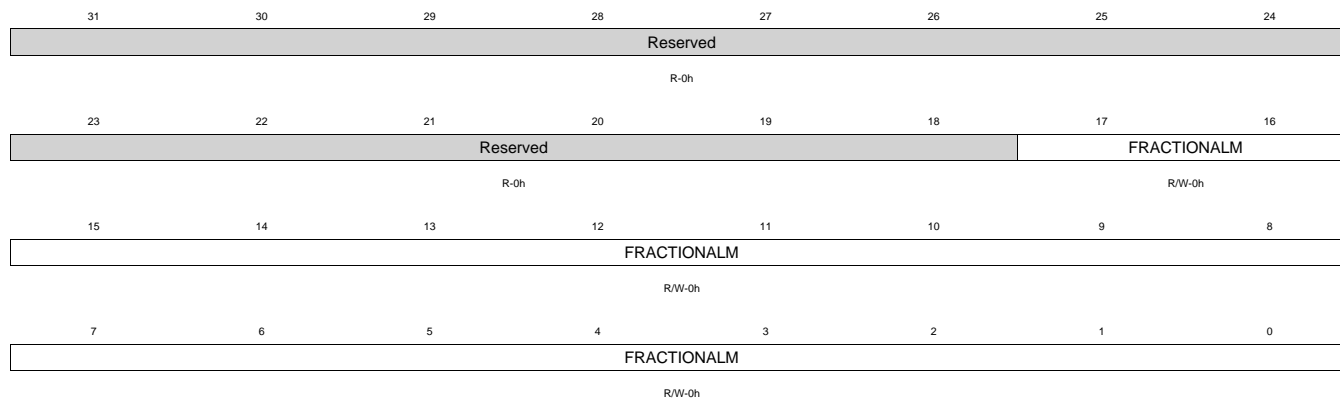

Table 2-52. MPUPLL_MN2DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	Reserved	R	0h	
20-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	Reserved	R	0h	
11-0	M	R/W	1F4h	Feedback multiplier is REGM

2.10.1.11 MPUPLL_FRACDIV Register (offset = 60h) [reset = 0h]

MPUPLL_FRACDIV is shown in [Figure 2-37](#) and described in [Table 2-53](#).

The MPU PLL FRACDIV register is for controlling the fractional values of MPU_PLL

Figure 2-37. MPUPLL_FRACDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-53. MPUPLL_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

2.10.1.12 MPUPLL_BWCTRL Register (offset = 64h) [reset = 0h]

MPUPLL_BWCTRL is shown in [Figure 2-38](#) and described in [Table 2-54](#).

The MPU PLL_BWCTRL register is for controlling the loop bandwidth of MPU _PLL

Figure 2-38. MPUPLL_BWCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-54. MPUPLL_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	Reserved	R	0h	

2.10.1.13 MPUPLL_FRACCTRL Register (offset = 68h) [reset = 0h]

MPUPLL_FRACCTRL is shown in [Figure 2-39](#) and described in [Table 2-55](#).

Controls the fractional portion of Modena PLL

Figure 2-39. MPUPLL_FRACCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-55. MPUPLL_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20	Reserved	R	0h	
19-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control.
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

2.10.1.14 MPUPLL_STATUS Register (offset = 6Ch) [reset = 121h]

MPUPLL_STATUS is shown in [Figure 2-40](#) and described in [Table 2-56](#).

The MPU PLL Status register is for viewing the status of the MPU PLL.

Figure 2-40. MPUPLL_STATUS Register

31	30	29	28	27	26	25	24
Reserved	SSACK	LDOPWDN	RECAL_BSTATUS3	RECAL_OPPIN	Reserved		
R-0h	R-0h	R-0h	R-0h	R-0h	R-0h		
23	22	21	20	19	18	17	16
Reserved							
R-0h							
15	14	13	12	11	10	9	8

R-0h					R-0h	R-0h	R-1h
7	6	5	4	3	2	1	0
STBYRETACK	LOSSREF	CLKOUTENACK	LOCK2	M2CHANGEACK	LIMP	HIGHJITTER	BYPASS
R-0h	R-0h	R-1h	R-0h	R-0h	R-0h	R-0h	R-1h

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-56. MPUPLL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	Reserved	R	0h	
30	SSACK	R	0h	PODPLL_MPU_SSACK
29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition.
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 (ADPLLLJ requires recalibration)
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 (ADPLLLJ requires recalibration)
26-11	Reserved	R	0h	
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0: indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the relck process. 0x1: indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	Indicates the enable/disable condition of CLKOUTEN 0x0 = CLKOUT gating completed 0x1 = CLKOUT enabling completed
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	Acknowledge for change to M2 divider. Toggles from 1-0 or 0-1 (depending on current value) once CLKOUT frequency change has completed.
2	LIMP	R	0h	0x1 In LIMP mode 0x0 In Stop Mode
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.

Table 2-56. MPUPLL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

2.10.1.15 MPUPLL_M3DIV Register (offset = 70h) [reset = 1h]

MPUPLL_M3DIV is shown in [Figure 2-41](#) and described in [Table 2-57](#).

The MPU PLL_M3DIV register is for controlling the M3 divider of MPU_PLL

Figure 2-41. MPUPLL_M3DIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

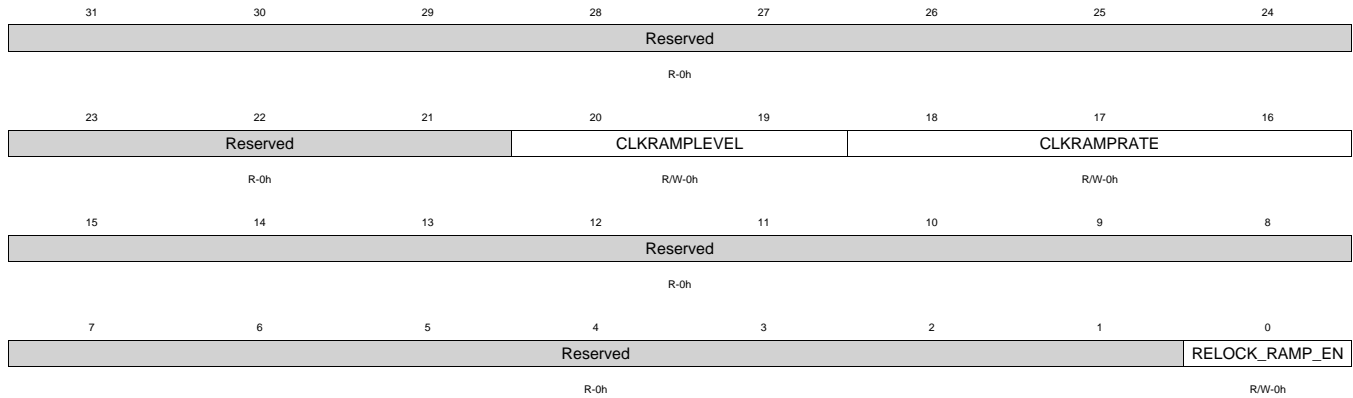

Table 2-57. MPUPLL_M3DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	Reserved	R	0h	
4-0	M3	R/W	1h	Post Divider Reg M3

2.10.1.16 MPUPLL_RAMPCTRL Register (offset = 74h) [reset = 0h]

 MPUPLL_RAMPCTRL is shown in [Figure 2-42](#) and described in [Table 2-58](#).

The MPUPLL_RAMPCTRL register is for controlling the ramping of MPU_PLL

Figure 2-42. MPUPLL_RAMPCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-58. MPUPLL_RAMPCTRL Register Field Descriptions

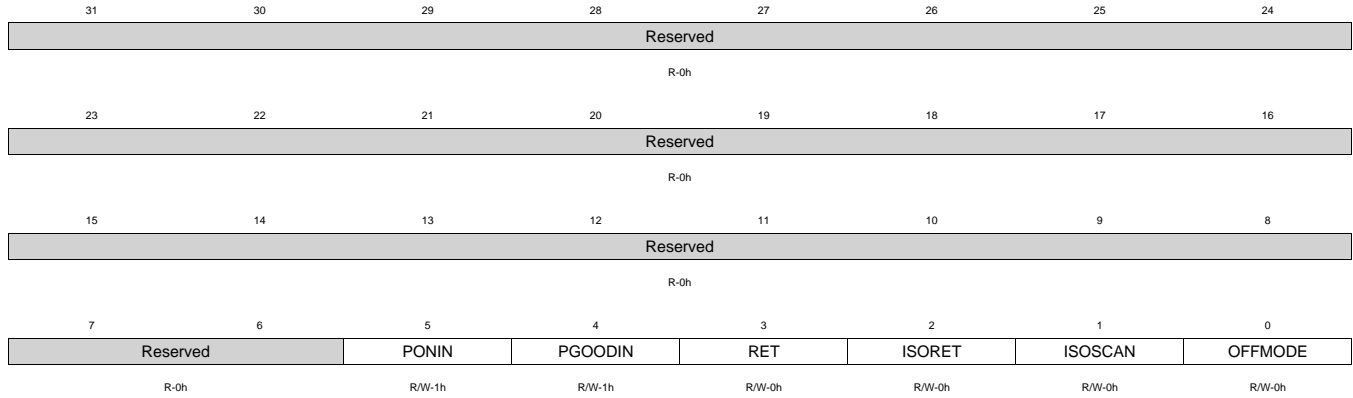

Bit	Field	Type	Reset	Description
31-21	Reserved	R	0h	
20-19	CLKRAMPLEVEL	R/W	0h	Controls the ramp sequence. 0x0 = 00 : No ramping 0x1 = 01 : Bypass clk /Fout/8 / Fout/4 / Fout/2 / Fout 0x2 = 10 : Bypass clk / Fout/4 / Fout/2 /Fout/1.5/Fout 0x3 = 11 : Reserved
18-16	CLKRAMPRATE	R/W	0h	Controls the time spent on each ramp step 0x0 = 000 : 2 REFCLKs 0x1 = 001 : 4 REFCLKs 0x2 = 010 : 8 REFCLKs 0x3 = 011 : 16 REFCLKs 0x4 = 100 : 32 REFCLKs 0x5 = 101 : 64 REFCLKs 0x6 = 110 : 128 REFCLKs 0x7 = 111 : 512 REFCLKs
15-1	Reserved	R	0h	
0	RELOCK_RAMP_EN	R/W	0h	0 Clock ramping happens only during initial lock as controlled by CLKRAMPLEVEL bits. No clock ramping during relock 1 Clock ramping happens both during initial lock and relock

2.10.1.17 DSPPLL_PWRCTRL Register (offset = 80h) [reset = 30h]

DSPPLL_PWRCTRL is shown in [Figure 2-43](#) and described in [Table 2-59](#).

The PLL Power Control register is used to control the power state of the respective PLL.

Figure 2-43. DSPPLL_PWRCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-59. DSPPLL_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins. For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

2.10.1.18 DSPPLL_CLKCTRL Register (offset = 84h) [reset = 914824h]

DSPPLL_CLKCTRL is shown in [Figure 2-44](#) and described in [Table 2-60](#).

The PLL Clock Control register is used to control the different clock control state of the respective PLL

Figure 2-44. DSPPLL_CLKCTRL Register

7-1	Reserved	R	12h	
0	TINITZ	R/W	0h	PLL core soft reset

2.10.1.19 DSPPLL_TENABLE Register (offset = 88h) [reset = 0h]

DSPPLL_TENABLE is shown in [Figure 2-45](#) and described in [Table 2-61](#).

Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.

Figure 2-45. DSPPLL_TENABLE Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-61. DSPPLL_TENABLE Register Field Descriptions

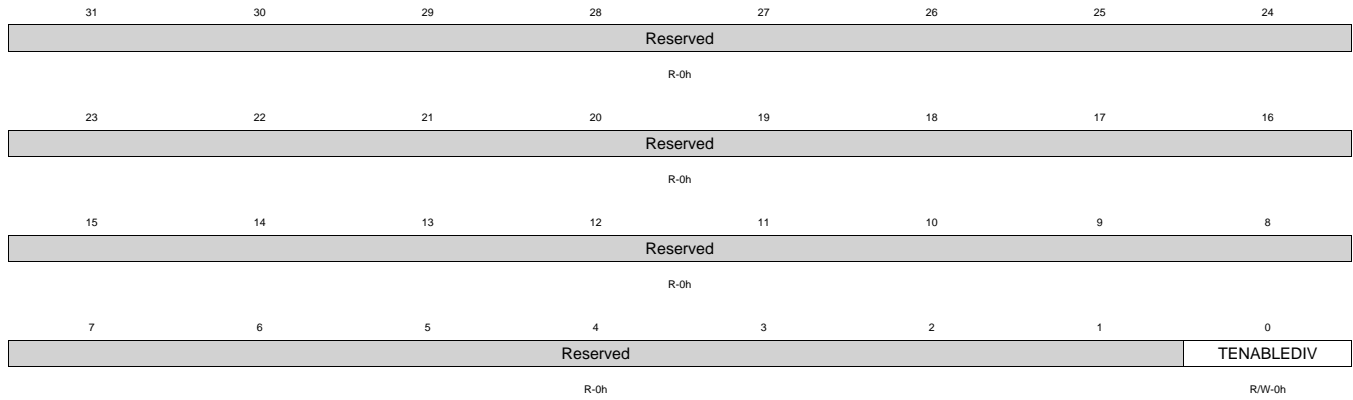

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLE	R/W	0h	M, N, SD and SELFREQDCO latch (active rise edge)

2.10.1.20 DSPPLL_TENABLEDIV Register (offset = 8Ch) [reset = 0h]

DSPPLL_TENABLEDIV is shown in [Figure 2-46](#) and described in [Table 2-62](#).

The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL

Figure 2-46. DSPPLL_TENABLEDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

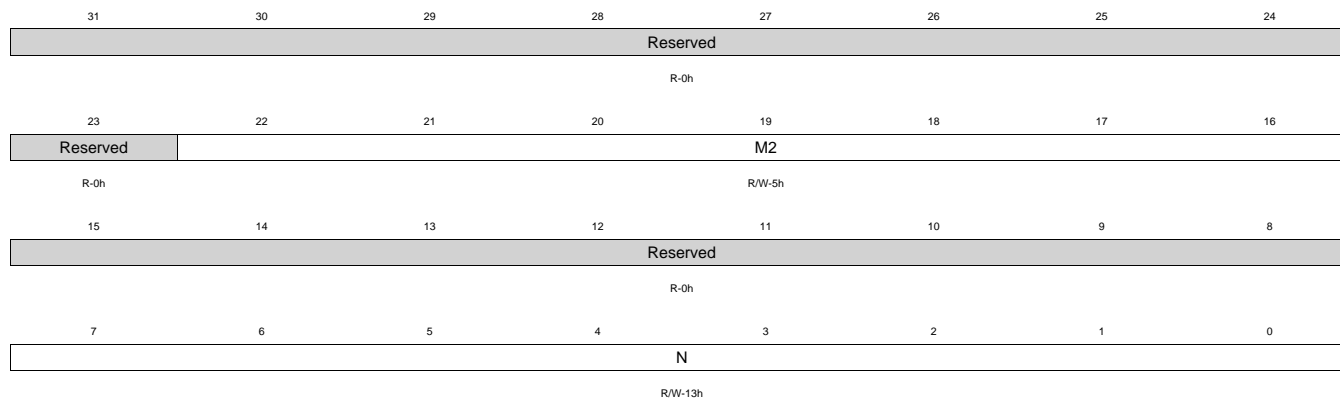

Table 2-62. DSPPLL_TENABLEDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLEDIV	R/W	0h	M2 and N2 latch (active rise edge)

2.10.1.21 DSPPLL_M2NDIV Register (offset = 90h) [reset = 50013h]

DSPPLL_M2NDIV is shown in [Figure 2-47](#) and described in [Table 2-63](#).

PLL M2NDIV register is for programming M2 and N values of respective PLL

Figure 2-47. DSPPLL_M2NDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-63. DSPPLL_M2NDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	Reserved	R	0h	
22-16	M2	R/W	5h	Post-divider is REGM2
15-8	Reserved	R	0h	
7-0	N	R/W	13h	Pre-divider is REGN+1

2.10.1.22 DSPPLL_MN2DIV Register (offset = 94h) [reset = 174h]

DSPPLL_MN2DIV is shown in [Figure 2-48](#) and described in [Table 2-64](#).

PLL MN2DIV register is for programming M and N2 values of respective PLL

Figure 2-48. DSPPLL_MN2DIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-64. DSPPLL_MN2DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	Reserved	R	0h	
11-0	M	R/W	174h	Feedback multiplier is REGM

2.10.1.23 DSPPLL_FRACDIV Register (offset = 98h) [reset = 800000h]

DSPPLL_FRACDIV is shown in [Figure 2-49](#) and described in [Table 2-65](#).

The PLL FRACDIV register is for controlling the fractional values of respective PLL

Figure 2-49. DSPPLL_FRACDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

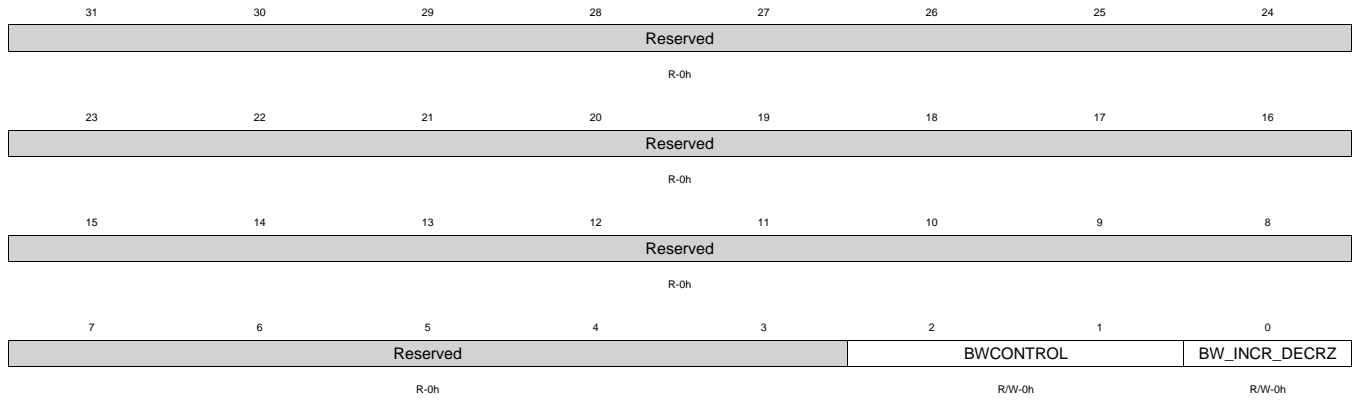

Table 2-65. DSPPLL_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING}([DPLL_MULT/(DPLL_DIV+1)] * CLKINP / 250)$, where CLKINP is the input clock of the DPLL in MHz). Must be set with M and N factors, and must not be changed once DPLL is locked.
23-18	Reserved	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

2.10.1.24 DSPPLL_BWCTRL Register (offset = 9Ch) [reset = 0h]

DSPPLL_BWCTRL is shown in [Figure 2-50](#) and described in [Table 2-66](#).

The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL

Figure 2-50. DSPPLL_BWCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-66. DSPPLL_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0 : decrease BW 0x1 : increase BW

2.10.1.25 DSPPLL_FRACCTRL Register (offset = A0h) [reset = 0h]

 DSPPLL_FRACCTRL is shown in [Figure 2-51](#) and described in [Table 2-67](#).

Controls the fractional portion of respective ADPLLJ.

Figure 2-51. DSPPLL_FRACCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-67. DSPPLL_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control.
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

2.10.1.26 DSPPLL_STATUS Register (offset = A4h) [reset = C000121h]

DSPPLL_STATUS is shown in [Figure 2-52](#) and described in [Table 2-68](#).

The PLL Status register is for viewing the status of the respective PLL.

Figure 2-52. DSPPLL_STATUS Register

31	30	29	28	27	26	25	24
PONOUT	PGOODOUT	LDOPWDN	RECAL_BSTATUS3	RECAL_OPPIN	Reserved

R-0h	R-0h	R-1h	R-0h	R-0h	R-0h	R-0h	R-1h

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-68. DSPPLL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition.
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 (ADPLLLJ requires recalibration)
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 (ADPLLLJ requires recalibration)
26-11	Reserved	R	0h	
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0: indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the relock process. 0x1: indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	Indicates the enable/disable condition of CLKOUTEN 0x0 = CLKOUT gating completed 0x1 = CLKOUT enabling completed
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	Acknowledge for change to M2 divider. Toggles from 1-0 or 0-1 (depending on current value) once CLKOUT frequency change has completed.

Table 2-68. DSPPLL_STATUS Register Field Descriptions (continued)

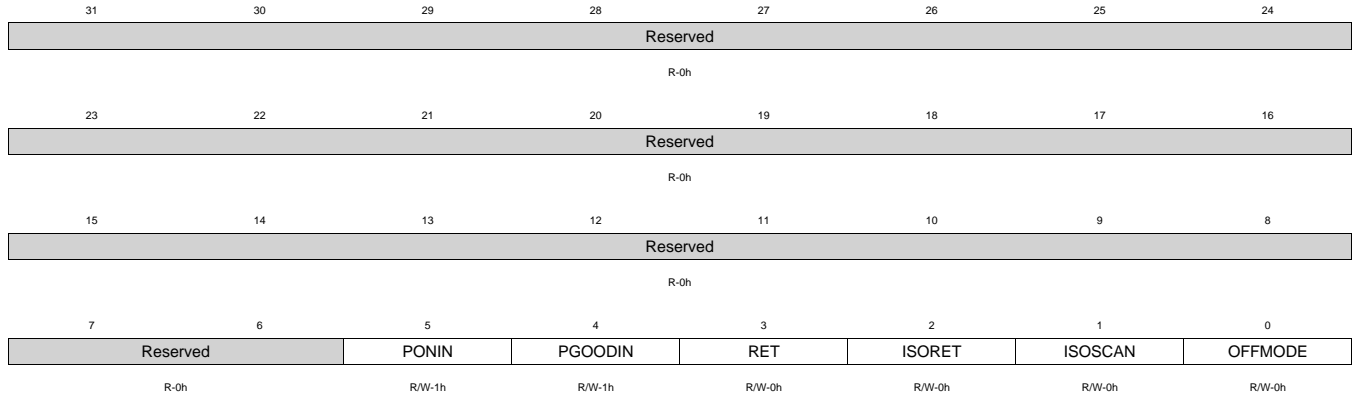

Bit	Field	Type	Reset	Description
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

2.10.1.27 SGXPLLL_PWRCTRL Register (offset = B0h) [reset = 30h]

SGXPLLL_PWRCTRL is shown in [Figure 2-53](#) and described in [Table 2-69](#).

The PLL Power Control register is used to control the power state of the respective PLL.

Figure 2-53. SGXPLLL_PWRCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-69. SGXPLLL_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

2.10.1.28 SGXPLL_CLKCTRL Register (offset = B4h) [reset = 914824h]

SGXPLL_CLKCTRL is shown in [Figure 2-54](#) and described in [Table 2-70](#).

The PLL Clock Control register is used to control the different clock control state of the respective PLL

Figure 2-54. SGXPLL_CLKCTRL Register

31	30	29	28	27	26	25	24
CYCLES_LIPEN	ENSSC	CLKDCOLDOEN	NWELLTRIM

R/W-1h	R/W-0h	R/W-0h	R/W-1h	R-0h	R/W-0h	R/W-0h	R/W-1h
15	14	13	12	11	10	9	8
Reserved	STOPMODE	Reserved	SELFREQDCO			Reserved	RELAXED_LOCK
R-0h	R/W-1h	R-0h	R/W-2h		R-0h	R/W-0h	
7	6	5	4	3	2	1	0
Reserved							TINITZ
R-12h							R/W-0h

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-70. SGXPLL_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLES_LIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	NWELLTRIM	R/W	0h	Trim values for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low power
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO

Table 2-70. SGXPLL_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0 : When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 1x1 : When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0 : Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	Reserved	R	0h	
14	STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	Reserved	R	0h	
12-10	SELFREQDCO	R/W	2h	DCO Clock (DCOCLK = CLKINP * [M/(N+1)]) frequency range selector. 0x0 : Reserved 0x2 : HS2 : DCOCLK range is from 500 MHz to 1000 MHz 0x3 : Reserved 0x4 : HS1 : DCOCLK range is from 1000 MHz to 2000 MHz 0x5 : Reserved
9	Reserved	R	0h	
8	RELAXED_LOCK	R/W	0h	Decides when FREQLOCK asserted 0x0 : FREQLOCK asserted when DC frequency error less than 1% 0x1 : FREQLOCK asserted when DC frequency error less than 2%
7-1	Reserved	R	12h	
0	TINITZ	R/W	0h	PLL core soft reset

2.10.1.29 SGXPLLL_TENABLE Register (offset = B8h) [reset = 0h]

SGXPLLL_TENABLE is shown in [Figure 2-55](#) and described in [Table 2-71](#).

Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.

Figure 2-55. SGXPLLL_TENABLE Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-71. SGXPLLL_TENABLE Register Field Descriptions

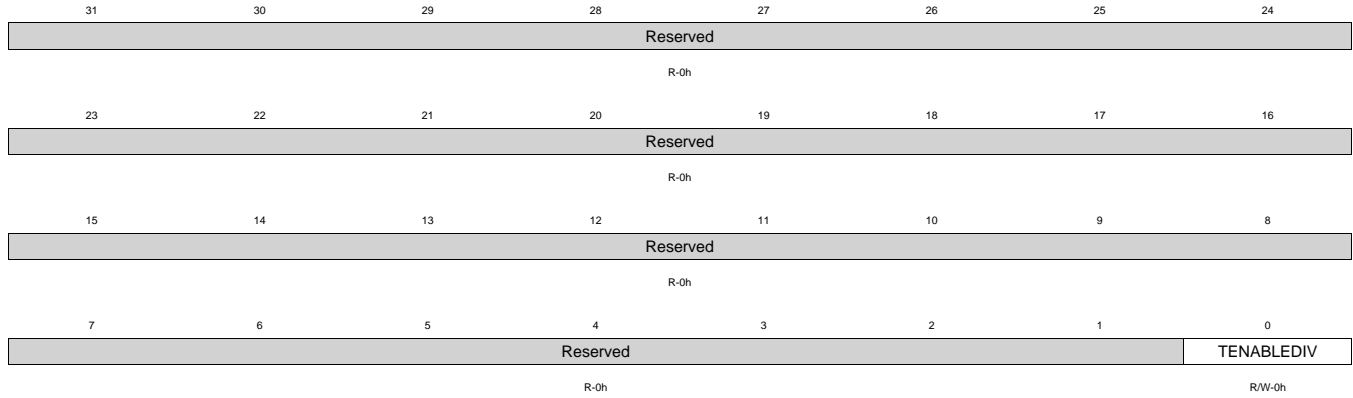

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLE	R/W	0h	M, N, SD and SELFREQDCO latch (active rise edge)

2.10.1.30 SGXPLL_TENABLEDIV Register (offset = BCh) [reset = 0h]

SGXPLL_TENABLEDIV is shown in [Figure 2-56](#) and described in [Table 2-72](#).

The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL

Figure 2-56. SGXPLL_TENABLEDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-72. SGXPLL_TENABLEDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLEDIV	R/W	0h	M2 and N2 latch (active rise edge)

2.10.1.31 SGXPLL_M2NDIV Register (offset = C0h) [reset = 50013h]

SGXPLL_M2NDIV is shown in [Figure 2-57](#) and described in [Table 2-73](#).

PLL M2NDIV register is for programming M2 and N values of respective PLL

Figure 2-57. SGXPLL_M2NDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-73. SGXPLL_M2NDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	Reserved	R	0h	
22-16	M2	R/W	5h	Post-divider is REGM2
15-8	Reserved	R	0h	
7-0	N	R/W	13h	Pre-divider is REGN+1

2.10.1.32 SGXPLL_MN2DIV Register (offset = C4h) [reset = 174h]

SGXPLL_MN2DIV is shown in [Figure 2-58](#) and described in [Table 2-74](#).

PLL MN2DIV register is for programming M and N2 values of respective PLL

Figure 2-58. SGXPLL_MN2DIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

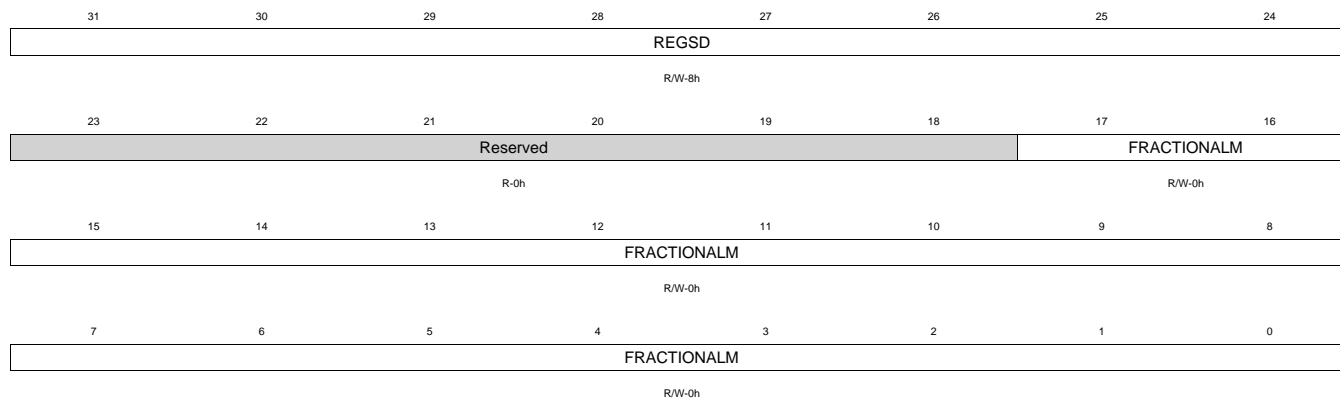

Table 2-74. SGXPLL_MN2DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	Reserved	R	0h	
11-0	M	R/W	174h	Feedback multiplier is REGM

2.10.1.33 SGXPLL_FRACDIV Register (offset = C8h) [reset = 800000h]

 SGXPLL_FRACDIV is shown in [Figure 2-59](#) and described in [Table 2-75](#).

The PLL FRACDIV register is for controlling the fractional values of respective PLL

Figure 2-59. SGXPLL_FRACDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-75. SGXPLL_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING}([DPLL_MULT/(DPLL_DIV+1)] * CLKINP / 250)$, where CLKINP is the input clock of the DPLL in MHz). Must be set with M and N factors, and must not be changed once DPLL is locked.
23-18	Reserved	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

2.10.1.34 SGXPLL_BWCTRL Register (offset = CCh) [reset = 0h]

SGXPLL_BWCTRL is shown in [Figure 2-60](#) and described in [Table 2-76](#).

The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL

Figure 2-60. SGXPLL_BWCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-76. SGXPLL_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0: decrease BW 0x1: increase BW

2.10.1.35 SGXPLL_FRACCTRL Register (offset = D0h) [reset = 0h]

 SGXPLL_FRACCTRL is shown in [Figure 2-61](#) and described in [Table 2-77](#).

Controls the fractional portion of respective ADPLLLJ.

Figure 2-61. SGXPLL_FRACCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-77. SGXPLL_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0: enables both side frequency spread about the programmed frequency. 0x1: enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control.
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

2.10.1.36 SGXPLL_STATUS Register (offset = D4h) [reset = C000121h]

 SGXPLL_STATUS is shown in [Figure 2-62](#) and described in [Table 2-78](#).

The PLL Status register is for viewing the status of the respective PLL.

Figure 2-62. SGXPLL_STATUS Register

31	30	29	28	27	26	25	24

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-78. SGXPLL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition.
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration)
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration)
26-11	Reserved	R	0h	
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0 : indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the reload process. 0x1 : indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	1/0 indicates enable/disable condition of CLKOUTEN
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	acknowledge for M2 change

Table 2-78. SGXPLL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

2.10.1.37 HDVICPPLL_PWRCTRL Register (offset = E0h) [reset = 30h]

HDVICPPLL_PWRCTRL is shown in [Figure 2-63](#) and described in [Table 2-79](#).

The PLL Power Control register is used to control the power state of the respective PLL.

Figure 2-63. HDVICPPLL_PWRCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-79. HDVICPPLL_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

2.10.1.38 HDVICPPLL_CLKCTRL Register (offset = E4h) [reset = 914824h]

HDVICPPLL_CLKCTRL is shown in [Figure 2-64](#) and described in [Table 2-80](#).

The PLL Clock Control register is used to control the different clock control state of the respective PLL

Table 2-80. HDVICPPLL_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLES_LIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	NWELLTRIM	R/W	0h	Trim values for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low power
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that dont have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO

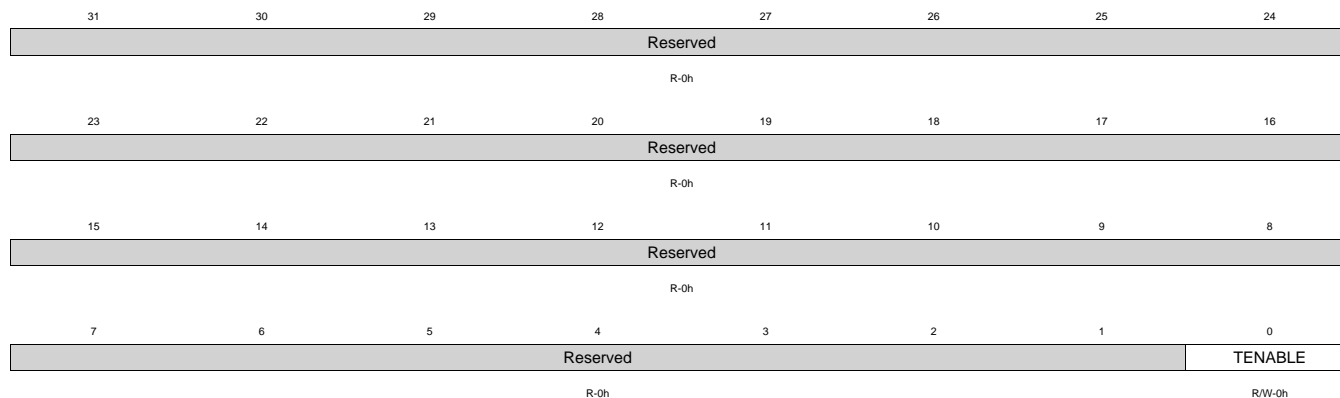

Table 2-80. HDVICPLL_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0 : When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 0x1 : When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0 : Asynchronous power down for M2 divider 0x1 : M2 divider is functional

31-1	Reserved	R	0h	
0	TENABLE	R/W	0h	M, N, SD and SELFREQDCO latch (active rise edge)

2.10.1.40 HDVICPPLL_TENABLEDIV Register (offset = ECh) [reset = 0h]

HDVICPPLL_TENABLEDIV is shown in [Figure 2-66](#) and described in [Table 2-82](#).

The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL

Figure 2-66. HDVICPPLL_TENABLEDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

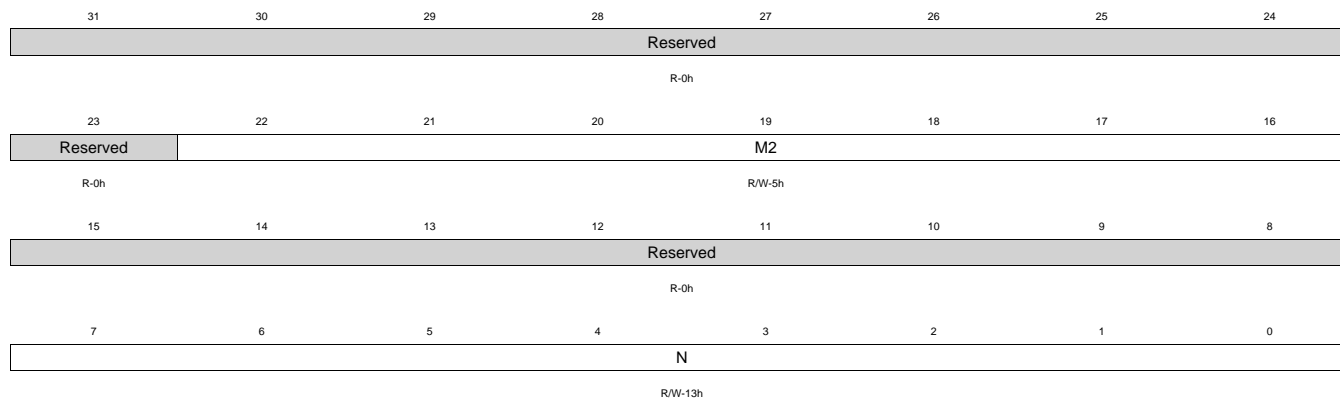

Table 2-82. HDVICPPLL_TENABLEDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLEDIV	R/W	0h	M2 and N2 latch (active rise edge)

2.10.1.41 HDVICPPLL_M2NDIV Register (offset = F0h) [reset = 50013h]

HDVICPPLL_M2NDIV is shown in [Figure 2-67](#) and described in [Table 2-83](#).

PLL M2NDIV register is for programming M2 and N values of respective PLL

Figure 2-67. HDVICPPLL_M2NDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-83. HDVICPPLL_M2NDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	Reserved	R	0h	
22-16	M2	R/W	5h	Post-divider is REGM2
15-8	Reserved	R	0h	
7-0	N	R/W	13h	Pre-divider is REGN+1

2.10.1.42 HDVICPPLL_MN2DIV Register (offset = F4h) [reset = 174h]

 HDVICPPLL_MN2DIV is shown in [Figure 2-68](#) and described in [Table 2-84](#).

PLL MN2DIV register is for programming M and N2 values of respective PLL

Figure 2-68. HDVICPPLL_MN2DIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-84. HDVICPPLL_MN2DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	Reserved	R	0h	
11-0	M	R/W	174h	Feedback multiplier is REGM

2.10.1.43 HDVICPPLL_FRACDIV Register (offset = F8h) [reset = 800000h]

HDVICPPLL_FRACDIV is shown in [Figure 2-69](#) and described in [Table 2-85](#).

The PLL FRACDIV register is for controlling the fractional values of respective PLL

Figure 2-69. HDVICPPLL_FRACDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-85. HDVICPPLL_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING} ([DPLL_MULT/(DPLL_DIV+1)] * CLKINP / 250)$, where CLKINP is the input clock of the DPLL in MHz). Must be set with M and N factors, and must not be changed once DPLL is locked.
23-18	Reserved	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

2.10.1.44 HDVICPPLL_BWCTRL Register (offset = FCh) [reset = 0h]

HDVICPPLL_BWCTRL is shown in [Figure 2-70](#) and described in [Table 2-86](#).

The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL

Figure 2-70. HDVICPPLL_BWCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-86. HDVICPPLL_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0 : decrease BW 0x1 : increase BW

2.10.1.45 HDVICPPLL_FRACCTRL Register (offset = 100h) [reset = 0h]

HDVICPPLL_FRACCTRL is shown in [Figure 2-71](#) and described in [Table 2-87](#).

Controls the fractional portion of respective ADPLLLJ.

Figure 2-71. HDVICPPLL_FRACCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-87. HDVICPPLL_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control.
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

2.10.1.46 HDVICPPLL_STATUS Register (offset = 104h) [reset = C000121h]

 HDVICPPLL_STATUS is shown in [Figure 2-72](#) and described in [Table 2-88](#).

The PLL Status register is for viewing the status of the respective PLL.

Figure 2-72. HDVICPPLL_STATUS Register

31	30	29	28	27	26	25	24

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-88. HDVICPPLL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition.
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 (ADPLLLJ requires recalibration)
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 (ADPLLLJ requires recalibration)
26-11	Reserved	R	0h	
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0 : indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the reload process. 0x1 : indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	1/0 indicates enable/disable condition of CLKOUTEN
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	acknowledge for M2 change

Table 2-88. HDVICPLL_STATUS Register Field Descriptions (continued)

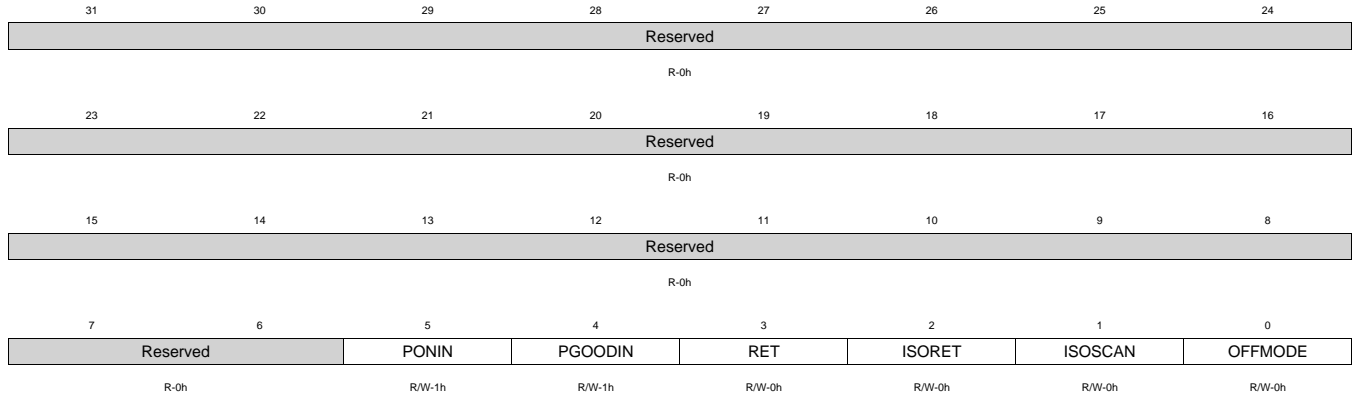

Bit	Field	Type	Reset	Description
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

2.10.1.47 L3PLL_PWRCTRL Register (offset = 110h) [reset = 30h]

L3PLL_PWRCTRL is shown in [Figure 2-73](#) and described in [Table 2-89](#).

The PLL Power Control register is used to control the power state of the respective PLL.

Figure 2-73. L3PLL_PWRCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-89. L3PLL_PWRCTRL Register Field Descriptions

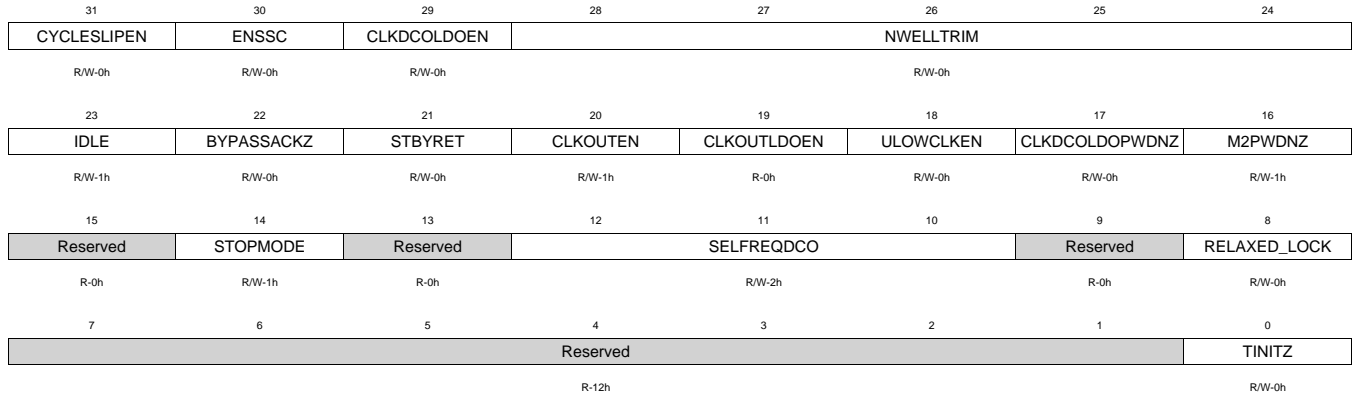

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

2.10.1.48 L3PLL_CLKCTRL Register (offset = 114h) [reset = 914824h]

L3PLL_CLKCTRL is shown in [Figure 2-74](#) and described in [Table 2-90](#).

The PLL Clock Control register is used to control the different clock control state of the respective PLL

Figure 2-74. L3PLL_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-90. L3PLL_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLES_LIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	N_WELLTRIM	R/W	0h	Trim values for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low power
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO

Table 2-90. L3PLL_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0 : When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 0x1 : When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.

15-8	Reserved	R	0h	
7-0	N	R/W	13h	Pre-divider is REGN+1

2.10.1.52 L3PLL_MN2DIV Register (offset = 124h) [reset = 174h]

L3PLL_MN2DIV is shown in [Figure 2-78](#) and described in [Table 2-94](#).

PLL MN2DIV register is for programming M and N2 values of respective PLL

Figure 2-78. L3PLL_MN2DIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

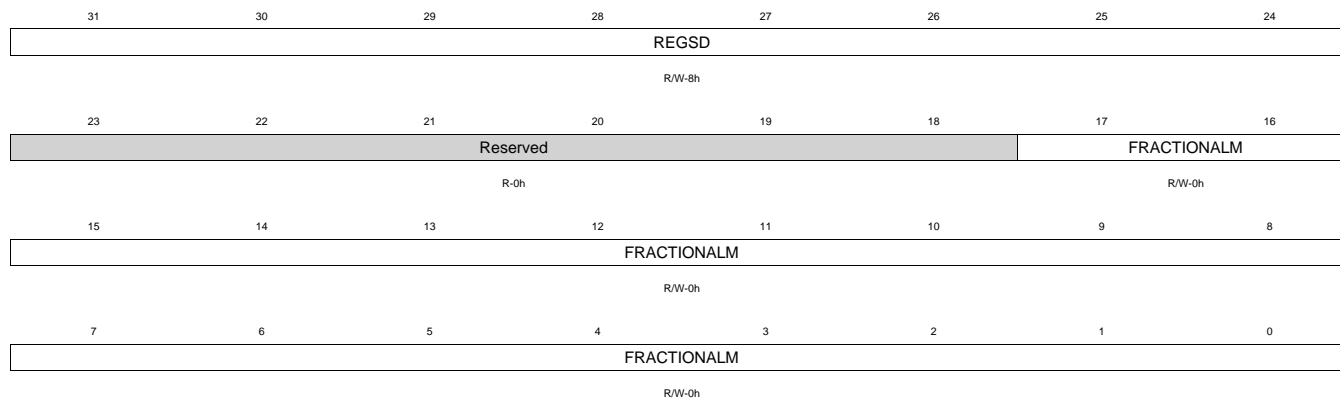

Table 2-94. L3PLL_MN2DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	Reserved	R	0h	
11-0	M	R/W	174h	Feedback multiplier is REGM

2.10.1.53 L3PLL_FRACDIV Register (offset = 128h) [reset = 800000h]

L3PLL_FRACDIV is shown in [Figure 2-79](#) and described in [Table 2-95](#).

The PLL FRACDIV register is for controlling the fractional values of respective PLL

Figure 2-79. L3PLL_FRACDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-95. L3PLL_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING}([DPLL_MULT/(DPLL_DIV+1)] * CLKINP / 250)$, where CLKINP is the input clock of the DPLL in MHz). Must be set with M and N factors, and must not be changed once DPLL is locked.
23-18	Reserved	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

2.10.1.54 L3PLL_BWCTRL Register (offset = 12Ch) [reset = 0h]

L3PLL_BWCTRL is shown in [Figure 2-80](#) and described in [Table 2-96](#).

The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL

Figure 2-80. L3PLL_BWCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-96. L3PLL_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0 : decrease BW 0x1 : increase BW

2.10.1.55 L3PLL_FRACCTRL Register (offset = 130h) [reset = 0h]

L3PLL_FRACCTRL is shown in [Figure 2-81](#) and described in [Table 2-97](#).

Controls the fractional portion of respective ADPLLJ.

Figure 2-81. L3PLL_FRACCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-97. L3PLL_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control.
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

2.10.1.56 L3PLL_STATUS Register (offset = 134h) [reset = C000121h]

L3PLL_STATUS is shown in [Figure 2-82](#) and described in [Table 2-98](#).

The PLL Status register is for viewing the status of the respective PLL.

Figure 2-82. L3PLL_STATUS Register

29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition.
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration)
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration)
26-11	Reserved	R	0h	
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0 : indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the reload process. 0x1 : indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	1/0 indicates enable/disable condition of CLKOUTEN
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	acknowledge for M2 change

Table 2-98. L3PLL_STATUS Register Field Descriptions (continued)

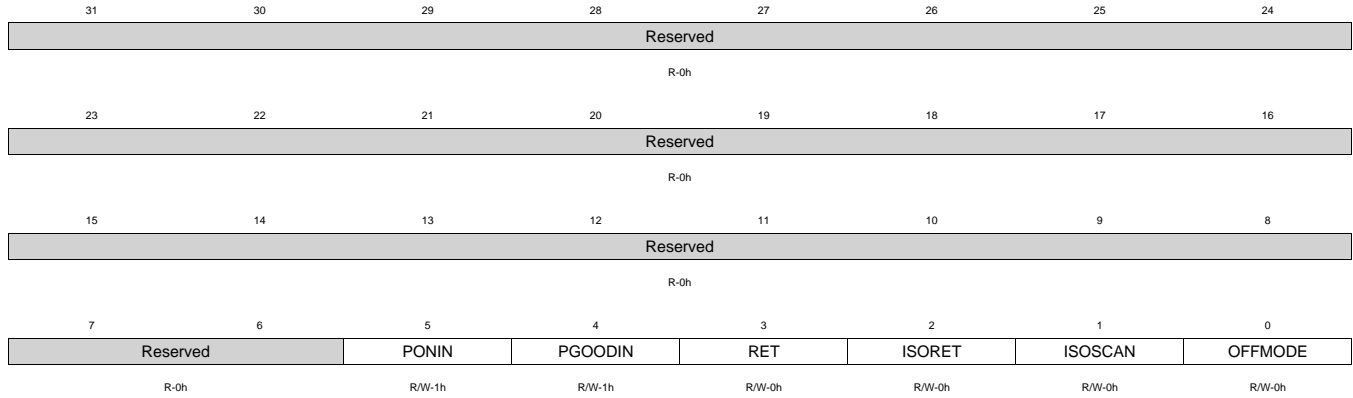

Bit	Field	Type	Reset	Description
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

2.10.1.57 ISPPLL_PWRCTRL Register (offset = 140h) [reset = 30h]

ISPPLL_PWRCTRL is shown in [Figure 2-83](#) and described in [Table 2-99](#).

The PLL Power Control register is used to control the power state of the respective PLL.

Figure 2-83. ISPPLL_PWRCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-99. ISPPLL_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

2.10.1.58 ISPPLL_CLKCTRL Register (offset = 144h) [reset = 914824h]

ISPPLL_CLKCTRL is shown in [Figure 2-84](#) and described in [Table 2-100](#).

The PLL Clock Control register is used to control the different clock control state of the respective PLL

Figure 2-84. ISPPLL_CLKCTRL Register

31	30	29	28	27	26	25	24
CYCLES_LIPEN	ENSSC	CLKDCOLDOEN	NWELLTRIM

R-12h							R/W-0h

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-100. ISPPLL_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLES_LIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	NWELLTRIM	R/W	0h	Trim values for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low power
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO

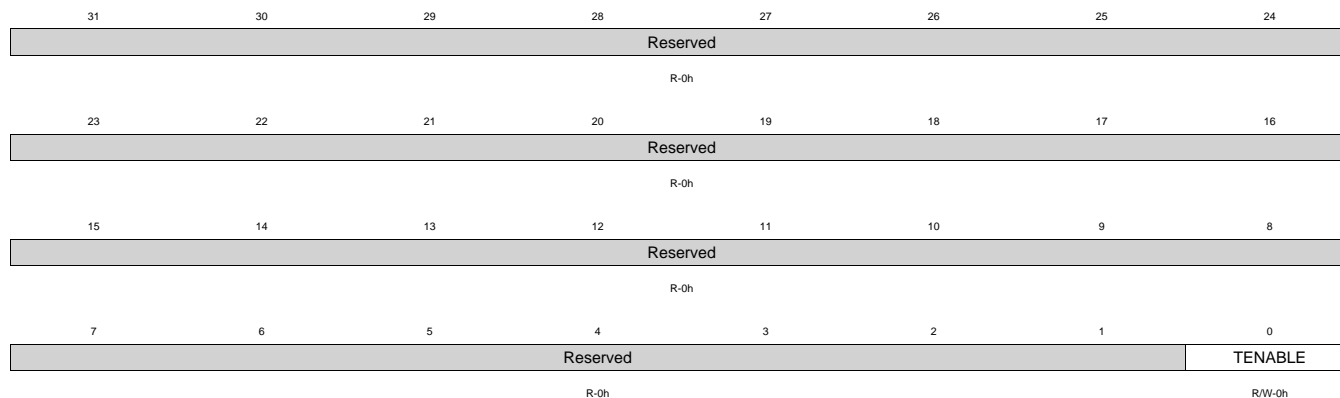

Table 2-100. ISPPLL_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0 : When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 0x1 : When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0 : Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	Reserved	R	0h	
14	STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	Reserved	R	0h	
12-10	SELFREQDCO	R/W	2h	DCO Clock (DCOCLK = CLKINP * [M/(N+1)]) frequency range selector. 0x0 : Reserved 0x2 : HS2 : DCOCLK range is from 500 MHz to 1000 MHz 0x3 : Reserved 0x4 : HS1 : DCOCLK range is from 1000 MHz to 2000 MHz 0x5 : Reserved
9	Reserved	R	0h	
8	RELAXED_LOCK	R/W	0h	Decides when FREQLOCK asserted 0x0 : FREQLOCK asserted when DC frequency error less than 1% 0x1 : FREQLOCK asserted when DC frequency error less than 2%
7-1	Reserved	R	12h	
0	TINITZ	R/W	0h	PLL core soft reset

2.10.1.59 ISPLL_TENABLE Register (offset = 148h) [reset = 0h]

ISPLL_TENABLE is shown in [Figure 2-85](#) and described in [Table 2-101](#).

Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.

Figure 2-85. ISPLL_TENABLE Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-101. ISPLL_TENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLE	R/W	0h	M, N, SD and SELFREQDCO latch (active rise edge)

2.10.1.60 ISPLL_TENABLEDIV Register (offset = 14Ch) [reset = 0h]

ISPLL_TENABLEDIV is shown in [Figure 2-86](#) and described in [Table 2-102](#).

The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL

Figure 2-86. ISPLL_TENABLEDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

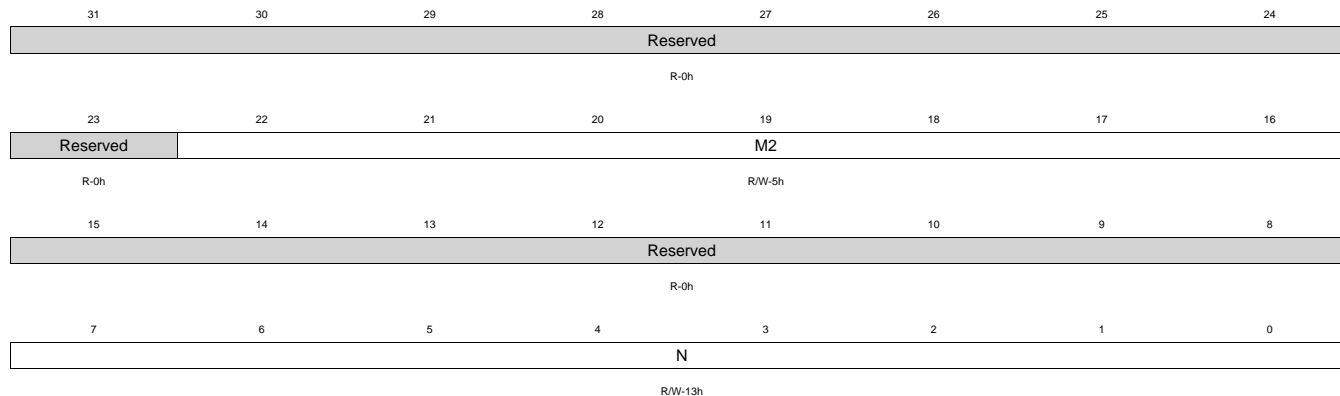

Table 2-102. ISPLL_TENABLEDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLEDIV	R/W	0h	M2 and N2 latch (active rise edge)

2.10.1.61 ISPPLL_M2NDIV Register (offset = 150h) [reset = 50013h]

ISPPLL_M2NDIV is shown in [Figure 2-87](#) and described in [Table 2-103](#).

PLL M2NDIV register is for programming M2 and N values of respective PLL

Figure 2-87. ISPPLL_M2NDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-103. ISPPLL_M2NDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	Reserved	R	0h	
22-16	M2	R/W	5h	Post-divider is REGM2
15-8	Reserved	R	0h	
7-0	N	R/W	13h	Pre-divider is REGN+1

2.10.1.62 ISPPLL_MN2DIV Register (offset = 154h) [reset = 174h]

 ISPPLL_MN2DIV is shown in [Figure 2-88](#) and described in [Table 2-104](#).

PLL MN2DIV register is for programming M and N2 values of respective PLL

Figure 2-88. ISPPLL_MN2DIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-104. ISPPLL_MN2DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	Reserved	R	0h	
11-0	M	R/W	174h	Feedback multiplier is REGM

2.10.1.63 ISPPLL_FRACDIV Register (offset = 158h) [reset = 800000h]

ISPPLL_FRACDIV is shown in [Figure 2-89](#) and described in [Table 2-105](#).

The PLL FRACDIV register is for controlling the fractional values of respective PLL

Figure 2-89. ISPPLL_FRACDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-105. ISPPLL_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING} ([DPLL_MULT/(DPLL_DIV+1)] * CLKINP / 250)$, where CLKINP is the input clock of the DPLL in MHz). Must be set with M and N factors, and must not be changed once DPLL is locked.
23-18	Reserved	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

2.10.1.64 ISPPLL_BWCTRL Register (offset = 15Ch) [reset = 0h]

ISPPLL_BWCTRL is shown in [Figure 2-90](#) and described in [Table 2-106](#).

The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL

Figure 2-90. ISPPLL_BWCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-106. ISPPLL_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0 : decrease BW 0x1 : increase BW

2.10.1.65 ISPLL_FRACCTRL Register (offset = 160h) [reset = 0h]

ISPLL_FRACCTRL is shown in [Figure 2-91](#) and described in [Table 2-107](#).

Controls the fractional portion of respective ADPLLJ.

Figure 2-91. ISPLL_FRACCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-107. ISPLL_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control.
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

2.10.1.66 ISPPLL_STATUS Register (offset = 164h) [reset = C000121h]

ISPPLL_STATUS is shown in [Figure 2-92](#) and described in [Table 2-108](#).

The PLL Status register is for viewing the status of the respective PLL.

Figure 2-92. ISPPLL_STATUS Register

31	30	29	28	27	26	25	24
PONOUT	PGOODOUT	LDOPWDN	RECAL_BSTATUS3	RECAL_OPPIN	Reserved

R-0h	R-0h	R-1h	R-0h	R-0h	R-0h	R-0h	R-1h

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-108. ISPPLL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition.
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 (ADPLLLJ requires recalibration)
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 (ADPLLLJ requires recalibration)
26-11	Reserved	R	0h	
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0 : indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the relck process. 0x1 : indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	1/0 indicates enable/disable condition of CLKOUTEN
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	acknowledge for M2 change

Table 2-108. ISPPLL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

2.10.1.67 DSSPLL_PWRCTRL Register (offset = 170h) [reset = 30h]

DSSPLL_PWRCTRL is shown in [Figure 2-93](#) and described in [Table 2-109](#).

The PLL Power Control register is used to control the power state of the respective PLL.

Figure 2-93. DSSPLL_PWRCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-109. DSSPLL_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

2.10.1.68 DSSPLL_CLKCTRL Register (offset = 174h) [reset = 914824h]

DSSPLL_CLKCTRL is shown in [Figure 2-94](#) and described in [Table 2-110](#).

The PLL Clock Control register is used to control the different clock control state of the respective PLL

Figure 2-94. DSSPLL_CLKCTRL Register

0	TENABLE	R/W	0h	M, N, SD and SELFREQDCO latch (active rise edge)

2.10.1.70 DSSPLL_TENABLEDIV Register (offset = 17Ch) [reset = 0h]

DSSPLL_TENABLEDIV is shown in [Figure 2-96](#) and described in [Table 2-112](#).

The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL

Figure 2-96. DSSPLL_TENABLEDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-112. DSSPLL_TENABLEDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLEDIV	R/W	0h	M2 and N2 latch (active rise edge)

2.10.1.71 DSSPLL_M2NDIV Register (offset = 180h) [reset = 50013h]

DSSPLL_M2NDIV is shown in [Figure 2-97](#) and described in [Table 2-113](#).

PLL M2NDIV register is for programming M2 and N values of respective PLL

Figure 2-97. DSSPLL_M2NDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-113. DSSPLL_M2NDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	Reserved	R	0h	
22-16	M2	R/W	5h	Post-divider is REGM2
15-8	Reserved	R	0h	
7-0	N	R/W	13h	Pre-divider is REGN+1

2.10.1.72 DSSPLL_MN2DIV Register (offset = 184h) [reset = 174h]

DSSPLL_MN2DIV is shown in [Figure 2-98](#) and described in [Table 2-114](#).

PLL MN2DIV register is for programming M and N2 values of respective PLL

Figure 2-98. DSSPLL_MN2DIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-114. DSSPLL_MN2DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	Reserved	R	0h	
11-0	M	R/W	174h	Feedback multiplier is REGM

2.10.1.73 DSSPLL_FRACDIV Register (offset = 188h) [reset = 800000h]

DSSPLL_FRACDIV is shown in [Figure 2-99](#) and described in [Table 2-115](#).

The PLL FRACDIV register is for controlling the fractional values of respective PLL

Figure 2-99. DSSPLL_FRACDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-115. DSSPLL_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING}([DPLL_MULT/(DPLL_DIV+1)] * CLKINP / 250)$, where CLKINP is the input clock of the DPLL in MHz). Must be set with M and N factors, and must not be changed once DPLL is locked.
23-18	Reserved	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

2.10.1.74 DSSPLL_BWCTRL Register (offset = 18Ch) [reset = 0h]

DSSPLL_BWCTRL is shown in [Figure 2-100](#) and described in [Table 2-116](#).

The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL

Figure 2-100. DSSPLL_BWCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-116. DSSPLL_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0 : decrease BW 0x1 : increase BW

2.10.1.75 DSSPLL_FRACCTRL Register (offset = 190h) [reset = 0h]

DSSPLL_FRACCTRL is shown in [Figure 2-101](#) and described in [Table 2-117](#).

Controls the fractional portion of respective ADPLLLJ.

Figure 2-101. DSSPLL_FRACCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-117. DSSPLL_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control.
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

2.10.1.76 DSSPLL_STATUS Register (offset = 194h) [reset = C000121h]

 DSSPLL_STATUS is shown in [Figure 2-102](#) and described in [Table 2-118](#).

The PLL Status register is for viewing the status of the respective PLL.

Figure 2-102. DSSPLL_STATUS Register

31	30	29	28	27	26	25	24
PONOUT	PGOODOUT	LDOPWDN	RECAL_BSTATUS3	RECAL_OPPIN	Reserved

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-118. DSSPLL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition.
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 (ADPLLLJ requires recalibration)
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 (ADPLLLJ requires recalibration)
26-11	Reserved	R	0h	
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0 : indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the reload process. 0x1 : indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	1/0 indicates enable/disable condition of CLKOUTEN
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	acknowledge for M2 change

Table 2-118. DSSPLL_STATUS Register Field Descriptions (continued)

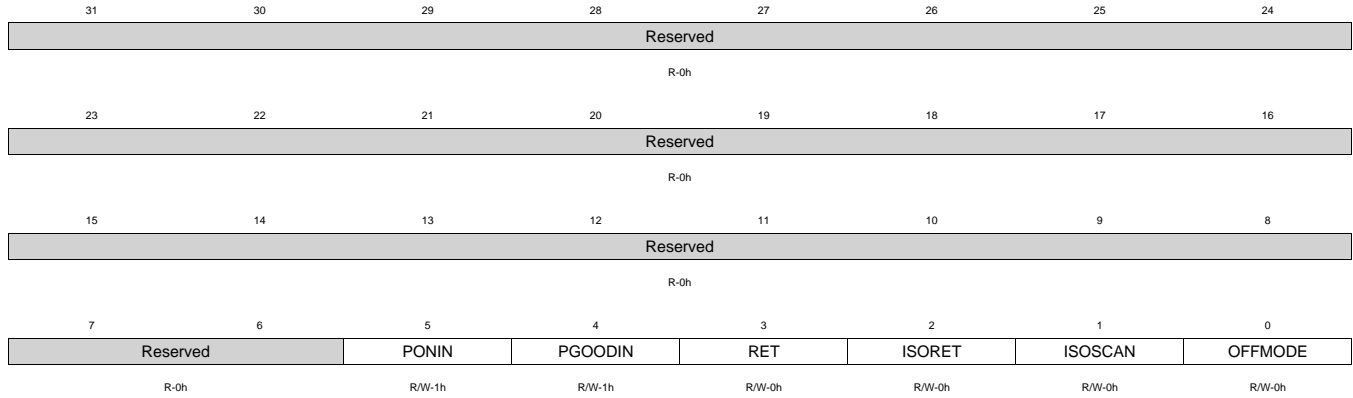

Bit	Field	Type	Reset	Description
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

2.10.1.77 VIDEO0PLL_PWRCTRL Register (offset = 1A0h) [reset = 30h]

VIDEO0PLL_PWRCTRL is shown in [Figure 2-103](#) and described in [Table 2-119](#).

The PLL Power Control register is used to control the power state of the respective PLL.

Figure 2-103. VIDEO0PLL_PWRCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-119. VIDEO0PLL_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

2.10.1.78 VIDEO0PLL_CLKCTRL Register (offset = 1A4h) [reset = 914824h]

VIDEO0PLL_CLKCTRL is shown in [Figure 2-104](#) and described in [Table 2-120](#).

The PLL Clock Control register is used to control the different clock control state of the respective PLL

Figure 2-104. VIDEO0PLL_CLKCTRL Register

31	30	29	28	27	26	25	24
CYCLES_LIPEN	ENSSC	CLKDCOLDOEN	N WELLTRIM

Reserved							TINITZ
R-12h							R/W-0h

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-120. VIDEO0PLL_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLES_LIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	N WELLTRIM	R/W	0h	Trim values for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low power
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO

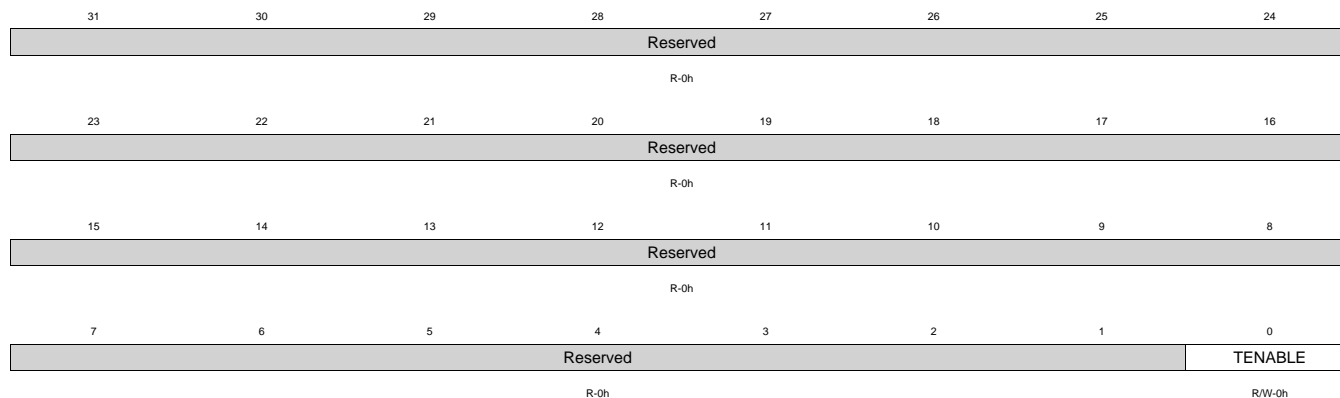

Table 2-120. VIDEOPLL_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0 : When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 0x1 : When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0 : Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	Reserved	R	0h	
14	STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	Reserved	R	0h	
12-10	SELFREQDCO	R/W	2h	DCO Clock (DCOCLK = CLKINP * [M/(N+1)]) frequency range selector. 0x0 : Reserved 0x2 : HS2 : DCOCLK range is from 500 MHz to 1000 MHz 0x3 : Reserved 0x4 : HS1 : DCOCLK range is from 1000 MHz to 2000 MHz 0x5 : Reserved
9	Reserved	R	0h	
8	RELAXED_LOCK	R/W	0h	Decides when FREQLOCK asserted 0x0 : FREQLOCK asserted when DC frequency error less than 1% 0x1 : FREQLOCK asserted when DC frequency error less than 2%
7-1	Reserved	R	12h	
0	TINITZ	R/W	0h	PLL core soft reset

2.10.1.79 VIDEO0PLL_TENABLE Register (offset = 1A8h) [reset = 0h]

VIDEO0PLL_TENABLE is shown in [Figure 2-105](#) and described in [Table 2-121](#).

Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLJ.

Figure 2-105. VIDEO0PLL_TENABLE Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-121. VIDEO0PLL_TENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLE	R/W	0h	M, N, SD and SELFREQDCO latch (active rise edge)

2.10.1.80 VIDEO0PLL_TENABLEDIV Register (offset = 1ACh) [reset = 0h]

VIDEO0PLL_TENABLEDIV is shown in [Figure 2-106](#) and described in [Table 2-122](#).

The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL

Figure 2-106. VIDEO0PLL_TENABLEDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

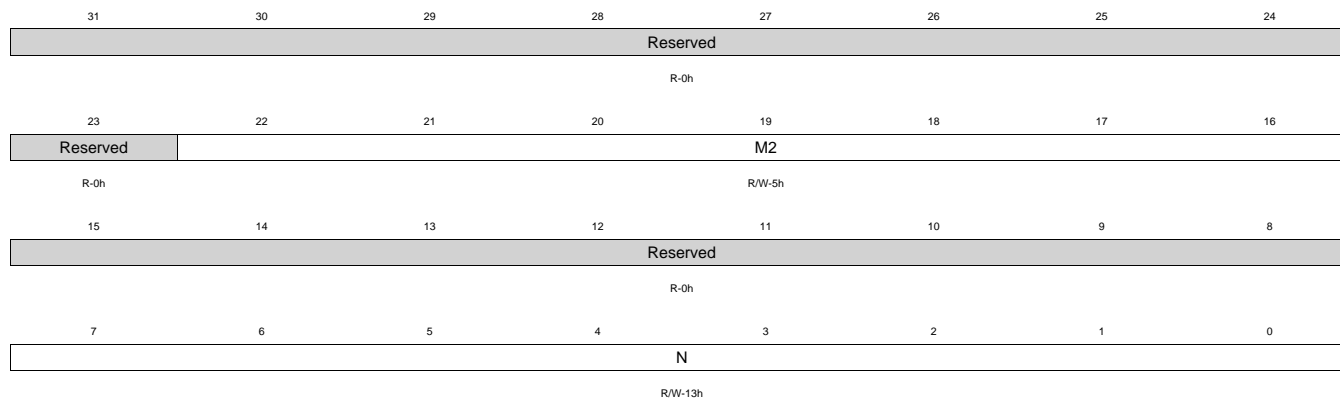

Table 2-122. VIDEO0PLL_TENABLEDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLEDIV	R/W	0h	M2 and N2 latch (active rise edge)

2.10.1.81 VIDEO0PLL_M2NDIV Register (offset = 1B0h) [reset = 50013h]

VIDEO0PLL_M2NDIV is shown in [Figure 2-107](#) and described in [Table 2-123](#).

PLL M2NDIV register is for programming M2 and N values of respective PLL

Figure 2-107. VIDEO0PLL_M2NDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-123. VIDEO0PLL_M2NDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	Reserved	R	0h	
22-16	M2	R/W	5h	Post-divider is REGM2
15-8	Reserved	R	0h	
7-0	N	R/W	13h	Pre-divider is REGN+1

2.10.1.82 VIDEO0PLL_MN2DIV Register (offset = 1B4h) [reset = 174h]

VIDEO0PLL_MN2DIV is shown in [Figure 2-108](#) and described in [Table 2-124](#).

PLL MN2DIV register is for programming M and N2 values of respective PLL

Figure 2-108. VIDEO0PLL_MN2DIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-124. VIDEO0PLL_MN2DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	Reserved	R	0h	
11-0	M	R/W	174h	Feedback multiplier is REGM

2.10.1.83 VIDEO0PLL_FRACDIV Register (offset = 1B8h) [reset = 800000h]

VIDEO0PLL_FRACDIV is shown in [Figure 2-109](#) and described in [Table 2-125](#).

The PLL FRACDIV register is for controlling the fractional values of respective PLL

Figure 2-109. VIDEO0PLL_FRACDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-125. VIDEO0PLL_FRACDIV Register Field Descriptions

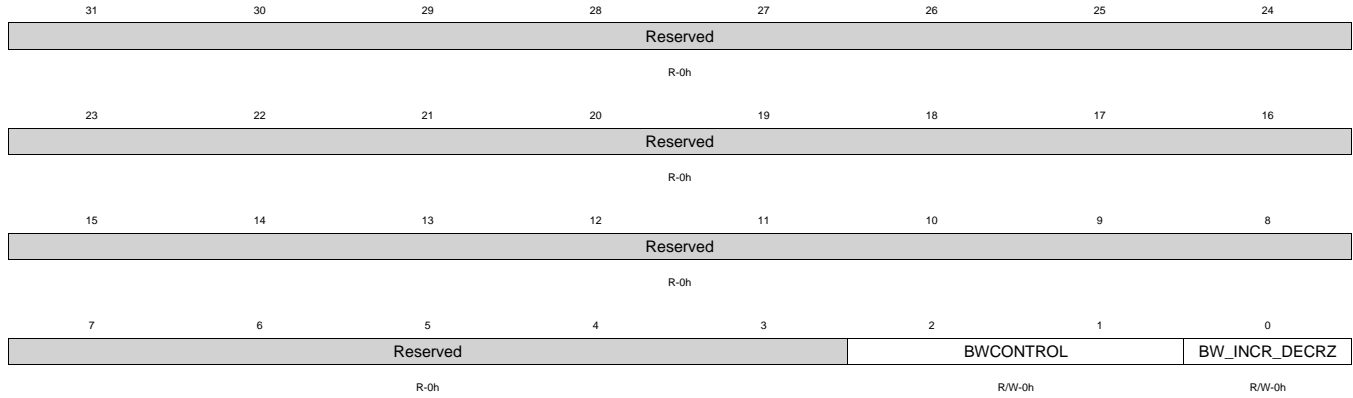

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING}([DPLL_MULT/(DPLL_DIV+1)] * CLKINP / 250)$, where CLKINP is the input clock of the DPLL in MHz). Must be set with M and N factors, and must not be changed once DPLL is locked.
23-18	Reserved	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

2.10.1.84 VIDEO0PLL_BWCTRL Register (offset = 1BCh) [reset = 0h]

VIDEO0PLL_BWCTRL is shown in [Figure 2-110](#) and described in [Table 2-126](#).

The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL

Figure 2-110. VIDEO0PLL_BWCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-126. VIDEO0PLL_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0 : decrease BW 0x1 : increase BW

2.10.1.85 VIDEO0PLL_FRACCTRL Register (offset = 1C0h) [reset = 0h]

 VIDEO0PLL_FRACCTRL is shown in [Figure 2-111](#) and described in [Table 2-127](#).

Controls the fractional portion of respective ADPLLJ.

Figure 2-111. VIDEO0PLL_FRACCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-127. VIDEO0PLL_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control.
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

2.10.1.86 VIDEO0PLL_STATUS Register (offset = 1C4h) [reset = C000121h]

VIDEO0PLL_STATUS is shown in [Figure 2-112](#) and described in [Table 2-128](#).

The PLL Status register is for viewing the status of the respective PLL.

Figure 2-112. VIDEO0PLL_STATUS Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-128. VIDEO0PLL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition.
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration)
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration)
26-11	Reserved	R	0h	
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0 : indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the reload process. 0x1 : indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	1 /0indicates enable/disable condition of CLKOUTEN
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	acknowledge for M2 change

Table 2-128. VIDEO0PLL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

2.10.1.87 VIDEO1PLL_PWRCTRL Register (offset = 1D0h) [reset = 30h]

VIDEO1PLL_PWRCTRL is shown in [Figure 2-113](#) and described in [Table 2-129](#).

The PLL Power Control register is used to control the power state of the respective PLL.

Figure 2-113. VIDEO1PLL_PWRCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-129. VIDEO1PLL_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

2.10.1.88 VIDEO1PLL_CLKCTRL Register (offset = 1D4h) [reset = 914824h]

VIDEO1PLL_CLKCTRL is shown in [Figure 2-114](#) and described in [Table 2-130](#).

The PLL Clock Control register is used to control the different clock control state of the respective PLL

Figure 2-114. VIDEO1PLL_CLKCTRL Register

14	STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	Reserved	R	0h	
12-10	SELFREQDCO	R/W	2h	DCO Clock (DCOCLK = CLKINP * [M/(N+1)]) frequency range selector. 0x0 : Reserved 0x2 : HS2 : DCOCLK range is from 500 MHz to 1000 MHz 0x3 : Reserved 0x4 : HS1 : DCOCLK range is from 1000 MHz to 2000 MHz 0x5 : Reserved
9	Reserved	R	0h	
8	RELAXED_LOCK	R/W	0h	Decides when FREQLOCK asserted 0x0 : FREQLOCK asserted when DC frequency error less than 1% 0x1 : FREQLOCK asserted when DC frequency error less than 2%
7-1	Reserved	R	12h	
0	TINITZ	R/W	0h	PLL core soft reset

2.10.1.89 VIDEO1PLL_TENABLE Register (offset = 1D8h) [reset = 0h]

VIDEO1PLL_TENABLE is shown in [Figure 2-115](#) and described in [Table 2-131](#).

Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLJ.

Figure 2-115. VIDEO1PLL_TENABLE Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-131. VIDEO1PLL_TENABLE Register Field Descriptions

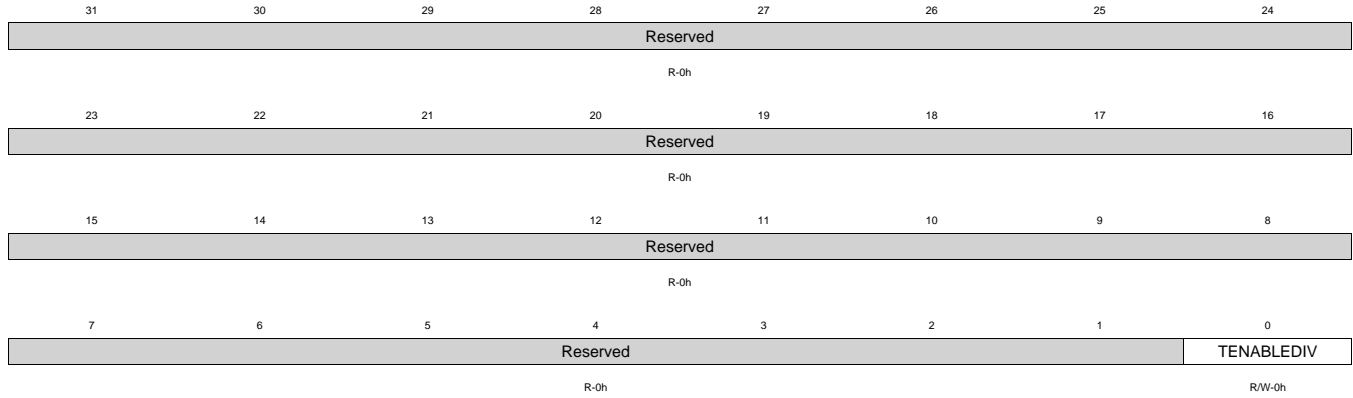

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLE	R/W	0h	M, N, SD and SELFREQDCO latch (active rise edge)

2.10.1.90 VIDEO1PLL_TENABLEDIV Register (offset = 1DCh) [reset = 0h]

VIDEO1PLL_TENABLEDIV is shown in [Figure 2-116](#) and described in [Table 2-132](#).

The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL

Figure 2-116. VIDEO1PLL_TENABLEDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-132. VIDEO1PLL_TENABLEDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLEDIV	R/W	0h	M2 and N2 latch (active rise edge)

2.10.1.91 VIDEO1PLL_M2NDIV Register (offset = 1E0h) [reset = 50013h]

VIDEO1PLL_M2NDIV is shown in [Figure 2-117](#) and described in [Table 2-133](#).

PLL M2NDIV register is for programming M2 and N values of respective PLL

Figure 2-117. VIDEO1PLL_M2NDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-133. VIDEO1PLL_M2NDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	Reserved	R	0h	
22-16	M2	R/W	5h	Post-divider is REGM2
15-8	Reserved	R	0h	
7-0	N	R/W	13h	Pre-divider is REGN+1

2.10.1.92 VIDEO1PLL_MN2DIV Register (offset = 1E4h) [reset = 174h]

VIDEO1PLL_MN2DIV is shown in [Figure 2-118](#) and described in [Table 2-134](#).

PLL MN2DIV register is for programming M and N2 values of respective PLL

Figure 2-118. VIDEO1PLL_MN2DIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

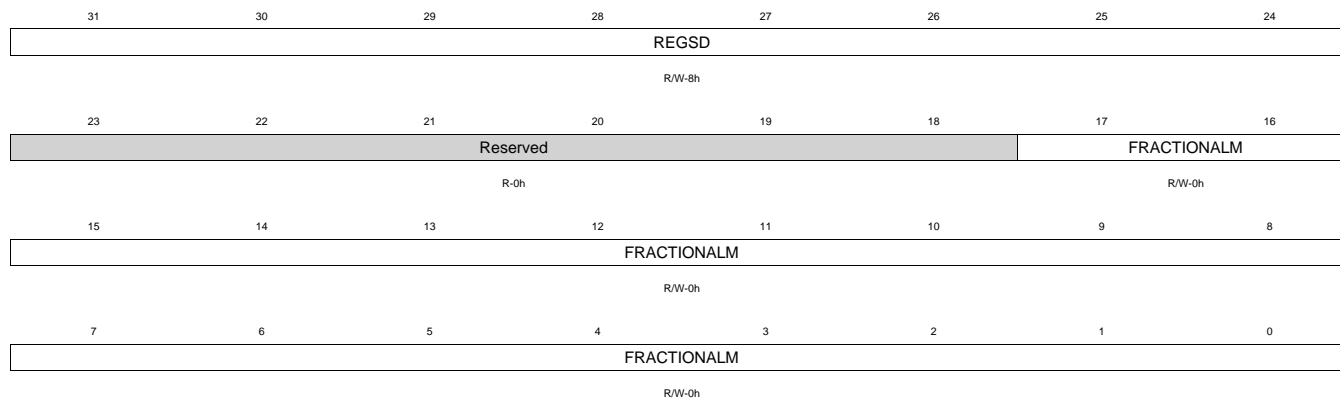

Table 2-134. VIDEO1PLL_MN2DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	Reserved	R	0h	
11-0	M	R/W	174h	Feedback multiplier is REGM

2.10.1.93 VIDEO1PLL_FRACDIV Register (offset = 1E8h) [reset = 800000h]

VIDEO1PLL_FRACDIV is shown in [Figure 2-119](#) and described in [Table 2-135](#).

The PLL FRACDIV register is for controlling the fractional values of respective PLL

Figure 2-119. VIDEO1PLL_FRACDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-135. VIDEO1PLL_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING}([DPLL_MULT/(DPLL_DIV+1)] * CLKINP / 250)$, where CLKINP is the input clock of the DPLL in MHz). Must be set with M and N factors, and must not be changed once DPLL is locked.
23-18	Reserved	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

2.10.1.94 VIDEO1PLL_BWCTRL Register (offset = 1ECh) [reset = 0h]

VIDEO1PLL_BWCTRL is shown in [Figure 2-120](#) and described in [Table 2-136](#).

The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL

Figure 2-120. VIDEO1PLL_BWCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-136. VIDEO1PLL_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0 : decrease BW 0x1 : increase BW

2.10.1.95 VIDEO1PLL_FRACCTRL Register (offset = 1F0h) [reset = 0h]

 VIDEO1PLL_FRACCTRL is shown in [Figure 2-121](#) and described in [Table 2-137](#).

Controls the fractional portion of respective ADPLLJ.

Figure 2-121. VIDEO1PLL_FRACCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-137. VIDEO1PLL_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control.
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

2.10.1.96 VIDEO1PLL_STATUS Register (offset = 1F4h) [reset = C000121h]

VIDEO1PLL_STATUS is shown in [Figure 2-122](#) and described in [Table 2-138](#).

The PLL Status register is for viewing the status of the respective PLL.

Figure 2-122. VIDEO1PLL_STATUS Register

31	30	29	28	27	26	25	24
PONOUT	PGOODOUT	LDOPWDN	RECAL_BSTATUS3	RECAL_OPPIN	Reserved

R-0h	R-0h	R-1h	R-0h	R-0h	R-0h	R-0h	R-1h

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-138. VIDEO1PLL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition.
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 (ADPLLLJ requires recalibration)
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 (ADPLLLJ requires recalibration)
26-11	Reserved	R	0h	
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0 : indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the reload process. 0x1 : indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	1/0 indicates enable/disable condition of CLKOUTEN
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	acknowledge for M2 change

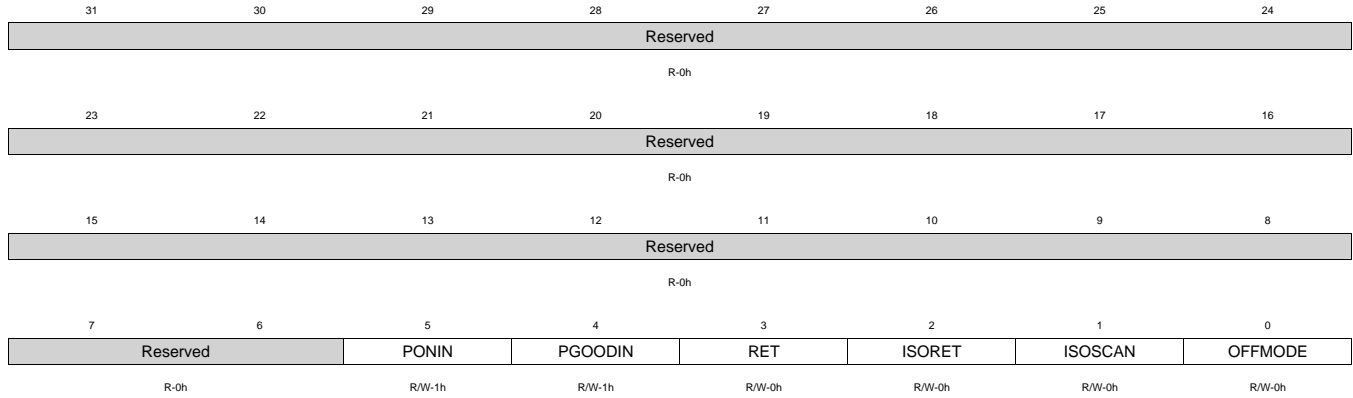

Table 2-138. VIDEO1PLL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

2.10.1.97 HDMIPLL_PWRCTRL Register (offset = 200h) [reset = 30h]

HDMIPLL_PWRCTRL is shown in [Figure 2-123](#) and described in [Table 2-139](#).

The PLL Power Control register is used to control the power state of the respective PLL.

Figure 2-123. HDMIPLL_PWRCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-139. HDMIPLL_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

2.10.1.98 HDMIPLL_CLKCTRL Register (offset = 204h) [reset = 914824h]

HDMIPLL_CLKCTRL is shown in [Figure 2-124](#) and described in [Table 2-140](#).

The PLL Clock Control register is used to control the different clock control state of the respective PLL

Figure 2-124. HDMIPLL_CLKCTRL Register

31	30	29	28	27	26	25	24
CYCLES_LIPEN	ENSSC	CLKDCOLDOEN	N WELLTRIM

IDLE	BYPASSACKZ	STBYRET	CLKOUTEN	CLKOUTLDOEN	ULOWCLKEN	CLKDCOLDOPWDNZ	M2PWDNZ
R/W-1h	R/W-0h	R/W-0h	R/W-1h	R-0h	R/W-0h	R/W-0h	R/W-1h
15	14	13	12	11	10	9	8
Reserved	STOPMODE	Reserved	SELFREQDCO			Reserved	RELAXED_LOCK
R-0h	R/W-1h	R-0h	R/W-2h		R-0h	R/W-0h	
7	6	5	4	3	2	1	0
Reserved							TINITZ
R-12h							R/W-0h

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-140. HDMIPLL_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLES_LIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	N WELLTRIM	R/W	0h	Trim values for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low power
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO

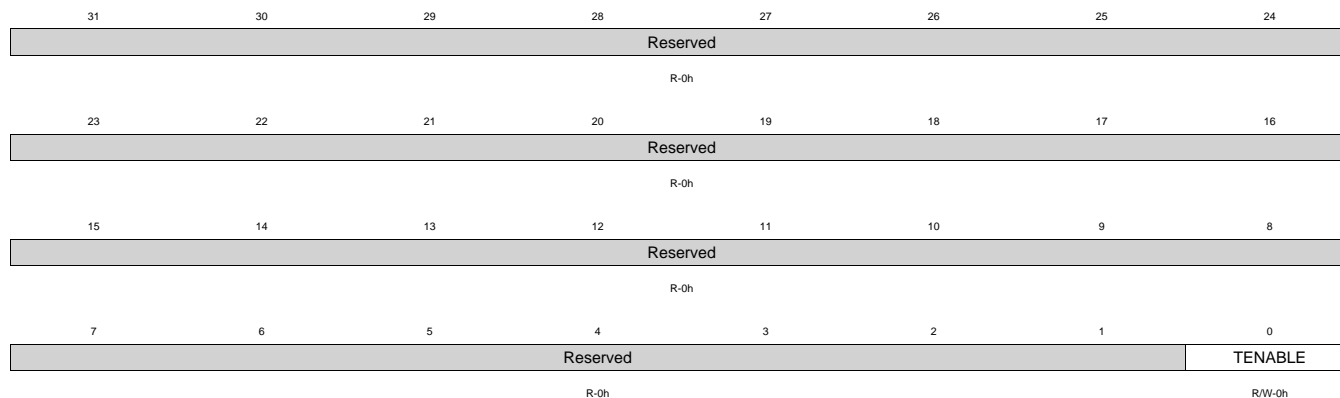

Table 2-140. HDMIPLL_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0 : When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 0x1 : When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0 : Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	Reserved	R	0h	
14	STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	Reserved	R	0h	
12-10	SELFREQDCO	R/W	2h	DCO Clock (DCOCLK = CLKINP * [M/(N+1)]) frequency range selector. 0x0 = Reserved 0x2 = HS2 : DCOCLK range is from 500 MHz to 1000 MHz 0x3 = Reserved 0x4 = HS1 : DCOCLK range is from 1000 MHz to 2000 MHz 0x5 = Reserved
9	Reserved	R	0h	
8	RELAXED_LOCK	R/W	0h	Decides when FREQLOCK asserted 0x0 : FREQLOCK asserted when DC frequency error less than 1% 0x1 : FREQLOCK asserted when DC frequency error less than 2%
7-1	Reserved	R	12h	
0	TINITZ	R/W	0h	PLL core soft reset

2.10.1.99 HDMIPLL_TENABLE Register (offset = 208h) [reset = 0h]

HDMIPLL_TENABLE is shown in [Figure 2-125](#) and described in [Table 2-141](#).

Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLJ.

Figure 2-125. HDMIPLL_TENABLE Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-141. HDMIPLL_TENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLE	R/W	0h	M, N, SD and SELFREQDCO latch (active rise edge)

2.10.1.100 HDMIPLL_TENABLEDIV Register (offset = 20Ch) [reset = 0h]

HDMIPLL_TENABLEDIV is shown in [Figure 2-126](#) and described in [Table 2-142](#).

The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL

Figure 2-126. HDMIPLL_TENABLEDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

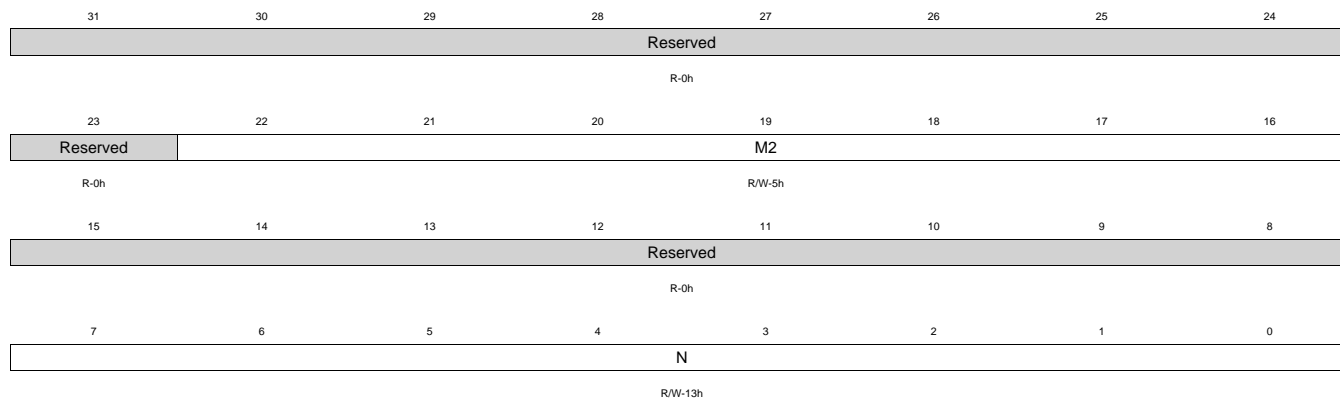

Table 2-142. HDMIPLL_TENABLEDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLEDIV	R/W	0h	M2 and N2 latch (active rise edge)

2.10.1.101 HDMIPLL_M2NDIV Register (offset = 210h) [reset = 50013h]

 HDMIPLL_M2NDIV is shown in [Figure 2-127](#) and described in [Table 2-143](#).

PLL M2NDIV register is for programming M2 and N values of respective PLL

Figure 2-127. HDMIPLL_M2NDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-143. HDMIPLL_M2NDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	Reserved	R	0h	
22-16	M2	R/W	5h	Post-divider is REGM2
15-8	Reserved	R	0h	
7-0	N	R/W	13h	Pre-divider is REGN+1

2.10.1.102 HDMIPLL_MN2DIV Register (offset = 214h) [reset = 174h]

HDMIPLL_MN2DIV is shown in [Figure 2-128](#) and described in [Table 2-144](#).

PLL MN2DIV register is for programming M and N2 values of respective PLL

Figure 2-128. HDMIPLL_MN2DIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-144. HDMIPLL_MN2DIV Register Field Descriptions

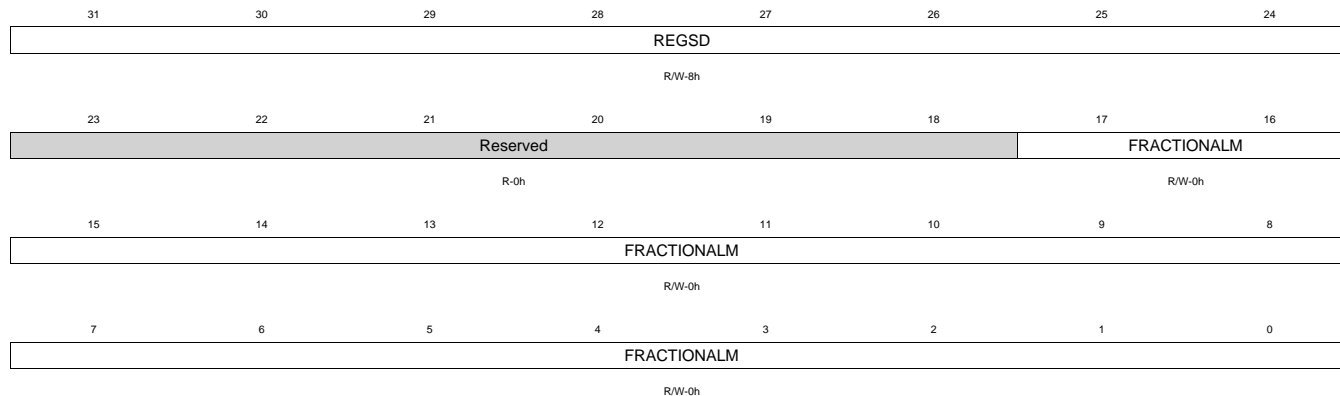

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	Reserved	R	0h	
11-0	M	R/W	174h	Feedback multiplier is REGM

2.10.1.103 HDMIPLL_FRACDIV Register (offset = 218h) [reset = 800000h]

HDMIPLL_FRACDIV is shown in [Figure 2-129](#) and described in [Table 2-145](#).

The PLL FRACDIV register is for controlling the fractional values of respective PLL

Figure 2-129. HDMIPLL_FRACDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

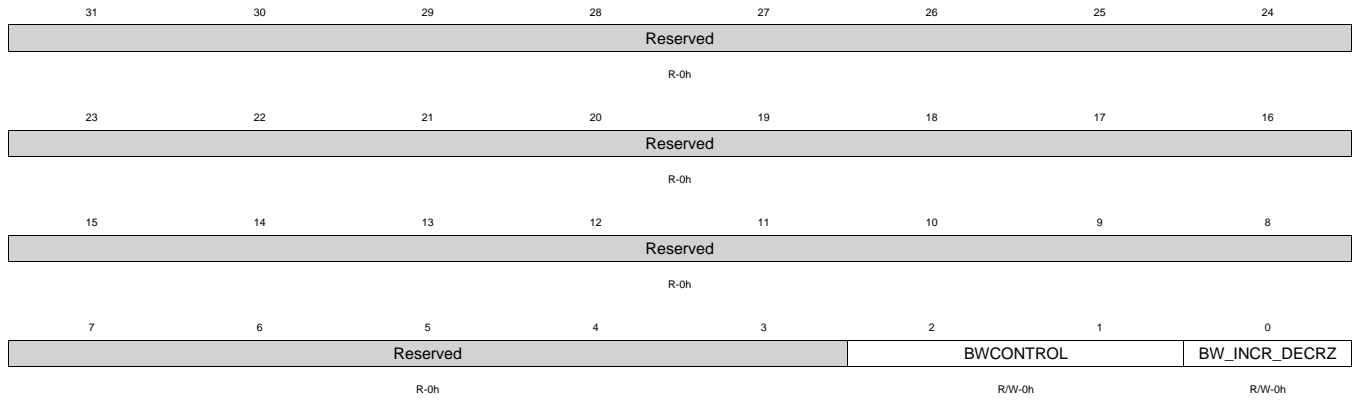

Table 2-145. HDMIPLL_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING} ([DPLL_MULT/(DPLL_DIV+1)] * CLKINP / 250)$, where CLKINP is the input clock of the DPLL in MHz). Must be set with M and N factors, and must not be changed once DPLL is locked.
23-18	Reserved	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

2.10.1.104 HDMIPLL_BWCTRL Register (offset = 21Ch) [reset = 0h]

HDMIPLL_BWCTRL is shown in [Figure 2-130](#) and described in [Table 2-146](#).

The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL

Figure 2-130. HDMIPLL_BWCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-146. HDMIPLL_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0 : decrease BW 0x1 : increase BW

2.10.1.105 HDMIPLL_FRACCTRL Register (offset = 220h) [reset = 0h]

 HDMIPLL_FRACCTRL is shown in [Figure 2-131](#) and described in [Table 2-147](#).

Controls the fractional portion of respective ADPLLLJ.

Figure 2-131. HDMIPLL_FRACCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-147. HDMIPLL_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control.
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

2.10.1.106 HDMIPLL_STATUS Register (offset = 224h) [reset = C0000121h]

 HDMIPLL_STATUS is shown in [Figure 2-132](#) and described in [Table 2-148](#).

The PLL Status register is for viewing the status of the respective PLL.

Figure 2-132. HDMIPLL_STATUS Register

8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0 : indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the reload process. 0x1 : indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	1/0 indicates enable/disable condition of CLKOUTEN
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	acknowledge for M2 change

Table 2-148. HDMIPLL_STATUS Register Field Descriptions (continued)

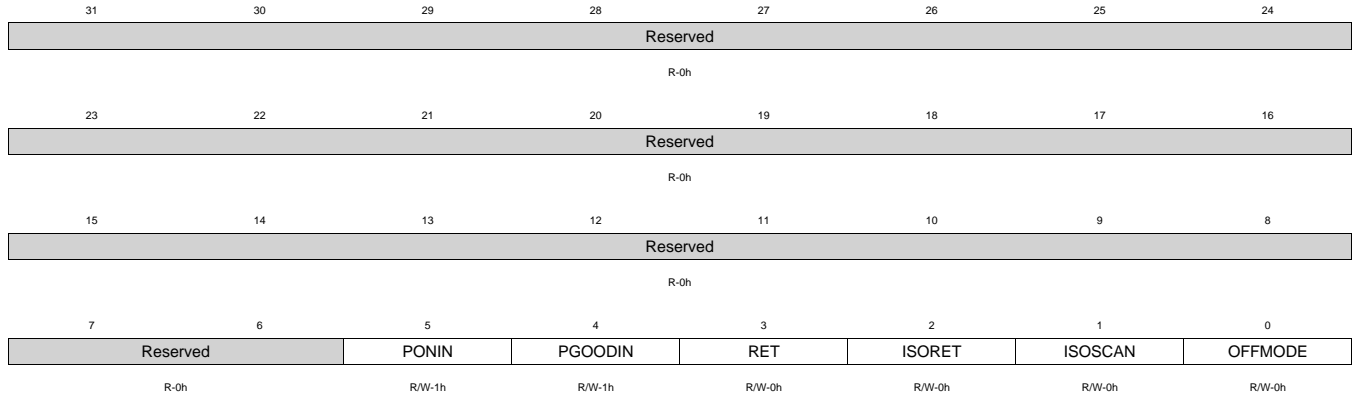

Bit	Field	Type	Reset	Description
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

2.10.1.107 AUDIOPLL_PWRCTRL Register (offset = 230h) [reset = 30h]

AUDIOPLL_PWRCTRL is shown in [Figure 2-133](#) and described in [Table 2-149](#).

The PLL Power Control register is used to control the power state of the respective PLL.

Figure 2-133. AUDIOPLL_PWRCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-149. AUDIOPLL_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

2.10.1.108 AUDIOPLL_CLKCTRL Register (offset = 234h) [reset = 914824h]

AUDIOPLL_CLKCTRL is shown in [Figure 2-134](#) and described in [Table 2-150](#).

The PLL Clock Control register is used to control the different clock control state of the respective PLL

Figure 2-134. AUDIOPLL_CLKCTRL Register

31	30	29	28	27	26	25	24
CYCLES_LIPEN	ENSSC	CLKDCOLDOEN	NWELLTRIM

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-150. AUDIOPLL_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLES_LIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	NWELLTRIM	R/W	0h	Trim values for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low power
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO

Table 2-150. AUDIOPLL_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0 : When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 0x1 : When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0 : Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	Reserved	R	0h	
14	STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	Reserved	R	0h	
12-10	SELFREQDCO	R/W	2h	DCO Clock (DCOCLK = CLKINP * [M/(N+1)]) frequency range selector. 0x0 : Reserved 0x2 : HS2 : DCOCLK range is from 500 MHz to 1000 MHz 0x3 : Reserved 0x4 : HS1 : DCOCLK range is from 1000 MHz to 2000 MHz 0x5 : Reserved
9	Reserved	R	0h	
8	RELAXED_LOCK	R/W	0h	Decides when FREQLOCK asserted 0x0 : FREQLOCK asserted when DC frequency error less than 1% 0x1 : FREQLOCK asserted when DC frequency error less than 2%
7-1	Reserved	R	12h	
0	TINITZ	R/W	0h	PLL core soft reset

2.10.1.109 AUDIOPLL_TENABLE Register (offset = 238h) [reset = 0h]

AUDIOPLL_TENABLE is shown in [Figure 2-135](#) and described in [Table 2-151](#).

Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLLJ.

Figure 2-135. AUDIOPLL_TENABLE Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-151. AUDIOPLL_TENABLE Register Field Descriptions

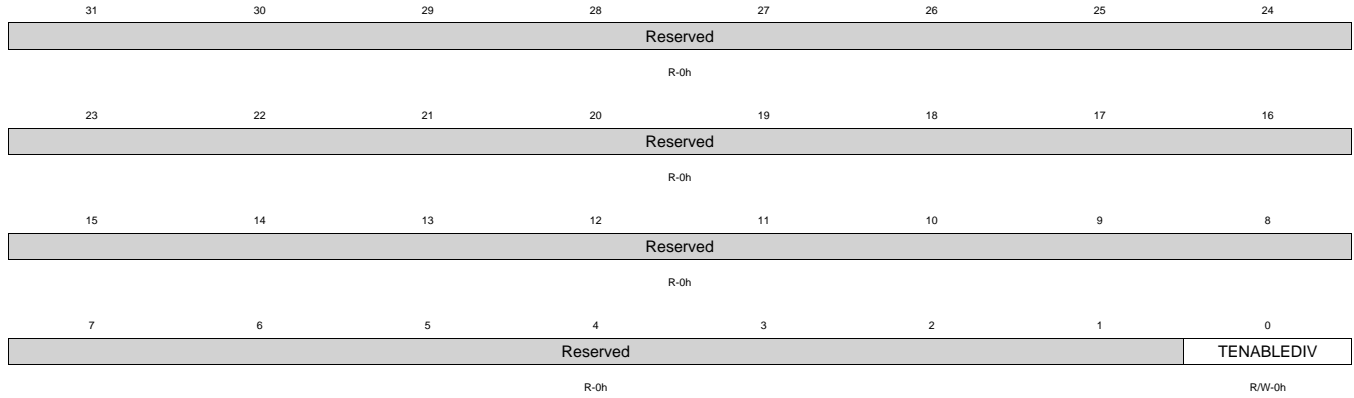

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLE	R/W	0h	M, N, SD and SELFREQDCO latch (active rise edge)

2.10.1.110 AUDIOPLL_TENABLEDIV Register (offset = 23Ch) [reset = 0h]

AUDIOPLL_TENABLEDIV is shown in [Figure 2-136](#) and described in [Table 2-152](#).

The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL

Figure 2-136. AUDIOPLL_TENABLEDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-152. AUDIOPLL_TENABLEDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLEDIV	R/W	0h	M2 and N2 latch (active rise edge)

2.10.1.111 AUDIOPLL_M2NDIV Register (offset = 240h) [reset = 50013h]

AUDIOPLL_M2NDIV is shown in [Figure 2-137](#) and described in [Table 2-153](#).

PLL M2NDIV register is for programming M2 and N values of respective PLL

Figure 2-137. AUDIOPLL_M2NDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-153. AUDIOPLL_M2NDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	Reserved	R	0h	
22-16	M2	R/W	5h	Post-divider is REGM2
15-8	Reserved	R	0h	
7-0	N	R/W	13h	Pre-divider is REGN+1

2.10.1.112 AUDIOPLL_MN2DIV Register (offset = 244h) [reset = 174h]

 AUDIOPLL_MN2DIV is shown in [Figure 2-138](#) and described in [Table 2-154](#).

PLL MN2DIV register is for programming M and N2 values of respective PLL

Figure 2-138. AUDIOPLL_MN2DIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-154. AUDIOPLL_MN2DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	Reserved	R	0h	
11-0	M	R/W	174h	Feedback multiplier is REGM

2.10.1.113 AUDIOPLL_FRACDIV Register (offset = 248h) [reset = 800000h]

AUDIOPLL_FRACDIV is shown in [Figure 2-139](#) and described in [Table 2-155](#).

The PLL FRACDIV register is for controlling the fractional values of respective PLL

Figure 2-139. AUDIOPLL_FRACDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-155. AUDIOPLL_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING} ([DPLL_MULT/(DPLL_DIV+1)] * CLKINP / 250)$, where CLKINP is the input clock of the DPLL in MHz). Must be set with M and N factors, and must not be changed once DPLL is locked.
23-18	Reserved	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

2.10.1.114 AUDIOPLL_BWCTRL Register (offset = 24Ch) [reset = 0h]

AUDIOPLL_BWCTRL is shown in [Figure 2-140](#) and described in [Table 2-156](#).

The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL

Figure 2-140. AUDIOPLL_BWCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-156. AUDIOPLL_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0 : decrease BW 0x1 : increase BW

2.10.1.115 AUDIOPLL_FRACCTRL Register (offset = 250h) [reset = 0h]

 AUDIOPLL_FRACCTRL is shown in [Figure 2-141](#) and described in [Table 2-157](#).

Controls the fractional portion of respective ADPLLLJ.

Figure 2-141. AUDIOPLL_FRACCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-157. AUDIOPLL_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control.
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

2.10.1.116 AUDIOPLL_STATUS Register (offset = 254h) [reset = C000121h]

AUDIOPLL_STATUS is shown in [Figure 2-142](#) and described in [Table 2-158](#).

The PLL Status register is for viewing the status of the respective PLL.

Figure 2-142. AUDIOPLL_STATUS Register

31	30	29	28	27	26	25	24
PONOUT	PGOODOUT	LDOPWDN	RECAL_BSTATUS3	RECAL_OPPIN	Reserved

STBYRETACK	LOSSREF	CLKOUTENACK	LOCK2	M2CHANGEACK	SSACK	HIGHJITTER	BYPASS
R-0h	R-0h	R-1h	R-0h	R-0h	R-0h	R-0h	R-1h

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-158. AUDIOPLL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition.
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 (ADPLLLJ requires recalibration)
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 (ADPLLLJ requires recalibration)
26-11	Reserved	R	0h	
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0 : indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the reload process. 0x1 : indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	1/0 indicates enable/disable condition of CLKOUTEN
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	acknowledge for M2 change

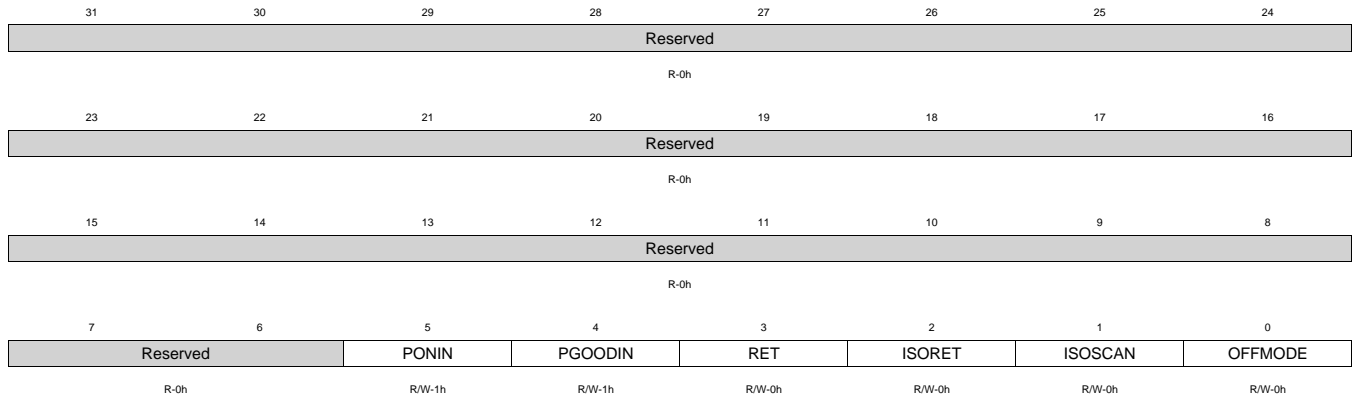

Table 2-158. AUDIOPLL_STATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

2.10.1.117 USBPLL_PWRCTRL Register (offset = 260h) [reset = 30h]

USBPLL_PWRCTRL is shown in [Figure 2-143](#) and described in [Table 2-159](#).

The PLL Power Control register is used to control the power state of the respective PLL.

Figure 2-143. USBPLL_PWRCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-159. USBPLL_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

2.10.1.118 USBPLL_CLKCTRL Register (offset = 264h) [reset = 914824h]

USBPLL_CLKCTRL is shown in [Figure 2-144](#) and described in [Table 2-160](#).

The PLL Clock Control register is used to control the different clock control state of the respective PLL

Figure 2-144. USBPLL_CLKCTRL Register

31-1	Reserved	R	0h	
0	TENABLEDIV	R/W	0h	M2 and N2 latch (active rise edge)

2.10.1.121 USBPLL_M2NDIV Register (offset = 270h) [reset = 50013h]

 USBPLL_M2NDIV is shown in [Figure 2-147](#) and described in [Table 2-163](#).

PLL M2NDIV register is for programming M2 and N values of respective PLL

Figure 2-147. USBPLL_M2NDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-163. USBPLL_M2NDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	Reserved	R	0h	
22-16	M2	R/W	5h	Post-divider is REGM2
15-8	Reserved	R	0h	
7-0	N	R/W	13h	Pre-divider is REGN+1

2.10.1.122 USBPLL_MN2DIV Register (offset = 274h) [reset = 174h]

USBPLL_MN2DIV is shown in [Figure 2-148](#) and described in [Table 2-164](#).

PLL MN2DIV register is for programming M and N2 values of respective PLL

Figure 2-148. USBPLL_MN2DIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-164. USBPLL_MN2DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	Reserved	R	0h	
11-0	M	R/W	174h	Feedback multiplier is REGM

2.10.1.123 USBPLL_FRACDIV Register (offset = 278h) [reset = 800000h]

 USBPLL_FRACDIV is shown in [Figure 2-149](#) and described in [Table 2-165](#).

The PLL FRACDIV register is for controlling the fractional values of respective PLL

Figure 2-149. USBPLL_FRACDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

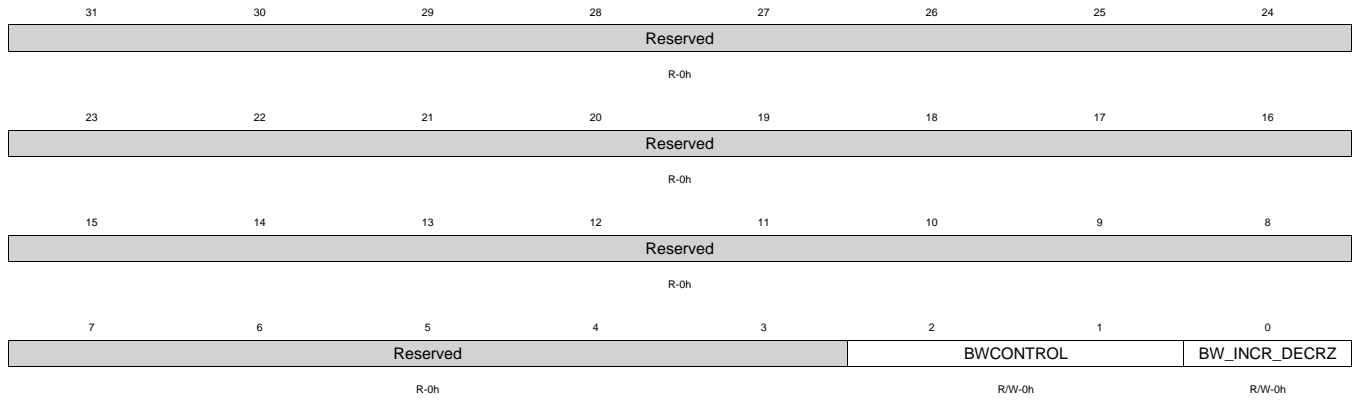

Table 2-165. USBPLL_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING}([DPLL_MULT/(DPLL_DIV+1)] * CLKINP / 250)$, where CLKINP is the input clock of the DPLL in MHz). Must be set with M and N factors, and must not be changed once DPLL is locked.
23-18	Reserved	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

2.10.1.124 USBPLL_BWCTRL Register (offset = 27Ch) [reset = 0h]

USBPLL_BWCTRL is shown in [Figure 2-150](#) and described in [Table 2-166](#).

The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL

Figure 2-150. USBPLL_BWCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-166. USBPLL_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0 = 0 : decrease BW 1 = 1 : increase BW

2.10.1.125 USBPLL_FRACCTRL Register (offset = 280h) [reset = 0h]

 USBPLL_FRACCTRL is shown in [Figure 2-151](#) and described in [Table 2-167](#).

Controls the fractional portion of respective ADPLLLJ.

Figure 2-151. USBPLL_FRACCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-167. USBPLL_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control.
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

2.10.1.126 USBPLL_STATUS Register (offset = 284h) [reset = C000121h]

 USBPLL_STATUS is shown in [Figure 2-152](#) and described in [Table 2-168](#).

The PLL Status register is for viewing the status of the respective PLL.

Figure 2-152. USBPLL_STATUS Register

31	30	29	28	27	26	25	24

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-168. USBPLL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	0h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition.
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration)
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration)
26-11	Reserved	R	0h	
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0 : indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the reload process. 0x1 : indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	0h	Reference input loss
5	CLKOUTENACK	R	1h	1 /0indicates enable/disable condition of CLKOUTEN
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	acknowledge for M2 change

Table 2-168. USBPLL_STATUS Register Field Descriptions (continued)

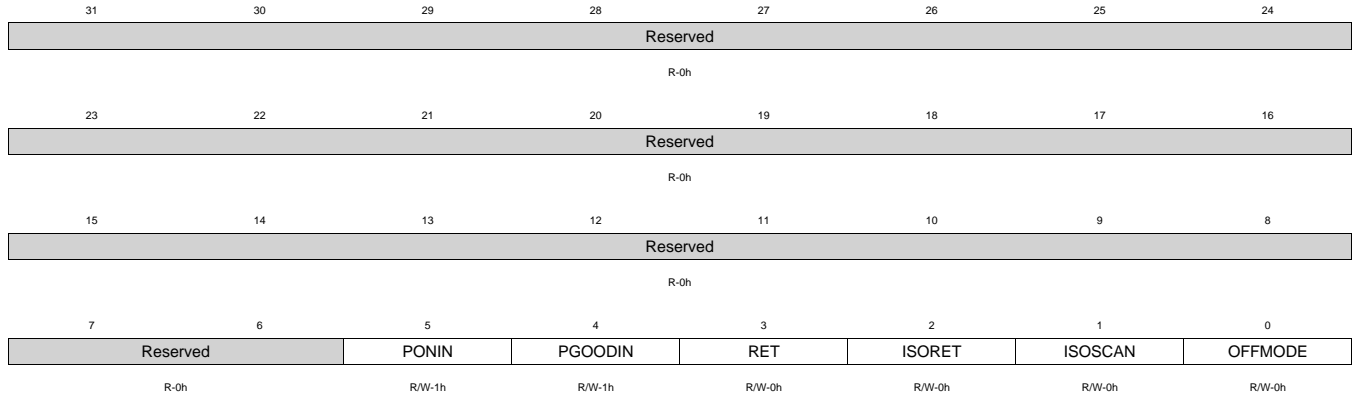

Bit	Field	Type	Reset	Description
2	SSCACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

2.10.1.127 DDRPLL_PWRCTRL Register (offset = 290h) [reset = 30h]

DDRPLL_PWRCTRL is shown in [Figure 2-153](#) and described in [Table 2-169](#).

The PLL Power Control register is used to control the power state of the respective PLL.

Figure 2-153. DDRPLL_PWRCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-169. DDRPLL_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

2.10.1.128 DDRPLL_CLKCTRL Register (offset = 294h) [reset = 914824h]

DDRPLL_CLKCTRL is shown in [Figure 2-154](#) and described in [Table 2-170](#).

The PLL Clock Control register is used to control the different clock control state of the respective PLL

Figure 2-154. DDRPLL_CLKCTRL Register

31	30	29	28	27	26	25	24
CYCLES_LIPEN	ENSSC	CLKDCOLDOEN	N WELLTRIM

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-170. DDRPLL_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLES_LIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	N WELLTRIM	R/W	0h	Trim values for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low power
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO

Table 2-170. DDRPLL_CLKCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0 : When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 0x1 : When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0 : Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	Reserved	R	0h	
14	STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	Reserved	R	0h	
12-10	SELFREQDCO	R/W	2h	DCO Clock (DCOCLK = CLKINP * [M/(N+1)]) frequency range selector. 0x0 : Reserved 0x2 : HS2 : DCOCLK range is from 500 MHz to 1000 MHz 0x3 : Reserved 0x4 : HS1 : DCOCLK range is from 1000 MHz to 2000 MHz 0x5 : Reserved
9	Reserved	R	0h	
8	RELAXED_LOCK	R/W	0h	Decides when FREQLOCK asserted 0x0 : FREQLOCK asserted when DC frequency error less than 1% 0x1 : FREQLOCK asserted when DC frequency error less than 2%
7-1	Reserved	R	12h	
0	TINITZ	R/W	0h	PLL core soft reset

2.10.1.129 DDRPLL_TENABLE Register (offset = 298h) [reset = 0h]

DDRPLL_TENABLE is shown in [Figure 2-155](#) and described in [Table 2-171](#).

Load the M, N, SD and SELFREQDCO dividers of the particular ADPLLJ.

Figure 2-155. DDRPLL_TENABLE Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-171. DDRPLL_TENABLE Register Field Descriptions

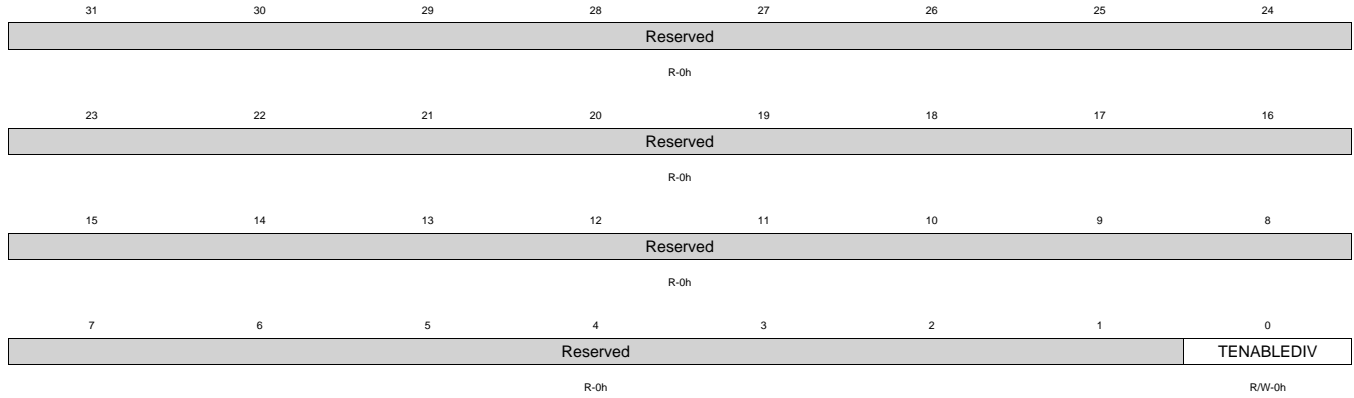

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLE	R/W	0h	M, N, SD and SELFREQDCO latch (active rise edge)

2.10.1.130 DDRPLL_TENABLEDIV Register (offset = 29Ch) [reset = 0h]

DDRPLL_TENABLEDIV is shown in [Figure 2-156](#) and described in [Table 2-172](#).

The PLL TENABLEDIV register is used to load the M2,N2 dividers of respective PLL

Figure 2-156. DDRPLL_TENABLEDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

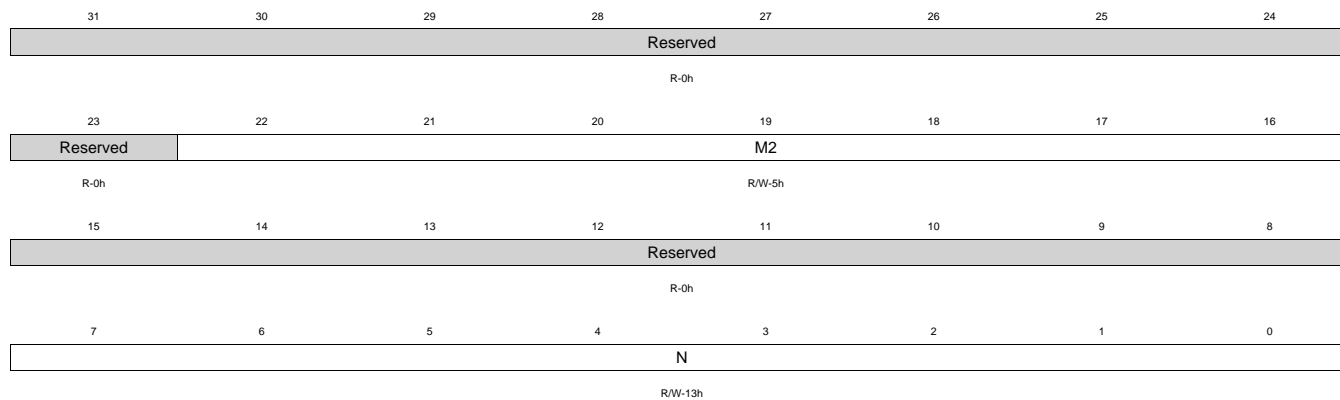

Table 2-172. DDRPLL_TENABLEDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	TENABLEDIV	R/W	0h	M2 and N2 latch (active rise edge)

2.10.1.131 DDRPLL_M2NDIV Register (offset = 2A0h) [reset = 50013h]

DDRPLL_M2NDIV is shown in [Figure 2-157](#) and described in [Table 2-173](#).

PLL M2NDIV register is for programming M2 and N values of respective PLL

Figure 2-157. DDRPLL_M2NDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-173. DDRPLL_M2NDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	Reserved	R	0h	
22-16	M2	R/W	5h	Post-divider is REGM2
15-8	Reserved	R	0h	
7-0	N	R/W	13h	Pre-divider is REGN+1

2.10.1.132 DDRPLL_MN2DIV Register (offset = 2A4h) [reset = 174h]

DDRPLL_MN2DIV is shown in [Figure 2-158](#) and described in [Table 2-174](#).

PLL MN2DIV register is for programming M and N2 values of respective PLL

Figure 2-158. DDRPLL_MN2DIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

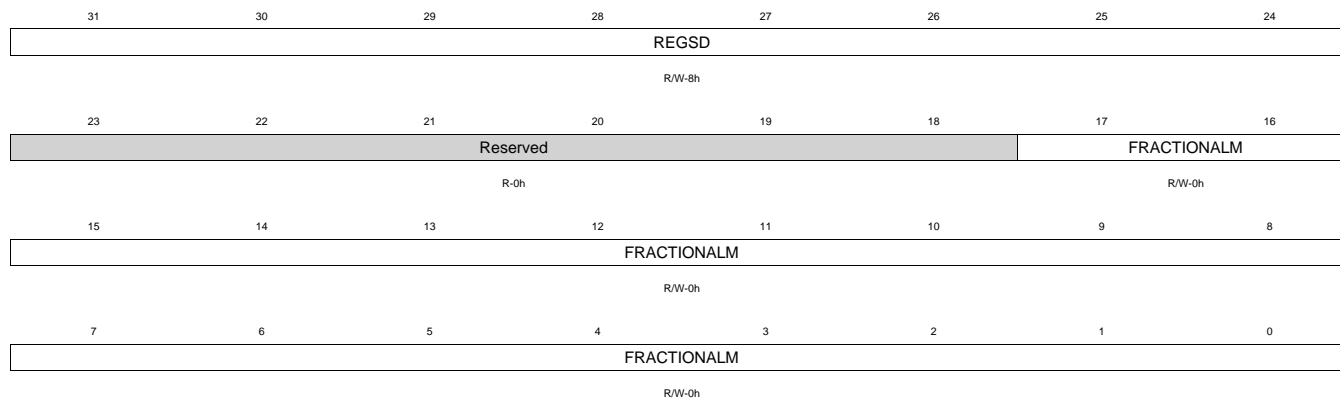

Table 2-174. DDRPLL_MN2DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	Reserved	R	0h	
11-0	M	R/W	174h	Feedback multiplier is REGM

2.10.1.133 DDRPLL_FRACDIV Register (offset = 2A8h) [reset = 800000h]

DDRPLL_FRACDIV is shown in [Figure 2-159](#) and described in [Table 2-175](#).

The PLL FRACDIV register is for controlling the fractional values of respective PLL

Figure 2-159. DDRPLL_FRACDIV Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-175. DDRPLL_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING}([DPLL_MULT/(DPLL_DIV+1)] * CLKINP / 250)$, where CLKINP is the input clock of the DPLL in MHz). Must be set with M and N factors, and must not be changed once DPLL is locked.
23-18	Reserved	R	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

2.10.1.134 DDRPLL_BWCTRL Register (offset = 2ACh) [reset = 0h]

DDRPLL_BWCTRL is shown in [Figure 2-160](#) and described in [Table 2-176](#).

The PLL_BWCTRL register is for controlling the loop bandwidth of respective PLL

Figure 2-160. DDRPLL_BWCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-176. DDRPLL_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0 : decrease BW 0x1 : increase BW

2.10.1.135 DDRPLL_FRACCTRL Register (offset = 2B0h) [reset = 0h]

 DDRPLL_FRACCTRL is shown in [Figure 2-161](#) and described in [Table 2-177](#).

Controls the fractional portion of respective ADPLLLJ.

Figure 2-161. DDRPLL_FRACCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-177. DDRPLL_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control.
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

2.10.1.136 DDRPLL_STATUS Register (offset = 2B4h) [reset = C000121h]

 DDRPLL_STATUS is shown in [Figure 2-162](#) and described in [Table 2-178](#).

The PLL Status register is for viewing the status of the respective PLL.

Figure 2-162. DDRPLL_STATUS Register

2.10.1.151 DEEPSLEEP_CTRL Register (offset = 324h) [reset = 6A75h]

DEEPSLEEP_CTRL is shown in [Figure 2-177](#) and described in [Table 2-193](#).

The DEEPSLEEP control register is used to control deep sleep power mode. Deep sleep is not supported on this SoC.

Figure 2-177. DEEPSLEEP_CTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-193. DEEPSLEEP_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17	DSENABLE	R/W	0h	'1' enables the deep sleep circuitry, and allows the device pin DEEPSLEEPZ(TBD) to have control
16	DSPOLARITY	R/W	0h	controls the polarity of DEEPSLEEPZ(TBD) pin. '0' means pin is active low. '1' means pin is active high.
15-0	DSCOUNT	R/W	6A75h	programmable count of how many osc clocks it needs to see prior to exiting deep sleep mode

2.10.1.152 DEEPSLEEP_STATUS Register (offset = 328h) [reset = 0h]

DEEPSLEEP_STATUS is shown in [Figure 2-178](#) and described in [Table 2-194](#).

The DEEPSLEEP control register logs the internal deepsleep counter value.

Figure 2-178. DEEPSLEEP_STATUS Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-194. DEEPSLEEP_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	DSCOMPLETE	R	0h	1' if DSCOUNT value equals the internal deepsleep counter value

2.10.2 PRM_DEVICE Registers

[Table 2-195](#) lists the memory-mapped registers for the PRM_DEVICE. All register offset addresses not listed in [Table 2-195](#) should be considered as reserved locations and the register contents should not be modified.

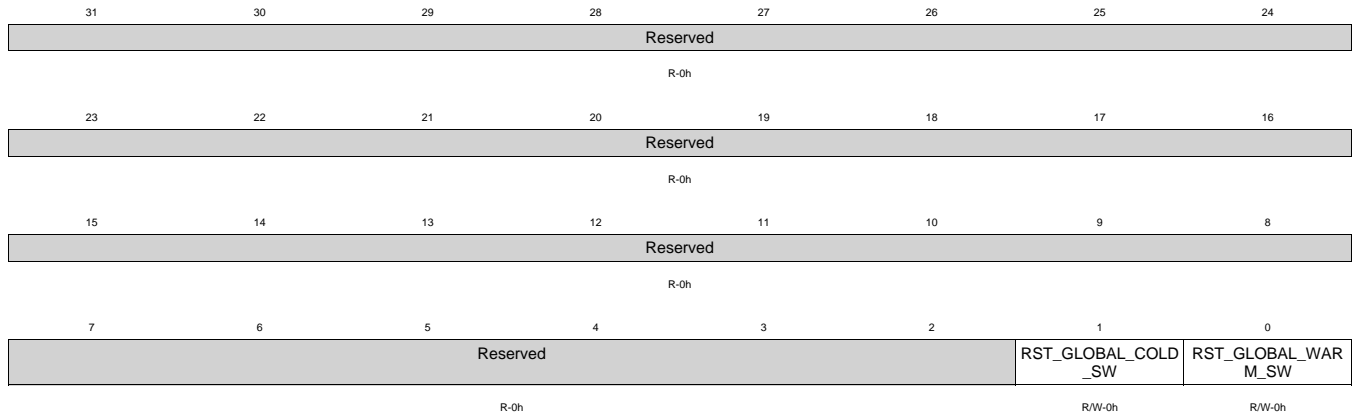

Table 2-195. PRM_DEVICE REGISTERS

Offset	Acronym	Register Name	Section
A0h	PRM_RSTCTRL	Global software cold and warm reset control. This register is auto-cleared. Only write 1 is possible. A read returns 0 only.	Section 2.10.2.1
A4h	PRM_RSTTIME	Reset duration control.	Section 2.10.2.2
A8h	PRM_RSTST	This register logs the global reset sources. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]	Section 2.10.2.3

2.10.2.1 PRM_RSTCTRL Register (offset = A0h) [reset = 0h]

PRM_RSTCTRL is shown in [Figure 2-179](#) and described in [Table 2-196](#).

Global software cold and warm reset control. This register is auto-cleared. Only write 1 is possible. A read returns 0 only.

Figure 2-179. PRM_RSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

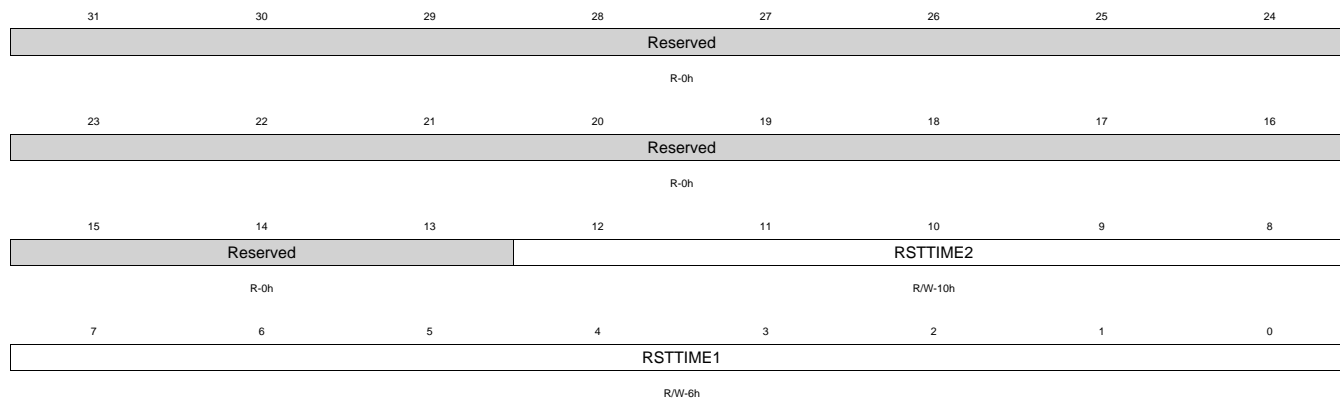

Table 2-196. PRM_RSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	Reserved	R	0h	
1	RST_GLOBAL_COLD_SW	R/W	0h	Global COLD software reset control. This bit is reset only upon a global cold source of reset. 0x0: Global COLD software reset is cleared. 0x1: Asserts a global COLD software reset. The software must ensure the SDRAM is properly put in self-refresh mode before applying this reset.
0	RST_GLOBAL_WARM_SW	R/W	0h	Global WARM software reset control. This bit is reset upon any global source of reset (warm and cold). 0x0: Global warm software reset is cleared. 0x1: Asserts a global warm software reset.

2.10.2.2 PRM_RSTTIME Register (offset = A4h) [reset = 1006h]

PRM_RSTTIME is shown in [Figure 2-180](#) and described in [Table 2-197](#).

Reset duration control.

Figure 2-180. PRM_RSTTIME Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-197. PRM_RSTTIME Register Field Descriptions

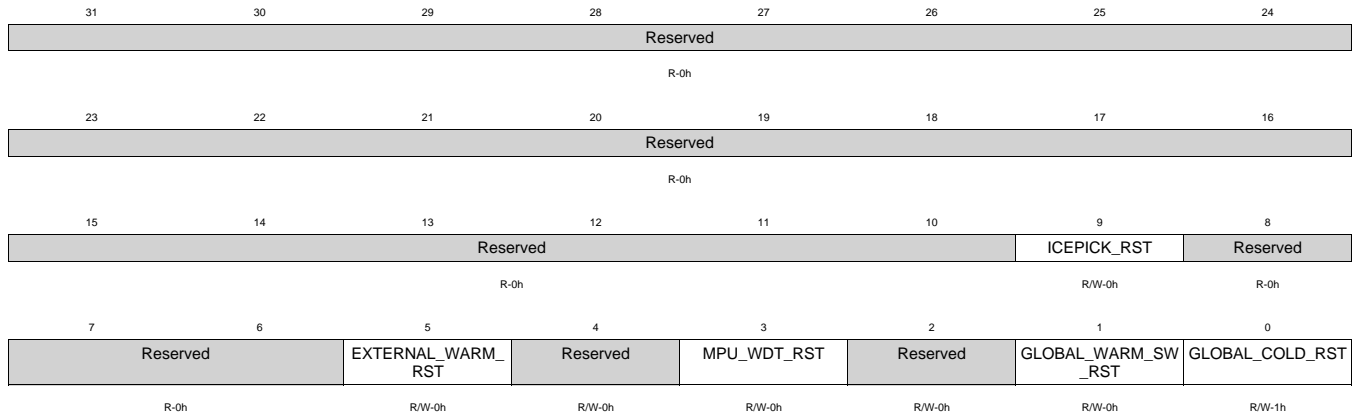

Bit	Field	Type	Reset	Description
31-13	Reserved	R	0h	
12-8	RSTTIME2	R/W	10h	(Power domain) reset duration 2 (number of SYS_CLK clock cycles)
7-0	RSTTIME1	R/W	6h	(Global) reset duration 1 (number of SYS_CLK clock cycles)

2.10.2.3 PRM_RSTST Register (offset = A8h) [reset = 1h]

PRM_RSTST is shown in Figure 2-181 and described in Table 2-198.

This register logs the global reset sources. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]

Figure 2-181. PRM_RSTST Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-198. PRM_RSTST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	Reserved	R	0h	
9	ICEPICK_RST	R/W	0h	IcePick reset event. This is a source of global warm reset initiated by the emulation. [warm reset insensitive] 0x0: No ICEPICK reset. 0x1: IcePick reset has occurred.
8-6	Reserved	R	0h	
5	EXTERNAL_WARM_RST	R/W	0h	External warm reset event [warm reset insensitive] 0x0: No global warm reset. 0x1: Global external warm reset has occurred.
4	Reserved	R/W	0h	
3	MPU_WDT_RST	R/W	0h	MPU Watchdog timer reset event. This is a source of global WARM reset. [warm reset insensitive] 0x0: No MPU watchdog reset. 0x1: MPU watchdog reset has occurred.
2	Reserved	R/W	0h	
1	GLOBAL_WARM_SW_RST	R/W	0h	Global warm software reset event [warm reset insensitive] 0x0: No global warm SW reset 0x1: Global warm SW reset has occurred.
0	GLOBAL_COLD_RST	R/W	1h	Power-on (cold) reset event [warm reset insensitive] 0x0: No power-on reset. 0x1: Power-on reset has occurred.

2.10.3 CM_DEVICE Registers

Table 2-199 lists the memory-mapped registers for the CM_DEVICE. All register offset addresses not listed in Table 2-199 should be considered as reserved locations and the register contents should not be modified.

Table 2-199. CM_DEVICE REGISTERS

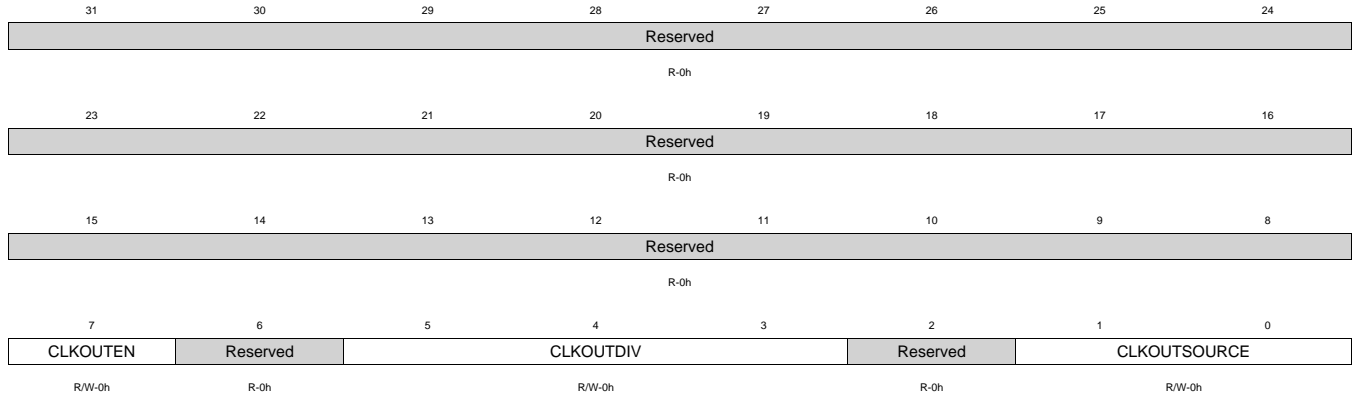

Offset	Acronym	Register Name	Section
0h	CM_CLKOUT_CTRL	This register provides the control over SYS_CLKOUT output	Section 2.10.3.1

2.10.3.1 CM_CLKOUT_CTRL Register (offset = 0h) [reset = 0h]

CM_CLKOUT_CTRL is shown in [Figure 2-182](#) and described in [Table 2-200](#).

This register provides the control over SYS_CLKOUT output

Figure 2-182. CM_CLKOUT_CTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-200. CM_CLKOUT_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	Reserved	R	0h	
7	CLKOUTEN	R/W	0h	This bit controls the external clock activity 0x0: DIS : SYS_CLKOUT is disabled 0x1: EN : SYS_CLKOUT is enabled
6	Reserved	R	0h	
5-3	CLKOUTDIV	R/W	0h	This field controls the external clock division factor of the CLKOUT Second Pin CLKOUT2 0x0 = SYS_CLKOUT2/1 0x1 = SYS_CLKOUT2/2 0x2 = SYS_CLKOUT2/3 0x3 = SYS_CLKOUT2/4 0x4 = SYS_CLKOUT2/5 0x5 = SYS_CLKOUT2/6 0x6 = SYS_CLKOUT2/7 0x7 = SYS_CLKOUT2/8
2	Reserved	R	0h	
1-0	CLKOUTSOURCE	R/W	0h	This field selects the external output clock source 0x0: MAIN_PLL_CLK : DEVOSC clock 0x1: DPLL_DSP_CLK : USB PLL clock output 0x2: VIDEO_PLL_CLK : VIDEO0 PLL clock output 0x3: AUDIO_PLL_CLK : RTCDIVIDER output

2.10.4 OCP_SOCKET_PRM Registers

[Table 2-201](#) lists the memory-mapped registers for the OCP_SOCKET_PRM. All register offset addresses not listed in [Table 2-201](#) should be considered as reserved locations and the register contents should not be modified.

Table 2-201. OCP_SOCKET_PRM REGISTERS

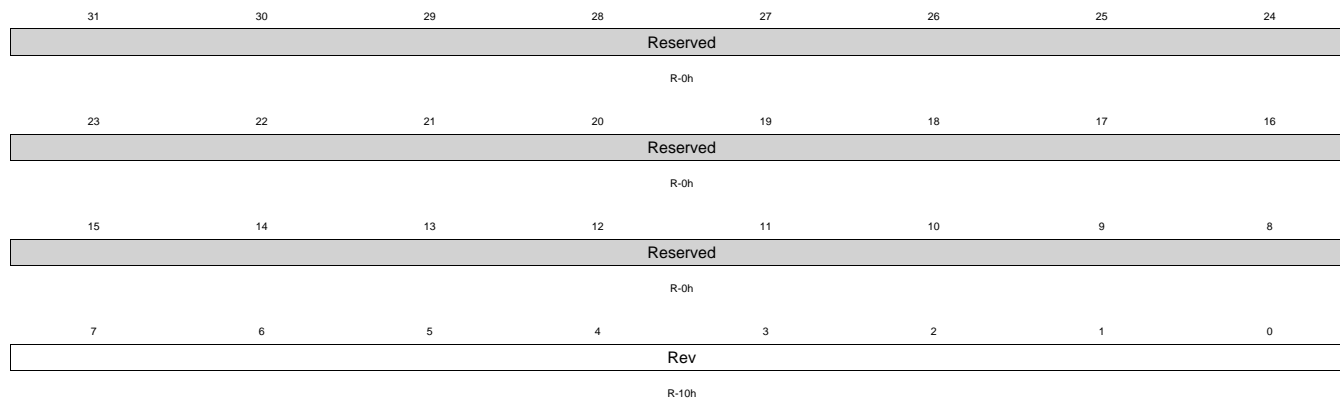

Offset	Acronym	Register Name	Section
0h	REVISION_PRM	This register contains the IP revision code for the PRCM	Section 2.10.4.1

2.10.4.1 REVISION_PRM Register (offset = 0h) [reset = 10h]

REVISION_PRM is shown in [Figure 2-183](#) and described in [Table 2-202](#).

This register contains the IP revision code for the PRCM

Figure 2-183. REVISION_PRM Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-202. REVISION_PRM Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	Reserved	R	0h	
7-0	Rev	R	10h	IP revision [7:4] Major revision [3:0] Minor revision Examples: 0x10 for 1.0, 0x21 for 2.1

2.10.5 CM_DPLL Registers

[Table 2-203](#) lists the memory-mapped registers for the CM_DPLL. All register offset addresses not listed in [Table 2-203](#) should be considered as reserved locations and the register contents should not be modified.

Table 2-203. CM_DPLL REGISTERS

Offset	Acronym	Register Name	Section
8h	CM_SYSCLK3_CLKSEL	Selects the divider value for SYSCLK3	Section 2.10.5.1
24h	CM_SYSCLK10_CLKSEL	Selects the divider value for SYSCLK10	Section 2.10.5.2
40h	CM_VPB3_CLKSEL	Selects the divider value for Video PLL B3 divider	Section 2.10.5.3
44h	CM_VPC1_CLKSEL	Selects the divider value for Video PLL C1 divider	Section 2.10.5.4
48h	CM_VPD1_CLKSEL	Selects the divider value for Video PLL D1 divider	Section 2.10.5.5
4Ch	CM_SYSCLK19_CLKSEL	Selects the divider value for SYSCLK19 clock	Section 2.10.5.6
50h	CM_SYSCLK20_CLKSEL	Selects the divider value for SYSCLK20 clock	Section 2.10.5.7
54h	CM_SYSCLK21_CLKSEL	Selects the divider value for SYSCLK21 clock	Section 2.10.5.8
58h	CM_SYSCLK22_CLKSEL	Selects the divider value for SYSCLK22 clock	Section 2.10.5.9
5Ch	CM_APA_CLKSEL	Selects the divider value for Audio PLL A divider	Section 2.10.5.10
70h	CM_SYSCLK14_CLKSEL	Selects the Mux select line for SYSCLK14 clock	Section 2.10.5.11
74h	CM_SYSCLK16_CLKSEL	Selects the Mux select line for SYSCLK16 clock	Section 2.10.5.12
78h	CM_SYSCLK18_CLKSEL	Selects the Mux select line for SYSCLK18 clock	Section 2.10.5.13
7Ch	CM_AUDIOCLK_MCASP0_CLKSEL	Selects the Mux select line for McASP0 audio clock	Section 2.10.5.14
80h	CM_AUDIOCLK_MCASP1_CLKSEL	Selects the Mux select line for McASP1 audio clock	Section 2.10.5.15

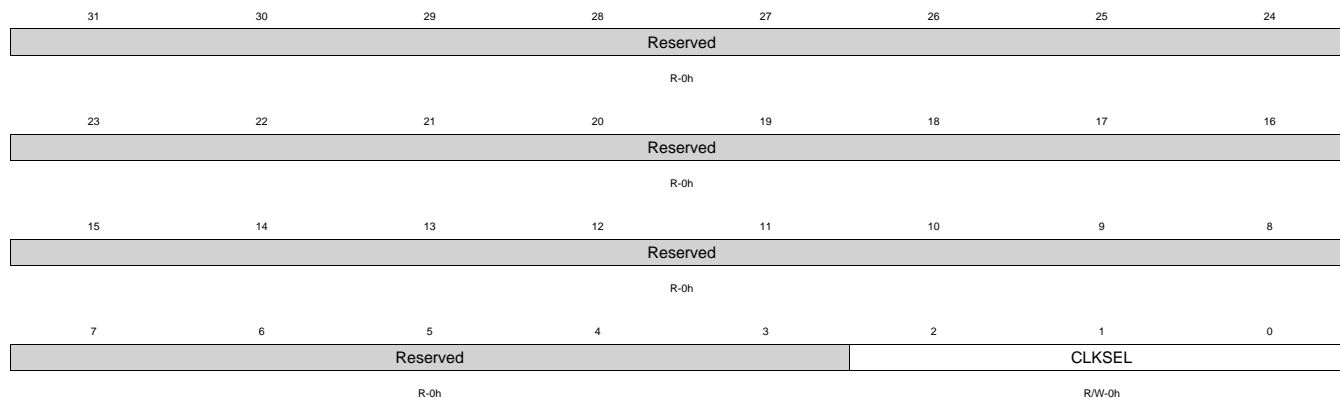

Table 2-203. CM_DPLL REGISTERS (continued)

Offset	Acronym	Register Name	Section
84h	CM_AUDIOCLK_MCASP2_CLKSEL	Selects the Mux select line for McASP2 audio clock	Section 2.10.5.16
88h	CM_AUDIOCLK_MCBSP_CLKSEL	Selects the Mux select line for McBSP audio clock	Section 2.10.5.17
ACh	CM_HDMI_CLKSEL	Selects the Mux select line for HDMI audio clock	Section 2.10.5.18
B0h	CM_SYSCLOCK23_CLKSEL	Selects the divider value for SYSCLOCK23 which is the SGX functional clock	Section 2.10.5.19

2.10.5.1 CM_SYCLK3_CLKSEL Register (offset = 8h) [reset = 0h]

 CM_SYCLK3_CLKSEL is shown in [Figure 2-184](#) and described in [Table 2-204](#).

Selects the divider value for SYCLK3

Figure 2-184. CM_SYCLK3_CLKSEL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-204. CM_SYCLK3_CLKSEL Register Field Descriptions

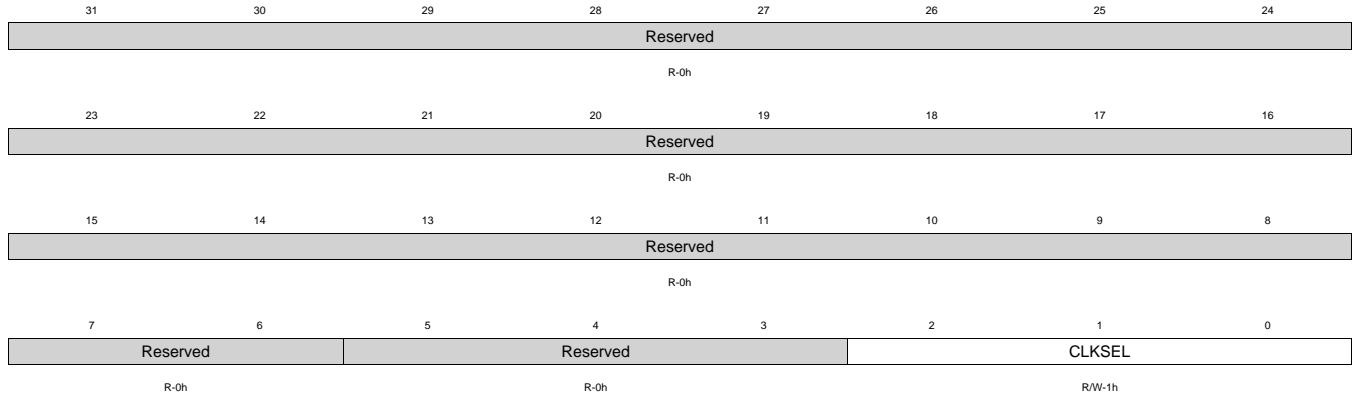

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2-0	CLKSEL	R/W	0h	Selects the divider value [warm reset insensitive] 0x0 = SYCLK_DIV_1 : Select SYS_CLK divided by 1 0x1 = SYCLK_DIV_2 : Select SYS_CLK divided by 2 0x2 = SYCLK_DIV_3 : Select SYS_CLK divided by 3 0x3 = SYCLK_DIV_4 : Select SYS_CLK divided by 4 0x4 = SYCLK_DIV_5 : Select SYS_CLK divided by 5 0x5 = SYCLK_DIV_6 : Select SYS_CLK divided by 6. 0x6 = SYCLK_DIV_7 : Select SYS_CLK divided by 7. 0x7 = SYCLK_DIV_8 : Select SYS_CLK divided by 8.

2.10.5.2 CM_SYSCLOCK10_CLKSEL Register (offset = 24h) [reset = 1h]

CM_SYSCLOCK10_CLKSEL is shown in [Figure 2-185](#) and described in [Table 2-205](#).

Selects the divider value for SYSCLOCK10

Figure 2-185. CM_SYSCLOCK10_CLKSEL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-205. CM_SYSCLOCK10_CLKSEL Register Field Descriptions

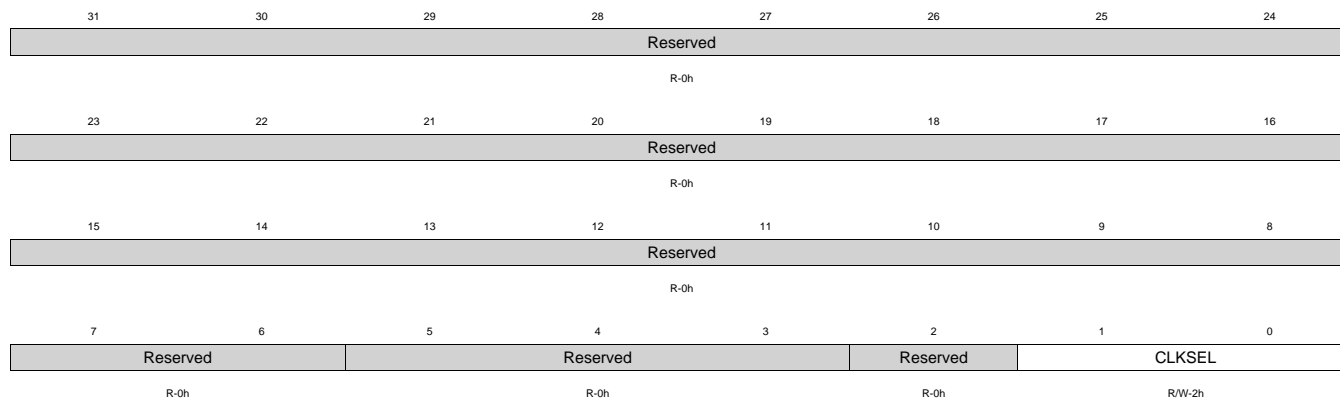

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5-3	Reserved	R	0h	
2-0	CLKSEL	R/W	1h	Selects the divider value [warm reset insensitive] 0x0 = SYSCLOCK_DIV_1 : Select SYS_CLK divided by 1 0x1 = SYSCLOCK_DIV_2 : Select SYS_CLK divided by 2 0x2 = SYSCLOCK_DIV_3 : Select SYS_CLK divided by 3 0x3 = SYSCLOCK_DIV_4 : Select SYS_CLK divided by 4 0x4 = SYSCLOCK_DIV_5 : Select SYS_CLK divided by 5 0x5 = SYSCLOCK_DIV_6 : Select SYS_CLK divided by 6 0x6 = SYSCLOCK_DIV_7 : Select SYS_CLK divided by 7 0x7 = SYSCLOCK_DIV_8 : Select SYS_CLK divided by 8

2.10.5.3 CM_VPB3_CLKSEL Register (offset = 40h) [reset = 2h]

CM_VPB3_CLKSEL is shown in [Figure 2-186](#) and described in [Table 2-206](#).

Selects the divider value for Video PLL B3 divider

Figure 2-186. CM_VPB3_CLKSEL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-206. CM_VPB3_CLKSEL Register Field Descriptions

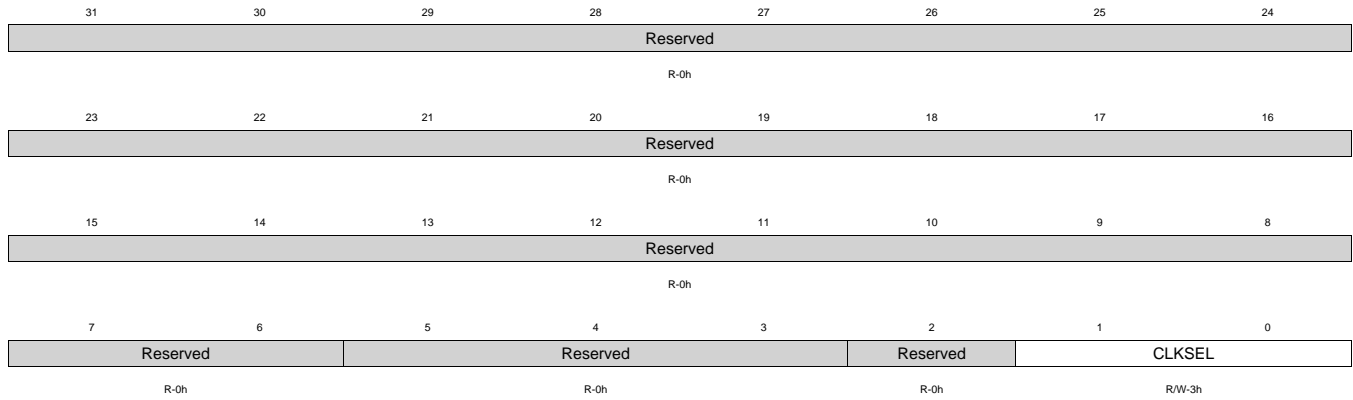

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5-3	Reserved	R	0h	
2	Reserved	R	0h	
1-0	CLKSEL	R/W	2h	Selects the divider value [warm reset insensitive] 0x0 = SYSCLK_DIV_1 : Select SYS_CLK divided by 1 0x1 = SYSCLK_DIV_2 : Select SYS_CLK divided by 2 0x2 = SYSCLK_DIV_22 : Select SYS_CLK divided by 22 0x3 = Reserved

2.10.5.4 CM_VPC1_CLKSEL Register (offset = 44h) [reset = 3h]

CM_VPC1_CLKSEL is shown in [Figure 2-187](#) and described in [Table 2-207](#).

Selects the divider value for Video PLL C1 divider

Figure 2-187. CM_VPC1_CLKSEL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-207. CM_VPC1_CLKSEL Register Field Descriptions

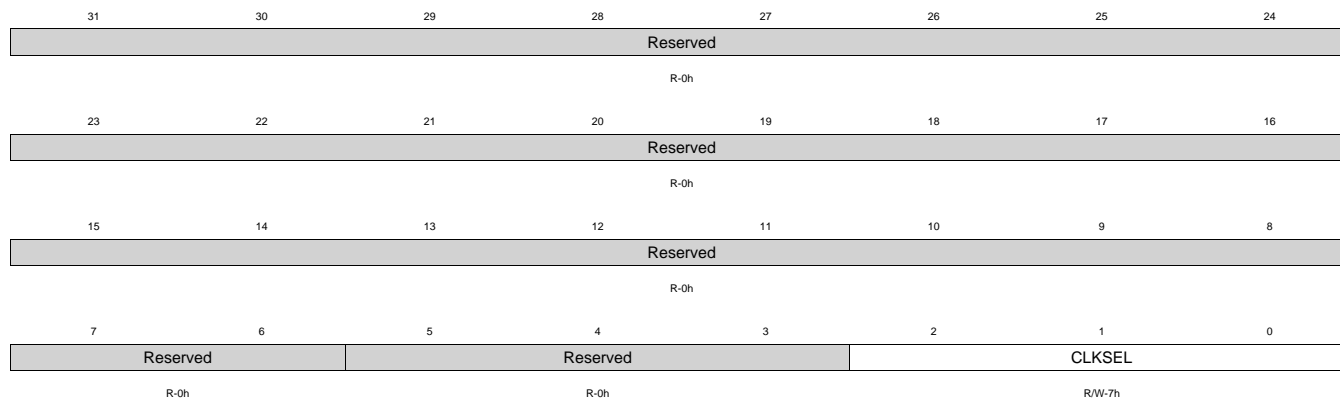

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5-3	Reserved	R	0h	
2	Reserved	R	0h	
1-0	CLKSEL	R/W	3h	Selects the divider value [warm reset insensitive] 0x0 = SYSCLK_DIV_1 : Select SYS_CLK divided by 1 0x1 = SYSCLK_DIV_2 : Select SYS_CLK divided by 2 0x2 = SYSCLK_DIV_22 : Select SYS_CLK divided by 22 0x3 = Reserved

2.10.5.5 CM_VPD1_CLKSEL Register (offset = 48h) [reset = 7h]

CM_VPD1_CLKSEL is shown in [Figure 2-188](#) and described in [Table 2-208](#).

Selects the divider value for Video PLL D1 divider

Figure 2-188. CM_VPD1_CLKSEL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-208. CM_VPD1_CLKSEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5-3	Reserved	R	0h	
2-0	CLKSEL	R/W	7h	Selects the divider value [warm reset insensitive] 0x0 = SYSCLK_DIV_1 : Select SYS_CLK divided by 1 0x1 = SYSCLK_DIV_2 : Select SYS_CLK divided by 2 0x2 = SYSCLK_DIV_3 : Select SYS_CLK divided by 3 0x3 = SYSCLK_DIV_4 : Select SYS_CLK divided by 4 0x4 = SYSCLK_DIV_5 : Select SYS_CLK divided by 5 0x5 = SYSCLK_DIV_6 : Select SYS_CLK divided by 6 0x6 = SYSCLK_DIV_7 : Select SYS_CLK divided by 7 0x7 = SYSCLK_DIV_8 : Select SYS_CLK divided by 8

2.10.5.6 CM_SYSCCLK19_CLKSEL Register (offset = 4Ch) [reset = 0h]

CM_SYSCCLK19_CLKSEL is shown in [Figure 2-189](#) and described in [Table 2-209](#).

Selects the divider value for SYSCCLK19 clock

Figure 2-189. CM_SYSCCLK19_CLKSEL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-209. CM_SYSCCLK19_CLKSEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5-3	Reserved	R	0h	
2-0	CLKSEL	R/W	0h	Selects the divider value [warm reset insensitive] 0x0 = SYSCCLK_DIV_1 : Select SYS_CLK divided by 1 0x1 = SYSCCLK_DIV_2 : Select SYS_CLK divided by 2 0x2 = SYSCCLK_DIV_3 : Select SYS_CLK divided by 3 0x3 = SYSCCLK_DIV_4 : Select SYS_CLK divided by 4 0x4 = SYSCCLK_DIV_5 : Select SYS_CLK divided by 5 0x5 = SYSCCLK_DIV_6 : Select SYS_CLK divided by 6 0x6 = SYSCCLK_DIV_7 : Select SYS_CLK divided by 7 0x7 = SYSCCLK_DIV_8 : Select SYS_CLK divided by 8

2.10.5.7 CM_SYSClk20_CLKSEL Register (offset = 50h) [reset = 0h]

 CM_SYSClk20_CLKSEL is shown in [Figure 2-190](#) and described in [Table 2-210](#).

Selects the divider value for SYSClk20 clock

Figure 2-190. CM_SYSClk20_CLKSEL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

2.10.6 CM_ACTIVE Registers

[Table 2-223](#) lists the memory-mapped registers for the CM_ACTIVE. All register offset addresses not listed in [Table 2-223](#) should be considered as reserved locations and the register contents should not be modified.

Table 2-223. CM_ACTIVE REGISTERS

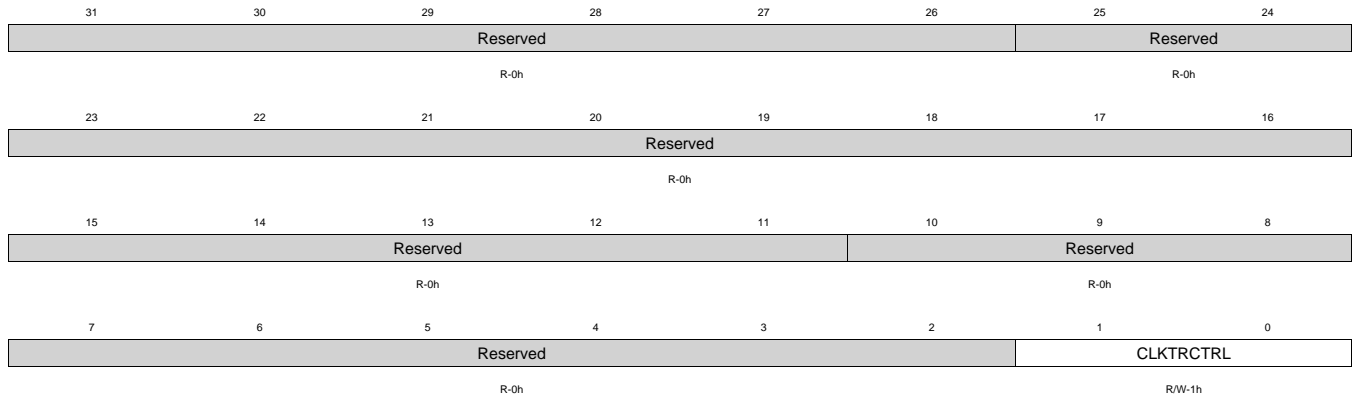

Offset	Acronym	Register Name	Section
0h	CM_GEM_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.6.1
20h	CM_ACTIVE_GEM_CLKCTRL	This register manages the DSP Subsystem C674x clocks.	Section 2.10.6.2

2.10.6.1 CM_GEM_CLKSTCTRL Register (offset = 0h) [reset = 1h]

CM_GEM_CLKSTCTRL is shown in [Figure 2-203](#) and described in [Table 2-224](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

Figure 2-203. CM_GEM_CLKSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-224. CM_GEM_CLKSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	Reserved	R	0h	
25-11	Reserved	R	0h	
10-2	Reserved	R	0h	
1-0	CLKTRCTRL	R/W	1h	Controls the clock state transition of the GEM clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: SW_SLEEP: Start a software forced sleep transition on the domain. 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.

2.10.6.2 CM_ACTIVE_GEM_CLKCTRL Register (offset = 20h) [reset = 70000h]

CM_ACTIVE_GEM_CLKCTRL is shown in [Figure 2-204](#) and described in [Table 2-225](#).

This register manages the DSP subsystem C674x clocks.

Figure 2-204. CM_ACTIVE_GEM_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-225. CM_ACTIVE_GEM_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	Reserved	R	0h	
18	STBYST	R	1h	Module standby status. 0x0: Func: Module is functional (not in standby) 0x1: Standby: Module is in standby
17-16	IDLEST	R	3h	Module idle status. 0x0: Func: Module is fully functional, including OCP 0x1: Trans: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Idle: Module is in Idle mode (only OCP part). It is functional if using separate functional clock 0x3: Disable: Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0: DISABLED: Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). Read 0x1: Reserved 0x2: ENABLE: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. Read 0x3: Reserved

2.10.7 CM_DEFAULT Registers

[Table 2-226](#) lists the memory-mapped registers for the CM_DEFAULT. All register offset addresses not listed in [Table 2-226](#) should be considered as reserved locations and the register contents should not be modified.

Table 2-226. CM_DEFAULT REGISTERS

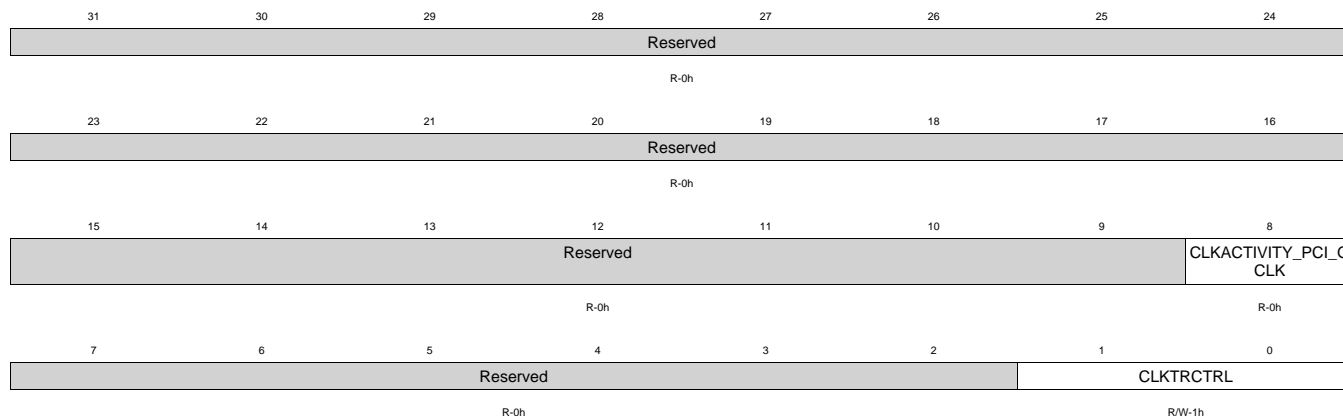

Offset	Acronym	Register Name	Section
10h	CM_DEFAULT_PCI_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.7.1
18h	CM_DEFAULT_DUCATI_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.7.2
28h	CM_DEFAULT_DMM_CLKCTRL	This register manages the DMM clocks.	Section 2.10.7.3
54h	Reserved		
58h	CM_DEFAULT_USB_CLKCTRL	This register manages the USB clocks.	Section 2.10.7.4
60h	CM_DEFAULT_SATA_CLKCTRL	This register manages the SATA clocks.	Section 21.6.2
74h	CM_DEFAULT_DUCATI_CLKCTRL	This register manages the DUCATI clocks.	Section 2.10.7.6
78h	CM_DEFAULT_PCI_CLKCTRL	This register manages the PCI clocks.	Section 2.10.7.7

2.10.7.1 CM_DEFAULT_PCI_CLKSTCTRL Register (offset = 10h) [reset = 1h]

CM_DEFAULT_PCI_CLKSTCTRL is shown in [Figure 2-206](#) and described in [Table 2-228](#).

This register manages the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

Figure 2-205. CM_DEFAULT_PCI_CLKSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

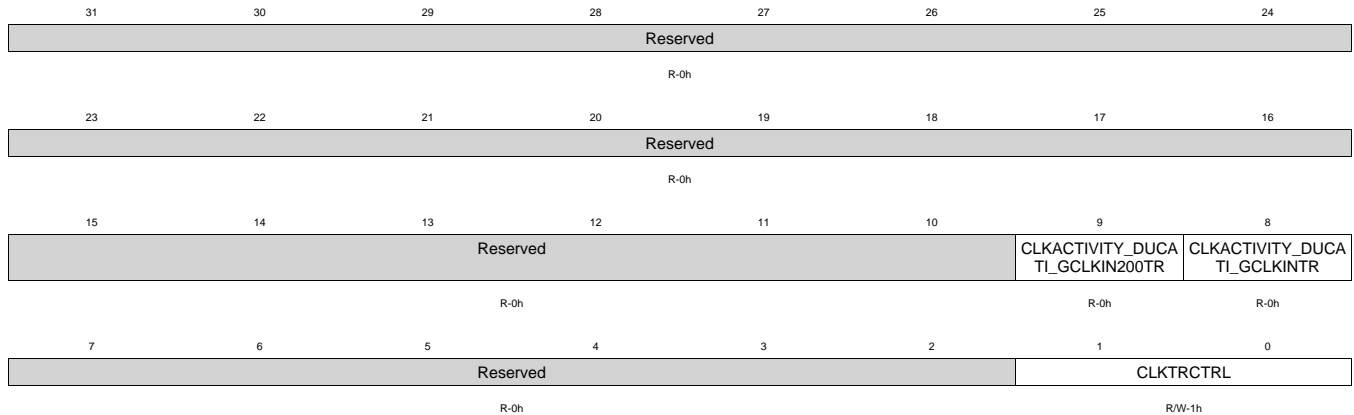

Table 2-227. CM_DEFAULT_PCI_CLKSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	Reserved	R	0h	
8	CLKACTIVITY_PCI_GCLK	R	0h	This field indicates the state of the PCI_GCLK clock in the domain. Read 0x0: Corresponding clock is gated. Read 0x1: Corresponding clock is active.
7-2	Reserved	R	0h	
1-0	CLKTRCTRL	R/W	1h	Controls the clock state transition of the PCI clock domains. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: SW_SLEEP: Start a software forced sleep transition on the domain. 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.

2.10.7.2 CM_DEFAULT_DUCATI_CLKSTCTRL Register (offset = 18h) [reset = 1h]

CM_DEFAULT_DUCATI_CLKSTCTRL is shown in [Figure 2-206](#) and described in [Table 2-228](#).

This register manages the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

Figure 2-206. CM_DEFAULT_DUCATI_CLKSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-228. CM_DEFAULT_DUCATI_CLKSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	Reserved	R	0h	
9	CLKACTIVITY_DUCATI_GCLKIN200TR	R	0h	This field indicates the state of the CLKIN200TR clock in the domain Read 0: Corresponding clock is gated Read 1: Corresponding clock is active
8	CLKACTIVITY_DUCATI_GCLKINTR	R	0h	This field indicates the state of the CLKINTR clock in the domain. Read 0: Corresponding clock is gated Read 1: Corresponding clock is active
7-2	Reserved	R	0h	
1-0	CLKTRCTRL	R/W	1h	Controls the clock state transition of the DUCATI clock domains. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: SW_SLEEP: Start a software forced sleep transition on the domain. 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.

2.10.7.3 CM_DEFAULT_DMM_CLKCTRL Register (offset = 28h) [reset = 30000h]

 CM_DEFAULT_DMM_CLKCTRL is shown in [Figure 2-207](#) and described in [Table 2-229](#).

This register manages the DMM clocks.

Figure 2-207. CM_DEFAULT_DMM_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-229. CM_DEFAULT_DMM_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. 0x0: Func: Module is fully functional, including INTERCONN 0x1: Trans: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Idle: Module is in Idle mode (only INTERCONN part). It is functional if using separate functional clock 0x3: Disable: Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0: DISABLED: Module is disable by SW. Any INTERCONN access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: RESERVED 0x2: ENABLE: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3: RESERVED

2.10.7.4 CM_DEFAULT_USB_CLKCTRL Register (offset = 58h) [reset = 70000h]

CM_DEFAULT_USB_CLKCTRL is shown in [Figure 2-208](#) and described in [Table 2-230](#).

This register manages the USB clocks.

Figure 2-208. CM_DEFAULT_USB_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-230. CM_DEFAULT_USB_CLKCTRL Register Field Descriptions

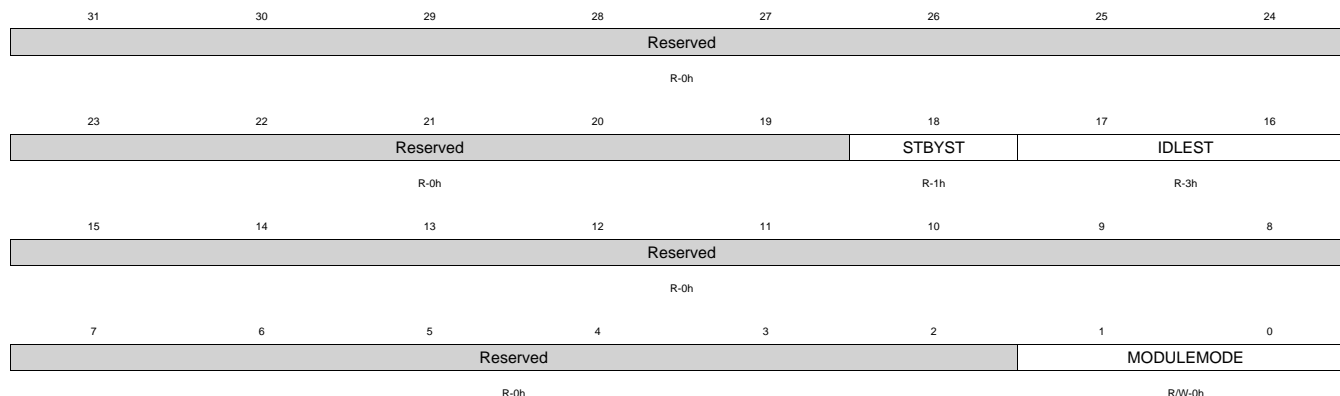

Bit	Field	Type	Reset	Description

2.10.8 CM_HDVICP Registers

[Table 2-234](#) lists the memory-mapped registers for the CM_HDVICP. All register offset addresses not listed in [Table 2-234](#) should be considered as reserved locations and the register contents should not be modified.

Table 2-234. CM_HDVICP REGISTERS

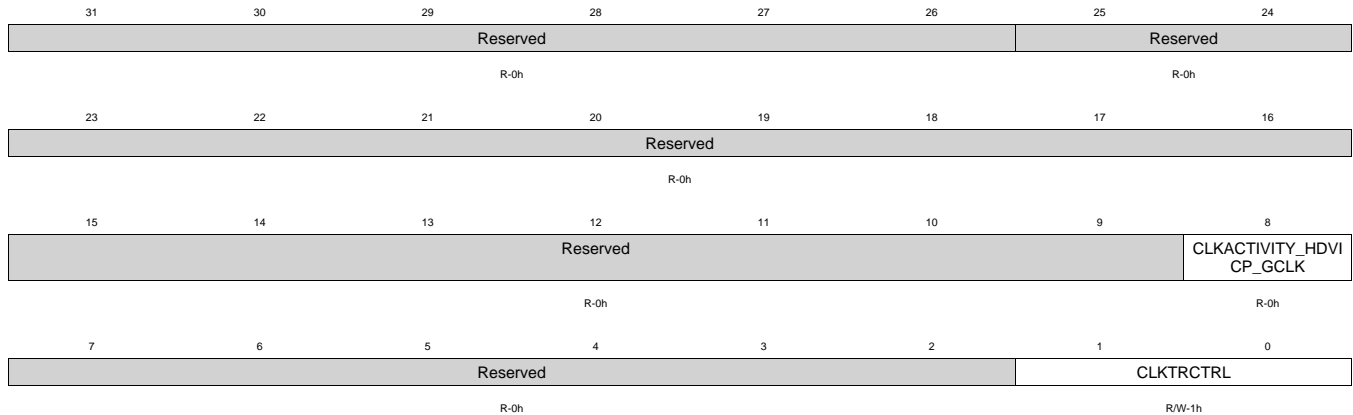

Offset	Acronym	Register Name	Section
0h	CM_HDVICP_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.8.1
20h	CM_HDVICP_CLKCTRL	This register manages the HDVICP clocks.	Section 2.10.8.2
24h	CM_HDVICP_SL2_CLKCTRL	This register manages the SL2 clocks.	Section 2.10.8.3

2.10.8.1 CM_HDVICP_CLKSTCTRL Register (offset = 0h) [reset = 1h]

CM_HDVICP_CLKSTCTRL is shown in [Figure 2-212](#) and described in [Table 2-235](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

Figure 2-212. CM_HDVICP_CLKSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-235. CM_HDVICP_CLKSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	Reserved	R	0h	
25-9	Reserved	R	0h	
8	CLKACTIVITY_HDVICP_GCLK	R	0h	This field indicates the state of the HDVICP_GCLK clock in the domain. 0x0: Inact : Corresponding clock is gated 0x1: Act : Corresponding clock is active
7-2	Reserved	R	0h	
1-0	CLKTRCTRL	R/W	1h	Controls the clock state transition of the HDVICP clock domain in HDVICP power domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: SW_SLEEP: Start a software forced sleep transition on the domain. 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.

2.10.8.2 CM_HDVICP_CLKCTRL Register (offset = 20h) [reset = 70000h]

CM_HDVICP_CLKCTRL is shown in [Figure 2-213](#) and described in [Table 2-236](#).

This register manages the HDVICP clocks.

Figure 2-213. CM_HDVICP_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

2.10.9 CM_ISP Registers

[Table 2-238](#) lists the memory-mapped registers for the CM_ISP. All register offset addresses not listed in [Table 2-238](#) should be considered as reserved locations and the register contents should not be modified.

Table 2-238. CM_ISP REGISTERS

Offset	Acronym	Register Description	Section
0h	CM_ISP_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.9.1
20h	CM_ISP_ISP_CLKCTRL	This register manages the ISP clocks.	Section 2.10.9.2

Table 2-238. CM_ISP REGISTERS (continued)

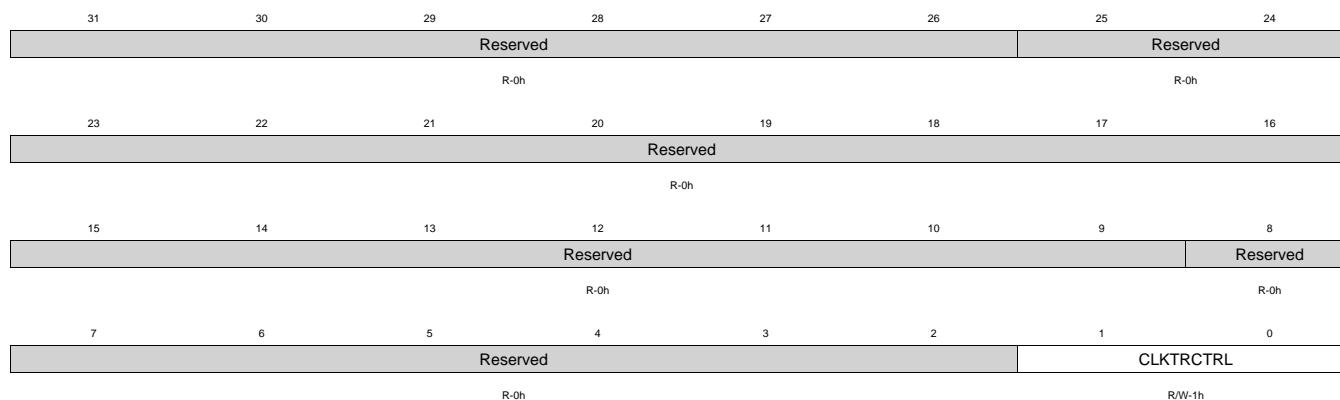

Offset	Acronym	Register Description	Section
24h	CM_ISP_FDIF_CLKCTRL	This register manages the FDIF clocks.	Section 2.10.9.3

2.10.9.1 CM_ISP_CLKSTCTRL Register (offset = 0h) [reset = 1h]

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

CM_ISP_CLKSTCTRL is shown in [Figure 2-215](#) and described in [Table 2-239](#).

Figure 2-215. CM_ISP_CLKSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-239. CM_ISP_CLKSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	Reserved	R	0h	
25-9	Reserved	R	0h	
8	Reserved	R	0h	
7-2	Reserved	R	0h	
1-0	CLKTRCTRL	R/W	1h	Controls the clock state transition of the ISP clock domain in ISP power domain. 0 - NO_SLEEP: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 1 - SW_SLEEP: SW_SLEEP: Start a software forced sleep transition on the domain. 2 - SW_WKUP: SW_WKUP: Start a software forced wake-up transition on the domain. 3 - HW_AUTO: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.

2.10.9.2 CM_ISP_ISP_CLKCTRL Register (offset = 20h) [reset = 0h]

This register manages the ISP clocks.

CM_ISP_ISP_CLKCTRL is shown in [Figure 2-216](#) and described in [Table 2-240](#).

Figure 2-216. CM_ISP_ISP_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-240. CM_ISP_ISP_CLKCTRL Register Field Descriptions

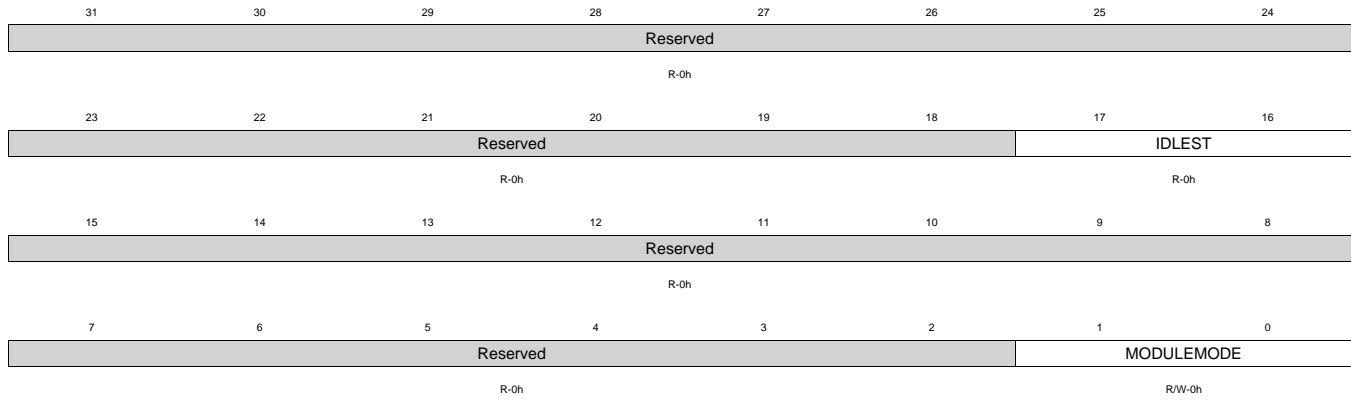

Bit	Field	Type	Reset	Description
31-19	Reserved	R	0h	
18	STBYST	R	0h	Module standby status. 0 - Func: Module is functional (not in standby) 1 - Standby: Module is in standby
17-16	IDLEST	R	0h	Module idle status. 0 - Func: Module is fully functional, including OCP 1 - Trans: Module is performing transition: wakeup, or sleep, or sleep abortion 2 - Idle: Module is in Idle mode (only OCP part). It is functional if using separate functional clock 3 - Disable: Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0 - DISABLED: Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 1 - RESERVED_1: Reserved 2 - ENABLE: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 3 - RESERVED: Reserved

2.10.9.3 CM_ISP_FDIF_CLKCTRL Register (offset = 24h) [reset = 0h]

This register manages the FDIF clocks.

CM_ISP_FDIF_CLKCTRL is shown in [Figure 2-217](#) and described in [Table 2-241](#).

Figure 2-217. CM_ISP_FDIF_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-241. CM_ISP_FDIF_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	IDLEST	R	0h	Module idle status. 0 - Func: Module is fully functional, including OCP 1 - Trans: Module is performing transition: wakeup, or sleep, or sleep abortion 2 - Idle: Module is in Idle mode (only OCP part). It is functional if using separate functional clock 3 - Disable: Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0 - DISABLED: Module is disable by SW. Any OCP access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 1 - RESERVED_1: Reserved 2 - ENABLE: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 3 - RESERVED: Reserved

2.10.10 CM_DSS Registers

[Table 2-242](#) lists the memory-mapped registers for the CM_DSS. All register offset addresses not listed in [Table 2-242](#) should be considered as reserved locations and the register contents should not be modified.

Table 2-242. CM_DSS REGISTERS

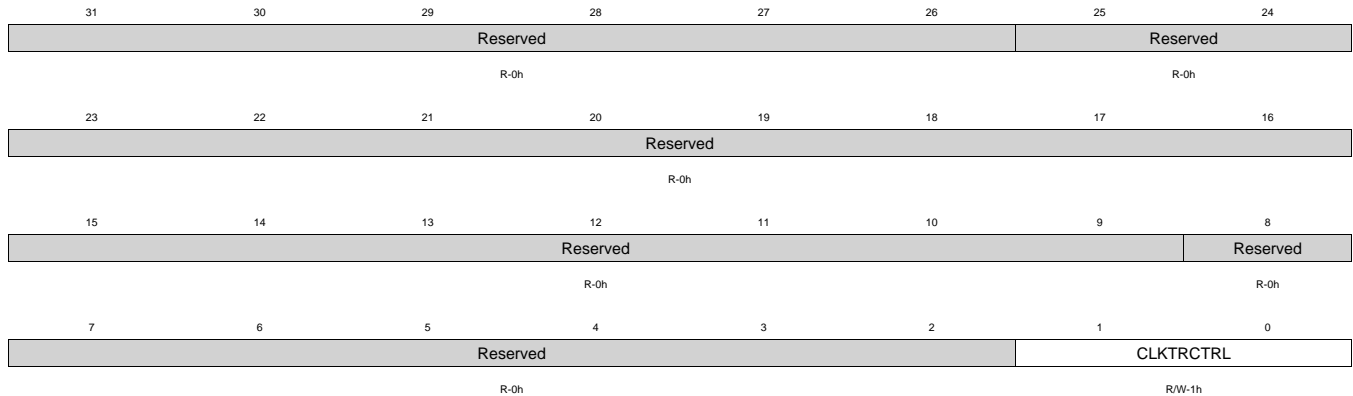

Offset	Acronym	Register Name	Section
0h	CM_DSS_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.10.1
20h	CM_DSS_DSS_CLKCTRL	This register manages the DSS clocks.	Section 2.10.10.2
24h	CM_DSS_HDMI_CLKCTRL	This register manages the HDMI clocks.	Section 2.10.10.3

2.10.10.1 CM_DSS_CLKSTCTRL Register (offset = 0h) [reset = 1h]

CM_DSS_CLKSTCTRL is shown in [Figure 2-218](#) and described in [Table 2-243](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

Figure 2-218. CM_DSS_CLKSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-243. CM_DSS_CLKSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	Reserved	R	0h	
25-9	Reserved	R	0h	
8	Reserved	R	0h	
7-2	Reserved	R	0h	
1-0	CLKTRCTRL	R/W	1h	Controls the clock state transition of the DSS clock domain in DSS power domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: SW_SLEEP: Start a software forced sleep transition on the domain. 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.

2.10.10.2 CM_DSS_DSS_CLKCTRL Register (offset = 20h) [reset = 70000h]

 CM_DSS_DSS_CLKCTRL is shown in [Figure 2-219](#) and described in [Table 2-244](#).

This register manages the DSS clocks.

Figure 2-219. CM_DSS_DSS_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-244. CM_DSS_DSS_CLKCTRL Register Field Descriptions

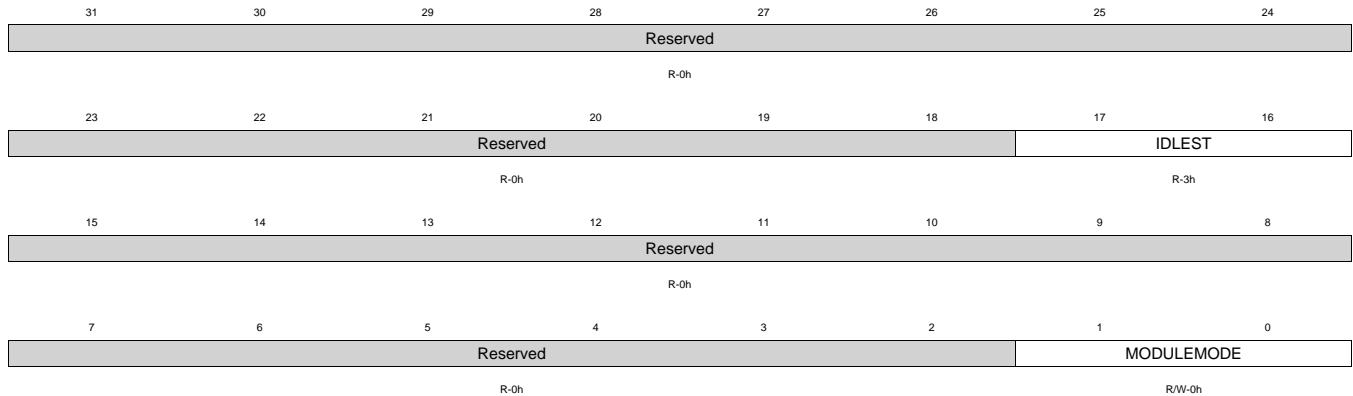

Bit	Field	Type	Reset	Description
31-19	Reserved	R	0h	
18	STBYST	R	1h	Module standby status. 0x0: Func: Module is functional (not in standby) 0x1: Standby: Module is in standby
17-16	IDLEST	R	3h	Module idle status. 0x0 Func: Module is fully functional, including INTERCONN 0x1: Trans: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Idle: Module is in Idle mode (only INTERCONN part). It is functional if using separate functional clock 0x3: Disable: Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0: DISABLED: Module is disable by SW. Any INTERCONN access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: RESERVED 0x2: ENABLE: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3: RESERVED

2.10.10.3 CM_DSS_HDMI_CLKCTRL Register (offset = 24h) [reset = 30000h]

CM_DSS_HDMI_CLKCTRL is shown in [Figure 2-220](#) and described in [Table 2-245](#).

This register manages the HDMI clocks.

Figure 2-220. CM_DSS_HDMI_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-245. CM_DSS_HDMI_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. 0x0: Func: Module is fully functional, including INTERCONN 0x1: Trans: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Idle: Module is in Idle mode (only INTERCONN part). It is functional if using separate functional clock 0x3: Disable: Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0: DISABLED: Module is disable by SW. Any INTERCONN access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: RESERVED 0x2: ENABLE: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3: RESERVED

2.10.11 CM_SGX Registers

[Table 2-246](#) lists the memory-mapped registers for the CM_SGX. All register offset addresses not listed in [Table 2-246](#) should be considered as reserved locations and the register contents should not be modified.

Table 2-246. CM_SGX REGISTERS

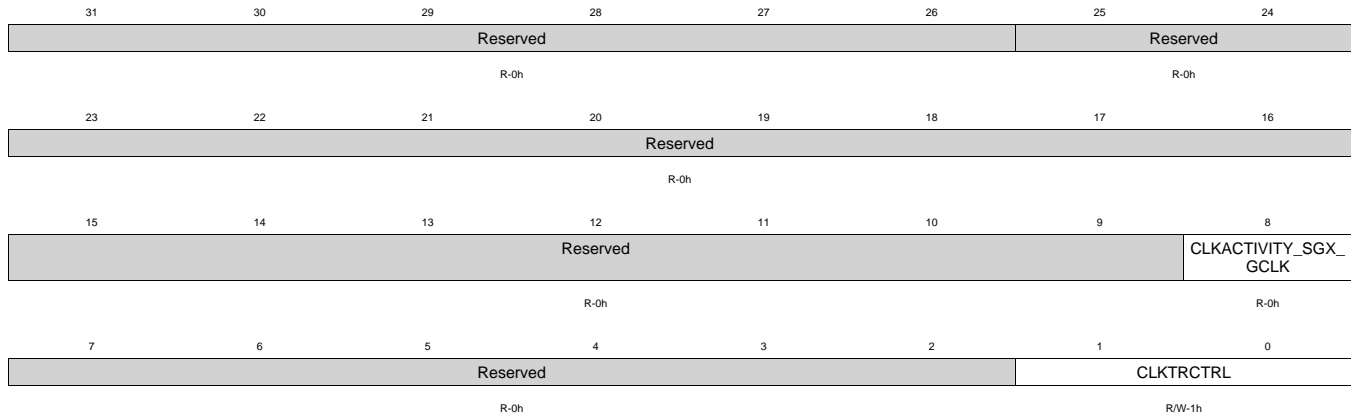

Offset	Acronym	Register Name	Section
0h	CM_SGX_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.11.1
20h	CM_SGX_SGX_CLKCTRL	This register manages the SGX clocks.	Section 2.10.11.2

2.10.11.1 CM_SGX_CLKSTCTRL Register (offset = 0h) [reset = 1h]

CM_SGX_CLKSTCTRL is shown in [Figure 2-221](#) and described in [Table 2-247](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

Figure 2-221. CM_SGX_CLKSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-247. CM_SGX_CLKSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	Reserved	R	0h	
25-9	Reserved	R	0h	
8	CLKACTIVITY_SGX_GCLK	R	0h	This field indicates the state of the SGX_GCLK clock in the domain. 0x0: Inact: Corresponding clock is gated 0x1: Act: Corresponding clock is active
7-2	Reserved	R	0h	
1-0	CLKTRCTRL	R/W	1h	Controls the clock state transition of the SGX clock domain in SGX power domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: SW_SLEEP: Start a software forced sleep transition on the domain. 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.

2.10.11.2 CM_SGX_SGX_CLKCTRL Register (offset = 20h) [reset = 70000h]

CM_SGX_SGX_CLKCTRL is shown in [Figure 2-222](#) and described in [Table 2-248](#).

This register manages the SGX clocks.

Figure 2-222. CM_SGX_SGX_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-248. CM_SGX_SGX_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	Reserved	R	0h	
18	STBYST	R	1h	Module standby status. 0x0: Func : Module is functional (not in standby) 0x1: Standby : Module is in standby
17-16	IDLEST	R	3h	Module idle status. 0x0: Func: Module is fully functional, including INTERCONN 0x1: Trans: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Idle: Module is in Idle mode (only INTERCONN part). It is functional if using separate functional clock 0x3: Disable: Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0: DISABLED: Module is disable by SW. Any INTERCONN access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: RESERVED 0x2: ENABLE: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3: RESERVED

2.10.12 PRM_ACTIVE Registers

[Table 2-249](#) lists the memory-mapped registers for the PRM_ACTIVE. All register offset addresses not listed in [Table 2-249](#) should be considered as reserved locations and the register contents should not be modified.

The ACTIVE domain contains the DSP logic and DSP memories.

Table 2-249. PRM_ACTIVE REGISTERS

Offset	Acronym	Register Name	Section
0h	PM_ACTIVE_PWRSTCTRL	This register controls the ACTIVE power state to reach upon a domain sleep transition [warm reset insensitive]	Section 2.10.12.1
4h	PM_ACTIVE_PWRSTST	This register provides a status on the current ACTIVE power domain state. [warm reset insensitive]	Section 2.10.12.2
10h	RM_ACTIVE_RSTCTRL	This register controls the release of the ACTIVE Domain resets.	Section 2.10.12.3
14h	RM_ACTIVE_RSTST	This register logs the different reset sources of the ACTIVE domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]	Section 2.10.12.4

2.10.12.1 PM_ACTIVE_PWRSTCTRL Register (offset = 0h) [reset = 30000h]

PM_ACTIVE_PWRSTCTRL is shown in [Figure 2-223](#) and described in [Table 2-250](#).

This register controls the ACTIVE power state to reach upon a domain sleep transition [warm reset insensitive]

Figure 2-223. PM_ACTIVE_PWRSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-250. PM_ACTIVE_PWRSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	Active_MEM_ONState	R	3h	Active Domain memory state when domain is ON.
15-5	Reserved	R	0h	
4	LowPowerStateChange	R/W	0h	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: DIS: Do not request a low power state change. 0x1: EN: Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.
3-2	Reserved	R	0h	
1-0	PowerState	R/W	0h	Power state control 0x0: OFF: OFF State [warm reset insensitive] 0x1: Reserved 0x2: Reserved 0x3: ON: ON State [warm reset insensitive]

2.10.12.2 PM_ACTIVE_PWRSTST Register (offset = 4h) [reset = 17h]

 PM_ACTIVE_PWRSTST is shown in [Figure 2-224](#) and described in [Table 2-251](#).

This register provides a status on the current ACTIVE power domain state. [warm reset insensitive]

Figure 2-224. PM_ACTIVE_PWRSTST Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-251. PM_ACTIVE_PWRSTST Register Field Descriptions

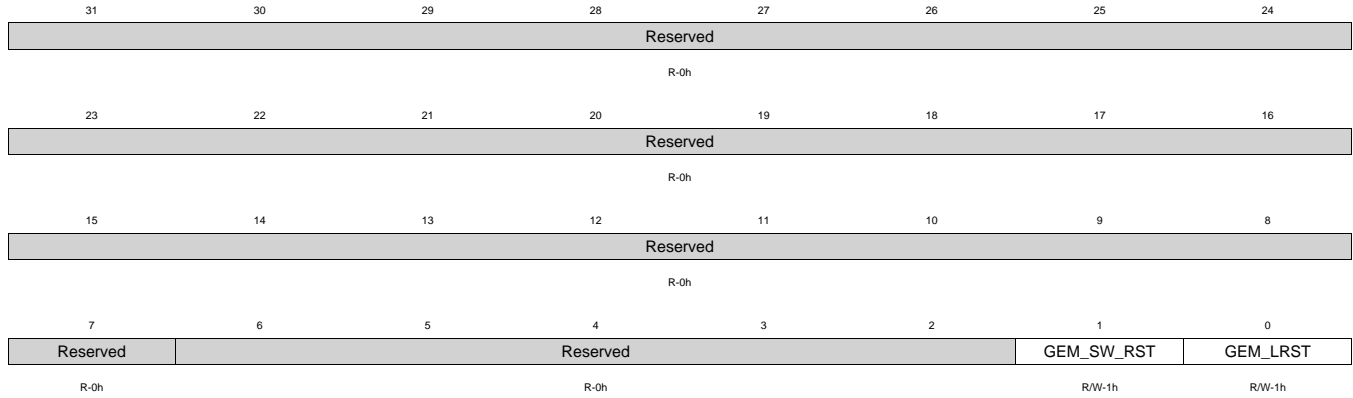

Bit	Field	Type	Reset	Description
31-21	Reserved	R	0h	
20	InTransition	R	0h	Domain transition status 0x0: No: No on-going transition on power domain 0x1: Ongoing: Power domain transition is in progress.
19-6	Reserved	R	0h	
5-4	Active_MEM_StateSt	R	1h	Active domain memory state status 0x0: Mem_off : Memory is OFF 0x2: Reserved : Reserved 0x3: Mem_on : Memory is ON
3	Reserved	R	0h	
2	LogicStateSt	R	1h	Logic state status 0x0: OFF : Logic in domain is OFF 0x1: ON : Logic in domain is ON
1-0	PowerStateSt	R	3h	Current Power State Status 0x0: OFF : OFF State 0x1: Reserved 0x2: Reserved1 0x3: ON : ON State

2.10.12.3 RM_ACTIVE_RSTCTRL Register (offset = 10h) [reset = 3h]

RM_ACTIVE_RSTCTRL is shown in [Figure 2-225](#) and described in [Table 2-252](#).

This register controls the release of the ACTIVE Domain resets.

Figure 2-225. RM_ACTIVE_RSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-252. RM_ACTIVE_RSTCTRL Register Field Descriptions

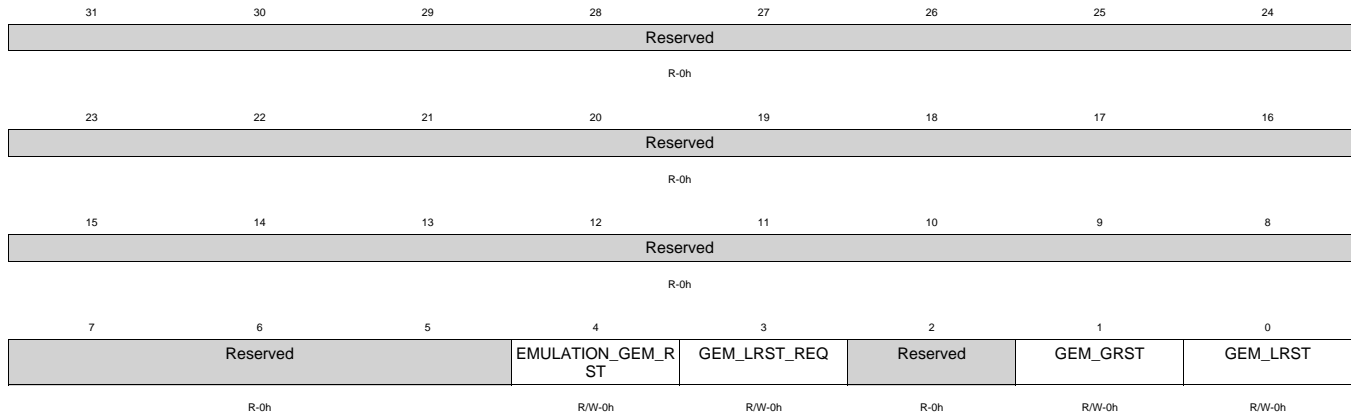

Bit	Field	Type	Reset	Description
31-7	Reserved	R	0h	
6-2	Reserved	R	0h	
1	GEM_SW_RST	R/W	1h	ACTIVE Domain DSP warm reset control 0x0: CLEAR : Reset is cleared for the Active domain DSP warm Reset 0x1: ASSERT : Reset is asserted for the Active domain DSP warm reset
0	GEM_LRST	R/W	1h	ACTIVE Domain DSP local reset control 0x0: CLEAR : Reset is cleared for the Active domain DSP local Reset 0x1: ASSERT : Reset is asserted for the Active domain DSP Local reset

2.10.12.4 RM_ACTIVE_RSTST Register (offset = 14h) [reset = 0h]

RM_ACTIVE_RSTST is shown in [Figure 2-226](#) and described in [Table 2-253](#).

This register logs the different reset sources of the ACTIVE domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]

Figure 2-226. RM_ACTIVE_RSTST Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-253. RM_ACTIVE_RSTST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	Reserved	R	0h	
4	EMULATION_GEM_RST	R/W	0h	DSP Local CPU has been reset due to emulation reset source e.g. assert reset command initiated by the icepick module 0x0: RESET_NO : No emulation reset 0x1: RESET_YES : Local ARM has been reset upon emulation reset
3	GEM_LRST_REQ	R/W	0h	Local Reser request generated by DSP(Because of Debug)
2	Reserved	R	0h	
1	GEM_GRST	R/W	0h	DSP SS warm reset 0x0: RESET_NO: No SW reset occurred 0x1: RESET_YES: DSP warm reset has been asserted.
0	GEM_LRST	R/W	0h	DSP local SW reset 0x0: RESET_NO: No SW reset occurred 0x1: RESET_YES: DSP Local reset has been asserted

2.10.13 PRM_DEFAULT Registers

[Table 2-254](#) lists the memory-mapped registers for the PRM_DEFAULT. All register offset addresses not listed in [Table 2-254](#) should be considered as reserved locations and the register contents should not be modified.

Table 2-254. PRM_DEFAULT REGISTERS

Offset	Acronym	Register Name	Section
0h	PM_DEFAULT_PWRSTCTRL	This register controls the DEFAULT power state to reach upon a domain sleep transition [warm reset insensitive].	Section 2.10.13.1
10h	RM_DEFAULT_RSTCTRL	This register controls the release of the DEFAULT sub-system resets.	Section 2.10.13.2

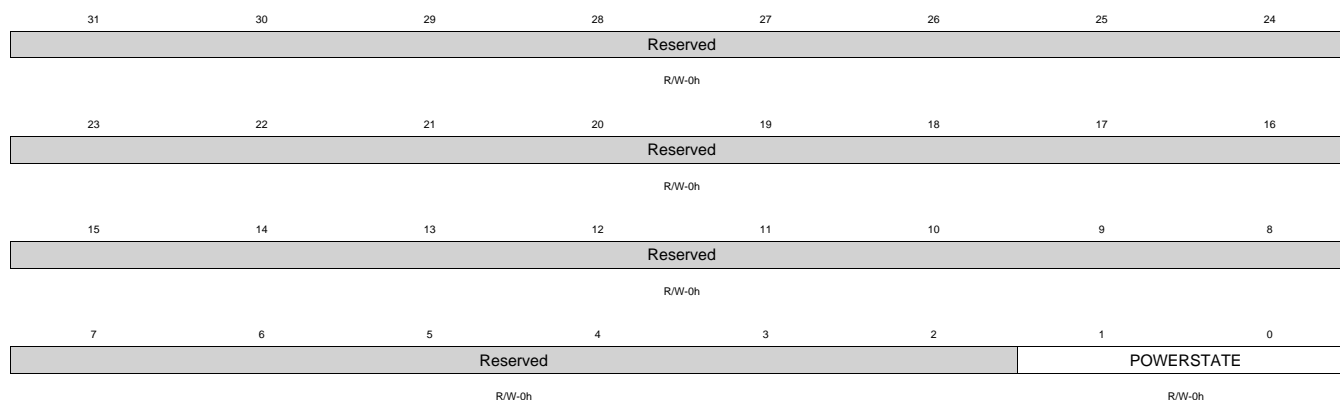

Table 2-254. PRM_DEFAULT REGISTERS (continued)

Offset	Acronym	Register Name	Section
14h	RM_DEFAULT_RSTST	This register logs the different reset sources of the DEFAULT domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]	Section 2.10.13.3

2.10.13.1 PM_DEFAULT_PWRSTCTRL Register (offset = 0h) [reset = 0h]

PM_DEFAULT_PWRSTCTRL is shown in [Figure 2-227](#) and described in [Table 2-255](#).

This register controls the DEFAULT power state to reach upon a domain sleep transition [warm reset insensitive].

Figure 2-227. PM_DEFAULT_PWRSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-255. PM_DEFAULT_PWRSTCTRL Register Field Descriptions

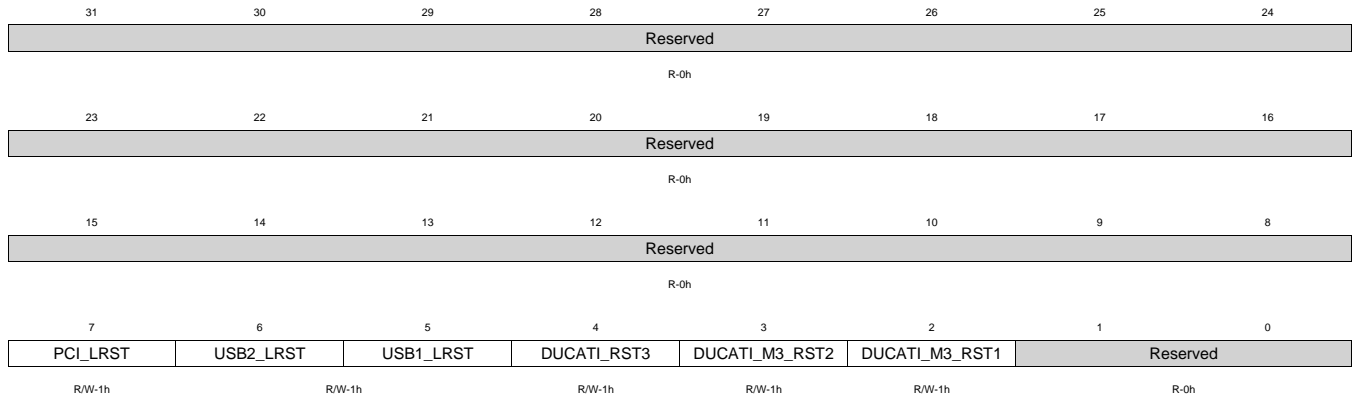

Bit	Field	Type	Reset	Description
31-2	Reserved	R/W	0h	
1-0	POWERSTATE	R/W	0h	Power state control: 0x0: OFF State 0x3: ON State: This POWERSTATE field of this register (bit 1:0) needs to be written to ON state (0x3 value) and keep it there.

2.10.13.2 RM_DEFAULT_RSTCTRL Register (offset = 10h) [reset = 9Fh]

RM_DEFAULT_RSTCTRL is shown in [Figure 2-228](#) and described in [Table 2-256](#).

This register controls the release of the DEFAULT sub-system resets.

Figure 2-228. RM_DEFAULT_RSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-256. RM_DEFAULT_RSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	Reserved	R	0h	
7	PCI_LRST	R/W	1h	ACTIVE domain PCI Local reset control 0x0: CLEAR : Reset is cleared. 0x1: ASSERT : Reset is asserted.
6	USB2_LRST	R/W	1h	USB2 local reset control 0x0: Local Reset is cleared for USB2. 0x1: Local Reset is asserted for USB2.
5	USB1_LRST	R/W	1h	USB1 local reset control 0x0: Local Reset is cleared for USB1. 0x1: Local Reset is asserted for USB1.
4	DUCATI_RST3	R/W	1h	Media Controller logic and MMU reset control 0x0: CLEAR : Reset is cleared for the Media Controller logic and MMU 0x1: ASSERT : Reset is asserted for the Media Controller logic and MMU
3	DUCATI_M3_RST2	R/W	1h	Media Controller Second M3 reset control 0x0: CLEAR : Reset is cleared for the ALWON sequencer CPU2 0x1: ASSERT : Reset is asserted for the ALWON sequencer CPU2
2	DUCATI_M3_RST1	R/W	1h	Media Controller First M3 reset control 0x0: CLEAR : Reset is cleared for the ALWON sequencer CPU1 0x1: ASSERT : Reset is asserted for the ALWON sequencer CPU1
1-0	Reserved	R	0h	

2.10.13.3 RM_DEFAULT_RSTST Register (offset = 14h) [reset = 0h]

RM_DEFAULT_RSTST is shown in [Figure 2-229](#) and described in [Table 2-257](#).

This register logs the different reset sources of the DEFAULT domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]

Figure 2-229. RM_DEFAULT_RSTST Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-257. RM_DEFAULT_RSTST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	Reserved	R	0h	
20-15	Reserved	R	0h	
14	ICECRUSHER_m3_2_RST	R/W	0h	DSS controller M3_2 has been reset due to DSS controller ICECRUSHER1 reset event 0x0: RESET_NO : No icecrusher reset 0x1: RESET_YES : Sequencer2 has been reset upon icecrusher reset
13	ICECRUSHER_M3_1_RST	R/W	0h	DSS controller M3_1 has been reset due to DSS controller ICECRUSHER1 reset event 0x0: RESET_NO : No icecrusher reset 0x1: RESET_YES : Sequencer1 has been reset upon icecrusher reset
12	EMULATION_M3_2_RST	R/W	0h	DSS controller M3_2 has been reset due to emulation reset source e.g. assert reset command initiated by the icepick module 0x0: RESET_NO : No emulation reset 0x1: RESET_YES : M3_2 has been reset upon emulation reset
11	EMULATION_M3_1_RST	R/W	0h	DSS controller M3_1 has been reset due to emulation reset source e.g. assert reset command initiated by the icepick module 0x0: RESET_NO : No emulation reset 0x1: RESET_YES : M3_1 has been reset upon emulation reset
10-8	Reserved	R	0h	
7	PCI_LRST	R/W	0h	PCI local SW reset 0x0: RESET_NO : No SW reset occurred 0x1: RESET_YES : PCI Local M3 has been reset upon SW reset
6	USB2_LRST	R/W	0h	USB2 Local Reset 0x0: RESET_NO: No SW reset occurred 0x1: RESET_YES: USB2 Local Logic has been reset upon SW reset
5	USB1_LRST	R/W	0h	USB1 Local Reset 0x0: RESET_NO: No SW reset occurred 0x1: RESET_YES: USB1 Local Logic has been reset upon SW reset

Table 2-257. RM_DEFAULT_RSTST Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	DUCATI_RST3	R/W	0h	Media Controller logic and MMU SW reset 0x0: RESET_NO : No SW reset occurred 0x1: RESET_YES : Media Controller logic and MMU has been reset upon SW reset
3	DUCATI_M3_RST2	R/W	0h	Media Controller second M3 SW reset 0x0: RESET_NO : No SW reset occurred 0x1: RESET_YES : Cortex M3_2 has been reset upon SW reset
2	DUCATI_M3_RST1	R/W	0h	Media Controller first cortex M3 SW reset 0x0: RESET_NO : No SW reset occurred 0x1: RESET_YES : Cortex M3_1 has been reset upon SW reset
1-0	Reserved	R	0h	

2.10.14 PRM_HDVICP Registers

Table 2-258 lists the memory-mapped registers for the PRM_HDVICP. All register offset addresses not listed in Table 2-258 should be considered as reserved locations and the register contents should not be modified.

Table 2-258. PRM_HDVICP REGISTERS

Offset	Acronym	Register Name	Section
0h	PM_HDVICP_PWRSTCTRL	This register controls the HDVICP power state to reach upon a domain sleep transition [warm reset insensitive]	Section 2.10.14.1
4h	PM_HDVICP_PWRSTST	This register provides a status on the current HDVICP power domain state. [warm reset insensitive]	Section 2.10.14.2
10h	RM_HDVICP_RSTCTRL	This register controls the release of the HDVICP sub-system resets.	Section 2.10.14.3
14h	RM_HDVICP_RSTST	This register logs the different reset sources of the HDVICP domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]	Section 2.10.14.4

2.10.14.1 PM_HDVICP_PWRSTCTRL Register (offset = 0h) [reset = 3000h]

PM_HDVICP_PWRSTCTRL is shown in [Figure 2-230](#) and described in [Table 2-259](#).

This register controls the HDVICP power state to reach upon a domain sleep transition [warm reset insensitive]

Figure 2-230. PM_HDVICP_PWRSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-259. PM_HDVICP_PWRSTCTRL Register Field Descriptions

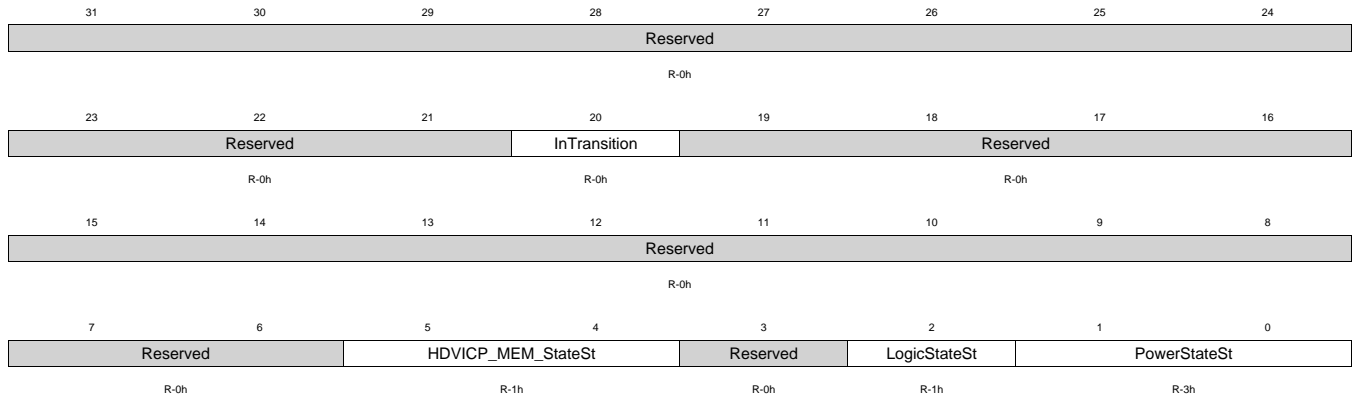

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	HDVICP_MEM_ONState	R	3h	HDVICP memory state when domain is ON.
15-5	Reserved	R	0h	
4	LowPowerStateChange	R/W	0h	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: DIS : Do not request a low power state change. 0x1: EN : Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.
3-2	Reserved	R	0h	
1-0	PowerState	R/W	0h	Power state control 0x0: OFF : OFF State 0x3: ON : ON State

2.10.14.2 PM_HDVICP_PWRSTST Register (offset = 4h) [reset = 17h]

PM_HDVICP_PWRSTST is shown in [Figure 2-231](#) and described in [Table 2-260](#).

This register provides a status on the current HDVICP power domain state. [warm reset insensitive]

Figure 2-231. PM_HDVICP_PWRSTST Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-260. PM_HDVICP_PWRSTST Register Field Descriptions

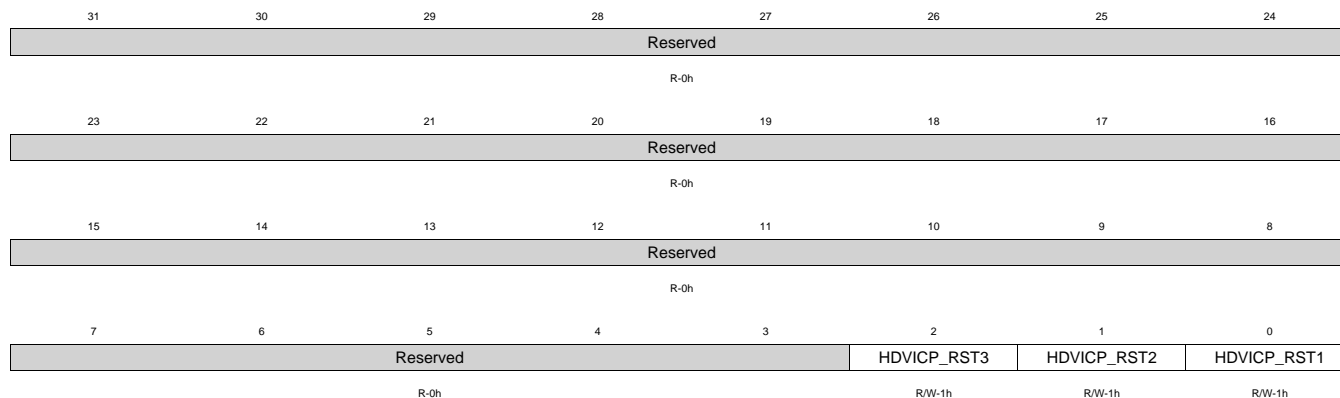

Bit	Field	Type	Reset	Description
31-21	Reserved	R	0h	
20	InTransition	R	0h	Domain transition status 0x0: No : No on-going transition on power domain 0x1: Ongoing : Power domain transition is in progress.
19-6	Reserved	R	0h	
5-4	HDVICP_MEM_StateSt	R	1h	HDVICP memory state status 0x0: Mem_off : Memory is OFF 0x2: Reserved : Reserved 0x3: Mem_on : Memory is ON
3	Reserved	R	0h	
2	LogicStateSt	R	1h	Logic state status 0x0: OFF : Logic in domain is OFF 0x1: ON : Logic in domain is ON
1-0	PowerStateSt	R	3h	Current Power State Status 0x0: OFF : OFF State [warm reset insensitive] 0x3: ON : ON State [warm reset insensitive]

2.10.14.3 RM_HDVICP_RSTCTRL Register (offset = 10h) [reset = 7h]

RM_HDVICP_RSTCTRL is shown in [Figure 2-232](#) and described in [Table 2-261](#).

This register controls the release of the HDVICP sub-system resets.

Figure 2-232. RM_HDVICP_RSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-261. RM_HDVICP_RSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2	HDVICP_RST3	R/W	1h	HDVICP logic and SL2 reset control 0x0: CLEAR: Reset is cleared for the HDVICP logic and SL2 0x1: ASSERT: Reset is asserted for HDVICP logic and SL2
1	HDVICP_RST2	R/W	1h	HDVICP sequencer2 reset control 0x0: CLEAR : Reset is cleared for the HDVICP sequencer CPU2 0x1: ASSERT : Reset is asserted for the HDVICP sequencer CPU2
0	HDVICP_RST1	R/W	1h	HDVICP sequencer1 reset control 0x0: CLEAR : Reset is cleared for the HDVICP sequencer CPU1 0x1: ASSERT : Reset is asserted for the HDVICP sequencer CPU1

2.10.14.4 RM_HDVICP_RSTST Register (offset = 14h) [reset = 0h]

 RM_HDVICP_RSTST is shown in [Figure 2-233](#) and described in [Table 2-262](#).

This register logs the different reset sources of the HDVICP domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]

Figure 2-233. RM_HDVICP_RSTST Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-262. RM_HDVICP_RSTST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h	
15-7	Reserved	R	0h	
6	ICECRUSHER_SEQ2_RST2	R/W	0h	Sequencer2 CPU has been reset due to HDVICP ICECRUSHER1 reset event 0x0 = RESET_NO : No icecrusher reset 0x1 = RESET_YES : Sequencer2 has been reset upon icecrusher reset
5	ICECRUSHER_SEQ1_RST1	R/W	0h	Sequencer1 CPU has been reset due to HDVICP ICECRUSHER1 reset event 0x0 = RESET_NO : No icecrusher reset 0x1 = RESET_YES : Sequencer1 has been reset upon icecrusher reset
4	EMULATION_SEQ2_RST2	R/W	0h	Sequencer2 CPU has been reset due to emulation reset source e.g. assert reset command initiated by the icepick module 0x0 = RESET_NO : No emulation reset 0x1 = RESET_YES : Sequencer2 has been reset upon emulation reset
3	EMULATION_SEQ1_RST1	R/W	0h	Sequencer1 CPU has been reset due to emulation reset source e.g. assert reset command initiated by the icepick module 0x0 = RESET_NO : No emulation reset 0x1 = RESET_YES : Sequencer1 has been reset upon emulation reset
2	HDVICP_RST3	R/W	0h	HDVICP logic and SL2 SW reset 0x0 = RESET_NO : No SW reset occurred 0x1 = RESET_YES : HDVICP logic and SL2 has been reset upon SW reset
1	HDVICP_RST2	R/W	0h	HDVICP Sequencer2 CPU SW reset 0x0 = RESET_NO : No SW reset occurred 0x1 = RESET_YES : Sequencer2 has been reset upon SW reset

Table 2-262. RM_HDVICP_RSTST Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	HDVICP_RST1	R/W	0h	HDVICP Sequencer1 CPU SW reset 0x0 = RESET_NO : No SW reset occurred 0x1 = RESET_YES : Sequencer1 has been reset upon SW reset

2.10.15 PRM_ISP Registers

Table 2-263 lists the memory-mapped registers for the PRM_ISP. All register offset addresses not listed in Table 2-263 should be considered as reserved locations and the register contents should not be modified.

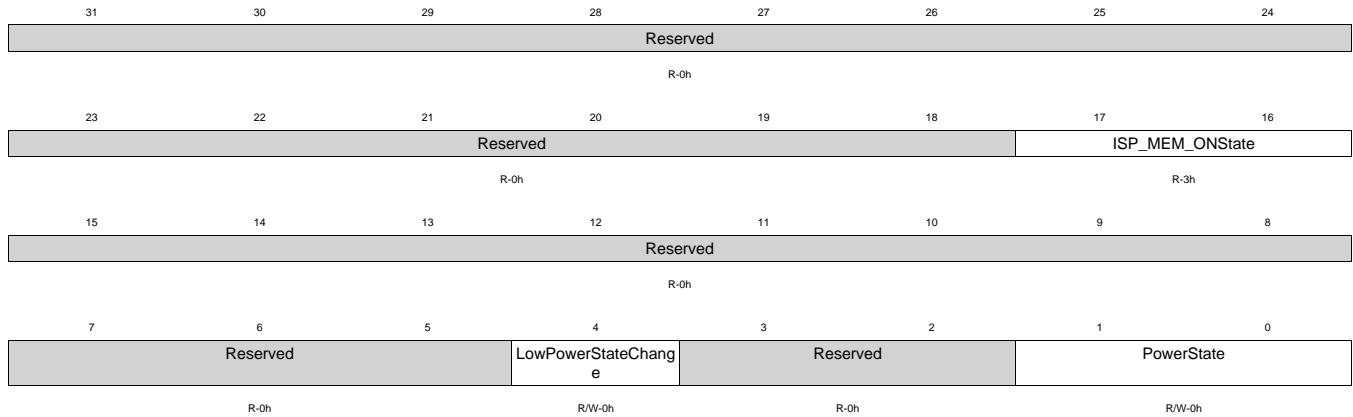

Table 2-263. PRM_ISP REGISTERS

Offset	Acronym	Register Name	Section
0h	PM_ISP_PWRSTCTRL	This register controls the ISP power state to reach upon a domain sleep transition [warm reset insensitive]	Section 2.10.15.1
4h	PM_ISP_PWRSTST	This register provides a status on the current ISP power domain state. [warm reset insensitive]	Section 2.10.15.2
10h	RM_ISP_RSTCTRL	This register controls the release of the ISP sub-system resets.	Section 2.10.15.3
14h	RM_ISP_RSTST	This register logs the different reset sources of the ISP domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]	Section 2.10.15.4

2.10.15.1 PM_ISP_PWRSTCTRL Register (offset = 0h) [reset = 30000h]

PM_ISP_PWRSTCTRL is shown in [Figure 2-234](#) and described in [Table 2-264](#).

This register controls the ISP power state to reach upon a domain sleep transition [warm reset insensitive]

Figure 2-234. PM_ISP_PWRSTCTRL Register

Table 2-264. PM_ISP_PWRSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	ISP_MEM_ONState	R	3h	ISP memory state when domain is ON.
15-5	Reserved	R	0h	
4	LowPowerStateChange	R/W	0h	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0: DIS : Do not request a low power state change. 0x1: EN : Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.
3-2	Reserved	R	0h	
1-0	PowerState	R/W	0h	Power state control 0x0: OFF : OFF State 0x3: ON : ON State

2.10.15.2 PM_ISP_PWRSTST Register (offset = 4h) [reset = 17h]

 PM_ISP_PWRSTST is shown in [Figure 2-235](#) and described in [Table 2-265](#).

This register provides a status on the current ISP power domain state. [warm reset insensitive]

Figure 2-235. PM_ISP_PWRSTST Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-265. PM_ISP_PWRSTST Register Field Descriptions

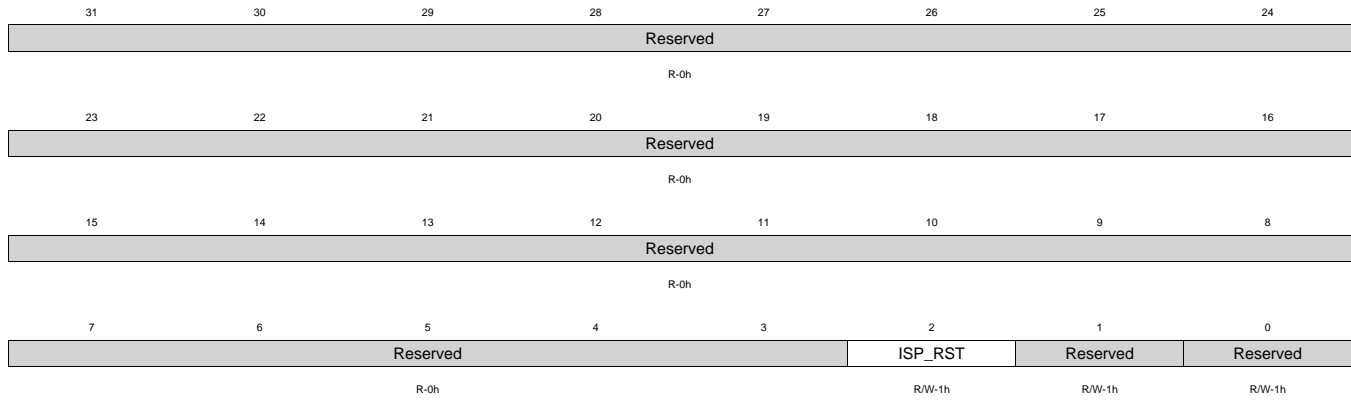

Bit	Field	Type	Reset	Description
31-21	Reserved	R	0h	
20	InTransition	R	0h	Domain transition status 0x0: No : No on-going transition on power domain 0x1: Ongoing : Power domain transition is in progress.
19-6	Reserved	R	0h	
5-4	ISP_MEM_StateSt	R	1h	ISP memory state status 0x0: Mem_off : Memory is OFF 0x2: Reserved : Reserved 0x3: Mem_on : Memory is ON
3	Reserved	R	0h	
2	LogicStateSt	R	1h	Logic state status 0x0: OFF : Logic in domain is OFF 0x1: ON : Logic in domain is ON
1-0	PowerStateSt	R	3h	Current Power State Status 0x0: OFF : OFF State [warm reset insensitive] 0x3: ON : ON State [warm reset insensitive]

2.10.15.3 RM_ISP_RSTCTRL Register (offset = 10h) [reset = 7h]

RM_ISP_RSTCTRL is shown in [Figure 2-236](#) and described in [Table 2-266](#).

This register controls the release of the ISP sub-system resets.

Figure 2-236. RM_ISP_RSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-266. RM_ISP_RSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2	ISP_RST	R/W	1h	ISP logic and FDIF reset control 0x0: CLEAR : Reset is cleared for the ISP logic and FDIF 0x1: ASSERT : Reset is asserted for ISP logic and FDIF
1	Reserved	R/W	1h	
0	Reserved	R/W	1h	

2.10.15.4 RM_ISP_RSTST Register (offset = 14h) [reset = 0h]

RM_ISP_RSTST is shown in [Figure 2-237](#) and described in [Table 2-267](#).

This register logs the different reset sources of the ISP domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]

Figure 2-237. RM_ISP_RSTST Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-267. RM_ISP_RSTST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h

1	Reserved	R/W	0h	
0	Reserved	R/W	0h	

2.10.16 PRM_DSS Registers

[Table 2-268](#) lists the memory-mapped registers for the PRM_DSS. All register offset addresses not listed in [Table 2-268](#) should be considered as reserved locations and the register contents should not be modified.

Table 2-268. PRM_DSS REGISTERS

Offset	Acronym	Register Name	Section
0h	PM_DSS_PWRSTCTRL	This register controls the DSS power state to reach upon a domain sleep transition [warm reset insensitive]	Section 2.10.16.1
4h	PM_DSS_PWRSTST	This register provides a status on the current DSS power domain state. [warm reset insensitive]	Section 2.10.16.2
10h	RM_DSS_RSTCTRL	This register controls the release of the DSS sub-system resets.	Section 2.10.16.3

Table 2-268. PRM_DSS REGISTERS (continued)

Offset	Acronym	Register Name	Section
14h	RM_DSS_RSTST	This register logs the different reset sources of the DSS domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]	Section 2.10.16.4

2.10.16.1 PM_DSS_PWRSTCTRL Register (offset = 0h) [reset = 30000h]

PM_DSS_PWRSTCTRL is shown in [Figure 2-238](#) and described in [Table 2-269](#).

This register controls the DSS power state to reach upon a domain sleep transition [warm reset insensitive]

Figure 2-238. PM_DSS_PWRSTCTRL Register

Table 2-269. PM_DSS_PWRSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	DSS_MEM_ONState	R	3h	DSS memory state when domain is ON.
15-5	Reserved	R	0h	
4	LowPowerStateChange	R/W	0h	Power state change request when domain has already performed a sleep transition. Allows going into deeper low power state without waking up the power domain. 0x0 = DIS : Do not request a low power state change. 0x1 = EN : Request a low power state change. This bit is automatically cleared when the power state is effectively changed or when power state is ON.
3-2	Reserved	R	0h	
1-0	PowerState	R/W	0h	Power state control 0x0 = OFF : OFF State 0x3 = ON : ON State

2.10.16.2 PM_DSS_PWRSTST Register (offset = 4h) [reset = 17h]

PM_DSS_PWRSTST is shown in [Figure 2-239](#) and described in [Table 2-270](#).

This register provides a status on the current DSS power domain state. [warm reset insensitive]

Figure 2-239. PM_DSS_PWRSTST Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-270. PM_DSS_PWRSTST Register Field Descriptions

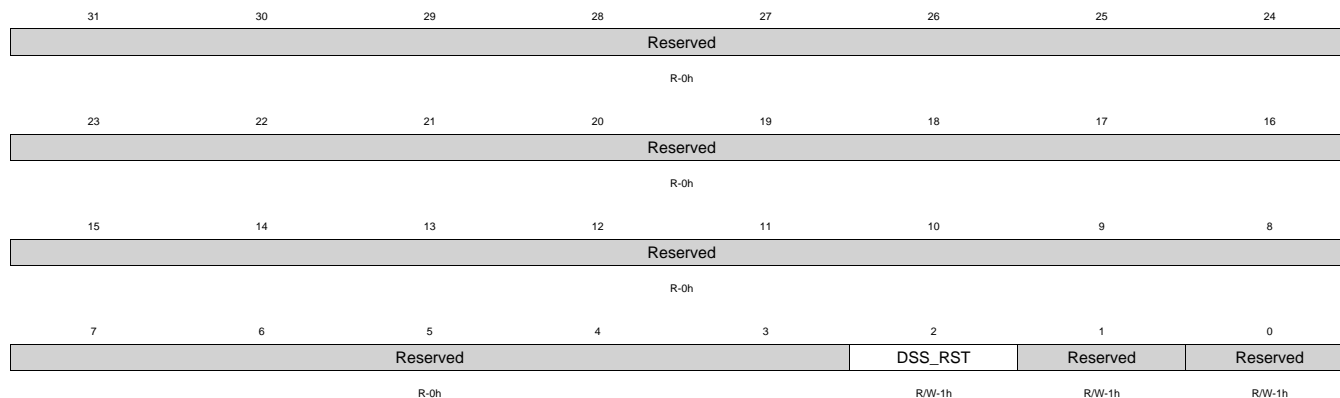

Bit	Field	Type	Reset	Description
31-21	Reserved	R	0h	
20	InTransition	R	0h	Domain transition status 0x0 = No : No on-going transition on power domain 0x1 = Ongoing : Power domain transition is in progress.
19-6	Reserved	R	0h	
5-4	DSS_MEM_StateSt	R	1h	DSS memory state status 0x0 = Mem_off : Memory is OFF 0x2 = Reserved : Reserved 0x3 = Mem_on : Memory is ON
3	Reserved	R	0h	
2	LogicStateSt	R	1h	Logic state status 0x0 = OFF : Logic in domain is OFF 0x1 = ON : Logic in domain is ON
1-0	PowerStateSt	R	3h	Current Power State Status 0x0 = OFF : OFF State [warm reset insensitive] 0x3 = ON : ON State [warm reset insensitive]

2.10.16.3 RM_DSS_RSTCTRL Register (offset = 10h) [reset = 7h]

RM_DSS_RSTCTRL is shown in [Figure 2-240](#) and described in [Table 2-271](#).

This register controls the release of the DSS sub-system resets.

Figure 2-240. RM_DSS_RSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-271. RM_DSS_RSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	Reserved	R	0h	
2	DSS_RST	R/W	1h	DSS logic and HDMI reset control 0x0 = CLEAR : Reset is cleared for the DSS logic and HDMI 0x1 = ASSERT : Reset is asserted for DSS logic and HDMI
1	Reserved	R/W	1h	
0	Reserved	R/W	1h	

2.10.16.4 RM_DSS_RSTST Register (offset = 14h) [reset = 0h]

RM_DSS_RSTST is shown in [Figure 2-241](#) and described in [Table 2-272](#).

This register logs the different reset sources of the DSS domain. Each bit is set upon release of the domain reset signal. Must be cleared by software. [warm reset insensitive]

Figure 2-241. RM_DSS_RSTST Register

1	Reserved	R	0h	
0	SGX_RST	R/W	0h	SGX Domain Logic Reset 0x0: RESET_NO : No SW reset occurred 0x1: RESET_YES : SGX Domain Logic has been reset upon SW reset

2.10.18 CM_ALWON Registers

[Table 2-278](#) lists the memory-mapped registers for the CM_ALWON. All register offset addresses not listed in [Table 2-278](#) should be considered as reserved locations and the register contents should not be modified.

Table 2-278. CM_ALWON REGISTERS

Offset	Acronym	Register Name	Section
0h	CM_ALWON_L3_SLOW_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.18.1
4h	CM_ETHERNET_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.18.2
8h	CM_ALWON_L3_MED_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.18.3

Table 2-278. CM_ALWON REGISTERS (continued)

Offset	Acronym	Register Name	Section
Ch	CM_MMU_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.18.4
10h	CM_MMUCFG_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.18.5
14h	CM_ALWON_OCMC_0_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.18.6
18h	CM_ALWON_VCP_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.18.7
1Ch	CM_ALWON_MPU_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.18.8
20h	CM_ALWON_SYSCLK4_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.18.9
24h	CM_ALWON_SYSCLK5_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.18.10
28h	CM_ALWON_SYSCLK6_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.18.11
2Ch	CM_ALWON_RTC_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.18.12
30h	CM_ALWON_L3_FAST_CLKSTCTRL	This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.	Section 2.10.18.13
140h	CM_ALWON_MCASP0_CLKCTRL	This register manages the MCASP_0 clocks.	Section 2.10.18.14
144h	CM_ALWON_MCASP1_CLKCTRL	This register manages the MCASP1 clocks.	Section 2.10.18.15
148h	CM_ALWON_MCASP2_CLKCTRL	This register manages the MCASP2 clocks.	Section 2.10.18.16
14Ch	CM_ALWON_MCBSP_CLKCTRL	This register manages the MCBSP clocks.	Section 2.10.18.17
150h	CM_ALWON_UART_0_CLKCTRL	This register manages the UART_0 clocks.	Section 2.10.18.18
154h	CM_ALWON_UART_1_CLKCTRL	This register manages the UART_1 clocks.	Section 2.10.18.19
158h	CM_ALWON_UART_2_CLKCTRL	This register manages the UART_2 clocks.	Section 2.10.18.20
15Ch	CM_ALWON_GPIO_0_CLKCTRL	This register manages the GPIO_0 clocks.	Section 2.10.18.21
160h	CM_ALWON_GPIO_1_CLKCTRL	This register manages the GPIO_1, GPIO_2 and GPIO_3 clocks.	Section 2.10.18.22

Table 2-278. CM_ALWON REGISTERS (continued)

Offset	Acronym	Register Name	Section

2.10.18.1 CM_ALWON_L3_SLOW_CLKSTCTRL Register (offset = 0h) [reset = C002h]

 CM_ALWON_L3_SLOW_CLKSTCTRL is shown in [Figure 2-246](#) and described in [Table 2-279](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

8	CLKACTIVITY_L3_SLOW_GCLK	R	1h	This field indicates the state of the CM_ALWON_L3_SLOW_CLKSTCTRL clock in the domain. 0x0: Inact: Corresponding clock is gated 0x1: Act: Corresponding clock is active
7-2	Reserved	R	0h	

Table 2-279. CM_ALWON_L3_SLOW_CLKSTCTRL Register Field Descriptions (continued)

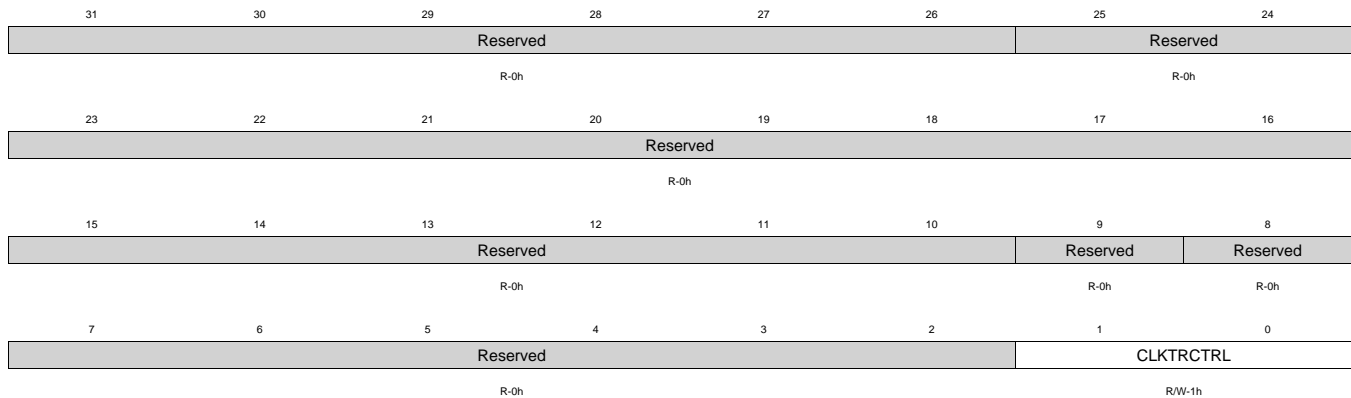

Bit	Field	Type	Reset	Description
1-0	CLKTRCTRL	R/W	2h	Controls the clock state transition of the L3_SLOW clock domain in Always ON power domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: SW_SLEEP: Start a software forced sleep transition on the domain. 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.

2.10.18.2 CM_ETHERNET_CLKSTCTRL Register (offset = 4h) [reset = 1h]

CM_ETHERNET_CLKSTCTRL is shown in [Figure 2-247](#) and described in [Table 2-280](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

Figure 2-247. CM_ETHERNET_CLKSTCTRL Register

8	CLKACTIVITY_RTC_GCLK	R	0h	This field indicates the state of the RTC_GCLK clock in the domain. 0x0: Inact: Corresponding clock is gated 0x1: Act: Corresponding clock is active
7-2	Reserved	R	0h	
1-0	CLKTRCTRL	R	2h	Controls the clock state transition of the RTC clock domain in Always ON power domain. 0x0 = Reserved 0x1 = Reserved 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3 = Reserved

2.10.18.13 CM_ALWON_L3_FAST_CLKSTCTRL Register (offset = 30h) [reset = 1h]

CM_ALWON_L3_FAST_CLKSTCTRL is shown in [Figure 2-258](#) and described in [Table 2-291](#).

This register enables the domain power state transition. It controls the SW supervised clock domain state transition between ON-ACTIVE and ON-INACTIVE states. It also hold one status bit per clock input of the domain.

Figure 2-258. CM_ALWON_L3_FAST_CLKSTCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-291. CM_ALWON_L3_FAST_CLKSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	Reserved	R	0h	
25-11	Reserved	R	0h	
10	Reserved	R	0h	
9	Reserved	R	0h	
8	CLKACTIVITY_FAST_GCLK	R	0h	This field indicates the state of the L3 Fast clock for TPTC and TPCC in the domain. 0x0: Inact: Corresponding clock is gated 0x1: Act: Corresponding clock is active
7-2	Reserved	R	0h	
1-0	CLKTRCTRL	R/W	1h	Controls the clock state transition of the L3 Fast clock domain. 0x0: NO_SLEEP: Sleep transition cannot be initiated. Wakeup transition may however occur. 0x1: SW_SLEEP: Start a software forced sleep transition on the domain. 0x2: SW_WKUP: Start a software forced wake-up transition on the domain. 0x3: HW_AUTO: Automatic transition is enabled. Sleep and wakeup transition are based upon hardware conditions.

2.10.18.14 CM_ALWON_MCASP0_CLKCTRL Register (offset = 140h) [reset = 3000h]

 CM_ALWON_MCASP0_CLKCTRL is shown in [Figure 2-259](#) and described in [Table 2-292](#).

This register manages the MCASP_0 clocks.

Figure 2-259. CM_ALWON_MCASP0_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-292. CM_ALWON_MCASP0_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. 0x0: Func: Module is fully functional, including INTERCONN 0x1: Trans: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Idle: Module is in Idle mode (only INTERCONN part). It is functional if using separate functional clock 0x3: Disable: Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0: DISABLED: Module is disable by SW. Any INTERCONN access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: RESERVED 0x2: ENABLE: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3: RESERVED

2.10.18.15 CM_ALWON_MCASP1_CLKCTRL Register (offset = 144h) [reset = 3000h]

 CM_ALWON_MCASP1_CLKCTRL is shown in [Figure 2-260](#) and described in [Table 2-293](#).

This register manages the MCASP1 clocks.

Figure 2-260. CM_ALWON_MCASP1_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

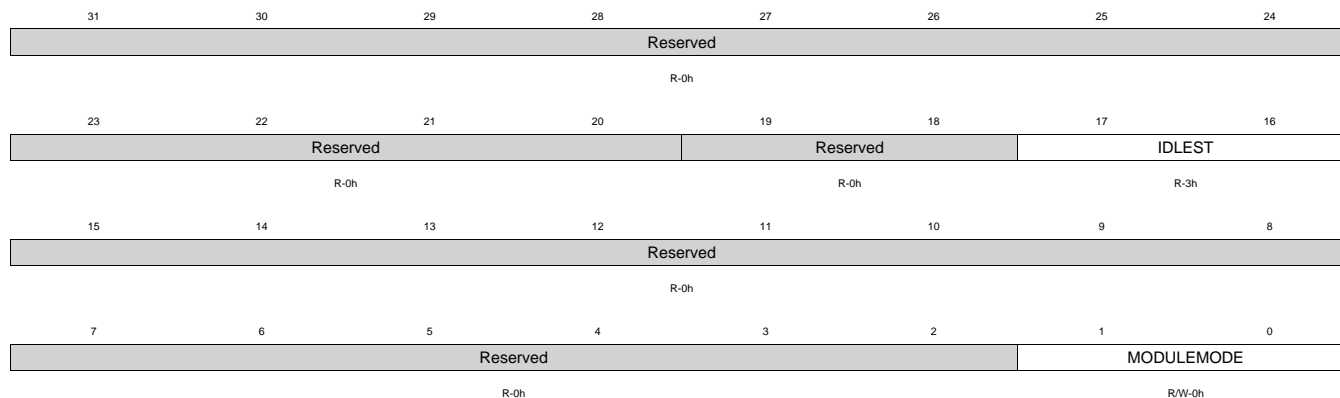

Table 2-293. CM_ALWON_MCASP1_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. 0x0: Func: Module is fully functional, including INTERCONN 0x1: Trans: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Idle: Module is in Idle mode (only INTERCONN part). It is functional if using separate functional clock 0x3: Disable: Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0: DISABLED: Module is disable by SW. Any INTERCONN access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: RESERVED 0x2: ENABLE: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3: RESERVED

2.10.18.16 CM_ALWON_MCASP2_CLKCTRL Register (offset = 148h) [reset = 3000h]

 CM_ALWON_MCASP2_CLKCTRL is shown in [Figure 2-261](#) and described in [Table 2-294](#).

This register manages the MCASP2 clocks.

Figure 2-261. CM_ALWON_MCASP2_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0: DISABLED: Module is disable by SW. Any INTERCONN access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: RESERVED 0x2: ENABLE: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3: RESERVED

2.10.18.30 CM_ALWON_UART_4_CLKCTRL Register (offset = 184h) [reset = 30000h]

CM_ALWON_UART_4_CLKCTRL is shown in [Figure 2-275](#) and described in [Table 2-308](#).

This register manages the UART 4 clocks.

Figure 2-275. CM_ALWON_UART_4_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-308. CM_ALWON_UART_4_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	Reserved	R	0h	
18	Reserved	R	0h	
17-16	IDLEST	R	3h	Module idle status. 0x0: Func: Module is fully functional, including INTERCONN 0x1: Trans: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Idle: Module is in Idle mode (only INTERCONN part). It is functional if using separate functional clock 0x3: Disable: Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R/W	0h	Control the way mandatory clocks are managed. 0x0: DISABLED: Module is disable by SW. Any INTERCONN access to module results in an error, except if resulting from a module wakeup (asynchronous wakeup). 0x1: RESERVED 0x2: ENABLE: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3: Reserved

2.10.18.46 CM_ALWON_L4HS_CLKCTRL Register (offset = 1E8h) [reset = 2h]

CM_ALWON_L4HS_CLKCTRL is shown in [Figure 2-291](#) and described in [Table 2-324](#).

This register manages the L4HS clocks.

Figure 2-291. CM_ALWON_L4HS_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

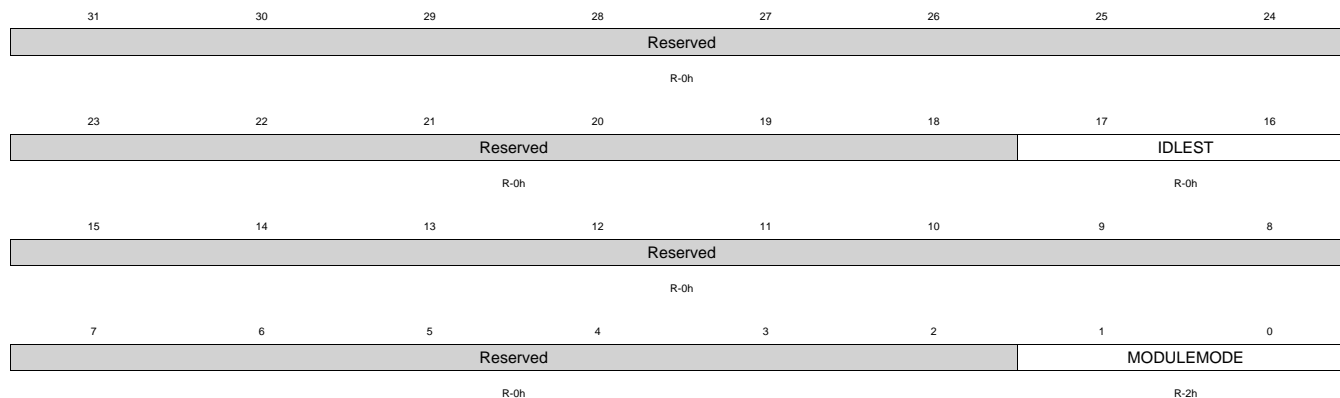

Table 2-324. CM_ALWON_L4HS_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	IDLEST	R	0h	Module idle status. 0x0: Func: Module is fully functional, including INTERCONN 0x1: Trans: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Idle: Module is in Idle mode (only INTERCONN part). It is functional if using separate functional clock 0x3: Disable: Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R	2h	Control the way mandatory clocks are managed. 0x0: Reserved 0x1: Reserved 0x2: ENABLE: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3: Reserved

2.10.18.47 CM_ALWON_L4LS_CLKCTRL Register (offset = 1ECh) [reset = 2h]

 CM_ALWON_L4LS_CLKCTRL is shown in [Figure 2-292](#) and described in [Table 2-325](#).

This register manages the L4LS clocks.

Figure 2-292. CM_ALWON_L4LS_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 2-325. CM_ALWON_L4LS_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	IDLEST	R	0h	Module idle status. 0x0: Func: Module is fully functional, including INTERCONN 0x1: Trans: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Idle: Module is in Idle mode (only INTERCONN part). It is functional if using separate functional clock 0x3: Disable: Module is disabled and cannot be accessed
15-2	Reserved	R	0h	
1-0	MODULEMODE	R	2h	Control the way mandatory clocks are managed. 0x0: Reserved 0x1: Reserved 0x2: ENABLE: Module is explicitly enabled. Interface clock (if not used for functions) may be gated according to the clock domain state. Functional clocks are guaranteed to stay present. As long as in this configuration, power domain sleep transition cannot happen. 0x3: Reserved

2.10.18.48 CM_ALWON_RTC_CLKCTRL Register (offset = 1F0h) [reset = 2h]

CM_ALWON_RTC_CLKCTRL is shown in [Figure 2-293](#) and described in [Table 2-326](#).

This register manages the RTC clocks.

Figure 2-293. CM_ALWON_RTC_CLKCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

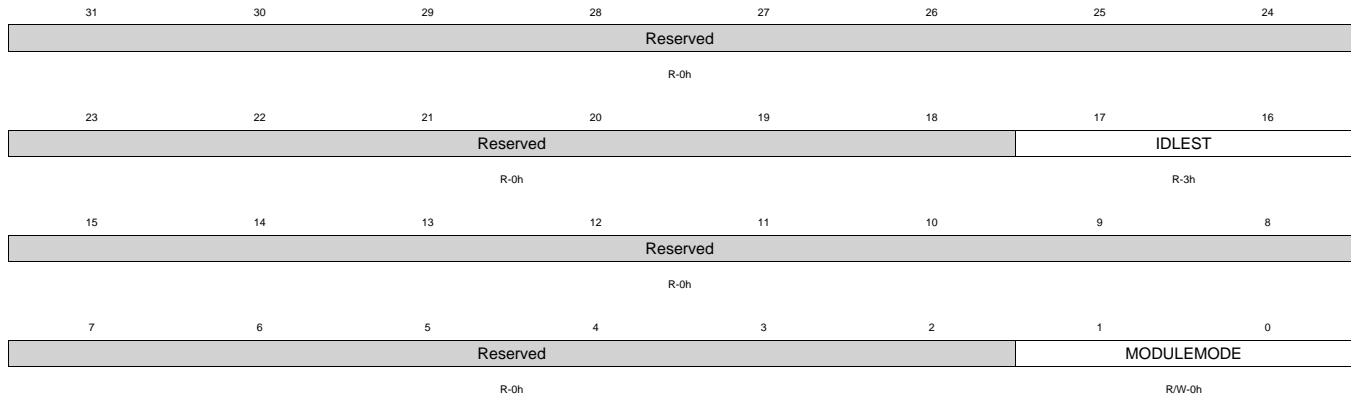

Table 2-326. CM_ALWON_RTC_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	Reserved	R	0h	
17-16	IDLEST	R	0h	Module idle status. 0x0: Func: Module is fully functional, including INTERCONN 0x1: Trans: Module is performing transition: wakeup, or sleep, or sleep abortion 0x2: Idle: Module is in Idle mode (only INTERCONN part). It is functional if using separate functional clock 0x3: Disable: Module is disabled and cannot be accessed

Control Module

This chapter provides information about the control module.

Topic	Page
3.1 Control Module.....	787
3.2 CONTROL_MODULE Registers.....	791

3.1 Control Module

This device contains a system-level control logic block. The control module includes status and control logic not addressed within the peripherals or the rest of the device infrastructure.

This module is the primary point of control for the following areas of the device:

- Functional I/O multiplexing
- Device status
- Static device configuration
- Reset isolation logic inside the chip control module
- Lock/unlock mechanism for section of MMR inside the chip control module

The device control module primarily implements a bank of registers accessible (read/write) by the software along with some read-only registers carrying status information.

Note: The following operating systems and devices are used interchangeably throughout this chapter:

- DSP and C674x
- MPU and CORTEX-A8

The Control Module registers are documented in the section *CONTROL_MODULE Registers*. The following sections give an overview of the most important functionality provided by the Control Module.

NOTE: A processor (or other bus master) must be operating in the Supervisor privilege state in order to write to the control module registers. Registers are readable in either User or Supervisor privilege state.

3.1.1 MMR_LOCK Register (Locked/Unlocked States)

The control module is segmented into 5 regions that are protected by a corresponding MMR_LOCKx register. The intent of the LOCK/UNLOCK mechanism is to prevent critical registers from being corrupted by undesired or malicious writes to the memory mapped addresses.

These regions default to LOCKED state, at which time the corresponding MMRs cannot be written. In order to write to the MMRs of the corresponding region, software must first UNLOCK the region by writing a specified 32-b value to the MMR_LOCKx register. At that point, the MMRs can be successfully written. Software should, in general, relock the registers after the necessary accesses have been done.

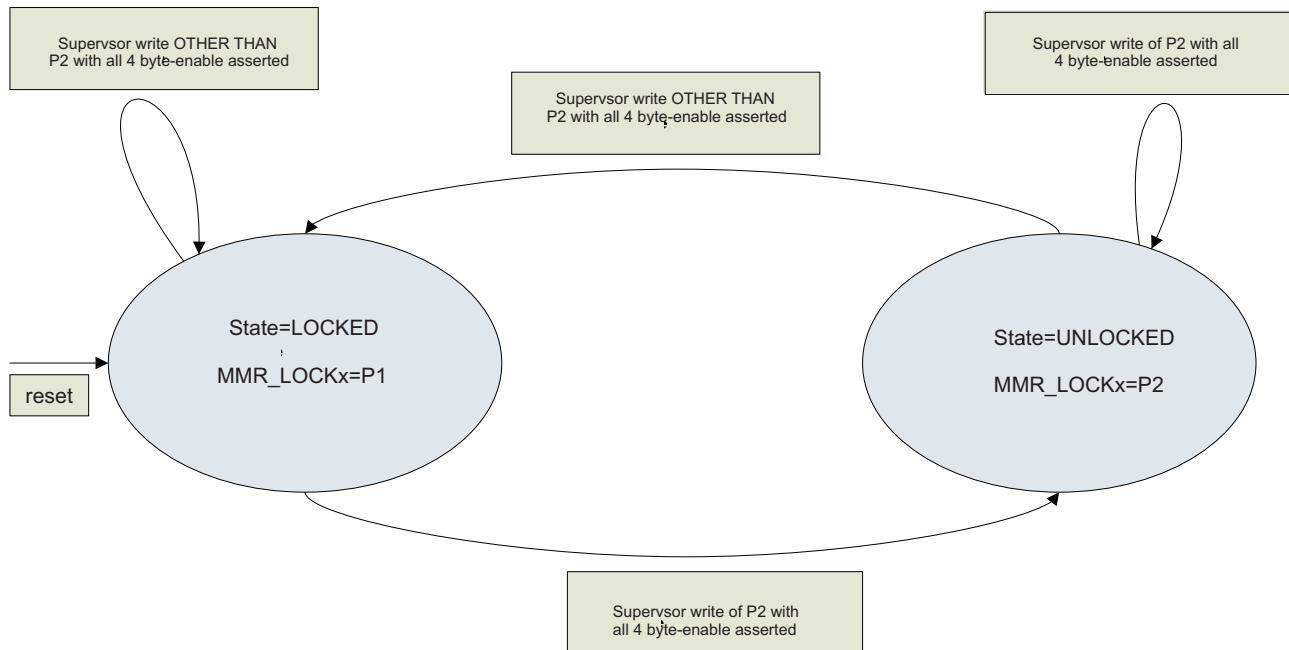

[Table 3-1](#) summarizes the MMR_LOCKx registers including offset address range that is protected by each register.

Table 3-1. MMR_LOCKx Registers

Register Name	LOCKED State (register value=P1)	UNLOCKED State (register value=P2)	Start_Address_x	End_Address_x
MMR_LOCK0	0x1A1C 8144	0x2FF1 AC2B	0x0400	0x05FF
MMR_LOCK1	0xFDF4 5530	0xF757 FDC0	0x0600	0x07FF
MMR_LOCK2	0x1AE6 E320	0xE2BC 3A6D	0x0800	0x0FFF
MMR_LOCK3	0x2FFA 927C	0x1EBF 131D	0x1000	0x12FF
MMR_LOCK4	0x143F 832C	0x6F36 1E05	0x1300	0x17FF

Figure 3-1 shows the transition from locked to unlocked state for the MMR_LOCK register.

Figure 3-1. MMR_LOCKx Transition from LOCKED/UNLOCKED State

Note: Non-supervisor writes should not reach this register.
Reads should always return the value P1 or P2, depending on the state.

3.1.2 Pin Multiplexing (Pin Mux)

Many I/O pin can be internally routed to/from one of several peripheral modules within the device. This routing is referred to as Pin Multiplexing. Pin Multiplexing allows software to choose the subset of internal signals which will be mapped to balls of the device for a given application.

Device-level pin multiplexing is controlled on a pin-by-pin basis by the MUXMODE bits of the PINCNTL1 – PINCNTL270 registers in this control module. The PINCNTLx registers' descriptions and functions can be found in the device data manual, *Pin Multiplexing Control* section.

A second level of pin selection is provided via specific control module registers. The secondary control is described in the following sections.

3.1.2.1 Other Pin Muxing Control

The GPIO_MUX register is used to select whether specific GPIO pins are sourced from device inputs or from internal interrupt sources. Refer to the register description for details.

The GMII_SEL register is used to select between GMII/MII, RMII, and RGMII modes of operation.

3.1.2.2 Special Muxing of GPIO1[7:10] Signals

The GPIO1[7:10] signals can be mapped on the following device balls:

- GPIO1[7] - on device ball W1
- GPIO1[8] - on device ball W2
- GPIO1[9] - on device ball V1
- GPIO1[10] - on device ball V2

To ensure this mapping, the user must not only configure the PINCNTL[62:65] registers properly, but also make the following settings in the MLBP_SIG_IO_CTRL and MLBP_DAT_IO_CTRL registers:

- MLBP_SIG_IO_CTRL register:

- Set bit [2] ENLVCMOS to '1' to map GPIO1[7] on device ball W1 and GPIO1[8] on device ball W2.
- Set bit [1] ENN to '0' to enable GPIO1[8] as output; or set this bit to '1' to enable GPIO1[8] as input.
- Set bit [0] ENP to '0' to enable GPIO1[7] as output; or set this bit to '1' to enable GPIO1[7] as input.
- MLBP_DAT_IO_CTRL register:
 - Set bit [2] ENLVCMOS to '1' to map GPIO1[9] on device ball V1 and GPIO1[10] on device ball V2.
 - Set bit [1] ENN to '0' to enable GPIO1[10] as output; or set this bit to '1' to enable GPIO1[10] as input.
 - Set bit [0] ENP to '0' to enable GPIO1[9] as output; or set this bit to '1' to enable GPIO1[9] as input.

NOTE: The GPIO[7:10] signals can also be mapped on other device balls. The MLBP_SIG_IO_CTRL and MLBP_DAT_IO_CTRL settings are only necessary for mapping GPIO1[7:10] to the [W1, W2, V1, V2] device balls. For more information about device balls mapping, see device data manual.

3.1.3 BOOT Status

The Control Module CONTROL_STATUS and BOOTSTAT register allows the software to poll the status of the device boot to determine which boot sequence was detected and if any boot errors persist.

This register can be used by software for verification of a (un)successful boot and if necessary display error messages to the user.

3.1.4 DSP / EDMA Memory Management Unit Configuration

The MMU_CFG register is used to optionally route certain initiators through the System MMU. The C674x_DSP MDMA port accesses will always be routed through the System MMU so no configuration bit is instantiated for C674x_DSP. Note that when TPTC0 is routed through the MMU, accesses to the C674x_DSP SDMA port will still by-pass the MMU for increased performance. MMU_CFG Additional details are provided in the *System MMU* chapter.

3.1.5 Interrupt and DMA Controller Crossbars

The device contains a large number of system interrupts that are triggered by on chip events. Each CPU has an interrupt controller which allows a limited number of system events to trigger a CPU interrupt.

For the device DSP and Media Controller, to accommodate CPU interrupt generation by all system events, an Interrupt Event Crossbar precedes their corresponding interrupt controllers. To allow a multiple DMA request sources mapping versus each line of the device EDMA subsystem, a DMA Event Crossbar precedes the EDMA3CC controller. This allows a flexible mapping where any input to the Interrupt / DMA event Crossbar can be mapped to any of the interrupt/event outputs of the crossbar (which maps to inputs to the processor interrupt controller or device DMA controller).

This functionality is controlled by the DSP_INTMUX, Media_Controller_INTMUX and EDMA3CC_EVTMUX registers, which format is briefly described in below sections.

3.1.5.1 DSP Interrupt Mux

Each DSP Interrupt mux is controlled by a MMR field which is 6 bit in length (of which only the 5 LSBs are used) .This field value descriptions are available in table *DSP INTC Interrupt Crossbar Mapping* of the section, *Interrupt Requests to DSP INTC*.

This MMR field DSP_INT_MUX_[#int_number], where #int_number is the interrupt number at GEM boundary. There is not interrupt mux for GEM interrupt number a) 0 to 14 and b) 96 to 127 so the range of #int_number is 15 to 95.

After reset DSP_INT_MUX_[#int_number] defaults to 0b000000, which maps the interrupt from default mapping to interrupt_[#int_number], e.g. interrupt_15's default mapping is MMCHS0's SDINT, interrupt_16's default mapping is McSPI0's SPIINT etc. The mapping for other values of DSP_INT_MUX_[#int_number] and additional details, including interrupt/event mapping, are provided in the *Device Interrupts and EDMA Events* section.

3.1.5.2 Media Controller Interrupt Mux

Each Media Controller interrupt mux is controlled by a MMR field which is 6 bit in length. This field value descriptions are available in table *Media Controller INTC Interrupt Crossbar Mapping* of the section, *Interrupt Requests to Media Controller*.

This MMR field Media_Controller_INT_MUX_[#int_number], where #int_number is the interrupt number at Media Controller boundary. The range of #int_number is 0 to 56.

After reset Media_Controller_INT_MUX_[#int_number] defaults to 0b000000, which maps the interrupt from default mapping to Media_Controller_interrupt_[#int_number], e.g. interrupt_0's default mapping is HDMI's HDMIINT, interrupt_2's default mapping is Timer1's TINT1, etc. The mapping for other values of Media_Controller_INT_MUX_[#int_number] and additional details, including interrupt/event mapping, are provided in the *Device Interrupts and EDMA Events* section.

3.1.5.3 EDMA3CC Event Mux

Each EDMA3CC (TPCC) Event mux is controlled by a MMR field which is 6 bit in length (of which only the 5 LSBs are used). This field value descriptions are available in table *EDMA Multiplexed Synchronization Events* of the section, *EDMA Channel Synchronization Events*.

This MMR field EDMA3CC_MUX_[evt_number], where #evt_number is the event number at EDMA3CC boundary. The range of #evt_number is 0 to 63.

After reset EDMA3CC_MUX_[#evt_number] defaults to 0b000000, which maps the event from default mapping to event_[#evt_number], e.g. EDMA3CC event_0's default mapping is VCP's VCPREVT0, EDMA3CC event_1's default mapping is VCP's VCPXEVT0 etc. The mapping for other values of EDMA3CC_MUX_[#evt_number] and additional details, including interrupt/event mapping, are provided in the *Device Interrupts and EDMA Events* section.

3.1.6 Device Level Peripheral Configuration

Various peripherals within the device contain various device level configuration that are not contained within the peripheral configuration registers. Device level configuration includes Power Management, MAC Address, USB Configuration / Status Registers, USB Product ID, Vendor ID Registers and PCIe Vendor ID, Product ID Registers.

3.1.7 Reset Isolation

The device supports reset isolation for the Ethernet Subsystem. For more information refer to the section *Reset Isolation* of the chapter, *Power, Reset, and Clock Management (PRCM) Module*.

[Table 3-2](#) describes the subset of device pins and the corresponding PINCNTLx registers that can be reset-isolated. The specific combination of pins that are enabled for isolation is controlled by the RESET_ISO register and is detailed in the Register section of this chapter. In summary, the ISO_CONTROL field can enable/disable reset isolation. The GMII_ISO, RMII_ISO0, and RMII_ISO1 fields control which subset of the Pin Groups (and PINCNTL registers) are selected for reset isolation.

Table 3-2. List of PINCNTLx Registers, reset affected by RESET_ISO.

RESET_ISO Pin Group	Associated PINCNTL Registers
MDIO/MDCLK	PINCNTL233 to PINCNTL234
EMAC[1]_Mx/Other ⁽¹⁾	PINCNTL204 to PINCNTL227
EMAC[0]_Mx/EMAC[1:0]_RGx	PINCNTL235 to PINCNTL258
EMAC_RMREFCLK	PINCNTL232

⁽¹⁾ Several pins not related to the Ethernet Subsystem are included in this Pin Group for device compatibility.

Table 3-2. List of PINCNTLx Registers, reset affected by RESET_ISO. (continued)

RESET_ISO Pin Group	Associated PINCNTL Registers
EMAC[1]_RMx_MUX0	PINCNTL252 to PINCNTL258
EMAC[1]_RMx_MUX1	PINCNTL157 to PINCNTL163
EMAC[0]_RMx	PINCNTL236 to PINCNTL242

3.2 CONTROL_MODULE Registers

Table 3-3 lists the memory-mapped registers for the CONTROL_MODULE. All register offset addresses not listed in Table 3-3 should be considered as reserved locations and the register contents should not be modified.

All these registers can only be modified by SUPERVISR mode access.

Table 3-3. CONTROL_MODULE REGISTERS

Offset	Acronym	Register Name	Section
0h	CONTROL_REVISION	The CONTROL_REVISION register is a read only register containing the revision number of the Control module. A write to this register has no effect.	Section 3.2.1
4h	CONTROL_HWINFO	The CONTROL_HWINFO register contains information about the module hardware configuration (typically HDL generics, if any).	Section 3.2.2
10h	CONTROL_SYSCONFIG	The CONTROL_SYSCONFIG register implements only a reduced set of the register defined in the register implements various standby and emulation control bits.	Section 3.2.3
40h	CONTROL_STATUS	The CONTROL_STATUS register reflects the system boot and the device type configuration values as sampled when the power-on reset (PORz) or warm reset (RESETz) signal goes high.	Section 3.2.4
44h	BOOTSTAT	The Boot Status (BOOTSTAT) register indicates the status of the device boot process	Section 3.2.5
48h	DSPBOOTADDR	The DSP boot address defaults to 0x00800000 (C674x_DSP L2 space). The Host ARM must place DSP boot code into C674x_DSP L2 prior to releasing C674x_DSP reset or change the DSPBOOTADDR to point to the code location. The DSPBOOTADDR register is reset to its default value by a hard reset only and retains its current value over a soft reset.	Section 3.2.6
60h	MMR_LOCK0	The MMR_LOCKx Register is used allow/block writes to the registers in address region Start_Address_x - End_Address_x. This register has 2 states LOCKED and UNLOCKED When in LOCKED state all writes to Start_Address_x -End_Address_x is blocked. When in UNLOCKED state all writes to Start_Address_x - End_Address_x is allowed. All reads to Start_Address_x -End_Address_x should not be blocked by the state of MMR_LOCKx registers.	Section 3.2.7
64h	MMR_LOCK1	The MMR_LOCKx Register is used allow/block writes to the registers in address region Start_Address_x - End_Address_x. This register has 2 states LOCKED and UNLOCKED When in LOCKED state all writes to Start_Address_x -End_Address_x is blocked. When in UNLOCKED state all writes to Start_Address_x - End_Address_x is allowed. All reads to Start_Address_x -End_Address_x should not be blocked by the state of MMR_LOCKx registers.	Section 3.2.8

Table 3-3. CONTROL_MODULE REGISTERS (continued)

Offset	Acronym	Register Name	Section
68h	MMR_LOCK2	The MMR_LOCKx Register is used allow/block writes to the registers in address region Start_Address_x - End_Address_x. This register has 2 states LOCKED and UNLOCKED When in LOCKED state all writes to Start_Address_x -End_Address_x is blocked. When in UNLOCKED state all writes to Start_Address_x - End_Address_x is allowed. All reads to Start_Address_x -End_Address_x should not be blocked by the state of MMR_LOCKx registers.	Section 3.2.9
6Ch	MMR_LOCK3	The MMR_LOCKx Register is used allow/block writes to the registers in address region Start_Address_x - End_Address_x. This register has 2 states LOCKED and UNLOCKED When in LOCKED state all writes to Start_Address_x -End_Address_x is blocked. When in UNLOCKED state all writes to Start_Address_x - End_Address_x is allowed. All reads to Start_Address_x -End_Address_x should not be blocked by the state of MMR_LOCKx registers.	Section 3.2.10
70h	MMR_LOCK4	The MMR_LOCKx Register is used allow/block writes to the registers in address region Start_Address_x - End_Address_x. This register has 2 states LOCKED and UNLOCKED When in LOCKED state all writes to Start_Address_x -End_Address_x is blocked. When in UNLOCKED state all writes to Start_Address_x - End_Address_x is allowed. All reads to Start_Address_x -End_Address_x should not be blocked by the state of MMR_LOCKx registers.	Section 3.2.11
100h	CONTROL_SEC_CTRL	Security Control Register	Section 3.2.12
468h	DEVOSC	Oscillator 0 Control. Note for deepsleep: - 1st program bit16 (DSPOLARITY) of register DEEPSLEEP_CTRL to the desired polarity - To enter deepsleep mode, set bit 17 (DSENABLE) of DEEPSLEEP_CTRL to 1. - To exit, toggle the external pin DEEPSLEEPZ.	Section 3.2.13
46Ch	AUXOSC	Oscillator 1 Control	Section 3.2.14
480h	PCIE_CFG	5.6.20. PCIE Configuration Register	Section 3.2.15
600h	DEVICE_ID	The DEVICE_ID register contains a software readable version of the device JTAG ID. Software can use this register to determine the version of the device on which it is executing.	Section 3.2.16
604h	DEV_FEATURE	The DEV_FEATURE register reflects the eFuse settings enabling or disabling certain device functions and capabilities. Note that DEV_FEATURE bits are all implemented as feature enabled bits. This may require inverting the value of those eFuses which are implemented as disable signals.	Section 3.2.17
608h	INIT_PRIORITY_0	The INIT_PRIORITY_0 register configures the infrastructure pressure input for L3 initiators to provide dynamic priority escalation.	Section 3.2.18
60Ch	INIT_PRIORITY_1	The INIT_PRIORITY_1 register configures the infrastructure pressure input for L3 initiators to provide dynamic priority escalation.	Section 3.2.19
610h	MMU_CFG	The MMU_CFG register is used to optionally route certain initiators through the System MMU. The C674x_DSP MDMA port accesses will always be routed through the System MMU so no configuration bit is instantiated for C674x_DSP. Note that when TPTC0 is routed through the MMU accesses to the C674x_DSP SDMA port will still by-pass the MMU for increased performance.	Section 3.2.20
614h	TPTC_CFG	The TPTC_CFG register configures the default burst size for TPTC0, 1, 2, and 3.	Section 3.2.21

Table 3-3. CONTROL_MODULE REGISTERS (continued)

Offset	Acronym	Register Name	Section
61Ch	DSP_IDLE_CFG	The C674x_DSP_IDLE_CFG register controls the state of the C674x_DSP initiator and target port interfaces.	Section 3.2.22
620h	USB_CTRL0	USB Control Register 0 controls the PHY, CM and OTG modules for USB0.	Section 3.2.23
624h	USB_STS0	USB Status Register 0 reflects the status of the USB0.	Section 3.2.24
628h	USB_CTRL1	USB Control Register 1 controls the PHY, CM and OTG modules for USB1.	Section 3.2.25
62Ch	USB_STS1	USB Status Register 1 reflects the status of the USB0.	Section 3.2.26
630h	MAC_ID0_LO	The MAC_ID0_LO register contains the lower 2 bytes of the 48-bit ID for MAC0.	Section 3.2.27
634h	MAC_ID0_HI	The MAC_ID0_HI register contains the upper 4 bytes of the 48-bit ID for MAC0.	Section 3.2.28
638h	MAC_ID1_LO	The MAC_ID1_LO register contains the lower 2 bytes of the 48-bit ID for MAC1.	Section 3.2.29
63Ch	MAC_ID1_HI	The MAC_ID1_HI register contains the upper 4 bytes of the 48-bit ID for MAC1.	Section 3.2.30
640h	SW_REVISION	The SW_REVISION register reads the Paper Spin Variant 32bit efuse. The SW can read this bit and decide what to do with a specific SW package.	Section 3.2.31
644h	DCAN_RAMINIT	The DCAN_RAMINIT register is used to start/check status of the autoinitialization process of DCAN RAM.	Section 3.2.32
64Ch	AUD_CTRL	The register controls loopback of McBSP data for testing purposes.	Section 3.2.33
650h	GMII_SEL	Ethernet GMII Select	Section 3.2.34
654h	OCMEM_PWRDN	The OCMEM_PWRDN Register determines the powerdown behavior of the OCMC RAM memories.	Section 3.2.35
65Ch	MEDIA_CONTROLLER_MEM_PWRDN	The MEDIA_CONTROLLER_MEM_PWRDN Register determines the powerdown behavior of the Media Controller memories.	Section 3.2.36
670h	SD_DAC_CTRL	The SD_DAC_CTRL Register controls operation of the Standard Definition video DACs.	Section 3.2.37
674h	SD_DAC0_CAL	The SD_DAC0_CAL Register is used to calibrate the output level of SD DAC 0 (SD Y). Users can use this register to drive a known value to the DAC input for performing system video level calibration.	Section 3.2.38
678h	SD_DAC1_CAL	The SD_DAC1_CAL Register is used to calibrate the output level of SD DAC 1 (SD C). Users can use this register to drive a known value to the DAC input for performing system video level calibration.	Section 3.2.39
67Ch	SD_DAC0_REGCTRL	The SD_DAC0_REGCTRL Register is used to provide an alternate method to program the AVDAC s CTL interface (to be used only when the internal registers of the AVDAC needs to be tweaked).	Section 3.2.40
680h	SD_DAC0_REGSTATUS	The SD_DAC0_REGSTATUS Register is used to provide to know the status of the last write to the AVDAC s internal registers (to be used only when the internal registers of the AVDAC needs to be tweaked).	Section 3.2.41
684h	SD_DAC1_REGCTRL	The SD_DAC1_REGCTRL Register is used to provide an alternate method to program the AVDAC s CTL interface (to be used only when the internal registers of the AVDAC needs to be tweaked).	Section 3.2.42
688h	SD_DAC1_REGSTATUS	The SD_DAC1_REGSTATUS Register is used to provide to know the status of the last write to the AVDAC s internal registers (to be used only when the internal registers of the AVDAC needs to be tweaked).	Section 3.2.43
694h	EMIF_CLK_GATE	This register provides a mechanism to control clock gating of DDR PHYs and see status of Self Refresh.	Section 3.2.44

Table 3-3. CONTROL_MODULE REGISTERS (continued)

Offset	Acronym	Register Name	Section
6A0h	SMRT_CTRL	The SMRT_CTRL Register reflects the control for the srsleep signal for the SRs .	Section 3.2.45
6A4h	ARM_CORTEX_A8_HW_DBG_SE L	This register controls what kind of debug info is returned by ARM Cortex-A8.	Section 3.2.46
6A8h	ARM_CORTEX_A8_HW_DBG_INF O	This register shows the debug info bus from ARM Cortex-A8. Please see below for definition. The selection bits are HW_DBG_SEL (3:0) in the MMR ARM_CORTEX_A8_HW_DBG_SEL	Section 3.2.47
6B0h	PRCM_DEBUG_ALWON_DEFAULT	This register is for PRCM debug.	Section 3.2.48
6B4h	PRCM_DEBUG_PD_DOMAIN_ST ATUS	This register is for PRCM debug.	Section 3.2.49
6D8h	PCIE_PLLCFG0	This is connected to "CF_APLL_0" on SERDES ANA Initial Settings required prior to power up sequence: PCIE_100M: 4000 7000 ; SATA_20M: C000 7060 ; SATA_100M: 4000 7060	Section 3.2.50

3.2.1 CONTROL_REVISION Register (offset = 0h) [reset = 4000000h]

CONTROL_REVISION is shown in Figure 3-2 and described in Table 3-4.

The CONTROL_REVISION register is a read only register containing the revision number of the Control module. A write to this register has no effect.

Figure 3-2. CONTROL_REVISION Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-4. CONTROL_REVISION Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	Reserved	R	1h	0x0 : Legacy (ASP or WTBU) scheme 0x1 : Highlander 0.8 scheme
29-28	Reserved	R	0h	
27-16	IP_REV_FUNC	R	0h	Function indicates a software compatible module family. If there is no level of software compatibility a new Func number (and hence REVISION) should be assigned.
15-11	IP_REV_RTL	R	0h	RTL Version (R), maintained by IP design owner.
10-8	IP_REV_MAJOR	R	0h	Major Revision (X), maintained by IP specification owner.
7-6	IP_REV_CUSTOM	R	0h	Indicates a special version for a particular device. Consequence of use may avoid use of standard Chip Support Library (CSL) / Drivers
5-0	IP_REV_MINOR	R	0h	Minor Revision (Y), maintained by IP specification owner.

3.2.2 CONTROL_HWINFO Register (offset = 4h) [reset = 0h]

CONTROL_HWINFO is shown in [Figure 3-3](#) and described in [Table 3-5](#).

The CONTROL_HWINFO register contains information about the module hardware configuration (typically HDL generics, if any).

Figure 3-3. CONTROL_HWINFO Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-5. CONTROL_HWINFO Register Field Descriptions

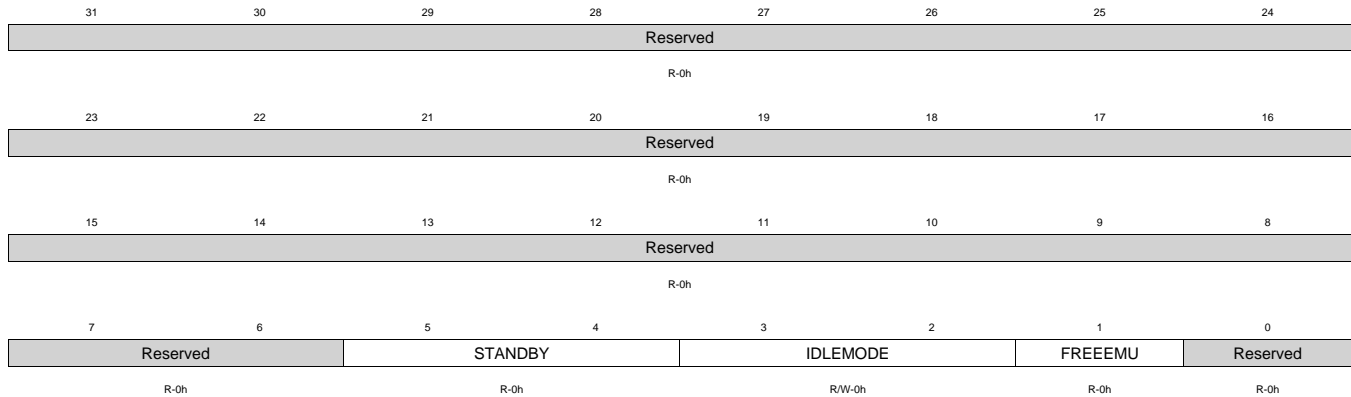

Bit	Field	Type	Reset	Description
31-0	IP_HWINFO	R	0h	IP Module dependent

3.2.3 CONTROL_SYSCONFIG Register (offset = 10h) [reset = 0h]

CONTROL_SYSCONFIG is shown in [Figure 3-4](#) and described in [Table 3-6](#).

The CONTROL_SYSCONFIG register implements only a reduced set of the register defined in the register implements various standby and emulation control bits.

Figure 3-4. CONTROL_SYSCONFIG Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-6. CONTROL_SYSCONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Reserved	R	0h	
5-4	STANDBY	R	0h	Configure local initiator state manaC674x_DSPent.Reserved in Control Module since it has no local initiator. 0x0 : Force Standby 0x1 : No Standby Mode 0x2 : Smart Standby 0x3 : Smart Standby wakeup capable
3-2	IDLEMODE	R/W	0h	Configure local target state manaC674x_DSPent 0x0 : Force Idle 0x1 : No Idle 0x2 : Smart Idle 0x3 : Smart Idle wakeup capable
1	FREEEMU	R	0h	Sensitivity to Emulation suspend input. 0x0 : Module is sensitive to EMU suspend 0x1 : Module not sensitive to EMU suspend
0	Reserved	R	0h	

3.2.4 CONTROL_STATUS Register (offset = 40h) [reset = 0h]

CONTROL_STATUS is shown in Figure 3-5 and described in Table 3-7.

The CONTROL_STATUS register reflects the system boot and the device type configuration values as sampled when the power-on reset (PORz) or warm reset (RESETz) signal goes high.

Figure 3-5. CONTROL_STATUS Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-7. CONTROL_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	Reserved	R	0h	
26	BOOT_11	R	0h	RSTOUT latch config. The default value comes from BOOT[11] pins 0x0 : RSTOUT only outputs OR of the 3 WD Timer reset output 0x1 : RSTOUT outputs combination of 3WD timer reset output + PRCM output
25	BOOT_10	R	0h	Read customer programmable IDs from efuse for PCIe/USB and NAND ROM. The default value comes from BOOT[10] pins
24-20	BOOT_9_5	R	0h	These registers are for future ROM code usage. The details will be published with the ROM code spec. From BOOT[9:5]
19-18	ADMUX	R	0h	GPMC CS0 Default Address Muxing. The default value comes from BOOT[13:14] pins 0x0 : No Addr/Data Muxing 0x1 : Addr/Data Muxing 0x2 : Addr/Addr/Data Muxing 0x3 : Reserved
17	WAITEN	R	0h	GPMC CS0 Default Wait Enable. The default value comes from BOOT[15] pins 0x0 : Ignore WAIT input 0x1 : Use WAIT input
16	BW	R	0h	GPMC CS0 Default Bus Width. The default value comes from BOOT[12] pins 0x0 : 8-bit data bus 0x1 : 16-bit data bus
15-11	Reserved	R	0h	

Table 3-7. CONTROL_STATUS Register Field Descriptions (continued)

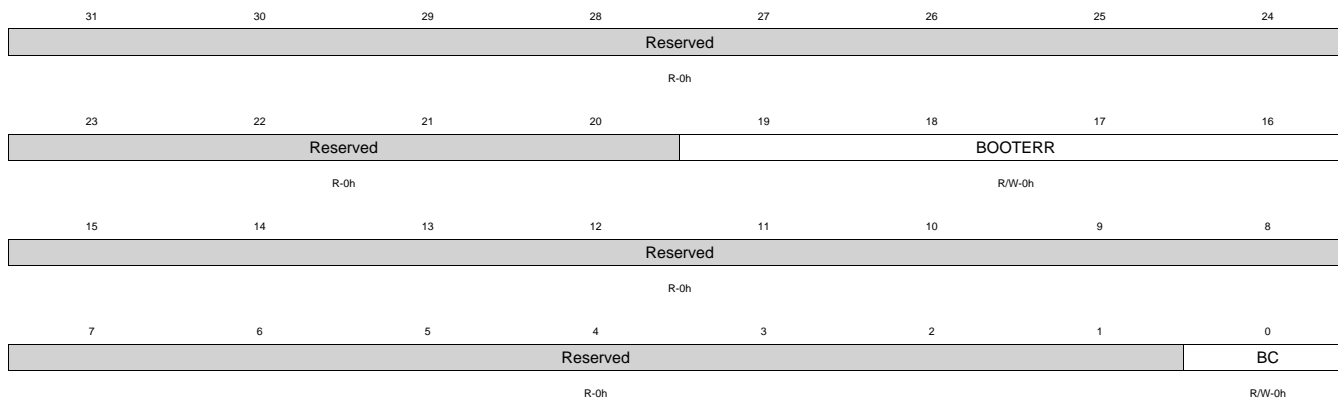

Bit	Field	Type	Reset	Description
10-8	DEVTYPE	R	0h	eFuse Device Type Decoded from PRODUCTION_ID eFuse 0x0 : Test 0x1 : EMUL 0x2 : HSL 0x3 : GP 0x4 : Bad 0x5 : HS 0x6 : EMU 0x7 : Bad
7-5	Reserved	R	0h	
4-0	SYSBOOT	R	0h	System Boot Type.The default value comes from BOOT[4:0] pins

3.2.5 BOOTSTAT Register (offset = 44h) [reset = 0h]

BOOTSTAT is shown in Figure 3-6 and described in Table 3-8.

The Boot Status (BOOTSTAT) register indicates the status of the device boot process

Figure 3-6. BOOTSTAT Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-8. BOOTSTAT Register Field Descriptions

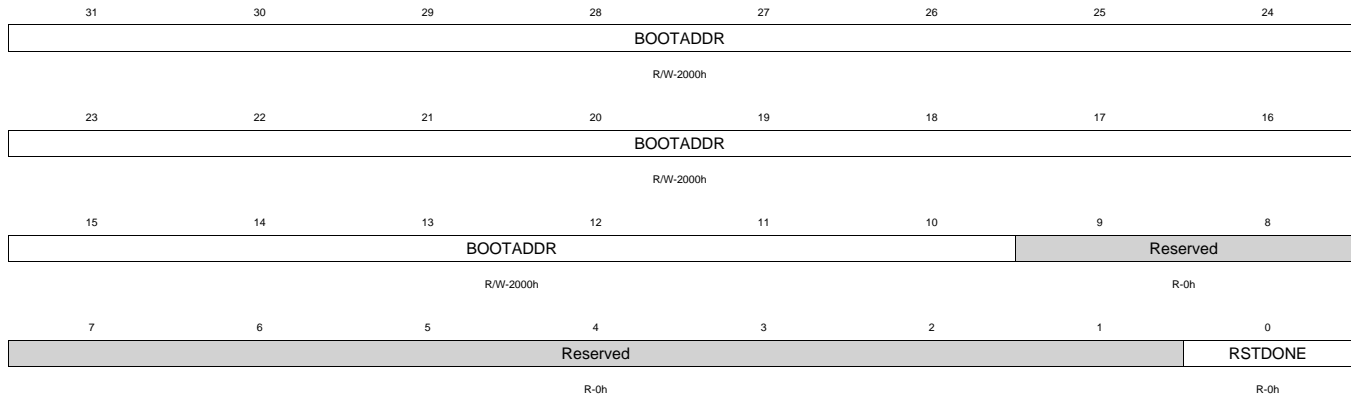

Bit	Field	Type	Reset	Description
31-20	Reserved	R	0h	
19-16	BOOTERR	R/W	0h	Boot Error The exact meaning of the various error codes will be determined by the bootloader software. 0x0: No Boot Error 0x1: Others. Bootloader detected boot error
15-1	Reserved	R	0h	
0	BC	R/W	0h	Boot Complete. This bit may be optionally set by a host boot device to indicate that it has finished loading code. The Host ARM can poll this bit to determine whether to continue the boot process 0x0 : Host hasn't complete boot seq. 0x1 : Host boot sequence is complete

3.2.6 DSPBOOTADDR Register (offset = 48h) [reset = 800000h]

DSPBOOTADDR is shown in [Figure 3-7](#) and described in [Table 3-9](#).

The DSP boot address defaults to 0x00800000 (C674x_DSP L2 space). The Host ARM must place DSP boot code into C674x_DSP L2 prior to releasing C674x_DSP reset or change the DSPBOOTADDR to point to the code location. The DSPBOOTADDR register is reset to its default value by a hard reset only and retains its current value over a soft reset.

Figure 3-7. DSPBOOTADDR Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -r = value after reset

Table 3-9. DSPBOOTADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	BOOTADDR	R/W	2000h	DSP Boot Address (upper 22 bits)
9-1	Reserved	R	0h	
0	RSTDONE	R	0h	DSP Reset Done (reset_out from C674x_DSP)

3.2.7 MMR_LOCK0 Register (offset = 60h) [reset = 1A1C8144h]

MMR_LOCK0 is shown in [Figure 3-8](#) and described in [Table 3-10](#).

The MMR_LOCKx Register is used allow/block writes to the registers in address region Start_Address_x - End_Address_x. This register has 2 states LOCKED and UNLOCKED. When in LOCKED state all writes to Start_Address_x - End_Address_x is blocked. When in UNLOCKED state all writes to Start_Address_x - End_Address_x is allowed. All reads to Start_Address_x - End_Address_x should not be blocked by the state of MMR_LOCKx registers.

Figure 3-8. MMR_LOCK0 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-10. MMR_LOCK0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MMR_LOCK0	R/W	1A1C8144h	Lock/Unlock register for region 0x0400 - 0x05FF 438075716 = LOCKED : All writes to 0x0400 - 0x05FF is blocked. 804367403 = UNLOCKED : All writes to 0x0400 - 0x05FF is allowed.

3.2.8 MMR_LOCK1 Register (offset = 64h) [reset = FDF45530h]

MMR_LOCK1 is shown in [Figure 3-9](#) and described in [Table 3-11](#).

The MMR_LOCKx Register is used allow/block writes to the registers in address region Start_Address_x - End_Address_x. This register has 2 states LOCKED and UNLOCKED. When in LOCKED state all writes to Start_Address_x -End_Address_x is blocked. When in UNLOCKED state all writes to Start_Address_x - End_Address_x is allowed. All reads to Start_Address_x -End_Address_x should not be blocked by the state of MMR_LOCKx registers.

Figure 3-9. MMR_LOCK1 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-11. MMR_LOCK1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MMR_LOCK1	R/W	FDF45530h	Lock/Unlock register for region 0x0600 - 0x07FF 4149738944 = UNLOCKED : All writes to 0x0600 - 0x07FF is allowed. 4260648240 = LOCKED : All writes to 0x0600 - 0x07FF is blocked.

3.2.9 MMR_LOCK2 Register (offset = 68h) [reset = 1AE6E320h]

MMR_LOCK2 is shown in [Figure 3-10](#) and described in [Table 3-12](#).

The MMR_LOCKx Register is used allow/block writes to the registers in address region Start_Address_x - End_Address_x. This register has 2 states LOCKED and UNLOCKED. When in LOCKED state all writes to Start_Address_x - End_Address_x is blocked. When in UNLOCKED state all writes to Start_Address_x - End_Address_x is allowed. All reads to Start_Address_x - End_Address_x should not be blocked by the state of MMR_LOCKx registers.

Figure 3-10. MMR_LOCK2 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-12. MMR_LOCK2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MMR_LOCK2	R/W	1AE6E320h	Lock/Unlock register for region 0x0800 - 0x0FFF 3803986541 = UNLOCKED : All writes to 0x0800 - 0x0FFF is allowed. 451339040 = LOCKED : All writes to 0x0800 - 0x0FFF is blocked.

3.2.10 MMR_LOCK3 Register (offset = 6Ch) [reset = 2FFA927Ch]

MMR_LOCK3 is shown in [Figure 3-11](#) and described in [Table 3-13](#).

The MMR_LOCKx Register is used allow/block writes to the registers in address region Start_Address_x - End_Address_x. This register has 2 states LOCKED and UNLOCKED. When in LOCKED state all writes to Start_Address_x - End_Address_x is blocked. When in UNLOCKED state all writes to Start_Address_x - End_Address_x is allowed. All reads to Start_Address_x - End_Address_x should not be blocked by the state of MMR_LOCKx registers.

Figure 3-11. MMR_LOCK3 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-13. MMR_LOCK3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MMR_LOCK3	R/W	2FFA927Ch	Lock/Unlock register for region 0x1000 - 0x12FF 515838749 = UNLOCKED : All writes to 0x1000 - 0x12FF is allowed. 804950652 = LOCKED : All writes to 0x1000 - 0x12FF is blocked.

3.2.11 MMR_LOCK4 Register (offset = 70h) [reset = 143F832Ch]

MMR_LOCK4 is shown in [Figure 3-12](#) and described in [Table 3-14](#).

The MMR_LOCKx Register is used allow/block writes to the registers in address region Start_Address_x - End_Address_x. This register has 2 states LOCKED and UNLOCKED. When in LOCKED state all writes to Start_Address_x - End_Address_x is blocked. When in UNLOCKED state all writes to Start_Address_x - End_Address_x is allowed. All reads to Start_Address_x - End_Address_x should not be blocked by the state of MMR_LOCKx registers.

Figure 3-12. MMR_LOCK4 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-14. MMR_LOCK4 Register Field Descriptions

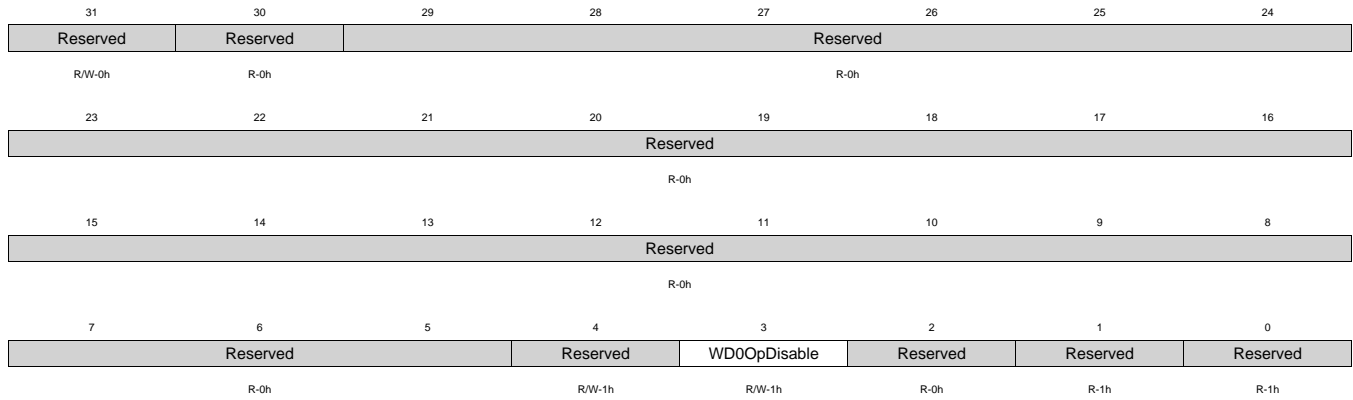

Bit	Field	Type	Reset	Description
31-0	MMR_LOCK4	R/W	143F832Ch	Lock/Unlock register for region 0x1300 - 0x17FF 1865817605 = UNLOCKED : All writes to 0x1300 - 0x17FF is allowed. 339706668 = LOCKED : All writes to 0x1300 - 0x17FF is blocked.

3.2.12 CONTROL_SEC_CTRL Register (offset = 100h) [reset = 1Bh]

CONTROL_SEC_CTRL is shown in [Figure 3-13](#) and described in [Table 3-15](#).

Security Control Register

Figure 3-13. CONTROL_SEC_CTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-15. CONTROL_SEC_CTRL Register Field Descriptions

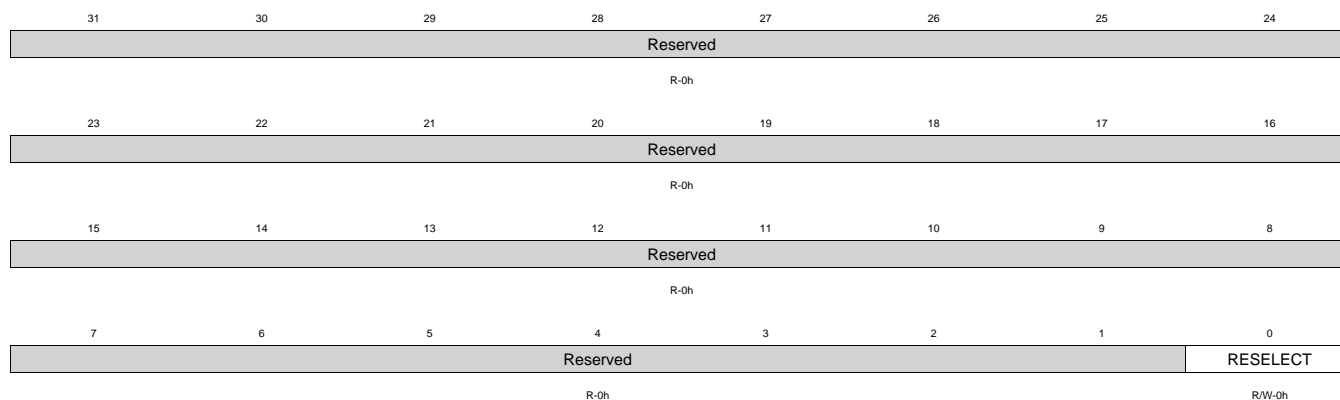

Bit	Field	Type	Reset	Description
31	Reserved	R/W	0h	
30	Reserved	R	0h	
29-5	Reserved	R	0h	
4	Reserved	R/W	1h	
3	WDOpDisable	R/W	1h	The general purpose watchdog timer (WDT 0) is not running by default after reset. This bit must be written to 0 to make the WDT 0 watchdog start running. Once a 0 is written to this bit, it cannot be changed again. Reads will always return 0 and the watchdog timer will continue running. MPU watchdog (WDT 0) operation enable control: 0 = Enabled : Watchdog timer is running. 1 = Disabled : Watchdog timer is frozen.
2	Reserved	R	0h	
1	Reserved	R	1h	
0	Reserved	R	1h	

3.2.13 DEVOSC Register (offset = 468h) [reset = 0h]

DEVOSC is shown in [Figure 3-14](#) and described in [Table 3-16](#).

Oscillator 0 Control. Note for deepsleep: - 1st program bit16 (DSPOLARITY) of register DEEPSLEEP_CTRL to the desired polarity - To enter deepsleep mode, set bit 17 (DSENABLE) of DEEPSLEEP_CTRL to 1. - To exit, toggle the external pin DEEPSLEEPZ.

Figure 3-14. DEVOSC Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-16. DEVOSC Register Field Descriptions

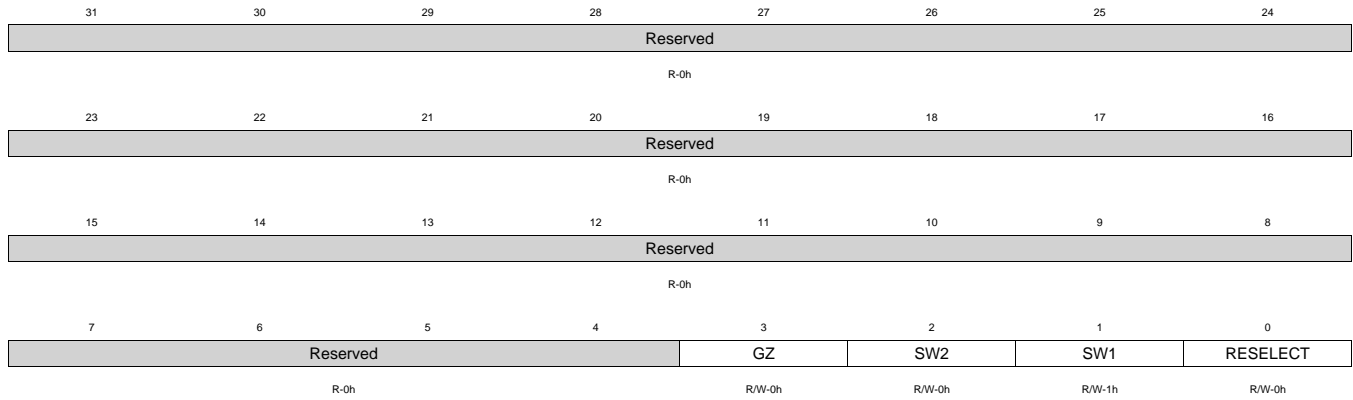

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	RESELECT	R/W	0h	Internal feedback resistor usage

3.2.14 AUXOSC Register (offset = 46Ch) [reset = 2h]

AUXOSC is shown in [Figure 3-15](#) and described in [Table 3-17](#).

Oscillator 1 Control

Figure 3-15. AUXOSC Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-17. AUXOSC Register Field Descriptions

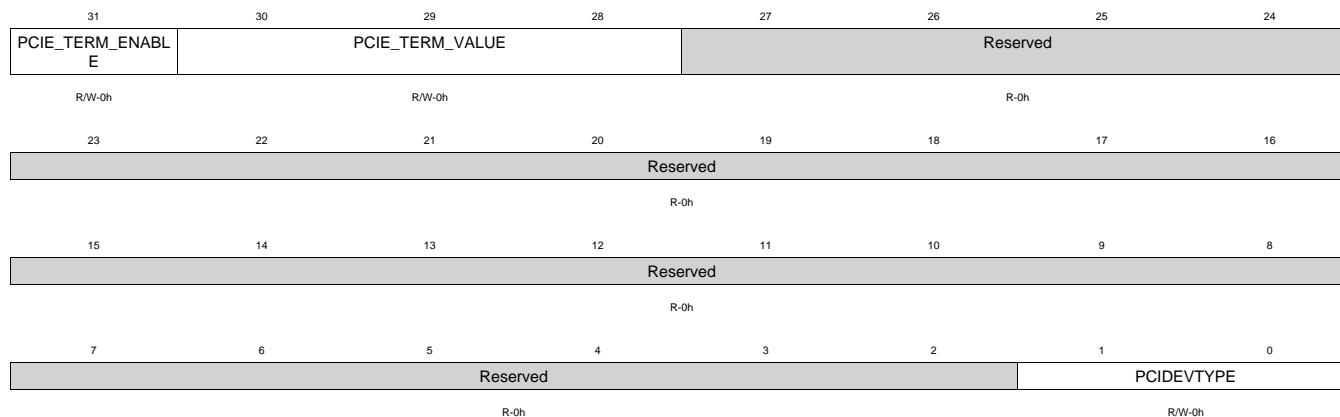

Bit	Field	Type	Reset	Description
31-4	Reserved	R	0h	
3	GZ	R/W	0h	Setting this to 1 will disable the oscillator. Note: - To enter into deepsleep, set this bit to 1 - To exit deepsleep, set this bit 0
2	SW2	R/W	0h	0 (select 15-35 MHz range)
1	SW1	R/W	1h	1 (select 15-35 MHz range)
0	RESELECT	R/W	0h	Internal feedback resistor usage

3.2.15 PCIE_CFG Register (offset = 480h) [reset = 0h]

PCIE_CFG is shown in [Figure 3-16](#) and described in [Table 3-18](#).

5.6.20. PCIE Configuration Register

Figure 3-16. PCIE_CFG Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-18. PCIE_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PCIE_TERM_ENABLE	R/W	0h	PCIE Termination enable (override for SERDES termination control, see PCI ESS/Serdes documentation).
30-28	PCIE_TERM_VALUE	R/W	0h	PCIE Termination value (override for SERDES termination control, see PCI ESS/Serdes documentation).
27-2	Reserved	R	0h	
1-0	PCIDEVTYPE	R/W	0h	Directly controls the DEVTYPE ports on the PCI ESS. Used to select PCI device type. Should be valid before releasing reset to PCI ESS. Full definition in PCI ESS IP spec.

3.2.16 DEVICE_ID Register (offset = 600h) [reset = B8F202Eh]

DEVICE_ID is shown in [Figure 3-17](#) and described in [Table 3-19](#).

The DEVICE_ID register contains a software readable version of the device JTAG ID. Software can use this register to determine the version of the device on which it is executing.

Figure 3-17. DEVICE_ID Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-19. DEVICE_ID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	DEVREV	R	0h	Device revision. Default value comes from Efuse.
27-12	PARTNUM	R	B8F2h	Device part number (unique JTAG ID)
11-1	MFGR	R	17h	Manufacturer s JTAG ID
0	Reserved	R	0h	

3.2.17 DEV_FEATURE Register (offset = 604h) [reset = 0h]

DEV_FEATURE is shown in Figure 3-18 and described in Table 3-20.

The DEV_FEATURE register reflects the eFuse settings enabling or disabling certain device functions and capabilities. Note that DEV_FEATURE bits are all implemented as feature enabled bits. This may require inverting the value of those eFuses which are implemented as disable signals.

3.2.19 INIT_PRIORITY_1 Register (offset = 60Ch) [reset = 0h]

INIT_PRIORITY_1 is shown in [Figure 3-20](#) and described in [Table 3-22](#).

The INIT_PRIORITY_1 register configures the infrastructure pressure input for L3 initiators to provide dynamic priority escalation.

Figure 3-20. INIT_PRIORITY_1 Register

3.2.20 MMU_CFG Register (offset = 610h) [reset = 80h]

MMU_CFG is shown in [Figure 3-21](#) and described in [Table 3-23](#).

The MMU_CFG register is used to optionally route certain initiators through the System MMU. The C674x_DSP MDMA port accesses will always be routed through the System MMU so no configuration bit is instantiated for C674x_DSP. Note that when TPTC0 is routed through the MMU accesses to the C674x_DSP SDMA port will still by-pass the MMU for increased performance.

Figure 3-21. MMU_CFG Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-23. MMU_CFG Register Field Descriptions

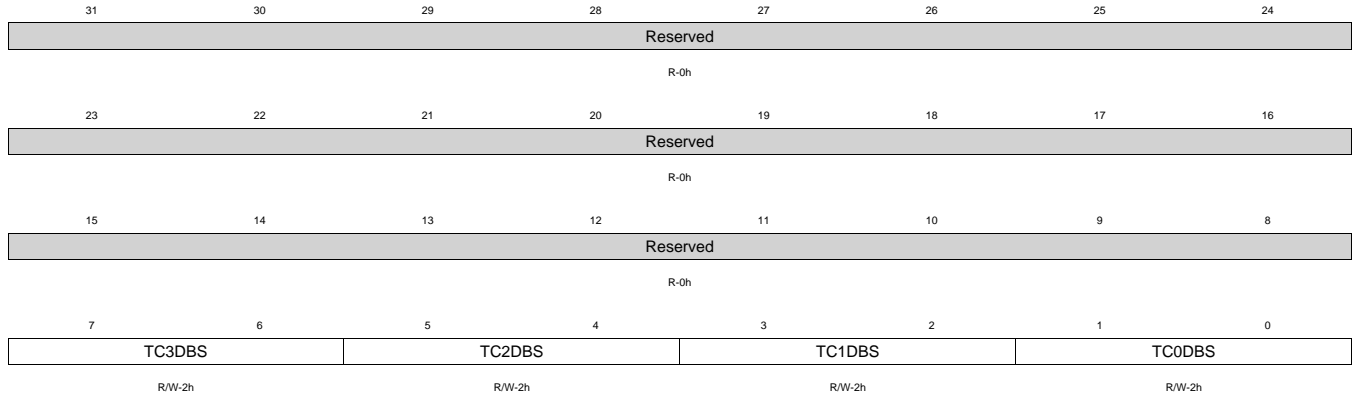

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h	
15	MMU_ABORT	R/W	0h	MMU abort operation This bit causes the MMU to abort the current operation in case of lockup.
14-8	Reserved	R	0h	
7	MMU_EN	R/W	1h	MMU Enable Clearing this bit disables MMU table lookup and causes accesses to use the non-translated address. This bit defaults to enabled but an identical bit within an MMU configuration register defaults to disabled and must be set after the page tables are programmed for MMU operation
6-2	Reserved	R	0h	
1	TC1MMU	R/W	0h	TPTC1 Uses MMU
0	TC0MMU	R/W	0h	TPTC0 Uses MMU

3.2.21 TPTC_CFG Register (offset = 614h) [reset = AAh]

TPTC_CFG is shown in [Figure 3-22](#) and described in [Table 3-24](#).

The TPTC_CFG register configures the default burst size for TPTC0, 1, 2, and 3.

Figure 3-22. TPTC_CFG Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

3.2.27 MAC_ID0_LO Register (offset = 630h) [reset = 0h]

MAC_ID0_LO is shown in [Figure 3-28](#) and described in [Table 3-30](#).

The MAC_ID0_LO register contains the lower 2 bytes of the 48-bit ID for MAC0.

Figure 3-28. MAC_ID0_LO Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-30. MAC_ID0_LO Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h	
15-8	MACADDR_7_0	R/W	0h	MAC0 Address -Byte 0.Value comes from Efuse
7-0	MACADDR_15_8	R/W	0h	MAC0 Address -Byte 1.Value comes from Efuse

3.2.28 MAC_ID0_HI Register (offset = 634h) [reset = 0h]

MAC_ID0_HI is shown in [Figure 3-29](#) and described in [Table 3-31](#).

The MAC_ID0_HI register contains the upper 4 bytes of the 48-bit ID for MAC0.

Figure 3-29. MAC_ID0_HI Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-31. MAC_ID0_HI Register Field Descriptions

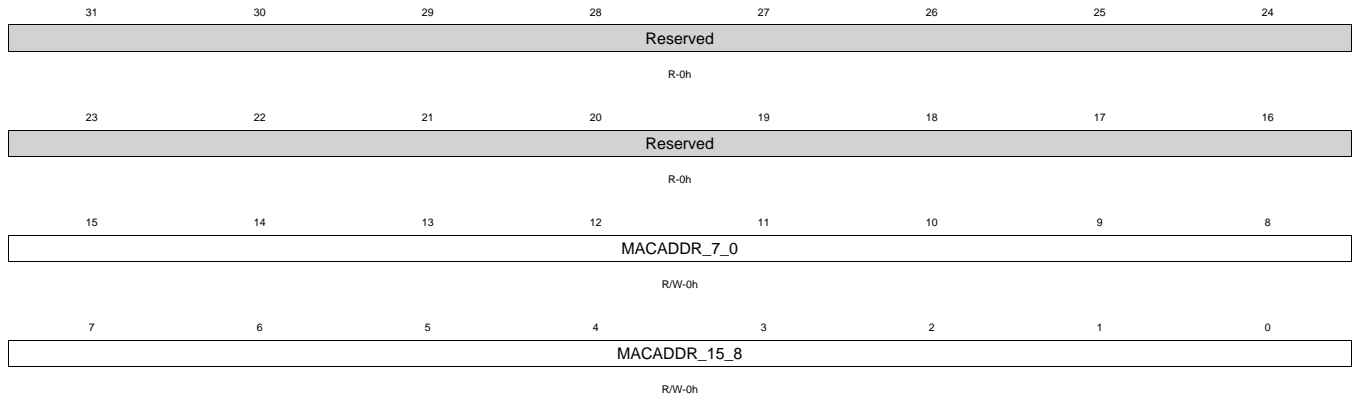

Bit	Field	Type	Reset	Description
31-24	MACADDR_23_16	R/W	0h	MAC0 Address -Byte 5. Value comes from Efuse

7-0	MACADDR_47_40	R/W	0h	MAC1 Address -Byte 5. Value comes from Efuse

3.2.31 SW_REVISION Register (offset = 640h) [reset = 0h]

SW_REVISION is shown in [Figure 3-32](#) and described in [Table 3-34](#).

The SW_REVISION register reads the Paper Spin Variant 32bit efuse. The SW can read this bit and decide what to do with a specific SW package.

Figure 3-32. SW_REVISION Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-34. SW_REVISION Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	REV	R	0h	SW revision field from efuse

3.2.32 DCAN_RAMINIT Register (offset = 644h) [reset = 0h]

DCAN_RAMINIT is shown in [Figure 3-33](#) and described in [Table 3-35](#).

The DCAN_RAMINIT register is used to start/check status of the autoinitialization process of DCAN RAM.

Figure 3-33. DCAN_RAMINIT Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-35. DCAN_RAMINIT Register Field Descriptions

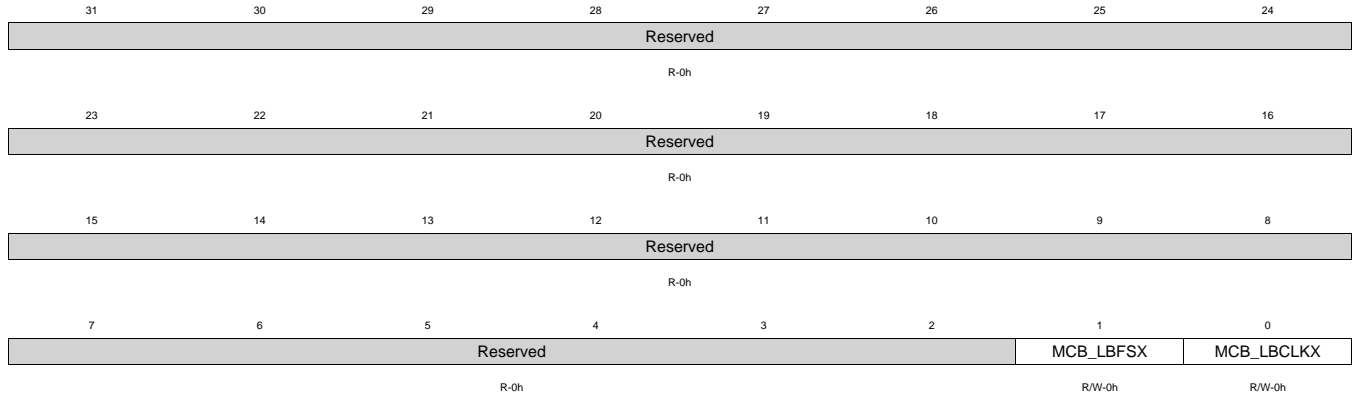

Bit	Field	Type	Reset	Description
31-10	Reserved	R	0h	
9	DCAN1_RAMINIT_DONE	R/W	0h	RAM initialization status 0x0 : DCAN1 RAM Initialization NOT complete 0x1 : DCAN1 RAM Initialization complete
8	DCAN0_RAMINIT_DONE	R/W	0h	RAM initialization status 0x0 : DCAN0 RAM Initialization NOT complete. W1toClr 0x1 : DCAN0 RAM Initialization complete.W1toClr
7-2	Reserved	R	0h	
1	DCAN1_RAMINIT_ST ART	R/W	0h	A transition from 0 to 1 will start DCAN1 RAM initialization sequence.
0	DCAN0_RAMINIT_ST ART	R/W	0h	A transition from 0 to 1 will start DCAN0 RAM initialization sequence.

3.2.33 AUD_CTRL Register (offset = 64Ch) [reset = 0h]

AUD_CTRL is shown in [Figure 3-34](#) and described in [Table 3-36](#).

The register controls loopback of McBSP data for testing purposes.

Figure 3-34. AUD_CTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-36. AUD_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	Reserved	R	0h	
1	MCB_LBFSX	R/W	0h	McBSP FSX Loopback enable -Drives McBSP PIALBCTRLRX[1] 0x0 : No loopback 0x1 : Enable loopback
0	MCB_LBCLKX	R/W	0h	McBSP CLKX Loopback enable -Drives McBSP PIALBCTRLRX[0] 0x0 : No loopback 0x1 : Enable loopback

3.2.34 GMII_SEL Register (offset = 650h) [reset = 0h]

GMII_SEL is shown in Figure 3-35 and described in Table 3-37.

Figure 3-35. GMII_SEL Register

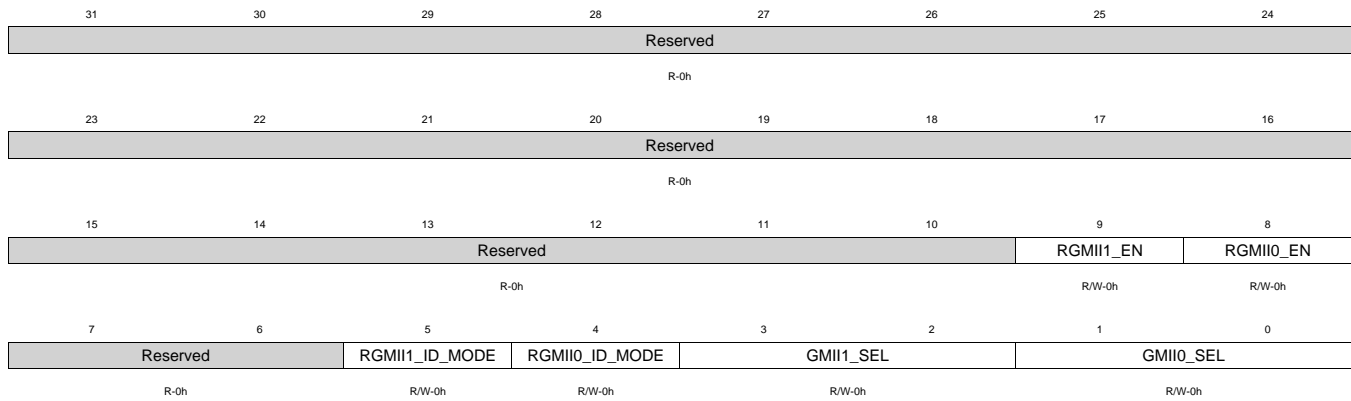

Table 3-37. GMII_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	Reserved	R	0h	
9	RGMII1_EN	R/W	0h	RGMII vs GMII pin mux control for Port 1 . For this bit to take effect, the PINCNTL settings for the device must select the GMII related function. This register is a secondary control that selects GMII vs RGMII. 0x0 : GMII / MII mode 0x1 : RGMII mode
8	RGMII0_EN	R/W	0h	RGMII vs GMII pin mux control for Port 0 . For this bit to take effect, the PINCNTL settings for the device must select the GMII related function. This register is a secondary control that selects GMII vs RGMII. 0x0 : GMII / MII mode 0x1 : RGMII mode
7-6	Reserved	R	0h	
5	RGMII1_ID_MODE	R/W	0h	Port 1 CPRGMII Internal Delay Mode 0x0 : Internal delay 0x1 : No Internal delay
4	RGMII0_ID_MODE	R/W	0h	Port 0 CPRGMII Internal Delay Mode 0x0 : Internal delay 0x1 : No Internal delay
3-2	GMII1_SEL	R/W	0h	Port 1 functionality 0x0 : GMII/MII 0x1 : RMII 0x2 : RGMII
1-0	GMII0_SEL	R/W	0h	Port 0 functionality 0x0 : GMII/MII 0x1 : RMII 0x2 : RGMII

3.2.35 OCMEM_PWRDN Register (offset = 654h) [reset = 0h]

OCMEM_PWRDN is shown in [Figure 3-36](#) and described in [Table 3-38](#).

The OCMEM_PWRDN Register determines the powerdown behavior of the OCMC RAM memories.

Figure 3-36. OCMEM_PWRDN Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-38. OCMEM_PWRDN Register Field Descriptions

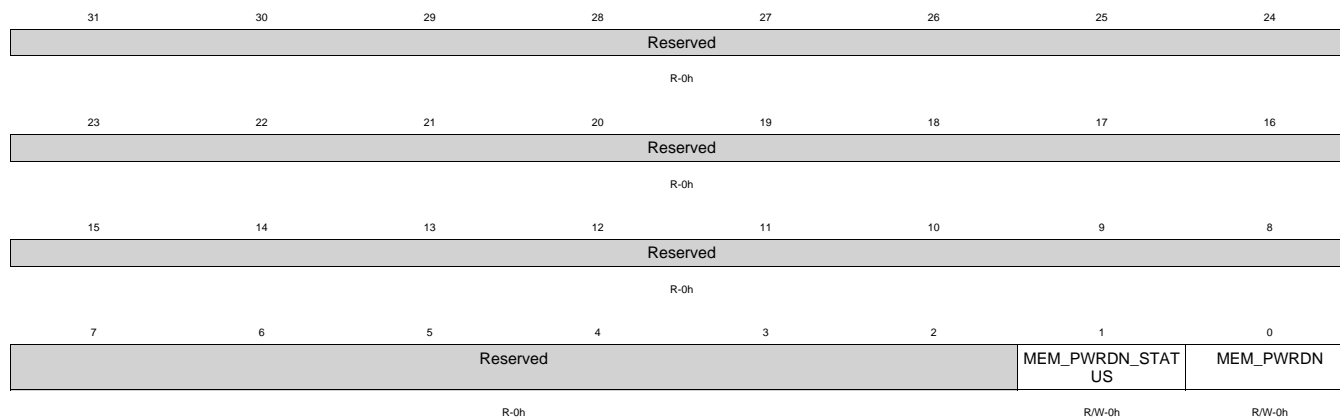

Bit	Field	Type	Reset	Description
31-2	Reserved	R	0h	
1	MEM_PWRDN_STATUS	R/W	0h	Power down status from the OCMEM 0x0 : memory not powered down 0x1 : memory powered down
0	MEM_PWRDN	R/W	0h	Power down request to the OCMEM 0x0 : No memory power down requested 0x1 : memory power down requested

3.2.36 MEDIA_CONTROLLER_MEM_PWRDN Register (offset = 65Ch) [reset = 0h]

MEDIA_CONTROLLER_MEM_PWRDN is shown in [Figure 3-37](#) and described in [Table 3-39](#).

The MEDIA_CONTROLLER_MEM_PWRDN Register determines the powerdown behavior of the Media Controller memories.

Figure 3-37. MEDIA_CONTROLLER_MEM_PWRDN Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-39. MEDIA_CONTROLLER_MEM_PWRDN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	Reserved	R	0h	
1	MEM_PWRDN_STATUS	R/W	0h	Power down status from the Media Controller MEM 0x0 : memory not powered down 0x1 : memory powered down
0	MEM_PWRDN	R/W	0h	Power down request to the Media Controller MEM 0x0 : No memory power down requested 0x1 : memory power down requested

3.2.37 SD_DAC_CTRL Register (offset = 670h) [reset = 18800C6h]

SD_DAC_CTRL is shown in [Figure 3-38](#) and described in [Table 3-40](#).

The SD_DAC_CTRL Register controls operation of the Standard Definition video DACs.

Figure 3-38. SD_DAC_CTRL Register

31				30				29				28				27				26				25				24

Table 3-40. SD_DAC_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	Reserved	R	0h	
25	DAC1_cm4	R/W	0h	It should be low by default .
24	DAC1_cm3	R/W	1h	Optional control used only for dual-channel configuration. It should be low by default (single-channel configuration). 0x0 : Single channel 0x1 : Dual channel configuration (see section 7.5.1)
23	DAC1_cm2	R/W	1h	Optional control used only for dual-channel configuration. It should be low by default (single-channel configuration). 0x0 : Module configured as Luma video channel (dual-channel configuration) or Composite video channel (single-channel configuration) 0x1 : Module configured as Chroma video channel (dual-channel configuration, see section 7.5.1)
22	DAC1_cm1	R/W	0h	Optional control for lower output swing. It should be low by default (high output swing). 0x0 : High full-scale output swing 0x1 : Low full-scale output swing.
21	DAC1_cm0	R/W	0h	Optional control for internal current reference. It should be low by default (external current reference). 0x0 : External current reference (external resistor connected to rset) 0x1 : DO NOT USE. The switched-capacitor resistor has been removed.
20	DAC0_cm4	R/W	0h	It should be low by default .
19	DAC0_cm3	R/W	1h	Optional control used only for dual-channel configuration. It should be low by default (single-channel configuration). 0x0 : Single channel 0x1 : Dual channel configuration (see section 7.5.1)

Table 3-40. SD_DAC_CTRL Register Field Descriptions (continued)

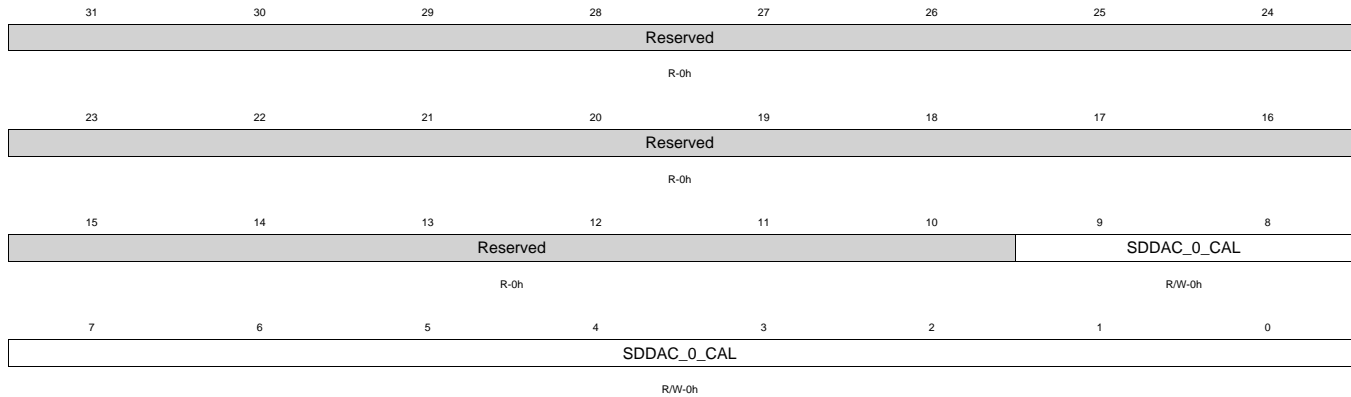

Bit	Field	Type	Reset	Description
18	DAC0_cm2	R/W	0h	Optional control used only for dual-channel configuration. It should be low by default (single-channel configuration). 0x0 : Module configured as Luma video channel (dual-channel configuration) or Composite video channel (single-channel configuration) 0x1 : Module configured as Chroma video channel (dual-channel configuration, see section 7.5.1)
17	DAC0_cm1	R/W	0h	Optional control for lower output swing. It should be low by default (high output swing). 0x0 : High full-scale output swing 0x1 : Low full-scale output swing.
16	DAC0_cm0	R/W	0h	Optional control for internal current reference. It should be low by default (external current reference). 0x0 : External current reference (external resistor connected to rset) 0x1 : DO NOT USE. The switched-capacitor resistor has been removed.
15-9	Reserved	R	0h	
8	TVOUTBYPASS	R/W	0h	TVOUT Bypass Signal. signal. Active high. Video Buffer is bypassed when tvoutbypass is high. Static Signal
7	ACEN	R/W	1h	AC coupling enable. Active high. Must be set low for DC coupling, high for AC coupling. Static signal.
6	INPUTINV	R/W	1h	Inversion of din[9:0]. Active high. It allows polarity alignment with Video Encoder data. It should be LOW for inverted video input data and HIGH for non-inverted video input data. Static signal.
5	DEMEN	R/W	0h	Dynamic Element Matching (DEM) enable. signal. Active high. When high DEM logic is enabled. Static Signal
4	PBNDACz	R/W	0h	DAC Power-Down Control Input. Active low. When low puts the entire DAC channel in power down mode, except the Bandgap and the internal LDO. 0x0 : DAC is powered down 0x1 : DAC is functional
3	PBNBGz	R/W	0h	Bandgap (BG) Power-Down Control. internal LDO in power down mode. Active low. When low puts Bandgap and internal LDO in power down mode. 0x0 : DAC BG is powereddown 0x1 : DAC BG is functional
2	OFFMODE	R/W	1h	Master power-down pin from a permanent (always-on) supply. Active high. When high it powers down all analog blocks regardless of the state of other power control pins. This pin must be used to power down if VDD is turned off. 0x0 : DAC normal operation 0x1 : DAC powered down
1	SD_CALSEL	R/W	1h	SD DAC Calibration Select Controls the video path mux between the Display Subsystem SD output and calibration register values. 0x0 : Output calibration value 0x1 : Normal operation (DSS output)
0	RESETz	R/W	0h	Reset signal. Asynchronous. Active low. When low, it resets data registers to mid-code (10000000) which is the default value. This signal can only be toggled when VDDA is ON.

3.2.38 SD_DAC0_CAL Register (offset = 674h) [reset = 0h]

SD_DAC0_CAL is shown in [Figure 3-39](#) and described in [Table 3-41](#).

The SD_DAC0_CAL Register is used to calibrate the output level of SD DAC 0 (SD Y). Users can use this register to drive a known value to the DAC input for performing system video level calibration.

Figure 3-39. SD_DAC0_CAL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-41. SD_DAC0_CAL Register Field Descriptions

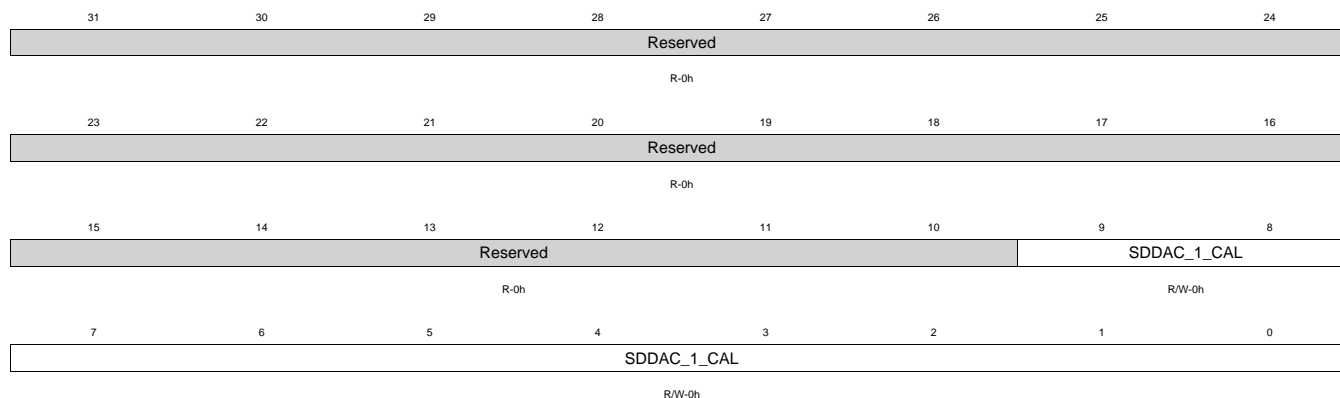

Bit	Field	Type	Reset	Description
31-10	Reserved	R	0h	
9-0	SDDAC_0_CAL	R/W	0h	SD DAC 0 calibration value This is driven as a constant value to the DAC when SD_CALSEL in the SD_DAC_CTRL register is set to 1.

3.2.39 SD_DAC1_CAL Register (offset = 678h) [reset = 0h]

SD_DAC1_CAL is shown in [Figure 3-40](#) and described in [Table 3-42](#).

The SD_DAC1_CAL Register is used to calibrate the output level of SD DAC 1 (SD C). Users can use this register to drive a known value to the DAC input for performing system video level calibration.

Figure 3-40. SD_DAC1_CAL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-42. SD_DAC1_CAL Register Field Descriptions

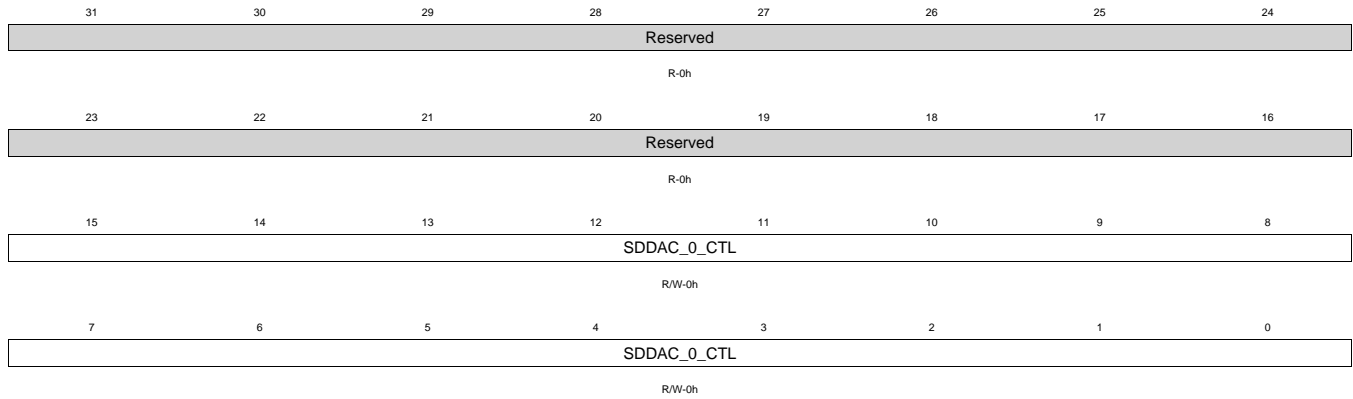

Bit	Field	Type	Reset	Description
31-10	Reserved	R	0h	
9-0	SDDAC_1_CAL	R/W	0h	SD DAC 1 calibration value This is driven as a constant value to the DAC when SD_CALSEL in the SD_DAC_CTRL register is set to 1.

3.2.40 SD_DAC0_REGCTRL Register (offset = 67Ch) [reset = 0h]

SD_DAC0_REGCTRL is shown in [Figure 3-41](#) and described in [Table 3-43](#).

The SD_DAC0_REGCTRL Register is used to provide an alternate method to program the AVDAC s CTL interface (to be used only when the internal registers of the AVDAC needs to be tweaked).

Figure 3-41. SD_DAC0_REGCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-43. SD_DAC0_REGCTRL Register Field Descriptions

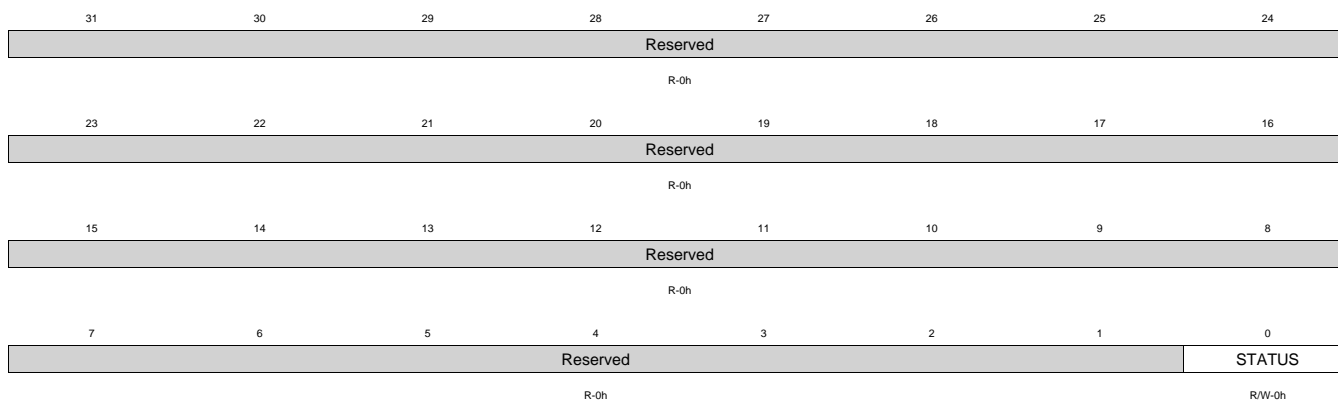

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h	
15-0	SDDAC_0_CTL	R/W	0h	CTL interface for the AVDAC

3.2.41 SD_DAC0_REGSTATUS Register (offset = 680h) [reset = 0h]

SD_DAC0_REGSTATUS is shown in [Figure 3-42](#) and described in [Table 3-44](#).

The SD_DAC0_REGSTATUS Register is used to provide to know the status of the last write to the AVDAC s internal registers (to be used only when the internal registers of the AVDAC needs to be tweaked).

Figure 3-42. SD_DAC0_REGSTATUS Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-44. SD_DAC0_REGSTATUS Register Field Descriptions

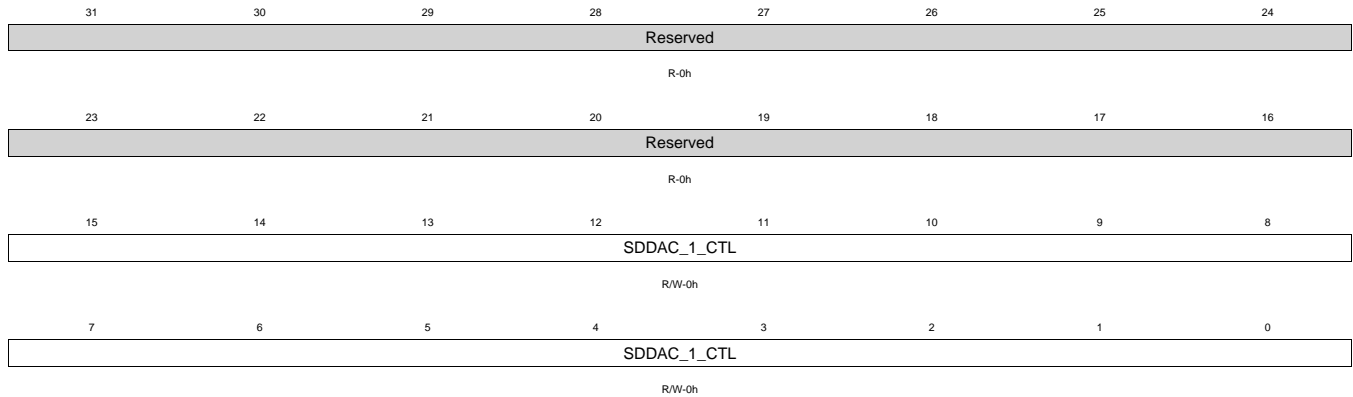

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	STATUS	R/W	0h	Write status for the AVDAC. Write 1 to clear. Output used only for Asynchronous mode of the CTL interface. It is by default low. It toggles high and then low when an asynchronous write on the ctl[15:0] bus has been acknowledged by the VDAC module (see section 5.3.4). 0x0 : Write pending 0x1 : Write acknowledged

3.2.42 SD_DAC1_REGCTRL Register (offset = 684h) [reset = 0h]

SD_DAC1_REGCTRL is shown in [Figure 3-43](#) and described in [Table 3-45](#).

The SD_DAC1_REGCTRL Register is used to provide an alternate method to program the AVDAC s CTL interface (to be used only when the internal registers of the AVDAC needs to be tweaked).

Figure 3-43. SD_DAC1_REGCTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-45. SD_DAC1_REGCTRL Register Field Descriptions

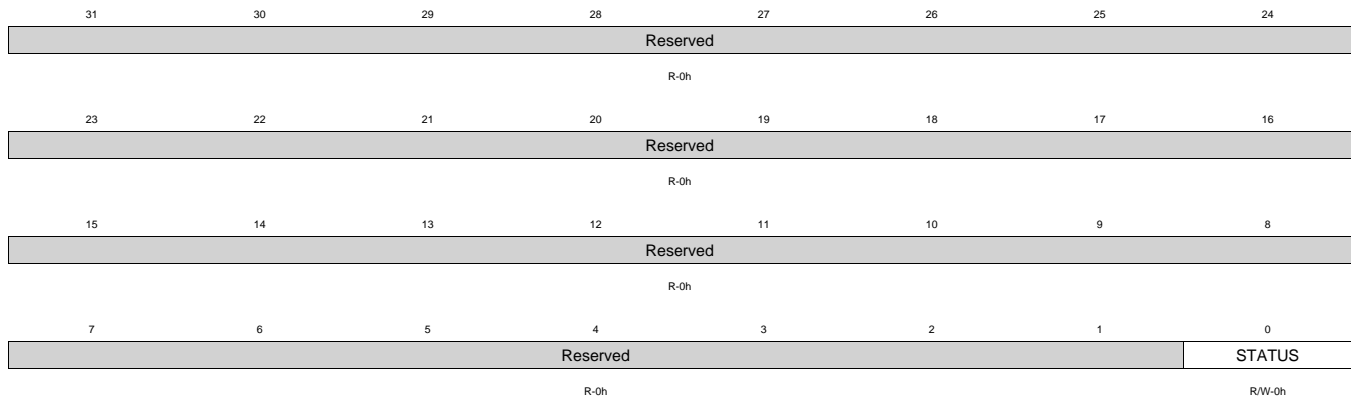

Bit	Field	Type	Reset	Description
31-16	Reserved	R	0h	
15-0	SDDAC_1_CTL	R/W	0h	CTL interface for the AVDAC

3.2.43 SD_DAC1_REGSTATUS Register (offset = 688h) [reset = 0h]

SD_DAC1_REGSTATUS is shown in [Figure 3-44](#) and described in [Table 3-46](#).

The SD_DAC1_REGSTATUS Register is used to provide to know the status of the last write to the AVDAC s internal registers (to be used only when the internal registers of the AVDAC needs to be tweaked).

Figure 3-44. SD_DAC1_REGSTATUS Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-46. SD_DAC1_REGSTATUS Register Field Descriptions

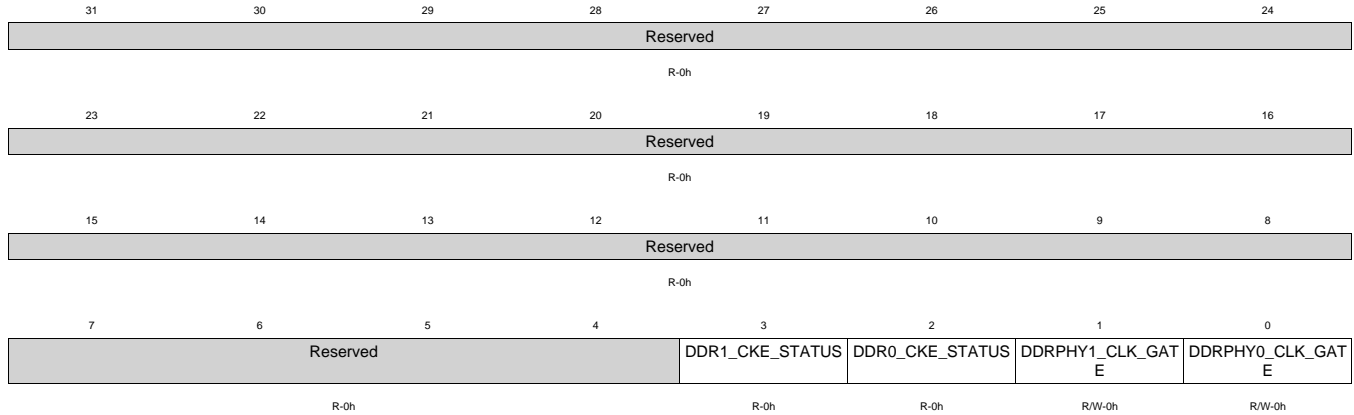

Bit	Field	Type	Reset	Description
31-1	Reserved	R	0h	
0	STATUS	R/W	0h	Write status for the AVDAC. Write 1 to clear. Output used only for Asynchronous mode of the CTL interface. It is by default low. It toggles high and then low when an asynchronous write on the ctl[15:0] bus has been acknowledged by the VDAC module (see section 5.3.4). 0x0 : Write pending 0x1 : Write acknowledged

3.2.44 EMIF_CLK_GATE Register (offset = 694h) [reset = 0h]

EMIF_CLK_GATE is shown in [Figure 3-45](#) and described in [Table 3-47](#).

This register provides a mechanism to control clock gating of DDR PHYs and see status of Self Refresh.

Figure 3-45. EMIF_CLK_GATE Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-47. EMIF_CLK_GATE Register Field Descriptions

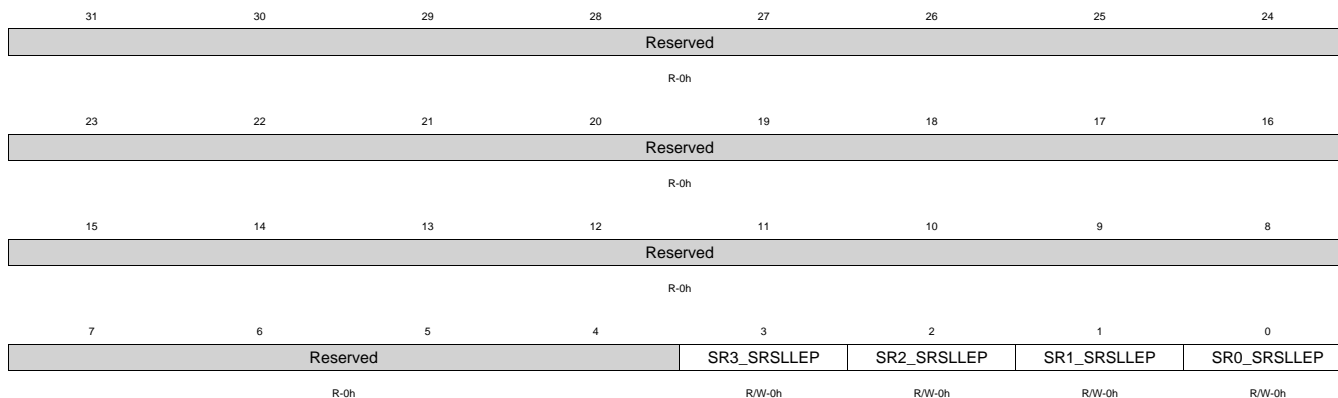

Bit	Field	Type	Reset	Description
31-4	Reserved	R	0h	
3	DDR1_CKE_STATUS	R	0h	CKE ststus for DDR0 0x0 : Not in Self Refresh 0x1 : In Self Refresh
2	DDR0_CKE_STATUS	R	0h	CKE ststus for DDR0 0x0 : Not in Self Refresh 0x1 : In Self Refresh
1	DDRPHY1_CLK_GATE	R/W	0h	Enables/disables the clock to the DDR1 PHY 0x0 : DDR1 PHY clock enabled (running) 0x1 : DDR1 PHY clock disabled (stopped)
0	DDRPHY0_CLK_GATE	R/W	0h	Enables/disables the clock to the DDR0 PHY 0x0 : DDR0 PHY clock enabled (running) 0x1 : DDR0 PHY clock disabled (stopped)

3.2.45 SMRT_CTRL Register (offset = 6A0h) [reset = 0h]

SMRT_CTRL is shown in Figure 3-46 and described in Table 3-48.

The SMRT_CTRL Register reflects the control for the srsleep signal for the SRs .

Figure 3-46. SMRT_CTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-48. SMRT_CTRL Register Field Descriptions

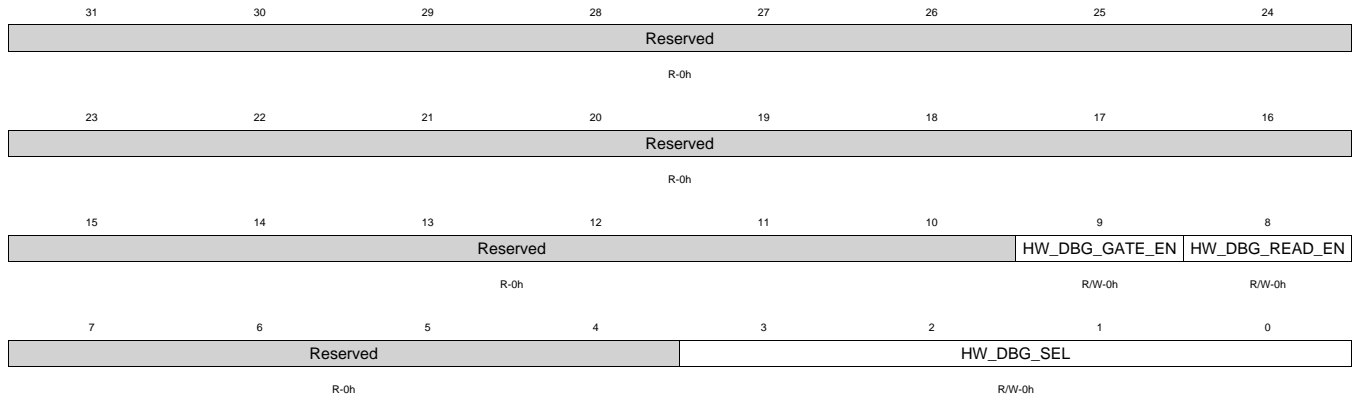

Bit	Field	Type	Reset	Description
31-4	Reserved	R	0h	
3	SR3_SRSLLLEP	R/W	0h	Disables or enables the sensor. 0x0 : disable sensor (SRSLEEP on sensor driven to 1) 0x1 : enable sensor (SRSLEEP on sensor driven to 0).
2	SR2_SRSLLLEP	R/W	0h	Disables or enables the sensor. 0x0 : disable sensor (SRSLEEP on sensor driven to 1) 0x1 : enable sensor (SRSLEEP on sensor driven to 0).
1	SR1_SRSLLLEP	R/W	0h	Disables or enables the sensor. 0x0 : disable sensor (SRSLEEP on sensor driven to 1) 0x1 : enable sensor (SRSLEEP on sensor driven to 0).
0	SR0_SRSLLLEP	R/W	0h	Disables or enables the sensor. 0x0 : disable sensor (SRSLEEP on sensor driven to 1) 0x1 : enable sensor (SRSLEEP on sensor driven to 0).

3.2.46 ARM_CORTEX_A8_HW_DBG_SEL Register (offset = 6A4h) [reset = 0h]

ARM_CORTEX_A8_HW_DBG_SEL is shown in [Figure 3-47](#) and described in [Table 3-49](#).

This register controls what kind of debug info is returned by ARM Cortex-A8.

Figure 3-47. ARM_CORTEX_A8_HW_DBG_SEL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-49. ARM_CORTEX_A8_HW_DBG_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	Reserved	R	0h	
9	HW_DBG_GATE_EN	R/W	0h	To save power input to ARM_CORTEX_A8_HW_DBG_INFO is gated off to all zeros when HW_DBG_GATE_EN bit is low. 0x0 : Debug info gated off 0x1 : Debug info not gated off
8	HW_DBG_READ_EN	R/W	0h	Enable/disable reads of ARM_CORTEX_A8_HW_DBG_INFO 0x0 : Read of ARM_CORTEX_A8_HW_DBG_INFO is not enabled 0x1 : Read of ARM_CORTEX_A8_HW_DBG_INFO is enabled
7-4	Reserved	R	0h	
3-0	HW_DBG_SEL	R/W	0h	Selects which Group of signals are sent out to the ARM_CORTEX_A8_HW_DBG_INFO register 0x0 : Group 0 0x1 : Group 1 0x2 : Group 2 0x3 : Group 3 0x4 : Group 4 0x5 : Group 5 0x6 : Group 6 0x7 : Group 7 0x8 - 0xF : Reserved

3.2.47 ARM_CORTEX_A8_HW_DBG_INFO Register (offset = 6A8h) [reset = 0h]

ARM_CORTEX_A8_HW_DBG_INFO is shown in [Figure 3-48](#) and described in [Table 3-50](#).

This register shows the debug info bus from ARM Cortex-A8. Please see below for definition. The selection bits are HW_DBG_SEL (3:0) in the MMR ARM_CORTEX_A8_HW_DBG_SEL

Figure 3-48. ARM_CORTEX_A8_HW_DBG_INFO Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-50. ARM_CORTEX_A8_HW_DBG_INFO Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	DBG_INFO	R	0h	Debug info from ARM Cortex-A8.

3.2.48 PRCM_DEBUG_ALWON_DEFAULT Register (offset = 6B0h) [reset = 3F7B0010h]

PRCM_DEBUG_ALWON_DEFAULT is shown in [Figure 3-49](#) and described in [Table 3-51](#).

This register is for PRCM debug.

Figure 3-49. PRCM_DEBUG_ALWON_DEFAULT Register

Table 3-53. PCIE_PLLCFG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	SEL_IN_FREQ	R/W	0h	Select input frequency: 0b0 = 100 M 0b1 = 20 M
30	DIGCLRZ	R/W	1h	CLRZ for APLL DIG and DLL DIG. Used to reset flops and state machines
29-28	Reserved	R/W	0h	Reserved
27	AMUXSEL	R/W	0h	AMUX select : 0b0 = KVCO 0b1 = VRTRIM
26	TESTCLKMUXSEL	R/W	0h	Selects test clock mux : 0b0=REF Clock 0b1=Divided clock
25-20	APLL_MISC_CTRL	R/W	0h	Used by APLL DIG Bitfield [21:20] encoding is : 0b00 = No step 0b01 = 75% to 100% 0b10 = 75% to 87.5% to 100% in 60, 20 , 20 cycle steps 0b11 = same as 0b10 but in 40, 40, 40 cycle steps Bit 22 specifies power saving : 0b0 = Default mode 0b1 = Used for debug Bit 23 function is: 0b0 = fixed divider 0b1 = programmable divider Bit 24 is for 50 MHz rtrim disable Bit 25 controls the lock speed : 0 = 128 clock 1 = 256 clock

Table 3-53. PCIE_PLLCFG0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	DIS_REFCLK	R/W	0h	Disable CML that control FREF output clock buffer. 0=Enable, 1=Disable
18	EN_3P	R/W	0h	Post_Cent_PG1.0. When high, enables the SC circuit in the APLL LF Pre_Cent_PG1.0. Logic '1' generates single phase output and puts other phases at '0' using 3-phase ring oscillator 0 = 4-phase output 1 = single phase output
17	PFD_CLR	R/W	0h	To open PLL loop; 0 = Closed loop, 1 = Open loop
16	CLK_FLIP	R/W	0h	Logic '1' flips the output clock phase
15	EN_RTRIM	R/W	0h	Enable resistor calibration 0=OFF, 1=ON
14	EN_MEAS	R/W	1h	To enable measurement circuit inside APLL ANA to control AMUX output. 0 = OFF, 1 = ON
13-12	EN_LATCH	R/W	3h	Enables output latch in differential ring to control power. Designer should be contacted while changing this value: 0b00 = All latch on 0b01 = Remove 33% 0b10 = Remove 16% 0b11 = Remove 50 %
11-8	CP_CTRL	R/W	0h	Charge pump control bit +- 50 % : 0b0000 = Nom 0b0001 = +13% 0b0010 = +27% 0b0011 = +50% 0b0100 = -20% 0b1000 = -27% 0b1010 = -50% All others are not valid.
7-6	RESVALUE	R/W	0h	Sets loop filter resistor value: 0b00 = 1 Kohm for PCIe 0b01 = 1.67 kohm for eSata 0b10 = 2.5 kohm for SSC 0b11 is not valid
5	C1_2X	R/W	0h	Increase filter capacitance by 2x in low reference (20 MHz) clock: 0b0 = 120 pF for PCIe 0b1 = 240 pF for eSATA and SSC
4	ENDIGLDO	R/W	0h	Enable DIG LDO. Required to wake pll up for pll dig
3	APLL_CP_CURR	R/W	0h	Post_Cent_PG1.0. When high, this bit increases the APLL CP current. Pre_Cent_PG1.0. Unused.
2	ENBGSC_REF	R/W	0h	Enable switched cap bias current module/REFGEN
1	ENPLLLDO	R/W	0h	Enable PLL LDO
0	ENPLL	R/W	0h	Enable PLL

3.2.51 PCIE_PLLCFG1 Register (offset = 6DCh) [reset = 0h]

PCIE_PLLCFG1 is shown in Figure 3-52 and described in Table 3-54.

This is connected to "CF_APLL_1" on SERDES ANA Initial Settings required prior to power up sequence:
 PCIE_100M: 0064 0000 ; SATA_100MHz: 912C 0000 ; SATA_20MHz: C02C 0000

Figure 3-52. PCIE_PLLCFG1 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-54. PCIE_PLLCFG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ENSATAMODE	R/W	0h	Mode select 0 = PCIe (2.5 GHz) / 1 = SATA (1.5 GHz). Used by APLLDIG and TRX_DIG for different purpose. Needs to configure this bit to get ethernet clocks
30	PLLREFSEL	R/W	0h	Chose reference clock value 0 = 100 MHz / 1 = 20 MHz (Note: only needs to be set if using fixed FB divider) For fixed divider mode [31:30] defines division ratio as: 0b00 = 25 0b01 = 125 0b10 = 15 0b11 = 75
29-26	NP1_DIV_INT	R/W	0h	Integer value of N+1 divider 0 value maps to 1 4 value maps to 5
25-18	MDIVINT	R/W	0h	8-bit integer value for M divider (Osc/ref). Valid range is 4 to 255
17-6	MDIVFRAC	R/W	0h	12-bit fractional value for M divider (Osc/ref)
5	EN_CLKAUX	R/W	0h	Old -- Enable for auxiliary clock (testclk) clock 0 = Enable / 1 = Disable Corrected on 11/30/2010 Updated -- Enable for auxiliary clock (testclk) clock 0 = Disable / 1 = Enable
4	EN_CLK125m	R/W	0h	Enable for 125MHz clock 0 = Disable / 1 = Enable. This is one of the Ethernet clocks
3	EN_CLK100m	R/W	0h	Enable for 100MHz clock 0 = Disable / 1 = Enable
2	EN_CLK50m	R/W	0h	Enable for 50MHz clock 0 = Disable / 1 = Enable. This is one of the Ethernet clocks
1	ENSSC	R/W	0h	Enable spread specturm support 0 = Disable / 1 = Enable
0	MDIVPULSE	R/W	0h	Update M div when pulse is high

3.2.52 PCIE_PLLCFG2 Register (offset = 6E0h) [reset = 0h]

PCIE_PLLCFG2 is shown in [Figure 3-53](#) and described in [Table 3-55](#).

This is connected to "CF_APLL_2" on SERDES ANA Initial Settings required prior to power up sequence:
 PCIE: 0000 0000 -- SATA: 0000 0000 (both modes)

Figure 3-53. PCIE_PLLCFG2 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-55. PCIE_PLLCFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	SSCDNSPREAD	R/W	0h	SSC downspread
30-24	SSCMANT	R/W	0h	Mantissa portion of the modified frequency in SSC operation
23-21	SSCEXPO	R/W	0h	Exponent portion of the modified frequency in SSC operation
20-0	SSCFRSPREAD	R/W	0h	SSC frequency spread

3.2.53 PCIE_PLLCFG3 Register (offset = 6E4h) [reset = 400000h]

PCIE_PLLCFG3 is shown in Figure 3-54 and described in Table 3-56.

This is connected to "CF_APLL_3" on SERDES ANA Initial Settings required prior to power up sequence: 0040 08E0

Figure 3-54. PCIE_PLLCFG3 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-56. PCIE_PLLCFG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	Reserved	R/W	0h	Reserved for future use
27	DIGLDO_BYPASS	R/W	0h	Digital signal when high puts the DIG LDO in bypass mode. Need to be careful while exercising this mode, the 1.8V external supply must be lowered before asserting this bit.
26	DIGLDO_PULLDOWNZ	R/W	1h	Digital signal when high disables all the pull down paths for LDO output
25	DIGLDO_DIS_SC_PROT	R/W	0h	Digital signal when high disables short circuit protection
24	DIGLDO_EN_SUB_REGULATION	R/W	0h	Digital signal when high disables sub regulation
23	DIGLDO_EN_HP_CAPLESSMODE	R/W	0h	Digital signal when high enables high performance Capless mode. In this mode, quiescent LDO current increases by 240uA
22	DIGLDO_EN_CAPLESSMODE	R/W	0h	Digital signal when high enables Capless Mode. In particular: (1) The 800fF capacitor between VDDAR and the gate of the power FET is bypassed (2) The output of the error amplifier connects to a 30pF capacitor and the other terminal of the capacitor connects to a 40k resistor whose other terminal goes to VSSA. This resistor is also bypassed.
21	DIGLDO_EN_LP_CAPLESSMODE	R/W	0h	Digital signal when high enables Low Power Capless Mode. Quiescent LDO current increases by 240uA typical when this bit is set to low.
20-16	DIGLDO_VSET	R/W	0h	Changed on Jan 12th 2011 Post PG1.0 Inversion in VSET bits, 1 and 0 swap Based upon Sami's measured data and DIGLDO spice sims VSET(4:0) VDDAR (V) 11111 1.20 11110 1.19 11101 1.18 11100 1.17 11011 1.16 11010 1.15 11001 1.14 11000 1.13 10111 1.12 10110 1.11 10101 1.10 10100 1.09 10011 1.08 10010 1.07 10001 1.06 10000 1.05 01111 1.36 01110 1.35 01101 1.34 01100 1.33 01011 1.32 01010 1.31 01001 1.30 01000 1.29 00111 1.28 00110 1.27 00101 1.26 00100 1.25 00011 1.24 00010 1.23 00001 1.22 00000 1.21

3.2.54 PCIE_PLLCFG4 Register (offset = 6E8h) [reset = 0h]

PCIE_PLLCFG4 is shown in [Figure 3-55](#) and described in [Table 3-57](#).

This is connected to "CF_APLL_4" on SERDES ANA Initial Settings required prior to power up sequence:
PCIE: 0000 609C -- SATA: 0000 0000 (both modes)

Figure 3-55. PCIE_PLLCFG4 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-57. PCIE_PLLCFG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	Reserved	R/W	0h	Spare
25	AUX_CLK_SEL	R/W	0h	0=Divided, 1=ref-clk
24-20	AUX_DIV	R/W	0h	Integer value of aux divider; Valid range is 2-31
19-18	RTRIM_RANGE	R/W	0h	Range for rtrim: 0b00 = 0.9-0.8 0b01 = 1.0-0.9 0b10 = 1.1-1.0 0b11 = 1.1-0.9
17	RTRIM_EXT_EN	R/W	0h	Select loop starting point. 0= mid-code 0000 / 1 = external input RTRIM_EXT_VAL
16	RTRIM_SPEED	R/W	0h	Selection on wait for # REFCLKs after previous update; 0 = 128 / 1 = 256
15-14	RTRIM_MODE	R/W	0h	Loop mode: "0b00" = off "0b10" = on - freeze (after lock freeze loop) "0bx1" = on - continuous (after lock keep lock running)
13-10	RTRIM_EXT_VAL	R/W	0h	2 s compliment rtrim control loop value. Valid range : 0111 (max) to 0000 (mid) to 1000 (min)
9-8	VTUNE_RANGE	R/W	0h	Range for Vtune: 0b00 = 0.9-0.8 0b01 = 1.0-0.9 0b10 = 1.1-1.0 0b11 = 1.1-0.9
7	VTUNE_EXT_EN	R/W	0h	Select loop starting point. 0= mid-code 0000 / 1 = external input VTUNE_EXT_VAL
6	VTUNE_SPEED	R/W	0h	Selection on wait for # REFCLKs after previous update; 0 = 128 / 1 = 256

Table 3-57. PCIE_PLLCFG4 Register Field Descriptions (continued)

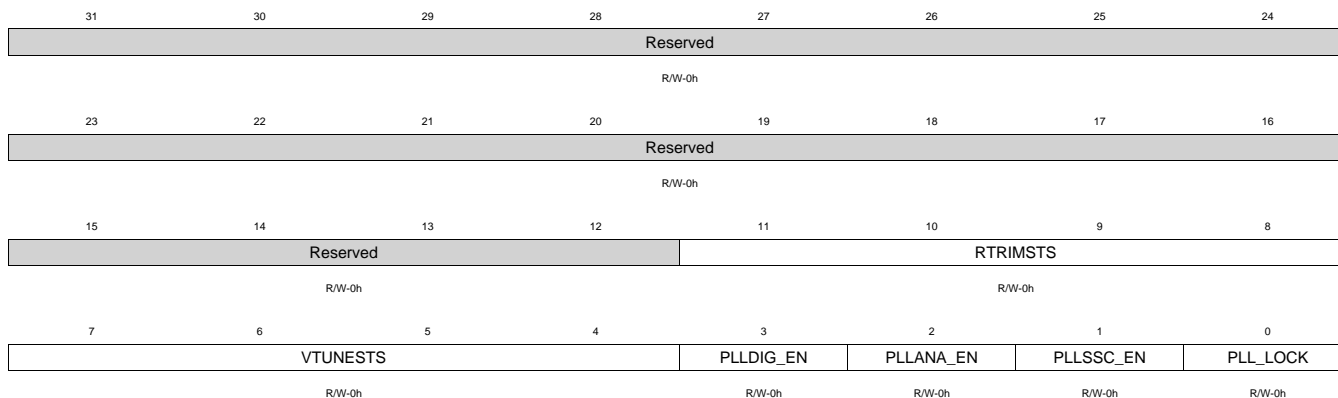

Bit	Field	Type	Reset	Description
5-4	VTUNE_MODE	R/W	0h	Loop mode : "0b00" = off "0b10" = on - freeze (after lock freeze loop) "0bx1" = on - continuous (after lock keep lock running)
3-0	VTUNE_EXT_VAL	R/W	0h	2 s compliment vtune control loop value. Valid ranges : 0100 (max) to 0000 (mid) to 1100 (min)

3.2.55 PCIE_PLLSTATUS Register (offset = 6ECh) [reset = 0h]

PCIE_PLLSTATUS is shown in [Figure 3-56](#) and described in [Table 3-58](#).

Initial Settings required prior to power up sequence:

Figure 3-56. PCIE_PLLSTATUS Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-58. PCIE_PLLSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	Reserved	R/W	0h	Not used
15-12	Reserved	R/W	0h	Not used
11-8	RTRIMSTS	R/W	0h	Value of the rtrim loop (may not be static in continuous mode of operation)
7-4	VTUNESTS	R/W	0h	Value of the vtune control loop (may not be static in continuous mode of operation)
3	PLLDIG_EN	R/W	0h	Digital EN. Same as APLL DIG STS 2 internally
2	PLLANA_EN	R/W	0h	Analog EN. Same as APLL DIG STS 4 internally
1	PLLSSC_EN	R/W	0h	SSC is engaged
0	PLL_LOCK	R/W	0h	APLL locked

3.2.56 PCIE_RXSTATUS Register (offset = 6F0h) [reset = 0h]

PCIE_RXSTATUS is shown in [Figure 3-57](#) and described in [Table 3-59](#).

PCIE SerDes Receive Status register

Figure 3-57. PCIE_RXSTATUS Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-59. PCIE_RXSTATUS Register Field Descriptions

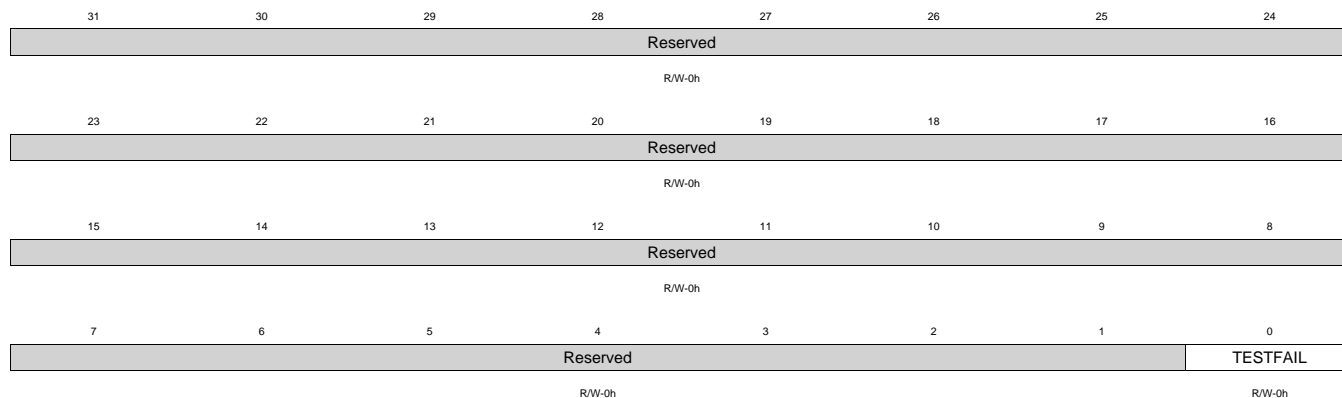

Bit	Field	Type	Reset	Description
31-1	Reserved	R/W	0h	Reserved, driven low.
0	TESTFAIL	R/W	0h	Test failure. Driven high when an error is encountered during a test sequence executed on channel i. Synchronous to RXBCLKIN[i].

3.2.57 PCIE_TXSTATUS Register (offset = 6F4h) [reset = 0h]

PCIE_TXSTATUS is shown in [Figure 3-58](#) and described in [Table 3-60](#).

This register reports PCIE SerDes Transmit Status.

Figure 3-58. PCIE_TXSTATUS Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-60. PCIE_TXSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	Reserved	R/W	0h	Reserved, driven low.
0	TESTFAIL	R/W	0h	Test failure. Driven high when an error is encountered during a test sequence executed on channel i, or if an over or underflow occurs in the Tx serialiser when ENFTP = 0. Synchronous to TXBCLKIN[j].

3.2.58 SATA_PLLCFG0 Register (offset = 720h) [reset = C0007160h]

SATA_PLLCFG0 is shown in [Figure 3-59](#) and described in [Table 3-61](#).

SATA PLL Configuration 0. Note: Please note that this registers s reset behavior depends upon the Reset Isolation Register (RESET_ISO) settings

Figure 3-59. SATA_PLLCFG0 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-61. SATA_PLLCFG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	SEL_IN_FREQ	R/W	1h	Select input frequency. 0=100M, 1=20M
30	DIGCLRZ	R/W	1h	CLRZ for APLL DIG and DLL DIG. Used to reset flops and state machines
29-28	Reserved	R	0h	
27	AMUXSEL	R/W	0h	AMUX select; 0=KVCO, 1=VRTRIM
26	TESTCLKMUXSEL	R/W	0h	Selects test clock mux; 0=REF Clock, 1=Divided clock
25-20	APLL_MISC_CTRL	R/W	0h	Used by APLL DIG
19	DIS_REFCLK	R/W	0h	0=Disable, 1= Enable
18	EN_3P	R/W	0h	Logic 1 enables the SC circuit in the APLL LF
17	PFD_CLR	R/W	0h	Reset for phase-frequency detector
16	CLK_FLIP	R/W	0h	Logic 1 flips the output clock phase
15	EN_RTRIM	R/W	0h	Enable resistor calibration 0=OFF, 1=ON
14	EN_MEAS	R/W	1h	To enable measurement circuit inside APLL ANA
13-12	EN_LATCH	R/W	3h	Enables output latch in differential ring
11-8	CP_CTRL	R/W	1h	Charge pump control bit +- 50 %
7-6	RESVALUE	R/W	1h	Sets loop filter resistor value
5	C1_2X	R/W	1h	Increase filter capacitance by 2x in low reference (20 MHz) clock
4	ENDIGLDO	R/W	0h	Enable DIG LDO. Required to wake pll up for pll dig
3	APLL_CP_CURR	R/W	0h	When high, this bit increases the APLL CP current
2	ENBGSC_REF	R/W	0h	ENBGSC_REF
1	ENPLLLDO	R/W	0h	Enable PLL LDO
0	ENPLL	R/W	0h	Enable PLL

3.2.59 SATA_PLLCFG1 Register (offset = 724h) [reset = 812C0000h]

SATA_PLLCFG1 is shown in [Figure 3-60](#) and described in [Table 3-62](#).

SATA PLL Configuration 1. Note: Please note that this registers s reset behavior depends upon the Reset Isolation Register (RESET_ISO) settings.

Figure 3-60. SATA_PLLCFG1 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-62. SATA_PLLCFG1 Register Field Descriptions

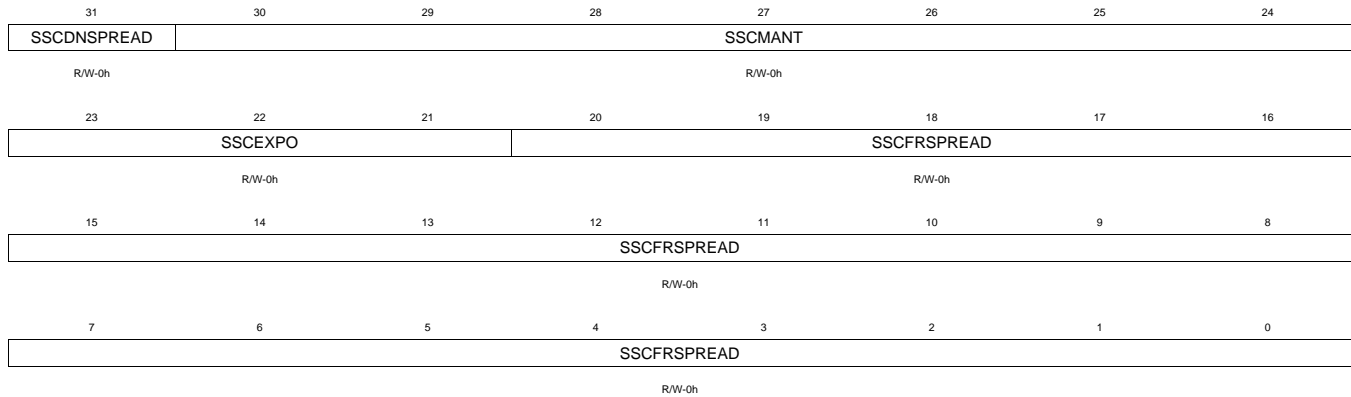

Bit	Field	Type	Reset	Description
31	ENSATAMODE	R/W	1h	Mode select 0 = PCIe (2.5 GHz) / 1 = SATA (1.5 GHz). Used by APLLDIG and TRX_DIG for different purpose. Needs to configure this bit to get Ethernet clocks.
30	PLLREFSEL	R/W	0h	Chose reference clock value 0 = 100 MHz / 1 = 20 MHz (Note: only needs to be set if using DLL outputs)
29-26	NP1_DIV_INT	R/W	0h	Integer value of N+1 divider
25-18	MDIVINT	R/W	4Bh	8-bit value, which is used as integer portion of feedback divider
17-6	MDIVFRAC	R/W	0h	12-bit value, which is used as fractional portion of feedback divider
5	EN_CLKAUX	R/W	0h	Enable for Auxilary clock 0 = Disable / 1 = Enable
4	EN_CLK125M	R/W	0h	Enable for 125MHz clock 0 = Disable / 1 = Enable
3	EN_CLK100M	R/W	0h	Enable for 100MHz clock 0 = Disable / 1 = Enable
2	EN_CLK50M	R/W	0h	EN_CLK50M Enable for 50MHz clock 0 = Disable / 1 = Enable
1	ENSSC	R/W	0h	Enable spread pectrum support
0	MDIVPULSE	R/W	0h	Update M div when pulse is high

3.2.60 SATA_PLLCFG2 Register (offset = 728h) [reset = 0h]

SATA_PLLCFG2 is shown in [Figure 3-61](#) and described in [Table 3-63](#).

SATA PLL Configuration 2. Note: Please note that this registers s reset behavior depends upon the Reset Isolation Register (RESET_ISO) settings.

Figure 3-61. SATA_PLLCFG2 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-63. SATA_PLLCFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	SSCDNSPREAD	R/W	0h	SSC downspread
30-24	SSCMANT	R/W	0h	Mantesa portion of the modified frequency in SSC operation
23-21	SSCEXPO	R/W	0h	Exponent portion of the modified frequency in SSC operation
20-0	SSCFRSPREAD	R/W	0h	SSC frequency spread

3.2.61 SATA_PLLCFG3 Register (offset = 72Ch) [reset = 400000h]

SATA_PLLCFG3 is shown in [Figure 3-62](#) and described in [Table 3-64](#).

SATA_PLLCFG3 Description. Note: Please note that this registers s reset behavior depends upon the Reset Isolation Register (RESET_ISO) settings.

Figure 3-62. SATA_PLLCFG3 Register

Reserved				DIGLDO_BYPASS	DIGLDO_PULLDOWNZ	DIGLDO_DIS_SC_PROT	DIGLDO_EN_SUB_REGULATION

R/W-0h			R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	
PLLLDO_EN_BUF_CUR	PLLLDO_EN_LP	PLLLDO_CTRL_TRIM				PLLLDO_CTRL		
R/W-0h	R/W-0h	R/W-0h				R/W-0h		

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-64. SATA_PLLCFG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	Reserved	R/W	0h	Reserved
27	DIGLDO_BYPASS	R/W	0h	Digital signal when high puts the DIG LDO in bypass mode. Caution Need to be careful while exercising this mode, the 1.8V external supply must be lowered before asserting this bit.
26	DIGLDO_PULLDOWNZ	R/W	1h	Digital signal when high disables all the pull down paths for LDO output
25	DIGLDO_DIS_SC_PROT	R/W	0h	Digital signal when high disables short circuit protection
24	DIGLDO_EN_SUB_REGULATION	R/W	0h	Digital signal when high disables sub regulation
23	DIGLDO_EN_HP_CAPLESSMODE	R/W	0h	Digital signal when high enables high performance Capless mode. In this mode, quiescent LDO current increases by 240uA
22	DIGLDO_EN_CAPLESSMODE	R/W	0h	Digital signal when high enables Capless Mode. In particular: (1) The 800fF capacitor between VDDAR and the gate of the power FET is bypassed (2) The output of the error amplifier connects to a 30pF capacitor and the other terminal of the capacitor connects to a 40k resistor whose other terminal goes to VSSA. This resistor is also bypassed.
21	DIGLDO_EN_LP_CAPLESSMODE	R/W	0h	Digital signal when high enables Low Power Capless Mode. Quiescent LDO current increases by 240uA typical when this bit is set to low.

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	NTARGET	R/W	0h	Ntarget value for C674x_DSP Voltage domain s OPP100.Default comes from Efuse.

3.2.71 VDD_C674x_DSP_OPP_120 Register (offset = 790h) [reset = 0h]

VDD_C674x_DSP_OPP_120 is shown in [Figure 3-72](#) and described in [Table 3-74](#).

Ntarget value for OPP120.

Figure 3-72. VDD_C674x_DSP_OPP_120 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-74. VDD_C674x_DSP_OPP_120 Register Field Descriptions

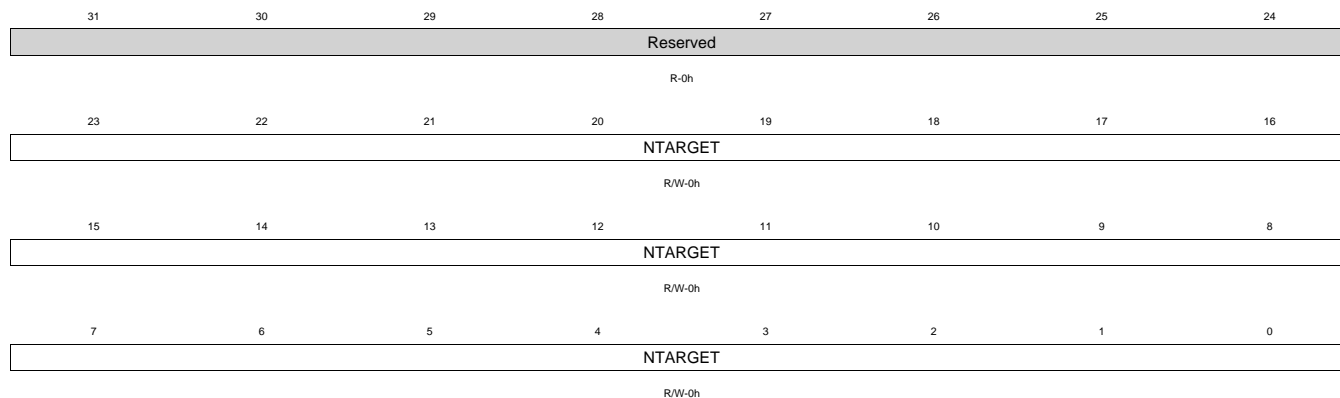

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	NTARGET	R/W	0h	Ntarget value for C674x_DSP Voltage domain s OPP119.Default comes from Efuse.

3.2.72 VDD_C674x_DSP_OPP_166 Register (offset = 794h) [reset = 0h]

VDD_C674x_DSP_OPP_166 is shown in [Figure 3-73](#) and described in [Table 3-75](#).

Ntarget value for OPP166.

Figure 3-73. VDD_C674x_DSP_OPP_166 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-75. VDD_C674x_DSP_OPP_166 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	NTARGET	R/W	0h	Ntarget value for C674x_DSP Voltage domain s OPPTURBO.Default comes from Efuse.

3.2.73 VDD_HDVICP_OPP_050 Register (offset = 7A0h) [reset = 0h]

VDD_HDVICP_OPP_050 is shown in [Figure 3-74](#) and described in [Table 3-76](#).

Ntarget value for OPP50.

Figure 3-74. VDD_HDVICP_OPP_050 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-76. VDD_HDVICP_OPP_050 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	NTARGET	R/W	0h	Ntarget value for HDVICP Voltage domain s OPP50.Default comes from Efuse.

3.2.74 VDD_HDVICP_OPP_100 Register (offset = 7A4h) [reset = 0h]

VDD_HDVICP_OPP_100 is shown in [Figure 3-75](#) and described in [Table 3-77](#).

Ntarget value for OPP100.

Figure 3-75. VDD_HDVICP_OPP_100 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-77. VDD_HDVICP_OPP_100 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	NTARGET	R/W	0h	Ntarget value for HDVICP Voltage domain s OPP100.Default comes from Efuse.

3.2.75 VDD_HDVICP_OPP_120 Register (offset = 7A8h) [reset = 0h]

VDD_HDVICP_OPP_120 is shown in [Figure 3-76](#) and described in [Table 3-78](#).

Ntarget value for OPP120.

Figure 3-76. VDD_HDVICP_OPP_120 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-78. VDD_HDVICP_OPP_120 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	NTARGET	R/W	0h	Ntarget value for HDVICP Voltage domain s OPP119.Default comes from Efuse.

3.2.76 VDD_HDVICP_OPP_166 Register (offset = 7ACh) [reset = 0h]

VDD_HDVICP_OPP_166 is shown in [Figure 3-77](#) and described in [Table 3-79](#).

Ntarget value for OPP166.

Figure 3-77. VDD_HDVICP_OPP_166 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-79. VDD_HDVICP_OPP_166 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	NTARGET	R/W	0h	Ntarget value for HDVICP Voltage domain s OPPTURBO.Default comes from Efuse.

3.2.77 VDD_CORE_OPP_050 Register (offset = 7B8h) [reset = 0h]

VDD_CORE_OPP_050 is shown in [Figure 3-78](#) and described in [Table 3-80](#).

Ntarget value for OPP50.

Figure 3-78. VDD_CORE_OPP_050 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-80. VDD_CORE_OPP_050 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	NTARGET	R/W	0h	Ntarget value for CORE Voltage domain s OPP50.Default comes from Efuse.

3.2.78 VDD_CORE_OPP_100 Register (offset = 7BCh) [reset = 0h]

VDD_CORE_OPP_100 is shown in [Figure 3-79](#) and described in [Table 3-81](#).

Ntarget value for OPP100.

Figure 3-79. VDD_CORE_OPP_100 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-81. VDD_CORE_OPP_100 Register Field Descriptions

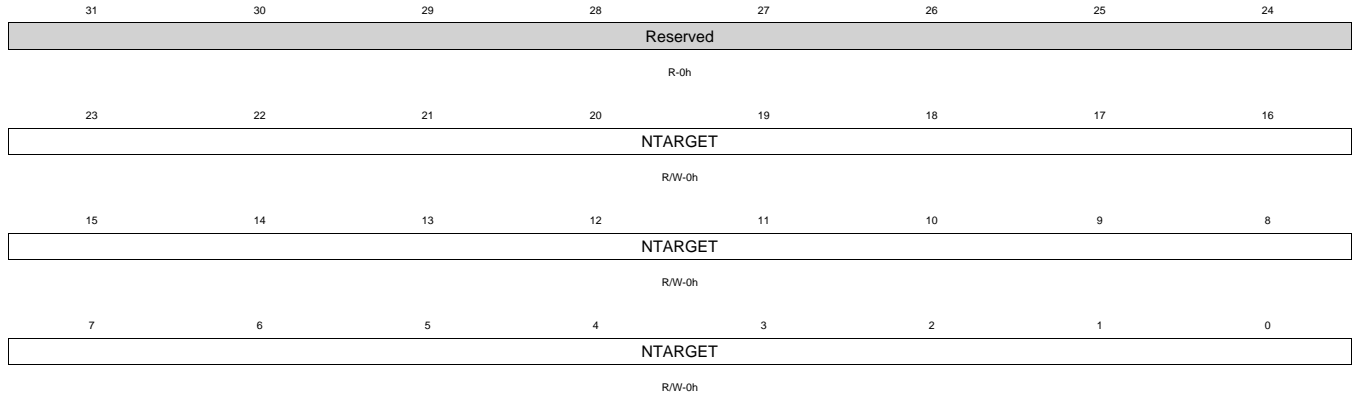

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	NTARGET	R/W	0h	Ntarget value for CORE Voltage domain s OPP100.Default comes from Efuse.

3.2.79 VDD_CORE_OPP_120 Register (offset = 7C0h) [reset = 0h]

VDD_CORE_OPP_120 is shown in [Figure 3-80](#) and described in [Table 3-82](#).

Ntarget value for OPP120.

Figure 3-80. VDD_CORE_OPP_120 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-82. VDD_CORE_OPP_120 Register Field Descriptions

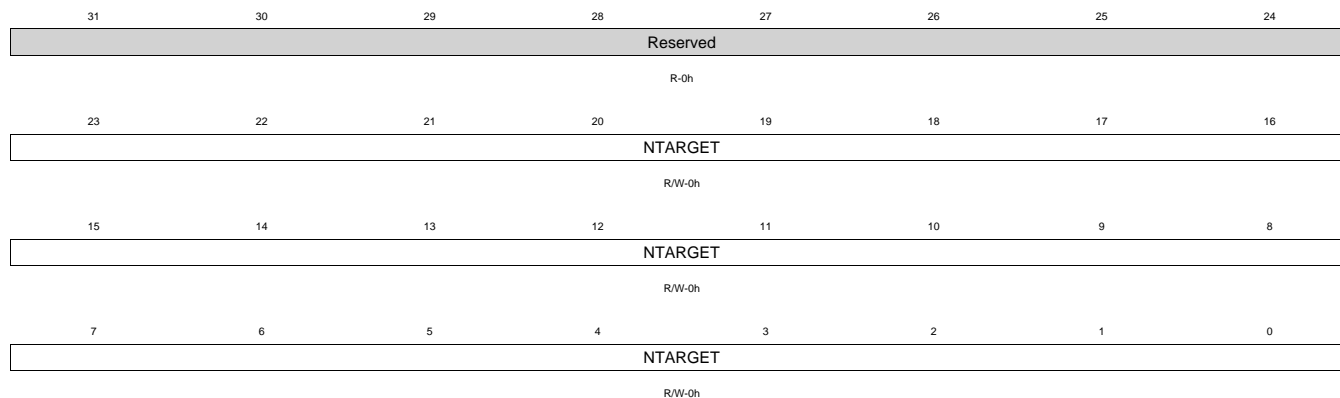

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	NTARGET	R/W	0h	Ntarget value for CORE Voltage domain s OPP119.Default comes from Efuse.

3.2.80 VDD_CORE_OPP_166 Register (offset = 7C4h) [reset = 0h]

VDD_CORE_OPP_166 is shown in [Figure 3-81](#) and described in [Table 3-83](#).

Ntarget value for OPP166.

Figure 3-81. VDD_CORE_OPP_166 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-83. VDD_CORE_OPP_166 Register Field Descriptions

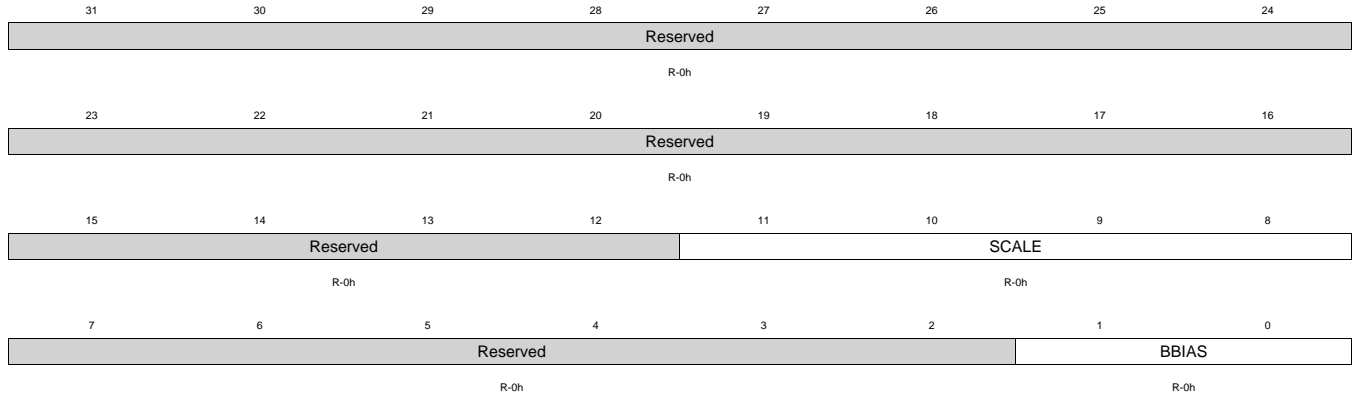

Bit	Field	Type	Reset	Description
31-24	Reserved	R	0h	
23-0	NTARGET	R/W	0h	Ntarget value for CORE Voltage domain s OPPTURBO.Default comes from Efuse.

3.2.81 BB_SCALE Register (offset = 7D0h) [reset = 0h]

BB_SCALE is shown in [Figure 3-82](#) and described in [Table 3-84](#).

Back Bias and Dynamic Core Voltage Scaling Register

Figure 3-82. BB_SCALE Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-84. BB_SCALE Register Field Descriptions

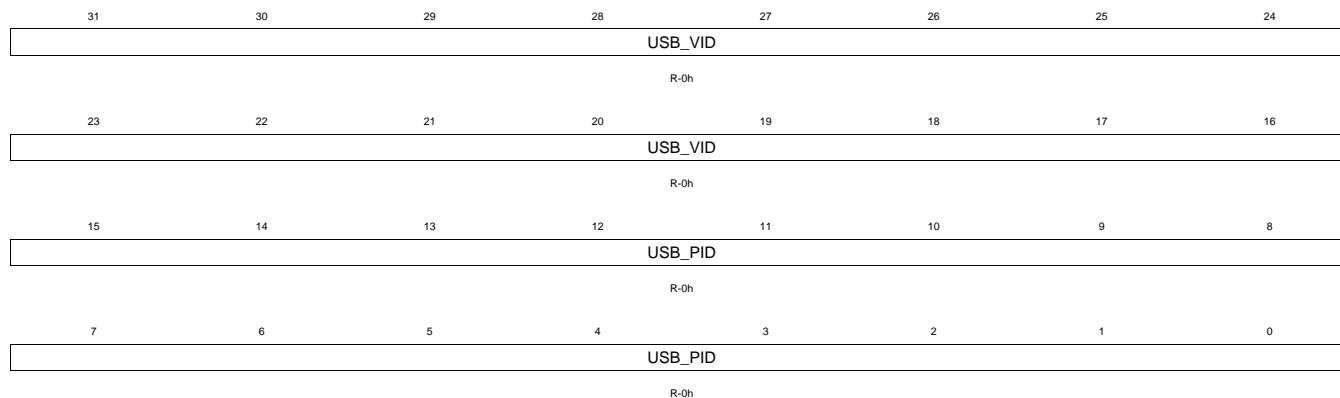

Bit	Field	Type	Reset	Description
31-12	Reserved	R	0h	
11-8	SCALE	R	0h	Dynamic Core Voltage Scaling For class 0 smart reflex.
7-2	Reserved	R	0h	
1-0	BBIAS	R	0h	BBIAS value from Efuse

3.2.82 USB_VID_PID Register (offset = 7F4h) [reset = 0h]

USB_VID_PID is shown in [Figure 3-83](#) and described in [Table 3-85](#).

From TI Efuse, use only for TI defined USB VID/PID option.

Figure 3-83. USB_VID_PID Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-85. USB_VID_PID Register Field Descriptions

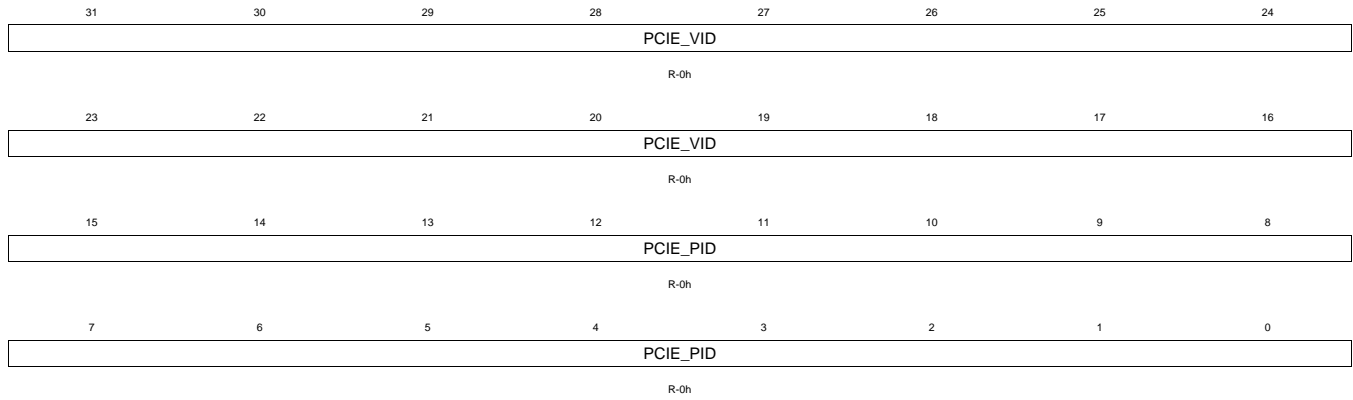

Bit	Field	Type	Reset	Description
31-16	USB_VID	R	0h	USB Vendor ID (TI Programmed Efuse)
15-0	USB_PID	R	0h	USB Product ID (TI programmed Efuse)

3.2.83 PCIE_VID_PID Register (offset = 7F8h) [reset = 0h]

PCIE_VID_PID is shown in [Figure 3-84](#) and described in [Table 3-86](#).

From TI Efuse, use only for TI defined USB VID/PID option.

Figure 3-84. PCIE_VID_PID Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-86. PCIE_VID_PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PCIE_VID	R	0h	PCIE Vendor ID (TI Programmed Efuse)
15-0	PCIE_PID	R	0h	PCIEUSB Product ID (TI programmed Efuse)

3.2.84 PINCNTL[270:1] Register (offset = 800h) [reset = 40000h]

PINCNTL[270:1] is shown in [Figure 3-85](#) and described in [Table 3-87](#).

This register is used to configure the device pin muxing and other IO characteristics. Refer to device *Data Manual* for full details.

Figure 3-85. PINCNTL[270:1] Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-87. PINCNTL[270:1] Register Field Descriptions

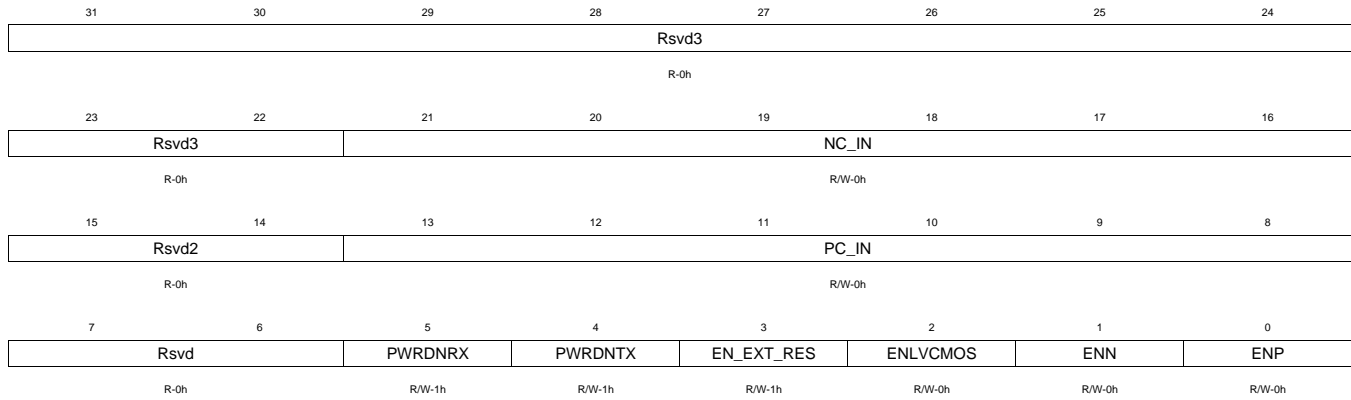

Bit	Field	Type	Reset	Description
31-20	Rsvd4		0h	Reserved-read returns 0
19	Rsvd3	R/W	0h	Reserved - This field must always be written with the reset (default) value. Reset value is Pad dependent
18	Rsvd2	R/W	0h	Reserved - This field must always be written as '1'.
17	PULLTYPESEL	R/W	0h	Pad Pullup / Pulldown Type. Reset value is Pad dependent 0x0 : Pulldown (PD) selected 0x1 : Pullup (PU) selected
16	PULLUDEN	R/W	0h	Pullup / Pulldown Enable. Reset value is Pad dependent 0x0 : PU/PD enabled 0x1 : PU/PD disabled
15-8	Rsvd1		0h	Reserved Read returns 0
7-0	MUXMODE	R/W	0h	Pin Multiplexing Selection Controls which multiplexed signal is assigned to the corresponding pin. Refer to device data manual for details.

3.2.85 MLBP_SIG_IO_CTRL Register (offset = E18h) [reset = 38h]

MLBP_SIG_IO_CTRL is shown in [Figure 3-86](#) and described in [Table 3-88](#).

This register controls the MLBP SIG pins IO characteristics.

Figure 3-86. MLBP_SIG_IO_CTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

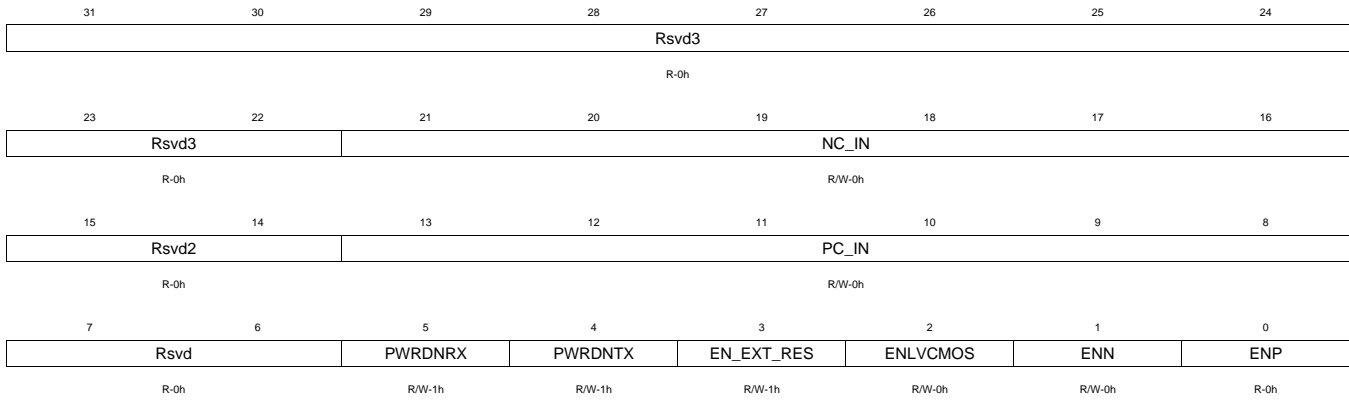

Table 3-88. MLBP_SIG_IO_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-22	Rsvd3	R	0h	Reserved-read returns 0
21-16	NC_IN	R/W	0h	MLB LVDS Output Drive Trim value. If register defaults to state of 0x0, then it should be set to the recommended state of 0x1A. If the register defaults to non-zero, that implies it was set to optimal value during manufacturing.
15-14	Rsvd2	R	0h	Reserved-read returns 0
13-8	PC_IN	R/W	0h	MLB LVDS Output Drive Trim value. If register defaults to state of 0x0, then it should be set to the recommended state of 0x24. If the register defaults to non-zero, that implies it was set to optimal value during manufacturing.
7-6	Rsvd	R	0h	Reserved-read returns 0
5	PWRDNRX	R/W	1h	Power down control for MLB LVDS receiver. A 1 written to this register will power down the receiver. A 0 written to this register will power on the receiver. By default, the receiver is in power down mode.
4	PWRDNTX	R/W	1h	Power down control for MLB LVDS transmitter. A 1 written to this register will power down the transmitter. A 0 written to this register will power on the transmitter. By default, the transmitter is in power down mode.
3	EN_EXT_RES	R/W	1h	Disables the internal resistors required for proper MLB LVDS operation. This register should always be programmed to 0x0
2	ENLVC MOS	R/W	0h	This registers is used to disable the MLB LVDS mode and program the pins as GPIO. Each pad acts as 50ohm LVCMOS TX and LVCMOS RX when this bit is set to 1. Each pad is MLB LVDS when this bit is set to zero.
1	ENN	R/W	0h	Receiver enable for LVCMOS GPIO mode. Programming this register to 1 enables the MLBP_SIGN pad to be a GPIO input. Programming this register to 0 disables the input and MLBP_SIGN pad is only an output.
0	ENP	R/W	0h	Receiver enable for LVCMOS GPIO mode. Programming this register to 1 enables the MLBP_SIGP pad to be a GPIO input. Programming this register to 0 disables the input and MLBP_SIGP pad is only an output.

3.2.86 MLBP_DAT_IO_CTRL Register (offset = E1Ch) [reset = 38h]

MLBP_DAT_IO_CTRL is shown in [Figure 3-87](#) and described in [Table 3-89](#).

This register controls the MLBP DAT pins IO characteristics.

Figure 3-87. MLBP_DAT_IO_CTRL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-89. MLBP_DAT_IO_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-22	Rsvd3	R	0h	Reserved-read returns 0
21-16	NC_IN	R/W	0h	MLB LVDS Output Drive Trim value. If register defaults to state of 0x0, then it should be set to the recommended state of 0x1A. If the register defaults to non-zero, that implies it was set to optimal value during manufacturing.
15-14	Rsvd2	R	0h	Reserved-read returns 0
13-8	PC_IN	R/W	0h	MLB LVDS Output Drive Trim value. If register defaults to state of 0x0, then it should be set to the recommended state of 0x24. If the register defaults to non-zero, that implies it was set to optimal value during manufacturing.
7-6	Rsvd	R	0h	Reserved-read returns 0
5	PWRDNRX	R/W	1h	Power down control for MLB LVDS receiver. A 1 written to this register will power down the receiver. A 0 written to this register will power on the receiver. By default, the receiver is in power down mode.
4	PWRDNTX	R/W	1h	Power down control for MLB LVDS transmitter. A 1 written to this register will power down the transmitter. A 0 written to this register will power on the transmitter. By default, the transmitter is in power down mode.
3	EN_EXT_RES	R/W	1h	Disables the internal resistors required for proper MLB LVDS operation. This register should always be programmed to 0x0
2	ENLVC MOS	R/W	0h	This registers is used to disable the MLB LVDS mode and program the pins as GPIO. Each pad acts as 50ohm LVCMOS TX and LVCMOS RX when this bit is set to 1. Each pad is MLB LVDS when this bit is set to zero.
1	ENN	R/W	0h	Receiver enable for LVCMOS GPIO mode. Programming this register to 1 enables the MLBP_DATN pad to be a GPIO input. Programming this register to 0 disables the input and MLBP_DATN pad is only an output.
0	ENP	R	0h	Receiver enable for LVCMOS GPIO mode. Programming this register to 1 enables the MLBP_DATP pad to be a GPIO input. Programming this register to 0 disables the input and MLBP_DATP pad is only an output.

3.2.87 SERDES_REFCLK_CTL Register (offset = E24h) [reset = 3h]

SERDES_REFCLK_CTL is shown in [Figure 3-88](#) and described in [Table 3-90](#).

This register controls the refclk for the SerDes block s IO powerdown.

Figure 3-88. SERDES_REFCLK_CTL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-90. SERDES_REFCLK_CTL Register Field Descriptions

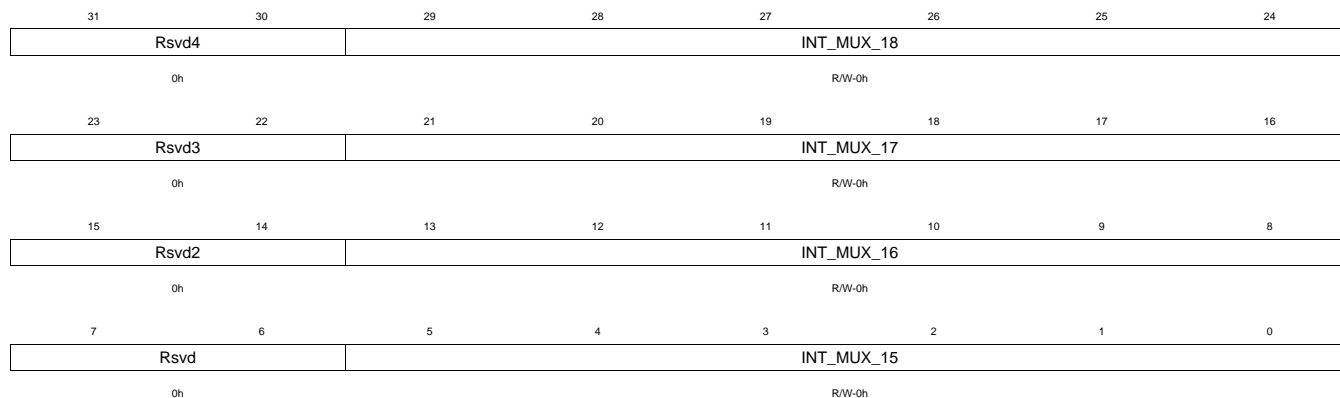

Bit	Field	Type	Reset	Description
31-2	Rsvd		0h	Reserved-read returns 0
1	PWRDN_SE	R/W	1h	Powerdown both refclkp/n single ended receiver
0	PWRDN	R/W	1h	Powerdown both refclkp/n receiver

3.2.88 DSP_INTMUX_15_18 Register (offset = F00h) [reset = 0h]

DSP_INTMUX_15_18 is shown in [Figure 3-89](#) and described in [Table 3-91](#).

This register controls interrupt mux assignment for Interrupt 15 to 18

Figure 3-89. DSP_INTMUX_15_18 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-91. DSP_INTMUX_15_18 Register Field Descriptions

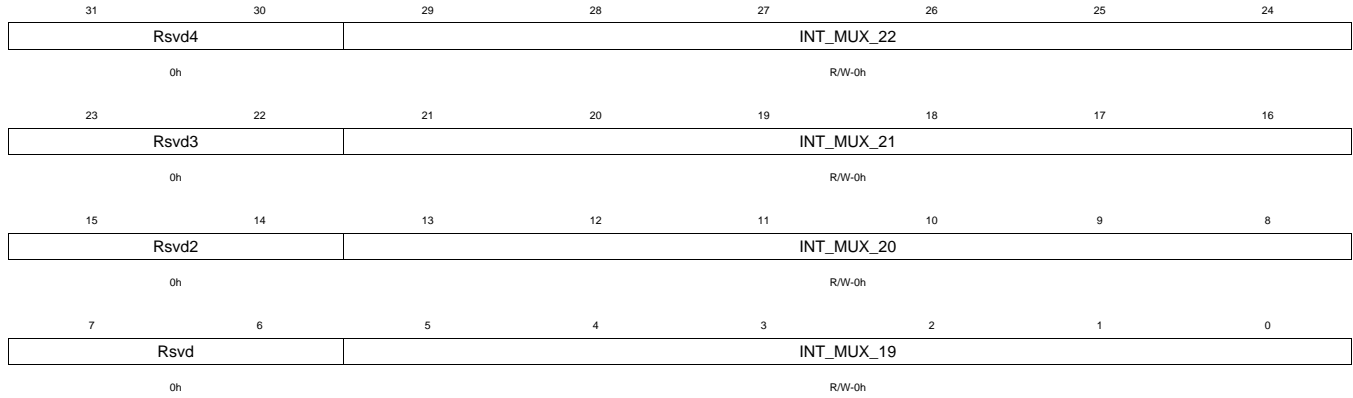

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_18	R/W	0h	Interrupt mux for GEM s interrupt number 18
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_17	R/W	0h	Interrupt mux for GEM s interrupt number 17
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_16	R/W	0h	Interrupt mux for GEM s interrupt number 16
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_15	R/W	0h	Interrupt mux for GEM s interrupt number 15

3.2.89 DSP_INTMUX_19_22 Register (offset = F04h) [reset = 0h]

DSP_INTMUX_19_22 is shown in [Figure 3-90](#) and described in [Table 3-92](#).

This register controls interrupt mux assignment for Interrupt 19 to 22

Figure 3-90. DSP_INTMUX_19_22 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-92. DSP_INTMUX_19_22 Register Field Descriptions

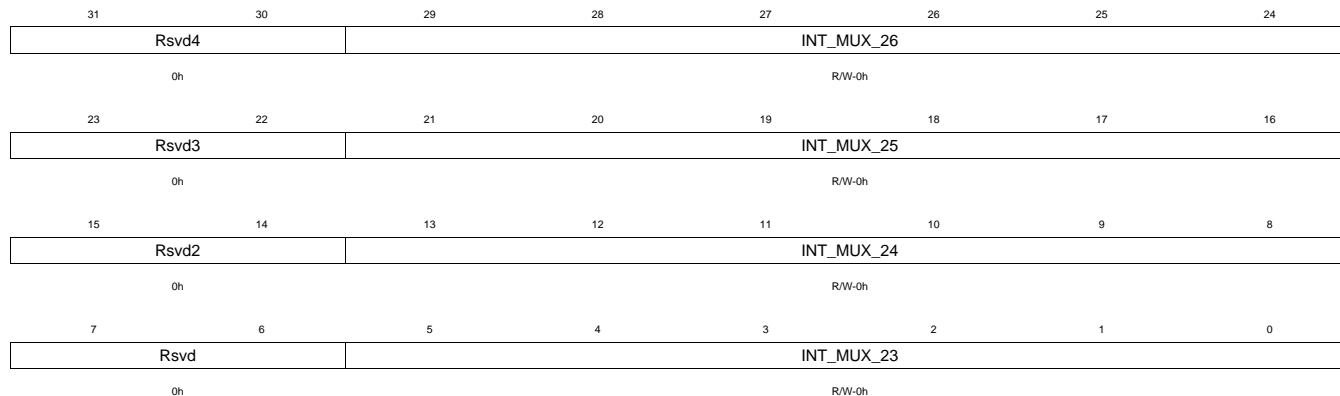

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_22	R/W	0h	Interrupt mux for GEM s interrupt number 22
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_21	R/W	0h	Interrupt mux for GEM s interrupt number 21
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_20	R/W	0h	Interrupt mux for GEM s interrupt number 20
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_19	R/W	0h	Interrupt mux for GEM s interrupt number 19

3.2.90 DSP_INTMUX_23_26 Register (offset = F08h) [reset = 0h]

DSP_INTMUX_23_26 is shown in [Figure 3-91](#) and described in [Table 3-93](#).

This register controls interrupt mux assignment for Interrupt 23 to 26

Figure 3-91. DSP_INTMUX_23_26 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-93. DSP_INTMUX_23_26 Register Field Descriptions

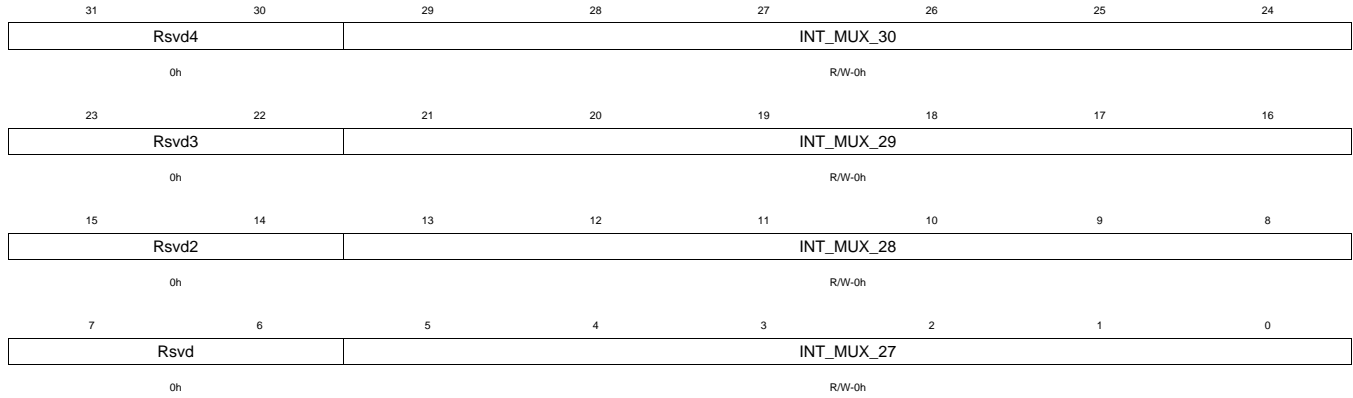

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_26	R/W	0h	Interrupt mux for GEM s interrupt number 26
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_25	R/W	0h	Interrupt mux for GEM s interrupt number 25
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_24	R/W	0h	Interrupt mux for GEM s interrupt number 24
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_23	R/W	0h	Interrupt mux for GEM s interrupt number 23

3.2.91 DSP_INTMUX_27_30 Register (offset = F0Ch) [reset = 0h]

DSP_INTMUX_27_30 is shown in [Figure 3-92](#) and described in [Table 3-94](#).

This register controls interrupt mux assignment for Interrupt 27 to 30

Figure 3-92. DSP_INTMUX_27_30 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-94. DSP_INTMUX_27_30 Register Field Descriptions

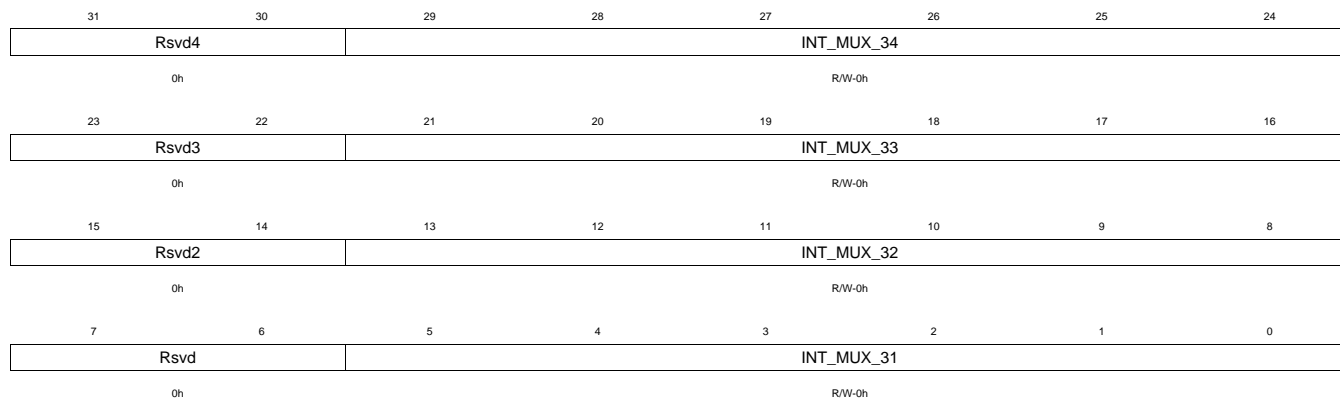

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_30	R/W	0h	Interrupt mux for GEM s interrupt number 30
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_29	R/W	0h	Interrupt mux for GEM s interrupt number 29
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_28	R/W	0h	Interrupt mux for GEM s interrupt number 28
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_27	R/W	0h	Interrupt mux for GEM s interrupt number 27

3.2.92 DSP_INTMUX_31_34 Register (offset = F10h) [reset = 0h]

DSP_INTMUX_31_34 is shown in [Figure 3-93](#) and described in [Table 3-95](#).

This register controls interrupt mux assignment for Interrupt 31 to 34

Figure 3-93. DSP_INTMUX_31_34 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-95. DSP_INTMUX_31_34 Register Field Descriptions

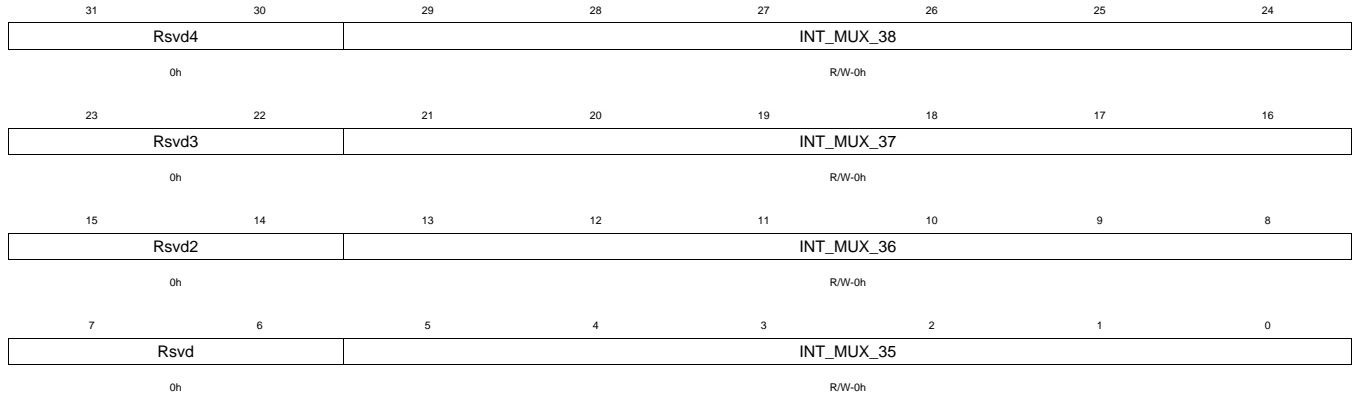

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_34	R/W	0h	Interrupt mux for GEM s interrupt number 34
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_33	R/W	0h	Interrupt mux for GEM s interrupt number 33
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_32	R/W	0h	Interrupt mux for GEM s interrupt number 32
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_31	R/W	0h	Interrupt mux for GEM s interrupt number 31

3.2.93 DSP_INTMUX_35_38 Register (offset = F14h) [reset = 0h]

DSP_INTMUX_35_38 is shown in [Figure 3-94](#) and described in [Table 3-96](#).

This register controls interrupt mux assignment for Interrupt 35 to 38

Figure 3-94. DSP_INTMUX_35_38 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-96. DSP_INTMUX_35_38 Register Field Descriptions

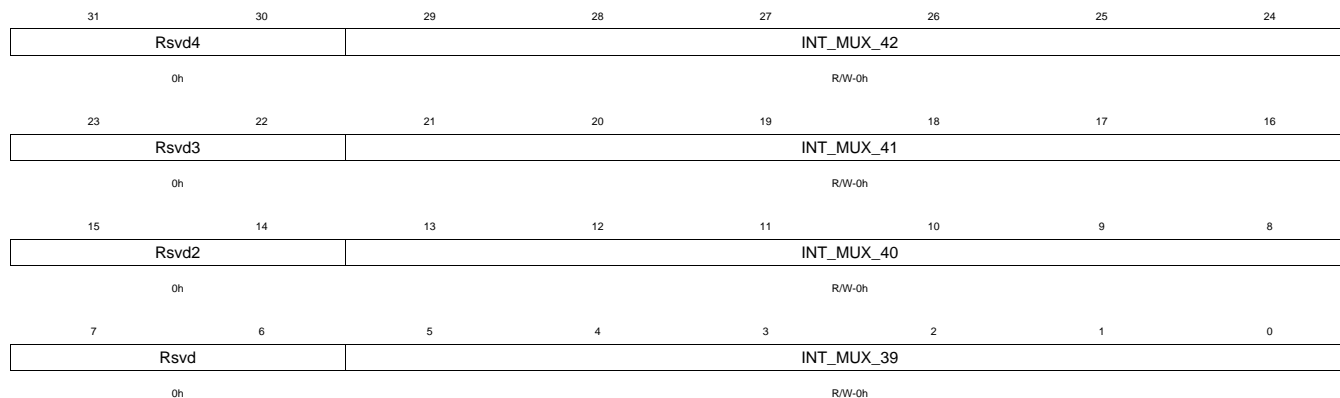

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_38	R/W	0h	Interrupt mux for GEM s interrupt number 38
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_37	R/W	0h	Interrupt mux for GEM s interrupt number 37
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_36	R/W	0h	Interrupt mux for GEM s interrupt number 36
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_35	R/W	0h	Interrupt mux for GEM s interrupt number 35

3.2.94 DSP_INTMUX_39_42 Register (offset = F18h) [reset = 0h]

DSP_INTMUX_39_42 is shown in [Figure 3-95](#) and described in [Table 3-97](#).

This register controls interrupt mux assignment for Interrupt 39 to 42

Figure 3-95. DSP_INTMUX_39_42 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-97. DSP_INTMUX_39_42 Register Field Descriptions

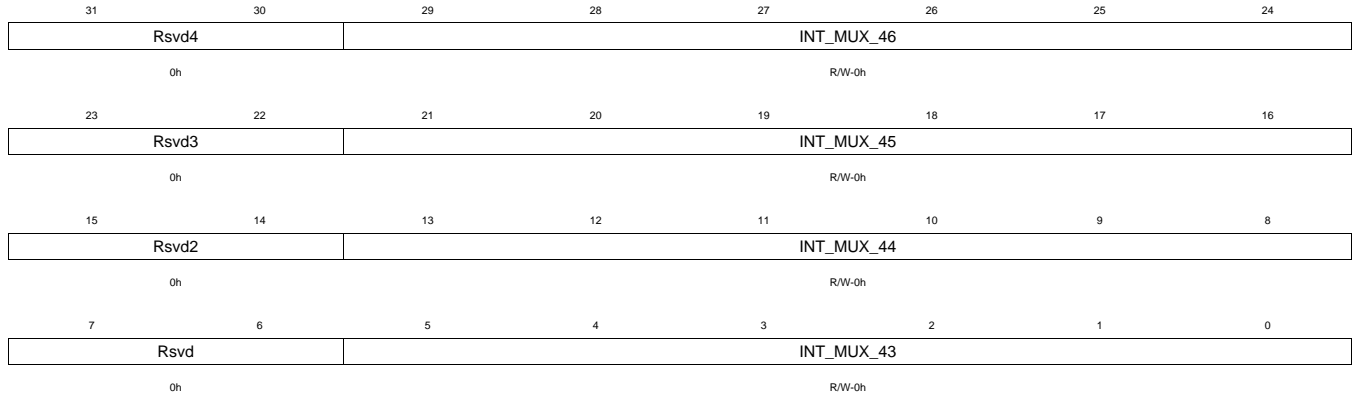

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_42	R/W	0h	Interrupt mux for GEM s interrupt number 42
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_41	R/W	0h	Interrupt mux for GEM s interrupt number 41
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_40	R/W	0h	Interrupt mux for GEM s interrupt number 40
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_39	R/W	0h	Interrupt mux for GEM s interrupt number 39

3.2.95 DSP_INTMUX_43_46 Register (offset = F1Ch) [reset = 0h]

DSP_INTMUX_43_46 is shown in [Figure 3-96](#) and described in [Table 3-98](#).

This register controls interrupt mux assignment for Interrupt 43 to 46

Figure 3-96. DSP_INTMUX_43_46 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-98. DSP_INTMUX_43_46 Register Field Descriptions

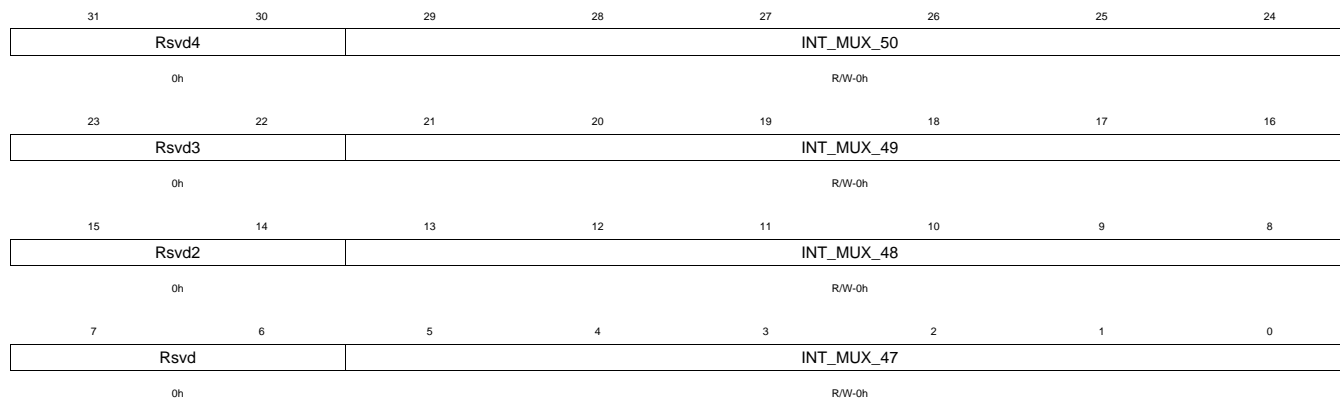

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_46	R/W	0h	Interrupt mux for GEM s interrupt number 46
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_45	R/W	0h	Interrupt mux for GEM s interrupt number 45
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_44	R/W	0h	Interrupt mux for GEM s interrupt number 44
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_43	R/W	0h	Interrupt mux for GEM s interrupt number 43

3.2.96 DSP_INTMUX_47_50 Register (offset = F20h) [reset = 0h]

DSP_INTMUX_47_50 is shown in [Figure 3-97](#) and described in [Table 3-99](#).

This register controls interrupt mux assignment for Interrupt 47 to 50

Figure 3-97. DSP_INTMUX_47_50 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-99. DSP_INTMUX_47_50 Register Field Descriptions

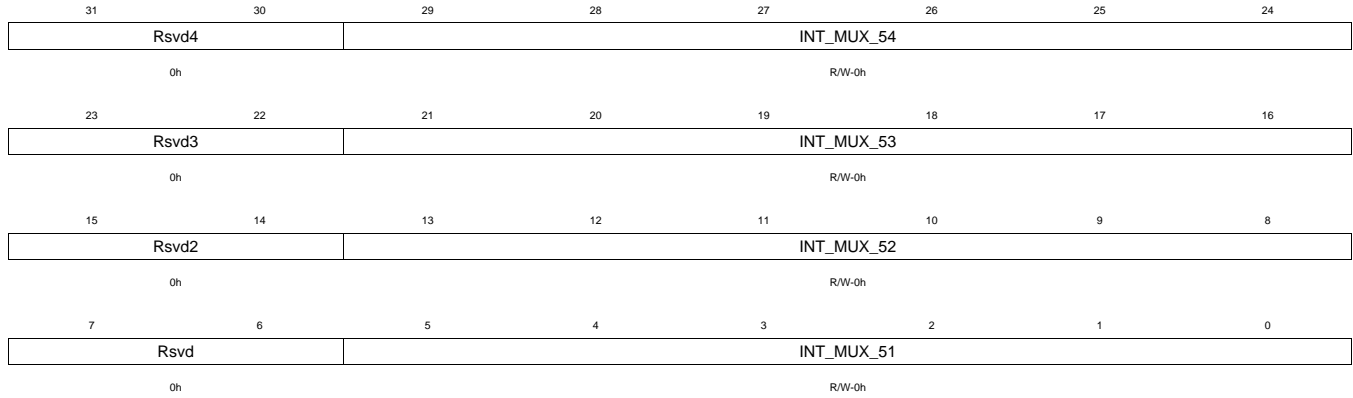

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_50	R/W	0h	Interrupt mux for GEM s interrupt number 50
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_49	R/W	0h	Interrupt mux for GEM s interrupt number 49
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_48	R/W	0h	Interrupt mux for GEM s interrupt number 48
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_47	R/W	0h	Interrupt mux for GEM s interrupt number 47

3.2.97 DSP_INTMUX_51_54 Register (offset = F24h) [reset = 0h]

DSP_INTMUX_51_54 is shown in [Figure 3-98](#) and described in [Table 3-100](#).

This register controls interrupt mux assignment for Interrupt 51 to 54

Figure 3-98. DSP_INTMUX_51_54 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

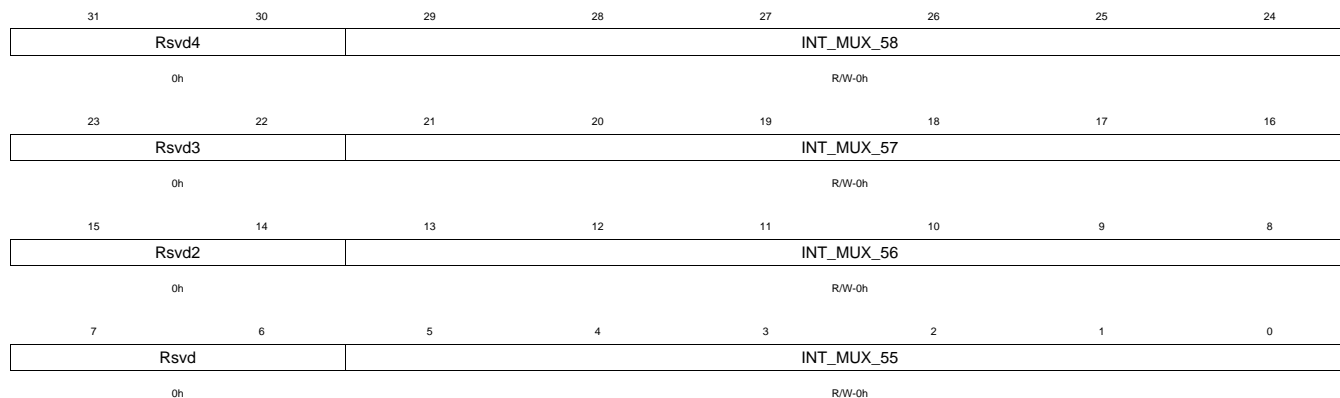

Table 3-100. DSP_INTMUX_51_54 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_54	R/W	0h	Interrupt mux for GEM s interrupt number 54
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_53	R/W	0h	Interrupt mux for GEM s interrupt number 53
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_52	R/W	0h	Interrupt mux for GEM s interrupt number 52
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_51	R/W	0h	Interrupt mux for GEM s interrupt number 51

3.2.98 DSP_INTMUX_55_58 Register (offset = F28h) [reset = 0h]

DSP_INTMUX_55_58 is shown in [Figure 3-99](#) and described in [Table 3-101](#).

This register controls interrupt mux assignment for Interrupt 55 to 58

Figure 3-99. DSP_INTMUX_55_58 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-101. DSP_INTMUX_55_58 Register Field Descriptions

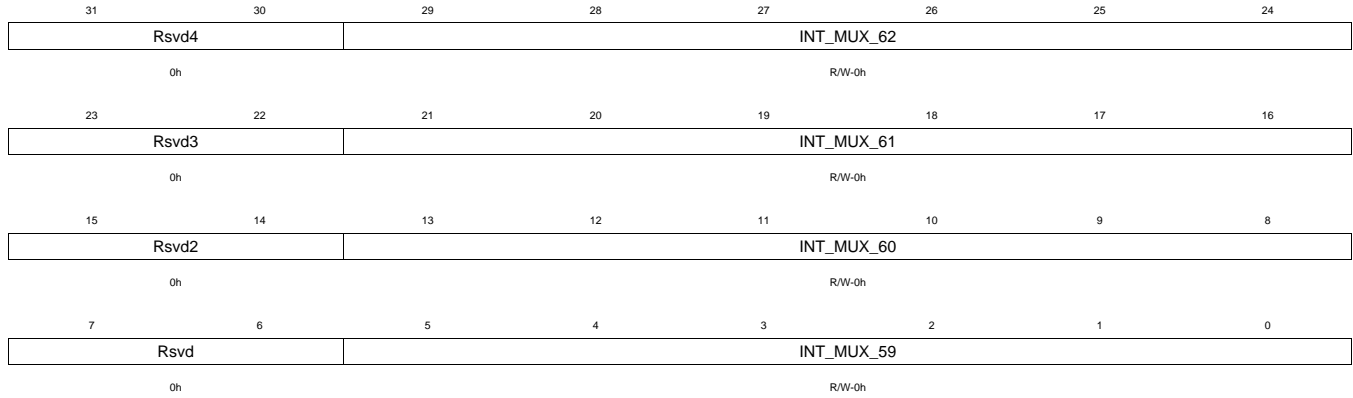

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_58	R/W	0h	Interrupt mux for GEM s interrupt number 58
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_57	R/W	0h	Interrupt mux for GEM s interrupt number 57
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_56	R/W	0h	Interrupt mux for GEM s interrupt number 56
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_55	R/W	0h	Interrupt mux for GEM s interrupt number 55

3.2.99 DSP_INTMUX_59_62 Register (offset = F2Ch) [reset = 0h]

DSP_INTMUX_59_62 is shown in [Figure 3-100](#) and described in [Table 3-102](#).

This register controls interrupt mux assignment for Interrupt 59 to 62

Figure 3-100. DSP_INTMUX_59_62 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-102. DSP_INTMUX_59_62 Register Field Descriptions

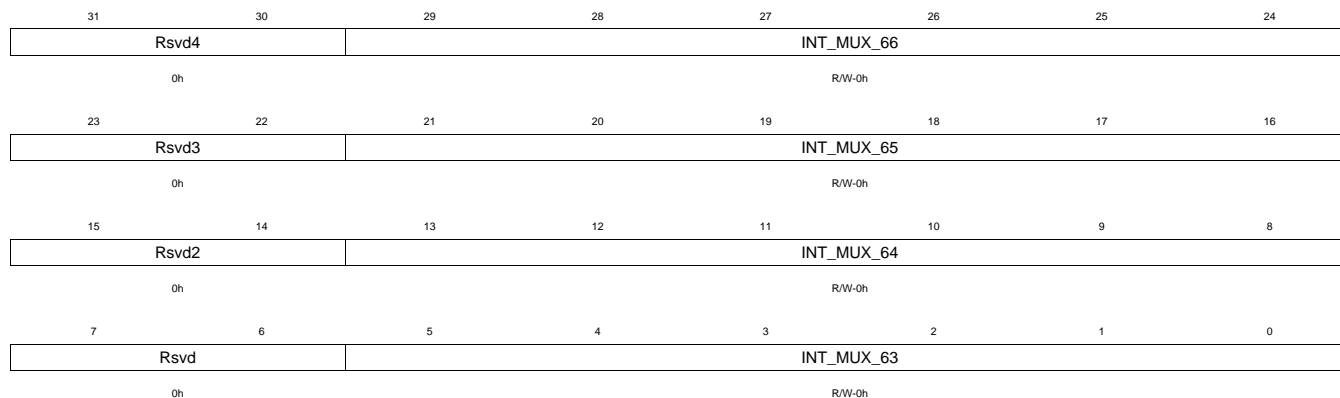

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_62	R/W	0h	Interrupt mux for GEM s interrupt number 62
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_61	R/W	0h	Interrupt mux for GEM s interrupt number 61
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_60	R/W	0h	Interrupt mux for GEM s interrupt number 60
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_59	R/W	0h	Interrupt mux for GEM s interrupt number 59

3.2.100 DSP_INTMUX_63_66 Register (offset = F30h) [reset = 0h]

DSP_INTMUX_63_66 is shown in [Figure 3-101](#) and described in [Table 3-103](#).

This register controls interrupt mux assignment for Interrupt 63 to 66

Figure 3-101. DSP_INTMUX_63_66 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-103. DSP_INTMUX_63_66 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_66	R/W	0h	Interrupt mux for GEM s interrupt number 66
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_65	R/W	0h	Interrupt mux for GEM s interrupt number 65
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_64	R/W	0h	Interrupt mux for GEM s interrupt number 64
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_63	R/W	0h	Interrupt mux for GEM s interrupt number 63

3.2.101 DSP_INTMUX_67_70 Register (offset = F34h) [reset = 0h]

DSP_INTMUX_67_70 is shown in [Figure 3-102](#) and described in [Table 3-104](#).

This register controls interrupt mux assignment for Interrupt 67 to 70

Figure 3-102. DSP_INTMUX_67_70 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-104. DSP_INTMUX_67_70 Register Field Descriptions

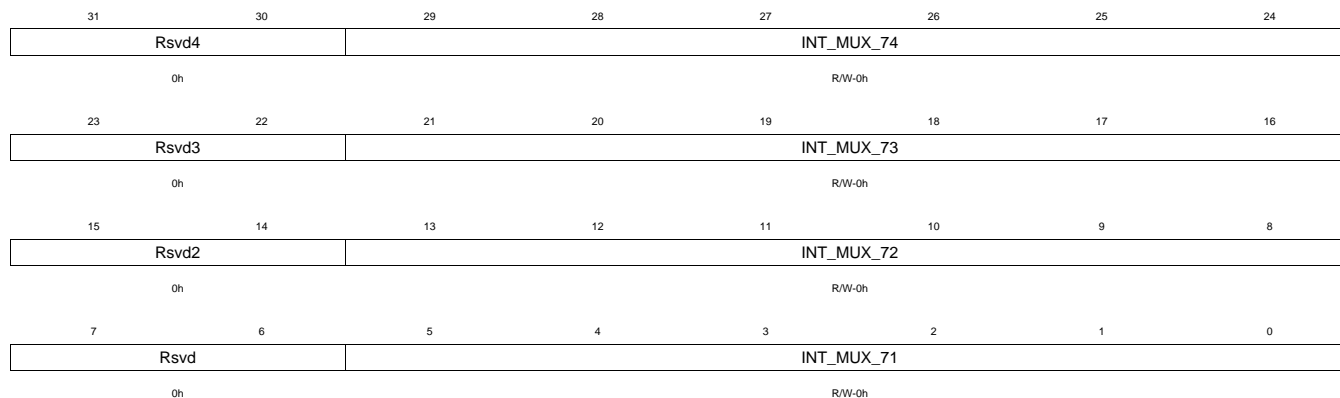

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_70	R/W	0h	Interrupt mux for GEM s interrupt number 70
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_69	R/W	0h	Interrupt mux for GEM s interrupt number 69
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_68	R/W	0h	Interrupt mux for GEM s interrupt number 68
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_67	R/W	0h	Interrupt mux for GEM s interrupt number 67

3.2.102 DSP_INTMUX_71_74 Register (offset = F38h) [reset = 0h]

DSP_INTMUX_71_74 is shown in [Figure 3-103](#) and described in [Table 3-105](#).

This register controls interrupt mux assignment for Interrupt 71 to 74

Figure 3-103. DSP_INTMUX_71_74 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-105. DSP_INTMUX_71_74 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_74	R/W	0h	Interrupt mux for GEM s interrupt number 74
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_73	R/W	0h	Interrupt mux for GEM s interrupt number 73
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_72	R/W	0h	Interrupt mux for GEM s interrupt number 72
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_71	R/W	0h	Interrupt mux for GEM s interrupt number 71

3.2.103 DSP_INTMUX_75_78 Register (offset = F3Ch) [reset = 0h]

DSP_INTMUX_75_78 is shown in [Figure 3-104](#) and described in [Table 3-106](#).

This register controls interrupt mux assignment for Interrupt 75 to 78

Figure 3-104. DSP_INTMUX_75_78 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

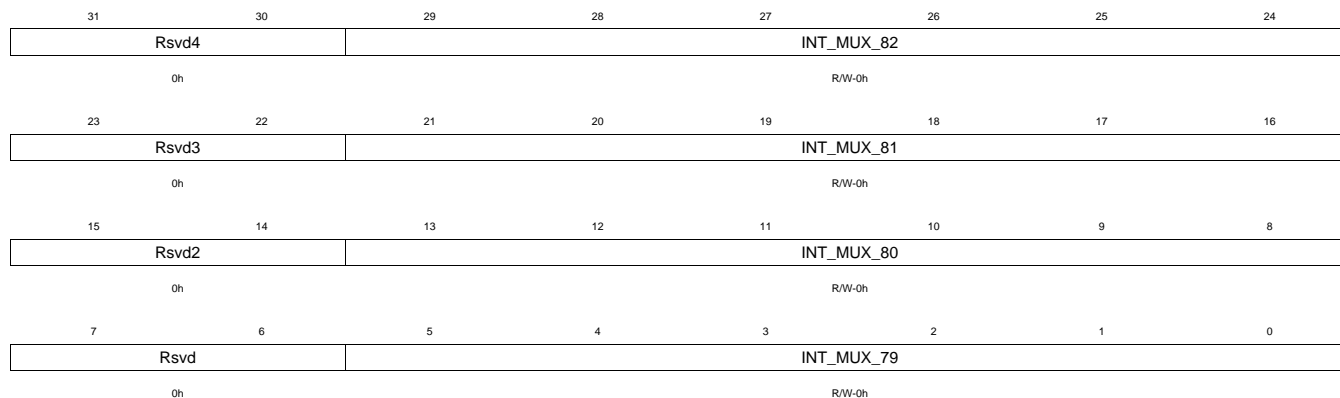

Table 3-106. DSP_INTMUX_75_78 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_78	R/W	0h	Interrupt mux for GEM s interrupt number 78
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_77	R/W	0h	Interrupt mux for GEM s interrupt number 77
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_76	R/W	0h	Interrupt mux for GEM s interrupt number 76
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_75	R/W	0h	Interrupt mux for GEM s interrupt number 75

3.2.104 DSP_INTMUX_79_82 Register (offset = F40h) [reset = 0h]

DSP_INTMUX_79_82 is shown in [Figure 3-105](#) and described in [Table 3-107](#).

This register controls interrupt mux assignment for Interrupt 79 to 82

Figure 3-105. DSP_INTMUX_79_82 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-107. DSP_INTMUX_79_82 Register Field Descriptions

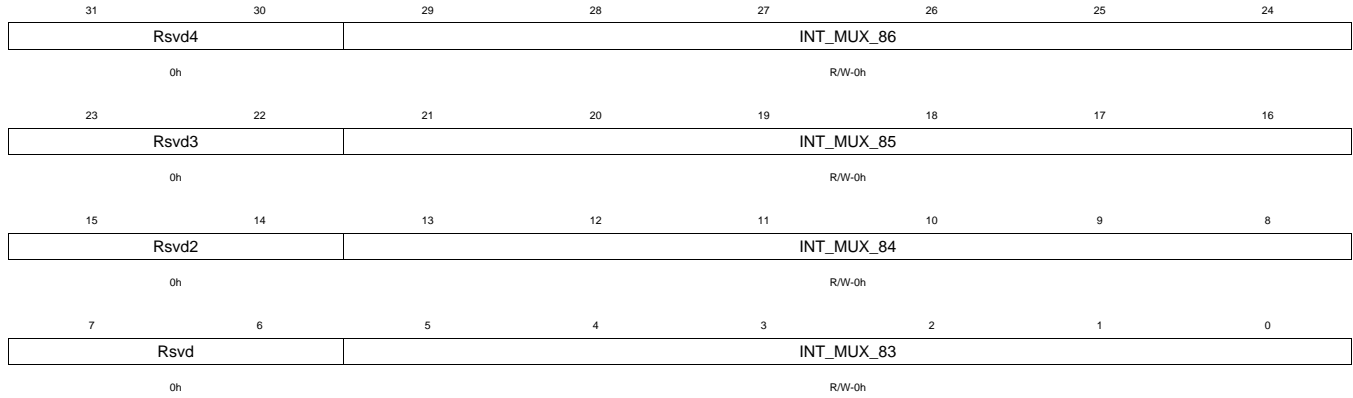

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_82	R/W	0h	Interrupt mux for GEM s interrupt number 82
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_81	R/W	0h	Interrupt mux for GEM s interrupt number 81
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_80	R/W	0h	Interrupt mux for GEM s interrupt number 80
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_79	R/W	0h	Interrupt mux for GEM s interrupt number 79

3.2.105 DSP_INTMUX_83_86 Register (offset = F44h) [reset = 0h]

DSP_INTMUX_83_86 is shown in [Figure 3-106](#) and described in [Table 3-108](#).

This register controls interrupt mux assignment for Interrupt 83 to 86

Figure 3-106. DSP_INTMUX_83_86 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-108. DSP_INTMUX_83_86 Register Field Descriptions

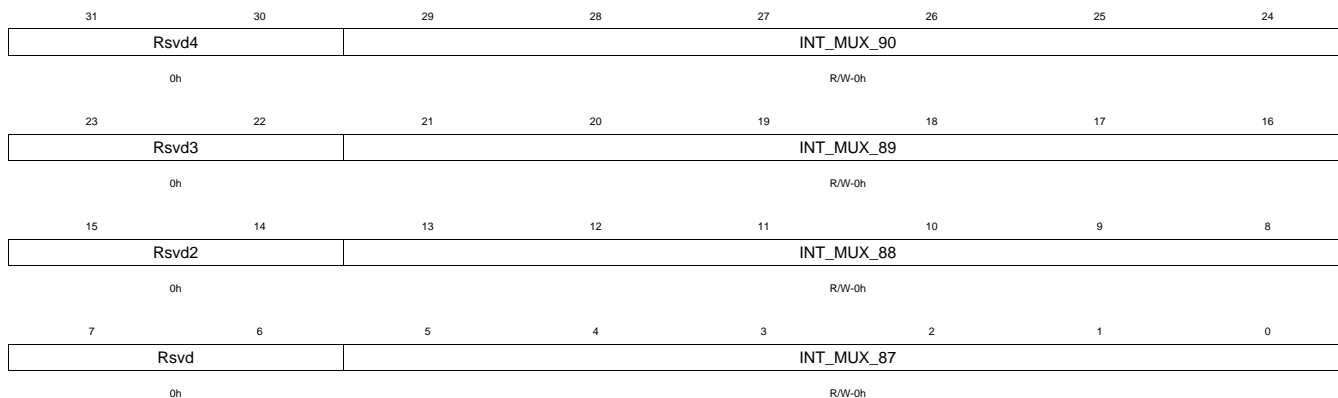

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_86	R/W	0h	Interrupt mux for GEM s interrupt number 86
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_85	R/W	0h	Interrupt mux for GEM s interrupt number 85
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_84	R/W	0h	Interrupt mux for GEM s interrupt number 84
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_83	R/W	0h	Interrupt mux for GEM s interrupt number 83

3.2.106 DSP_INTMUX_87_90 Register (offset = F48h) [reset = 0h]

DSP_INTMUX_87_90 is shown in [Figure 3-107](#) and described in [Table 3-109](#).

This register controls interrupt mux assignment for Interrupt 87 to 90

Figure 3-107. DSP_INTMUX_87_90 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-109. DSP_INTMUX_87_90 Register Field Descriptions

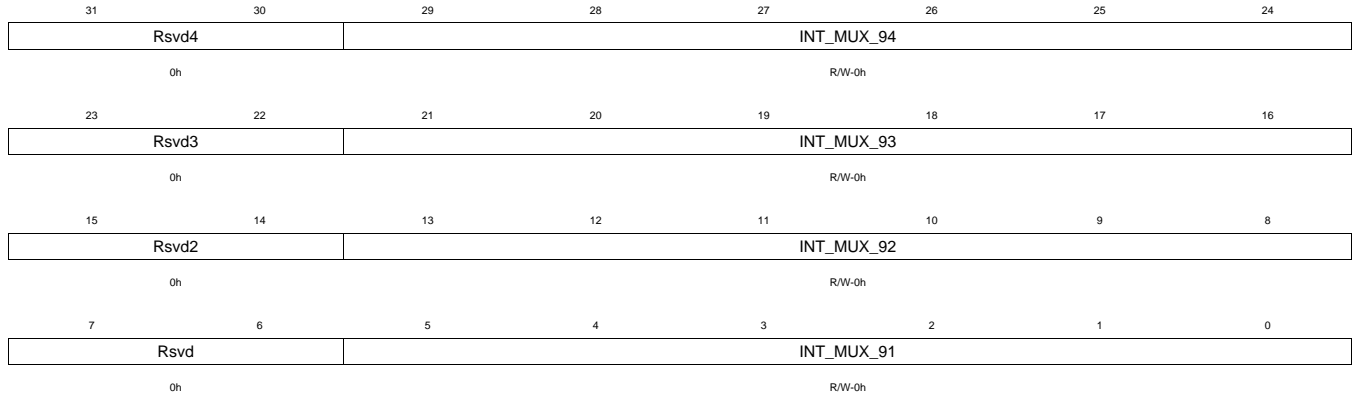

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_90	R/W	0h	Interrupt mux for GEM s interrupt number 90
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_89	R/W	0h	Interrupt mux for GEM s interrupt number 89
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_88	R/W	0h	Interrupt mux for GEM s interrupt number 88
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_87	R/W	0h	Interrupt mux for GEM s interrupt number 87

3.2.107 DSP_INTMUX_91_94 Register (offset = F4Ch) [reset = 0h]

DSP_INTMUX_91_94 is shown in [Figure 3-108](#) and described in [Table 3-110](#).

This register controls interrupt mux assignment for Interrupt 91 to 94

Figure 3-108. DSP_INTMUX_91_94 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-110. DSP_INTMUX_91_94 Register Field Descriptions

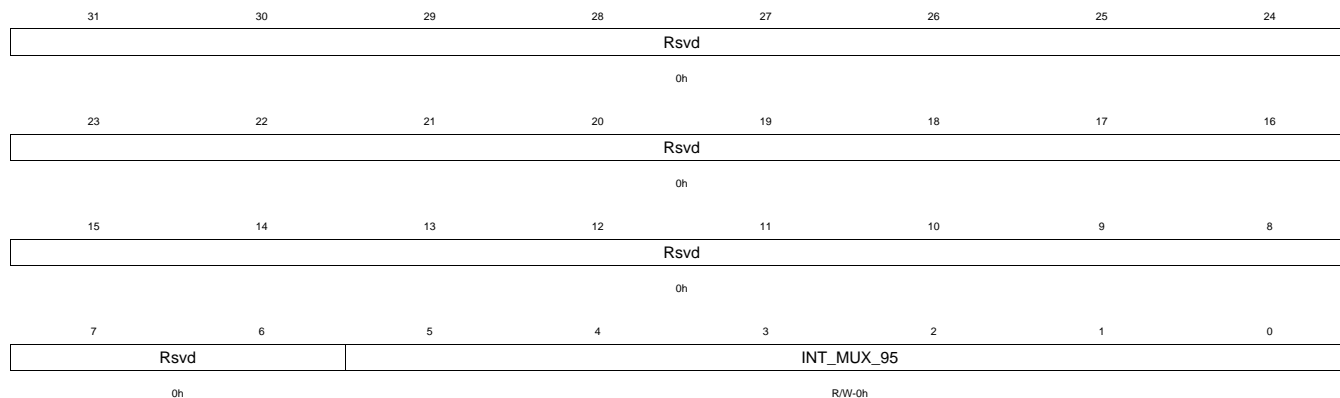

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	INT_MUX_94	R/W	0h	Interrupt mux for GEM s interrupt number 94
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	INT_MUX_93	R/W	0h	Interrupt mux for GEM s interrupt number 93
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	INT_MUX_92	R/W	0h	Interrupt mux for GEM s interrupt number 92
7-6	Rsvd		0h	Reserved
5-0	INT_MUX_91	R/W	0h	Interrupt mux for GEM s interrupt number 91

3.2.108 DSP_INTMUX_95 Register (offset = F50h) [reset = 0h]

DSP_INTMUX_95 is shown in [Figure 3-109](#) and described in [Table 3-111](#).

This register controls interrupt mux assignment for Interrupt 95

Figure 3-109. DSP_INTMUX_95 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-111. DSP_INTMUX_95 Register Field Descriptions

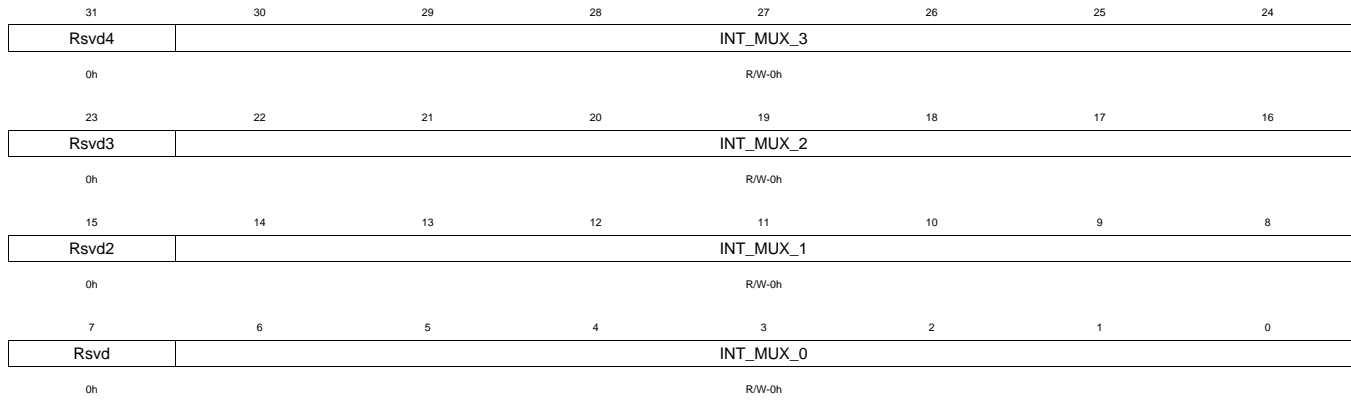

Bit	Field	Type	Reset	Description
31-6	Rsvd		0h	Reserved-Read returns 0
5-0	INT_MUX_95	R/W	0h	Interrupt mux for GEM s interrupt number 95

3.2.109 Media_Controller_INTMUX_0_3 Register (offset = F54h) [reset = 0h]

Media_Controller_INTMUX_0_3 is shown in [Figure 3-110](#) and described in [Table 3-112](#).

This register controls Media Controller interrupt assignment for interrupts through 0 to 3

Figure 3-110. Media_Controller_INTMUX_0_3 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

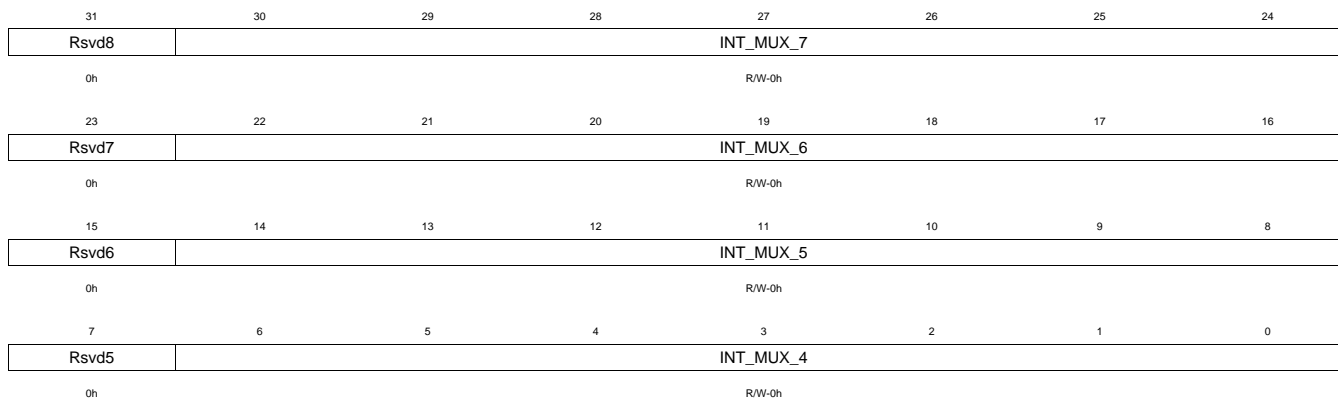

Table 3-112. Media_Controller_INTMUX_0_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	Rsvd4		0h	Reserved -Read returns 0
30-24	INT_MUX_3	R/W	0h	Interrupt mux 3
23	Rsvd3		0h	Reserved-Read returns 0
22-16	INT_MUX_2	R/W	0h	Interrupt mux 2
15	Rsvd2		0h	Reserved-Read returns 0
14-8	INT_MUX_1	R/W	0h	Interrupt mux 1
7	Rsvd		0h	Reserved-Read returns 0
6-0	INT_MUX_0	R/W	0h	Interrupt mux 0

3.2.110 Media_Controller_INTMUX_4_7 Register (offset = F58h) [reset = 0h]

Media_Controller_INTMUX_4_7 is shown in [Figure 3-111](#) and described in [Table 3-113](#).

This register controls Media Controller interrupt assignment for interrupts through 4 to 7

Figure 3-111. Media_Controller_INTMUX_4_7 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-113. Media_Controller_INTMUX_4_7 Register Field Descriptions

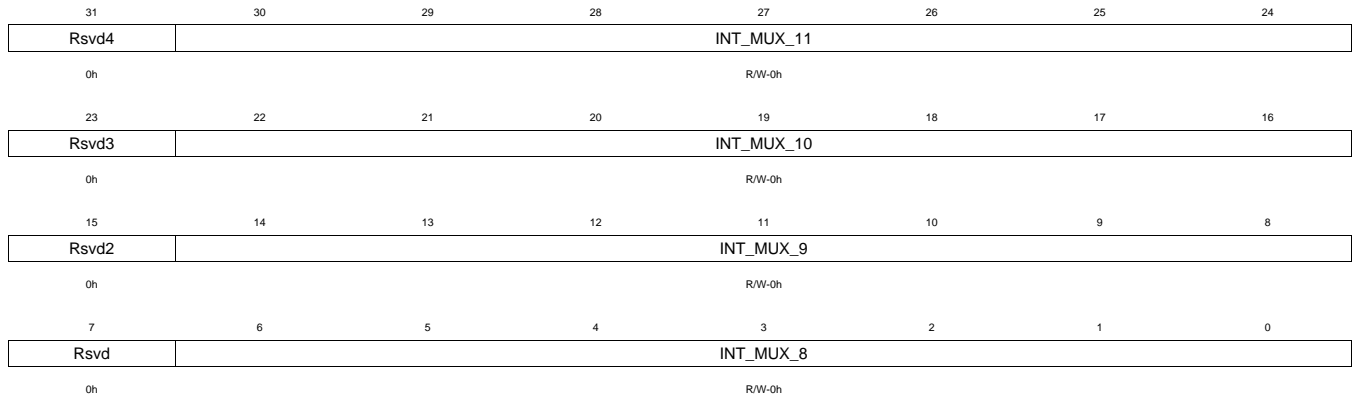

Bit	Field	Type	Reset	Description
31	Rsvd8		0h	Reserved -Read returns 0
30-24	INT_MUX_7	R/W	0h	Interrupt mux 7
23	Rsvd7		0h	Reserved-Read returns 0
22-16	INT_MUX_6	R/W	0h	Interrupt mux 6
15	Rsvd6		0h	Reserved-Read returns 0
14-8	INT_MUX_5	R/W	0h	Interrupt mux 5
7	Rsvd5		0h	Reserved-Read returns 0
6-0	INT_MUX_4	R/W	0h	Interrupt mux 4

3.2.111 Media_Controller_INTMUX_8_11 Register (offset = F5Ch) [reset = 0h]

Media_Controller_INTMUX_8_11 is shown in [Figure 3-112](#) and described in [Table 3-114](#).

This register controls Media Controller interrupt assignment for interrupts through 8 to 11

Figure 3-112. Media_Controller_INTMUX_8_11 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

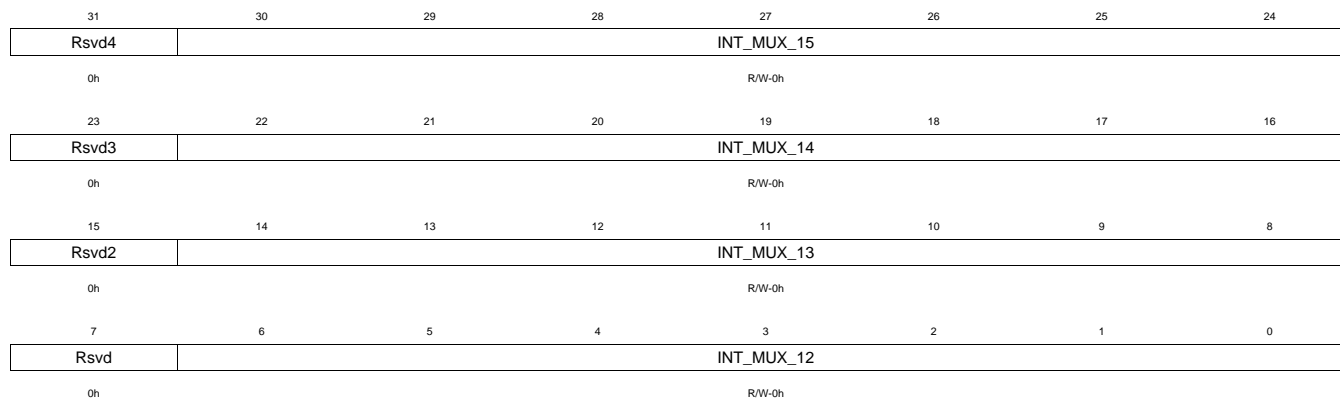

Table 3-114. Media_Controller_INTMUX_8_11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	Rsvd4		0h	Reserved -Read returns 0
30-24	INT_MUX_11	R/W	0h	Interrupt mux 11
23	Rsvd3		0h	Reserved-Read returns 0
22-16	INT_MUX_10	R/W	0h	Interrupt mux 10
15	Rsvd2		0h	Reserved-Read returns 0
14-8	INT_MUX_9	R/W	0h	Interrupt mux 9
7	Rsvd		0h	Reserved-Read returns 0
6-0	INT_MUX_8	R/W	0h	Interrupt mux 8

3.2.112 Media_Controller_INTMUX_12_15 Register (offset = F60h) [reset = 0h]

Media_Controller_INTMUX_12_15 is shown in [Figure 3-113](#) and described in [Table 3-115](#).

This register controls Media Controller interrupt assignment for interrupts through 12 to 15

Figure 3-113. Media_Controller_INTMUX_12_15 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-115. Media_Controller_INTMUX_12_15 Register Field Descriptions

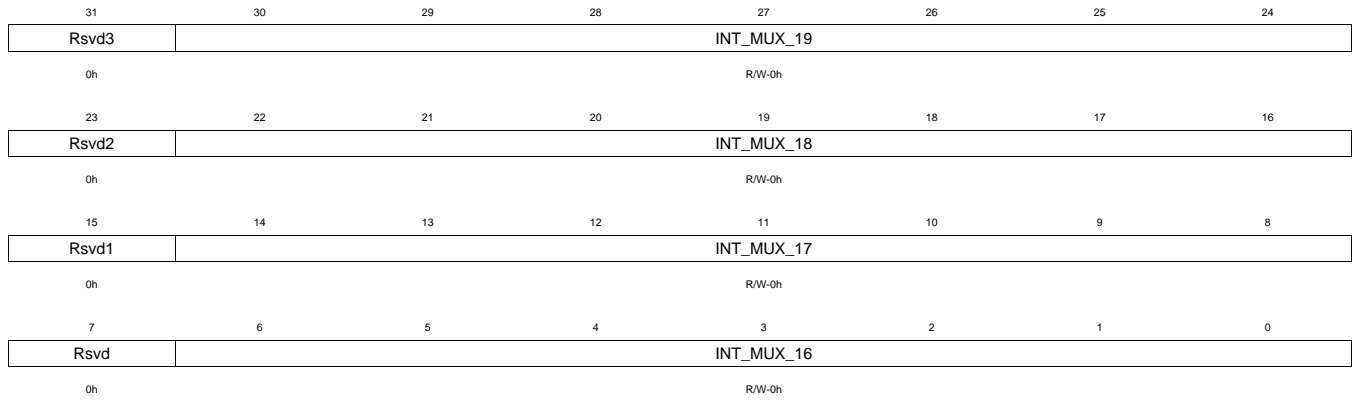

Bit	Field	Type	Reset	Description
31	Rsvd4		0h	Reserved -Read returns 0
30-24	INT_MUX_15	R/W	0h	Interrupt mux 15
23	Rsvd3		0h	Reserved-Read returns 0
22-16	INT_MUX_14	R/W	0h	Interrupt mux 14
15	Rsvd2		0h	Reserved-Read returns 0
14-8	INT_MUX_13	R/W	0h	Interrupt mux 13
7	Rsvd		0h	Reserved-Read returns 0
6-0	INT_MUX_12	R/W	0h	Interrupt mux 12

3.2.113 Media_Controller_INTMUX_16_19 Register (offset = F64h) [reset = 0h]

Media_Controller_INTMUX_16_19 is shown in [Figure 3-114](#) and described in [Table 3-116](#).

This register controls Media Controller interrupt assignment for interrupts through 16 to 19

Figure 3-114. Media_Controller_INTMUX_16_19 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

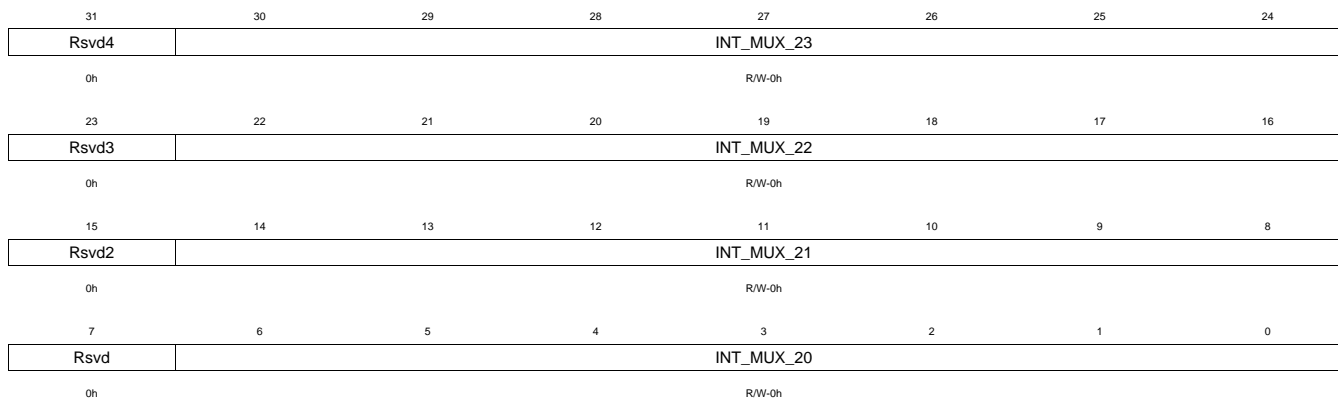

Table 3-116. Media_Controller_INTMUX_16_19 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	Rsvd3		0h	Reserved -Read returns 0
30-24	INT_MUX_19	R/W	0h	Interrupt mux 19
23	Rsvd2		0h	Reserved-Read returns 0
22-16	INT_MUX_18	R/W	0h	Interrupt mux 18
15	Rsvd1		0h	Reserved-Read returns 0
14-8	INT_MUX_17	R/W	0h	Interrupt mux 17
7	Rsvd		0h	Reserved-Read returns 0
6-0	INT_MUX_16	R/W	0h	Interrupt mux 16

3.2.114 Media_Controller_INTMUX_20_23 Register (offset = F68h) [reset = 0h]

Media_Controller_INTMUX_20_23 is shown in [Figure 3-115](#) and described in [Table 3-117](#).

This register controls Media Controller interrupt assignment for interrupts through 20 to 23

Figure 3-115. Media_Controller_INTMUX_20_23 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-117. Media_Controller_INTMUX_20_23 Register Field Descriptions

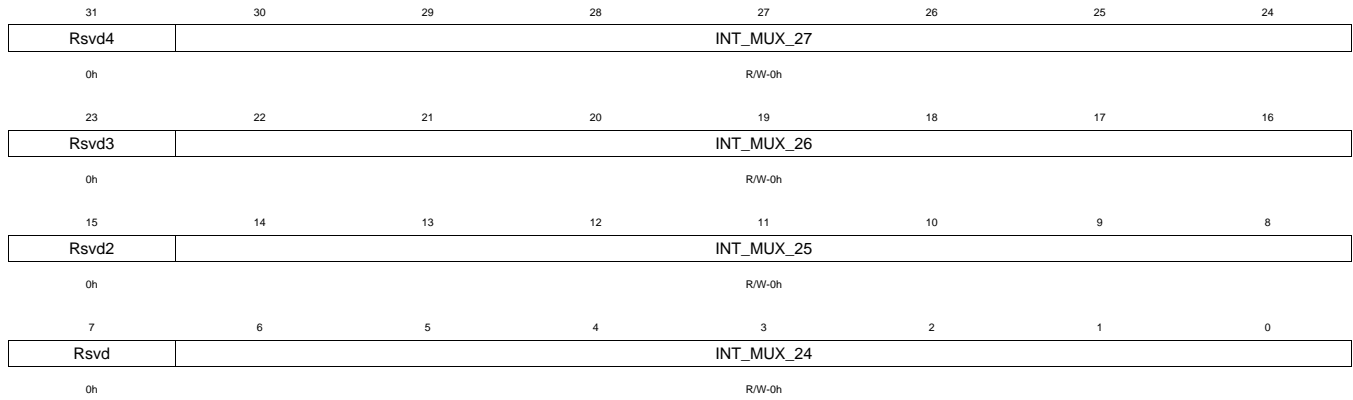

Bit	Field	Type	Reset	Description
31	Rsvd4		0h	Reserved -Read returns 0
30-24	INT_MUX_23	R/W	0h	Interrupt mux 23
23	Rsvd3		0h	Reserved-Read returns 0
22-16	INT_MUX_22	R/W	0h	Interrupt mux 22
15	Rsvd2		0h	Reserved-Read returns 0
14-8	INT_MUX_21	R/W	0h	Interrupt mux 21
7	Rsvd		0h	Reserved-Read returns 0
6-0	INT_MUX_20	R/W	0h	Interrupt mux 20

3.2.115 Media_Controller_INTMUX_24_27 Register (offset = F6Ch) [reset = 0h]

Media_Controller_INTMUX_24_27 is shown in [Figure 3-116](#) and described in [Table 3-118](#).

This register controls Media Controller interrupt assignment for interrupts through 24 to 27

Figure 3-116. Media_Controller_INTMUX_24_27 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

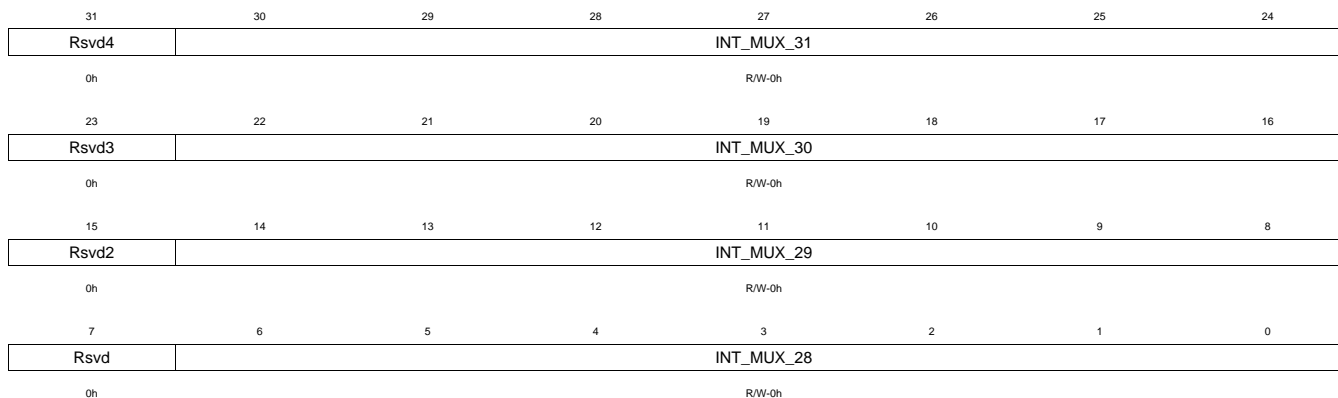

Table 3-118. Media_Controller_INTMUX_24_27 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	Rsvd4		0h	Reserved -Read returns 0
30-24	INT_MUX_27	R/W	0h	Interrupt mux 27
23	Rsvd3		0h	Reserved-Read returns 0
22-16	INT_MUX_26	R/W	0h	Interrupt mux 26
15	Rsvd2		0h	Reserved-Read returns 0
14-8	INT_MUX_25	R/W	0h	Interrupt mux 25
7	Rsvd		0h	Reserved-Read returns 0
6-0	INT_MUX_24	R/W	0h	Interrupt mux 24

3.2.116 Media_Controller_INTMUX_28_31 Register (offset = F70h) [reset = 0h]

Media_Controller_INTMUX_28_31 is shown in [Figure 3-117](#) and described in [Table 3-119](#).

This register controls Media Controller interrupt assignment for interrupts through 28 to 31

Figure 3-117. Media_Controller_INTMUX_28_31 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-119. Media_Controller_INTMUX_28_31 Register Field Descriptions

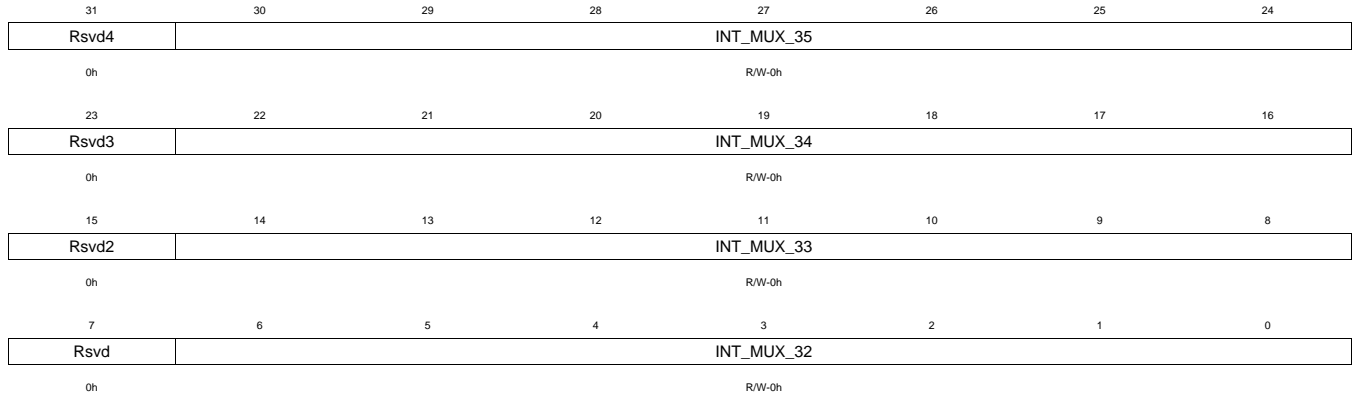

Bit	Field	Type	Reset	Description
31	Rsvd4		0h	Reserved -Read returns 0
30-24	INT_MUX_31	R/W	0h	Interrupt mux 31
23	Rsvd3		0h	Reserved-Read returns 0
22-16	INT_MUX_30	R/W	0h	Interrupt mux 30
15	Rsvd2		0h	Reserved-Read returns 0
14-8	INT_MUX_29	R/W	0h	Interrupt mux 29
7	Rsvd		0h	Reserved-Read returns 0
6-0	INT_MUX_28	R/W	0h	Interrupt mux 28

3.2.117 Media_Controller_INTMUX_32_35 Register (offset = F74h) [reset = 0h]

Media_Controller_INTMUX_32_35 is shown in [Figure 3-118](#) and described in [Table 3-120](#).

This register controls Media Controller interrupt assignment for interrupts through 32 to 35

Figure 3-118. Media_Controller_INTMUX_32_35 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

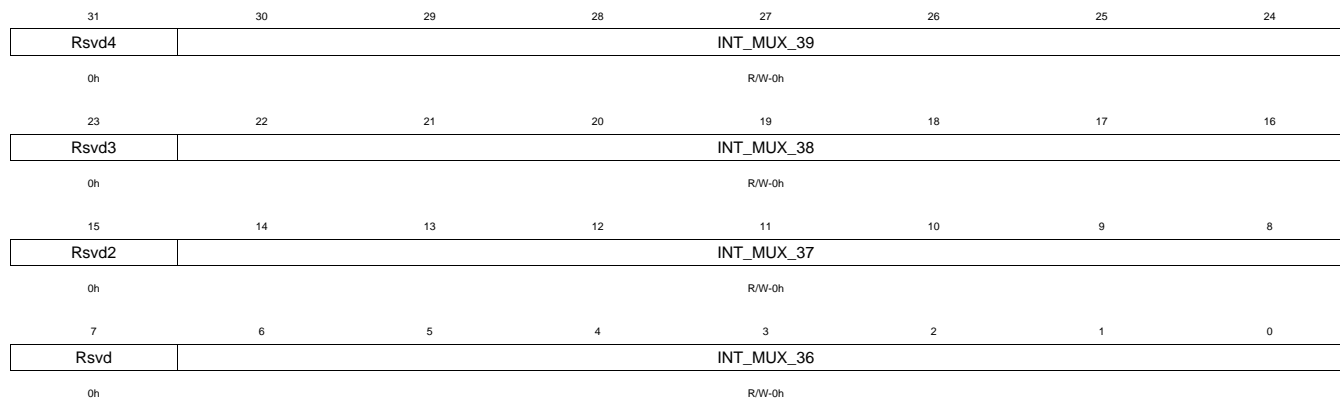

Table 3-120. Media_Controller_INTMUX_32_35 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	Rsvd4		0h	Reserved -Read returns 0
30-24	INT_MUX_35	R/W	0h	Interrupt mux 35
23	Rsvd3		0h	Reserved-Read returns 0
22-16	INT_MUX_34	R/W	0h	Interrupt mux 34
15	Rsvd2		0h	Reserved-Read returns 0
14-8	INT_MUX_33	R/W	0h	Interrupt mux 33
7	Rsvd		0h	Reserved-Read returns 0
6-0	INT_MUX_32	R/W	0h	Interrupt mux 32

3.2.118 Media_Controller_INTMUX_36_39 Register (offset = F78h) [reset = 0h]

Media_Controller_INTMUX_36_39 is shown in [Figure 3-119](#) and described in [Table 3-121](#).

This register controls Media Controller interrupt assignment for interrupts through 36 to 39

Figure 3-119. Media_Controller_INTMUX_36_39 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-121. Media_Controller_INTMUX_36_39 Register Field Descriptions

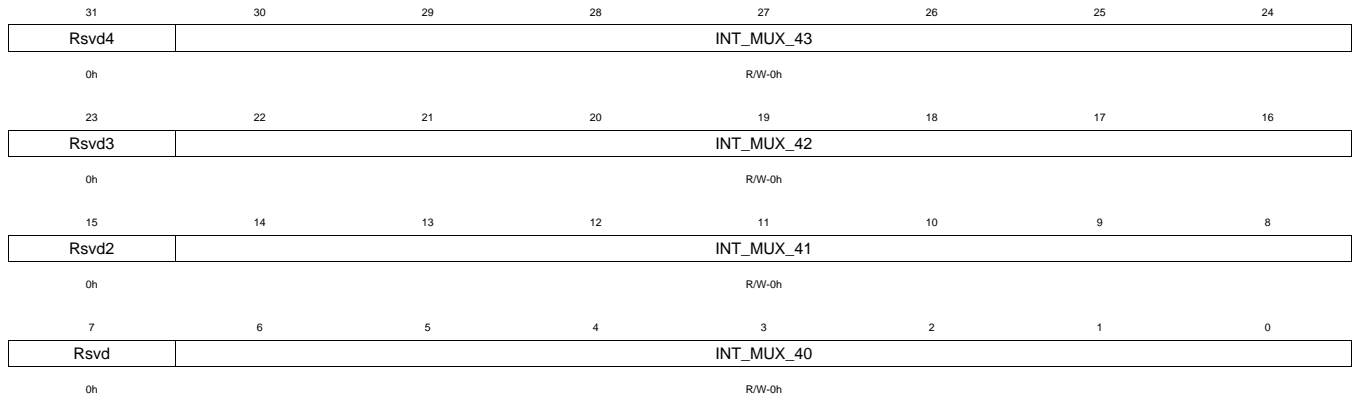

Bit	Field	Type	Reset	Description
31	Rsvd4		0h	Reserved -Read returns 0
30-24	INT_MUX_39	R/W	0h	Interrupt mux 39
23	Rsvd3		0h	Reserved-Read returns 0
22-16	INT_MUX_38	R/W	0h	Interrupt mux 38
15	Rsvd2		0h	Reserved-Read returns 0
14-8	INT_MUX_37	R/W	0h	Interrupt mux 37
7	Rsvd		0h	Reserved-Read returns 0
6-0	INT_MUX_36	R/W	0h	Interrupt mux 36

3.2.119 Media_Controller_INTMUX_40_43 Register (offset = F7Ch) [reset = 0h]

Media_Controller_INTMUX_40_43 is shown in [Figure 3-120](#) and described in [Table 3-122](#).

This register controls Media Controller interrupt assignment for interrupts through 40 to 43

Figure 3-120. Media_Controller_INTMUX_40_43 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

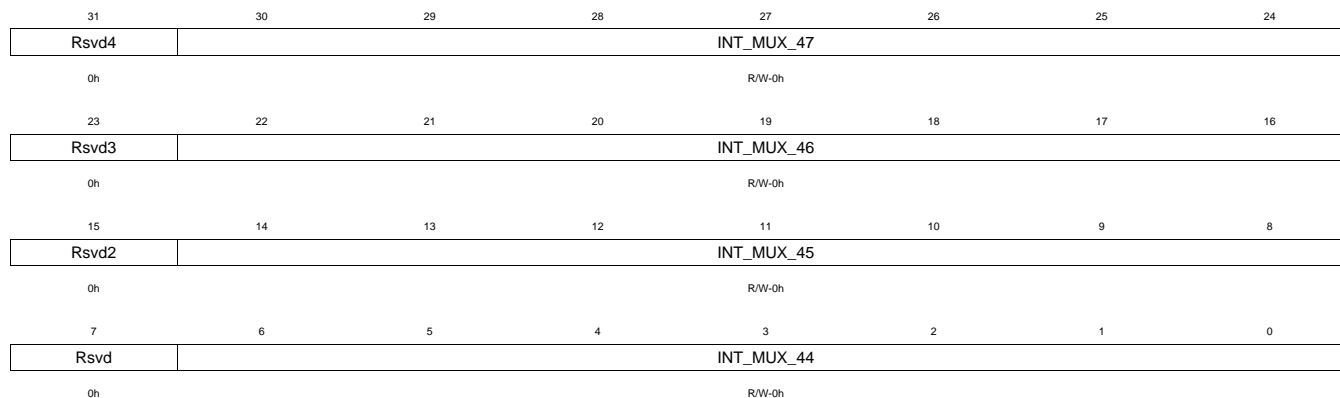

Table 3-122. Media_Controller_INTMUX_40_43 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	Rsvd4		0h	Reserved -Read returns 0
30-24	INT_MUX_43	R/W	0h	Interrupt mux 43
23	Rsvd3		0h	Reserved-Read returns 0
22-16	INT_MUX_42	R/W	0h	Interrupt mux 42
15	Rsvd2		0h	Reserved-Read returns 0
14-8	INT_MUX_41	R/W	0h	Interrupt mux 41
7	Rsvd		0h	Reserved-Read returns 0
6-0	INT_MUX_40	R/W	0h	Interrupt mux 40

3.2.120 Media_Controller_INTMUX_44_47 Register (offset = F80h) [reset = 0h]

Media_Controller_INTMUX_44_47 is shown in [Figure 3-121](#) and described in [Table 3-123](#).

This register controls Media Controller interrupt assignment for interrupts through 44 to 47

Figure 3-121. Media_Controller_INTMUX_44_47 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-123. Media_Controller_INTMUX_44_47 Register Field Descriptions

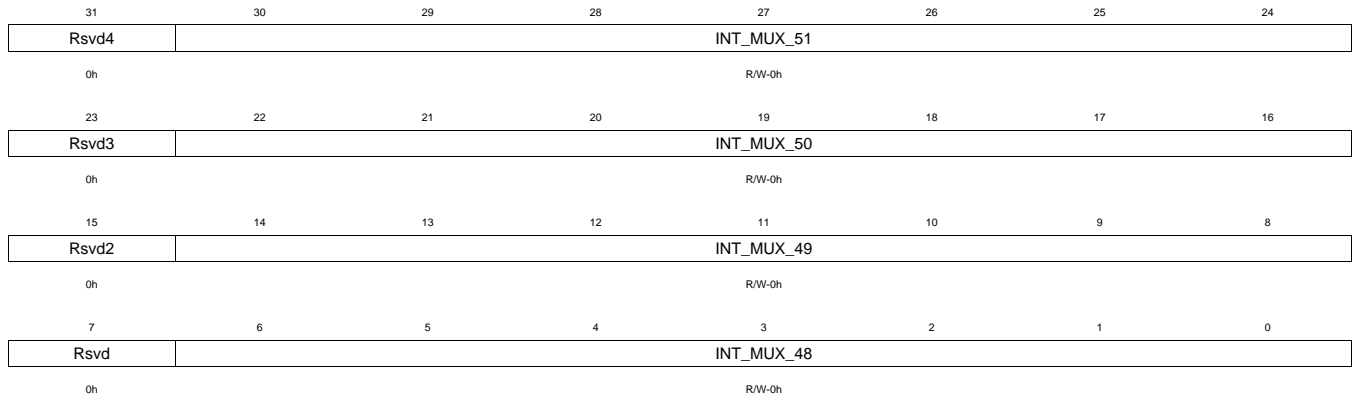

Bit	Field	Type	Reset	Description
31	Rsvd4		0h	Reserved -Read returns 0
30-24	INT_MUX_47	R/W	0h	Interrupt mux 47
23	Rsvd3		0h	Reserved-Read returns 0
22-16	INT_MUX_46	R/W	0h	Interrupt mux 46
15	Rsvd2		0h	Reserved-Read returns 0
14-8	INT_MUX_45	R/W	0h	Interrupt mux 45
7	Rsvd		0h	Reserved-Read returns 0
6-0	INT_MUX_44	R/W	0h	Interrupt mux 44

3.2.121 Media_Controller_INTMUX_48_51 Register (offset = F84h) [reset = 0h]

Media_Controller_INTMUX_48_51 is shown in [Figure 3-122](#) and described in [Table 3-124](#).

This register controls Media Controller interrupt assignment for interrupts through 48 to 51

Figure 3-122. Media_Controller_INTMUX_48_51 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

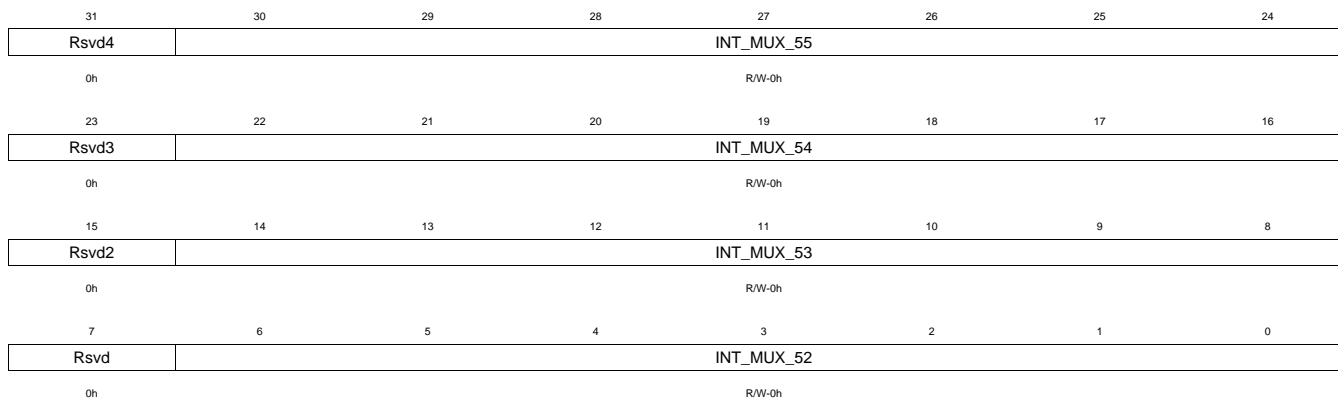

Table 3-124. Media_Controller_INTMUX_48_51 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	Rsvd4		0h	Reserved -Read returns 0
30-24	INT_MUX_51	R/W	0h	Interrupt mux 51
23	Rsvd3		0h	Reserved-Read returns 0
22-16	INT_MUX_50	R/W	0h	Interrupt mux 50
15	Rsvd2		0h	Reserved-Read returns 0
14-8	INT_MUX_49	R/W	0h	Interrupt mux 49
7	Rsvd		0h	Reserved-Read returns 0
6-0	INT_MUX_48	R/W	0h	Interrupt mux 48

3.2.122 Media_Controller_INTMUX_52_55 Register (offset = F88h) [reset = 0h]

Media_Controller_INTMUX_52_55 is shown in [Figure 3-123](#) and described in [Table 3-125](#).

This register controls Media Controller interrupt assignment for interrupts through 52 to 55

Figure 3-123. Media_Controller_INTMUX_52_55 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-125. Media_Controller_INTMUX_52_55 Register Field Descriptions

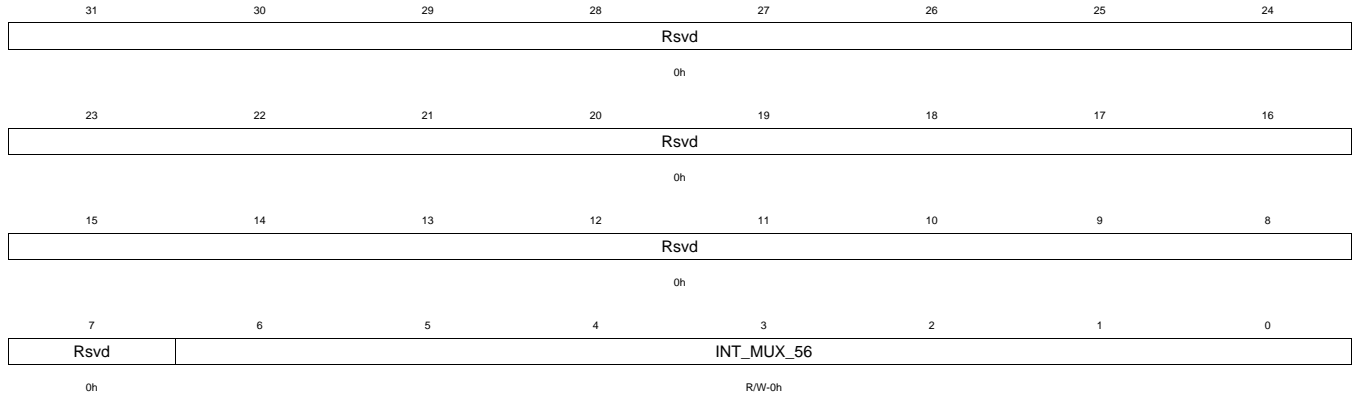

Bit	Field	Type	Reset	Description
31	Rsvd4		0h	Reserved -Read returns 0
30-24	INT_MUX_55	R/W	0h	Interrupt mux 55
23	Rsvd3		0h	Reserved-Read returns 0
22-16	INT_MUX_54	R/W	0h	Interrupt mux 54
15	Rsvd2		0h	Reserved-Read returns 0
14-8	INT_MUX_53	R/W	0h	Interrupt mux 53
7	Rsvd		0h	Reserved-Read returns 0
6-0	INT_MUX_52	R/W	0h	Interrupt mux 52

3.2.123 Media_Controller_INTMUX_56 Register (offset = F8Ch) [reset = 0h]

Media_Controller_INTMUX_56 is shown in [Figure 3-124](#) and described in [Table 3-126](#).

This register controls Media Controller interrupt assignment for interrupt number 56.

Figure 3-124. Media_Controller_INTMUX_56 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-126. Media_Controller_INTMUX_56 Register Field Descriptions

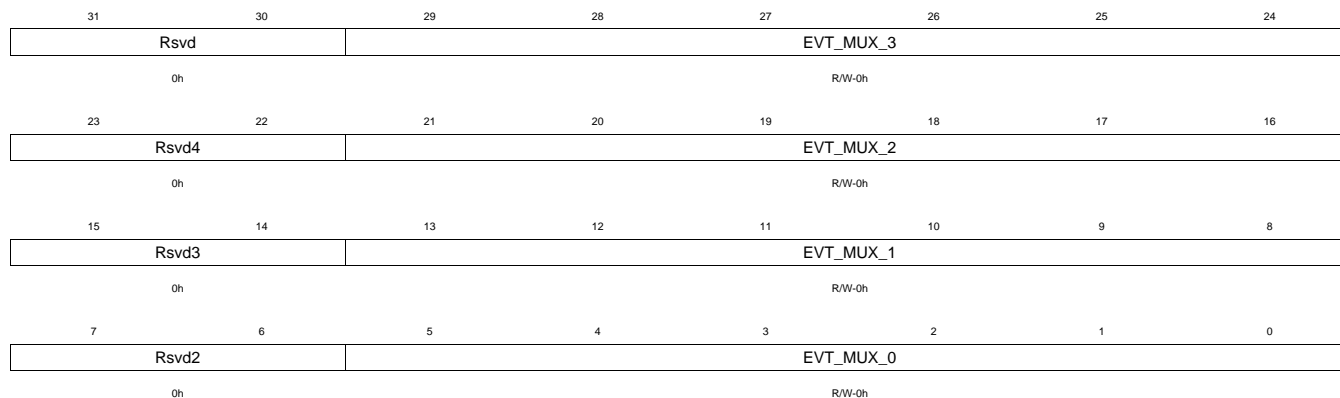

Bit	Field	Type	Reset	Description
31-7	Rsvd		0h	Reserved- Read returns 0
6-0	INT_MUX_56	R/W	0h	Interrupt mux 56

3.2.124 EDMA3CC_EVTMUX_0_3 Register (offset = F90h) [reset = 0h]

EDMA3CC_EVTMUX_0_3 is shown in [Figure 3-125](#) and described in [Table 3-127](#).

This register controls EDMA3CC Event mux assignment for event no 0 to 3

Figure 3-125. EDMA3CC_EVTMUX_0_3 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-127. EDMA3CC_EVTMUX_0_3 Register Field Descriptions

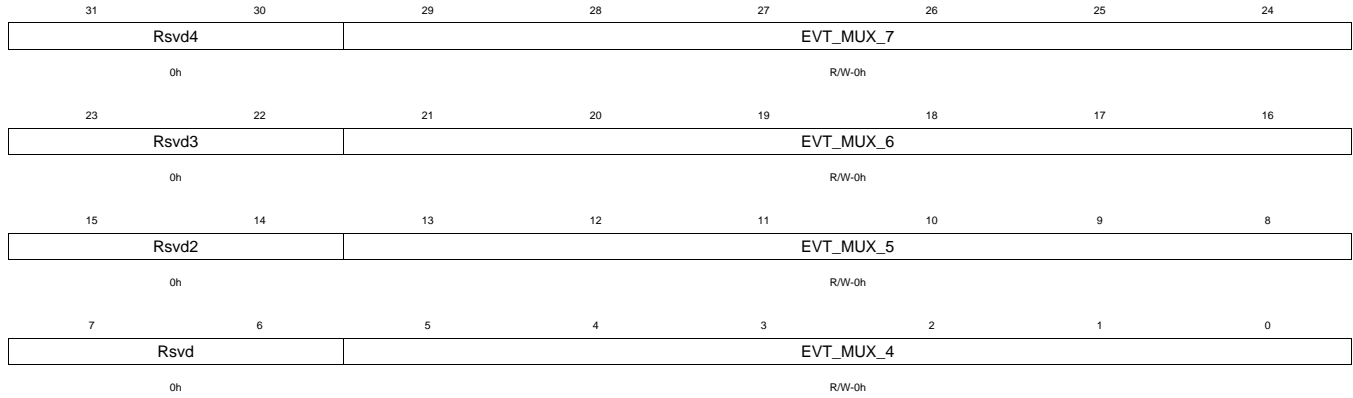

Bit	Field	Type	Reset	Description
31-30	Rsvd		0h	Reserved-Read returns 0
29-24	EVT_MUX_3	R/W	0h	Event mux for EDMA3CC event number 3
23-22	Rsvd4		0h	Reserved-Read returns 0
21-16	EVT_MUX_2	R/W	0h	Event mux for EDMA3CC event number 2
15-14	Rsvd3		0h	Reserved-Read returns 0
13-8	EVT_MUX_1	R/W	0h	Event mux for EDMA3CC event number 1
7-6	Rsvd2		0h	Reserved-Read returns 0
5-0	EVT_MUX_0	R/W	0h	Event mux for EDMA3CC event number 0

3.2.125 EDMA3CC_EVTMUX_4_7 Register (offset = F94h) [reset = 0h]

EDMA3CC_EVTMUX_4_7 is shown in [Figure 3-126](#) and described in [Table 3-128](#).

This register controls EDMA3CC Event mux assignment for event no 4 to 7

Figure 3-126. EDMA3CC_EVTMUX_4_7 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

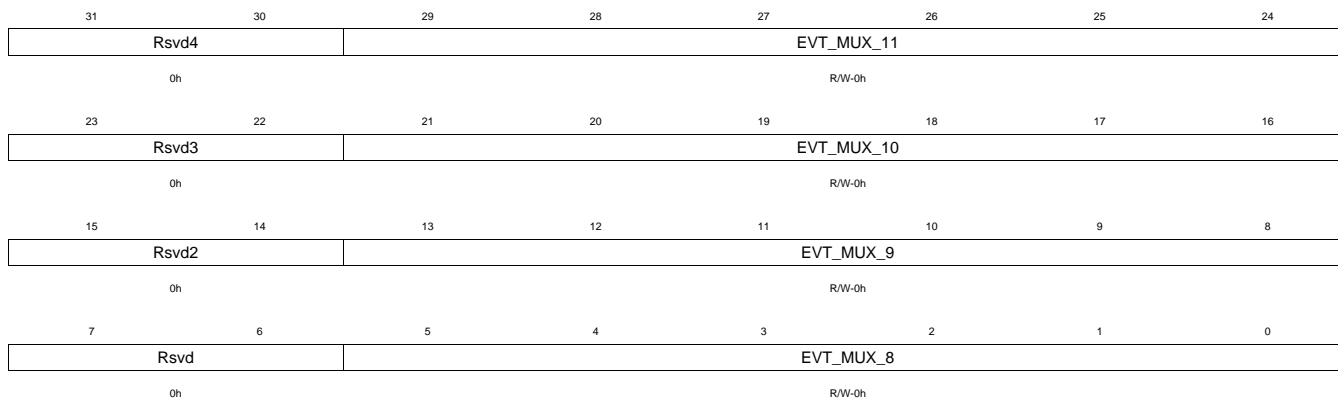

Table 3-128. EDMA3CC_EVTMUX_4_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	EVT_MUX_7	R/W	0h	Event mux for EDMA3CC event number 7
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	EVT_MUX_6	R/W	0h	Event mux for EDMA3CC event number 6
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	EVT_MUX_5	R/W	0h	Event mux for EDMA3CC event number 5
7-6	Rsvd		0h	Reserved-Read returns 0
5-0	EVT_MUX_4	R/W	0h	Event mux for EDMA3CC event number 4

3.2.126 EDMA3CC_EVTMUX_8_11 Register (offset = F98h) [reset = 0h]

EDMA3CC_EVTMUX_8_11 is shown in [Figure 3-127](#) and described in [Table 3-129](#).

This register controls EDMA3CC Event mux assignment for event no 8 to 11

Figure 3-127. EDMA3CC_EVTMUX_8_11 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-129. EDMA3CC_EVTMUX_8_11 Register Field Descriptions

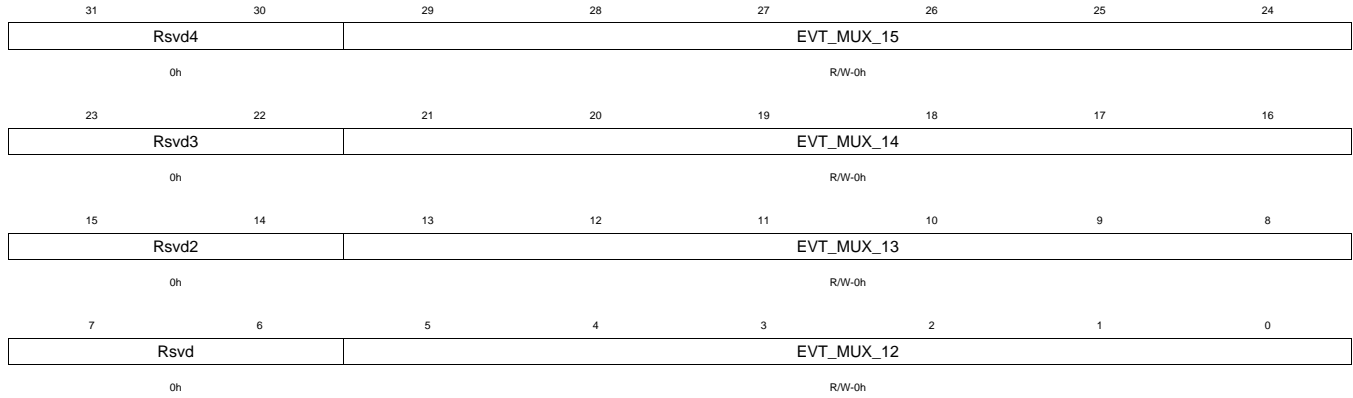

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	EVT_MUX_11	R/W	0h	Event mux for EDMA3CC event number 11
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	EVT_MUX_10	R/W	0h	Event mux for EDMA3CC event number 10
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	EVT_MUX_9	R/W	0h	Event mux for EDMA3CC event number 9
7-6	Rsvd		0h	Reserved-Read returns 0
5-0	EVT_MUX_8	R/W	0h	Event mux for EDMA3CC event number 8

3.2.127 EDMA3CC_EVTMUX_12_15 Register (offset = F9Ch) [reset = 0h]

EDMA3CC_EVTMUX_12_15 is shown in [Figure 3-128](#) and described in [Table 3-130](#).

This register controls EDMA3CC Event mux assignment for event no 12 to 15

Figure 3-128. EDMA3CC_EVTMUX_12_15 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

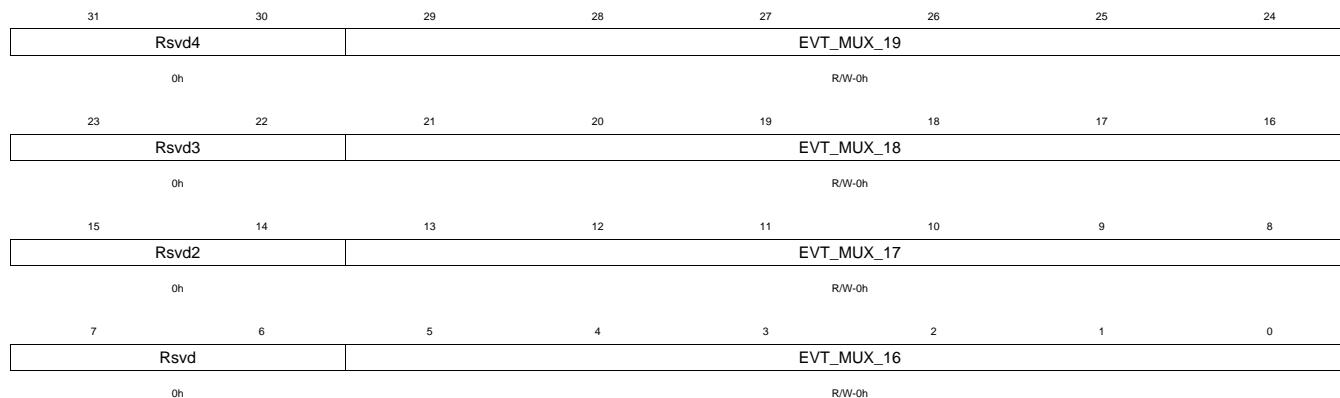

Table 3-130. EDMA3CC_EVTMUX_12_15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	EVT_MUX_15	R/W	0h	Event mux for EDMA3CC event number 15
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	EVT_MUX_14	R/W	0h	Event mux for EDMA3CC event number 14
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	EVT_MUX_13	R/W	0h	Event mux for EDMA3CC event number 13
7-6	Rsvd		0h	Reserved-Read returns 0
5-0	EVT_MUX_12	R/W	0h	Event mux for EDMA3CC event number 12

3.2.128 EDMA3CC_EVTMUX_16_19 Register (offset = FA0h) [reset = 0h]

EDMA3CC_EVTMUX_16_19 is shown in [Figure 3-129](#) and described in [Table 3-131](#).

This register controls EDMA3CC Event mux assignment for event no 16 to 19

Figure 3-129. EDMA3CC_EVTMUX_16_19 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-131. EDMA3CC_EVTMUX_16_19 Register Field Descriptions

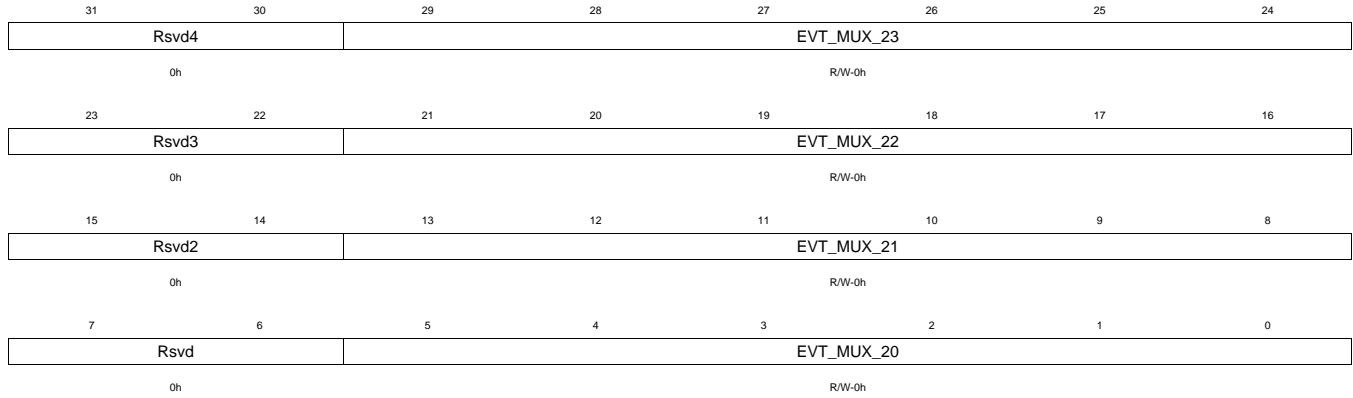

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	EVT_MUX_19	R/W	0h	Event mux for EDMA3CC event number 19
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	EVT_MUX_18	R/W	0h	Event mux for EDMA3CC event number 18
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	EVT_MUX_17	R/W	0h	Event mux for EDMA3CC event number 17
7-6	Rsvd		0h	Reserved-Read returns 0
5-0	EVT_MUX_16	R/W	0h	Event mux for EDMA3CC event number 16

3.2.129 EDMA3CC_EVTMUX_20_23 Register (offset = FA4h) [reset = 0h]

EDMA3CC_EVTMUX_20_23 is shown in [Figure 3-130](#) and described in [Table 3-132](#).

This register controls EDMA3CC Event mux assignment for event no 20 to 23

Figure 3-130. EDMA3CC_EVTMUX_20_23 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-132. EDMA3CC_EVTMUX_20_23 Register Field Descriptions

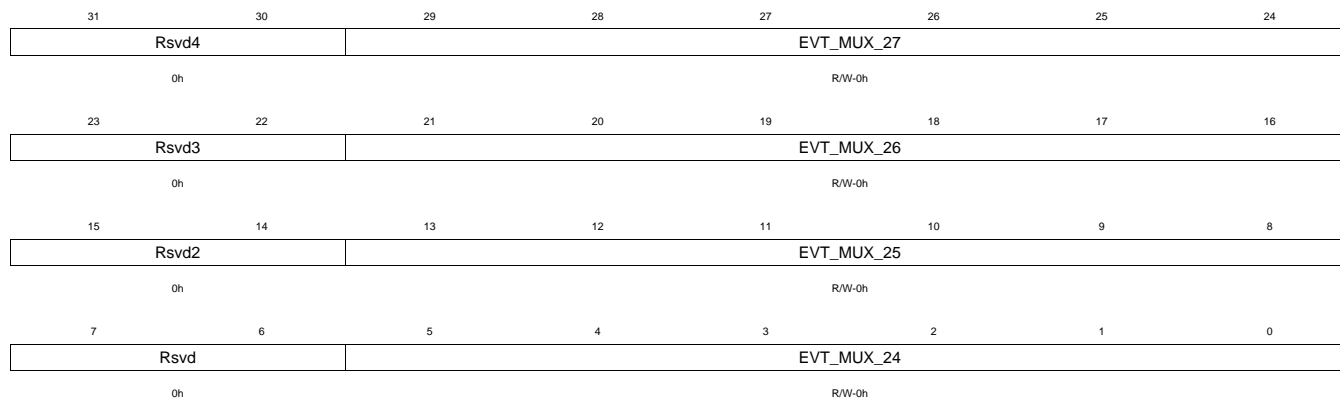

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	EVT_MUX_23	R/W	0h	Event mux for EDMA3CC event number 23
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	EVT_MUX_22	R/W	0h	Event mux for EDMA3CC event number 22
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	EVT_MUX_21	R/W	0h	Event mux for EDMA3CC event number 21
7-6	Rsvd		0h	Reserved-Read returns 0
5-0	EVT_MUX_20	R/W	0h	Event mux for EDMA3CC event number 20

3.2.130 EDMA3CC_EVTMUX_24_27 Register (offset = FA8h) [reset = 0h]

EDMA3CC_EVTMUX_24_27 is shown in Figure 3-131 and described in Table 3-133.

This register controls EDMA3CC Event mux assignment for event no 24 to 27

Figure 3-131. EDMA3CC_EVTMUX_24_27 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-133. EDMA3CC_EVTMUX_24_27 Register Field Descriptions

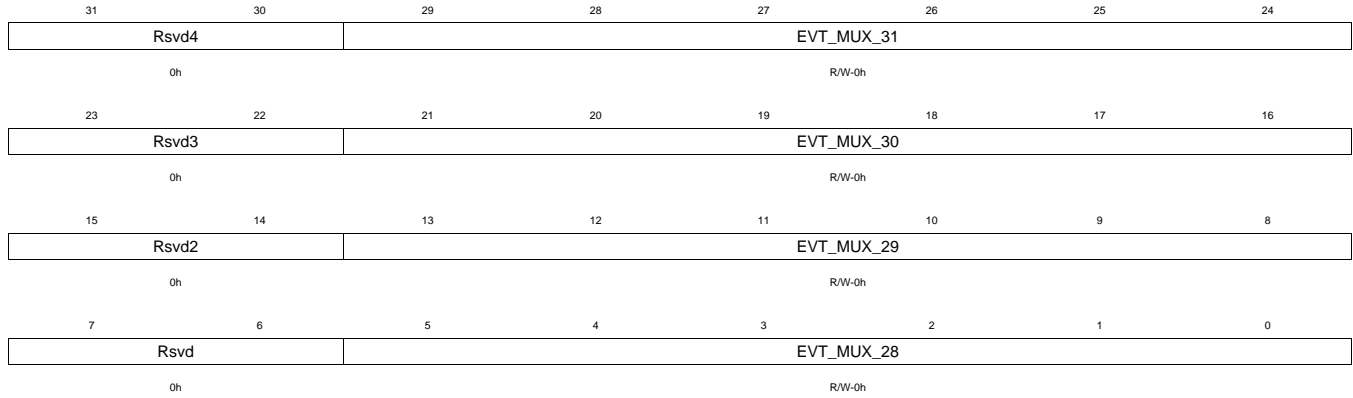

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	EVT_MUX_27	R/W	0h	Event mux for EDMA3CC event number 27
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	EVT_MUX_26	R/W	0h	Event mux for EDMA3CC event number 26
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	EVT_MUX_25	R/W	0h	Event mux for EDMA3CC event number 25
7-6	Rsvd		0h	Reserved-Read returns 0
5-0	EVT_MUX_24	R/W	0h	Event mux for EDMA3CC event number 24

3.2.131 EDMA3CC_EVTMUX_28_31 Register (offset = FACH) [reset = 0h]

EDMA3CC_EVTMUX_28_31 is shown in [Figure 3-132](#) and described in [Table 3-134](#).

This register controls EDMA3CC Event mux assignment for event no 28 to 31

Figure 3-132. EDMA3CC_EVTMUX_28_31 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

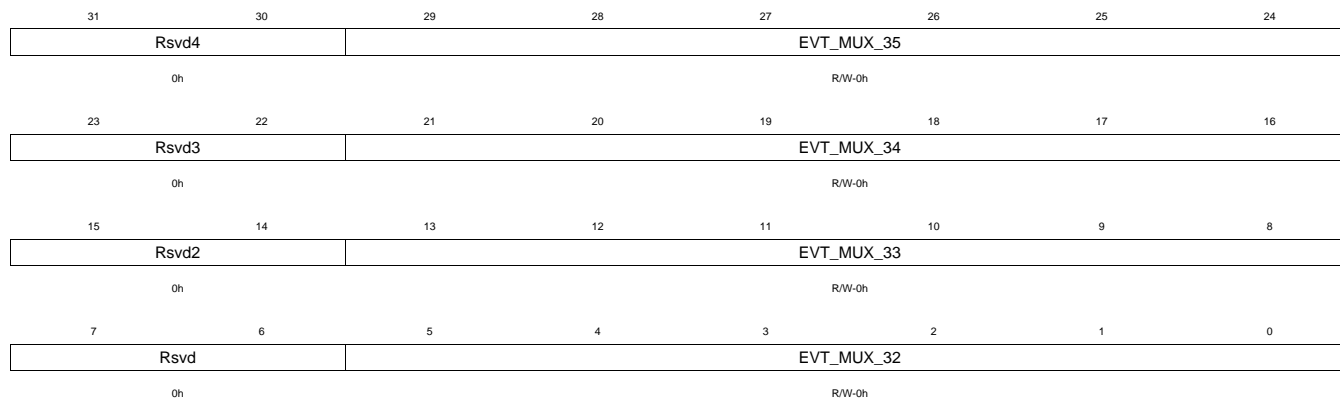

Table 3-134. EDMA3CC_EVTMUX_28_31 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	EVT_MUX_31	R/W	0h	Event mux for EDMA3CC event number 31
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	EVT_MUX_30	R/W	0h	Event mux for EDMA3CC event number 30
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	EVT_MUX_29	R/W	0h	Event mux for EDMA3CC event number 29
7-6	Rsvd		0h	Reserved-Read returns 0
5-0	EVT_MUX_28	R/W	0h	Event mux for EDMA3CC event number 28

3.2.132 EDMA3CC_EVTMUX_32_35 Register (offset = FB0h) [reset = 0h]

 EDMA3CC_EVTMUX_32_35 is shown in [Figure 3-133](#) and described in [Table 3-135](#).

This register controls EDMA3CC Event mux assignment for event no 32 to 35

Figure 3-133. EDMA3CC_EVTMUX_32_35 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-135. EDMA3CC_EVTMUX_32_35 Register Field Descriptions

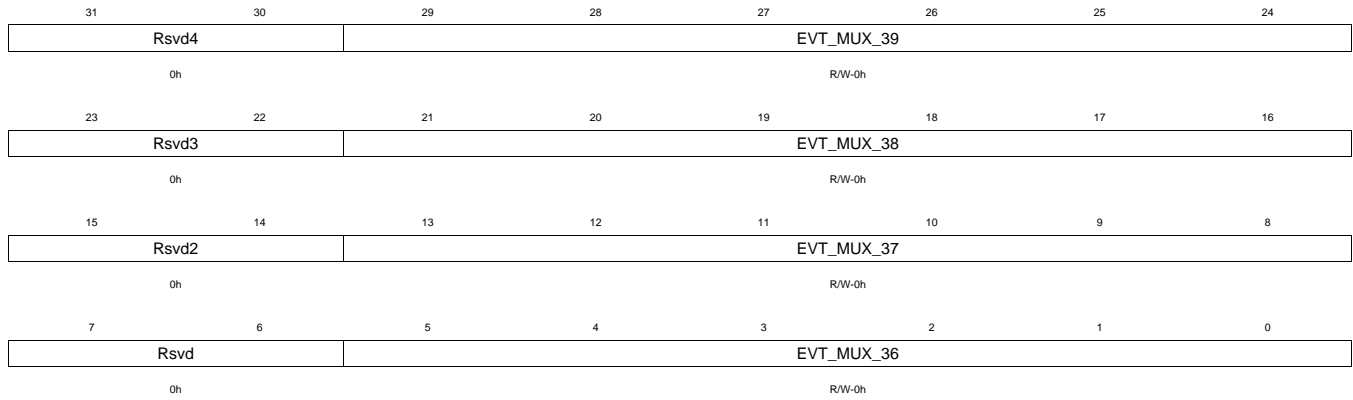

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	EVT_MUX_35	R/W	0h	Event mux for EDMA3CC event number 35
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	EVT_MUX_34	R/W	0h	Event mux for EDMA3CC event number 30
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	EVT_MUX_33	R/W	0h	Event mux for EDMA3CC event number 33
7-6	Rsvd		0h	Reserved-Read returns 0
5-0	EVT_MUX_32	R/W	0h	Event mux for EDMA3CC event number 32

3.2.133 EDMA3CC_EVTMUX_36_39 Register (offset = FB4h) [reset = 0h]

EDMA3CC_EVTMUX_36_39 is shown in [Figure 3-134](#) and described in [Table 3-136](#).

This register controls EDMA3CC Event mux assignment for event no 36 to 39

Figure 3-134. EDMA3CC_EVTMUX_36_39 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

5-0	EVT_MUX_48	R/W	0h	Event mux for EDMA3CC event number 48

3.2.137 EDMA3CC_EVTMUX_52_55 Register (offset = FC4h) [reset = 0h]

EDMA3CC_EVTMUX_52_55 is shown in [Figure 3-138](#) and described in [Table 3-140](#).

This register controls EDMA3CC Event mux assignment for event no 52 to 55

Figure 3-138. EDMA3CC_EVTMUX_52_55 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

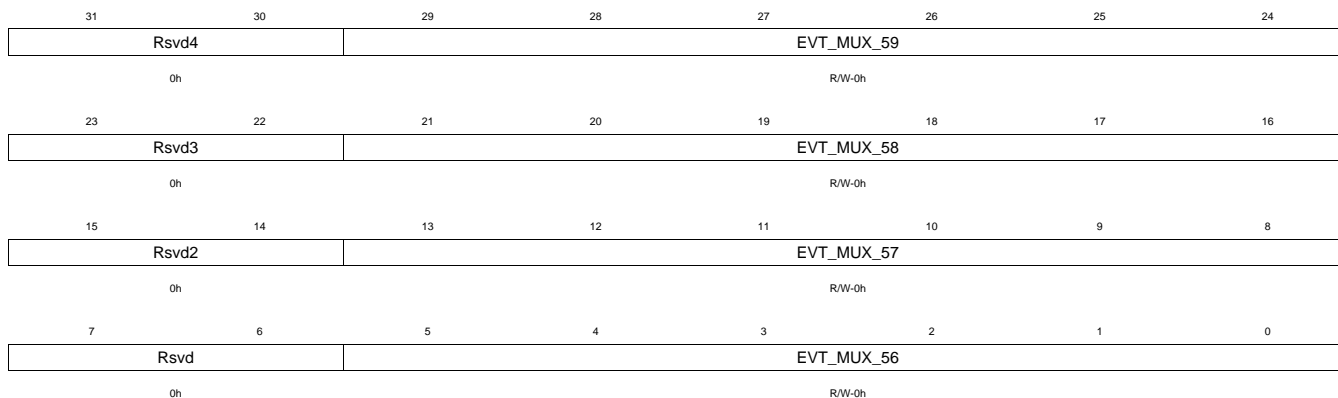

Table 3-140. EDMA3CC_EVTMUX_52_55 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	EVT_MUX_55	R/W	0h	Event mux for EDMA3CC event number 55
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	EVT_MUX_54	R/W	0h	Event mux for EDMA3CC event number 54
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	EVT_MUX_53	R/W	0h	Event mux for EDMA3CC event number 53
7-6	Rsvd		0h	Reserved-Read returns 0
5-0	EVT_MUX_52	R/W	0h	Event mux for EDMA3CC event number 52

3.2.138 EDMA3CC_EVTMUX_56_59 Register (offset = FC8h) [reset = 0h]

EDMA3CC_EVTMUX_56_59 is shown in [Figure 3-139](#) and described in [Table 3-141](#).

This register controls EDMA3CC Event mux assignment for event no 56 to 59

Figure 3-139. EDMA3CC_EVTMUX_56_59 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	EVT_MUX_59	R/W	0h	Event mux for EDMA3CC event number 59
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	EVT_MUX_58	R/W	0h	Event mux for EDMA3CC event number 58
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	EVT_MUX_57	R/W	0h	Event mux for EDMA3CC event number 57
7-6	Rsvd		0h	Reserved-Read returns 0
5-0	EVT_MUX_56	R/W	0h	Event mux for EDMA3CC event number 56

3.2.139 EDMA3CC_EVTMUX_60_63 Register (offset = FCCh) [reset = 0h]

EDMA3CC_EVTMUX_60_63 is shown in [Figure 3-140](#) and described in [Table 3-142](#).

This register controls EDMA3CC Event mux assignment for event no 60 to 63

Figure 3-140. EDMA3CC_EVTMUX_60_63 Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-142. EDMA3CC_EVTMUX_60_63 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	Rsvd4		0h	Reserved-Read returns 0
29-24	EVT_MUX_63	R/W	0h	Event mux for EDMA3CC event number 63
23-22	Rsvd3		0h	Reserved-Read returns 0
21-16	EVT_MUX_62	R/W	0h	Event mux for EDMA3CC event number 62
15-14	Rsvd2		0h	Reserved-Read returns 0
13-8	EVT_MUX_61	R/W	0h	Event mux for EDMA3CC event number 61
7-6	Rsvd		0h	Reserved-Read returns 0
5-0	EVT_MUX_60	R/W	0h	Event mux for EDMA3CC event number 60

3.2.140 GPIO_MUX Register (offset = FD4h) [reset = 0h]

GPIO_MUX is shown in [Figure 3-141](#) and described in [Table 3-143](#).

This register controls the input source for GPIO1_0 to GPIO1_5 inputs. The input source can either come from the device pin (as a GPIO), or from an internal interrupt source.

Figure 3-141. GPIO_MUX Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-143. GPIO_MUX Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	Rsvd		0h	Reserved-Read returns 0
5	GPIO1_5_MUX	R/W	0h	GPIO1_5 input coming from : 0x0: GPIO1_5 pad 0x1: USB1 charge detect
4	GPIO1_4_MUX	R/W	0h	GPIO1_4 input coming from : 0x0: GPIO1_4 pad 0x1: USB0 charge detect
3	GPIO1_3_MUX	R/W	0h	GPIO1_3 input coming from : 0x0: GPIO1_3 pad 0x1: bandgap1 Tshut
2	GPIO1_2_MUX	R/W	0h	GPIO1_2 input coming from : 0x0: GPIO1_2 pad 0x1: bandgap0 Tshut
1	GPIO1_1_MUX	R/W	0h	GPIO1_1 input coming from : 0x0: GPIO1_1 pad 0x1: vdac_tvint (tv detect)
0	GPIO1_0_MUX	R/W	0h	GPIO1_0 input coming from : 0x0: GPIO1_0 pad 0x1: vdac_tvint (tv detect)

3.2.141 RESET_ISO Register (offset = 1000h) [reset = 0h]

RESET_ISO is shown in [Figure 3-142](#) and described in [Table 3-144](#).

This register controls the reset isolation operation for the Ethernet Subsystem.

Figure 3-142. RESET_ISO Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

Table 3-144. RESET_ISO Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	Rsvd		0h	Reserved, driven low.
3	RMIISO1	R/W	0h	RMIISO Mux1 Pin Groups Isolation enable 0x0 : Pin group is not isolated. 0x1 : The following pin groups are isolated from reset: EMAC_RMREFCLK, EMAC[1]_RMx (Option 1), EMAC[0]_RMx, and MDIO/MDCLK. Refer to the Reset Isolation section for pin group definitions.
2	RMIISO0	R/W	0h	RMIISO Mux0 Pin Groups Isolation enable 0x0 : Pin group is not isolated. 0x1 : The following pin groups are isolated from reset: EMAC_RMREFCLK, EMAC[1]_RMx (Option 0), EMAC[0]_RMx, and MDIO/MDCLK. Refer to the Reset Isolation section for pin group definitions.
1	GMIIISO	R/W	0h	GMII Pin Groups Isolation enable 0x0 : Pin group is not isolated. 0x1 : The following pin groups are isolated from reset: EMAC[1]_Mx/Other, EMAC[0]_Mx/EMAC[1:0]_RGx, and MDIO/MDCLK. Refer to the Reset Isolation section for pin group definitions.
0	ISOCONTROL	R/W	0h	Ethernet Reset Isolation control 0x0 : Reset isolation is disabled 0x1 : The Ethernet subsystem is isolated from reset, along with the pin groups selected by the GMIIISO, RMIISO0, and RMIISO1 settings. Exactly one bit of either the GMIIISO, RMIISO0, or RMIISO1 should be set in this mode. Refer to the Reset Isolation section for pin group definitions.

ROM Code Memory and Peripheral Booting

This chapter describes the booting functionality of the public ROM code, referred hereafter as ROM Code. The booting functionality covers the following features:

- *Memory Booting* – booting the device by starting code stored on permanent memories like flash-memory or memory cards. This process is usually performed after either device cold or warm reset.
- *Peripheral Booting* – booting the device by downloading the executable code over a communication interface like UART or Ethernet. This process is intended for flashing a device.

The device always starts up in secure mode. The ROM Code takes care of early initialization. The ROM code switches the device into public mode; hence, the Public ROM Code provides run-time services for cache maintenance.

This chapter is intended for all who design systems based on this device, develop bootloader images and flashing tools.

4.1 Introduction

This chapter describes the booting functionality of the Public ROM Code.

4.1.1 Acronyms and Naming Conventions

The following tables provides acronyms and abbreviations, as well as the naming conventions used in this document.

Table 4-1. Acronyms and Abbreviations

Acronym/Abbreviation	Definition
ASIC	Application Specific Integrated Circuit
B	Byte (8 bits)
CS	Chip Select
CH	Configuration Header
DPLL	Digital PLL
EMIF	External Memory InterFace (SDRAM Controller)
FIQ	Fast Interrupt Request
FS USB	Full Speed USB
GPMC	General Purpose Memory Controller
HLOS	High Level Operating System
HS USB	High Speed USB
HW	Hardware
HWA	Hardware Accelerator
I2C	Inter-Integrated Circuit
IRQ	Interrupt
ISR	Interrupt Service Routine
JTAG	Joint Test Action Group. This term is used to refer to the Debugging and Testing interface.
Kbps	Kilobits per second
KB	Kilobyte, 1024 B
LPDDR2	Low Power Double Data Rate rev. 2
LPDDR2-NVM	Non volatile type of memory connected to EMIF interface
MB	Megabyte, 1024 KB
MMC	Multimedia Card.
MPU	Micro Processor Unit
OCM	On-Chip Memory
OneNAND™	A type of Flash memory
PA	Protected Application (also see Table 4-2)
PLL	Phase Locked Loop
PK	Public Key
PPA	Primary Protected Application (also see Table 4-2)
POR	Power On Reset
PMU	Power Management Unit
PRCM	Power, Reset and Clock Management module
RAM	Random Access Memory. Refers to the OMAP internal static RAM
ROM	Read Only Memory
RSA	Rivest, Shamir, Adleman encryption algorithm
SAR	Save & Restore
SDRAM	Synchronous Dynamic Random Access Memory
SWI	Software Interrupt
TOC	Table Of Contents – a structure within an executable image

Table 4-1. Acronyms and Abbreviations (continued)

Acronym/Abbreviation	Definition
UART	Universal Asynchronous Receiver/Transmitter
USB	Universal Serial Bus
XIP	Execute In Place
WDT	Watchdog timer

Table 4-2. Naming Conventions

Name	Definition
Bootstrap	Initial SW that is launched by the ROM Code during the Memory Booting phase
Downloaded SW	Initial SW that is downloaded into internal RAM by the ROM Code during peripheral booting phase.
E-Fuse	A one-time programmable memory location usually set at the factory
Flash Loader	Downloaded software launched by the ROM Code in Pre-Flashing and which programs an image into external memories.
Initial SW	Software which is executed by any of the ROM Code mechanisms (Memory Booting or Peripheral Booting). Initial software is a generic term for Bootstrap and Downloaded software.
Memory Booting	ROM Code mechanism that consists of executing an Initial SW from external memory.
Monitor Mode Manager	ROM Code software component in charge of handling all entry/exit to/from MPU Secure State.
Peripheral Booting	ROM Code mechanism that consists of polling selected interfaces, downloading and executing an Initial SW (in this case called Downloaded SW) in internal RAM.
Pre-Flashing	Specific case of peripheral booting, where the ROM Code mechanism is used to program external Flash memories.

4.2 Overview

4.2.1 Architecture

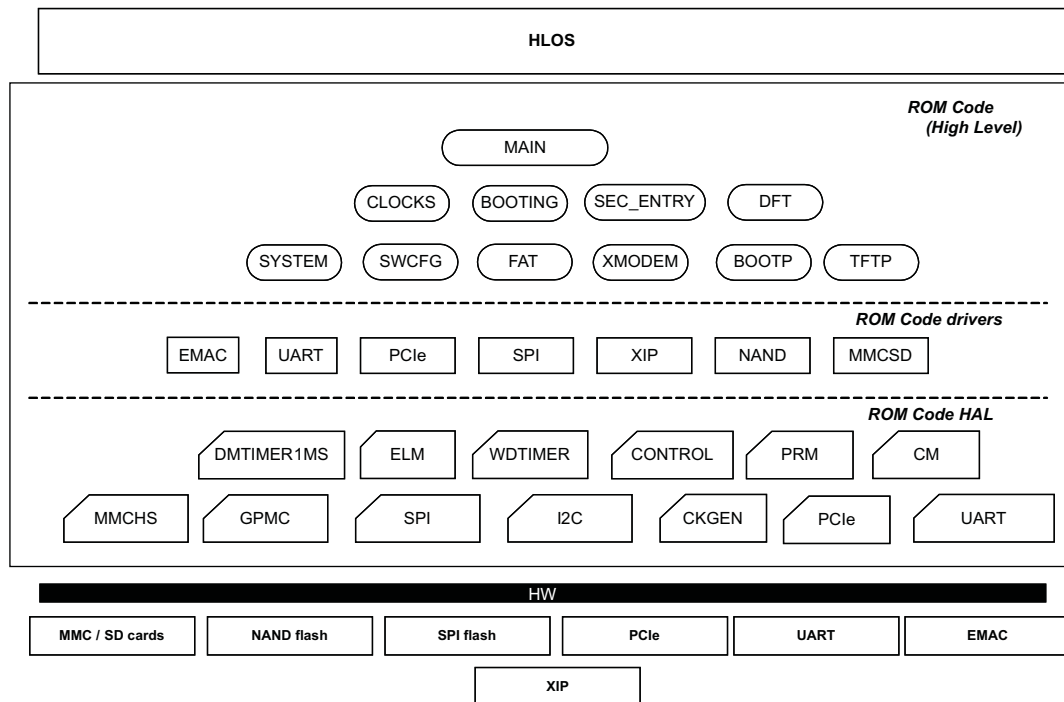

The architecture of the ROM code is shown in [Figure 4-1](#). It is split into three main layers with a top-down approach: high-level, drivers, and hardware abstraction layer (HAL). One layer communicates with a lower level layer through a unified interface.

The high level layer is in charge of the main tasks of the ROM Code: watchdog and clocks configuration and main booting routine.

The drivers layer implements the logical and communication protocols for any booting device in accordance with the interface specification.

Finally the HAL implements the lowest level code for interacting with the hardware infrastructure IPs. End booting devices are attached to device IO pads.

Figure 4-1. ROM Code Architecture

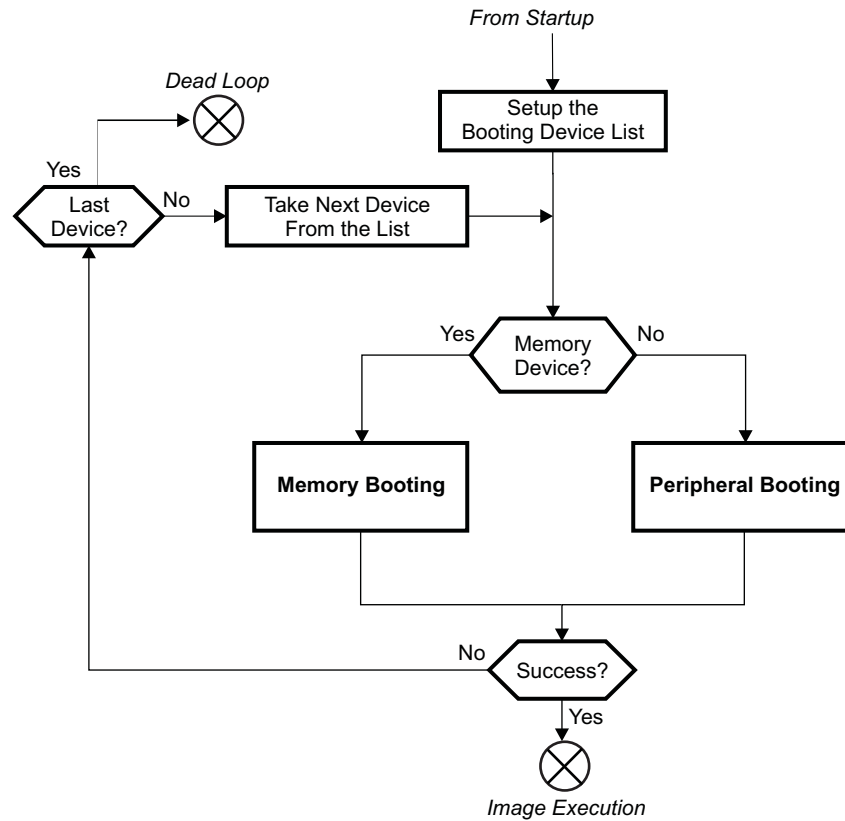

4.2.2 Functionality

Figure 4-2 illustrates the high level flow for the Public ROM Code booting procedure. On the device, the Public ROM Code starts upon completion of the secure startup (performed by the Secure ROM Code). The ROM Code then performs platform configuration and initialization as part of the public start-up procedure.

The booting device list is created based on the MBOOT. A booting device can be a memory booting device (soldered flash memory or temporarily booting device like memory card) or a peripheral interface connected to a host.

The main loop of the booting procedure goes through the booting device list and tries to search for an image from the currently selected booting device. This loop is exited if a valid booting image is found and successfully executed or upon watchdog expiration.

Figure 4-2. ROM Code Boot Procedure

4.3 Memory Map

4.3.1 ROM Memory Map

The on-chip ROM memory map is shown in [Figure 4-3](#). The ROM Code mapping consists in the following:

- Exception vectors
- CRC
- Dead loops collection
- Code and const data sections
- API Table
- ROM Version

Figure 4-3. ROM Memory Map

4.3.1.1 ROM Exception Vectors

Table 4-3 lists the ROM exception vectors. The reset exception is redirected to the ROM Code startup. Other exceptions are redirected to their RAM handlers by loading appropriate addresses into the PC register.

Table 4-3. ROM Exception Vectors

Address	Exception	Content
20000h	Reset	Branch to the ROM Code startup
20004h	Undefined	PC = 4030 D004h
20008h	SWI	PC = 4030 D008h
2000Ch	Pre-fetch abort	PC = 4030 D00Ch
20010h	Data abort	PC = 4030 D010h
20014h	Unused	PC = 4030 D014h
20018h	IRQ	PC = 4030 D018h
2001Ch	FIQ	PC = 4030 D01Ch

4.3.1.2 ROM Code CRC

The ROM Code CRC is calculated as 32 bit CRC code (CRC-32-IEEE 802.3) for the address range 20000h–2BFFFh. The four bytes CRC code is stored at location 20020h.

4.3.1.3 Dead Loops

Built-in dead loops are used for different purposes as shown in Table 4-4. All dead loops are branch instructions coded in ARM mode. The fixed location of these dead loops facilitates debugging and testing. The first seven dead loops are default exception handlers linked with RAM exception vectors. The dead loops might be called directly from the user code. However there exists a special function which can be called from ROM code in order to execute a dead loop. The function is an assembly code in ARM mode which takes the dead loop address from the R0 register. The main purpose of the function is to issue a global SW reset before going to a dead loop. The function is located at address 200C0h. In addition the function clears global cold reset status upon issuing the global SW reset.

Table 4-4. Dead Loops

Address	Purpose
20080h	Undefined exception default handler
20084h	SWI exception default handler
20088h	Pre-fetch abort exception default handler
2008Ch	Data abort exception default handler

Table 4-4. Dead Loops (continued)

Address	Purpose
20090h	Unused exception default handler
20094h	IRQ exception default handler
20098h	FIQ exception default handler
2009Ch	Validation tests PASS
200A0h	Validation tests FAIL
200A4h	Reserved
200A8h	Image not executed or returned.
200ACh	Reserved
200B0h	Reserved
200B4h	Reserved
200B8h	Reserved
200BCh	Reserved

4.3.1.4 Code

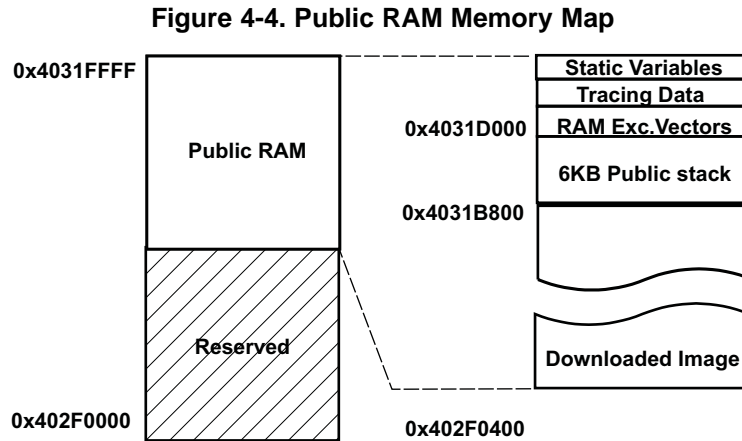

This space is used to hold code and constant data.

4.3.1.5 Public ROM Code Version

The ROM code version consists of two decimal numbers: major and minor. It can be used to identify the ROM Code release version burnt in a given IC (e.g., useful to identify an IC version). The ROM code version is a 32 bits hexadecimal value located at address 2BFFCh.

4.3.2 RAM Memory Map

The ROM code makes use of the on chip RAM module connected to the L3 interconnect (further referred as L3 RAM in this document). Its usage is shown in Figure 4-4. The RAM memory map ranges from address 4020F000h to 4031FFFFh.

4.3.2.1 Downloaded Image

This area is used by the ROM code to store the downloaded boot image. It can be up to 173 KB.

4.3.2.2 Public Stack

Space reserved for stack.

4.3.2.3 RAM Exception Vectors

The RAM exception vectors enable a simple means for redirecting exceptions to custom handlers. Table 4-5 shows content of the RAM space reserved for RAM vectors. The first seven addresses are ARM instructions which load the value located in the subsequent seven addresses into the PC register. These instructions are executed when an exception occurs since they are called from the ROM exception vectors. Undefined, SWI, Unused and FIQ exceptions are redirected to a hardcoded dead loop. Pre-fetch abort, data abort, and IRQ exception are redirected to pre-defined ROM handlers. User code can redirect any exception to a custom handler either by writing its address to the appropriate location from 4031 D024h to 4031 D03Ch or by overriding the branch (load into PC) instruction between addresses from 4031 D004h to 4031 D01Ch.

Table 4-5. RAM Exception Vectors

Address	Exception	Content
4031 D000h	Reserved	Reserved
4031 D004h	Undefined	PC = [4031 D024h]
4031 D008h	SWI	PC = [4031 D028h]
4031 D00Ch	Pre-fetch abort	PC = [4031 D02Ch]
4031 D010h	Data abort	PC = [4031 D030h]
4031 D014h	Unused	PC = [4031 D034h]
4031 D018h	IRQ	PC = [4031 D038h]
4031 D01Ch	FIQ	PC = [4031 D03Ch]
4031 D020h	Reserved	20090h
4031 D024h	Undefined	20080h
4031 D028h	SWI	20084h
4031 D02Ch	Pre-fetch abort	Address of default pre-fetch abort handler (*)

Table 4-5. RAM Exception Vectors (continued)

Address	Exception	Content
4031 D030h	Data abort	Address of default data abort handler (*)
4031 D034h	Unused	20090h
4031 D038h	IRQ	Address of default IRQ handler
4031 D03Ch	FIQ	20098h

(*) the default handlers for pre-fetch and data abort are performing reads from CP15 debug registers to retrieve the reason of the abort:

- In case of pre-fetch abort: the IFAR register is read from CP15 and stored into R0. The IFSR register is read and stored into the R1 register. Then the ROM Code jumps to the pre-fetch abort dead loop (20088h).
- In case of data abort: the DFAR register is read from CP15 and stored into R0. The DFSR register is read and stored into the R1 register. Then the ROM Code jumps to the data abort dead loop (2008Ch).

4.3.2.4 Tracing Data

This section contains trace vectors reflecting the execution path of the public boot. [Section 4.12](#) describes the usage of the different trace vectors and lists all the possible trace codes.

Table 4-6. Tracing Data

Address	Size [bytes]	Description
4031 D040h	4	Current tracing vector, word 1
4031 D044h	4	Current tracing vector, word 2
4031 D048h	4	Current tracing vector, word 3
4031 D04Ch	4	Current copy of the PRM_RSTST register (reset reasons)
4031 D050h	4	Cold reset run tracing vector, word 1
4031 D054h	4	Cold reset run tracing vector, word 2
4031 D058h	4	Cold reset run tracing vector, word 3
4031 D05Ch	4	Reserved
4031 D060h	4	Reserved
4031 D064h	4	Reserved

4.3.2.5 Static Variables

This area contains the ROM code static variables used during boot time (and possibly during run-time, if calling the Public ROM API functions).

4.4 Startup and Configuration

4.4.1 ROM Code Start-up

The main MPU subsystem always starts its execution in secure mode after reset due to the TrustZone architecture (the Secure ROM code implements the reset handler). The Public ROM code is physically located at the address 20000h that is immediately next to the Secure ROM code.

As shown at top of [Figure 4-5](#), the CPU jumps to the Public ROM Code reset vector once it has completed the secure boot initialization.

Once in public mode the CPU performs the public-side initialization and stack setup (compiler auto generated C- initialization or “scatter loading”) as shown in left hand side of [Figure 4-5](#). Then it configures the watchdog timer 2 (set to three minutes), and performs system clocks configuration. Finally it jumps to the booting routine.

Figure 4-5. ROM Code Start-up Sequence

4.4.2 CPU State at Public Startup

The CPU L1 instruction cache and branch prediction mechanisms are not activated as part of the public boot process. The public vector base address is configured to the reset vector of Public ROM Code (20000h). MMU is left switched off during the public boot (hence L1 data cache off).

No specific configuration is performed for the slave CPU which keeps its default configuration after reset (L1 instruction and data caches off, branch prediction off, MMU off, no remap of public vectors base address).

4.4.3 Clocking Configuration

The supported system clock frequencies are OSC0 = 20 MHz.

The ROM Code configures the clocks and DPLLs that are necessary for ROM Code execution:

- L3 DPLL locked to provide 220MHz clocks for peripheral blocks
- DDR DPLL locked to provide 400MHz
- ARM DPLL is locked to provide 600MHz for the A8
- USB DPLL is locked to provide 960MHz and 192MHz for peripheral blocks

[Table 4-7](#) summarizes the ROM Code default settings for clocks. This default configuration enables all the ROM Code functionalities with minimized needs on power during boot.

The DPLLs and PRCM clock dividers are configured with the ROM Code default values after cold or warm reset in order to give the same working conditions to the Public ROM Code sequence

Table 4-7. ROM Code Default Clock Settings

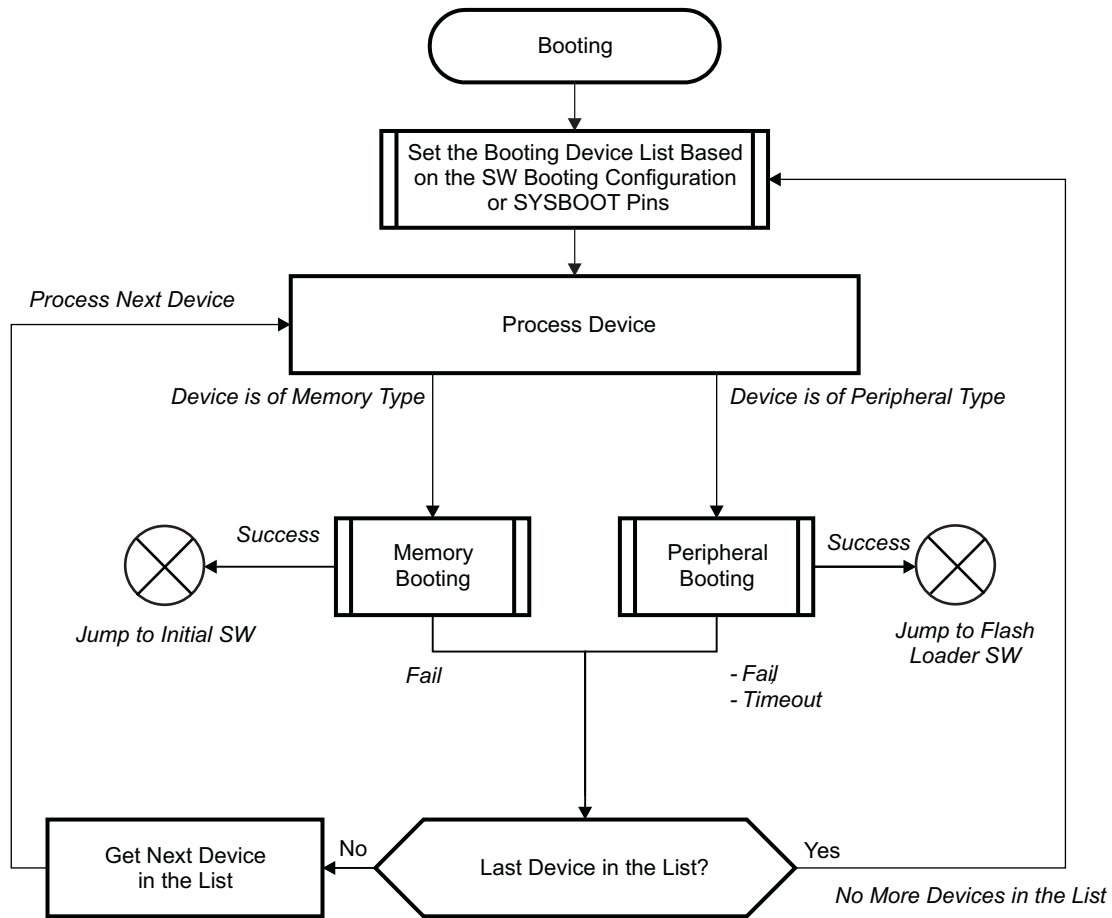

Clock	Frequency (MHz)	Source
PLL_ARM	600	OSC0
PLL_L3	220	OSC0
PLL_USB	960	OSC0
PLL_DDR	400	OSC0
SYSCLK4	220	PLL_L3/1
SYSCLK8	192	(PLL_USB/5)/1
SYSCLK10	48	(PLL_USB/5)/4
SYSCLK18B	32KHz	RTCDIVIDER

4.5 Booting

4.5.1 Overview

[Figure 4-6](#) shows the booting procedure. First, a booting device list is created. The list consists of all devices which will be searched for a booting image. The list is filled in based on the SYSBOOT.

Figure 4-6. ROM Code Booting Procedure

Once the booting device list is set up, the booting routine examines the devices enumerated in the list sequentially and either executes the memory booting or peripheral booting procedure depending on the booting device type. The memory booting procedure is executed when the booting device type is one of NOR, NAND, MMC, or SPI-EEPROM. The peripheral booting is executed when the booting device type is Ethernet, PCIe or UART.

The memory booting procedure reads data from a memory type device. If a valid booting image is found and successfully read from the external memory device, the initial SW is simply started.

The peripheral booting procedure downloads data from a host (commonly a PC) to the device by means of Ethernet, PCIe or UART links. The ROM Code uses a host-slave logical protocol for synchronization. Upon successful PCIe enumeration (or UART or Ethernet connection) the host sends the image binary contents. The peripheral booting procedure is described in detail in [Section 4.8](#).

If the memory or peripheral booting fails for all devices enumerated in the device list, then the ROM Code gets back to the first device in the list. The device list is then processed again in a loop. This loop shall be further interrupted by the MPU or secure watchdog.

4.5.2 Device List

The ROM Code creates the device list based on information gathered from the SYSBOOT configuration pins sensed in the control module. The pins are used to index the device table from which the list of devices is extracted.

4.5.2.1 BTMode[4-0] Configuration Pins

The following table describes the BTMode[4-0] configuration pins.

Table 4-8. BTMode[4-0] Configuration Pins

Boot Modes				BTMODE[4:0]
1st	2nd	3rd	4th	
Reserved	Reserved	Reserved	Reserved	00000
UART	XIP w/ WAIT (MUX0)	MMC	SPI	00001
UART	SPI	NAND	NANDI2C	00010
UART	SPI	XIP (MUX0)	MMC	00011
EMAC	SPI	NAND	NANDI2C	00100
Reserved	Reserved	Reserved	Reserved	00101
Reserved	Reserved	Reserved	Reserved	00110
EMAC	MMC	SPI	XIP (MUX 1)	00111
PCIE_32	Reserved	Reserved	Reserved	01000
PCIE_64	Reserved	Reserved	Reserved	01001
Reserved	Reserved	Reserved	Reserved	01010
Reserved	Reserved	Reserved	Reserved	01011
Reserved	Reserved	Reserved	Reserved	01100
Reserved	Reserved	Reserved	Reserved	01101
Reserved	Reserved	Reserved	Reserved	01110
Fast External Boot	UART	EMAC	PCIE_64	01111
XIP (MUX1)	UART	EMAC	MMC	10000
XIP w/WAIT (MUX1)	UART	EMAC	MMC	10001
NAND	NANDI2C	SPI	UART	10010
NAND	NANDI2C	MMC	UART	10011
NAND	NANDI2C	SPI	EMAC	10100
NANDI2C	MMC	EMAC	UART	10101
SPI	MMC	UART	EMAC	10110
MMC	SPI	UART	EMAC	10111
SPI	MMC	PCIE_32	Reserved	11000
SPI	MMC	PCIE_64	Reserved	11001
XIP (MUX0)	UART	SPI	MMC	11010
XIP w/ WAIT (MUX0)	UART	SPI	MMC	11011
Reserved	Reserved	Reserved	Reserved	11100
Reserved	Reserved	Reserved	Reserved	11101
Reserved	Reserved	Reserved	Reserved	11110
Fast external Boot	EMAC	UART	PCIE_32	11111

The ROM Code uses the row pointed by the MBOOT configuration value. The device list is filled in with the 1st to 4th devices. is the decoding table for MBOOT configuration pins. The following shortcuts are used in the table:

MMC	MMC or SD card (MMC port 1)
NAND / NANDI2C	NAND flash memory / read flash geometry from I2C EEPROM
XIP / XIP w/ WAIT	NOR or other XIP device with or without wait monitoring
UART	UART interface (UART port 0)
EMAC	Ethernet GMII0m RGMII and RMII interface (EMAC port 0)
SPI	SPI EEPROM (SPI 0, CS0)
PCIE_32 / PCIE_64	PCI Express interface with 32 bit / 64 bit addressing

4.6 Fast External Booting

4.6.1 Overview

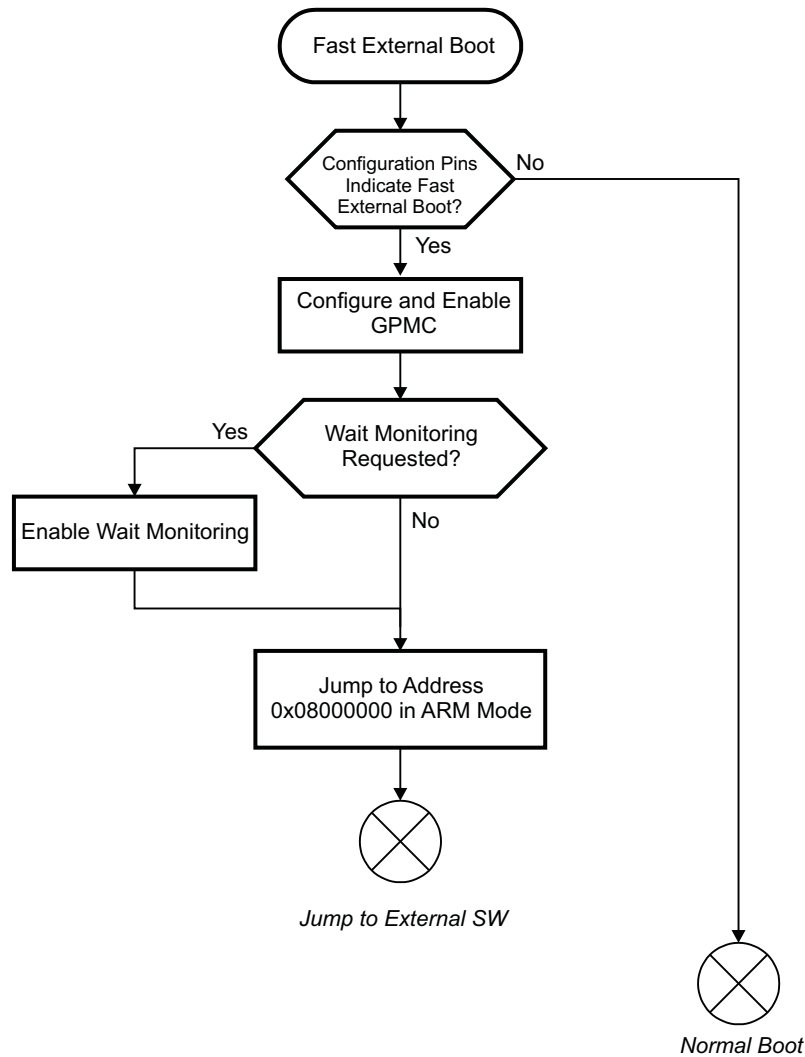

The fast external boot feature:

- Consists of a blind jump in ARM mode to a code located in an external XIP device connected to CS0
- The jump is performed with minimum on-chip ROM Code execution, without configuring any PLL
- Allows the customer to create its own booting code
- Is set up by means of the configuration pins, see [Table 4-8](#)

4.6.2 External Booting

Figure 4-7 shows the fast external boot procedure. The code does not make use of RAM and is designed for fast execution.

Figure 4-7. Fast External Boot

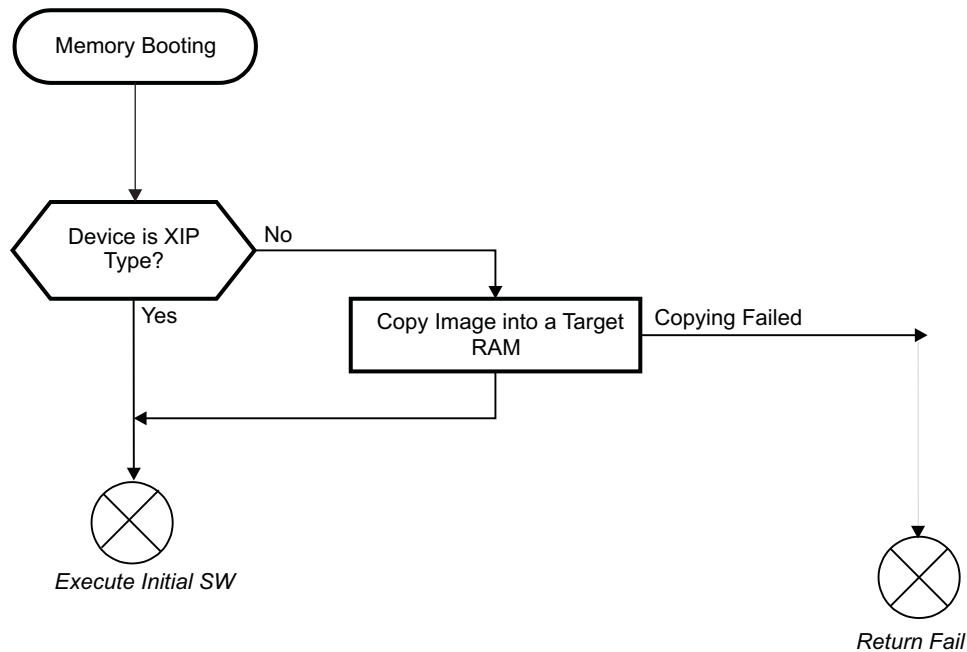

4.7 Memory Booting

4.7.1 Overview

The memory booting procedure takes care of starting an external code located in memory device types. These devices are also called permanent booting devices since they are used in that manner.

Figure 4-8. Memory Booting

The permanent booting devices supported are:

- MMC/SD cards
- NOR flash
- NAND flash
- SPI EEPROMs

There are two groups of permanent booting devices distinguished by the need of code shadowing. The code shadowing means copying a code from a non-directly addressable device into a location (typically a RAM area) from where the code can be executed. Devices which are directly addressable are called eXecute In Place (XIP) devices.

The memory booting flowchart is shown in [Figure 4-8](#). The second step is about performing the shadowing of the image that is copying the image from external mass storage (non-XIP) into internal RAM. Failure in image copy results in memory booting returning to the main booting procedure which will select the next device for booting. The next sections detail procedures for device initialization & detection in addition to the description of the sector read routine for each supported device type. A sector is a logical unit of 512 bytes.

A valid image is considered to be present when the first 4 bytes word of the sector is not equal to 0000 0000h or FFFF FFFFh.

During the first read sector call, sectors are copied to a temporary RAM buffer. Once the image is found and a destination address is known, the content of the temporary buffer is moved to the target RAM location so it is needed to re-read the first image sector. The header is discarded; therefore, only executable code is located in RAM with the first executable instruction located at the destination address.

For more information about image formats and contents refer to [Section 4.9](#).

MMC/SD cards and NAND devices can hold up to four copies of the booting image. Therefore the ROM Code searches for one valid image out of the four if present by walking over the first four blocks of the mass storage space. Other XIP devices (NOR) use only one copy of the booting image.

4.7.2 XIP Memory

The ROM Code can boot directly from XIP devices. A typical XIP device is a NOR flash memory. Support for XIP devices is performed under the following assumptions:

- Uses GPMC as the communication interface
- Can connect up to 1 Gbit (128 Mbytes) memories
- Uses both x8 and x16 data bus width
- Follows asynchronous protocol
- Supports address / data multiplexed mode and non-multiplexed mode
- GPMC clock is 55 MHz
- Device is connected to CS0 mapped to address 800 0000h
- Wait pin signal WAIT0 is monitored depending on the MBOOT configuration pins (XIP/XIPWAIT).

Depending on the MBOOT option the GPMC is configured to use the WAIT signal connected on the WAIT0 pin or not. Wait pin polarity is set to stall accessing memory when the WAIT0 pin is low. The wait monitoring is intended to be used with memories which require long time for initialization after reset or need to pause while reading data. The boot procedure from XIP device can be described as such:

1. Configure GPMC for XIP device access
2. Set the image location to 800 0000h
3. Verify if bootable image is present at the image location.
4. If the image has been found, start it.
5. If the image has not been found, return from XIP booting to the main booting loop.

4.7.2.1 XIP Initialization and Detection

GPMC Initialization

[Figure 4-9](#) and [Table 4-9](#) describes the GPMC timing settings set for XIP boot and other address-data accessible devices (e.g., OneNAND).

Figure 4-9. GPMC XIP Timings

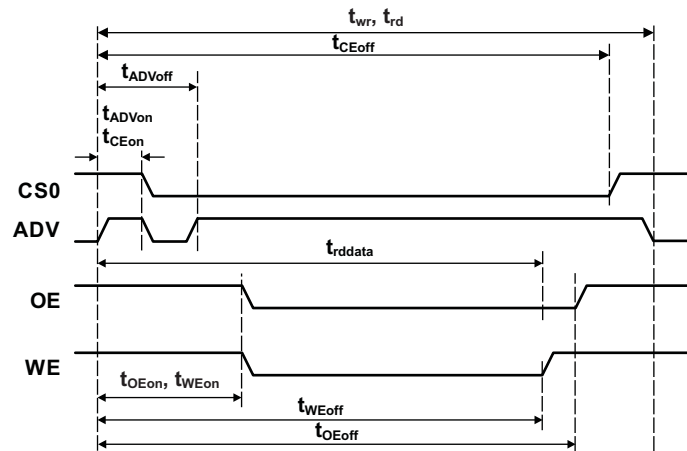

Table 4-9. XIP Timings Parameters

Parameter	Description	Value [clock cycles]
twr	write cycle period	17
trd	read cycle period	17
tCEon	CE low time	1
tCEoff	CE high time	16
tADVon	ADV low time	1
tADVoff	ADV high time	2
tOEon	OE low time	3
tWEon	WE low time	3
trddata	data latch time	15
tOEoff	OE high time	16
tWEoff	WE high time	15

The one clock cycle is 18.182 ns which corresponds to 55MHz frequency.

Device Detection

There is no specific identification routine executed prior to booting from an XIP device.

4.7.2.2 Pins Used for NOR Boot

The list of pins that are configured by the ROM in the case of NOR boot mode are listed in [Table 4-10](#). Note that all the pins might not be driven at boot time. The decision as to which pins need to be driven is based on the type of NOR flash selected.

Table 4-10. Pins Used for NOR Boot

Signal name	Pin used in XIP_MUX0 mode	Pin used in XIP_MUX1 mode
cs0	gpmc_cs0	gpmc_cs0
advn_ale	gpmc_advn_ale	gpmc_advn_ale
oen_ren	gpmc_oen_ren	gpmc_oen_ren
be0n_cle	gpmc_be0n_cle	gpmc_be0n_cle
wen	gpmc_wen	gpmc_wen
wait	gpmc_wait	gpmc_wait

Table 4-10. Pins Used for NOR Boot (continued)

Signal name	Pin used in XIP_MUX0 mode	Pin used in XIP_MUX1 mode
clk	gpmc_clk	gpmc_clk
ad0 - ad15	gpmc_ad0 - gpmc_ad15	gpmc_ad0 - gpmc_ad15
a0	gmii0_rxd[3]	vout1_b_cb_c[2]
a1	gmii0_rxd[4]	mmc2_dat[3]
a2	gmii0_rxd[5]	mmc2_dat[2]
a3	gmii0_rxd[6]	mmc2_dat[1]
a4	gmii0_rxd[7]	mmc2_dat[0]
a5	gmii0_rxdv	vout1_g_y_yc[1]
a6	gmii0_gtxclk	vout1_g_y_yc[0]
a7	gmii0_txd[0]	vout1_r_cr[1]
a8	gmii0_txd[1]	vout1_r_cr[0]
a9	gmii0_txd[2]	vout1_b_cb_c[1]
a10	gmii0_txd[3]	vout1_b_cb_c[0]
a11	gmii0_txd[4]	vout1_fid
a12	gmii0_txd[5]	vout0_fid

Note: The ROM code does not multiplex high order address lines gpmc_a[27:13] to their address functions, although the external memory device generally needs to see logic "0" on its higher order address bits to correctly address memory. Many of the high order address pads default to internal pull-down active; however, some pins will default to internal pull-up active and therefore will need to be driven or pulled low by external hardware for the duration of XIP boot operation. See the device data manual for specific details.

In PG2.0, if MBOOT[10] = 1b, the following changes come into effect. These override the pin configuration mentioned above.

- GPMC_CLK is not configured
- GPMC_BE0N_CLE is not configured
- GPMC_ADV_NALE is configured only for multiplexed NOR boot
- GPMC_A0 configured pinmux in case of 8-bit wide data NOR boot ONLY.
- GPMC_WAIT0 is configured for NOR (muxed and Non-muxed) with default settings in case we use as WAIT, else do a PULL DOWN
- For the following Pins a PULL DOWN is done for both Muxed NOR and Non-Muxed NOR devices
 - GPMC_A[20]
 - GPMC_A[22]
 - SD2_DAT[7]
 - SD2_DAT[6]
 - SD2_DAT[5]
 - GPMC_WAIT[0] (UNLESS configured as WAIT per BOOTMODE)
- For the following Pins a PULL DOWN is done for Non-Muxed NOR devices only
 - VOUT[1]_G_Y_YC[2]
 - VOUT[1]_R_CR[3]

4.7.2.3 Sysboot Pins

Some of the SYSBOOT pins have special meanings when NOR boot is selected.

Table 4-11. Special SYSBOOT Pins for NOR Boot

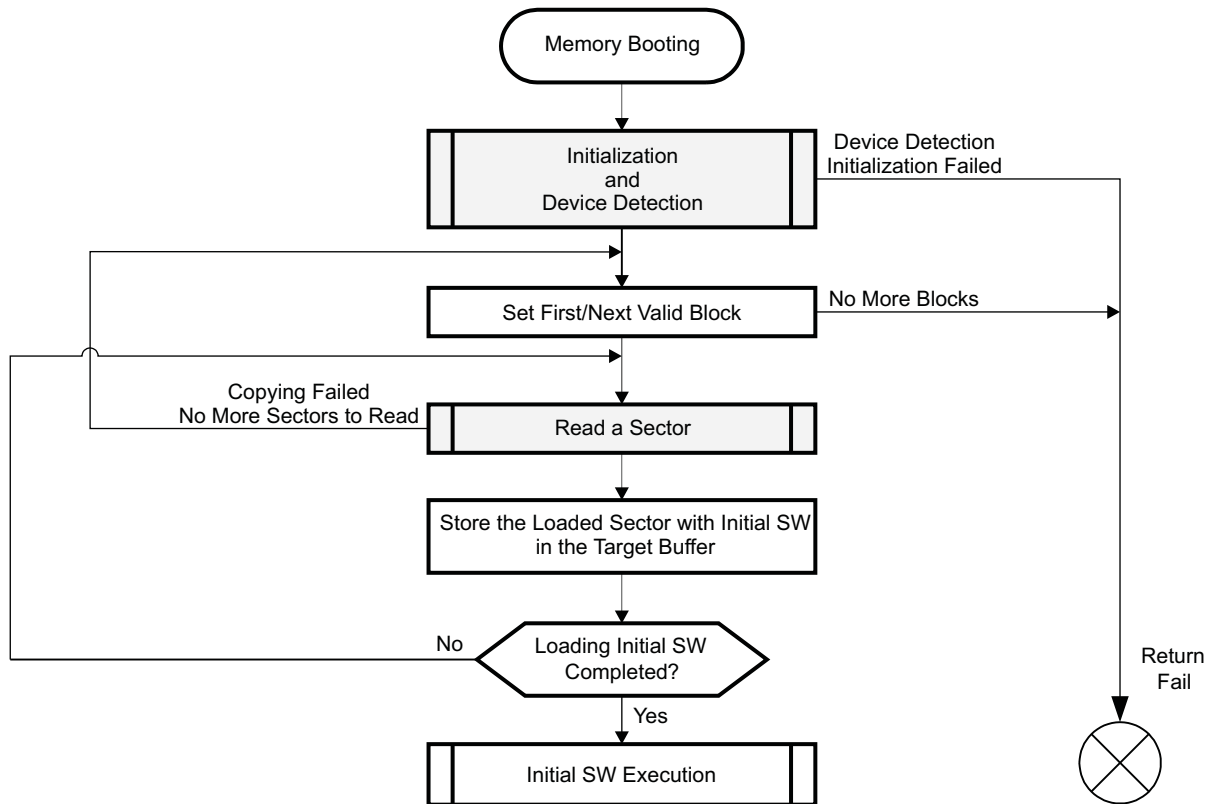

SYSBOOT[n]	Description
[12] (CS0BW)	Must be 0 if 8-bit device is used Must be 1 if 16-bit device is used
[15] (CS0WAIT)	Must be 0 if XIP WAIT is not used Must be 1 if XIP WAIT is used
[14:13] (CS0MUX[1:0])	00b – Non-muxed device 01b – A/D muxed device 10b – AAD muxed device 11b – reserved.

4.7.2.4 Image Shadowing for non-XIP Memories

Shadowing on the device

Shadowing uses the following approach.

Figure 4-10. Image Shadowing on the Device

4.7.3 NAND

The NAND flash memory is not XIP and requires shadowing before the code can be executed.

4.7.3.1 NAND Features

The NAND features include:

- GPMC as the communication interface
- Device from 512Mbit (64 MByte)
- x8 and x16 bus width
- Support for large page size (2048 bytes + 64 spare bytes) or very large page size 4096 bytes + 128 / 218 spare bytes)
- CE don't care devices only
- Single Level Cell (SLC) and Multiple Level Cell (MLC) devices
- Device Identification based on ONFI or ROM table
- ECC correction : 8 bits/sector for most devices (16b/sector for devices with large spare area)
- GPMC timings adjusted for NAND access
- 55MHz GPMC clock
- Device connected to CS0
- Wait pin signal WAITPIN0 connected to NAND BUSY output
- Four physical blocks are searched for an image. The block size depends on device.

4.7.3.2 Initialization and Detection

The initialization routine for NAND devices consists in three parts: GPMC initialization, device detection with parameters determination and finally bad block detection.

- **ONFI support.** The NAND identification starts with ONFI detection.
- **GPMC initialization.** The GPMC interface is configured such that it can be used for accessing NAND devices. The address bus is released since a NAND device does not use it. The data bus width is initially set to 8 bits; and changed to 16 bits if needed after device parameters determination. The following scheme is applied since NAND devices require different timings when compared to regular NOR devices:

Figure 4-11 and Table 4-12 describes the timings configured for NAND device access. The one clock cycle is 18.181 ns which correspond to 55 MHz frequency.

Figure 4-11. GPMC NAND Timings

Table 4-12. NAND Timings Parameters

Parameter	Description	Value [clock cycles]
twr	write cycle period	30
trd	read cycle period	30
tCEon	CE low (not marked on the figure)	0
tOEon	CE low to OE low time	7
tWEon	CE low to WE low time	5
trddata	CE low to data latch time	21
tOEoff	CE low to OE high time	24
tWEoff	CE low to WE high time	22

- Device detection and parameters.** The ROM code first performs an initial wait for device auto initialization (with 250ms timeout) with polling of the ready information. Then, it needs to identify the NAND type connected to the GPMC interface. The GPMC is initialized using 8 bits, asynchronous mode. The NAND device is reset (command FFh) and its status is polled until ready for operation (with 100ms timeout). The ONFI Read ID (command 90h / address 20h) is sent to the NAND device. If it replies with the ONFI signature (4 bytes) then a Read parameters page (command ECh) is sent.
- If the parameters page does not have the ONFI signature, then the ONFI identification fails and the device falls back to using the look up table. If the parameter page contains the ONFI signature, the information shown in [Table 4-13](#) is then extracted: page size, spare area size, number of pages per block, and the addressing mode. The remaining data bytes from the parameters page stream are simply ignored.

Table 4-13. ONFI Parameters Page Description

Offset	Description	Size (bytes)
6	Features supported	2
80	Number of data bytes per page	4
84	Number of spare bytes per page	2
92	Number of pages per block	4
101	Number of address cycles	1

If the ONFI Read ID command fails (it will be the case with any device not supporting ONFI) then the device is reset again with polling for device to be ready (with 100ms timeout). Then, the standard Read ID (command 90h / address 00h) is sent. If the Device ID (2nd byte of the ID byte stream) is recognized as being a supported device, then the device parameters are extracted from an internal ROM Code table. The list of supported devices is shown in [Table 4-14](#).

Table 4-14. Supported NAND Devices

Capacity	Device ID	Bus Width	Page size
512 Mb	F0	x8	2048
512 Mb	C0	x16	2048
512 Mb	A0	x8	2048
512 Mb	B0	x16	2048
512 Mb	F2	x8	2048
512 Mb	C2	x16	2048
512 Mb	A2	x8	2048
512 Mb	B2	x16	2048
1 Gb	F1	x8	2048
1 Gb	C1	x16	2048
1 Gb	A1	x8	2048

Table 4-14. Supported NAND Devices (continued)

Capacity	Device ID	Bus Width	Page size
1 Gb	B1	x16	2048
2 Gb	DA	x8	2048
2 Gb	CA	x16	2048
2 Gb	AA	x8	2048
2 Gb	BA	x16	2048
2 Gb	83	x8	2048
2 Gb	93	x16	2048
4 Gb	DC	x8	2048
4 Gb	CC	x16	2048
4 Gb	AC	x8	2048/4096
4 Gb	BC	x16	2048/4096
4 Gb	84	x8	2048
4 Gb	94	x16	2048
8 Gb	D3	x8	2048/4096
8 Gb	C3	x16	2048/4096
8 Gb	A3	x8	2048/4096
8 Gb	B3	x16	2048/4096
8 Gb	85	x8	2048
8 Gb	95	x16	2048
16 Gb	D5	x8	2048/4096
16 Gb	C5	x16	2048/4096
16 Gb	A5	x8	2048/4096
16 Gb	B5	x16	2048/4096
16 Gb	86	x8	2048
16 Gb	96	x16	2048
32 Gb	D7	x8	2048/4096
32 Gb	C7	x16	2048/4096
32 Gb	A7	x8	2048/4096
32 Gb	B7	x16	2048/4096
32 Gb	87	x8	2048
32 Gb	97	x16	2048
64 Gb	DE	x8	2048/4096
64 Gb	CE	x16	2048/4096
64 Gb	AE	x8	2048/4096
64 Gb	BE	x16	2048/4096

When the parameters are retrieved from the ROM table: page size and block size is updated based on 4th byte of NAND ID data. Due to inconsistency amongst different manufacturers, only devices which has been recognized to be at least 2Gb (included) have these parameters updated. Therefore, the ROM Code supports 4kB page devices but only if their size, according to the table, is at least 2Gb. Devices which are smaller than 2Gb have the block size parameter set to 128kB (when page size is 2KB). [Table 4-15](#) shows the 4th ID Data byte encoding used in ROM Code.

Table 4-15. 4th NAND ID Data Byte

Item	Description	I/O #							
		7	6	5	4	3	2	1	0
Page Size	1kB							0	0
	2kB							0	1
	4kB							1	0
	8kB							1	1
Cell type	2 levels					0	0		
	4 levels					0	1		
	8 levels					1	0		
	16 levels					1	1		
Block Size	64kB			0	0				
	128kB			0	1				
	256kB			1	0				
	512kB			1	1				

- Reading NAND geometry from I2C EEPROM.** ROM supports a special boot mode called NANDI2C to support NAND devices whose geometry cannot be detected by the ROM automatically using methods described in the previous section ([Figure 4-12](#)). If this boot mode is selected, the ROM code tries to read NAND geometry from an I2C EEPROM. If the read is successful, ROM code then proceeds to the next steps of NAND boot, beginning with reading bad blocks of information.

The list of pins that are configured by the ROM in case of NANDI2C boot mode (this is in addition to the NAND boot pins) is described in [Table 4-18](#).

Table 4-16. Pins used for NANDI2C boot for I2C EEPROM access

Signal name	Pin used
I2C SCL	i2c0_scl
I2C SDA	i2c0_sda

ROM accesses the I2C EEPROM at I2C slave address 50h and reads 7 bytes starting from address offset 80h. The format of this (NAND geometry information) is as follows:

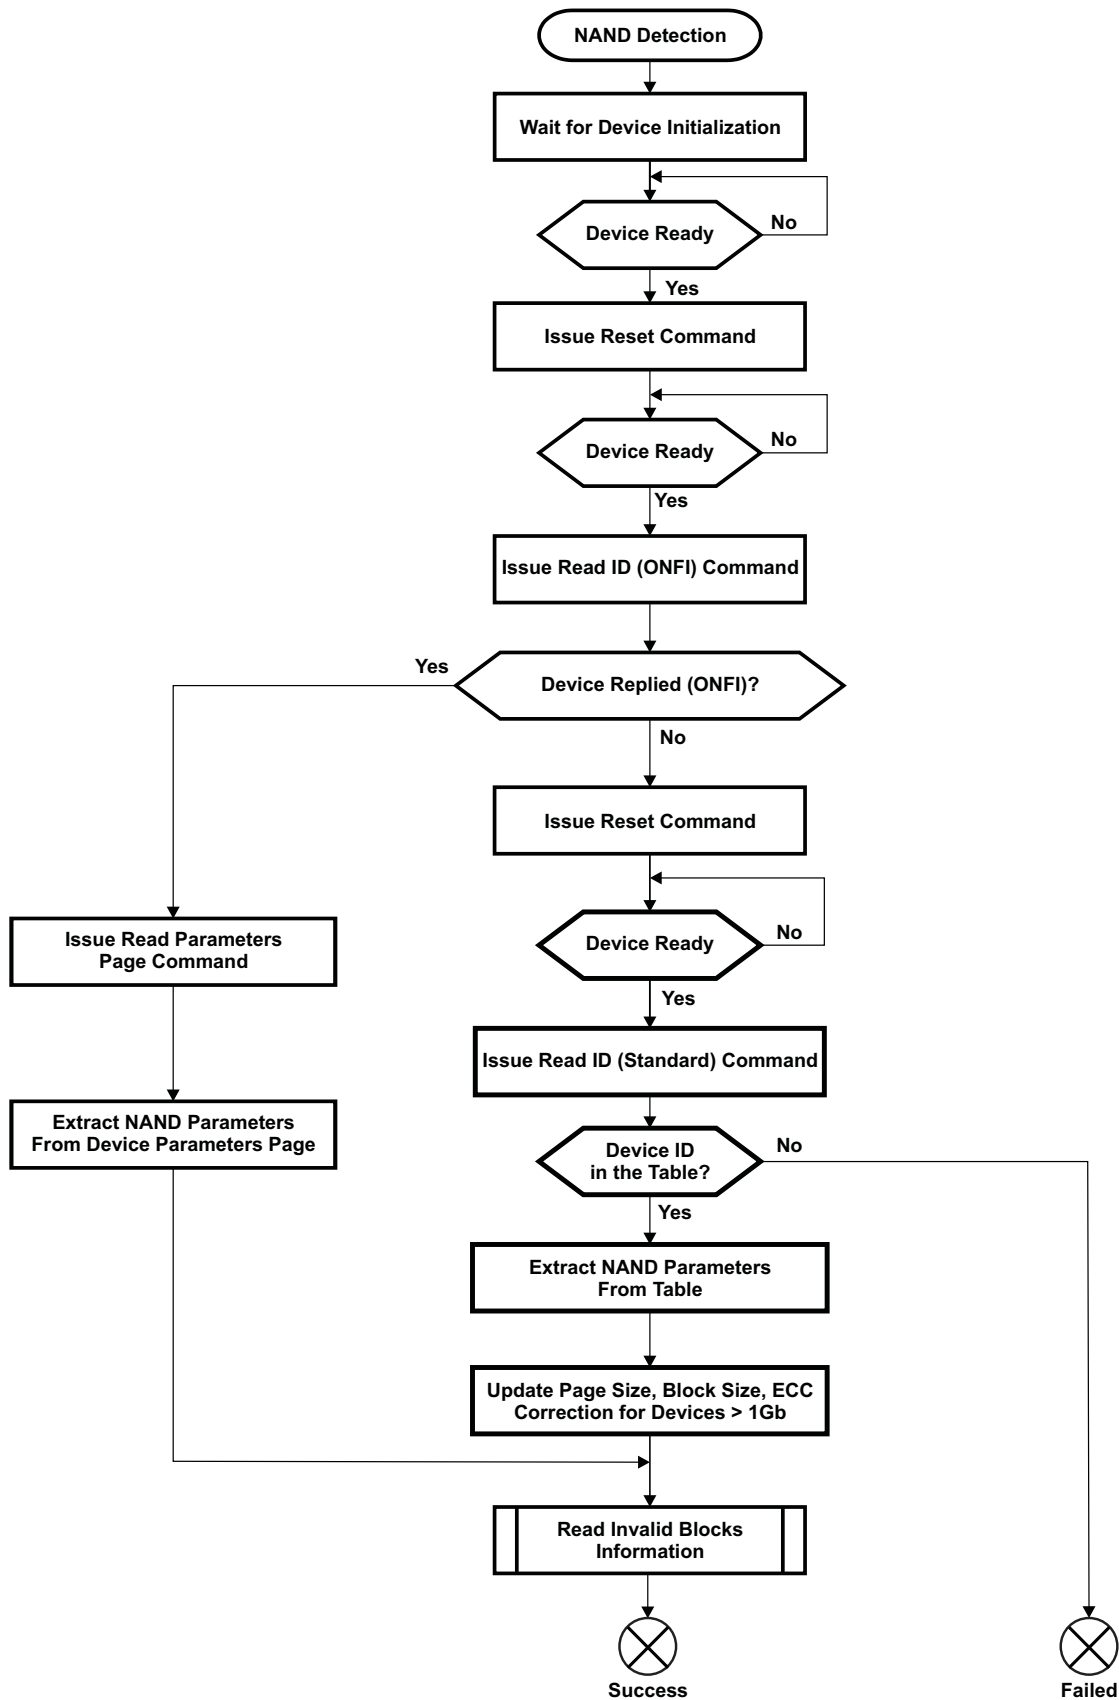

Table 4-17. NAND Geometry Information on I2C EEPROM

Byte address	Information	
	Upper nibble	Lower nibble
80h	Magic Number – 10h	
81h	Magic Number – B3h	
82h	Magic Number – 57h	
83h	Magic Number – A6h	
84h	NAND column address (word/byte offset within a page) size in bytes, Example: 2	NAND row address (page offset) size in bytes. Example: 3
85h	Page size (2N) exponent "N". Example (for page size of 2048): 11	Pages per block (2N) exponent "N" Example (for number of blocks 64): 6
86h	NAND bus width 0 → 8-bit, 1 → 16-bit	ECC Type 0 → No ECC, 1 → BCH8, 2 → BCH16

- **ECC correction.** The default ECC correction applied is BCH 8b/sector using the GPMC and ELM hardware.
For device ID codes D3h, C3h, D5h, C5h, D7h, C7h, DEh, CEh when manufacturer code (first ID byte) is 98h the cell type information is checked in the 4th byte of ID data. If it is equal to 10b then the ECC correction applied is BCH 16b/sector.

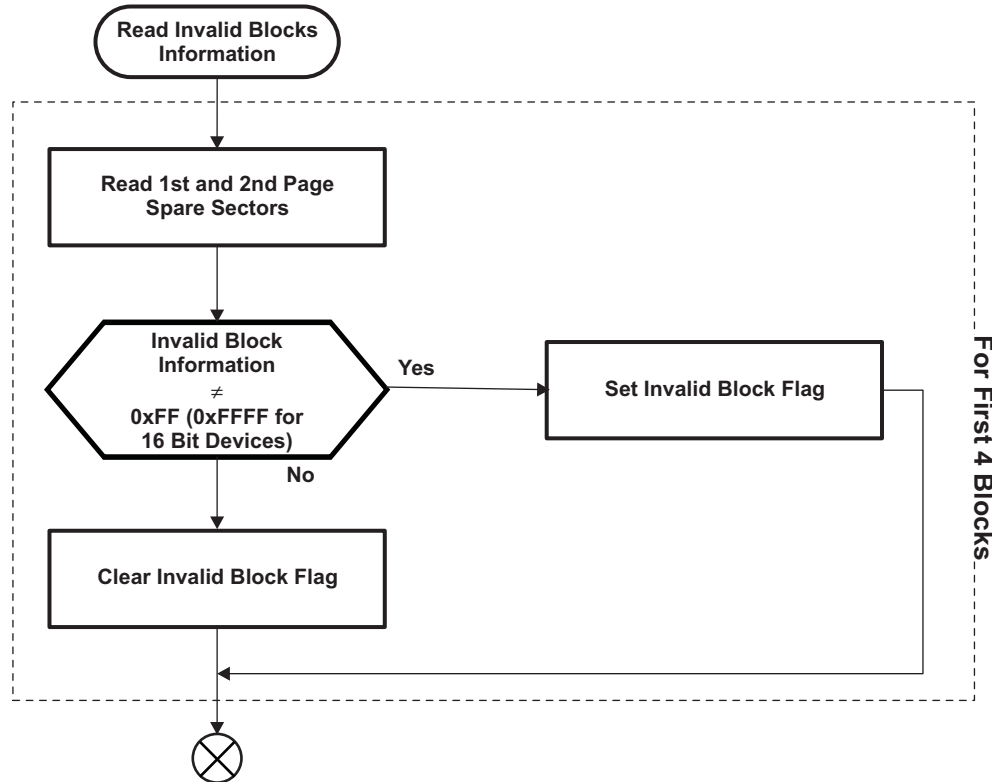

The detection procedure is described in [Figure 4-12](#). Once the device has been successfully detected, the ROM code changes GPMC to 16-bit bus width if necessary.

Figure 4-12. NAND Device Detection

- Bad block verification.** Invalid blocks are blocks which contain invalid bits whose reliability cannot be guaranteed by the manufacturer. Those bits are identified in the factory or during the programming and reported in the initial invalid block information located in the spare area on the 1st and 2nd page of each block. Since the ROM Code is looking for an image in the first four blocks, it must detect block validity status of these blocks. Blocks which are detected as invalid are not accessed later on. Blocks validity status is coded in the spare areas of the first two pages of a block (first byte equal to FFh in 1st and 2nd pages for an 8 bits device / first word equal to FFFFh in 1st and 2nd page for a 16-bit device). [Figure 4-13](#) depicts the invalid block detection routine. The routine consists in reading spare areas and checking validity data pattern.

Figure 4-13. NAND Invalid Blocks Detection

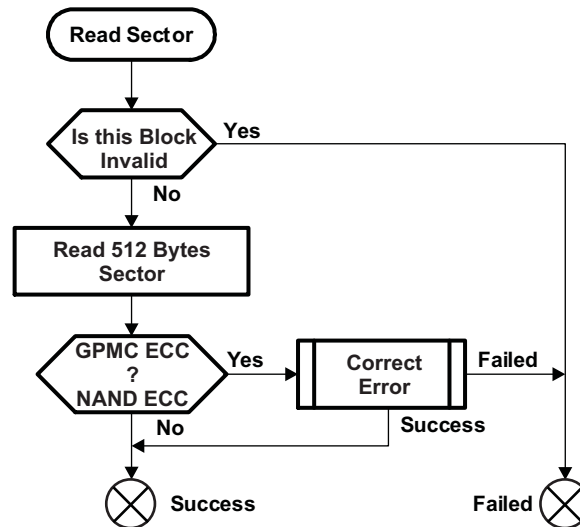

4.7.3.3 NAND Read Sector Procedure

The ROM Code reads data from NAND devices in 512 bytes sectors. The read function fails in two cases:

- The accessed sector is within a block marked as invalid
- The accessed sector contains an error which cannot be corrected with ECC

Figure 4-14 shows the read sector routine for NAND devices. The ROM Code uses normal read (command 00h 30h) for reading NAND page data.

Figure 4-14. NAND Read Sector Procedure

Page data can contain errors due to memory alteration. The ROM Code uses an ECC correction algorithm to detect and possibly correct those errors. The ECC algorithm used is BCH with capability for correcting 8b or 16b errors per sector. The BCH data is automatically calculated by the GPMC on reading each 512 bytes sector. The computed ECC is compared against ECC stored in the spare area for the corresponding page. Depending on the page size, the amount of ECC data bytes stored in the corresponding spare area is different. Figure 4-15 and Figure 4-16 show the mapping of ECC data inside the spare area for respectively 2KB-page and 4KB- page devices. If both ECC data are equal then the Read Sector function returns the read 512 bytes sector without error. Otherwise, the ROM Code tries to correct error(s) in the corresponding sector (this procedure is assisted by the ELM hardware) and returns the data if successful. If errors are uncorrectable, the function returns with FAIL.

Figure 4-15. ECC Data Mapping for 2KB Page and 8b BCH Encoding

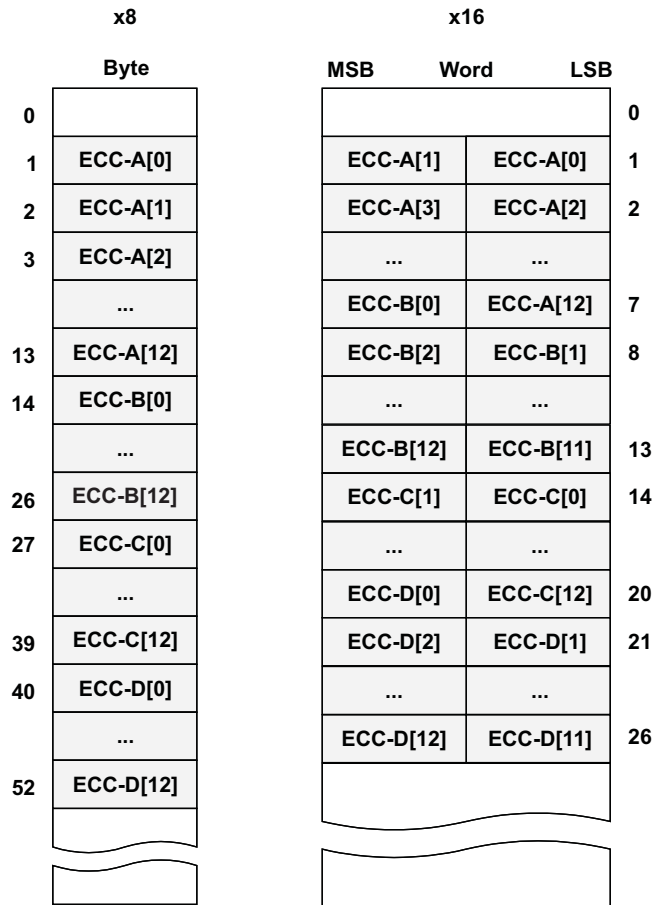

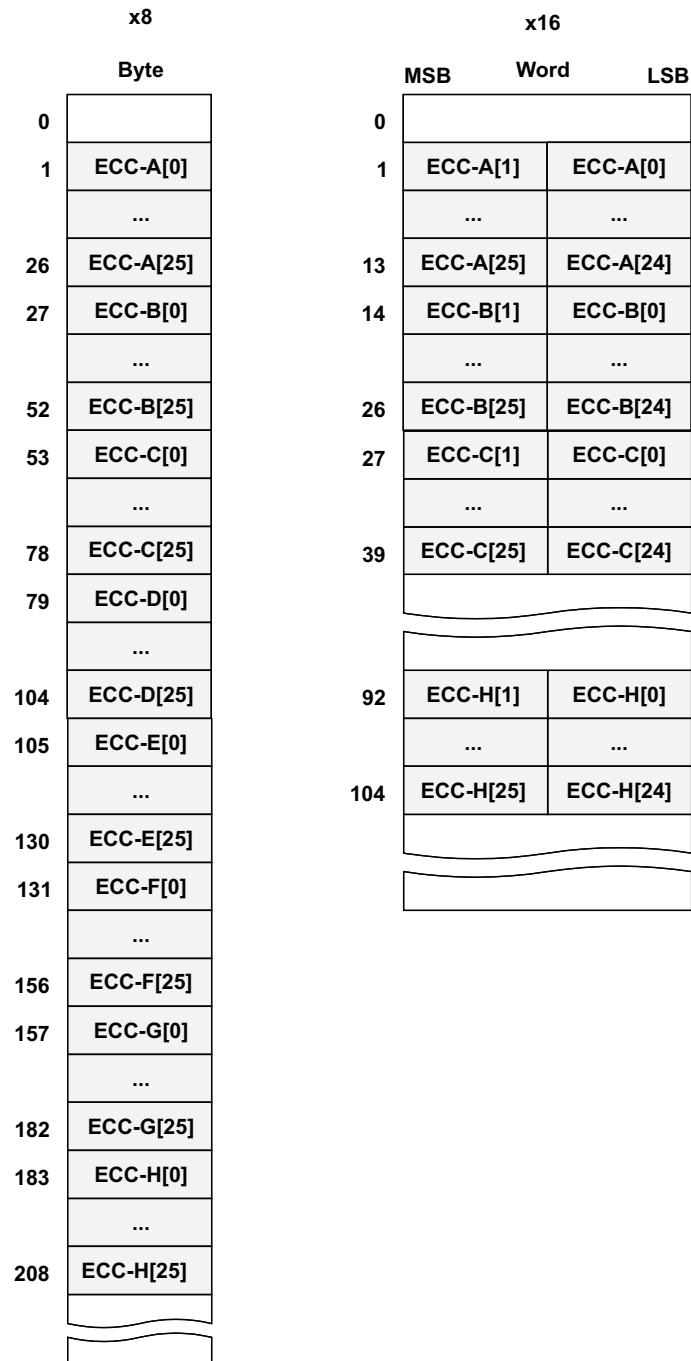

Figure 4-16. ECC Data Mapping for 4KB Page and 16b BCH Encoding

4.7.3.4 Pins Used for NAND Boot

The list of pins that are configured by the ROM in case of NAND boot mode are in [Table 4-18](#). Note that all the pins might not be driven at boot time.

Table 4-18. Pins Used for NAND Boot

Signal name	Pin used
cs0	gpmc_cs0
advn_ale	gpmc_advn_ale

Table 4-18. Pins Used for NAND Boot (continued)

Signal name	Pin used
oen_ren	gpmc_oen_ren
be0n_cle	gpmc_be0n_cle
wen	gpmc_wen
wait	gpmc_wait
clk	gpmc_clk ⁽¹⁾
ad0 - ad15	gpmc_ad0 - gpmc_ad15

⁽¹⁾ gpmc_clk is not configured in MBOOT[10] = 1b

4.7.3.5 Sysboot Pins for NAND Boot

Some of the SYSBOOT pins have special meanings when NAND boot is selected.

Table 4-19. Special SYSBOOT pins for NAND boot

SYSBOOT[n]	Description
[12] (CS0BW)	Must be 0 if 8-bit NAND is used
	Must be 1 if 16-bit NAND is used
[15] (CS0WAIT)	Must be 0
[14:13] (CS0MUX[1:0])	Must be 0

4.7.4 MMC/SD Cards

4.7.4.1 Overview

The ROM code supports booting from MMC/SD cards in the following conditions:

- MMC/SD Cards compliant to low and high capacities
- MMC/SD cards connected to MMC interface #1
- 3V VCC power supply, support for 3V or 1.8V I/O voltages
- Initial 1-bit MMC Mode, optional 4-bits or 8-bits mode
- Clock Frequency: identification mode: 400 KHz; data transfer mode up to 10 MHz
- Only one card connected to the bus
- Raw mode, image data read directly from sectors in the user area
- File system mode (FAT12/16/32 supported with or without Master Boot Record), image data is read from a booting file

4.7.4.2 System Interconnection

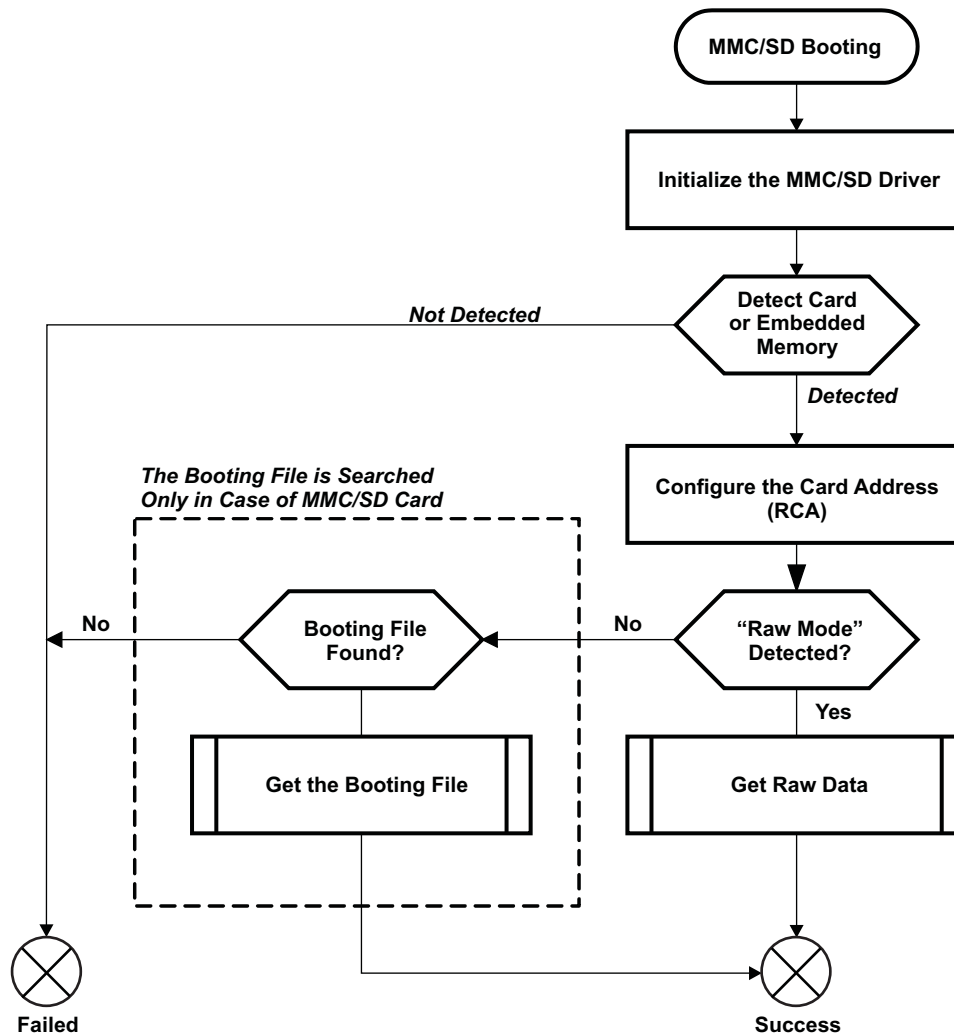

An MMC/SD card can be connected to the MMC1 interface typically through a card cage.

Notes:

- It may be possible to design the system so that an eMMC/eSD memory type is connected to the MMC1 interface. However, the dual voltage IOs feature of MMC1 dedicates it preferably to cards.
- The ROM Code does not handle the card detection feature on card cage.

4.7.4.3 Booting Procedure

The high level flowchart of the eMMC/eSD and MMC/SD booting procedure is depicted in [Figure 4-17](#). The booting file is searched only in case of booting from a card. eMMC/eSD embedded memories only support raw mode.

Figure 4-17. MMC/SD Booting

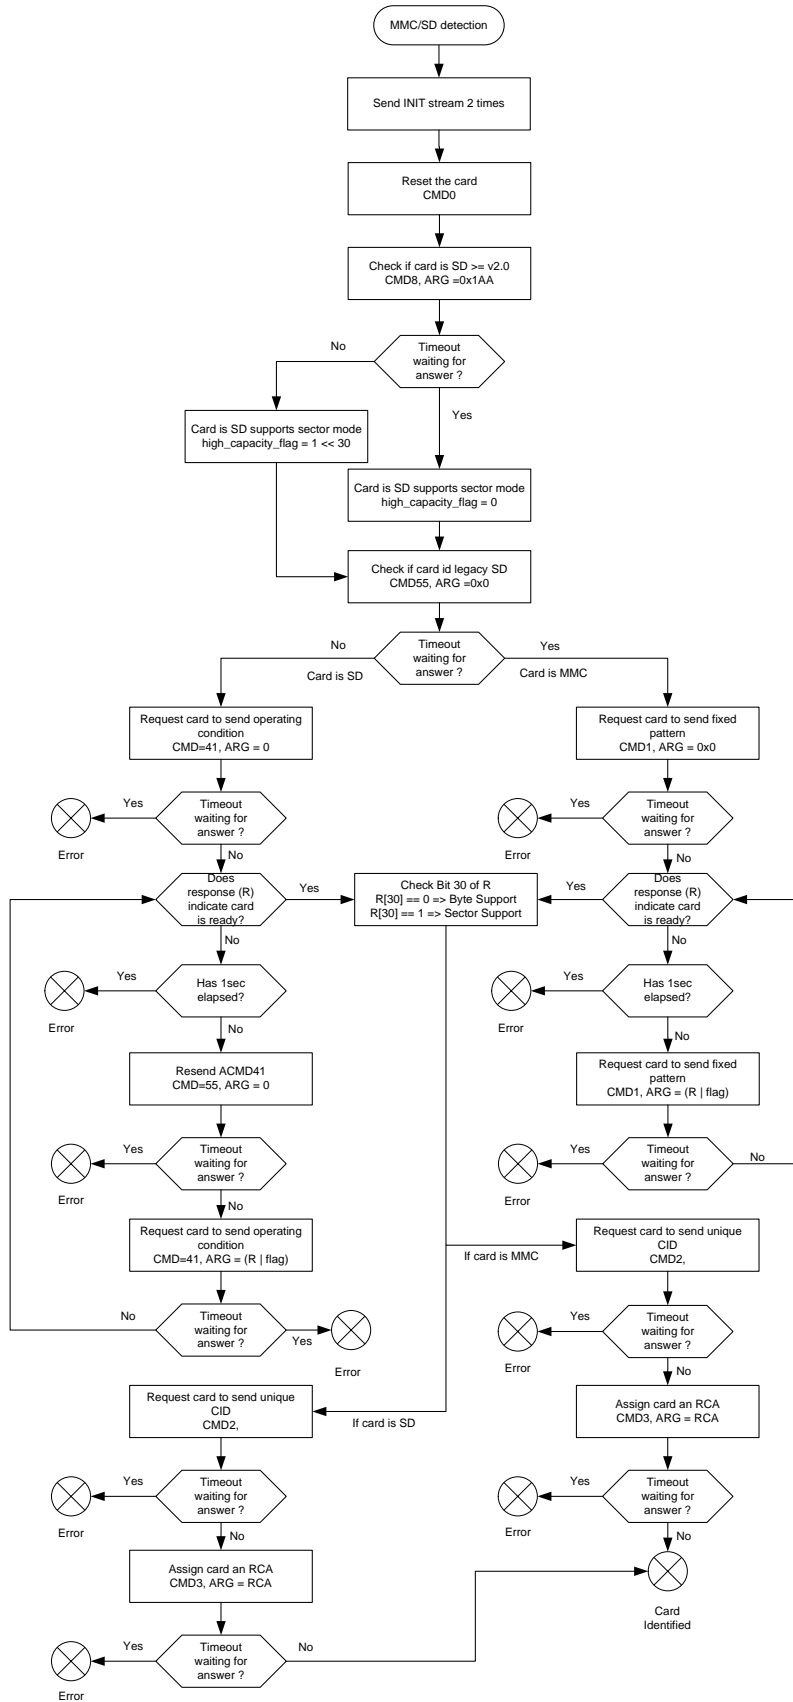

4.7.4.4 Initialization and Detection

The ROM Code initializes the memory device or card connected on MMC interface using the standard High-Voltage range (3.0V). If neither memory device nor card is detected then the ROM code carries on to the next booting device. The standard identification process and relative card address (RCA) assignment are used. However, the ROM Code assumes that only one memory or card is present on the bus. This first sequence is done using the CMD signal that is common to SD and MMC devices.

MMC and SD standards detail this phase as initialization phase. Both standards differ in the first commands involved: CMD1 and ACMD41. The ROM code uses this difference in command set to discriminate between MMC and SD devices: CMD1 is supported only by the MMC standard whereas ACMD41 is only supported by SD standard. The ROM code first sends a CMD1 to the device and gets a response only if an MMC device is connected. If no response is received then ACMD41 (ACMD41 is made out of CMD55 and ACMD41) is sent and a response is expected from an SD device. If no response is received then it is assumed that no device is connected and the ROM Code exits the MMC/SD Booting procedure with FAIL. This detection procedure is shown in [Figure 4-18](#).

As previously mentioned, the contents of an MMC/D card may be formatted as raw binary or within a FAT filesystem. eMMC/SD devices only support raw mode. The ROM Code reads out raw sectors from image or the booting file within the file system and boots from it.

Figure 4-18. MMC/SD Detection Procedure

As previously mentioned, the contents of an MMC/D card may be formatted as raw binary or within a FAT filesystem. eMMC/SD devices only support raw mode. The ROM Code reads out raw sectors from image or the booting file within the file system and boots from it.

4.7.4.5 MMC/SD Read Sector Procedure in Raw Mode

In raw mode the booting image can be located at one of the four consecutive locations in the main area: offset 0/20000h (128KB)/40000h (256KB)/60000h (384KB). For this reason a booting image shall not exceed 128KB in size. However it is possible to flash a device with an image greater than 128KB starting at one of the aforementioned locations. Therefore the ROM code does not check the image size. The only drawback is that the image will cross the subsequent image boundary.

The raw mode is detected by reading sectors #0, #256, #512, #768. The content of these sectors is then verified for presence of a TOC structure as described in [Figure 4-26](#). A configuration header (CH) must be located in the first sector followed by a header. The CH might be void (only containing a CHSETTINGS item for which the Valid field is zero).

4.7.4.6 MMC/SD Read Sector Procedure in FAT Mode

MMC/SD cards may hold a FAT file system which ROM Code is able to read and process. The image used by the booting procedure is taken from a specific booting file named "MLO." This file has to be located in the root directory on an active primary partition of type FAT12/16 or FAT32.

An MMC/SD card can be configured either as floppy-like or hard-drive-like.

- When acting as floppy-like, the content of the card is a single file system without any master boot record (MBR) holding a partition table
- When acting as hard-drive-like, an MBR is present in the first sector of the card. This MBR holds a table of partitions, one of which must be FAT12/16/32, primary and active.

The card should always hold an MBR except for MMC cards using floppy-like file system (refer to the CSD internal Register fields FILE_FORMAT_GRP and FILE_FORMAT). However, depending on the operating system, the MMC/SD card will be formatted either with partition(s) (using an MBR) or without. The ROM code supports both types; this is described in the following section.

The ROM code retrieves a map of the booting file from the FAT table. The booting file map is a collection of all FAT table entries related to the booting file (a FAT entry points to a cluster holding part of the file). The booting procedure uses this map to access any 512 byte sector within the booting file without involving ROM code FAT module.

The sector read procedure utilizes standard MMC/SD raw data read function. The sector address is generated based on the booting memory file map collected during the initialization. Hence the ROM Code can address sectors freely within the booting file space.

4.7.4.7 FAT File System

This paragraph describes functionalities which are used by the ROM Code. It is not intended to fully describe the Master Boot Record and the FAT file system, but does include:

- How to recognize if a sector is the 1st sector of an MBR
- How to recognize if a sector is the 1st sector of a FAT12/16/32
- How to find the 1st cluster of the booting file
- How to buffer the booting file FAT entries

Some memory devices which support file systems can be formatted with or without MBR, therefore the first task of the ROM Code is to detect whether or not the device is holding an MBR in the first sector. If this is the case, an active FAT12/16/32 partition is searched in all four MBR partition entries, based on the Type field. If the MBR entries are not valid or if no useable partition is found then the ROM Code returns to the Booting procedure with FAIL. The Extended partitions are not checked, the booting file must reside in a primary partition.

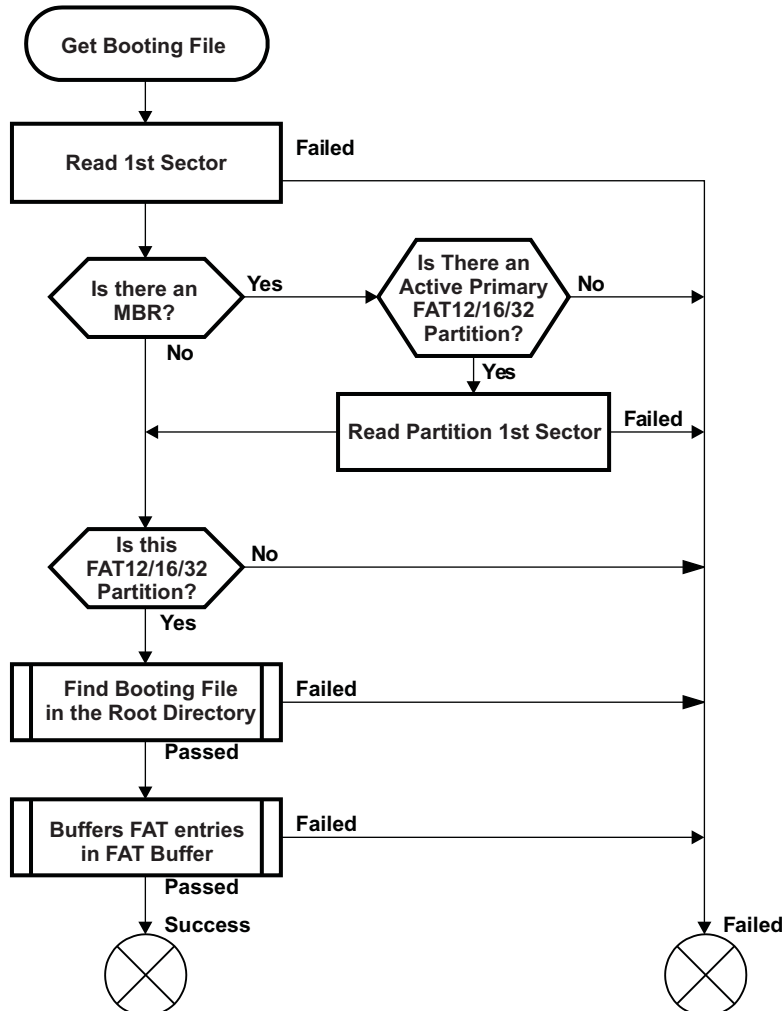

If a partition is found then its first sector is read and used further on. If no MBR is present (in case of a floppy-like system), the first sector of the device is read and used further on. The read sector is checked to be a valid FAT12/16 or FAT32 partition. If this fails, in case another partition type is used (i.e., Linux FS or any other) or if the partition is not valid, the ROM Code returns with FAIL.

Otherwise, the Root Directory entries are searched for a file named depending on the booting device. The Long File Names (LFN) format is not used and only File Names in 8.3 Format are searched for. If no valid file is found, the ROM Code returns with FAIL.

Once the file has been found, the ROM Code reads the File Allocation Table (FAT) and buffers the singly-linked chain of clusters in a FAT Buffer which will be used by the Booting Procedure to access the file directly sector by sector. For FAT12/16 and for FAT32 (valid if a specific flag has been set in the FAT32 Boot Sector), there exist multiples copies of the FAT (ROM Code supports only two copies). When buffering FAT entries, the two FATs are compared. If they are not the same, only entries from the last FAT are used. The FAT Buffer holds sector numbers and not cluster numbers. The ROM Code converts each cluster entry to one or several sector entries if applicable.

The whole process is described in [Figure 4-19](#). Every part related to MBR or FAT12/16/32 is described in the next paragraph.

Figure 4-19. MMC/SD Booting, Get Booting File

4.7.4.7.1 Master Boot Record: MBR

The Master boot record is the 1st sector of a memory device. It is made out of some executable code and four partition entries. The aim of such a structure is to be able to divide the hard disk in partitions mostly used to boot different systems (Microsoft Windows™, Linux, ...). Its structure is described in [Table 4-20](#) and [Table 4-21](#). The valid partition types searched by the ROM Code are described in [Table 4-22](#).

Table 4-20. Master Boot Record Structure

Offset	Length [bytes]	Entry Description	Value
0000h	446	Optional Code	
01BEh	16	Partition Table Entry	(see)
01CEh	16	Partition Table Entry	(see)
01DEh	16	Partition Table Entry	(see)
01EEh	16	Partition Table Entry	(see)
01FEh	2	Signature	AA55h

Table 4-21. Partition Entry

Offset	Length [bytes]	Entry Description	Value
0000h	1	Partition State	00h: Inactive 80h: Active
0001h	1	Partition Start Head	H_s
0002h	2	Partition Start Cylinder and Sector	$C_s[7:0]-C_s[9:8]-S_s[5:0]$
0004h	1	Partition Type	Refer to for partial partition types
0005h	16	Partition End Head	H_e
0006h	2	Partition End Cylinder and Sector	$C_e[7:0] - C_e[9:8] - S_e[5:0]$
0008h	4	First sector position relative to the beginning of media	$LBA_s = C_s.H.S + H_s.S + S_s - 1$
000Ch	4	Number of sectors in partition	$LBA_e = C_e.H.S + H_e.S + S_e - 1$ $Nb_s = LBA_e - LBA_s + 1$

Table 4-22. Partition Types

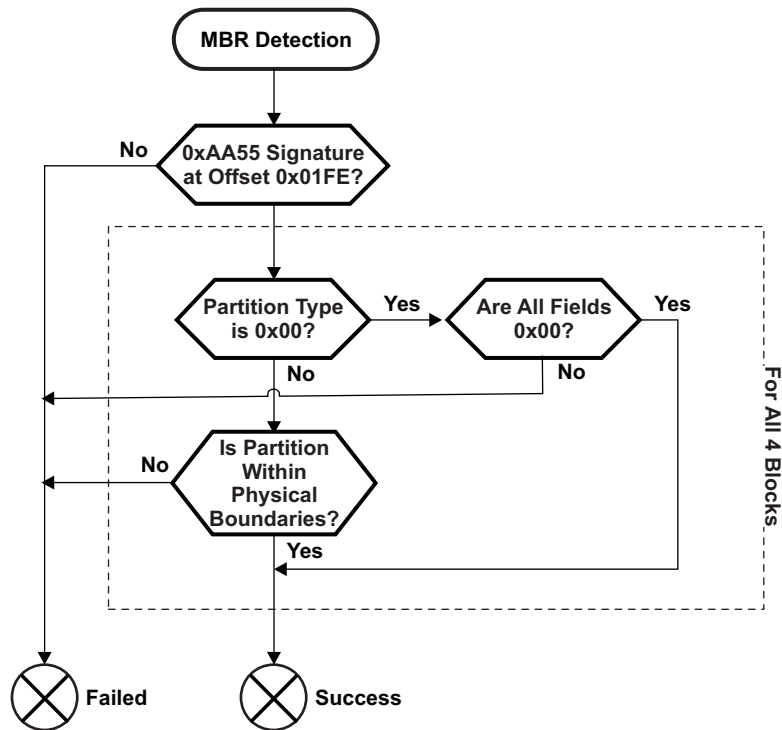

Partition Type	Description
01h	FAT12
04h, 06h, 0Eh	FAT16
0Bh, 0Ch, 0Fh	FAT32

The way the ROM Code detects whether a sector is the 1st sector of an MBR or not is described in [Figure 4-20](#).

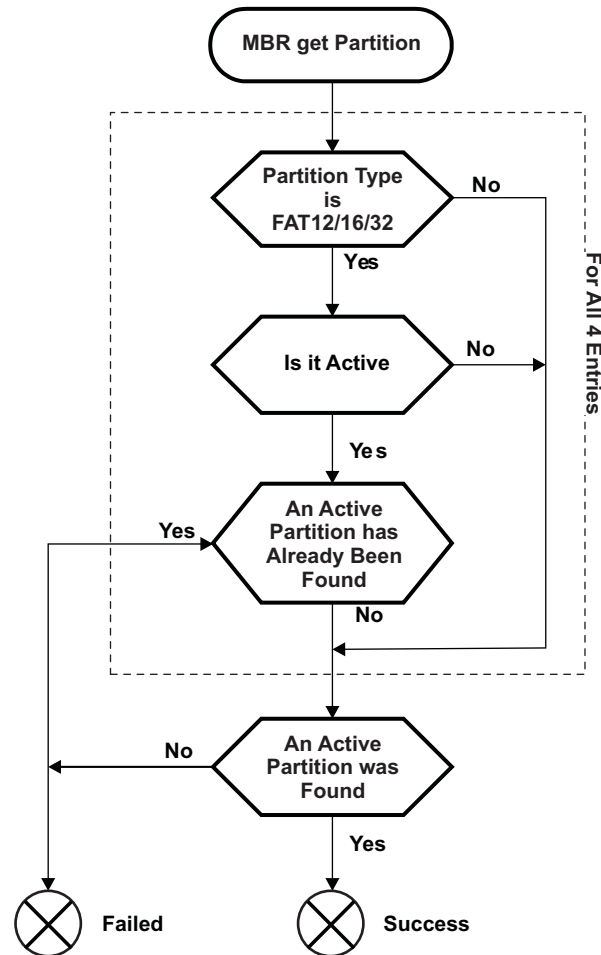

The ROM Code first checks if the signature is present. Each partition entry is checked:

- If its type is set to 00h then all fields in the entry must be 00h
- The partition is checked to be within physical boundaries, i.e. the partition is located inside and its size fits the total physical sectors.

Figure 4-20. MBR Detection Procedure

Once identified, the ROM Code gets the partition using the procedure described in [Figure 4-21](#). The partition type is checked to be FAT12/16 or FAT32. Its state must be 00h or 80h (if there is more than one active partition the test fails). The ROM Code returns with FAIL if no active primary FAT12/16/32 could be found.

Figure 4-21. MBR, Get Partition

4.7.4.7.2 FAT12/16/32 Boot Sector

The FAT file system is made out of several parts:

- Boot Sector which holds the BIOS Parameter Block (BPB)
- File Allocation Table (FAT) which describes the use of each cluster of the partition
- Data Area which holds the Files, Directories and Root Directory (for FAT12/16, the Root Directory has a specific fixed location)

The boot sector is described in [Table 4-23](#). In the following description, all the fields whose names start with BPB_ are part of the BPB. All the fields whose names start with BS_ are part of the Boot Sector and not really part of the BPB (not mandatory); they are not used at all by the ROM Code.

Table 4-23. FAT Boot Sector

	Offset	Length [bytes]	Name	Description
	0000h	3	BS_jmpBoot	Jump Instruction to Boot Code (not used)
	0003h	8	BS_OEMName	Name of the System which created the partition

Table 4-23. FAT Boot Sector (continued)

	Offset	Length [bytes]	Name	Description
	000Bh	2	BPB_BytsPerSec	Counts of Bytes per sector (usually 512)
	000Dh	1	BPB_SecPerClus	Number of sectors per allocation unit
	000Eh	2	BPB_RsvdSecCnt	Number of reserved sectors for the Boot Sector For FAT12/16 is 1, for FAT32, usually 32
	0010h	1	BPB_NumFATs	Number of copies of FAT, usually 2
	0011h	2	BPB_RootEntCnt	For FAT12/16, number of 32 bytes entries in the Root Directory (multiple of BPB_BytsPerSec/32) For FAT32 this value is 0
	0013h	2	BPB_TotSec16	Total Count of sectors on the volume. If the size is bigger than 10000h or for FAT32, this field is 0 and BPB_TotSec32 holds the value
	0015h	1	BPB_Media	Media Type, usually F8h: fixed, non-removable
	0016h	2	BPB_FATSz16	For FAT12/16, size in sectors of one FAT For FAT32, holds 0
	0018h	2	BPB_SecPerTrk	Number of sectors per track, 63 for MMC/SD
	001Ah	2	BPB_NumHeads	Number of heads, 255 for MMC/SD
	001Ch	4	BPB_HiddSec	Number of sectors preceding the partition
	0020h	4	BPB_TotSec32	Total Count of sectors on the volume. If the size is smaller than 10000h (for FAT12/16), this field is 0 and BPB_TotSec16 is valid
FAT12/16	0024h	1	BS_DrvNum	Drive Number
	0025h	1	BS_Reserved1	00h
	0026h	1	BS_BootSig	Extended Boot Signature 29h. Indicates that the following 3 fields are present
	0027h	4	BS_VolID	Volume Serial Number
	002Bh	11	BS_VolLab	Volume Label
	0036h	8	BS_FilSysType	File system Type: "FAT12", "FAT16", "FAT32". Note: This field is not mandatory (i.e., BS_) therefore it cannot be used to identify the partition type.
FAT32	0024h	4	BPB_FATSz32	Size in sectors of one FAT. Field BPB_FATSz16 must be 0
	0028h	2	BPB_ExtFlags	FAT Flags: [7]: 0 = FAT is mirrored; 1 = Only one FAT is used [3:0]: Number of used FAT if no mirroring used
	002Ah	2	BPB_FSVer	File system Version Number
	002Ch	4	BPB_RootClus	First Cluster number of the Root Directory
	0030h	2	BPB_FSInfo	Sector number of FSINFO Structure in the reserved-area, usually 1
	0032h	2	BPB_BkBootSec	If non-zero, indicates the sector number in the reserved-area of a copy of the Boot Sector
	0034h	12	BPB_Reserved	Reserved, set to 00h
	0040h	1	BS_DrvNum	Drive Number
	0041h	1	BS_Reserved1	00h
	0042h	1	BS_BootSig	Extended Boot Signature 29h. Indicates that the following 3 fields are present
	0043h	4	BS_VolID	Volume Serial Number
	0047h	11	BS_VolLab	Volume Label
	0052h	8	BS_FilSysType	File system Type: "FAT12", "FAT16", "FAT32". Note: This field is not mandatory (i.e., BS_) therefore it cannot be used to identify the partition type.
		01FEh	2	BPB_Signature

To check whether or not a sector holds a valid FAT12/16/32 partition, only fields starting with BPB can be checked as they are mandatory. The fields starting from offset 0024h to 01FDh cannot be used for the check as they will differ if using FAT12/16 or FAT32. The procedure is described in Figure 22. First the ROM Code checks if the BPB_Signature is equal to AA55h. Then it checks some fields which must have some specific values (BPB_BytsPerSec, BPB_SecPerClus, BPB_RsvdSecCnt, BPB_NumFATs, BPB_RootEntCnt). If the geometry of the device is known then it is compared against BPB_SecPerTrk and BPB_NumHeads fields. If an MBR was found before, the partition size is also checked.

$$BPB_TotSec16 = MBR_Partition_Size$$

or

$$BPB_TotSec32 = MBR_Partition_Size$$

The field BPB_TotSec16 is used if the total number of sectors is below 65518 (in this case BPB_TotSec32=0), otherwise, BPB_TotSec32 is used (BPB_TotSec16=0). The partition sector offset is also checked: BPB_HiddSec = MBR_Partition_Offset (if this value is not 0 as some operating systems do not update this field correctly). The last step is to decide which type of FAT file system it is. The ROM Code computes the number of clusters in the Data Area part of the partition:

$$Nb_{clusters} < 4085 \Rightarrow \text{FAT12}$$

$$4085 \leq Nb_{clusters} < 65525 \Rightarrow \text{FAT16}$$

$$65525 \leq Nb_{clusters} \Rightarrow \text{FAT32}$$

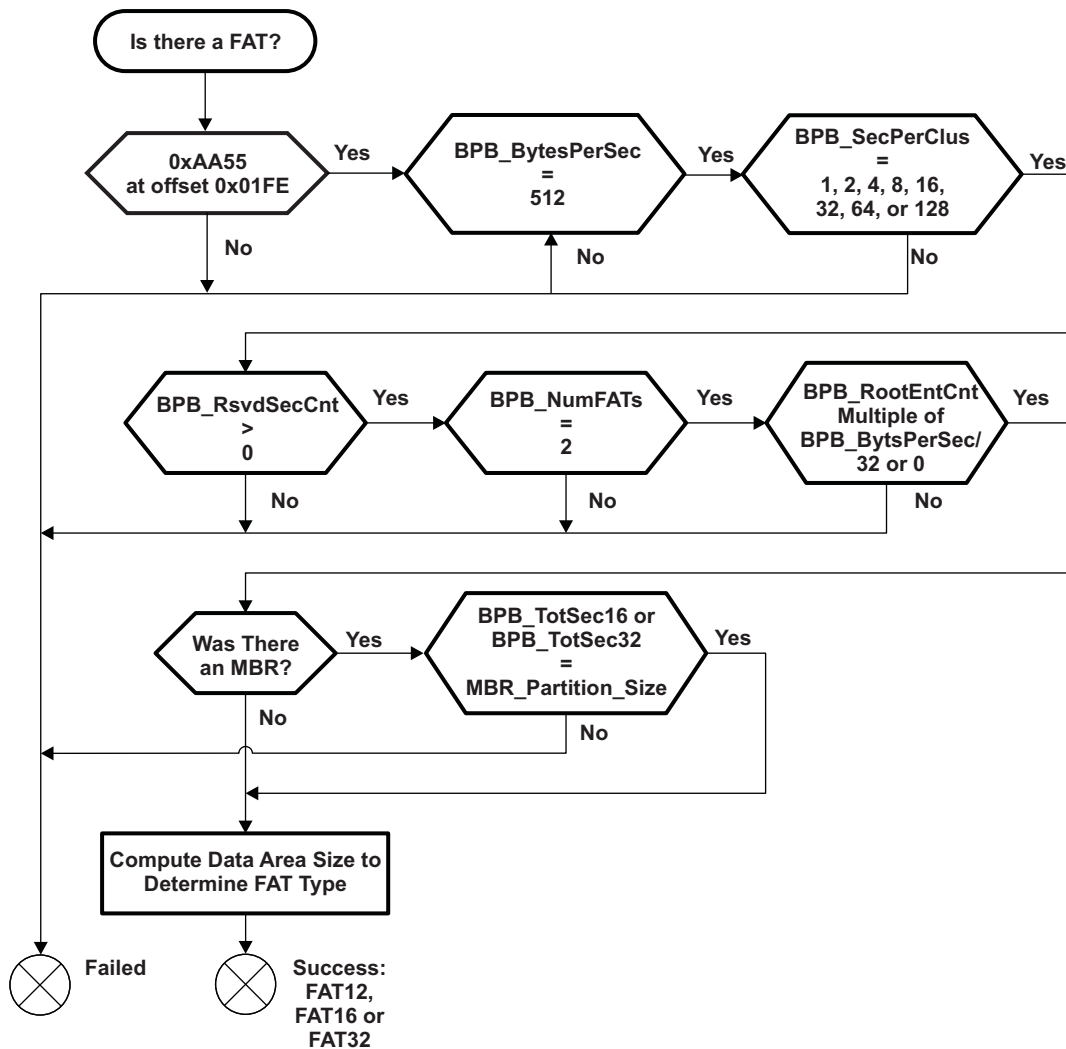

Where Nbclusters is given by the size of the Data Area:

$$RootDirSectors = \frac{BPB_RootEntCnt * 32}{BPB_BytesPerSec}$$

$$DataSec = BPB_TotSec - (BPB_RsvdSecCnt + (BPB_NumFATs * BPB_FATsSz) + RootDirSectors)$$

$$Nb_{clusters} = \frac{DataSec}{BPB_SecPerClus}$$

Figure 4-22. FAT Detection Procedure

4.7.4.8 FAT12/16/32 Root Directory

The next task for the ROM Code is to find the booting file named “MLO” inside the Root Directory of the FAT12/16/32 file system. The file is not searched in any other location. For a FAT12/16 file system, the Root Directory has a fixed location which is cluster 0. For a FAT32 file system, its cluster location is given by BPB_RootClus. The general formulae to find the sector number (relative to device sector 0, not partition sector 0) of a cluster is given by:

$$Cluster_{sector} = BPB_HiddSec + BPB_RsvdSecCnt + BPB_NumFATs \cdot BPB_FATSz + Cluster \cdot BPB_SecPerClus$$

Note: BPB_FatSz is BPB_FatSz16 for FAT12/16 or BPB_FatSz32 for FAT32

Note: The BPB_HiddSec field can contain 0 even though the FAT file system is located somewhere other than on sector 0 (floppy-like). The ROM Code actually uses the partition offset taken from the MBR instead of this field which can be wrong. If no MBR was found (floppy-like) the value 0 is used.

Each entry in the Root Directory is 32 bytes long and hold information about the file, i.e., filename, date of creation, rights, cluster location etc. This is described in [Table 4-24](#).

Table 4-24. FAT Directory Entry

Offset	Length	Name	Description	
	[bytes]			
0000h	11	DIR_Name	Short Name (8+3)	
000Bh	1	DIR_Attr	File Attributes:	
			ATTR_READ_ONLY	01h
			ATTR_HIDDEN	02h
			ATTR_SYSTEM	04h
			ATTR_VOLUME_ID	08h
			ATTR_DIRECTORY	10h
			ATTR_ARCHIVE	20h
			ATTR_LONG_NAME	ATTR_READ_ONLY ATTR_HIDDEN ATTR_SYSTEM ATTR_VOLUME_ID
000Ch	1	DIR_NTRes	Reserved, set to 00h	
000Dh	1	DIR_CrtTimeTenth	Millisecond stamp at file creation	
000Eh	2	DIR_CrtTime	Time file was created	
0010h	2	DIR_CrtDate	Date file was created	
0012h	2	DIR_LstAccDate	Last Access date	
0014h	2	DIR_FstClusHi	High word of this entry's first cluster number	
0016h	2	DIR_WrtTime	Time of last write	
0018h	2	DIR_WrtDate	Date of last write	
001Ah	2	DIR_FstClusLo	Low word of this entry's first cluster number	
001Ch	4	DIR_FileSize	File size in bytes	

The ROM Code checks each entry in the Root Directory until either the booting file is found or the entry is empty (first byte is 00h) or when the end of the Root Directory has been reached. Entries with ATTR_LONG_NAME attribute (LFN) and with first byte at E5h (erased file) are ignored. When found, the first cluster offset of the file is read from the DIR_FstClusHi/DIR_FstClusLo fields.

There is a slight difference between FAT12/16 and FAT32 when handling the Root Directory. On FAT12/16, this directory has a fixed location (see above) and length fixed by BPB_RootEntCnt which is the total number of 32 bytes entries. Handling this directory is therefore straight forward. On FAT32, the Root Directory is like a standard file, the File Allocation Table (FAT) has to be used in order to retrieve each sector of the Directory. The way the FAT is handled is described in the next paragraph.

4.7.4.9 FAT12/16/32 File Allocation Table

The ROM Code needs to read the FAT in order to retrieve sectors either for the booting file or for the Root Directory (in case the file system is FAT32).

There can be multiple copies of the FAT inside the file system (ROM Code supports only 2) located after the Boot Sector:

$$FATn_{sector} = BPB_HiddSec + BPB_RsvdSecCnt + BPB_FatSz \cdot n$$

Its size is given by BPB_FATsSz16 or BPB_FATsSz32. The ROM Code checks each copy of the FAT if identical. In case the values are different, the ROM Code uses the value from the last FAT copy. With FAT32 file system, the copy system can be disabled according to a flag located in BPB_ExtFlags[7]. If this flag is set then FAT BPB_ExtFlags[3:0] is used. In this case no verification is made by the ROM Code with other copies of FAT.

The FAT is a simple array of values each referring to a cluster located in the Data Area. One entry of the array is 12, 16 or 32 bits depending on the file system in use. The value inside an entry defines whether the cluster is being used or not and if another cluster has to be taken into account. This creates a singly-linked chain of clusters defining the file. The meaning of an entry is described in [Table 4-25](#).

Note: : For compatibility reasons, clusters 0 and 1 are not used for files and those entries must contain FF8h and FFFh (for FAT12); FFF8h and FFFFh (for FAT16); FFFFFFFF8h and FFFFFFFFh (for FAT32).

Table 4-25. FAT Entry Description

FAT12	FAT16	FAT32	Description
000h	0000h	?0000000h	Free Cluster
001h	0001h	?0000001h	Reserved Cluster
002h-FEFh	0002h-FFEfH	00000002h-?FFFFFFEFh	Used Cluster; value points to next cluster
FF0h-FF6h	FFF0h-FFF6h	?FFFFFFF0h-?FFFFFFF6h	Reserved values
FF7h	FFF7h	?FFFFFFF7h	Bad Cluster
FF8h-FFFh	FFF8h-FFFFh	?FFFFFFF8h-?FFFFFFFh	Last Cluster in File

Note: FAT32 uses only bits [27:0], the upper 4 bits are usually 0 and should be left untouched. When accessing the Root Directory for FAT32, the ROM Code just starts from the Root Directory Cluster entry and follows the linked chain to retrieve the clusters.

When the booting file has been found, the ROM Code buffers each FAT entry corresponding to the file in a sector way. This means each cluster is translated to one or several sectors depending on how many sectors are in a cluster (BPB_SecPerClus). This buffer is used later on by the booting procedure to access the file.

4.7.4.10 Pins Used for MMC Boot

The list of pins that are configured by the ROM in case of MMC boot mode are as follows. Please note that all the pins might not be driven at boot time.

Table 4-26. Pins Used for MMC Boot

Signal name	Pin used
clk	mmc1_clk
cmd	mmc1_cmd_mux0
dat0	mmc1_dat0
dat1	mmc1_dat1
dat2	mmc1_dat2
dat3	mmc1_dat3

4.7.5 SPI

SPI EEPROMs or SPI flashes have an EEPROM or NOR flash backend and they connect to the device using the serial SPI protocol. These typically devices operate in three stages – the command stage, the address stage and the data transfer stage. The command is usually an 8 bit value followed by the address (depending on the size of the device) followed by the data to be read or written. Because of the need for fewer pins, these devices are comparatively inexpensive, easy for board layout, and are the devices of choice when cost, complexity and form factor are critical considerations.

4.7.5.1 SPI Features

The following features are included in SPI:

- Supports 12 MHz clock (50% duty cycle)
- Supports only SPI Mode 3 (clock polarity = 1, clock phase = 1)
- Supports only 24 bit addressable EEPROMs

- Supports only 4-pin SPI mode (CS, CLK, Serial Input, Serial Output)
- The boot devices must be connected to channel 0 and must support the read command (03h)
- The boot image is copied into internal memory and then executed

4.7.5.2 Initialization and Detection

The ROM Code initializes the SPI controller, pin muxing and clocks for communicating with the SPI device. The controller is initialized in Mode 3 and the clock is setup to operate at 12 MHz. There is no specific device identification routine that is executed by the ROM code to identify whether a boot device is preset or not. If no SPI device is present, the sector read will return only 0xFFFFFFFF and the SPI boot will be treated as failed.

4.7.5.3 SPI Read Sector Procedure

The ROM Code reads SPI data from the boot device in 512 byte sectors. For each call to the SPI Read Sector routine, the SPI Read Command (0x03) is sent along with the 24 bit start address of the data to be read.

From the next iteration onwards, a dummy value is transmitted on the master out line and the data is received on the master in line. This needs to be done because SPI protocol always operated in full duplex mode. The dummy data transmitted by the ROM is the Read Command appended to the start address. The data from the boot device is received MSB first.

As the A8 is a little-endian processor, and SPI operates in a big-endian format, this means that while writing to the flash, care needs to be taken to write the image in a big-endian format. This way we can avoid doing the endian conversion at boot time, thus improving boot performance

4.7.5.4 Pins Used for SPI Boot

The list of device pins that are configured by the ROM in the case of SPI boot mode are shown in the table below. Please note that all the pins might not be driven at boot time.

The default state of the other SPI chip select pins could be low at POR, so care must be taken if any other devices are connected to CS[1], CS[2] or CS[3]. External logic must be used to ensure that the chip select to these devices are not enabled by default. .

Table 4-27. Pins Used for SPI Boot

Signal name	Pin used
cs	spi0_cs0
miso	spi0_d0
mosi	spi0_d1
clk	spi0_sclk

4.7.6 Blocks and Sectors Search Summary

[Table 4-28](#) summarizes numbers of blocks and sectors which are searched during the memory booting from devices requiring image shadowing. NAND is organized with blocks, which are erasable units.

Table 4-28. Blocks and Sectors Searched on non-XIP Memories

Memory	Maximum number of blocks checked	Number of sectors searched
NAND	first 4	Number of sectors in one block ⁽¹⁾
SPI, eMMC/eSD and MMC/SD cards (raw mode)	first 4	1

⁽¹⁾ Depends on NAND geometry.

Regarding MMC/SD card booting in FAT mode, the file system area is searched for one file.

4.8 Peripheral Booting

4.8.1 Overview

The ROM Code can boot from three different peripheral interfaces:

EMAC	1000/100/10 Mbps Ethernet, using standard TCP/IP network boot protocols BOOTP and TFTP
PCIe	One lane @250 MB/s
UART	115.2Kbps, 8 bits, even parity, 1 stop bit, no flow control

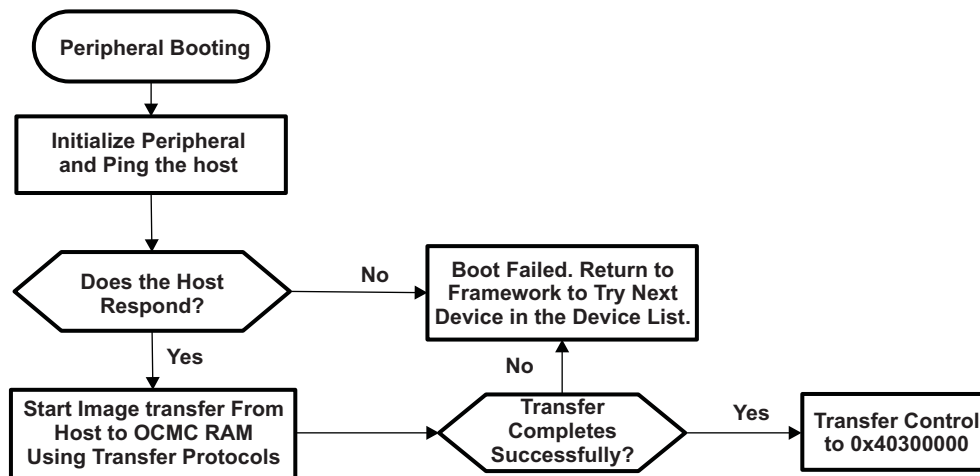

The purpose of booting from a peripheral interface is to download a boot image from an external host (typically a PC). This booting method is mostly used for programming flash memories connected to the device (e.g., in the case of initial flashing, firmware update or servicing).

4.8.2 Boot Image Location and Size

The boot image is downloaded directly into internal RAM at the location 40300000h. The maximum size of downloaded image is 110KB.

4.8.3 Peripheral Boot Procedure Overview

Figure 4-23. Peripheral Booting Procedure

4.8.4 EMAC Boot Procedure

4.8.4.1 Device Initialization

- EMAC boot uses the CPGMAC0 subsystem of the device. It can be connected to external Ethernet PHY using the GMII0, RMII or RGMII interfaces and MDIO pins
- Device uses EFUSE register MAC_ID0 for Ethernet MAC address of the device.
- Device detects if the PHY is alive on the MDIO interface and
 - Reads the STATUS register to check if Ethernet link is active
 - Reads the CONTROL register to detect the auto-negotiated mode of operation
 - Is the mode full-duplex or half duplex
 - Speed of operation, 1000/100/10 Mbps

4.8.4.2 BOOTP (RFC 951)

The device then proceeds to obtain the IP and Boot information using BOOTP protocol. The device prepares and broadcasts the BOOTP message that has the following information:

- Device MAC address in “chaddr” field – to uniquely identify the device to the server.
- “Vender-class-identifier” option number 60 (RFC 1497, RFC 1533). Servers could use this information to identify the device type. The value present is “DM816x ROM v1.0”
- “Client-identifier” option number 61 (RFC 1497, RFC 1533). This has the ASIC-ID structure which contains additional info for the device.

The device then expects a BOOTP response that provides the following information for the booting to proceed:

- Device IP address from “yiaddr” field
- Subnetmask from extended option 1 (RFC 1497, RFC 1533)
- Gateway IP from extended option number 3 (RFC 1497, RFC 1533) or from “giaddr” field of BOOTP response.
- Boot image filename from “file” field
- TFTP server IP address from the “siaddr” field
- Timeouts and retries
- Exponentially increasing timeouts starting from 4s
- Five retries

4.8.4.3 FTP (RFC 1350)

After a successful BOOTP completion, the device initiates the TFTP download of the boot image into SRAM. The device has the capability to reach TFTP server within the local subnet or outside, though the gateway.

Timeouts and retries

- Timeout of 1s to receive a response for the READ request
- 5 retries for the READ request
- Retries are managed by server once data transfer starts (server re-sends a data packet if the ACK was not received within a timeout value)
- Device has a 60s timeout to complete the data transfer, to handle the scenario if the server dies in the middle of a data transfer

4.8.4.4 Pins Used for EMAC Boot

The list of pins that are configured by the ROM in case of EMAC boot mode are in . Note that all the pins might not be driven at boot time.

Table 4-29. Pins Used for EMAC Boot

4.8.5 PCIe Boot Procedure

4.8.5.1 Device Initialization

- ROM code configures the PCIe vendor ID as 104Ch

- ROM code configures the PCIe device ID as B801h.
- The BAR window sizes for inbound translation are configurable as per the tables below
- Only legacy interrupt A is enabled. MSI is disabled
- The device is configured in the D0 power state
- The link and device capability is configured for maximum flexibility
- The PCIe settings used by the ROM can be overridden after boot by the Root Complex

Figure 4-24. PCIe Peripheral Booting Procedure

Table 4-33. PCIe 32 BAR Window Size Configuration

PCIe32							
BAR0	BAR1	BAR2		BAR3		BAR4	
		CS0BW	Size	CS0MUX[1:0]	Size	CS0WAIT	Size
4KB	8MB	0	0	0	0	0	0
		1	16MB	01	32MB	1	256MB
				10	64MB		
				11	128MB

	01	256MB	01	1GB
	10	523MB	10	2GB
	11	1GB	11	4GB

Table 4-35. PCIe BAR Window Base Address and Offset Configuration

BAR	Base Address	Offset	Comments
0	0000 0000h	0000 0000h	
1 (64bit BAR0)	4000 0000h	4030 0000h	OCMC RAM
2	6000 0000h	5000 0000h	GPMC
3 (64 Bit BAR2)	8000 0000h	8000 0000h	DDR 0
4	A000 0000h	C000 0000h	DDR 1

Note that the base address and offset configurations can be changed from the host after the enumeration is complete.

4.8.6 UART Boot Procedure

4.8.6.1 Device Initialization

- UART boot uses UART0
- UART0 is configured to run at 115200 baud, 8-bits, even parity, 1 stop bit and no flow control.

4.8.6.2 Boot Image Download

- UART boot uses x-modem client protocol to receive the boot image.
- Utilities like hyperterm, teraterm, minicom can be used on the PC side to download the boot image to the board
- With x-modem packet size of 1K throughout is roughly about 4KBytes/Sec.
- The ROM code will ping the host 10 times in 3s to start x-modem transfer. If host does not respond, UART boot will timeout.
- Once the transfer has started, if the host does not send any packet for 3s, UART boot will time out.
- If the delay between two consecutive bytes of the same packet is more than 2ms, the host is requested to re-transmit the entire packet again.
- Error checking using the CRC-16 support in x-modem. If an error is detected, the host is requested to re-transmit the packet again.

4.8.6.3 Pins Used for UART Boot Mode

The list of pins that are configured by the ROM incase of UART boot mode are in [Table 4-36](#). Note that all the pins might not be driven at boot time.

Table 4-36. Pins Used for UART Boot

Signal name	Pin used
rx	uart0_rxd
tx	uart0_txd

ASIC ID Structure

The ASIC ID size is 58 Bytes for UART and 81 Bytes for others.

4.9 Image Format

4.9.1 Overview

All preceding sections describe how the ROM Code searches and detects a boot image from a memory or a peripheral device type. This section describes the format of the boot image itself.

A boot image is basically made out of two major parts:

- The software to execute
- A header containing the destination address and size of the image for non-XIP memory devices

The mandatory section of a boot image contains the software which will be loaded into the memory and executed. An overview of the image formats is shown in [Figure 4-25](#).

Figure 4-25. Image Formats

(a) Non - XIP Memory Booting

It is used for memories which require shadowing (for example, an MMC). The image must begin with a header which contains information on image size and destination address

(b) Peripheral Booting and XIP Memory Booting

When the memory device is of XIP type (e.g., NOR) the header is not needed and the image can contain code for direct execution. The same image format is used for peripheral booting (where the code is transferred to internal RAM).

4.9.1.1 Image Formats

When the booting memory device is non-XIP (for example, an MMC), the image must contain a small header with the size of the software to load, and the destination address which tells where to store it.

The header is not needed when booting from an XIP memory device (for example, NOR) or in case of peripheral booting. In this case, the peripheral or memory booting image starts directly with executable code.

Table 4-37. Image Formats

Field	non-XIP device (offset)	XIP device (offset)	Size (bytes)	Description
Size	0000h	-	4	Size of the image
Destination	0004h	-	4	Address where to store the image / code entry point
Image	0008h	0000h	x	Executable code

Note: the “Destination” address field stands for both:

- Target address for the image copy from the non-XIP storage to the target XIP location (for example, internal RAM or SDRAM)
- Entry point for image code

In other words, the user must take care to locate the code entry point to the target address for image copy.

4.9.2 Table of Contents

The TOC is 512 bytes long and consists of a maximum of 16 TOC items (32 bytes long each), located one after the other. If the number of TOC items is less than 16, the TOC item after the last used TOC item must be filled by FFh. Each TOC item contains information required by the ROM Code such as item location, size and name, as illustrated in [Figure 4-26](#) and [Table 4-38](#)

Figure 4-26. TOC Structure

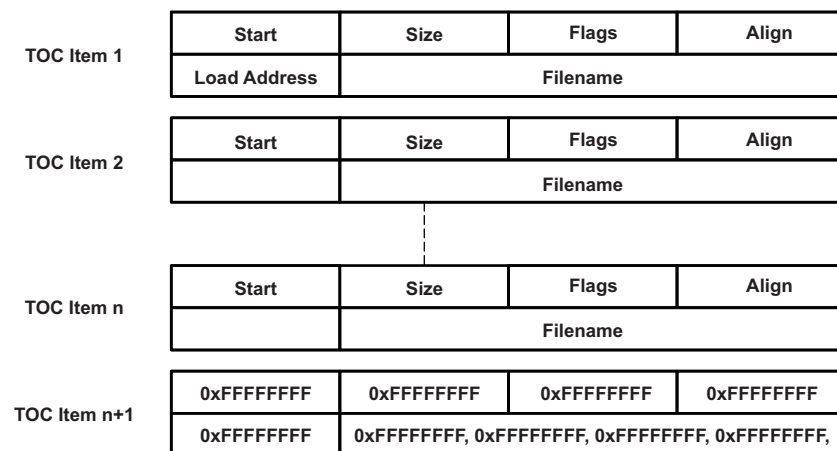

Table 4-38. TOC Item Fields

Offset	Field	Size [bytes]	Description
0h	Start	4	Offset from the start address of TOC to the actual address of sub image.
4h	Size	4	Size of sub image.
8h	Flags	4	Reserved
Ch	Align	4	Reserved

Table 4-38. TOC Item Fields (continued)

Offset	Field	Size [bytes]	Description
10h	Load Address	4	For an Initial SW TOC item during Memory Booting this field is the target address for item copy. It is ignored in other cases.
14h	Filename	12	12 character long name of sub image, including the zero ('\0') terminator.

The ROM Code recognizes sections pointed to by the TOC based on the filename as described in [Table 4-39](#).

- The 'X-LOADER', '2ND', 'MLO', or 'ULO' section contains the Initial Software
- Optionally, the TOC may contain CH sections. CHSETTINGS is a mandatory section of CH and is used to recognize CH presence.

Table 4-39. Filenames in TOC

Filename	Description
X-LOADER	Bootstrap
2ND	Secondary loader (peripheral booting)
MLO	MMC/SD Loader (Memory booting)
ULO	Alternative filename used for Secondary Loader via USB (Peripheral booting)
CHSETTINGS	Configuration Header general setting item. this item is mandatory for CH
CHRAM	Configuration Header EMIF item
CHFLASH	Configuration Header GPMC item
CHMMCS	Configuration Header MMD/SD item

4.10 Execution

4.10.1 Overview

One of the early steps of the public ROM code execution is to search for a boot image from the requested medium (configured by the MBOOT pins) and copy it to RAM if needed. If the boot interface is non-XIP then the image is simply copied to the provided destination address (internal or external RAM) and then executed. If the boot interface is of XIP type then the image copy is not needed and execution is directly given to the XIP memory.

4.10.2 Execution

The image is executed at the time the ROM Code performs the branch to the first executable instruction inside the Initial SW. For a non-XIP device, the execution address is the first word after the header. The branch is performed in ARM supervisor mode. The R0 register points to the booting parameters structure (see [Table 4-40](#)) which contains details about the booting execution.

Table 4-40. Booting Parameters Structure

Offset	Field	Size [bytes]	Description
0h	Reserved	4	Reserved
4h	Memory booting device descriptor address	4	Pointer to the memory device descriptor that has been used during the memory booting process
5h	Current Booting Device	1	Code of device used for booting 0h – void, no device 1h – XIP MUX1 memory 2h – XIPWAIT MUX1 memory (wait monitoring on)

Table 4-40. Booting Parameters Structure (continued)

Offset	Field	Size [bytes]	Description
			3h – XIP MUX2 memory 4h – XIPWAIT MUX 2 (wait monitoring on) 5h – NAND 6h – NAND with I2C 8h – MMC/SD port 0 9h – MMC/SD port 1 15h – SPI 41h – UART0 44h – USB 46h – CPGMAC0
6h	Reset Reason	1	Current reset reason bit mask (bit=1-event present) [0] – power-on reset [1] – global software reset [3] – security violation reset [4] – MPU watchdog reset [5] – secure watchdog reset [6] – external warm reset Other bits – reserved
7h	Reserved	1	Reserved

4.11 Services for HLOS Support

The TrustZone® architecture of the Cortex™-A8 core restricts accesses to secure mode only coprocessor registers. The Cortex-A8 core of the device is forbidden from entering the secure mode and hence cannot directly access any secure resources. However, a high-level OS needs to access secure registers for L2 cache maintenance and other operations.

For these purposes, the ROM Code provides different primitives that can be called. These services are implemented in monitor mode (service must be called by writing function ID into R12 register and using the SMC instruction) and do not use any resources like RAM/stack or hardware outside the MPU. The caller must take care of saving R0, R1, and R12 before using these APIs, as these get overwritten by the ROM code.

The services provided are:

- Write Auxiliary Control Register (WRITE_ACR).
- Write Nonsecure Access Control Register (WRITE_NACR).
- Write L2 Cache Auxiliary Control Register (WRITE_CACR).

Table 4-41. Write Auxiliary Control Register (WRITE_ACR)

Function ID	Description	
R12 = 0x100	This function writes the ARM CP15 Auxiliary Control Register with the input value in R0.	
Parameters		
Type	Field	Description
Input	32 bit unsigned integer – R0 32 bit unsigned integer – R1	Value to set in the register Don't care
Output	-	-
Return	-	-

Table 4-42. Write Nonsecure Access Control Register (WRITE_NACR)

Function ID	Description	
R12 = 0x101	This function writes the ARM CP15 Nonsecure Access Control Register with the input value in R0.	
Parameters		
Type	Field	Description
Input	32 bit unsigned integer – R0 32 bit unsigned integer – R1	Value to set in the register Don't care
Output	-	-
Return	-	-

Table 4-43. Write L2 Cache Auxiliary Control Register (WRITE_CACR)

Function ID	Description	
R12 = 0x102	This function writes the ARM CP15 L2 Cache Auxiliary Control Register with the input value in R0.	
Parameters		
Type	Field	Description
Input	32 bit unsigned integer – R0 32 bit unsigned integer – R1	Value to set in the register Don't care
Output	-	-
Return	-	-

For more information about ARM registers, see the *Cortex™-A8 Technical Reference Manual*.

4.12 Tracing

Tracing in the Public ROM Code consist in three 32 bit vectors for which each bit corresponds to a particular “way point” in the ROM Code execution sequence (refer to [Section 4.3.2.4](#)). Tracing vectors are initialized at the very beginning of the startup phase and updated all along the boot process.

There are two sets of tracing vectors. The first set is the current trace information (after cold or warm reset). The second set holds a copy of trace vectors collected at the first ROM Code run after cold reset. As a consequence after a warm reset, it is possible to have visibility on the boot scenario that occurred during cold reset.

Table 4-44. Tracing Vectors

Trace vector	Bit #	Group	Meaning
1	0	General	Passed the public reset vector
1	1	General	Entered main function
1	2	General	Running after the cold reset
1	3	Boot	Main booting routine entered
1	4	Memory Boot	Memory booting started
1	5	Peripheral Boot	Peripheral booting started
1	6	Boot	Booting loop reached last device
1	7	Boot	Header found

5.14 Registers	1045

5.1 Overview

This chapter contains a general description of the DCAN Controller Area Network module, a high-integrity serial communications protocol for distributed real-time applications.

The DCAN module supports bit rates up to 1 Mbit/s and is compliant to the CAN 2.0B protocol specification. This device has two DCAN modules, referred to as DCAN0 and DCAN1 in this document.

5.1.1 Features

The DCAN module implements the following features:

- Support for CAN protocol version 2.0 part A, B
- Bit rates up to 1 MBit/s
- Dual clock source
- 64 message objects (see [Section 5.1.2.3](#))
- Individual identifier mask for each message object
- Programmable FIFO mode for message objects
- Programmable loop-back modes for self-test operation
- Suspend mode for debug support
- Software module reset
- Automatic bus on after Bus-Off state by a programmable 32-bit timer
- Message RAM parity check mechanism
- Direct access to message RAM during test mode
- CAN Rx/Tx pins configurable as general purpose input/output (I/O) pins
- Support for two interrupt lines: Level 0 and Level 1
- Local power down and wakeup support
- Automatic RAM initialization
- Support for DMA access

5.1.2 Functional Description

The DCAN module consists of the components CAN Core, Message RAM, Message RAM Interface, Message Handler, Registers and Message Object access and Module Interface (see [Figure 5-1](#)). The DCAN module performs CAN protocol communication according to ISO 11898-1. The bit rate can be programmed to values up to 1 MBit/s. Additional transceiver hardware is required for the connection to the physical layer (CAN bus).

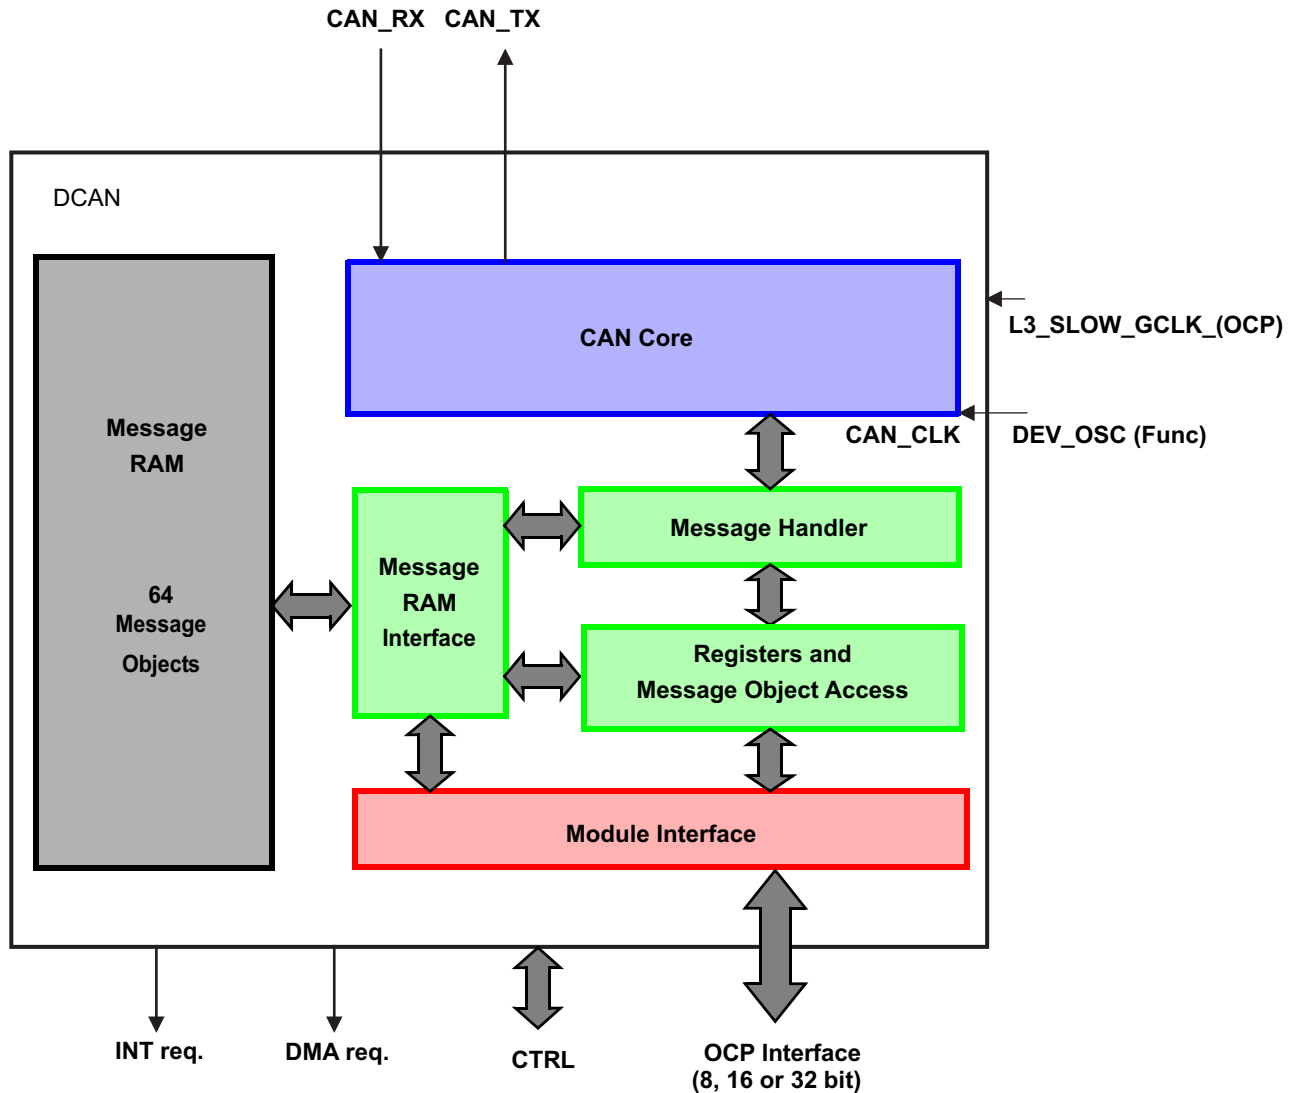

For communication on a CAN network, individual message objects can be configured. The message objects and identifier masks are stored in the message RAM.

All functions concerning the handling of messages are implemented in the message handler. Those functions are acceptance filtering, the transfer of messages between the CAN core and the message RAM, and the handling of transmission requests, as well as the generation of interrupts or DMA requests.

The register set of the DCAN module can be accessed directly by the CPU via the module interface. These registers are used to control and configure the CAN core and the message handler, and to access the message RAM.

[Figure 5-1](#) shows the DCAN block diagram and its features are described below.

Figure 5-1. DCAN Block Diagram

5.1.2.1 CAN Core

The CAN core consists of the CAN protocol controller and the Rx/Tx shift register. It handles all ISO 11898-1 protocol functions.

5.1.2.2 Message Handler

The message handler is a state machine that controls the data transfer between the single-ported message RAM and the CAN core's Rx/Tx shift register. It also handles acceptance filtering and the interrupt/DMA request generation as programmed in the control registers.

5.1.2.3 Message RAM

DCAN0 and DCAN1 enables the storage of 64 CAN messages.

5.1.2.4 Message RAM Interface

Three interface register sets control the CPU read and write accesses to the message RAM. There are two interface registers sets for read and write access, IF1 and IF2, and one interface register set for read access only, IF3. Additional information can be found in [Section 5.9.12](#).

The interface registers have the same word-length as the message RAM.

5.1.2.5 Registers and Message Object Access

Data consistency is ensured by indirect accesses to the message objects. During normal operation, all CPU and DMA accesses to the message RAM are done through interface registers. In a dedicated test mode, the message RAM is memory mapped and can be directly accessed by either CPU or DMA.

5.1.2.6 Module Interface

The DCAN module registers are accessed by the CPU or user software through a 32-bit peripheral bus interface.

5.1.2.7 Dual Clock Source

Two clock domains are provided to the DCAN module: the peripheral synchronous clock domain (L3_SLOW_GCLK) and the peripheral asynchronous clock source domain (DEV_OSC) for CAN_CLK.

5.2 CAN Operation

After hardware reset, the `Init` bit in the CAN control register (DCAN CTL) is set and all CAN protocol functions are disabled. The CAN module must be initialized before operating it. [Figure 5-2](#) illustrates the basic initialization flow for the CAN module.

5.2.1 CAN Module Initialization

A general CAN module initialization would mean the following two critical steps:

- Configuration of the CAN bit timing
- Configuration of message objects

To initialize the CAN controller, the CPU has to set up the CAN bit timing and those message objects that have to be used for CAN communication. Message objects that are not needed, can be deactivated.

Figure 5-2. CAN Module General Initialization Flow

5.2.1.1 Configuration of CAN Bit Timing

The CAN module must be in initialization mode to configure the CAN bit timing.

For CAN bit timing software configuration flow, see [Figure 5-3](#).

Step 1: Enter *initialization mode* by setting the `Init` (Initialization) bit in the CAN control register.

While the `Init` bit is set, the message transfer from and to the CAN bus is stopped, and the status of the `CAN_TX` output is recessive (high).

The CAN error counters are not updated. Setting the `Init` bit does not change any other configuration register.

Also, note that the CAN module is in initialization mode on hardware reset and during Bus-Off.

Figure 5-3. CAN Bit-Timing Configuration

Step 2: Set the Configure Change Enable (`CCE`) bit in the CAN control register.

The access to the Bit Timing register (BTR) for the configuration of the bit timing is enabled when both `Init` and `CCE` bits in the CAN Control register are set.

Step 3: Wait for the `Init` bit to get set. This would make sure that the module has entered *Initialization mode*.

Step 4: Write the bit timing values into the bit timing register. See [Section 5.10.2](#) for the BTR value calculation for a given bit timing.

Step 5: Clear the `CCE` and `Init` bit.

Step 6: Wait for the `Init` bit to clear. This would ensure that the module has come out of *initialization mode*.

Following these steps, the module comes to operation by synchronizing itself to the CAN bus, provided the BTR is configured as per the CAN bus baud rate, although the message objects have to be configured before carrying out any communication.

NOTE: The module will not come out of the *initialization mode* if any incorrect BTR values are written in step 4.

NOTE: The required message objects should be configured as transmit or receive objects before the start of data transfer as explained in [Section 5.2.1](#).

5.2.1.2 Configuration of Message Objects

The message objects can be configured only through the interface registers; the CPU does not have direct access to the message object (message RAM) . Familiarize yourself with the interface register set (IFx) usage (see [Section 5.11](#)) and the message object structure (see [Section 5.12](#)) before configuring the message objects.

For more information regarding the procedure to configure the message objects, see [Section 5.8](#). All the message objects should be configured to particular identifiers or set to not valid before the message transfer is started. It is possible to change the configuration of message objects during normal operation (that is between data transfers).

NOTE: The message objects initialization is independent of the bit-timing configuration.

5.2.1.3 DCAN RAM Hardware Initialization

The memory hardware initialization for the DCAN module is enabled in the device control register, DCAN_RAMINIT, which initializes the RAM with zeros and sets parity bits accordingly. Wait for the RAMINIT_DONE bit to be set to ensure successful RAM initialization.

For more details on RAM hardware initialization, see the system module reference guide.

5.2.2 CAN Message Transfer (Normal Operation)

Once the DCAN is initialized and [Init](#) bit is reset to zero, the CAN core synchronizes itself to the CAN bus and is ready for message transfer as per the configured message objects.

The CPU may enable the interrupt lines (setting IE0 and IE1 to '1') at the same time when it clears [Init](#) and CCE. The status interrupts EIE and SIE may be enabled simultaneously.

The CAN communication can be carried out in any of the following two modes: interrupt and polling.

The interrupt register points to those message objects with [IntPnd](#) = '1'. It is updated even if the interrupt lines to the CPU are disabled (IE0/IE1 are zero).

The CPU may poll all MessageObject's [NewDat](#) and [TxRqst](#) bits in parallel from the [NewData X](#) registers and the [Transmission Request X](#) Registers (DCAN TXRQ X). Polling can be made easier if all transmit objects are grouped at the low numbers and all receive objects are grouped at the high numbers.

Received messages are stored into their appropriate message objects if they pass acceptance filtering.

The whole message (including all arbitration bits, DLC and up to eight data bytes) is stored into the message object. As a consequence (e.g., when the identifier mask is used), the arbitration bits which are masked to "don't care" may change in the message object when a received message is stored.

The CPU may read or write each message at any time via the interface registers, as the message handler guarantees data consistency in case of concurrent accesses.

If a permanent message object (arbitration and control bits set up during configuration and leaving unchanged for multiple CAN transfers) exists for the message, it is possible to only update the data bytes.

If several transmit messages should be assigned to one message object, the whole message object has to be configured before the transmission of this message is requested.

The transmission of multiple message objects may be requested at the same time. They are subsequently transmitted, according to their internal priority.

Messages may be updated or set to not valid at any time, even if a requested transmission is still pending. However, the data bytes will be discarded if a message is updated before a pending transmission has started.

Depending on the configuration of the message object, a transmission may be automatically requested by the reception of a remote frame with a matching identifier.

5.2.2.1 Automatic Retransmission

According to the CAN Specification (ISO11898), the DCAN provides a mechanism to automatically retransmit frames which have lost arbitration or have been disturbed by errors during transmission. The frame transmission service will not be confirmed to the user before the transmission is successfully completed.

By default, this automatic retransmission is enabled. It can be disabled by setting bit disable automatic retransmission ([DAR](#)) in the CAN Control register. Further details to this mode are provided in [Section 5.9.3](#).

5.2.2.2 Auto-Bus-On

By default, after the DCAN has entered Bus-Off state, the CPU can start a Bus-Off-Recovery sequence by resetting the Init bit. If this is not done, the module will stay in Bus-Off state.

The DCAN provides an automatic Auto-Bus-On feature which is enabled by bit [ABO](#) in the CAN control register. If set, the DCAN will automatically start the Bus-Off-Recovery sequence. The sequence can be delayed by a user-defined number of L3_SLOW_GCLK cycles which can be defined in the Auto-Bus-On Time register (DCAN ABOTR).

NOTE: If the DCAN goes to Bus-Off state due to a massive occurrence of CAN bus errors, it stops all bus activities and automatically sets the Init bit. Once the Init bit has been reset by the CPU or due to the Auto-Bus-On feature, the device will wait for 129 occurrences of bus Idle (equal to $129 * 11$ consecutive recessive bits) before resuming normal operation. At the end of the Bus-Off recovery sequence, the error counters will be reset.

5.2.3 Test Modes

The DCAN module provides several test modes which are mainly intended for production tests or self test.

For all test modes, the [Test](#) bit in the CAN control register needs to be set to 1. This enables write access to the test register (DCAN TEST).

NOTE: When using any of the Loop Back modes, it must be ensured by software that all message transfers are finished before setting the [Init](#) bit to 1.

5.2.3.1 Silent Mode

The silent mode may be used to analyze the traffic on the CAN bus without affecting it by sending dominant bits (for example, acknowledge bit, overload flag, active error flag). The DCAN is still able to receive valid data frames and valid remote frames, but it will not send any dominant bits. However, these are internally routed to the CAN core.

[Figure 5-4](#) shows the connection of signals CAN_TX and CAN_RX to the CAN core in silent mode. Silent mode can be activated by setting the [Silent](#) bit in the Test register to one. In ISO 11898-1, the silent mode is called the bus monitoring mode.

Figure 5-4. CAN Core in Silent Mode

5.2.3.2 Loopback Mode

The loopback mode is mainly intended for hardware self-test functions. In this mode, the CAN core uses internal feedback from Tx output to Rx input. Transmitted messages are treated as received messages, and can be stored into message objects if they pass acceptance filtering. The actual value of the CAN_RX input pin is disregarded by the CAN core. Transmitted messages can still be monitored at the CAN_TX pin.

In order to be independent from external stimulation, the CAN core ignores acknowledge sampled in the acknowledge slot of a data/remote frame.

Figure 5-5 shows the connection of signals CAN_TX and CAN_RX to the CAN core in loopback mode.

Loopback mode can be activated by setting bit **LBack** in the test register to one.

NOTE: In loopback mode, the signal path from CAN core to Tx pin, the Tx pin itself, and the signal path from Tx pin back to CAN core are disregarded. For including these into the testing, see [Section 5.2.3.3](#).

Figure 5-5. CAN Core in Loopback Mode

5.2.3.3 External Loopback Mode

The external loopback mode is similar to the loopback mode; however, it includes the signal path from CAN core to Tx pin, the Tx pin itself, and the signal path from Tx pin back to CAN core. When external loopback mode is selected, the input of the CAN core is connected to the input buffer of the Tx pin.

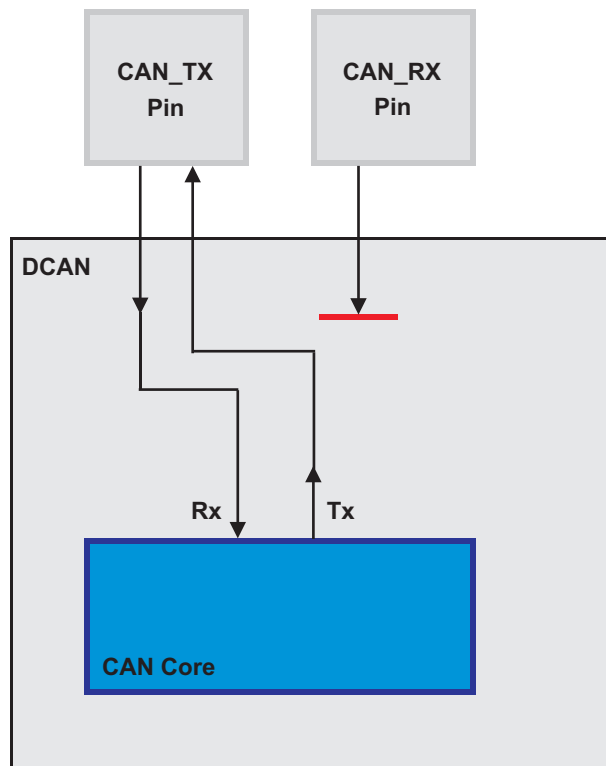

With this configuration, the Tx pin IO circuit can be tested.

External loopback mode can be activated by setting bit **ExL** in test register to one.

Figure 5-6 shows the connection of signals CAN_TX and CAN_RX to the CAN core in external loopback mode.

NOTE: When loopback mode is active (LBack bit set), the ExL bit will be ignored.

Figure 5-6. CAN Core in External Loopback Mode

5.2.3.4 Loopback Mode Combined With Silent Mode

It is also possible to combine loopback mode and silent mode by setting bits **LBack** and **Silent** at the same time. This mode can be used for a “Hot Selftest,” i.e., the DCAN hardware can be tested without affecting the CAN network. In this mode, the CAN_RX pin is disconnected from the CAN core and no dominant bits will be sent on the CAN_TX pin.

Figure 5-7 shows the connection of the signals CAN_TX and CAN_RX to the CAN core in case of the combination of loopback mode with silent mode.

Figure 5-7. CAN Core in Loop Back Combined With Silent Mode

5.2.3.5 Software Control of CAN_TX pin

Four output functions are available for the CAN transmit pin CAN_TX. In addition to its default function (serial data output), the CAN_TX pin can drive constant dominant or recessive values, or it can drive the CAN sample point signal to monitor the CAN core's bit timing.

Combined with the readable value of the CAN_RX pin, this function can be used to check the physical layer of the CAN bus.

The output mode of pin CAN_TX is selected by programming the test register bits Tx[1:0] as described in section [Section 5.14.1.6](#).

NOTE: The software control for the CAN_TX pin interferes with CAN protocol functions. For CAN message transfer or any of the test modes (loopback mode, external loopback mode or silent mode), the CAN_TX pin should operate in its default functionality.

5.3 Dual Clock Source

Two clock domains are provided to the DCAN module: the peripheral synchronous clock domain (L3_SLOW_GCLK) as the general module clock source, and the peripheral asynchronous clock source domain (DEV_OSC) provided to the CAN core (as clock source CAN_CLK) for generating the CAN bit timing.

Both clock domains can be derived from the same clock source (so that L3_SLOW_GCLK = DEV_OSC).

For more information on how to configure the relevant clock source registers in the system module, see the system module reference guide and the device-specific data sheet.

Between the two clock domains, a synchronization mechanism is implemented in the DCAN module in order to ensure correct data transfer.

NOTE: If the dual clock functionality is used, then L3_SLOW_GCLK must always be higher or equal to CAN_CLK (DEV_OSC) (derived from the asynchronous clock source), in order to achieve a stable functionality of the DCAN. Here also the frequency shift of the modulated L3_SLOW_GCLK has to be considered:

$$f_{0, L3_SLOW_GCLK}(OCP) \pm \Delta f_{FM, L3_SLOW_GCLK}(OCP) \geq f_{CANCLK}$$

NOTE: The CAN core has to be programmed to at least 8 clock cycles per bit time. To achieve a transfer rate of 1 MBaud when using the asynchronous clock domain as the clock source for CAN_CLK (DEV_OSC), an oscillator frequency of 8MHz or higher has to be used.

5.4 Interrupt Functionality

Interrupts can be generated on two interrupt lines: DCANINT0 and DCANINT1. These lines can be enabled by setting the **IE0** and **IE1** bits, respectively, in the CAN control register. The interrupts are level triggered at the chip level.

The DCAN provides three groups of interrupt sources: message object interrupts, status change interrupts, and error interrupts (see [Figure 5-8](#) and [Figure 5-9](#)).

The source of an interrupt can be determined by the interrupt identifiers Int0ID/Int1ID in the interrupt register (see [Section 5.14.1.5](#)). When no interrupt is pending, the register will hold the value zero.

Each interrupt line remains active until the dedicated field in the interrupt register **DCAN INT** (Int0ID / Int1ID) again reach zero (this means the cause of the interrupt is reset), or until IE0 / IE1 are reset.

The value 0x8000 in the Int0ID field indicates that an interrupt is pending because the CAN core has updated (not necessarily changed) the Error and Status register (DCAN ES and PARITYERR_EOI). This interrupt has the highest priority. The CPU can update (reset) the status bits WakeUpPnd, RxOk, TxOk and LEC by reading the error and status register **DCAN ES**, but a write access of the CPU will never generate or reset an interrupt.

Values between 1 and the number of the last message object indicates that the source of the interrupt is one of the message objects, Int0ID resp. Int1ID will point to the pending message interrupt with the highest priority. The Message Object 1 has the highest priority; the last message object has the lowest priority.

An interrupt service routine that reads the message that is the source of the interrupt may read the message and reset the message object's IntPnd at the same time (ClrIntPnd bit in the IF1/IF2 command register). When IntPnd is cleared, the interrupt register will point to the next message object with a pending interrupt.

5.4.1 Message Object Interrupts

Message object interrupts are generated by events from the message objects. They are controlled by the flags IntPND, TxIE and RxIE that are described in [Section 5.12.1](#).

Message object interrupts can be routed to either DCANINT0 or DCANINT1 line, controlled by the interrupt multiplexer register (DCAN INTMUX12 to DCAN INTMUX78), see [Section 5.14.1.17](#).

5.4.2 Status Change Interrupts

The events WakeUpPnd, RxOk, TxOk and LEC in error and status register (**DCAN ES**) belong to the status change interrupts. The status change interrupt group can be enabled by **SIE** bit in the CAN control register.

If **SIE** is set, a status change interrupt will be generated at each CAN frame, independent of bus errors or valid CAN communication, and also independent of the message RAM configuration.

Status change interrupts can only be routed to interrupt line DCAN0INT, which has to be enabled by setting **IE0** in the CAN control register.

NOTE: Reading the error and status register will clear the WakeUpPnd flag. If in global power-down mode, the WakeUpPnd flag is cleared by such a read access before the DCAN module has been waken up by the system, the DCAN may re-assert the WakeUpPnd flag, and a second interrupt may occur.

5.4.3 Error Interrupts

The events PER, BOff and EWarn, monitored in the Error and Status register, **DCAN ES**, belong to the error interrupts. The error interrupt group can be enabled by setting bit **EIE** in the CAN Control register.

Error interrupts can only be routed to interrupt line **DCAN0INT**, which has to be enabled by setting **IE0** in the CAN Control register.

Figure 5-8. CAN Interrupt Topology 1

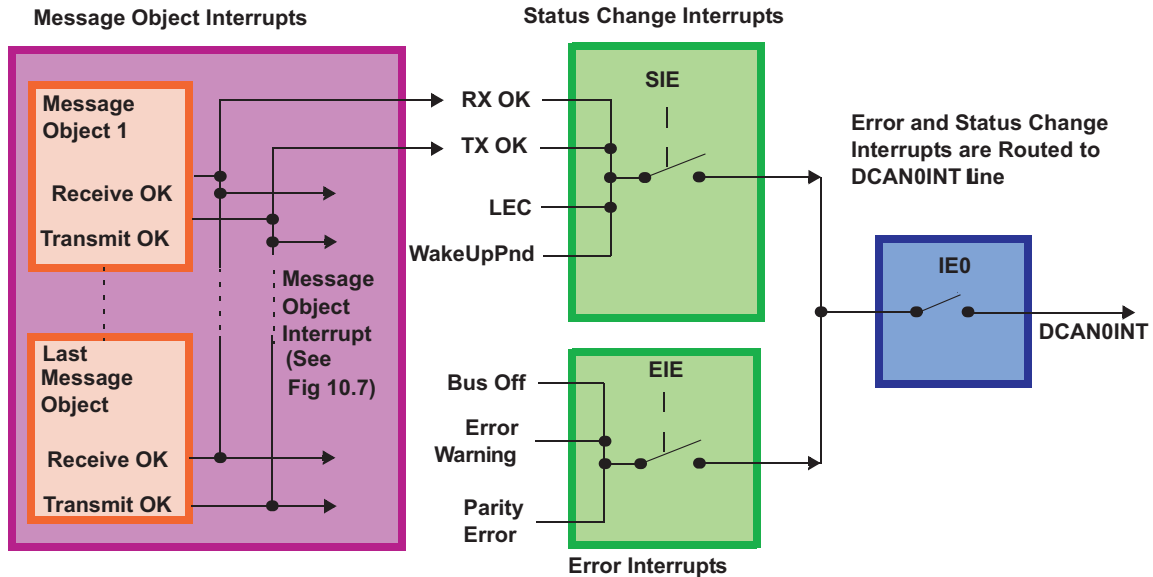

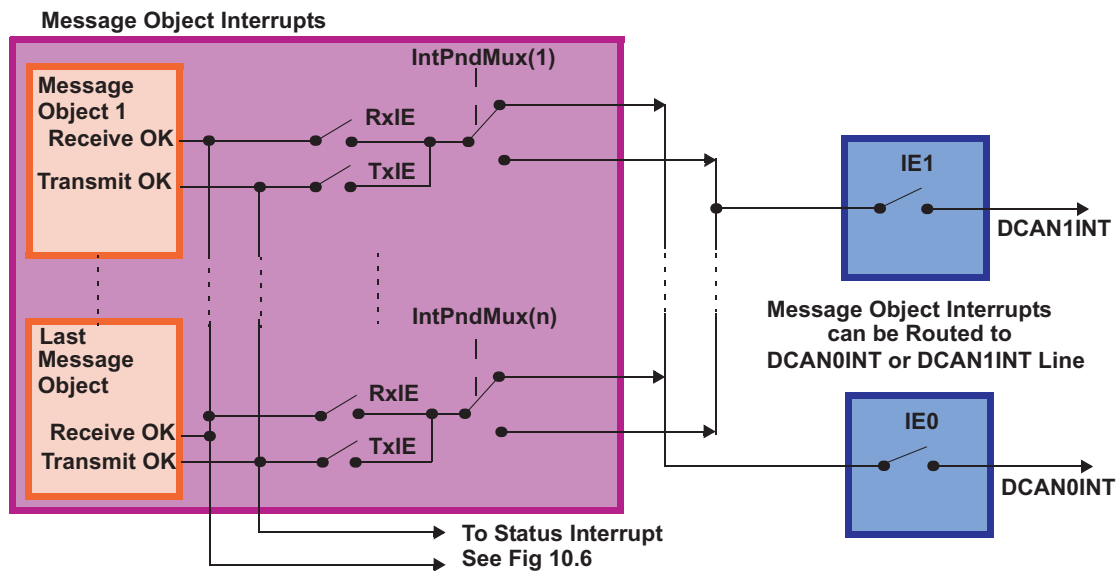

Figure 5-9. CAN Interrupt Topology 2

5.5 Local Power-Down Mode

The DCAN supports a local power-down mode, which can be controlled within the DCAN control registers.

5.5.1 Entering Local Power-Down Mode

The local power-down mode is requested by setting the **PDR** bit in CAN Control register.

The DCAN then finishes all transmit requests of the message objects. When all requests are done, DCAN waits until a bus idle state is recognized. Then it will automatically set the **InIt** bit in CAN control register to prevent any further CAN transfers, and it will also set the **PDA** bit in CAN error and status register. With setting the PDA bits, the DCAN module indicates that the local power-down mode has been entered.

During local power-down mode, the internal clocks of the DCAN module are turned off, but there is a wakeup logic (see [Section 5.5.2](#)) that can be active, if enabled. Also, the actual contents of the control registers can be read back.

NOTE: In local low-power mode, the application should not clear the InIt bit while PDR is set. If there are any messages in the message RAM which are configured as transmit messages and the application resets the init bit, these messages may get sent.

5.5.2 Wakeup From Local Power Down

There are two ways to wake up the DCAN from local power-down mode:

- The application could wake up the DCAN module manually by clearing the **PDR** bit and then clearing the **InIt** bit in CAN Control register.
- Alternatively, a CAN bus activity detection circuit can be activated by setting the wakeup on bus activity bit (**WUBA**) in the CAN control register. If this circuit is active, on occurrence of a dominant CAN bus level, the DCAN will automatically start the wakeup sequence. It will clear the PDR bit in the CAN Control register and also clear the PDA bit in the error and status register. The **WakeUpPnd** bit in CAN error and status register will be set. If status interrupts are enabled, also an interrupt will be generated. Finally the **InIt** bit in CAN control register will be cleared.

After the InIt bit has been cleared, the module waits until it detects 11 consecutive recessive bits on the CAN_RX pin and then goes bus-active again.

NOTE: The CAN transceiver circuit has to stay active in order to detect any CAN bus activity while the DCAN is in local power down mode. The first CAN message, which initiates the bus activity, cannot be received. This means that the first message received in power-down and automatic wake-up mode, is lost.

[Figure 5-10](#) shows a flow diagram about entering and leaving local power-down mode.

Figure 5-10. Local Power-Down Mode Flow Diagram

5.6 Parity Check Mechanism

The DCAN provides a parity check mechanism to ensure data integrity of message RAM data. For each word (32 bits) in message RAM, one parity bit will be calculated. The formation of the different words is according to the message RAM representation in RDA mode, see [Section 5.12.4](#).

Parity information is stored in the message RAM on write accesses and will be checked against the stored parity bit from message RAM on read accesses.

The Parity check functionality can be enabled or disabled by **PMD** bit field in the CAN control register.

In case of disabled parity check, the parity bits in message RAM will be left unchanged on write access to data area and no check will be done on read access.

If parity checking is enabled, parity bits will be automatically generated and checked by the DCAN. The parity bits could be read in debug/suspend mode (see [Section 5.12.3](#)) or in RDA mode (see [Section 5.12.4](#)). However, direct write access to the parity bits is only possible in this two modes with parity check disabled.

A parity bit will be set, if the modulo-2-sum of the data bits is 1. This definition is equivalent to: The parity bit will be set, if the number of 1 bits in the data is odd.

NOTE: The parity scheme is tied to even parity at the device level.

5.6.1 Behavior on Parity Error

On any read access to message RAM (e.g., during start of a CAN frame transmission), the parity of the message object will be checked. If a parity error is detected, the **PER** bit in the error and status register will be set. If error interrupts are enabled, an interrupt would also be generated. In order to avoid the transmission of invalid data over the CAN bus, the **MsgVal** bit of the message object will be reset.

The message object data can be read by the host CPU, independently of parity errors. Thus, the application has to ensure that the read data is valid, e.g., by immediately checking the parity error code register (DCAN PERR) on parity error interrupt.

NOTE: During RAM initialization, no parity check will be done, but if the **PMD** bit is set, the parity bits will be generated.

5.6.2 Parity Testing

Testing the parity mechanism can be done by enabling the bit **RamDirectAccess** (**RDA**) and manually writing the parity bits directly to the dedicated RAM locations. With this, data and parity bits could be checked when reading directly from RAM.

NOTE: If parity check was disabled, the application has to ensure correct parity bit handling in order to prevent parity errors later on when parity check is enabled.

5.7 Debug/Suspend Mode

The module supports the usage of an external debug unit by providing functions like pausing DCAN activities and making message RAM content accessible via OCP interface.

Before entering debug/suspend mode, the circuit will either wait until a started transmission or reception will be finished and bus idle state is recognized, or immediately interrupt a current transmission or reception. This is depending on bit **IDS** in the CAN control register.

Afterwards, the DCAN enters debug/suspend mode, indicated by **InitDbg** flag in the CAN control register.

During debug/suspend mode, all DCAN registers can be accessed. Reading reserved bits will return '0'. Writing to reserved bits will have no effect.

Also, the message RAM will be memory mapped. This allows the external debug unit to read the message RAM. For the memory organization, see [Section 5.12.3](#).

NOTE: During debug/suspend mode, the message RAM cannot be accessed via the IFx register sets.

NOTE: Writing to control registers in debug/suspend mode may influence the CAN state machine and further message handling.

For debug support, the auto clear functionality of the following DCAN registers is disabled:

- Error and status register (clear of status flags by read)
- IF1/IF2 command registers (clear of DMAActive flag by read/write)

5.8 Configuration of Message Objects

The whole message RAM should be configured before the end of the initialization, however it is also possible to change the configuration of message objects during CAN communication.

The CAN software driver library should offer subroutines that:

- Transfer a complete message structure into a message object. (Configuration)
- Transfer the data bytes of a message into a message object and set TxRqst and NewDat. (Start a new transmission)
- Get the data bytes of a message from a message object and clear NewDat (and IntPnd). (Read received data)
- Get the complete message from a message object and clear NewDat (and IntPnd). (Read a received message, including identifier, from a message object with UMask = '1')

Parameters of the subroutines are the Message Number and a pointer to a complete message structure or to the data bytes of a message structure.

Two examples of assigning the IFx interface register sets to these subroutines are shown here:

In the first method, the tasks of the application program that may access the module are divided into two groups. Each group is restricted to the use of one of the interface register sets. The tasks of one group may interrupt tasks of the other group, but not of the same group.

In the second method, which may be a special case of the first method, there are only two tasks in the application program that access the module. A Read_Message task that uses IF2 or IF3 to get received messages from the message RAM and a Write_Message task that uses IF1 to write messages to be transmitted (or to be configured) into the message RAM. Both tasks may interrupt each other.

5.8.1 Configuration of a Transmit Object for Data Frames

Table 5-1 shows how a transmit object can be initialized.

Table 5-1. Initialization of a Transmit Object

MsgVal	Arb	Data	Mask	EoB	Dir	NewDat	MsgLst	RxIE	TxIE	IntPnd	RmtEn	TxRqst
1	appl.	appl.	appl.	1	1	0	0	0	appl.	0	appl.	0

The arbitration bits (ID[28:0] and Xtd bit) are given by the application. They define the identifier and type of the outgoing message. If an 11-bit identifier (standard frame) is used (Xtd = '0'), it is programmed to ID[28:18]. In this case, ID[17:0] can be ignored.

The data registers (DLC[3:0] and Data0-7) are given by the application. TxRqst and RmtEn should not be set before the data is valid.

If the TxIE bit is set, the IntPnd bit will be set after a successful transmission of the message object.

If the RmtEn bit is set, a matching received remote frame will cause the TxRqst bit to be set; the remote frame will autonomously be answered by a data frame.

The mask bits (Msk[28:0], UMask, MXtd, and MDir bits) may be used (UMask='1') to allow groups of remote frames with similar identifiers to set the TxRqst bit. The Dir bit should not be masked. For details, see Section 5.9.8. Identifier masking must be disabled (UMask = '0') if no remote frames are allowed to set the TxRqst bit (RmtEn = '0').

5.8.2 Configuration of a Transmit Object for Remote Frames

It is not necessary to configure transmit objects for the transmission of remote frames. Setting TxRqst for a receive object causes the transmission of a remote frame with the same identifier as the data frame for which this receive object is configured.

5.8.3 Configuration of a Single Receive Object for Data Frames

Table 5-2 shows how a receive object for data frames can be initialized.

Table 5-2. Initialization of a single Receive Object for Data Frames

MsgVal	Arb	Data	Mask	EoB	Dir	NewDat	MsgLst	RxIE	TxIE	IntPnd	RmtEn	TxRqst
1	appl.	appl.	appl.	1	0	0	0	appl.	0	0	0	0

The arbitration bits (ID[28:0] and Xtd bit) are given by the application. They define the identifier and type of accepted received messages. If an 11-bit Identifier (standard frame) is used (Xtd = '0'), it is programmed to ID[28:18]. In this case, ID[17:0] can be ignored. When a data frame with an 11-bit Identifier is received, ID[17:0] is set to '0'.

The data length code (DLC[3:0]) is given by the application. When the message handler stores a data frame in the message object, it will store the received data length code and eight data bytes. If the data length code is less than 8, the remaining bytes of the message object may be overwritten by non specified values.

The mask bits (Msk[28:0], UMask, MXtd, and MDir bits) may be used (UMask = '1') to allow groups of data frames with similar identifiers to be accepted. The Dir bit should not be masked in typical applications. If some bits of the mask bits are set to "don't care," the corresponding bits of the arbitration register will be overwritten by the bits of the stored data frame.

If the RxIE bit is set, the IntPnd bit will be set when a received data frame is accepted and stored in the message object.

If the TxRqst bit is set, the transmission of a remote frame with the same identifier as actually stored in the arbitration bits will be triggered. The content of the arbitration bits may change if the mask bits are used (UMask = '1') for acceptance filtering.

5.8.4 Configuration of a Single Receive Object for Remote Frames

Table 5-3 shows how a receive object for remote frames can be initialized.

Table 5-3. Initialization of a Single Receive Object for Remote Frames

MsgVal	Arb	Data	Mask	EoB	Dir	NewDat	MsgLst	RxIE	TxIE	IntPnd	RmtEn	TxRqst
1	appl.	appl.	appl.	1	1	0	0	appl.	0	0	0	0

A receive object for remote frames may be used to monitor remote frames on the CAN bus. The remote frame stored in the receive object will not trigger the transmission of a data frame. Receive objects for remote frames may be expanded to a FIFO buffer (see Section 5.8.5).

UMask must be set to '1.' The mask bits (Msk[28:0], UMask, MXtd, and MDir bits) may be set to "must-match" or to "don't care," to allow groups of remote frames with similar identifiers to be accepted. The Dir bit should not be masked in typical applications. For details, see Section 5.9.8.

The arbitration bits (ID[28:0] and Xtd bit) may be given by the application. They define the identifier and type of accepted received remote frames. If some bits of the mask bits are set to "don't care," the corresponding bits of the arbitration bits will be overwritten by the bits of the stored remote frame. If an 11-bit Identifier (standard frame) is used (Xtd = '0'), it is programmed to ID[28:18]. In this case, ID[17:0] can be ignored. When a remote frame with an 11-bit Identifier is received, ID[17:0] will be set to '0.'

The data length code (DLC[3:0]) may be given by the application. When the message handler stores a remote frame in the message object, it will store the received data length code. The data bytes of the message object will remain unchanged.

If the RxIE bit is set, the IntPnd bit will be set when a received remote frame is accepted and stored in the message object.

5.8.5 Configuration of a FIFO Buffer

With the exception of the EoB bit, the configuration of receive objects belonging to a FIFO buffer is the same as the configuration of a single receive object.

To concatenate multiple message objects to a FIFO buffer, the identifiers and masks (if used) of these message objects have to be programmed to matching values. Due to the implicit priority of the message objects, the message object with the lowest number will be the first message object of the FIFO buffer. The EoB bit of all message objects of a FIFO buffer except the last one have to be programmed to zero. The EoB bits of the last message object of a FIFO Buffer is set to one, configuring it as the end of the block.

5.9 Message Handling

When initialization is finished, the DCAN module synchronizes itself to the traffic on the CAN bus. It does acceptance filtering on received messages and stores those frames that are accepted into the designated message objects. The application has to update the data of the messages to be transmitted and to enable and request their transmission. The transmission is requested automatically when a matching remote frame is received.

The application may read messages which are received and accepted. Messages that are not read before the next messages is accepted for the same message object will be overwritten.

Messages may be read interrupt-driven or after polling of NewDat.

5.9.1 Message Handler Overview

The message handler state machine controls the data transfer between the Rx/Tx shift register of the CAN core and the message RAM. It performs the following tasks:

- Data transfer from message RAM to CAN core (messages to be transmitted)
- Data transfer from CAN core to the message RAM (received messages)
- Data transfer from CAN core to the acceptance filtering unit
- Scanning of message RAM for a matching message object (acceptance filtering)
- Scanning the same message object after being changed by IF1/IF2 registers when priority is the same or higher as the message the object found by last scanning
- Handling of TxRqst flags
- Handling of interrupt flags

The message handler registers contains status flags of all message objects grouped into the following topics:

- Transmission Request Flags
- New Data Flags
- Interrupt Pending Flags
- Message Valid Registers

Instead of collecting above listed status information of each message object via IFx registers separately, these message handler registers provides a fast and easy way to get an overview, for example, about all pending transmission requests.

All message handler registers are read-only.

5.9.2 Receive/Transmit Priority

The receive/transmit priority for the message objects is attached to the message number, not to the CAN identifier. Message object 1 has the highest priority, while the last implemented message object has the lowest priority. If more than one transmission request is pending, they are serviced due to the priority of the corresponding message object so messages with the highest priority, for example, can be placed in the message objects with the lowest numbers.

The acceptance filtering for received data frames or remote frames is also done in ascending order of message objects, so a frame that has been accepted by a message object cannot be accepted by another message object with a higher message number. The last message object may be configured to accept any data frame or remote frame that was not accepted by any other message object, for nodes that need to log the complete message traffic on the CAN bus.

5.9.3 Transmission of Messages in Event Driven CAN Communication

If the shift register of the CAN core is ready for loading and if there is no data transfer between the IFx registers and message RAM, the MsgVal bits in the Message Valid register (DCAN MSGVAL12 to DCAN MSGVAL78) and the TxRqst bits in the transmission request register are evaluated. The valid message object with the highest priority pending transmission request is loaded into the shift register by the message handler and the transmission is started. The message object's NewDat bit is reset.

After a successful transmission and if no new data was written to the message object (NewDat = '0') since the start of the transmission, the TxRqst bit will be reset. If TxIE is set, IntPnd will be set after a successful transmission. If the DCAN has lost the arbitration or if an error occurred during the transmission, the message will be retransmitted as soon as the CAN bus is free again. If meanwhile the transmission of a message with higher priority has been requested, the messages will be transmitted in the order of their priority.

If automatic retransmission mode is disabled by setting the **DAR** bit in the CAN control register, the behavior of bits TxRqst and NewDat in the Message Control register of the interface register set is as follows:

- When a transmission starts, the TxRqst bit of the respective interface register set is reset, while bit NewDat remains set.
- When the transmission has been successfully completed, the NewDat bit is reset.

When a transmission failed (lost arbitration or error) bit NewDat remains set. To restart the transmission, the application has to set TxRqst again.

Received remote frames do not require a receive object. They will automatically trigger the transmission of a data frame, if in the matching transmit object the RmtEn bit is set.

5.9.4 Updating a Transmit Object

The CPU may update the data bytes of a transmit object any time via the IF1/IF2 interface registers, neither d nor TxRqst have to be reset before the update.

Even if only a part of the data bytes are to be updated, all four bytes in the corresponding IF1/IF2 Data A register (DCAN IF1DATA/DCAN IF2DATA) or IF1/IF2 Data B register (DCAN IF1DATB/DCAN IF2DATB) have to be valid before the content of that register is transferred to the message object. Either the CPU has to write all four bytes into the IF1/IF2 data register or the message object is transferred to the IF1/IF2 data register before the CPU writes the new data bytes.

When only the data bytes are updated, first 0x87 can be written to bits [23:16] of the IF1/IF2 Command register (DCAN IF1CMD/DCAN IF2CMD) and then the number of the message object is written to bits [7:0] of the command register, concurrently updating the data bytes and setting TxRqst with NewDat.

To prevent the reset of TxRqst at the end of a transmission that may already be in progress while the data is updated, NewDat has to be set together with TxRqst in event driven CAN communication. For details, see [Section 5.9.3](#).

When NewDat is set together with TxRqst, NewDat will be reset as soon as the new transmission has started.

5.9.5 Changing a Transmit Object

If the number of implemented message objects is not sufficient to be used as permanent message objects only, the transmit objects may be managed dynamically. The CPU can write the whole message (arbitration, control, and data) into the interface register. The bits [23:16] of the command register can be set to 0xB7 for the transfer of the whole message object content into the message object. Before changing the configuration of a message object, MsgVal has to be reset.

If a previously requested transmission of this message object is not completed but already in progress, it will be continued; however, it will not be repeated if it is disturbed.

To only update the data bytes of a message to be transmitted, bits [23:16] of the command register should be set to 0x87.

NOTE: After the update of the transmit object, the interface register set will contain a copy of the actual contents of the object, including the part that had not been updated.

5.9.6 Acceptance Filtering of Received Messages

When the arbitration and control bits (Identifier + IDE + RTR + DLC) of an incoming message are completely shifted into the shift register of the CAN core, the message handler starts the scan of the message RAM for a matching valid message object:

- The acceptance filtering unit is loaded with the arbitration bits from the CAN core shift register.
- Then the arbitration and mask bits (including MsgVal, UMask, NewDat, and EoB) of message object 1 are loaded into the acceptance filtering unit and are compared with the arbitration bits from the shift register. This is repeated for all following message objects until a matching message object is found, or until the end of the message RAM is reached.
- If a match occurs, the scanning is stopped and the message handler proceeds depending on the type of the frame (data frame or remote frame) received.

5.9.7 Reception of Data Frames

The message handler stores the message from the CAN core shift register into the respective message object in the message RAM. Not only the data bytes, but all arbitration bits and the data length code are stored into the corresponding message object. This ensures that the data bytes stay associated to the identifier even if arbitration mask registers are used.

The NewDat bit is set to indicate that new data (not yet seen by the CPU) has been received. The CPU should reset the NewDat bit when it reads the message object. If at the time of the reception the NewDat bit was already set, MsgLst is set to indicate that the previous data (supposedly not seen by the CPU) is lost. If the RxIE bit is set, the IntPnd bit is set, causing the interrupt register to point to this message object.

The TxRqst bit of this message object is reset to prevent the transmission of a remote frame, while the requested data frame has just been received.

5.9.8 Reception of Remote Frames

When a remote frame is received, three different configurations of the matching message object have to be considered:

- Dir = '1' (direction = transmit), RmtEn = '1', UMask = '1' or '0'
The TxRqst bit of this message object is set at the reception of a matching remote frame. The rest of the message object remains unchanged.
- Dir = '1' (direction = transmit), RmtEn = '0', UMask = '0'
The remote frame is ignored, this message object remains unchanged.
- Dir = '1' (direction = transmit), RmtEn = '0', UMask = '1'
The remote frame is treated similar to a received data frame. At the reception of a matching Remote Frame, the TxRqst bit of this message object is reset. The arbitration and control bits (Identifier + IDE + RTR + DLC) from the shift register are stored in the message object in the message RAM and the NewDat bit of this message object is set. The data bytes of the message object remain unchanged.

5.9.9 Reading Received Messages

The CPU may read a received message any time via the IFx interface register. The data consistency is guaranteed by the message handler state machine. Typically the CPU will write first 0x7F to bits [23:16] and then the number of the message object to bits [7:0] of the command register. That combination will transfer the entire received message from the message RAM into the interface register set. Additionally, the bits NewDat and IntPnd are cleared in the message RAM (not in the interface register set). The values of these bits in the message control register always reflect the status before resetting the bits. If the message object uses masks for acceptance filtering, the arbitration bits show which of the different matching messages has been received.

The actual value of NewDat shows whether a new message has been received since last time when this message object was read. The actual value of MsgLst shows whether more than one message has been received since the last time when this message object was read. MsgLst will not be automatically reset.

5.9.10 Requesting New Data for a Receive Object

By means of a remote frame, the CPU may request another CAN node to provide new data for a receive object. Setting the TxRqst bit of a receive object will cause the transmission of a remote frame with the identifier of the receive object. This remote frame triggers the other CAN node to start the transmission of the matching data frame. If the matching data frame is received before the remote frame could be transmitted, the TxRqst bit is automatically reset. Setting the TxRqst bit without changing the contents of a message object requires the value 0x84 in bits [23:16] of the command register.

5.9.11 Storing Received Messages in FIFO Buffers

Several message objects may be grouped to form one or more FIFO buffers. Each FIFO buffer configured to store received messages with a particular (group of) identifier(s). arbitration and mask registers of the FIFO buffer's message objects are identical. The end of buffer (EoB) bits of all but the last of the FIFO buffer's message objects are '0'; in the last one the EoB bit is '1.'

Received messages with identifiers matching to a FIFO buffer are stored into a message object of this FIFO buffer, starting with the message object with the lowest message number. When a message is stored into a message object of a FIFO buffer, the NewDat bit of this message object is set. By setting NewDat while EoB is '0', the message object is locked for further write accesses by the message handler until the CPU has cleared the NewDat bit.

Messages are stored into a FIFO buffer until the last message object of this FIFO buffer is reached. If none of the preceding message objects is released by writing NewDat to '0,' all further messages for this FIFO buffer will be written into the last message object of the FIFO buffer (EoB = '1') and therefore overwrite previous messages in this message object.

5.9.12 Reading From a FIFO Buffer

Several messages may be accumulated in a set of message objects which are concatenated to form a FIFO buffer before the application program is required (in order to avoid the loss of data) to empty the buffer.

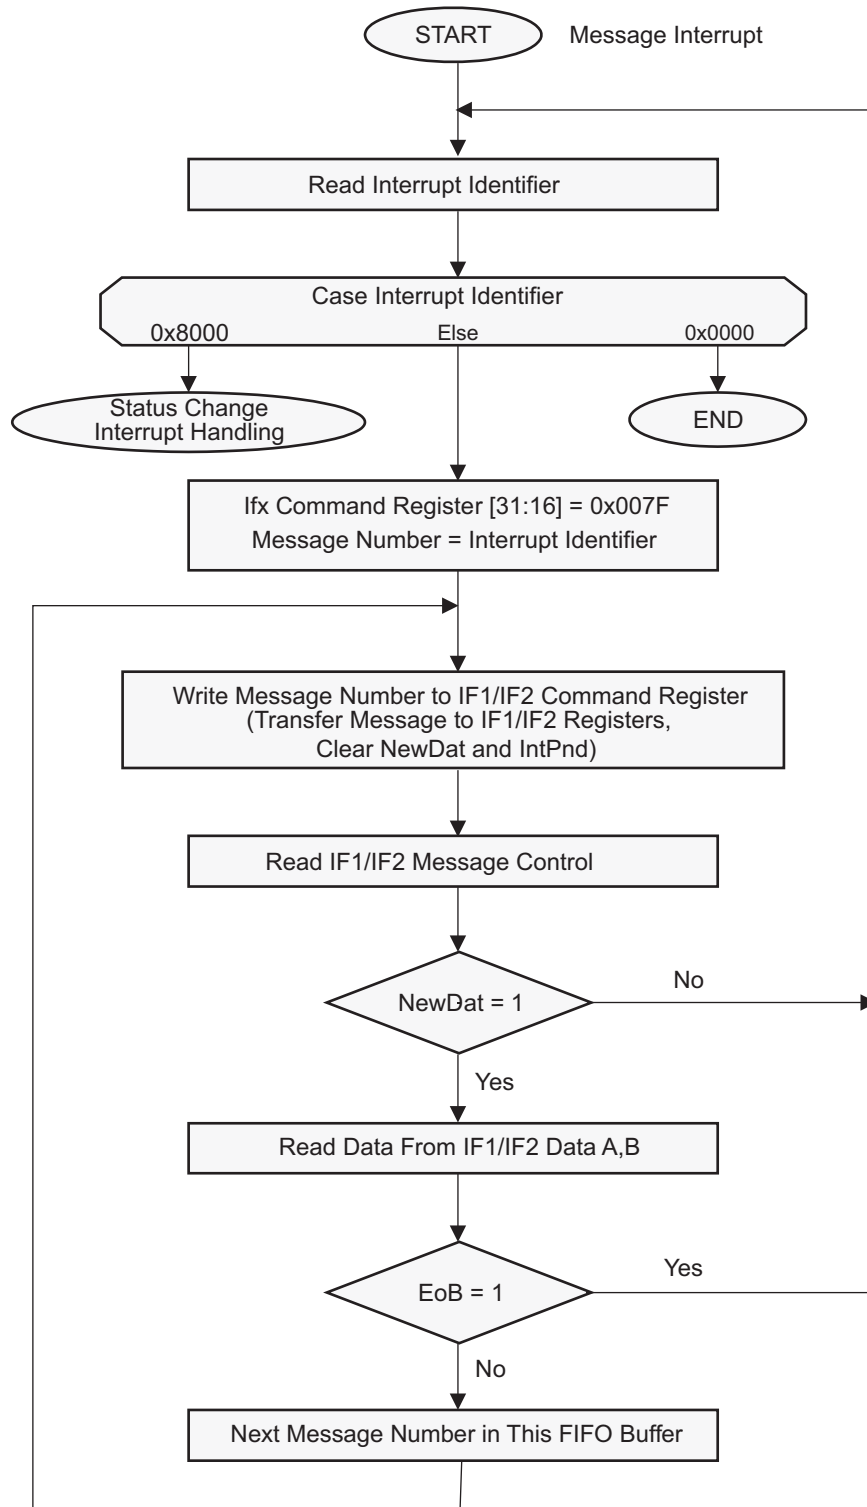

A FIFO buffer of length N will store N – 1 plus A FIFO buffer of length N will store – 1 plus the last received message since last time it was cleared.

A FIFO buffer is cleared by reading and resetting the NewDat bits of all its message objects, starting at the FIFO Object with the lowest message number. This should be done in a subroutine following the example shown in [Figure 5-11](#).

NOTE: All message objects of a FIFO buffer needs to be read and cleared before the next batch of messages can be stored. Otherwise, true FIFO functionality can not be guaranteed, since the message objects of a partly read buffer will be re-filled according to the normal (descending) priority.

Reading from a FIFO buffer message object and resetting its NewDat bit is handled the same way as reading from a single message object.

Figure 5-11. CPU Handling of a FIFO Buffer (Interrupt Driven)

5.10 CAN Bit Timing

The DCAN supports bit rates between less than 1 kBit/s and 1000 kBit/s.

Each member of the CAN network has its own clock generator, typically derived from a crystal oscillator. The bit timing parameters can be configured individually for each CAN node, creating a common bit rate even though the CAN nodes' oscillator periods (f_{osc}) may be different.

The frequencies of these oscillators are not absolutely stable. Small variations are caused by changes in temperature or voltage and by deteriorating components. As long as the variations remain inside a specific oscillator tolerance range (df), the CAN nodes are able to compensate for the different bit rates by resynchronizing to the bit stream.

In many cases, the CAN bit synchronization will amend a faulty configuration of the CAN bit timing to such a degree that only occasionally an error frame is generated. In the case of arbitration however, when two or more CAN nodes simultaneously try to transmit a frame, a misplaced sample point may cause one of the transmitters to become error passive.

The analysis of such sporadic errors requires a detailed knowledge of the CAN bit synchronization inside a CAN node and of the CAN nodes' interaction on the CAN bus.

Even if minor errors in the configuration of the CAN bit timing do not result in immediate failure, the performance of a CAN network can be reduced significantly.

5.10.1 Bit Time and Bit Rate

According to the CAN specification, the bit time is divided into four segments (see [Figure 5-12](#)):

- Synchronization segment (Sync_Seg)
- Propagation time segment (Prop_Seg)
- Phase buffer segment 1 (Phase_Seg1)
- Phase buffer segment 2 (Phase_Seg2)

Each segment consists of a specific number of time quanta. The length of one time quantum (t_q), which is the basic time unit of the bit time, is given by the CAN_CLK and the baud rate prescalers (BRPE and BRP). With these two baud rate prescalers combined, divider values from 1 to 1024 can be programmed:

$$t_q = \text{Baud Rate Prescaler} / \text{CAN_CLK}$$

Apart from the fixed length of the synchronization segment, these numbers are programmable. [Table 5-4](#) describes the minimum programmable ranges required by the CAN protocol.

A given bit rate may be met by different bit time configurations.

Table 5-4. Parameters of the CAN Bit Time

Parameter	Range	Remark
Sync_Seg	1 t_q (fixed)	Synchronization of bus input to CAN_CLK
Prop_Seg	[1 ... 8] t_q	Compensates for the physical delay times
Phase_Seg1	[1 ... 8] t_q	May be lengthened temporarily by synchronization
Phase_Seg2	[1 ... 8] t_q	May be shortened temporarily by synchronization
Synchronization Jump Width (SJW)	[1 ... 4] t_q	May not be longer than either Phase Buffer Segment

NOTE: For proper functionality of the CAN network, the physical delay times and the oscillator's tolerance range have to be considered.

5.10.1.1 Synchronization Segment

The synchronization segment (Sync_Seg) is the part of the bit time where edges of the CAN bus level are expected to occur. If an edge occurs outside of Sync_Seg, its distance to the Sync_Seg is called the phase error of this edge.

5.10.1.2 Propagation Time Segment

This part of the bit time is used to compensate physical delay times within the CAN network. These delay times consist of the signal propagation time on the bus and the internal delay time of the CAN nodes.

Any CAN node synchronized to the bit stream on the CAN bus can be out of phase with the transmitter of the bit stream, caused by the signal propagation time between the two nodes. The CAN protocol's non-destructive bitwise arbitration and the dominant acknowledge bit provided by receivers of CAN messages require that a CAN node transmitting a bit stream must also be able to receive dominant bits transmitted by other CAN nodes that are synchronized to that bit stream. The example in Figure 5-13 shows the phase shift and propagation times between two CAN nodes.

Figure 5-13. The Propagation Time Segment

$$\text{Delay A_to_B} \geq \text{node output delay(A)} + \text{bus line delay(A/E/B)} + \text{node input delay(B)}$$

$$\text{Prop_Seg} \geq \text{Delay A_to_B} + \text{Delay B_to_A}$$

$$\text{Prop_Seg} \geq 2 \cdot [\max(\text{node output delay}, \text{bus line delay} + \text{node input delay})]$$

In this example, both nodes A and B are transmitters performing an arbitration for the CAN bus. The node A has sent its start of frame bit less than one bit time earlier than node B, therefore node B has synchronized itself to the received edge from recessive to dominant. Since node B has received this edge delay(A_to_B) after it has been transmitted, node B's bit timing segments are shifted with regard to node A. Node B sends an identifier with higher priority and so it will win the arbitration at a specific identifier bit when it transmits a dominant bit while node A transmits a recessive bit. The dominant bit transmitted by node B will arrive at node A after the delay (B_to_A).

Due to oscillator tolerances, the actual position of node A's sample point can be anywhere inside the nominal range of node A's Phase Buffer Segments, so the bit transmitted by node B must arrive at node A before the start of Phase_Seg1. This condition defines the length of Prop_Seg.

If the edge from recessive to dominant transmitted by node B would arrive at node A after the start of Phase_Seg1, it could happen that node A samples a recessive bit instead of a dominant bit, resulting in a bit error and the destruction of the current frame by an error flag.

This error only occurs when two nodes arbitrate for the CAN bus which have oscillators of opposite ends of the tolerance range and are separated by a long bus line; this is an example of a minor error in the bit timing configuration (Prop_Seg too short) that causes sporadic bus errors.

Some CAN implementations provide an optional 3 Sample Mode. The DCAN does not. In this mode, the CAN bus input signal passes a digital low-pass filter, using three samples and a majority logic to determine the valid bit value. This results in an additional input delay of $1 t_q$, requiring a longer Prop_Seg.

5.10.1.3 Phase Buffer Segments and Synchronization

The phase buffer segments (Phase_Seg1 and Phase_Seg2) and the synchronization jump width (SJW) are used to compensate for the oscillator tolerance.

The phase buffer segments surround the sample point and may be lengthened or shortened by synchronization.

The synchronization jump width (SJW) defines how far the resynchronizing mechanism may move the sample point inside the limits defined by the phase buffer segments to compensate for edge phase errors.

Synchronizations occur on edges from recessive to dominant. Their purpose is to control the distance between edges and sample points.

Edges are detected by sampling the actual bus level in each time quantum and comparing it with the bus level at the previous sample point. A synchronization may be done only if a recessive bit was sampled at the previous sample point and if the actual time quantum's bus level is dominant.

An edge is synchronous if it occurs inside of Sync_Seg; otherwise, its distance to the Sync_Seg is the edge phase error, measured in time quanta. If the edge occurs before Sync_Seg, the phase error is negative, else it is positive.

Two types of synchronization exist: hard synchronization and resynchronizing. A hard synchronization is done once at the start of a frame; inside a frame, only resynchronization is possible.

- **Hard Synchronization**

After a hard synchronization, the bit time is restarted with the end of Sync_Seg, regardless of the edge phase error. Thus hard synchronization forces the edge which has caused the hard synchronization, to lie within the synchronization segment of the restarted bit time.

- **Bit Resynchronizations**

Resynchronization leads to a shortening or lengthening of the Bit time such that the position of the sample point is shifted with regard to the edge.

When the phase error of the edge which causes resynchronization is positive, Phase_Seg1 is lengthened. If the magnitude of the phase error is less than SJW, Phase_Seg1 is lengthened by the magnitude of the phase error, else it is lengthened by SJW.

When the phase error of the edge which causes Resynchronization is negative, Phase_Seg2 is shortened. If the magnitude of the phase error is less than SJW, Phase_Seg2 is shortened by the magnitude of the phase error, else it is shortened by SJW.

If the magnitude of the phase error of the edge is less than or equal to the programmed value of SJW, the results of hard synchronization and resynchronization are the same. If the magnitude of the phase error is larger than SJW, the resynchronization cannot compensate the phase error completely, and an error of (phase error - SJW) remains.

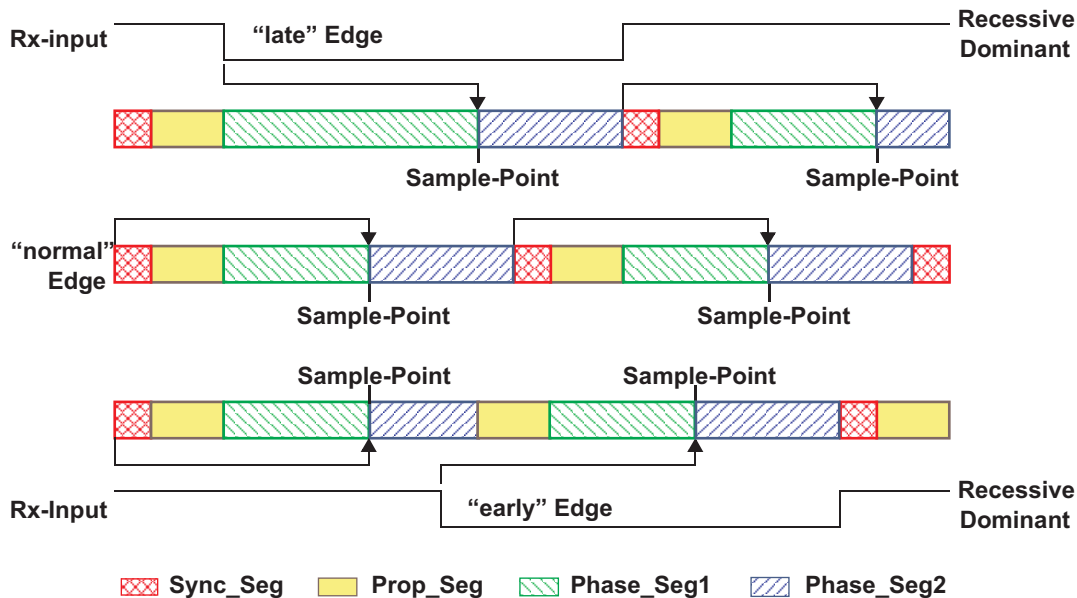

Only one synchronization may be done between two sample points. The synchronizations maintain a minimum distance between edges and sample points, giving the bus level time to stabilize and filtering out spikes that are shorter than (Prop_Seg + Phase_Seg1).

Apart from noise spikes, most synchronizations are caused by arbitration. All nodes synchronize “hard” on the edge transmitted by the “leading” transceiver that started transmitting first, but due to propagation delay times, they cannot become ideally synchronized. The leading transmitter does not necessarily win the arbitration; therefore, the receivers have to synchronize themselves to different transmitters that subsequently take the lead and that are differently synchronized to the previously leading transmitter. The same happens at the acknowledge field, where the transmitter and some of the receivers will have to synchronize to that receiver that takes the lead in the transmission of the dominant acknowledge bit.

Synchronizations after the end of the arbitration will be caused by oscillator tolerance, when the differences in the oscillator’s clock periods of transmitter and receivers sum up during the time between synchronizations (at most ten bits). These summarized differences may not be longer than the SJW, limiting the oscillator’s tolerance range.

Figure 5-14 shows how the phase buffer segments are used to compensate for phase errors. There are three drawings of each two consecutive bit timings. The upper drawing shows the synchronization on a “late” edge, the lower drawing shows the synchronization on an “early” edge, and the middle drawing is the reference without synchronization.

Figure 5-14. Synchronization on Late and Early Edges

In the first example, an edge from recessive to dominant occurs at the end of Prop_Seg. The edge is "late" since it occurs after the Sync_Seg. Reacting to the late edge, Phase_Seg1 is lengthened so that the distance from the edge to the sample point is the same as it would have been from the Sync_Seg to the sample point if no edge had occurred. The phase error of this late edge is less than SJW, so it is fully compensated and the edge from dominant to recessive at the end of the bit, which is one nominal bit time long, occurs in the Sync_Seg.

In the second example, an edge from recessive to dominant occurs during Phase_Seg2. The edge is "early" since it occurs before a Sync_Seg. Reacting to the early edge, Phase_Seg2 is shortened and Sync_Seg is omitted, so that the distance from the edge to the sample point is the same as it would have been from a Sync_Seg to the sample point if no edge had occurred. As in the previous example, the magnitude of this early edge’s phase error is less than SJW, so it is fully compensated.

The phase buffer segments are lengthened or shortened temporarily only; at the next bit time, the segments return to their nominal programmed values.

In these examples, the bit timing is seen from the point of view of the CAN implementation's state machine, where the bit time starts and ends at the sample points. The state machine omits Sync_Seg when synchronizing on an early edge because it cannot subsequently redefine that time quantum of Phase_Seg2 where the edge occurs to be the Sync_Seg.

Figure 5-15 shows how short dominant noise spikes are filtered by synchronizations. In both examples, the spike starts at the end of Prop_Seg and has the length of (Prop_Seg + Phase_Seg1).

In the first example, the synchronization jump width is greater than or equal to the phase error of the spike's edge from recessive to dominant. Therefore the sample point is shifted after the end of the spike; a recessive bus level is sampled.

In the second example, SJW is shorter than the phase error, so the sample point cannot be shifted far enough; the dominant spike is sampled as actual bus level.

Figure 5-15. Filtering of Short Dominant Spikes

5.10.1.4 Oscillator Tolerance Range

With the introduction of CAN protocol version 1.2, the option to synchronize on edges from dominant to recessive became obsolete. Only edges from recessive to dominant are considered for synchronization. The protocol update to version 2.0 (A and B) had no influence on the oscillator tolerance.

The tolerance range df for an oscillator's frequency f_{osc} around the nominal frequency f_{nom} with:

$$(1 - df) \cdot f_{nom} \leq f_{osc} \leq (1 + df) \cdot f_{nom}$$

depends on the proportions of Phase_Seg1, Phase_Seg2, SJW, and the bit time. The maximum tolerance df is defined by two conditions (both shall be met):

$$I: df \leq \frac{\min(TSeg1, TSeg2)}{2x(13x(bit_time - TSeg2))}$$

$$II: df \leq \frac{SJW}{20xbit_time}$$

It has to be considered that SJW may not be larger than the smaller of the phase buffer segments and that the propagation time segment limits that part of the bit time that may be used for the phase buffer segments.

The combination Prop_Seg = 1 and Phase_Seg1 = Phase_Seg2 = SJW = 4 allows the largest possible oscillator tolerance of 1.58%. This combination with a propagation time segment of only 10% of the bit time is not suitable for short bit times; it can be used for bit rates of up to 125 kBit/s (bit time = 8 μs) with a bus length of 40 m.

5.10.2 DCAN Bit Timing Registers

In the DCAN, the bit timing configuration is programmed in two register bytes, additionally a third byte for a baud rate prescaler extension of four bits (BRPE) is provided. The sum of Prop_Seg and Phase_Seg1 (as TSEG1) is combined with Phase_Seg2 (as TSEG2) in one byte, SJW and BRP (plus BRPE in third byte) are combined in the other byte (see Figure 5-16).

Figure 5-16. Structure of the CAN Core's CAN Protocol Controller

In this bit timing register, the components TSEG1, TSEG2, SJW and BRP have to be programmed to a numerical value that is one less than its functional value; so instead of values in the range of [1...n], values in the range of [0...n-1] are programmed. That way, for example, SJW (functional range of [1...4]) is represented by only two bits.

Therefore, the length of the bit time is (programmed values) $[TSEG1 + TSEG2 + 3] t_q$ or (functional values) $[Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] t_q$.

The data in the bit timing register (BTR) is the configuration input of the CAN protocol controller. The baud rate prescaler (configured by BRPE/BRP) defines the length of the time quantum (the basic time unit of the bit time); the bit timing logic (configured by TSEG1, TSEG2, and SJW) defines the number of time quanta in the bit time.

The processing of the bit time, the calculation of the position of the sample point, and occasional synchronizations are controlled by the bit timing state machine, which is evaluated once each time quantum. The rest of the CAN protocol controller, the bit stream processor (BSP) state machine, is evaluated once each bit time, at the sample point.

The shift register serializes the messages to be sent and parallelizes received messages. Its loading and shifting is controlled by the BSP. The BSP translates messages into frames and vice versa. It generates and discards the enclosing fixed format bits, inserts and extracts stuff bits, calculates and checks the CRC code, performs the error management, and decides which type of synchronization is to be used. It is evaluated at the sample point and processes the sampled bus input bit. The time after the sample point that is needed to calculate the next bit to be sent (for example, data bit, CRC bit, stuff bit, error flag, or idle) is called the information processing time (IPT), which is 0 t_q for the DCAN.

Generally, the IPT is CAN controller-specific, but may not be longer than 2 t_q . The IPC length is the lower limit of the programmed length of Phase_Seg2. In case of a synchronization, Phase_Seg2 may be shortened to a value less than IPT, which does not affect bus timing.

5.10.2.1 Calculation of the Bit Timing Parameters

Usually, the calculation of the bit timing configuration starts with a desired bit rate or bit time. The resulting bit time (1 / Bit rate) must be an integer multiple of the CAN clock period.

NOTE: 8 MHz is the minimum CAN clock frequency required to operate the DCAN at a bit rate of 1 MBit/s.

The bit time may consist of 8 to 25 time quanta. The length of the time quantum t_q is defined by the baud rate prescaler with $t_q = (\text{Baud Rate Prescaler}) / \text{CAN_CLK}$. Several combinations may lead to the desired bit time, allowing iterations of the following steps.

First part of the bit time to be defined is the Prop_Seg. Its length depends on the delay times measured in the system. A maximum bus length as well as a maximum node delay has to be defined for expandible CAN bus systems. The resulting time for Prop_Seg is converted into time quanta (rounded up to the nearest integer multiple of t_q).

The Sync_Seg is 1 t_q long (fixed), leaving (bit time – Prop_Seg – 1) t_q for the two Phase Buffer Segments. If the number of remaining t_q is even, the Phase Buffer Segments have the same length, Phase_Seg2 = Phase_Seg1, else Phase_Seg2 = Phase_Seg1 + 1.

The minimum nominal length of Phase_Seg2 has to be regarded as well. Phase_Seg2 may not be shorter than any CAN controller's Information Processing Time in the network, which is device dependent and can be in the range of [0...2] t_q .

The length of the synchronization jump width is set to its maximum value, which is the minimum of four (4) and Phase_Seg1.

The oscillator tolerance range necessary for the resulting configuration is calculated by the formulas given in [Section 5.10.2.3](#).

If more than one configurations are possible to reach a certain Bit rate, it is recommended to choose the configuration which allows the highest oscillator tolerance range.

CAN nodes with different clocks require different configurations to come to the same bit rate. The calculation of the propagation time in the CAN network, based on the nodes with the longest delay times, is done once for the whole network.

The CAN system's oscillator tolerance range is limited by the node with the lowest tolerance range.

The calculation may show that bus length or bit rate have to be decreased or that the oscillator frequencies' stability has to be increased in order to find a protocol compliant configuration of the CAN bit timing.

The resulting configuration is written into the bit timing register:

Tseg2 = Phase_Seg2-1

Tseg1 = Phase_Seg1+ Prop_Seg-1

SJW = SynchronizationJumpWidth-1

BRP = Prescaler-1

5.10.2.2 Example for Bit Timing at High Baud Rate

In this example, the frequency of CAN_CLK is 10 MHz, BRP is 0, the bit rate is 1 MBit/s.

t_q	100 ns	=	t_{CAN_CLK}
delay of bus driver	90 ns	=	
delay of receiver circuit	40 ns	=	
delay of bus line (40 m)	220 ns	=	
t_{Prop}	700 ns	=	$INT(2 \cdot \text{delays} + 1) = 7 \cdot t_q$
t_{SJW}	100 ns	=	$1 \cdot t_q$
t_{TSeg1}	800 ns	=	$t_{Prop} + t_{SJW}$
t_{TSeg2}	100 ns	=	Information Processing Time + $1 \cdot t_q$
$t_{Sync-Seg}$	100 ns	=	$1 \cdot t_q$
bit time	1000 ns	=	$t_{Sync-Seg} + t_{TSeg1} + t_{TSeg2}$
tolerance for CAN_CLK	0.43 %	=	$\frac{(\min(TSeg1, TSeg2))}{2x(13x(\text{bit_time} - TSeg2))}$
		=	$\frac{0.1 \mu s}{2x(13x(1 \mu s - 0.1 \mu s))}$

In this example, the concatenated bit time parameters are $(1-1)_3 \& (8-1)_4 \& (1-1)_2 \& (1-1)_6$, so the bit timing register is programmed to = 0x00000700.

5.10.2.3 Example for Bit Timing at Low Baud Rate

In this example, the frequency of CAN_CLK is 2 MHz, BRP is 1, the bit rate is 100 KBit/s.

t_q	1 μs	=	t_{CAN_CLK}
Delay of bus driver	200 ns	=	
Delay of receiver circuit	80 ns	=	
Delay of bus line (40 m)	220 ns	=	
t_{Prop}	1 μs	=	$1 \cdot t_q$
t_{SJW}	4 μs	=	$4 \cdot t_q$
t_{TSeg1}	5 μs	=	$t_{Prop} + t_{SJW}$
t_{TSeg2}	3 μs	=	Information Processing Time + $3 \cdot t_q$
$t_{Sync-Seg}$	1 μs	=	$1 \cdot t_q$
Bit time	9 μs	=	$t_{Sync-Seg} + t_{TSeg1} + t_{TSeg2}$
Tolerance for CAN_CLK		=	$\frac{(\min(TSeg1, TSeg2))}{2x(13x(\text{bit_time} - TSeg2))}$
		=	$\frac{0.1 \mu s}{2x(13x(1 \mu s - 0.1 \mu s))}$

In this example, the concatenated bit time parameters are $(3-1)_3 \& (5-1)_4 \& (4-1)_2 \& (2-1)_6$, so the bit timing register is programmed to = 0x000024C1.

5.11 Message Interface Register Sets

The interface register sets control the CPU read and write accesses to the message RAM. There are two interface registers sets for read/write access, IF1 and IF2 and one interface register set for read access only, IF3.

Due to the structure of the message RAM, it is not possible to change single bits or bytes of a message object. Instead, always a complete message object in the message RAM is accessed. Therefore the data transfer from the IF1/IF2 registers to the message RAM requires the message handler to perform a read-modify-write cycle: First those parts of the message object that are not to be changed are read from the message RAM into the interface register set, and after the update the whole content of the interface register set is written into the message object.

After the partial write of a message object, those parts of the interface register set that are not selected in the command register, will be set to the actual contents of the selected message object.

After the partial read of a message object, those parts of the interface register set that are not selected in the command register, will be left unchanged.

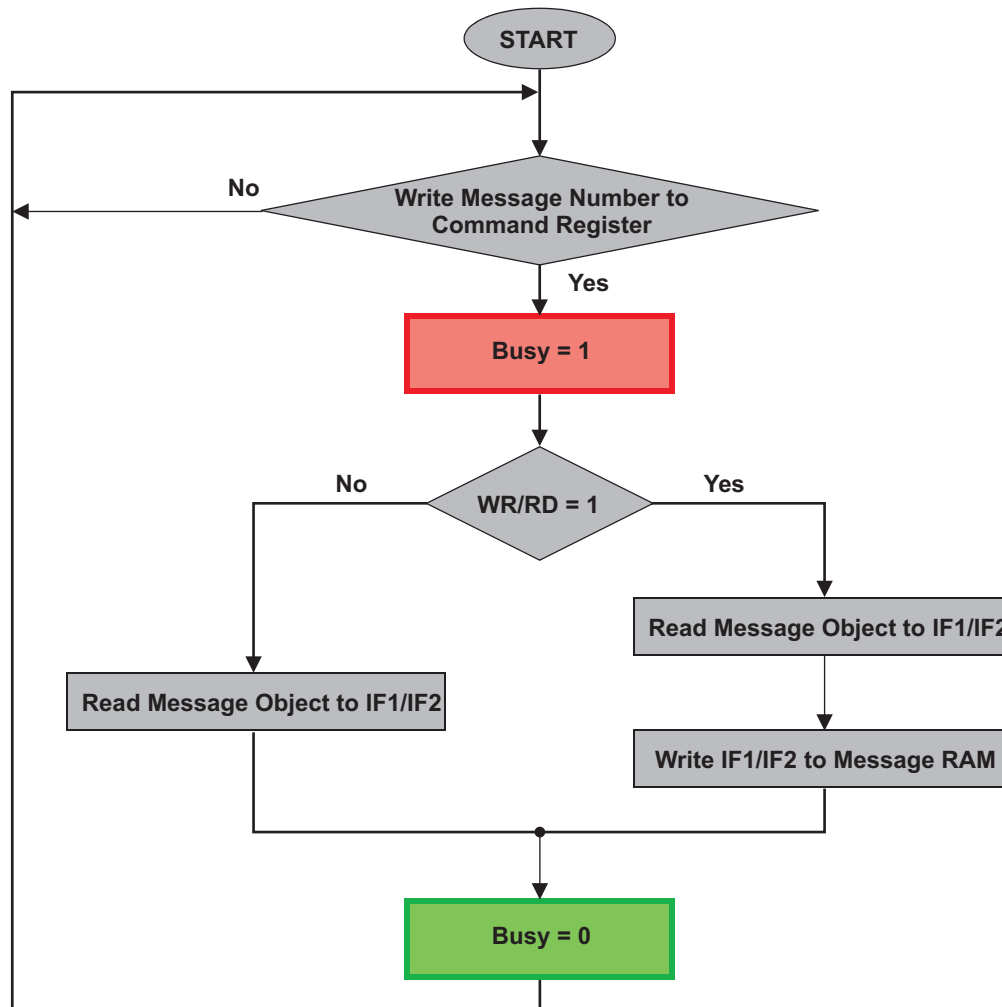

By buffering the data to be transferred, the interface register sets avoid conflicts between concurrent CPU accesses to the message RAM and CAN message reception and transmission. A complete message object (see [Section 5.12.1](#)) or parts of the message object may be transferred between the message RAM and the IF1/IF2 register set (see [Section 5.14.1.19](#)) in one single transfer. This transfer, performed in parallel on all selected parts of the message object, guarantees the data consistency of the CAN message.

5.11.1 Message Interface Register Sets 1 and 2

The IF1 and IF2 register sets control the data transfer to and from the message object. The command register addresses the desired message object in the message RAM and specifies whether a complete message object or only parts should be transferred. The data transfer is initiated by writing the message number to the bits [7:0] of the command register.

When the CPU initiates a data transfer between the IF1/IF2 registers and message RAM, the message handler sets the busy bit in the respective command register to '1'. After the transfer has completed, the busy bit is set back to '0' (see [Figure 5-17](#)).

Figure 5-17. Data Transfer Between IF1/IF2 Registers and Message RAM

5.11.2 IF3 Register Set

The IF3 register set can automatically be updated with received message objects without the need to initiate the transfer from message RAM by CPU. The intention of this feature of IF3 is to provide an interface for the DMA to read packets efficiently. The automatic update functionality can be programmed for each message object (Section 5.14.1.28).

All valid message objects in message RAM which are configured for automatic update, will be checked for active NewDat flags. If such a message object is found, it will be transferred to the IF3 register (if no previous DMA transfers are ongoing), controlled by IF3 Observation register. If more than one NewDat flag is active, the message object with the lowest number has the highest priority for automatic IF3 update.

The NewDat bit in the message object will be reset by a transfer to IF3.

If DCAN internal IF3 update is complete, a DMA request is generated. The DMA request stays active until first read access to one of the IF3 registers. The DMA functionality has to be enabled by setting bit DE3 in CAN control register. Please refer to the device datasheet to find out if this DMA source is available.

NOTE: The IF3 register set can not be used for transferring data into message objects.

5.12 Message RAM

CAUTION

Writes to the DCAN RAM must not be done while it is in low-power mode. If such writes occur, the behavior is undefined and RAM content is corrupted. It has to be ensured in software that the low-power mode is removed from the DCAN RAM before writing to it.

The DCAN message RAM contains message objects and parity bits for the message objects. There are up to 64 message objects in the message RAM.

During normal operation, accesses to the message RAM are performed via the interface register sets, and the CPU cannot directly access the message RAM.

The interface register sets IF1 and IF2 provide indirect read/write access from the CPU to the message RAM. The IF1 and IF2 register sets can buffer control and user data to be transferred to and from the message objects.

The third interface register set IF3 can be configured to automatically receive control and user data from the message RAM when a message object has been updated after reception of a CAN message. The CPU does not need to initiate the transfer from message RAM to IF3 register set.

The message handler avoids potential conflicts between concurrent accesses to message RAM and CAN frame reception/transmission.

There are two modes where the message RAM can be directly accessed by the CPU:

- Debug/Suspend mode (see [Section 5.12.3](#))
- RAM Direct Access (RDA) mode (see [Section 5.12.4](#))

For the message RAM base address, see the device-specific data sheet.

5.12.1 Structure of Message Objects

Table 5-5 shows the structure of a message object. Table 5-6 provides a description of the fields.

The grayed fields are those parts of the message object which are represented in dedicated registers. For example, the transmit request flags of all message objects are represented in centralized transmit request registers.

Table 5-5. Structure of a Message Object

Message Object												
UMask	Msk[28:0]	MXtd	MDir	EoB	unused	NewDat	MsgLst	RxIE	TxIE	IntPnd	RmtEn	TxRqst
MsgVal	ID[28:0]	Xtd	Dir	DLC[3:0]	Data 0	Data 1	Data 2	Data 3	Data 4	Data 5	Data 6	Data 7

Table 5-6. Field Descriptions

Name	Value	Description
MsgVal		Message valid. The CPU should reset the MsgVal bit of all unused Messages Objects during the initialization before it resets the Init bit in the CAN control register.
	0	The message object is ignored by the message handler.
	1	The message object is to be used by the message handler. Note: This bit may be kept at level '1' even when the identifier bits ID[28:0], the control bits Xtd, Dir, or the data length code are changed. It should be reset if the Messages Object is no longer required.
UMask		Use acceptance mask
	0	Mask bits (Msk[28:0], MXtd and MDir) are ignored and not used for acceptance filtering.
	1	Mask bits are used for acceptance filtering. Note: If the UMask bit is set to one, the message object's mask bits have to be programmed during initialization of the message object before MsgVal is set to one.
ID[28:0]		Message identifier
	ID[28:0]	29-bit ("extended") identifier bits
	ID[28:18]	11-bit ("standard") identifier bits
Msk[28:0]		Identifier mask
	0	The corresponding bit in the message identifier is not used for acceptance filtering (don't care).
	1	The corresponding bit in the message identifier is used for acceptance filtering.
Xtd		Extended identifier
	0	The 11-bit ("standard") identifier will be used for this message object.
	1	The 29-bit ("extended") identifier will be used for this message object.
MXtd		Mask extended identifier
	0	The extended identifier bit (IDE) has no effect on the acceptance filtering.
	1	The extended identifier bit (IDE) is used for acceptance filtering. Note: When 11-bit ("standard") Identifiers are used for a message object, the identifiers of received data frames are written into bits ID[28:18]. For acceptance filtering, only these bits together with mask bits Msk[28:18] are considered.
Dir		Message direction
	0	Direction = receive: On TxRqst, a remote frame with the identifier of this message object is transmitted. On reception of a data frame with matching identifier, the message is stored in this message object.
	1	Direction = transmit: On TxRqst, a data frame is transmitted. On reception of a remote frame with matching identifier, the TxRqst bit of this message object is set (if RmtEn = one).
MDir		Mask message direction
	0	The message direction bit (Dir) has no effect on the acceptance filtering.
	1	The message direction bit (Dir) is used for acceptance filtering.

Table 5-6. Field Descriptions (continued)

Name	Value	Description
EOB	0	End of block The message object is part of a FIFO Buffer block and is not the last message object of this FIFO Buffer block.
	1	The message object is a single message object or the last message object in a FIFO Buffer Block. Note: This bit is used to concatenate multiple message objects to build a FIFO Buffer. For single message objects (not belonging to a FIFO Buffer), this bit must always be set to one.
NewDat	0	New data No new data has been written into the data bytes of this message object by the message handler since the last time when this flag was cleared by the CPU.
	1	The message handler or the CPU has written new data into the data bytes of this message object.
MsgLst	0	Message lost (only valid for message objects with direction = receive) No message was lost since the last time when this bit was reset by the CPU.
	1	The message handler stored a new message into this message object when NewDat was still set, so the previous message has been overwritten.
RxIE	0	Receive interrupt enable IntPnd will not be triggered after the successful reception of a frame.
	1	IntPnd will be triggered after the successful reception of a frame.
TxIE	0	Transmit interrupt enable IntPnd will not be triggered after the successful transmission of a frame.
	1	IntPnd will be triggered after the successful transmission of a frame.
IntPnd	0	Interrupt pending This message object is not the source of an interrupt.
	1	This message object is the source of an interrupt. The interrupt Identifier in the interrupt register will point to this message object if there is no other interrupt source with higher priority.
RmtEn	0	Remote enable At the reception of a remote frame, TxRqst is not changed.
	1	At the reception of a remote frame, TxRqst is set.
TxRqst	0	Transmit request This message object is not waiting for a transmission.
	1	The transmission of this message object is requested and is not yet done.
DLC[3:0]	0-8	Data length code Data frame has 0-8 data bits.
	9-15	Data frame has 8 data bytes. Note: The data length code of a message object must be defined to the same value as in the corresponding objects with the same identifier at other nodes. When the message handler stores a data frame, it will write the DLC to the value given by the received message.
Data 0		1st data byte of a CAN data frame
Data 1		2nd data byte of a CAN data frame
Data 2		3rd data byte of a CAN data frame
Data 3		4th data byte of a CAN data frame
Data 4		5th data byte of a CAN data frame
Data 5		6th data byte of a CAN data frame
Data 6		7th data byte of a CAN data frame
Data 7		8th data byte of a CAN data frame Note: Byte Data 0 is the first data byte shifted into the shift register of the CAN core during a reception, byte Data 7 is the last. When the message handler stores a data frame, it will write all the eight data bytes into a message object. If the data length code is less than 8, the remaining bytes of the message object may be overwritten by undefined values.

5.12.2 Addressing Message Objects in RAM

The starting location of a particular message object in RAM is:
 Message RAM base address + (message object number) * 0x20

This means that message object 1 starts at offset 0x0020; message object 2 starts at offset 0x0040, etc.
 '0' is not a valid message object number.

The base address for DCAN0 RAM is 0x481C_D000 and DCAN1 RAM is 0x481D_1000.

Message object number 1 has the highest priority.

Table 5-7. Message RAM addressing in Debug/Suspend and RDA Mode

Message Object Number	Offset From Base Address	Word Number	Debug/Suspend Mode, see Section 5.12.3	RDA mode, see Section 5.12.4
1	0x0020	1	Parity	Data Bytes 4-7
	0x0024	2	MXtd,MDir,Mask	Data Bytes 0-3

5.12.3 Message RAM Representation in Debug/Suspend Mode

In debug/suspend mode, the message RAM will be memory mapped. This allows the external debug unit to access the message RAM.

NOTE: During debug/suspend mode, the message RAM cannot be accessed via the IFx register sets.

Table 5-8. Message RAM Representation in Debug/Suspend Mode

Bit #	31/15	30/14	29/13	29/12	27/11	26/10	25/9	24/8	23/7	22/6	21/5	20/4	19/3	18/2	17/1	16/0

MsgAddr + 0x0C	Reserved															
	Rsvd	MsgLst	Rsvd	UMask	TxE	RxTE	RmtEn	Rsvd	EOB	Reserved				DLC[3:0]		
MsgAddr + 0x10	Data 3								Data 2							
	Data 1								Data 0							
MsgAddr + 0x14	Data 7								Data 6							
	Data 5								Data 4							

5.12.4 Message RAM Representation in Direct Access Mode

When the **RDA** bit in the test register is set while the DCAN module is in test mode (test bit in the CAN control register is set), the CPU has direct access to the message RAM. Due to the 32-bit bus structure, the RAM is split into word lines to support this feature. The CPU has access to one word line at a time only.

In RAM direct access mode, the RAM is represented by a continuous memory space within the address frame of the DCAN module, starting at the message RAM base address.

Note: During direct access mode, the message RAM cannot be accessed via the IFx register sets.

Any read or write to the RAM addresses for RamDirectAccess during normal operation mode (TestMode bit or RDA bit not set) will be ignored.

Table 5-9. Message RAM Representation in RAM Direct Access Mode

Bit #	31/ 15	30/ 14	29/ 13	29/ 12	27/ 11	26/ 10	25/ 9	24/ 8	23/ 7	22/ 6	21/ 5	20/ 4	19/ 3	18/ 2	17/ 1	16/ 0

MsgAddr + 0x10	Reserved												Parity [4]			
	Parity[3:0]			Unused			Msg Lst	UMa sk	TxIE	RxT E	Rmt En	EOB	MX td	MDir		

NOTE: Writes to unused bits has no effect.

5.13 GIO Support

The CAN_RX and CAN_TX pins of the DCAN module can be used as general purpose IO pins, if CAN functionality is not needed. This function is controlled by the CAN TX IO control register (DCAN TIOC) (see [Section 5.14.1.29](#)) and the CAN RX IO control register (DCAN RIOC) (see [Section 5.14.1.30](#)).

5.14 Registers

The base address for the:

- DCAN0 registers is 0x481C_C000
- DCAN1 registers is 0x481D_0000

5.14.1 DCAN Control Registers

After hardware reset, the registers of the DCAN hold the values shown in the register descriptions.

Additionally, the Bus-Off state is reset and the CAN_TX pin is set to recessive (HIGH). The Init bit in the CAN control register is set to enable the software initialization. The DCAN will not influence the CAN bus until the CPU resets Init to '0'.

LEGEND: R/W = Read/Write; R = Read only; WP = Write protected by init bit; -n = value after reset

Table 5-11. CAN Control Register (DCAN CTL) Field Descriptions

Bit	Field	Value	Description
31-26	Reserved	0	These bits are always read as 0. Writes have no effect.
26	WUBA	0 1	Automatic wake up on bus activity when in local power-down mode No detection of a dominant CAN bus level while in local power-down mode. Detection of a dominant CAN bus level while in local power-down mode is enabled. On occurrence of a dominant CAN bus level, the wake up sequence is started (Additional information can be found in <i>Local Power-Down Mode</i>). Note: The CAN message, which initiates the bus activity, cannot be received. This means that the first message received in power down and automatic wake-up mode, will be lost.
24	PDR	0 1	Request for local low power-down mode No application request for local low power-down mode. If the application has cleared this bit while DCAN in local power-down mode, also the Init bit has to be cleared. Local power-down mode has been requested by application. The DCAN will acknowledge the local power-down mode by setting bit PDA in the error and status register. The local clocks will be turned off by DCAN internal logic (Additional information can be found in <i>Local Power-Down Mode</i>).
23-21	Reserved	0	These bits are always read as 0. Writes have no effect.
20	DE3	0 1	Enable DMA request line for IF3 Disabled Enabled Note: A pending DMA request for IF3 remains active until first access to one of the IF3 registers.
19	DE2	0 1	Enable DMA request line for IF2 Disabled Enabled Note: A pending DMA request for IF2 remains active until first access to one of the IF2 registers.
18	DE1	0 1	Enable DMA request line for IF1 Disabled Enabled Note: A pending DMA request for IF1 remains active until first access to one of the IF1 registers.
17	IE1	0 1	Interrupt line 1 enable Disabled - Module interrupt DCAN1INT is always low. Enabled - interrupts will assert line DCAN1INT to one; line remains active until pending interrupts are processed.

Table 5-11. CAN Control Register (DCAN CTL) Field Descriptions (continued)

Bit	Field	Value	Description
16	InitDbg	0	Internal init state while debug access Not in debug mode, or debug mode requested but not entered.
		1	Debug mode requested and internally entered; the DCAN is ready for debug accesses.
15	SWR	0	SW reset enable Normal Operation
		1	Module is forced to reset state. This bit will automatically get cleared after execution of SW reset after one OCP clock cycle. Note: To execute software reset, the following procedure is necessary: 1. Set Init bit to shut down CAN communication. 2. Set SWR bit additionally to Init bit.
14	Reserved	0	This bit is always read as 0. Writes have no effect.
13-10	PMD	0x5	Parity on/off Parity function disabled
		Others	Parity function enabled
9	ABO	0	Auto-Bus-On enable The Auto-Bus-On feature is disabled
		1	The Auto-Bus-On feature is enabled
8	IDS	0	Interruption debug support enable When Debug/Suspend mode is requested, DCAN will wait for a started transmission or reception to be completed before entering Debug/Suspend mode
		1	When Debug/Suspend mode is requested, DCAN will interrupt any transmission or reception, and enter Debug/Suspend mode immediately.
7	Test	0	Test mode enable Normal Operation
		1	Test Mode
6	CCE	0	Configuration change enable The CPU has no write access to the configuration registers.
		1	The CPU has write access to the configuration registers (when Init bit is set).
5	DAR	0	Disable automatic retransmission Automatic retransmission of not successful messages enabled.
		1	Automatic retransmission disabled.
4	Reserved	0	This bit is always read as 0. Writes have no effect.
3	EIE	0	Error interrupt enable Disabled - PER, BOff and EWarn bits can not generate an interrupt.
		1	Enabled - PER, BOff and EWarn bits can generate an interrupt at DCAN0INT line and affect the interrupt register.
2	SIE	0	Status change interrupt enable Disabled - WakeUpPnd, RxOk, TxOk and LEC bits can not generate an interrupt.
		1	Enabled - WakeUpPnd, RxOk, TxOk and LEC can generate an interrupt at DCAN0INT line and affect the interrupt register.
1	IE0	0	Interrupt line 0 enable Disabled - Module interrupt DCAN0INT is always low.
		1	Enabled - interrupts will assert line DCAN0INT to one; line remains active until pending interrupts are processed.
0	Init	0	Initialization Normal operation
		1	Initialization mode is entered

NOTE: The Bus-Off recovery sequence (refer to CAN specification) cannot be shortened by setting or resetting Init bit. If the module goes Bus-Off, it will automatically set the Init bit and stop all bus activities.

When the Init bit is cleared by the application again, the module will then wait for 129 occurrences of Bus Idle (129 * 11 consecutive recessive bits) before resuming normal operation. At the end of the bus-off recovery sequence, the error counters will be reset.

After the Init bit is reset, each time when a sequence of 11 recessive bits is monitored, a Bit0 error code is written to the error and status register, enabling the CPU to check whether the CAN bus is stuck at dominant or continuously disturbed, and to monitor the proceeding of the bus-off recovery sequence.

5.14.1.2 Error and Status Register (DCAN ES) and DCAN Parity Error EOI Register (PARITYERR_EOI)

The error and status register (DCAN ES) is shown in [Figure 5-19](#) and described in [Table 5-12](#). The DCAN Parity Error EOI register is shown in [Figure 5-20](#) and described in [Table 5-13](#).

Figure 5-19. Error and Status Register (DCAN ES)

LEGEND: R = Read only; S = Set by Read; C = Clear by Read; -n = value after reset

Table 5-12. Error and Status Register (DCAN ES) Field Descriptions

Bit	Field	Value	Description
31-11	Reserved	0	These bits are always read as 0. Writes have no effect.
10	PDA	0	Local power-down mode acknowledge
		1	DCAN is not in local power-down mode. Application request for setting DCAN to local power-down mode was successful. DCAN is in local power-down mode.
9	WakeUp Pnd		Wake up pending. This bit can be used by the CPU to identify the DCAN as the source to wake up the system.
		0	No Wake Up is requested by DCAN.
		1	DCAN has initiated a wake up of the system due to dominant CAN bus while module power down. This bit will be reset if error and status register is read.

Table 5-12. Error and Status Register (DCAN ES) Field Descriptions (continued)

Bit	Field	Value	Description
8	PER	0	No parity error has been detected since last read access.
		1	The parity check mechanism has detected a parity error in the Message RAM. This bit will be reset if error and status register is read.
7	BOff	0	The CAN module is not bus-off state.
		1	The CAN module is in bus-off state.
6	EWarn	0	Both error counters are below the error warning limit of 96.
		1	At least one of the error counters has reached the error warning limit of 96.
5	EPass	0	On CAN Bus error, the DCAN could send active error frames.
		1	The CAN core is in the error passive state as defined in the CAN Specification.
4	RxOk	0	No message has been successfully received since the last time when this bit was read by the CPU. This bit is never reset by DCAN internal events.
		1	A message has been successfully received since the last time when this bit was reset by a read access of the CPU (independent of the result of acceptance filtering). This bit will be reset if error and status register is read.
3	TxOk	0	No message has been successfully transmitted since the last time when this bit was read by the CPU. This bit is never reset by DCAN internal events.
		1	A message has been successfully transmitted (error free and acknowledged by at least one other node) since the last time when this bit was reset by a read access of the CPU. This bit will be reset if error and status register is read.
2-0	LEC		Last error code. The LEC field indicates the type of the last error on the CAN bus. This field will be cleared to '0' when a message has been transferred (reception or transmission) without error.
		0	No error
		1	Stuff error: More than five equal bits in a row have been detected in a part of a received message where this is not allowed.
		2	Form error: A fixed format part of a received frame has the wrong format.
		3	Ack error: The message this CAN core transmitted was not acknowledged by another node.
		4	Bit1 error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant.
		5	Bit0 error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device wanted to send a dominant level (logical value '0'), but the monitored bus level was recessive. During Bus-Off recovery, this status is set each time a sequence of 11 recessive bits has been monitored. This enables the CPU to monitor the proceeding of the Bus-Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed).
		6	CRC error: In a received message, the CRC check sum was incorrect. (CRC received for an incoming message does not match the calculated CRC for the received data).
7	No CAN bus event was detected since the last time the CPU read the error and status register. Any read access to the error and status register re-initializes the LEC to value '7.'		

Table 5-13. Parity Error End of Interrupt Register (PARITYERR_EOI) Field Descriptions

Bit	Field	Value	Description
31-9	Reserved	0	These bits are always read as 0. Writes have no effect.
8	PARITYERR_EOI	0 1	End of interrupt indication for parity error Has no effect writing Indicated end of interrupt for parity error
7-0	Reserved		These bits are always read as 0. Writes have no effect.

Interrupts are generated by bits PER, BOff and EWarn (if EIE bit in CAN control register is set) and by bits WakeUpPnd, RxOk, TxOk, and LEC (if SIE bit in CAN control register is set).

A change of bit EPass will not generate an interrupt.

PARITYERR_EOI is used to signal an end of interrupt of the parity error interrupt (dcan_parity) to the IP. PARITYERR_EOI register is a *Write only* register.

A read from this offset address will result in a read from the DCAN ES register, where as a write will result in a write to the PARITYERR_EOI register.

NOTE: Reading the error and status register clears the WakeUpPnd, PER, RxOk and TxOk bits and set the LEC to value '7.' Additionally, the status interrupt value (0x8000) in the interrupt register will be replaced by the next lower priority interrupt value. The EOI for all other interrupts (DCANINT0 and DCANINT1) are automatically handled by hardware.

NOTE: For debug support, the auto clear functionality of error and status register (clear of status flags by read) is disabled when in debug/suspend mode.

5.14.1.3 Error Counter Register (DCAN ERRC)

The error counter register (DCAN ERRC) is shown in [Figure 5-21](#) and described in [Table 5-14](#).

Figure 5-21. Error Counter Register (DCAN ERRC)

LEGEND: R = Read only; -n = value after reset

Table 5-14. Error Counter Register (DCAN ERRC) Field Descriptions

Bit	Field	Value	Description
31-16	Reserved	0	These bits are always read as 0. Writes have no effect.
15	RP	0 1	Receive error passive The receive error counter is below the error passive level. The receive error counter has reached the error passive level as defined in the CAN specification.
14-8	REC[6:0]		Receive error counter. Actual state of the receive error counter (values from 0 to 255).
7-0	TEC[7:0]		Transmit error counter. Actual state of the transmit error counter (values from 0 to 255).

5.14.1.4 Bit Timing Register (DCAN BTR)

The bit timing register (DCAN BTR) is shown in [Figure 5-22](#) and described in [Table 5-15](#).

Figure 5-22. Bit Timing Register (DCAN BTR)

LEGEND: R = Read only; WP = Write protected by CCE bit; -n = value after reset

Table 5-15. Bit Timing Register (DCAN BTR) Field Descriptions

Bit	Field	Value	Description
31-20	Reserved	0	These bits are always read as 0. Writes have no effect.
19-16	BRPE	0x00-0x0F	Baud rate prescaler extension. Valid programmed values are 0 to 15. By programming BRPE the baud rate prescaler can be extended to values up to 1024.
15	Reserved	0	These bits are always read as 0. Writes have no effect.
14-12	TSeg2	0x0-0x7	Time segment after the sample point Valid programmed values are 0 to 7. The actual TSeg2 value which is interpreted for the bit timing will be the programmed TSeg2 value + 1.
11-8	TSeg1	0x01-0x0F	Time segment before the sample point Valid programmed values are 1 to 15. The actual TSeg1 value interpreted for the bit timing will be the programmed TSeg1 value + 1.
7-6	SJW	0x0-0x3	Synchronization Jump Width Valid programmed values are 0 to 3. The actual SJW value interpreted for the synchronization will be the programmed SJW value + 1.
5-0	BRP	0x00-0x3F	Baud rate prescaler Value by which the CAN_CLK frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid programmed values are 0 to 63. The actual BRP value interpreted for the bit timing will be the programmed BRP value + 1.

NOTE: This register is only writable if CCE and Init bits in the CAN control register are set.

NOTE: The CAN bit time may be programmed in the range of 8 to 25 time quanta.

NOTE: The CAN time quantum may be programmed in the range of 1 to 1024 CAN_CLK periods.

With a CAN_CLK of 8 MHz and BRPE = 0x00, the reset value of 0x00002301 configures the DCAN for a bit rate of 500kBit/s.

5.14.1.5 Interrupt Register (DCAN INT)

The interrupt register (DCAN INT) is shown in [Figure 5-23](#) and described in [Table 5-16](#).

Figure 5-23. Interrupt Register (DCAN INT)

LEGEND: R = Read only; -n = value after reset

Table 5-16. Interrupt Register (DCAN INT) Field Descriptions

Bit	Field	Value	Description
31-24	Reserved	0	These bits are always read as 0. Writes have no effect.
23-16	Int1ID[23:16]	0x00 0x01-0x80 0x81-0xFF	<p>Interrupt 1 Identifier (indicates the message object with the highest pending interrupt)</p> <p>No interrupt is pending</p> <p>Number of message object which caused the interrupt.</p> <p>Unused</p> <p>If several interrupts are pending, the CAN interrupt register will point to the pending interrupt with the highest priority. The DCAN1INT interrupt line remains active until Int1ID reaches value 0 (the cause of the interrupt is reset) or until IE1 is cleared.</p> <p>A message interrupt is cleared by clearing the message object's IntPnd bit.</p> <p>Among the message interrupts, the message object's interrupt priority decreases with increasing message number.</p>
15-0	Int0ID[15:0]	0x0000 0x0001-0x0080 0x0081-0x7FFF 0x8000 0x8001-0xFFFF	<p>Interrupt Identifier (the number here indicates the source of the interrupt)</p> <p>No interrupt is pending</p> <p>Number of message object which caused the interrupt.</p> <p>Unused</p> <p>Error and status register value is not 0x07.</p> <p>Unused</p> <p>If several interrupts are pending, the CAN interrupt register will point to the pending interrupt with the highest priority. The DCAN0INT interrupt line remains active until Int0ID reaches value 0 (the cause of the interrupt is reset) or until IEO is cleared.</p> <p>The Status interrupt has the highest priority. Among the message interrupts, the message object's interrupt priority decreases with increasing message number.</p>

5.14.1.6 Test Register (DCAN TEST)

The test register (DCAN TEST) is shown in [Figure 5-24](#) and described in [Table 5-17](#).

Figure 5-24. Test Register (DCAN TEST)

LEGEND: R = Read only; WP = Write protected by test bit; -n = value after reset; U = Undefined

Table 5-17. Test Register (DCAN TEST) Field Descriptions

Bit	Field	Value	Description
31-10	Reserved	0	These bits are always read as 0. Writes have no effect.
9	RDA	0	Normal pperation
		1	Direct access to the RAM is enabled while in test mode
8	EXL	0	Disabled
		1	Enabled
7	Rx	0	The CAN bus is dominant
		1	The CAN bus is recessive
6-5	Tx[1:0]	00	Normal operation, CAN_TX is controlled by the CAN core.
		01	Sample point can be monitored at CAN_TX pin.
		10	CAN_TX pin drives a dominant value.
		11	CAN_TX pin drives a recessive value.
4	LBack	0	Disabled
		1	Enabled
3	Silent	0	Disabled
		1	Enabled
2-0	Reserved	0	These bits are always read as 0. Writes have no effect.

For all test modes, the test bit in CAN control register needs to be set to one. If test bit is set, the RDA, EXL, Tx1, Tx0, LBack and Silent bits are writable. Bit Rx monitors the state of pin CAN_RX and therefore is only readable. All test register functions are disabled when test bit is cleared.

NOTE: The test register is only writable if test bit in CAN control register is set.

NOTE: Setting Tx[1:0] other than '00' will disturb message transfer.

NOTE: When the internal loop-back mode is active (bit LBack is set), bit EXL will be ignored.

5.14.1.7 Parity Error Code Register (DCAN PERR)

The parity error code register (DCAN PERR) is shown in [Figure 5-25](#) and described in [Table 5-18](#).

Figure 5-25. Parity Error Code Register (DCAN PERR)

LEGEND: R = Read only; -n = value after reset; U = Undefined

Table 5-18. Parity Error Code Register (DCAN PERR) Field Descriptions

Bit	Field	Value	Description
31-11	Reserved	0	These bits are always read as 0. Writes have no effect.
10-8	Word Number	0x01-0x05	Word number where parity error has been detected RDA word number (1 to 5) of the message object (according to the message RAM representation in RDA mode).
7-0	Message Number	0x01-0x80	Message object number where parity error has been detected

If a parity error is detected, the PER flag will be set in the error and status register. This bit is not reset by the parity check mechanism; it must be reset by reading the error and status register.

In addition to the PER flag, the parity error code register will indicate the memory area where the parity error has been detected (message number and word number).

If more than one word with a parity error was detected, the highest word number with a parity error will be displayed.

After a parity error has been detected, the register will hold the last error code until power is removed.

5.14.1.8 Auto-Bus-On Time Register (DCAN ABOTR)

The Auto-Bus-On time register (DCAN ABOTR) is shown in [Figure 5-26](#) and described in [Table 5-19](#).

Figure 5-26. Auto-Bus-On Time Register (DCAN ABOTR)

LEGEND: R = Read only; W = Write only; -n = value after reset

Table 5-19. Auto-Bus-On Time Register (DCAN ABOTR) Field Descriptions

Bit	Field	Value	Description
31-0	ABO Time		Number of OCP clock cycles before a Bus-Off recovery sequence is started by clearing the Init bit. This function has to be enabled by setting bit ABO in CAN control register. The Auto-Bus-On timer is realized by a 32-bit counter that starts to count down to zero when the module goes Bus-Off. The counter will be reloaded with the preload value of the ABO time register after this phase.

NOTE: On write access to the CAN control register while Auto-Bus-On timer is running, the Auto-Bus-On procedure will be aborted.

NOTE: During Debug/Suspend mode, running Auto-Bus-On timer will be paused.

5.14.1.9 Transmission Request X Register (DCAN TXRQ X)

With the transmission request X register (DCAN TXRQ X), the CPU can detect if one or more bits in the different transmission request registers are set. Each register bit represents a group of eight message objects. If at least one of the TxRqst bits of these message objects are set, the corresponding bit in the transmission request X register will be set. The transmission request X register is shown in [Figure 5-27](#).

Figure 5-27. Transmission Request X Register (DCAN TXRQ X)

LEGEND: R = Read only; -n = value after reset

Example 1. Bit 0 of the transmission request X register represents byte 0 of the transmission request 1 register. If one or more bits in this byte are set, bit 0 of the transmission request X register will be set.

5.14.1.10 Transmission Request Registers (DCAN TXRQ12 to DCAN TXRQ78)

These registers hold the TxRqst bits of the implemented message objects. By reading out these bits, the CPU can check for pending transmission requests. The TxRqst bit in a specific message object can be set/reset by the CPU via the IF1/IF2 message interface registers, or by the message handler after reception of a remote frame or after a successful transmission.

The transmission request registers are shown in [Table 5-20](#) and described in [Table 5-21](#).

Table 5-20. Transmission Request Registers (DCAN TXRQ12 to DCAN TXRQ78)

Offset/Register	31/ 15	30/ 14	29/ 13	29/ 12	27/ 11	26/ 10	25/ 9	24/ 8	23/ 7	22/ 6	21/ 5	20/ 4	19/ 3	18/ 2	17/ 1	16/ 0

LEGEND: R = Read only; -n = value after reset

Table 5-21. Transmission Request Registers (DCAN TXRQ12 to DCAN TXRQ78) Field Descriptions

Bit	Field	Value	Description
31-0	TxRqs[128:1]		Transmission request bits (for all message objects)
		0	No transmission has been requested for this message object.
		1	The transmission of this message object is requested and is not yet done.

5.14.1.11 New Data X Register (DCAN NWDAT X)

With the new data X register, the CPU can detect if one or more bits in the different new data registers are set. Each register bit represents a group of eight message objects. If at least one of the NewDat bits of these message objects are set, the corresponding bit in the new data X register will be set.

The new data X register (DCAN NWDAT X) is shown in [Figure 5-28](#).

Figure 5-28. Transmission Request X Register (DCAN TXRQ X)

LEGEND: R = Read only; -n = value after reset

Example 1. Bit 0 of the new data X register represents byte 0 of the new data 1 register. If one or more bits in this byte are set, bit 0 of the new data X register will be set.

5.14.1.12 New Data Registers (DCAN NWDAT12 to DCAN NWDAT78)

These registers hold the NewDat bits of the implemented message objects. By reading out these bits, the CPU can check for new data in the message objects. The NewDat bit of a specific message object can be set/reset by the CPU via the IF1/IF2 interface register sets, or by the message handler after reception of a data frame or after a successful transmission.

The new data registers (DCAN NWDAT12 to DCAN NWDAT78) are shown in [Table 5-22](#) and described in [Table 5-23](#).

Table 5-22. New Data Registers (DCAN NWDAT12 to DCAN NWDAT78)

Offset/Register	31/ 15	30/ 14	29/ 13	29/ 12	27/ 11	26/ 10	25/ 9	24/ 8	23/ 7	22/ 6	21/ 5	20/ 4	19/ 3	18/ 2	17/ 1	16/ 0

	NewDat[112:97]															
	R-0															

LEGEND: R = Read only; -n = value after reset

Table 5-23. New Data Registers (DCAN NWDAT12 to DCAN NWDAT78) Field Descriptions

Bit	Field	Value	Description
31-0	NewDat[128:1]	0	New Data Bits (for all message objects)
		0	No new data has been written into the data portion of this message object by the message handler since the last time when this flag was cleared by the CPU.
		1	The message handler or the CPU has written new data into the data portion of this message object.

5.14.1.13 Interrupt Pending X Register (DCAN INTPND X)

With the interrupt pending X register, the CPU can detect if one or more bits in the different interrupt pending registers are set. Each bit of this register represents a group of eight message objects. If at least one of the IntPnd bits of these message objects are set, the corresponding bit in the interrupt pending X register will be set.

The interrupt pending X register (DCAN INTPND X) is shown in [Figure 5-29](#).

Figure 5-29. Interrupt Pending X Register (DCAN INTPND X)

LEGEND: R = Read only; -n = value after reset

Example 2. Bit 0 of the interrupt pending X register represents byte 0 of the interrupt pending 1 register. If one or more bits in this byte are set, bit 0 of the interrupt pending X register will be set.

5.14.1.14 Interrupt Pending Registers (DCAN INTPND12 to DCAN INTPND78)

These registers hold the IntPnd bits of the implemented message objects. By reading out these bits, the CPU can check for pending interrupts in the message objects. The IntPnd bit of a specific message object can be set/reset by the CPU via the IF1/IF2 interface register sets, or by the message handler after a reception or a successful transmission.

The interrupt pending registers (DCAN INTPND12 to DCAN INTPND78) are shown in [Table 5-24](#) and described in [Table 5-25](#).

Table 5-24. New Data Registers (DCAN NWDAT12 to DCAN NWDAT78)

Offset/Register	31/ 15	30/ 14	29/ 13	29/ 12	27/ 11	26/ 10	25/ 9	24/ 8	23/ 7	22/ 6	21/ 5	20/ 4	19/ 3	18/ 2	17/ 1	16/ 0

Table 5-25. New Data Registers (DCAN NWDAT12 to DCAN NWDAT78) Field Descriptions

Bit	Field	Value	Description
31-0	IntPnd[128:1]		Interrupt Pending Bits (for all message objects)
		0	This message object is not the source of an interrupt.
		1	This message object is the source of an interrupt.

5.14.1.15 Message Valid X Register (DCAN MSGVAL X)

With the message valid X register, the CPU can detect if one or more bits in the different message valid registers are set. Each bit of this register represents a group of eight message objects. If at least one of the MsgVal bits of these message objects are set, the corresponding bit in the message valid X register will be set.

The message valid X register (DCAN MSGVAL X) is shown in [Figure 5-30](#).

Figure 5-30. Message Valid X Register (DCAN MSGVAL X)

LEGEND: R = Read only; -n = value after reset

Example 3. Bit 0 of the message valid X register represents byte 0 of the message valid 1 register. If one or more bits in this byte are set, bit 0 of the message valid X register will be set.

5.14.1.16 Message Valid Registers (DCAN MSGVAL12 to DCAN MSGVAL78)

These registers hold the MsgVal bits of the implemented message objects. By reading out these bits, the CPU can check which message objects are valid. The MsgVal bit of a specific message object can be set/reset by the CPU via the IF1/IF2 interface register sets, or by the message handler after a reception or a successful transmission.

The message valid registers (DCAN MSGVAL12 to MSGVAL78) is shown in [Table 5-26](#) and described in [Table 5-27](#).

Table 5-26. Message Valid Registers (DCAN MSGVAL12 to DCAN MSGVAL78)

Offset/Register	31/ 15	30/ 14	29/ 13	29/ 12	27/ 11	26/ 10	25/ 9	24/ 8	23/ 7	22/ 6	21/ 5	20/ 4	19/ 3	18/ 2	17/ 1	16/ 0

Table 5-27. Message Valid Registers (DCAN MSGVAL12 to DCAN MSGVAL78) Field Descriptions

Bit	Field	Value	Description
31-0	MsgVal[128:1]		Message valid bits (for all message objects)
		0	This message object is ignored by the message handler.
		1	This message object is configured and will be considered by the message handler.

5.14.1.17 Interrupt Multiplexer Registers (DCAN INTMUX12 to DCAN INTMUX78)

The IntMux flag determine for each message object, which of the two interrupt lines (DCAN0INT or DCAN1INT) will be asserted when the IntPnd of this message object is set. Both interrupt lines can be globally enabled or disabled by setting or clearing IE0 and IE1 bits in CAN control register.

The IntPnd bit of a specific message object can be set or reset by the CPU via the IF1/IF2 interface register sets, or by message handler after reception or successful transmission of a frame. This will also affect the Int0ID resp Int1ID flags in the interrupt register.

The interrupt multiplexer registers are shown in [Table 5-28](#) and described in [Table 5-29](#).

Table 5-28. Interrupt Multiplexer Registers (DCAN INTMUX12 to DCAN INTMUX78)

Offset/Register	31/ 15	30/ 14	29/ 13	29/ 12	27/ 11	26/ 10	25/ 9	24/ 8	23/ 7	22/ 6	21/ 5	20/ 4	19/ 3	18/ 2	17/ 1	16/ 0

LEGEND: R = Read only; -n = value after reset

Table 5-29. Interrupt Multiplexer Registers (DCAN INTMUX12 to DCAN INTMUX78) Field Descriptions

Bit	Field	Value	Description
31-0	IntMux[128:1]		Multiplexes IntPnd value to either DCAN0INT or DCAN1INT interrupt lines (for all message objects)
		0	DCAN0INT line is active if corresponding IntPnd flag is one.
		1	DCAN1INT line is active if corresponding IntPnd flag is one.

5.14.1.18 IF1/IF2 Command Registers (DCAN IF1CMD, DCAN IF2CMD)

The IF1/IF2 Command Register (DCAN IF1CMD, DCAN IF2CMD) configure and initiate the transfer between the IF1/IF2 register sets and the message RAM. It is configurable which portions of the message object should be transferred.

A transfer is started when the CPU writes the message number to bits [7:0] of the IF1/IF2 command register. With this write operation, the Busy bit is automatically set to '1' to indicate that a transfer is in progress.

After 4 to 14 OCP clock cycles, the transfer between the interface register and the message RAM will be completed and the Busy bit is cleared. The maximum number of cycles is needed when the message transfer concurs with a CAN message transmission, acceptance filtering, or message storage.

If the CPU writes to both IF1/IF2 command registers consecutively (request of a second transfer while first transfer is still in progress), the second transfer will start after the first one has been completed.

The IF1/IF2 command registers are shown in [Figure 5-31](#) and [Figure 5-32](#) and described in [Table 5-30](#).

NOTE: While Busy bit is one, IF1/IF2 register sets are write protected.

NOTE: For debug support, the auto clear functionality of the IF1/IF2 command registers (clear of DMAactive flag by r/w) is disabled during Debug/Suspend mode.

NOTE: If an invalid Message Number is written to bits [7:0] of the IF1/IF2 command register, the message handler may access an implemented (valid) message object instead.

Table 5-30. IF1/IF2 Command Registers (DCAN IF1CMD, DCAN IF2CMD) Field Descriptions

Bit	Field	Value	Description
31-24	Reserved	0	These bits are always read as 0. Writes have no effect.
23	WR/RD	0 1	Write/Read 0 Direction = Read: Transfer direction is from the message object addressed by Message Number (Bits [7:0]) to the IF1/IF2 register set. 1 Direction = Write: Transfer direction is from the IF1/IF2 register set to the message object addressed by Message Number (Bits [7:0]).
22	Mask	0 1	Access mask bits 0 Mask bits will not be changed 1 Direction = Read: The mask bits (identifier mask + MDir + MXtd) will be transferred from the message object addressed by Message Number (Bits [7:0]) to the IF1/IF2 register set. Direction = Write: The mask bits (identifier mask + MDir + MXtd) will be transferred from the IF1/IF2 register set to the message object addressed by Message Number (Bits [7:0]).
21	Arb	0 1	Access arbitration bits 0 Arbitration bits will not be changed 1 Direction = Read: The Arbitration bits (Identifier + Dir + Xtd + MsgVal) will be transferred from the message object addressed by Message Number (Bits [7:0]) to the corresponding IF1/IF2 register set. Direction = Write: The Arbitration bits (Identifier + Dir + Xtd + MsgVal) will be transferred from the IF1/IF2 register set to the message object addressed by Message Number (Bits [7:0]).
20	Control	0 1	Access control bits 0 Control bits will not be changed 1 Direction = Read: The message control bits will be transferred from the message object addressed by message number (Bits [7:0]) to the IF1/IF2 registerset. Direction = Write: The message control bits will be transferred from the IF1/IF2 registerset to the message object addressed by message number (Bits [7:0]). If the TxRqst/NewDat bit in this register(Bit [18]) is set, the TxRqst/ NewDat bit in the IF1/IF2 message control register will be ignored.
19	ClrIntPnd	0 1	Clear interrupt pending bit 0 IntPnd bit will not be changed 1 Direction = Read: Clears IntPnd bit in the message object. Direction = Write: This bit is ignored. Copying of IntPnd flag from IF1/IF2 Registers to message RAM can only be controlled by the control flag (Bit [20]).
18	TxRqst/NewDat	0 1	Access transmission request bit 0 Direction = Read: NewDat bit will not be changed. Direction = Write: TxRqst/NewDat bit will be handled according to the control bit. 1 Direction = Read: Clears NewDat bit in the message object. Direction = Write: Sets TxRqst/NewDat in message object. Note: If a CAN transmission is requested by setting TxRqst/NewDat in this register, the TxRqst/NewDat bits in the message object will be set to one independent of the values in IF1/IF2 message control Register. Note: A read access to a message object can be combined with the reset of the control bits IntPnd and NewDat. The values of these bits transferred to the IF1/IF2 message control register always reflect the status before resetting them.
17	Data A	0 1	Access Data Bytes 0-3 0 Data Bytes 0-3 will not be changed. 1 Direction = Read: The data bytes 0-3 will be transferred from the message object addressed by the Message Number (Bits [7:0]) to the corresponding IF1/IF2 registerset. Direction = Write: The data bytes 0-3 will be transferred from the IF1/IF2 registerset to the message object addressed by the Message Number (Bits [7:0]). Note: The duration of the message transfer is independent of the number of bytes to be transferred.

Table 5-30. IF1/IF2 Command Registers (DCAN IF1CMD, DCAN IF2CMD) Field Descriptions (continued)

Bit	Field	Value	Description
16	Data B	0 1	<p>Access Data Bytes 4-7</p> <p>0 Data Bytes 4-7 will not be changed.</p> <p>1 Direction = Read: The data bytes 4-7 will be transferred from the message object addressed by Message Number (Bits [7:0]) to the corresponding IF1/IF2 registerset.</p> <p>Direction = Write: The data bytes 4-7 will be transferred from the IF1/IF2 registerset to the message object addressed by message number (Bits [7:0]).</p> <p>Note: The duration of the message transfer is independent of the number of bytes to be transferred.</p>
15	Busy	0 1	<p>Busy flag</p> <p>0 No transfer between IF1/IF2 register set and message RAM is in progress.</p> <p>1 Transfer between IF1/IF2 register set and message RAM is in progress.</p> <p>This bit is set to one after the message number has been written to bits [7:0]. IF1/IF2 register set will be write protected. The bit is cleared after read/write action has been finished.</p>
14	DMAactive	0 1	<p>Activation of DMA feature for subsequent internal IF1/IF2 update</p> <p>0 DMA request line is independent of IF1/IF2 activities.</p> <p>1 DMA is requested after completed transfer between IF1/IF2 register set and message RAM.</p> <p>The DMA request remains active until the first read or write to one of the IF1/IF2 registers; an exception is a write to Message Number (Bits [7:0]) when DMAactive is one.</p> <p>Note: Due to the auto reset feature of the DMAactive bit, this bit has to be set for each subsequent DMA cycle separately.</p>
13-8	Reserved	0	These bits are always read as 0. Writes have no effect.
7-0	Message Number	0x00 0x01- 0x80 0x81- 0xFF	<p>Number of message object in message RAM which is used for data transfer</p> <p>0x00 Invalid message number</p> <p>0x01- 0x80 Valid message numbers</p> <p>0x81- 0xFF Invalid message numbers</p>

5.14.1.19 IF1/IF2 Mask Registers (DCAN IF1MSK, DCAN IF2MSK)

The bits of the IF1/IF2 mask registers mirror the mask bits of a message object. The function of the relevant message objects bits is described in *Structure of Message Objects*.

The IF1/IF2 mask registers (DCAN IF1MSK, DCAN IF2MSK) are shown in [Figure 5-33](#) and [Figure 5-34](#) and described in [Table 5-31](#).

NOTE: While Busy bit of IF1/IF2 command register is one, IF1/IF2 register set is write protected.

Table 5-31. IF1/IF2 Mask Registers (DCAN IF1MSK, DCAN IF2MSK) Field Descriptions

Bit	Field	Value	Description
31	MXtd	0	The extended identifier bit (IDE) has no effect on the acceptance filtering.
		1	The extended identifier bit (IDE) is used for acceptance filtering. When 11-bit ("standard") identifiers are used for a message object, the identifiers of received data frames are written into bits ID[28:18]. For acceptance filtering, only these bits together with mask bits Msk[28:18] are considered.
30	MDir	0	The message direction bit (Dir) has no effect on the acceptance filtering.
		1	The message direction bit (Dir) is used for acceptance filtering.
29	Reserved	0	These bits are always read as 0. Writes have no effect.
28-0	Msk[28:0]	0	The corresponding bit in the identifier of the message object is not used for acceptance filtering (don't care).
		1	The corresponding bit in the identifier of the message object is used for acceptance filtering.

5.14.1.20 IF1/IF2 Arbitration Registers (DCAN IF1ARB, DCAN IF2ARB)

The bits of the IF1/IF2 arbitration registers mirror the arbitration bits of a message object. The function of the relevant message objects bits is described in *Structure of Message Objects*.

The IF1/IF2 arbitration registers (DCAN IF1ARB, DCAN IF2ARB) are shown in [Figure 5-35](#) and [Figure 5-36](#) and described in [Table 5-32](#).

NOTE: While Busy bit of IF1/IF2 command register is one, IF1/IF2 register set is write protected.

R/WP-0				

LEGEND: R = Read only; WP = Write protected (protected by busy bit); -n = value after reset

Table 5-32. IF1/IF2 Arbitration Registers (DCAN IF1ARB, DCAN IF2ARB) Field Descriptions

Bit	Field	Value	Description
31	MsgVal	0	The message object is ignored by the message handler.
		1	The message object is to be used by the message handler. The CPU should reset the MsgVal bit of all unused Messages Objects during the initialization before it resets bit Init in the CAN control register. This bit must also be reset before the identifier ID[28:0], the control bits Xtd, Dir or DLC[3:0] are modified, or if the messages object is no longer required.
30	Xtd	0	The 11-bit ("standard") Identifier is used for this message object.
		1	The 29-bit ("extended") Identifier is used for this message object.
29	Dir	0	Direction = receive: On TxRqst, a remote frame with the identifier of this message object is transmitted. On reception of a data frame with matching identifier, this message is stored in this message object.
		1	Direction = transmit: On TxRqst, the respective message object is transmitted as a data frame. On reception of a remote frame with matching identifier, the TxRqst bit of this message object is set (if RmtEn = 1).

Table 5-32. IF1/IF2 Arbitration Registers (DCAN IF1ARB, DCAN IF2ARB) Field Descriptions (continued)

Bit	Field	Value	Description
28-0	ID[28:0]		Message identifier
		ID[28:0]	29-bit identifier (extended frame)
		ID[28:1 8]	11-bit identifier (standard frame)

The Arbitration bits ID[28:0], Xtd, and Dir are used to define the identifier and type of outgoing messages and (together with the mask bits Msk[28:0], MXtd, and MDir) for acceptance filtering of incoming messages.

A received message is stored into the valid message object with matching identifier and Direction = receive (data frame) or Direction = transmit (remote frame).

Extended frames can be stored only in message objects with Xtd = one, standard frames in message objects with Xtd = zero.

If a received message (data frame or remote frame) matches more than one valid message objects, it is stored into the one with the lowest message number.

5.14.1.21 IF1/IF2 Message Control Registers (DCAN IF1MCTL, DCAN IF2MCTL)

The bits of the IF1/IF2 message control registers mirror the message control bits of a message object. The function of the relevant message objects bits is described in *Structure of Message Objects*.

The IF1/IF2 message control registers (DCAN IF1MCTL, DCAN IF2MCTL) are shown in [Figure 5-37](#) and [Figure 5-38](#) and described in [Table 5-33](#).

NOTE: While Busy bit of IF1/IF2 command register is one, IF1/IF2 register set is write protected.

Table 5-33. IF1/IF2 Message Control Registers (DCAN IF1MCTL, DCAN IF2MCTL) Field Descriptions

Bit	Field	Value	Description
31-16	Reserved	0	These bits are always read as 0. Writes have no effect.
15	NewDat	0	No new data has been written into the data portion of this message object by the message handler since the last time when this flag was cleared by the CPU.
		1	The message handler or the CPU has written new data into the data portion of this message object.
14	MsgLst	0	No message lost since the last time when this bit was reset by the CPU.
		1	The message handler stored a new message into this object when NewDat was still set, so the previous message has been overwritten.
13	IntPnd	0	This message object is not the source of an interrupt.
		1	This message object is the source of an interrupt. The Interrupt Identifier in the interrupt register will point to this message object if there is no other interrupt source with higher priority.
12	UMask	0	Mask ignored
		1	Use mask (Msk[28:0], MXtd, and MDir) for acceptance filtering If the UMask bit is set to one, the message object's mask bits have to be programmed during initialization of the message object before MsgVal is set to one.

Table 5-33. IF1/IF2 Message Control Registers (DCAN IF1MCTL, DCAN IF2MCTL) Field Descriptions (continued)

Bit	Field	Value	Description
11	TxIE	0	Transmit interrupt enable IntPnd will not be triggered after the successful transmission of a frame.
		1	IntPnd will be triggered after the successful transmission of a frame.
10	RxIE	0	Receive interrupt enable IntPnd will not be triggered after the successful reception of a frame.
		1	IntPnd will be triggered after the successful reception of a frame.
9	RmtEn	0	Remote enable At the reception of a remote frame, TxRqst is not changed.
		1	At the reception of a remote frame, TxRqst is set.
8	TxRqst	0	Transmit request This message object is not waiting for a transmission.
		1	The transmission of this message object is requested and is not yet done.
7	EoB	0	End of Block The message object is part of a FIFO Buffer block and is not the last message object of the FIFO Buffer block.
		1	The message object is a single message object or the last message object in a FIFO Buffer Block. Note: This bit is used to concatenate multiple message objects to build a FIFO Buffer. For single message objects (not belonging to a FIFO Buffer), this bit must always be set to one.
6-4	Reserved	0	These bits are always read as 0. Writes have no effect.
3-0	DLC[3:0]	0-8	Data length code Data frame has 0-8 data bits.
		9-15	Data frame has 8 data bytes. Note: The data length code of a message object must be defined the same as in all the corresponding objects with the same identifier at other nodes. When the message handler stores a data frame, it will write the DLC to the value given by the received message.

5.14.1.22 IF1/IF2 Data A and Data B Registers (DCAN IF1DATA/DATB, DCAN IF2DATA/DATB)

The data bytes of CAN messages are stored in the IF1/IF2 registers in the following order:

1. In a CAN data frame, Data 0 is the first, and Data 7 is the last byte to be transmitted or received.
2. In CAN's serial bit stream, the MSB of each byte will be transmitted first.

The IF1/IF2 data A and data B registers (DCAN IF1DATA/DATB, DCAN IF2DATA/DATB) registers are shown in [Figure 5-39](#), [Figure 5-40](#), [Figure 5-41](#) and [Figure 5-42](#).

5.14.1.23 IF3 Observation Register (DCAN IF3OBS)

The IF3 register set can automatically be updated with received message objects without the need to initiate the transfer from message RAM by CPU (Additional information can be found in *Structure of Message Objects*).

The observation flags (Bits [4:0]) in the IF3 observation register are used to determine, which data sections of the IF3 interface register set have to be read in order to complete a DMA read cycle. After all marked data sections are read, the DCAN is enabled to update the IF3 interface register set with new data.

Any access order of single bytes or half-words is supported. When using byte or half-word accesses, a data section is marked as completed, if all bytes are read.

NOTE: If IF3 Update Enable is used and no Observation flag is set, the corresponding message objects will be copied to IF3 without activating the DMA request line and without waiting for DMA read accesses.

A write access to this register aborts a pending DMA cycle by resetting the DMA line and enables updating of IF3 interface register set with new data. To avoid data inconsistency, the DMA controller should be disabled before reconfiguring IF3 observation register.

The status of the current read-cycle can be observed via status flags (Bits [12:8]).

If an interrupt line is available for IF3, an interrupt will be generated by IF3Upd flag. See the device-specific data sheet for the availability of this interrupt source.

With this interrupt, the observation status bits and the IF3Upd bit could be used by the application to realize the notification about new IF3 content in polling or interrupt mode.

The IF3 observation register (DCAN IF3OBS) is shown in [Figure 5-43](#) and described in [Table 5-34](#).

Figure 5-43. IF3 Observation Register (DCAN IF3OBS)

31-16	Reserved	0	These bits are always read as 0. Writes have no effect.
15	NewDat	0	No new data has been written into the data portion of this message object by the message handler since the last time when this flag was cleared by the CPU.
		1	The message handler or the CPU has written new data into the data portion of this message object.
14	MsgLst	0	Message Lost (only valid for message objects with direction = receive) No message lost since the last time when this bit was reset by the CPU.
		1	The message handler stored a new message into this object when NewDat was still set, so the previous message has been overwritten.
13	IntPnd	0	Interrupt Pending This message object is not the source of an interrupt.
		1	This message object is the source of an interrupt. The Interrupt Identifier in the interrupt register will point to this message object if there is no other interrupt source with higher priority.
12	UMask	0	Use Acceptance Mask Mask ignored
		1	Use mask (Msk[28:0], MXtd, and MDir) for acceptance filtering If the UMask bit is set to one, the message object's mask bits have to be programmed during initialization of the message object before MsgVal is set to one.
11	TxIE	0	Transmit Interrupt enable IntPnd will not be triggered after the successful transmission of a frame.
		1	IntPnd will be triggered after the successful transmission of a frame.
10	RxIE	0	Receive Interrupt enable IntPnd will not be triggered after the successful reception of a frame.
		1	IntPnd will be triggered after the successful reception of a frame.
9	RmtEn	0	Remote enable At the reception of a remote frame, TxRqst is not changed.
		1	At the reception of a remote frame, TxRqst is set.
8	TxRqst	0	Transmit Request This message object is not waiting for a transmission.
		1	The transmission of this message object is requested and is not yet done.
7	EoB	0	End of Block The message object is part of a FIFO Buffer block and is not the last message object of the FIFO Buffer block.
		1	The message object is a single message object or the last message object in a FIFO Buffer Block. Note: This bit is used to concatenate multiple message objects to build a FIFO Buffer. For single message objects (not belonging to a FIFO Buffer), this bit must always be set to one.
6-4	Reserved	0	These bits are always read as 0. Writes have no effect.

Table 5-37. IF3 Message Control Register (DCAN IF3MCTL) Field Descriptions (continued)

Bit	Field	Value	Description
3-0	DLC[3:0]	0-8 9-15	<p>Data Length Code</p> <p>Data frame has 0-8 data bits.</p> <p>Data frame has 8 data bytes.</p> <p>Note: The data length code of a message object must be defined the same as in all the corresponding objects with the same identifier at other nodes. When the message handler stores a data frame, it will write the DLC to the value given by the received message.</p>

5.14.1.27 IF3 Data A and Data B Registers (DCAN IF3DATA/DATB)

The data bytes of CAN messages are stored in the IF3 registers in the following order.

In a CAN data frame, Data 0 is the first, and Data 7 is the last byte to be transmitted or received. In CAN's serial bit stream, the MSB of each byte will be transmitted first.

The IF3 data A and data B registers (DCAN IF3DATA/DATB) are shown in [Figure 5-47](#) and [Figure 5-48](#).

Figure 5-47. IF3 Data A Register (DCAN IF3DATA)

LEGEND: R = Read only; -n = value after reset

Figure 5-48. IF3 Data B Register (DCAN IF3DATB)

LEGEND: R = Read only; -n = value after reset

5.14.1.28 Update Enable Registers (DCAN IF3UPD12 to IF3UPD78)

The automatic update functionality of the IF3 register set can be configured for each message object. A message object is enabled for automatic IF3 update, if the dedicated IF3UpdEn flag is set. This means that an active NewDat flag of this message object (e.g due to reception of a CAN frame) will trigger an automatic copy of the whole message object to IF3 register set.

The update enable registers (DCAN IF3UPD12 to IF3UPD78) are shown in [Table 5-38](#) and described in [Table 5-39](#).

NOTE: IF3 Update enable should not be set for transmit objects.

Table 5-38. Update Enable Registers (DCAN IF3UPD12 to IF3UPD78)

Bit	Field	Value	Description
31-0	IF3UpdEn[128:1]	0	IF3 Update Enabled (for all message objects) Automatic IF3 update is disabled for this message object.
		1	Automatic IF3 update is enabled for this message object. A message object is scheduled to be copied to IF3 register set, if NewDat flag of the message object is active.

5.14.1.29 CAN TX I/O Control Register (DCAN TIOC)

The CAN_TX pin of the DCAN module can be used as general purpose IO pin if CAN function is not needed. The CAN TX I/O control register (DCAN TIOC) is shown in Figure 5-49 and described in Table 5-40.

NOTE: The values of the IO control registers are only writable if Init bit of the CAN control register is set.

NOTE: The OD, Func, Dir and Out bits of the CAN TX IO control register are forced to certain values when Init bit of CAN control register is reset (see bit descriptions).

Table 5-40. CAN TX I/O Control Register (DCAN TIOC) Field Descriptions

Bit	Field	Value	Description
31-19	Reserved	0	These bits are always read as 0. Writes have no effect.
18	PU	0 1	CAN_TX pull up/pull down select. This bit is only active when CAN_TX is configured to be an input. 0 CAN_TX pull down is selected, when pull logic is active (PD = 0). 1 CAN_TX pull up is selected, when pull logic is active(PD = 0).
17	PD	0 1	CAN_TX pull disable. This bit is only active when CAN_TX is configured to be an input. 0 CAN_TX pull is active 1 CAN_TX pull is disabled
16	OD	0 1	CAN_TX open drain enable. This bit is only active when CAN_TX is configured to be in GIO mode (TIOC.Func=0). 0 The CAN_TX pin is configured in push/pull mode. 1 The CAN_TX pin is configured in open drain mode. Forced to '0' if Init bit of CAN control register is reset.
15-4	Reserved	0	These bits are always read as 0. Writes have no effect.
3	Func	0 1	CAN_TX function. This bit changes the function of the CAN_TX pin 0 CAN_TX pin is in GIO mode. 1 CAN_TX pin is in functional mode (as an output to transmit CAN data). Forced to '1' if Init bit of CAN control register is reset.
2	Dir	0 1	CAN_TX data direction. This bit controls the direction of the CAN_TX pin when it is configured to be in GIO mode only (TIOC.Func=0) 0 The CAN_TX pin is an input. 1 The CAN_TX pin is an output Forced to '1' if Init bit of CAN control register is reset.

Table 5-40. CAN TX I/O Control Register (DCAN TIOC) Field Descriptions (continued)

Bit	Field	Value	Description
1	Out	0 1	CAN_TX data out write. This bit is only active when CAN_TX pin is configured to be in GIO mode (TIOC.Func = 0) and configured to be an output pin (TIOC.Dir = 1). The value of this bit indicates the value to be output to the CAN_TX pin. The CAN_TX pin is driven to logic low The CAN_TX pin is driven to logic high Forced to Tx output of the CAN core, if Init bit of CAN control register is reset.
0	In	0 1	CAN_TX data in The CAN_TX pin is at logic low The CAN_TX pin is at logic high Note: When CAN_TX pin is connected to a CAN transceiver, an external pullup resistor has to be used to ensure that the CAN bus will not be disturbed (e.g. while reset of the DCAN module).

5.14.1.30 CAN RX IO Control Register (DCAN RIOC)

The CAN_RX pin of the DCAN module can be used as general purpose IO pin if CAN function is not needed. The CAN RX I/O control register (DCAN RIOC) is shown in [Figure 5-50](#) and described in [Table 5-41](#).

NOTE: The values of the IO control registers are writable only if Init bit of CAN control register is set.

NOTE: The OD, Func and Dir bits of the CAN RX IO control register are forced to certain values when the Init bit of CAN control register is reset (see bit descriptions).

Figure 5-50. CAN RX IO control register (DCAN RIOC)

DMM/TILER

This chapter describes the Dynamic Memory Manager (DMM) and its Tiling and Isometric Lightweight Engine for Rotation (TILER) submodule.

Topic	Page
6.1 Introduction	1088
6.2 Architecture	1091
6.3 Use Case	1125
6.4 DMM/TILER Registers.....	1141

6.1 Introduction

6.1.1 Overview

This section describes the Dynamic Memory Manager (DMM) and its Tiling and Isometric Lightweight Engine for Rotation (TILER) submodule.

As shown in [Figure 6-1](#), the DMM is located in front to the SDRAM controllers and thus interfaces to the memory accesses generated by all the initiators.

The dynamic memory manager (DMM), is a module aimed at managing – in a broad sense – various aspects of memory accesses such as:

- Initiator-indexed priority generation
- Multizone SDRAM memory interleaving configuration
- Block object transfer optimization – tiling and sub-tiling
- Centralized low-latency page translation – MMU-like feature

The dynamic qualifier for memory management highlights the software configurability – and, hence, the run-time nature – of the four aspects of memory management handled by the DMM.

On a functional perspective, the role of the DMM is to:

- add initiator-based priority to any incoming requests
- perform to-and-fro tiling conversions of "tiled" requests
- provide an optional low-latency page-based translation to handle memory fragmentation - MMU
- distribute the traffic on both the attached memory controllers according to the interleaving configuration

The TILER is a submodule within the DMM aimed at efficient handling of two dimensional data by the use of tiled format.

- optionally managing the memory fragmentation and zero-copy physical frame buffers swapping through a page-grained translation
- making on-the-fly, zero overhead transforms, such as 90°, 180°, or 270° rotations, with either a horizontal or vertical reflection

Figure 6-1. DMM Integration

6.1.2 Features

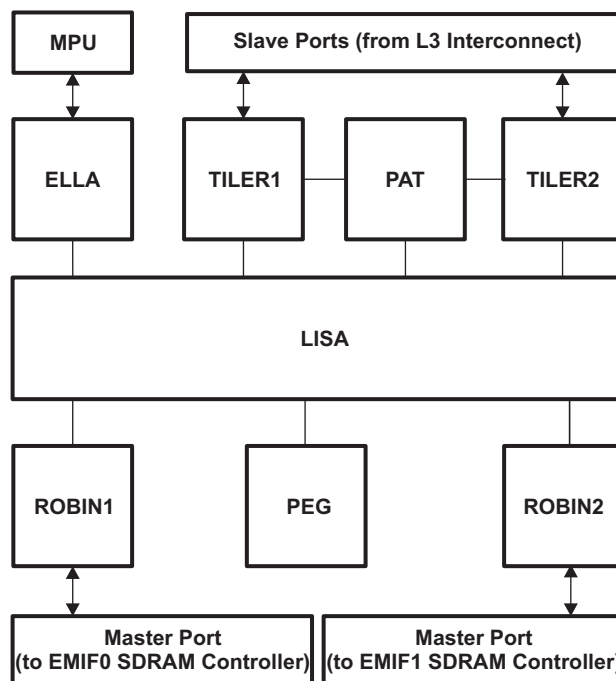

- Special low latency interconnect port. ELLA, only for Cortex-A8 accesses.
- Ability to interleave the DDR data between two EMIF banks, using the programmable multi-zone DRAM memory mapping . This increases the memory throughput by a factor of 2. Up-to four unique memory sections supported.
- Programmable Initiator based request priority extension, for up to 16 Initiator groups.
- Support for address translations of tiled data, on a 4KB page granularity using the PAT. This helps manage memory fragmentation.
- Supports up to 4 unique PAT views.

6.1.3 Functional Block Diagram

Figure 6-2 shows the DMM macro architecture. The DMM consists of six blocks:

- A Priority Extension Generator (PEG) to generate priorities required by the SDRAM controller, note that these priorities are not used in the DMM
- One Extra Low Latency Access (ELLA), having its own interconnect slave port, for providing lower latency accesses to the memory
- A Local Interconnect and Synchronization Agent (LISA) to synchronize all DMM subsystems and provide access to their configuration registers
- A Physical Address Translator (PAT) for managing the memory fragmentation
- Two Re-Ordering Buffer and Initiator Nodes (ROBIN), having each their own interconnect master port, to initiate requests to the SDRAM controller and allow tiled data, tiled response and split response reconstruction. The ROBIN block is only managing the re-ordering buffer and performing the data re-ordering due to the orientation.
- Two Tiling and Isometric Lightweight Engine for Rotation (TILER), having each their own interconnect slave port, for converting requests to-and-fro between the input virtual addressing mode and the output physical tiled addressing mode. Note that, the tiling conversions of requests, write data and responses is fully performed in the TILER blocks.

Figure 6-2. DMM Block Diagram

6.1.4 Terminologies and Acronyms Used in this Document

The following is a brief explanation of some terms used in this document:

bpp— Bits per pixel

DMM— Dynamic Memory Manager

ELLA— Extra Low Latency Access

GB, GiB— Both imply Giga Byte

Initiator— A node inside the Device and is either a CPU, peripheral or DMA engine, which can be internal bus Master. Each initiator is identified by a ConnID (Connection ID). With a limit of only 16 ConnIDs, some of the Initiators are grouped together with same ConnID.

Interlaced— Qualifier for accesses skipping one line every line

LISA— Local Interconnect and Synchronisation Agent

KB, KiB— Both imply Kilo Byte

LUT— Look Up Table

MMU— Memory Management Unit

MPU— Main Processing Unit. For this device, it is Cortex-A8

PAT— Physical Address Translator

PEG— Priority Extension Generator

Progressive— Qualifier for line-by-line accesses

ROBIN— Re-Ordering Buffer and Initiator Node

Tiled access— 1D or 2D Access to the tiled area, where the image data is read and written in two dimensional format, to improve the efficiency of accesses of 2D accesses, example image macro block. TILER Tiling and Isometric Lightweight Engine for Rotation 1D access A simple linear read or write access request. The DMM responds with read/write from/to the contiguous memory starting with address specified in the request.

2D access— HD_VPSS, can generate a special access to 2D image buffers, with read/ write request, with Height and Width information. The DMM-TILER decodes the access type based on the Height, width and address, and responds with read/write from/to data in the physical memory, which has been co-located, with sub-tile granularity.

6.2 Architecture

6.2.1 DMM Functional Description

6.2.1.1 Priority Extension Generator (PEG)

The priority extension generator (PEG) is a dynamic software-programmable initiator-indexed table of priorities. Its unique role is to generate priorities for each access forwarded by the DMM to the SDRAM controller. For initiators that do not generate their own per-transaction priority, the priority value that is programmed in the table, will be assigned to all SDRAM accesses generated by that initiator. These priorities are not used by the DMM, for internal arbitrations.

The 64 priority entries are software-programmable with DMM_PEG_PRI00 (for the first eight entries of the ConnID table) through DMM_PEG_PRI07 (for the last eight entries) registers and set on a 3-bit scale, ranging from values 0-7, with Priority=0, being the highest priority.

When a request is passed to the SDRAM controller, the priority from the corresponding DMM_PEG_PRI0x field for an initiator is passed to SDRAM. However, for HD_VPSS, the peripheral itself generates a priority. The DMM_PEG_PRI0x field for HD_VPSS is bypassed and the priority indicated by HD_VPSS access is sent to SDRAM controller.

6.2.1.2 ELLA

The Extra Low Latency Access (ELLA) of the DMM is a simple interface port for all accesses made by Cortex-A8. As the name suggests, this interface is simplified to reduce latency to the request from Cortex-A8. In this respect, the ELLA block:

- Is limited to 1D bursts only
- Is not capable of performing tiling conversions
- Does not interact with the PAT block

The ELLA block main role is to split incoming requests at DMM atomic unit boundaries to ensure that requests sent to the SDRAM controller fit in a single SDRAM page. More precisely, the ELLA block is responsible for:

- Allocating an internal response context to timely generate the appropriate responses
- Splitting the incoming requests at DMM atomic section boundaries
- Requesting internal buffer allocation in the appropriate ROBIN
- In case of a write request, allocating and updating an internal write context to subsequently direct the incoming write data into the relevant re-ordering buffer

NOTE: In the device, Cortex-A8 accesses in the system address space of 8000 0000h-FFFF FFFFh, are only routed through ELLA port. Accesses made by Cortex-A8, in the all four tiled modes, including Paged mode, will be routed through the TILER ports, thus not getting benefit of lower latency of the ELLA port.

ELLA sub-module is not software configurable.

6.2.1.3 LISA

The Local Interconnect and Synchronisation Agent (LISA) is a hardware interconnect module, aimed at setting priorities, managing tags and memory mapping. LISA maps the system addresses on the incoming DMM requests to the SDRAM addresses, as per the LISA sections programming.

LISA interconnect routes:

1. ELLA and TILER requests on the ROBIN initiator nodes.
2. ELLA and TILER write data on the ROBIN write buffers.
3. ROBIN read data to the relevant TILER initiators or to ELLA initiator.

The LISA block registers are DMM_LISA_MAP_i (i = 0 to 3) and DMM_LISA_LOCK.

LISA block manages all the incoming requests to ELLA, TILER and PAT and translates them to requests to Registers and ROBIN ports. Highest priority is given to accesses coming to the low-latency port (ELLA). When both DMM-ROBIN ports are in use, LISA module interleaves the two ports at a programmable boundary from 128 Bytes or more, as programmed in the DMM_LISA_MAPn registers. See sub-section on Section Mapping for details about LISA sections programming.

6.2.1.3.1 LISA LOCK

The DMM_LISA_LOCK register is used to lock the configuration once set. If written to one, the LOCK bit prevents further writes to all DMM_LISA_MAP_i registers. The LOCK itself cannot be written back to 0. A reset is required to re-program the sections.

It is expected that LISA MAP is set up once during system configuration and not changed subsequently. The LOCK feature helps accomplish this and is expected to be set once the configuration is done.

6.2.1.4 PAT, Physical Address Translator Engine

The physical address translation engine (PAT) of the DMM is composed of two 32-k entry physical address translation vector table and a set of four refill engines. The refill engine is a specialized DMA aimed at refilling the content of the physical address translation table.

The address translation mechanism is only available when the incoming request is hitting a page mode or tiled mode container, that is, when the incoming address is targeting the TILER or its aliased view in the system addressing space. Otherwise the physical address translation logic is bypassed so that the resulting physical address corresponds to the input address.

The PAT is supporting multiple address translation schemes, called views, which can be bound to one or more initiator through a view mapping mechanism.

The usage of the Refill Engines is described in detail in the later section.

6.2.1.4.1 PAT Views

A PAT view defines the kind of physical address translation to perform for each tiled mode accesses (page, 8-bit, 16-bit and 32-bit). Each mode of each PAT view can be configured to either use PAT Direct Access Translation or PAT In-Direct Access Translation.

The PAT supports up to four unique Views, using the DMM_PAT_VIEW_MAP[0..3] Registers.

6.2.1.4.2 PAT View Mappings

The 16 groups of initiators of the Device, each identified by their ConnID, share a set of 4 PAT views. The connection from an initiator to a PAT view is made through the DMM_PAT_VIEW register. The register DMM_PAT_VIEW0 is used for the first eight initiator groups and DMM_PAT_VIEW1 for the second eight. Thus each initiator can choose one of the four configurable PAT views in the system.

6.2.1.4.3 PAT View Map Base Address

The PAT view map base address is defining the base address of all PAT translated addresses. The bit 31 of all PAT translated address is set to BASE_ADDR. In the Device, the bit 31 should be set to 1, which corresponds to 2GB assigned for external SDRAM in the system memory map. Hence the addresses translated by PAT range in addresses 8000 0000h-FFFF FFFFh.

6.2.1.4.4 PAT - Look Up Tables (LUTs)

This geometry corresponds to that of the Virtual TILER container. So incoming address maps the actual entry in the LUT. The PAT shall then translate to a physical memory mapped to any 4K page the DDR. Each entry of the PAT address corresponds to the page in the DMM container that has the same location. For example - The entry (74, 42) in the table corresponds to the page (74, 42) in any DMM container.

Figure 6-3. DMM Look-Up Table

Each of this entry points to a 4K page in the memory. Hence a total of 128 MB of tiled memory can be mapped using one LUT. With upto 2G of DDR space, supported in the Device, each LUT entry is 19 bits wide.

The PAT uses the LUTs only in case of PAT In-Direct Access Translation.

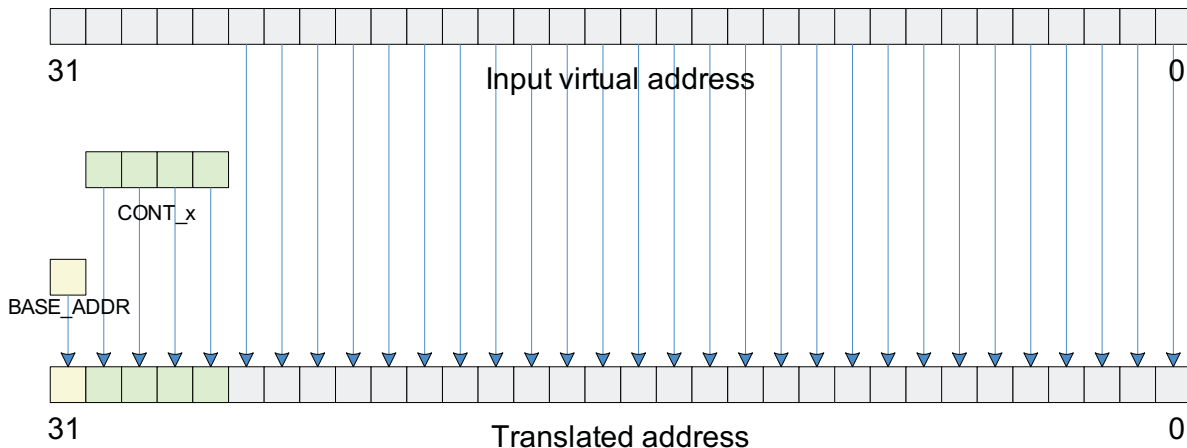

6.2.1.4.5 PAT Direct Access Translation

The container-grained translation is named the direct access. In this mode, the translation vector is directly given by the CONT_x field, in DMM_PAT_VIEW_MAP register, corresponding to the accessed mode(8-bit/16-bit/32-bit/paged mode).

With PAT Direct Access translation, the 128 MB virtual containers for all the four modes, 8-bit, 16-bit, 32-bit, and paged modes can be mapped to their unique System Address, by defining their base addresses.

Figure 6-4 describes the actual translation that happens.

Figure 6-4. DMM PAT Direct Access Translation

6.2.1.4.6 PAT In-Direct Access Translation - Paged Mode Access

DMM_PAT_VIEW[0..3] specify, whether to do Direct or In-direct access translation. Then bits [19:12] of input address specify the X co-ordinate and bits [26:20] of input address specify the Y co-ordinate LUT entry. The PAT replaces bits[30:12] of input address, with 19-bit value specified in LUT entry.

This translation happens on the 4K page boundary and hence the lower 12 bits are not translated. [Figure 6-5](#) describes the actual translation that happens.

Figure 6-5. DMM PAT In-Direct Access Translation

6.2.1.4.7 PAT In-Direct Access Translation - 8-bit, 16-bit, 32-bit Mode Access

DMM_PAT_VIEW[0..3] specify, whether to do Direct or In-direct access translation. Per each of the 8-bit, 16-bit, 32-bit and paged container mode, user specifies which LUT to use for address lookup, by using CONT_x field, in DMM_PAT_VIEW_MAP registers.

How the 26 LSBs of this incoming virtual address is interpreted by the PAT is different for 8-bit, 16-bit, 32-bit mode accesses, as compared to the paged mode access described in the preceding section. Please refer the TILER section describes the rationale behind decoding the address this way.

Virtual address decoding in 8-bit mode access mode is:

- Bits 0:5 - 6 bits offset into the horizontal line of the page
- Bits 6:13 - 8 bits, that select horizontal page in the tiler container as well as the X co-ordinate of the LUT table
- Bits 14:19 - 6 bits offset to select the line inside the page
- Bits 20:26 - 7 bits, that select vertical page in the tiler container and also Y co-ordinate of the LUT table
- Bits 27:31 - In 8 bit mode, their value is binary (01100), that is address in range 6000 0000h-67FF FFFFh

Virtual address decoding in 16-bit mode access mode is:

- Bit 0 - is always 0, as accesses are at-least 16-bit aligned
- Bits 1:6 - 6 bits offset into the horizontal line of the page
- Bits 7:14 - 8 bits, that select horizontal page in the tiler container as well as the X co-ordinate of the LUT table
- Bits 15:19 - 5 bits offset to select the line inside the page
- Bits 20:26 - 7 bits, that select vertical page in the tiler container and also Y co-ordinate of the LUT table
- Bits 27:31 - In 16 bit mode, their value is binary (01101), that is address in range 6800 0000h-6FFF FFFFh

Virtual address decoding in 32-bit mode access mode is:

- Bit 0,1 - are always 0, as accesses are at-least 32-bit aligned
- Bits 2:6 - 5 bits offset into the horizontal line of the page
- Bits 7:14 - 8 bits, that select horizontal page in the tiler container as well as the X co-ordinate of the LUT table
- Bits 15:19 - 5 bits offset to select the line inside the page
- Bits 20:26 - 7 bits, that select vertical page in the tiler container and also Y co-ordinate of the LUT table
- Bits 27:31 - In 32 bit mode, their value is binary (01110), that is address in range 7000 0000h-77FF FFFFh

6.2.1.5 ROBIN

The re-ordering buffer and initiator node (ROBIN) is a block aimed at providing some working buffering for converting data and responses to-and-fro between raster and tiled organizations and a master port to connect to the SDRAM controller.

The ROBIN block does:

- Request Forwarding
- Buffering of Write access data and buffering of Read access Response data
- Keeps write data ordering
- Intra-word tiling and orientation transforms
- Tag handling

NOTE: Both ROBIN sub-modules are not software configurable.

6.2.1.6 Section Mapping

In the device, DMM supports two unique SDRAM controllers, with a software configurable option to interleave data between both banks, at granularity of 128 Bytes, 256 Bytes and 512 Bytes. When accessing tiled data in 8-bit, 16-bit and 32-bit modes, which in the interleaved section of the memory, the interleaving will happen at the tile boundary of 1KB, over-riding the interleaving definition of the section.

For optimal system performance, it is recommended to enable interleaving between the 2 EMIF banks and thus have same sized memory on both the EMIF banks. Example : 512MB of DDR3 on EMIF bank 0 and 512MB of DDR3 on EMIF bank 1, for a total system DDR3 memory of 1GB.

NOTE: This interleaving is supported only if DDRs system connected to both the SDRAM controllers have same electrical characteristics.

If for cost reduction, one chooses to build a system with asymmetrical memory on both EMIF banks, then a few limited configurations can be supported by using the LISA section programming feature of DMM.

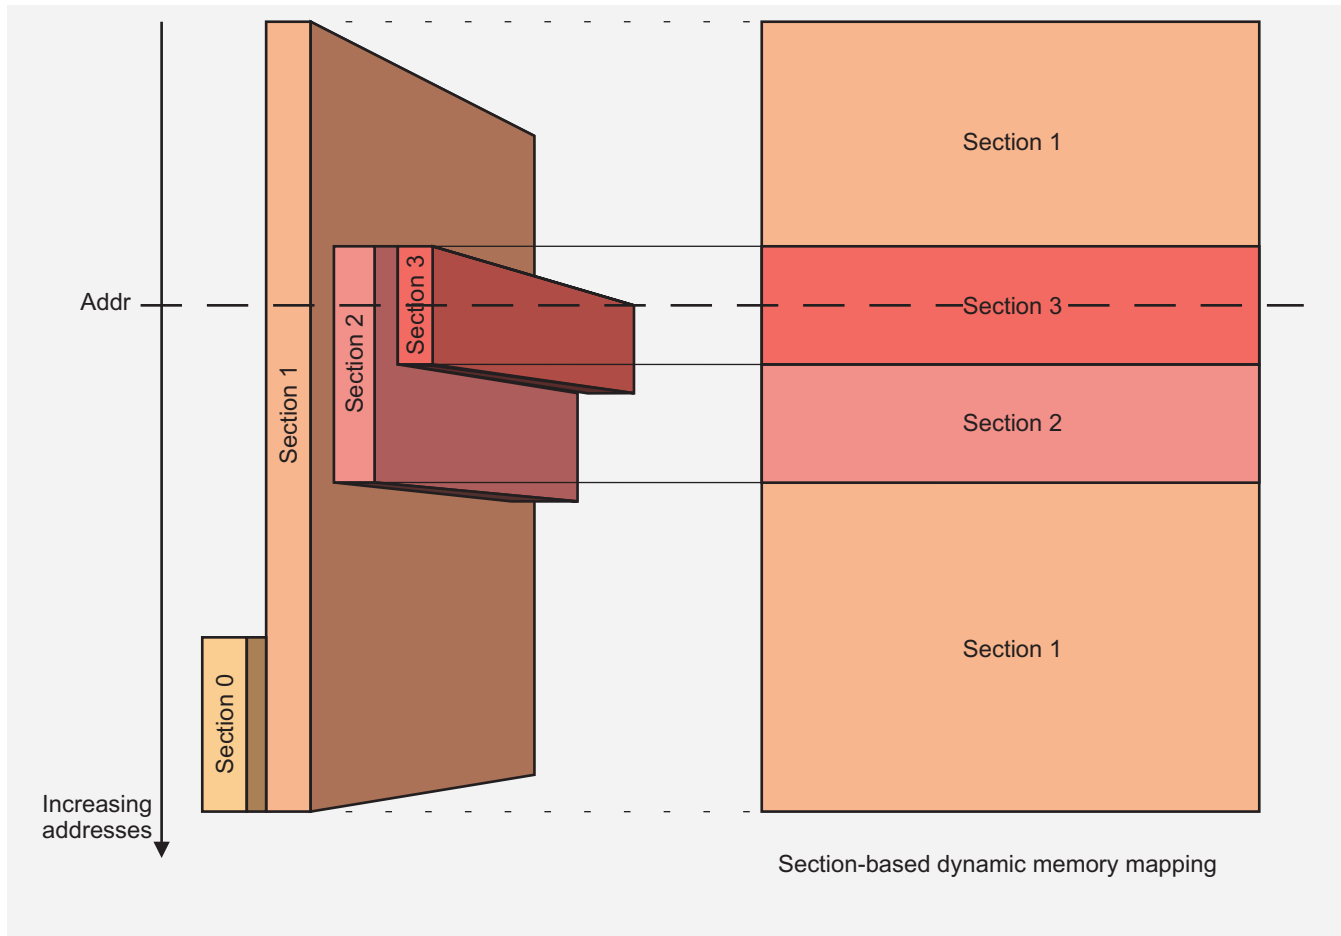

The address mapping inside the DMM is configurable through up to four sections. Each section is defined based on:

- Its system address: the base address of the decoding range for the section. This is the address of the incoming access to the DMM, also referred to as System Address.
- Its size: the encoding is the number of bits actually used in the upper 8-bits of the incoming system address. Hence the size of the section can be a value 16MB-2GB and power of 2. With interleaving enabled, the minimum size of the section is 32 MB.
- Its physical address: the base address of the memory range access in the external memory controller. It is also referred to as SDRC address.
- The target memory controller: A section may hit either of EMIF banks or both.
- Its interleaving definition : Interleave at 128Bytes, 256 Bytes, 512 Bytes or no interleaving.

A LISA section is:

- a memory segment of size 16MB – 2GB, which is a power of two and aligned to that size in the system map. If the section is configured to interleave data between 2 EMIF, then the minimum section size is 32 MB.
- An area with constant interleaving scheme, with fixed interleaving granularity. Interleaving between 2 EMIF banks can be also disabled, for this section.
- If two sections overlap, then the property of higher section number will be applied, as shown in [Figure 6-6](#). There can be a total of 4 unique section definition in DMM.

Figure 6-6. DMM Section and Memory Mapping

In [Figure 6-6](#), a request at the system address Addr will follow the interleaving scheme of section 3, although hitting sections 1, 2 and 3. Similarly, this DMM configuration also prevents any request to use the interleaving scheme of section 0, since section 0 is fully masked by section 1 – which has a higher priority.

The DMM section specifies the range of incoming (to DMM) System address (granularity of 16 MB) and how it maps to the physical SDRC address of EMIF0 and/or EMIF 1, with similarly aligned granularity.

The interleaving of data between two EMIF banks is transparent to all the initiators of the system and will not require special address conversions. [Figure 6-7](#) and [Figure 6-8](#) give examples of all the interleaving schemes.

Figure 6-7. 128B and 256B Interleaving

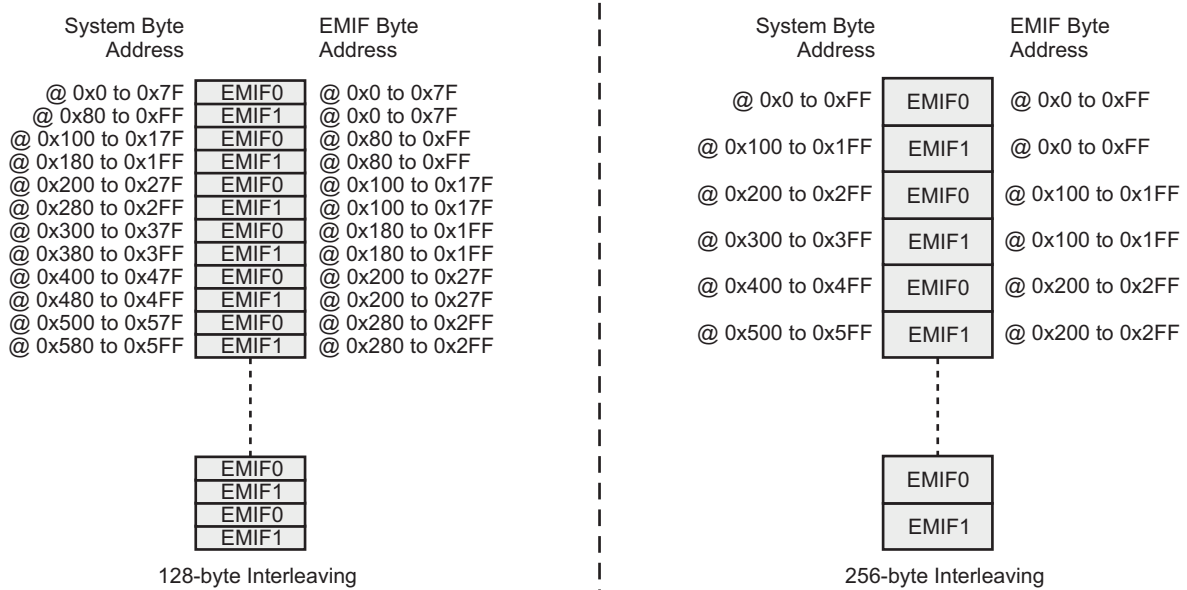

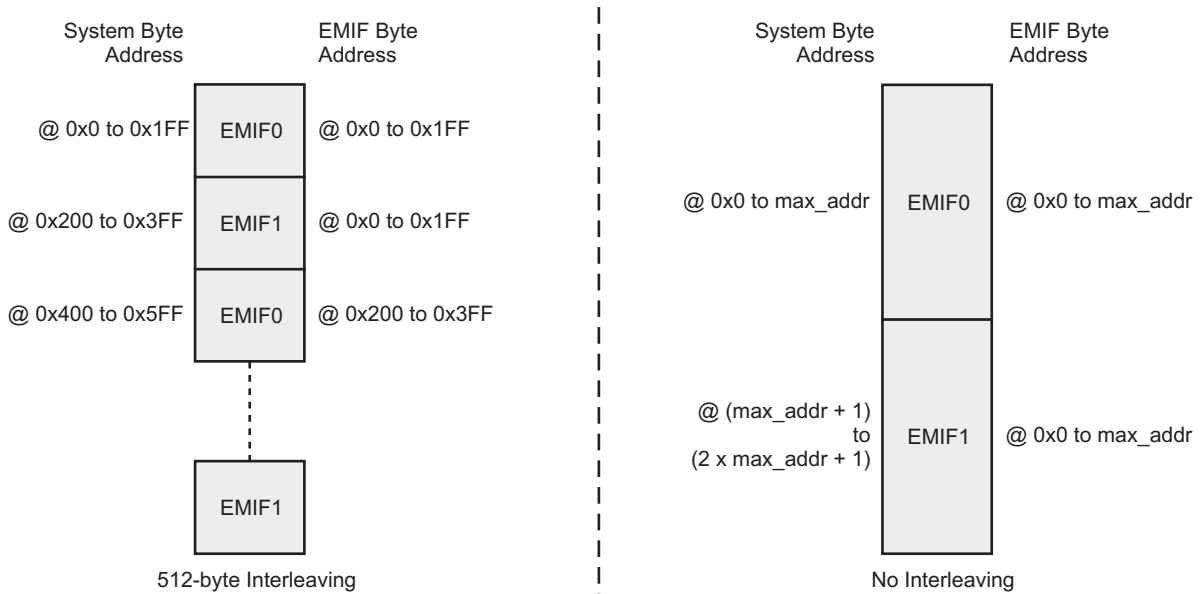

Figure 6-8. 512KB and 1KB Interleaving

6.2.1.7 TILER

As can be seen in [Figure 6-2](#), the two TILER ports interface to the incoming accesses to DMM. Its primary function is increase efficiency of a 2D Tiled Block access. Mentioned below are the main functions of the TILER module:

1. primary handling efficiently 2 dimensional data mapped in tiles, such as video or graphics macro blocks.
2. optionally managing the memory fragmentation and zero-copy physical frame buffers swapping through a page-grained translation, on 4KB page granularity.
3. making isometric – distance preserving – transforms, such as 90°, 180°, or 270° rotations, with either a horizontal or vertical reflection, with no overhead.

Written differently, the functionality of this TILER module is to map a 2D virtually-addressed incoming request into one or more physically-addressed SDRAM requests by:

1. Decoding the incoming access address to qualify whether the request targets the TILER or the memory directly.
2. If the incoming access is a TILER-specific requests, then transforming to the virtual address, data and byte enable to match the requested 0°, 90°, 180°, or 270° orientation in a tiled 2D addressing space.
3. optionally translating the oriented tiled address by a page-specific vector to manage memory fragmentation and physical object aliasing, as shown in [Figure 6-9](#).
4. Splitting tiled requests at tile boundaries and non-tiled requests at DMM atomic section boundaries
5. Requesting the page-based address translation
6. Requesting buffer allocation in the appropriate ROBIN.
7. In case of a write request, allocating and updating an internal write context to subsequently direct the incoming write data into the relevant re-ordering buffer.

Figure 6-9. Overview of Request Conversion

6.2.1.7.1 Device Memory Map - For Tiled Data

In the Device, the initiators read and write tiled data by generating accesses to the tiled space by the one of the two methods:

1. For all initiators except, HD_VPSS, the tiled space is accessed in the 512 MB address range of (6000 0000h to 7FFF FFFFh). These initiators use the access the any of 8 views by using the respective DMM_TILER_OR0 or DMM_TILER_OR1 registers.
2. For HD_VPSS, the TILER module supports its own 4-GB virtual addressing space, from address (1 0000 0000h to 1 FFFF FFFFh), and allows any of the eight 512-MB oriented sub-spaces – or views – to be remapped in the system virtual addressing space.

Figure 6-10. Memory Map

NOTE: Despite the larger virtual address windows, 512 MB in the system memory map and 4GB in the TILER memory map, the maximum size of physical tiled data is only 128MB. This 128MB is co-located in a 128MB aligned space, if using PAT direct access translation. In case of using the optional PAT Indirect access translation, then this 128MB is mapped to any location in the SDRAM, using the LUT tables, at the granularity of 4KB page.

6.2.1.8 Clock

The DMM is a synchronous design and operates from the same clock as the internal L3 interconnect. All timings use this clock as a reference.

6.2.1.9 Interrupts

DMM module generates interrupt to Cortex-A8, for status and error conditions related to PAT refills engines. There 8 different conditions which can be individually enabled or disabled. With 4 Refill engines, there are total 32 unique sources of interrupts.

Refer to [Section 6.3.3](#) for detailed description on using the PAT refill engines.

Per Refill engine, status and error conditions are mentioned below:

1. FILL_DSCn: Refill of any descriptor, for engine n, complete.
2. FILL_LSTn: Refill of the last descriptor, for engine n, complete.
3. ERR_INV_DSCn: Invalid descriptor pointer, for engine n.
4. ERR_INV_DATAAn: Invalid data table pointer, for engine n.
5. ERR_UPD_AREAn: Error caused by area register update while refilling, for engine n.
6. ERR_UPD_CTRLn: Error caused by control register update while refilling, for engine n.
7. ERR_UPD_DATAAn: Error caused by data register update while refilling, for engine n.
8. ERR_LUT_MISSn: Access to a yet-to-be-filled entry, that is part of the area being refilled, for engine n.

The six error conditions mentioned above are also reported in the respective DMM_PAT_STATUSn register.

6.2.1.10 Address Translations Within DMM, For Tiled Accesses

This section describes address translations that happen at various interfaces within DMM, for tiled accesses.

From a user perspective, the PAT can be seen as an additional step in the process applied to the tiled addresses by the TILER:

- the TILER first transforms a tiled address into a 27 bit physical address which fits within a 128MB address range.
- the PAT then processes the high order bits of the physical address output by the TILER, and outputs a 32-bit physical address which covers a 4GB address range. [Section 6.2.1.4](#) describes the exact details for this address translation.

The purpose of the PAT is to map the tiled data anywhere in the 4GB physical address range, with a PAGE granularity (The TILER page is the granularity of physical memory allocation in TILER container. Each page is 4KB). This can be summed-up in [Figure 6-11](#) where the PAT process appears in red.

Only the high order bits of the physical address are modified by the PAT: the 12 low-order bits remain unchanged. This means that the data ordering within each 4kB PAGE remains as calculated by the TILER.

A PAT view is defining the kind of physical address translation to perform for each of the page, 8-bit, 16-bit and 32-bit mode accesses. Each mode in each PAT view can be programmed in 2 different modes (direct translation and indirect translation) which will be described in PAT section. Note that indirect mode is the most commonly used. Direct mode is used only for debug or in case of a DMM without PAT module.

Figure 6-11. DMM Address Translations

6.2.2 TILER Functional Description

6.2.2.1 Introduction to TILER

6.2.2.1.1 Need for a TILER

Image processing algorithms like H.264 encode and decode, which works on the principle of spatial locality, access the image data in two-dimensional format, for example, 16 pixels wide by 16 pixels high. If the image is stored in the memory in linear format then it would appear as in Figure 6-12. Thus, to access the macroblock, multiple memory accesses would need to be made. In the device, each memory access can be up to 128 bytes large. However, because macroblock is not stored contiguously in the memory, only partial pixels is useful in each memory access and the rest is discarded and a new access is generated to fetch rest of the data.

Figure 6-12. Image Stored in the Memory Linearly

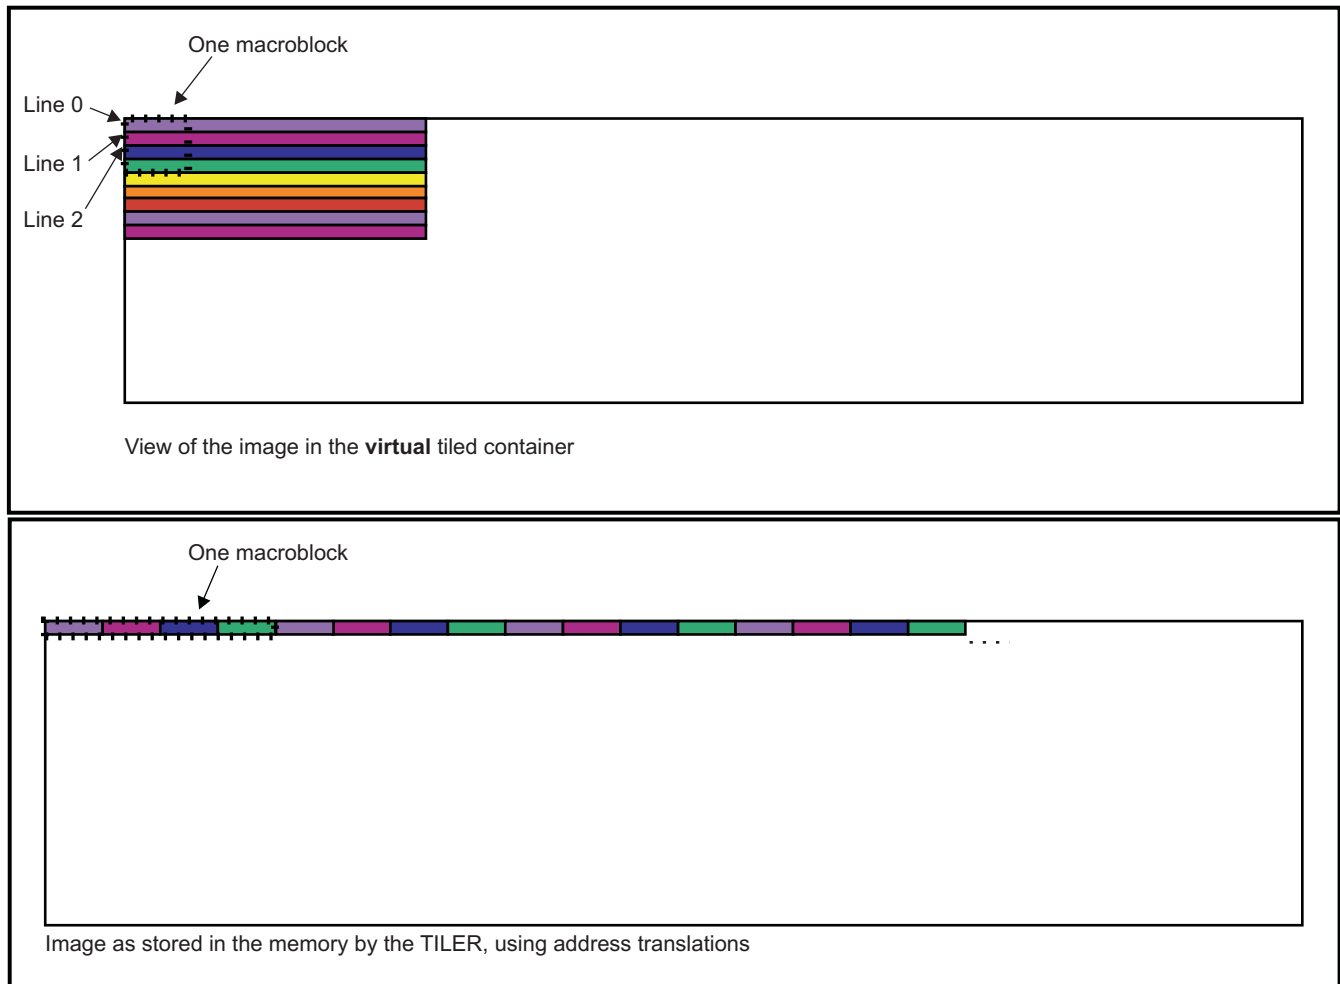

Instead, if the image is stored in bi-dimensional format, much fewer accesses are needed to read the entire macroblock of data, which directly transforms into several advantages:

1. Faster processing of algorithms.
2. Fewer SDRAM page opens.
3. Lesser wastage of memory bandwidth in the system.

This concept is the primary motive for storing the image data in the tiled format.

Figure 6-13. Image Stored in the Memory by TILER

NOTE : This is only a pictorial representation and actual arrangement of the data in the 128-bit subtile may be different.

6.2.2.1.2 Consuming Tiled Data

In the device, the DMA engine of HD_VPSS, also known as VPDMA, has internal line buffers of its capture and display paths (called clients). For every tiled access, it is ensured that rastering tiled data has zero overhead, when processing an entire frame, or 2^{2n} number of lines.

6.2.2.2 TILER Rationale - A Top-down Approach

This section is a synthesis of all TILER concepts, through a top-down approach starting from the main object container, giving one rule per TILER structure level. [Figure 6-14](#) shows the TILER address space structure for tiled modes.

Figure 6-14. Address Space Structure for Tiled Modes

6.2.2.2.1 The TILER is a 4-GB Virtual Address Space Composed of Eight Views

A TILER is addressed using a virtual 4 GB address space, containing 8 unique orientation views of 512 MB each. There is one view for each of the eight possible way of scanning a frame-buffer.

1. From left to right then from top to bottom (0 natural orientation)
2. From right to left then from top to bottom
3. From left to right then from bottom to top
4. From right to left then from bottom to top
5. From top to bottom then from left to right
6. From top to bottom then from right to left
7. From bottom to top then from left to right
8. From bottom to top then from right to left

Section 6.2.2.7 summarizes how the view can be visualized on a 128MB TILER container.

6.2.2.2.2 A View is a 512-MB Virtual Address Space Composed of Four Containers

There is one container per element size to allow correct access patterns in any of the eight possible orientations. The container is the entity where all objects of a given element type are allocated. The element is the entity of maximum size - 8 bits, 16 bits, 32 bits or page-sized - which is invariant in any orientation.

6.2.2.2.3 A Container is a 128-MB Virtual Address Space

A 128 MB container can be visualized as an array of 128 x 256 pages of 4 KB each. The page defines the granularity of physical memory allocation through a physical address translation unit - MMU.

6.2.2.2.4 A Page is a 4-KB Virtual Address Space

A page is composed of two lines. Each line consists of two tiles. Figure 6-15, Figure 6-16, and Figure 6-17 illustrate the Page geometry for 8-, 16-, and 32-bit views, respectively.

Figure 6-15. 4KB Page, 8-bit Mode

Figure 6-16. 4KB Page, 16-bit Mode

Figure 6-17. 4KB Page, 32-bit Mode

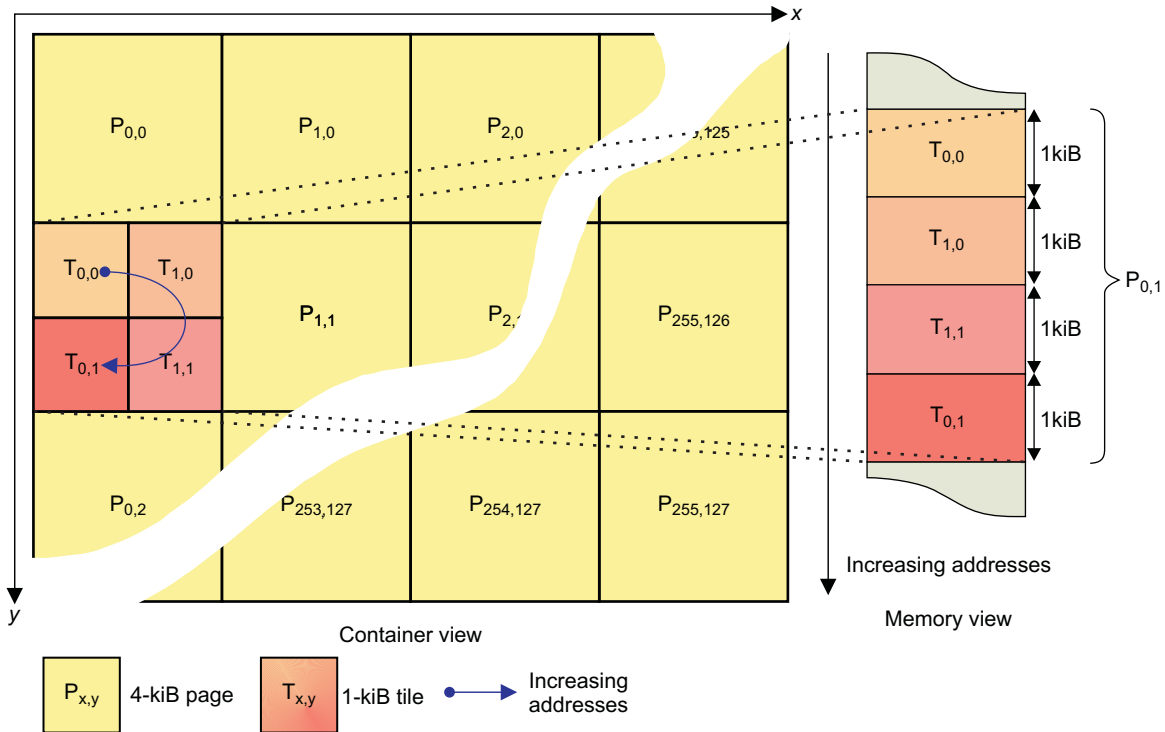

6.2.2.2.5 A Tile is a 1-KB Address Space

The tile is designed to offer bi-dimensional data locality in a single SDRAM page. In this respect, it has been sized to 1 KB (the size of the smallest SDRAM page).

Figure 6-18 shows how 4 tiles are arranged in a page. This arrangement ensures that any two adjacent tiles in a page are not stored on the same EMIF (when interleaving is enabled). Thus a large tiled access will be efficient as it will be evenly spread across both SDRAM controllers.

Figure 6-18. Four 1KB Tiles in One 4KB Page

6.2.2.2.6 A Sub-tile is a 128-bit Address Space

A 1KB tile is further decomposed into 64 sub-tiles, each sized 128 bits. The sub-tile structure is such that it balances accesses in two-dimensional modes, thus improving SDRAM access efficiency.

Furthermore, using Sub-tile pairing, the interlaced accesses to the tiled data can be improved. A Sub-tile is defined as follows:

1. An 8-bit sub-tile (Figure 6-19) is defined as an array of four horizontal lines of four 8-bit data. Thus, in 8-bit tiled mode, the TILER container is a 16384 × 8192 2D array of 8-bit elements.
2. A 16-bit sub-tile (Figure 6-20) is defined as an array of two horizontal lines of four 16-bit data. Thus, in 16-bit tiled mode, the TILER container is a 16384 × 4096 2D array of 16-bit elements.
3. A 32-bit tiled (Figure 6-21) mode as an array of two horizontal lines of two 32-bit data. Thus, in 32-bit tiled mode, the TILER container is an 8192 × 4096 2D array of 32-bit elements.

Figure 6-19. 8-bit Sub-tile

Figure 6-20. 16-bit Sub-tile

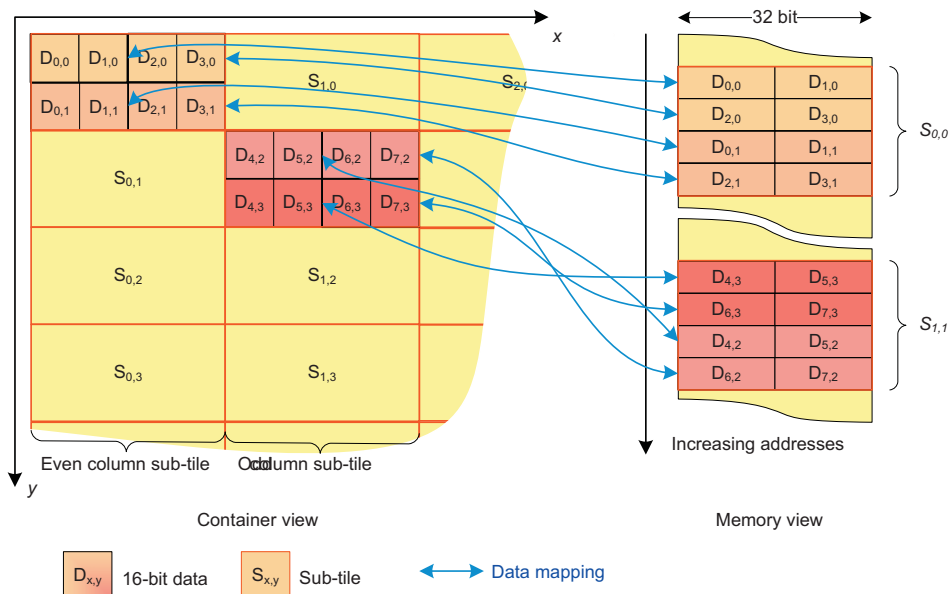

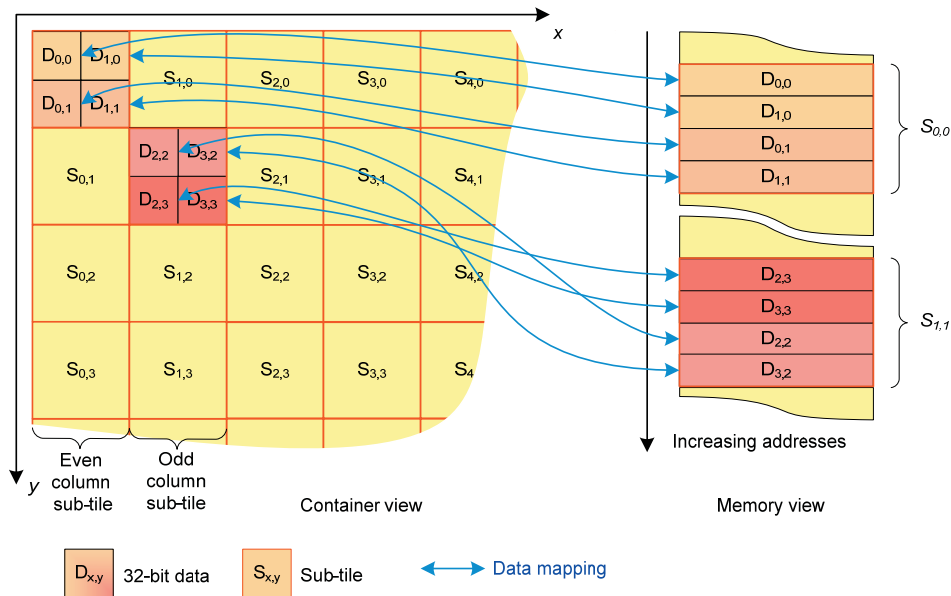

Figure 6-21. 32-bit Sub-tile

6.2.2.3 TILER Container - Summary

TILER is a 128-MB virtual container arranged in 2 dimensions as 256 × 128 pages, each of 4KB.

Each 4-KB page is has 4 tiles.

Each 1-KB tile has 64 subtiles, each of size 128 bits.

Based on the mode of access, 8/16/32 bit, the data stored can be aligned differently, as explained in the previous section.

6.2.2.3.1 Where Will the Tiled Data Be Stored in Physical Memory?

Using PAT Direct Access Translation:

By bypassing the LUT, the entire 128MB space has to be contiguous in the physical memory. Then each of the 8-bit 128 MB virtual container, 16-bit 128 MB virtual container, 32-bit 128 MB virtual container and paged container, can be mapped to either the same physical 128 MB space or at different locations. Refer to the PAT_VIEW_MAP register, which defines the base address of this 128 MB space. As can be seen, this base address is 256 MB aligned.

Using PAT In-Direct Access Translation:

6.2.2.3.2 Addressing Formats

Figure 6-22. Address Format

1. The 33rd bit, noted T, is aimed at distinguishing the standard 4-GB system address map from the 4-GB TILER-specific address map. In the Device, only HD_VPSS can generate accesses in the latter space.
2. The orientation bits, noted S, Y, and X, define the request orientation as specified in [Section 6.2.2.7](#).
3. The mode bits, noted M1 and M0, encoded as in [Section 6.2.2.8.1](#).
4. The remaining 27 bits, noted A0 to A26, define the mode and orientation specific virtual address.

6.2.2.4 TILER Modes

The TILER is supporting three major access modes - bypass, page and tiled - each having a specific output request generation.

6.2.2.4.1 Bypass Mode

This mode is transparent at the TILER perspective. Bypass mode is for accesses generated by initiators with System addresses outside the virtual tiled address range, since TILER will bypass PAT. Still, at the DMM perspective:

- 2D block bursts are broken down on a line-basis in a set of incremental bursts
- Incremental bursts - including those issued by a 2D block burst breakdown - are split at the DMM atomic unit of the section hit by the burst at:
 - at the interleaving granularity of the section - 128 byte, 256 byte or 512 byte - in interleaved sections
 - at 1-KB boundary in non-interleaved sections

6.2.2.4.2 Paged Mode

The purpose of this mode is to use the DMM PAT address translation mechanism for non-tiled accesses. In this respect it is similar to the bypass mode:

- 2D block bursts are broken down on a line-basis in a set of incremental bursts
- Incremental bursts - including those issued by a 2D block burst breakdown - are split at:
 - the interleaving granularity of the section - 128 byte, 256 byte or 512 byte - in interleaved sections
 - 1-KB boundary in non-interleaved sections

6.2.2.4.3 Tiled Mode

When the being accessed in tiled mode, it can be either of the following:

- A well formed 2D block requests - conforming to the orientation, mode and stride
- A 1D incremental requests and ill-formed 2D block requests

Table 6-1. Stride for Well-formed Tiled Mode 2D Block Requests

Orientation			Mode		Stride (bytes)	Description
S	Y	X	M1	M0		
0	x	x	0	0	16384	Plain access to an 8-bit progressive frame in 0° or 180°
					32768	Field access to an 8-bit interlaced frame in 0° or 180°
			0	1	32768	Plain access to a 16-bit progressive frame in 0° or 180°
					65536	Field access to a 16-bit interlaced frame in 0° or 180°
			1	0	32768	Plain access to a 32-bit progressive frame in 0° or 180°
					65536	Field access to a 32-bit interlaced frame in 0° or 180°
1	x	x	0	0	8192	Plain access to an 8-bit progressive frame in 90° or 270°
					16384	Field access to an 8-bit interlaced frame in 90° or 270°
			0	1	8192	Plain access to a 16-bit progressive frame in 90° or 270°
					16384	Field access to a 16-bit interlaced frame in 90° or 270°
			1	0	16384	Plain access to a 32-bit progressive frame in 90° or 270°
					32768	Field access to a 32-bit interlaced frame in 90° or 270°

6.2.2.5 Object Container Definition

The object container is the unique addressable entry point of the TILER. It is a 128-MB virtual address space, where all objects of a same kind - and orientation - are allocated. Four main types of containers are present in the TILER, each one being referred by a mode:

- A 8-bit element mode, for efficiently accessing bi-dimensional arrays of 8-bit data, example 8-bits per pixel Luma buffers of image.
- A 16-bit element mode, for efficiently accessing bi-dimensional arrays of 16-bit data, example 16-bits per pixel interleaved-Chroma(CbCr) buffers of image.
- A 32-bit element mode, for efficiently accessing bi-dimensional arrays of 32-bit data, example 32-bits per pixel, ARGB graphics buffers.
- A page mode, for efficient 1D accesses

Figure 6-23 shows the TILER object containers and views.

Figure 6-23. TILER Object Containers and Views

In the device, there is the PAT. Each LUT can map up to 128MB of objects at a 4KB page granularity. The four modes share the .

Figure 6-24. Using LUT to Translate Tiled Virtual Address to Physical SDR3 Address

NOTE: You need to ensure that an object allocated in a particular container mode does not physically overlap with any other object either in the same mode or other container modes.

6.2.2.6 Page Definition

A TILER page defines the granularity of object allocation in virtual TILER containers. Given that the sub-page structure is mode specific, the 4KB page is the smallest granularity common to all modes, making it the granularity to consider in the TILER resource manager for object allocation.

6.2.2.6.1 Container Geometry with 4-kiB Pages

As pages size is 4KB, any 128MB object container is a set of $256 \times 128 = 32768$ pages, organized in an array of 256 columns and 128 rows, as shown in Figure 6-25.

Figure 6-25. Object Container Geometry with 4KB Pages

This array of pages is mapped to the system address space as shown in Figure 6-26.

Figure 6-26. TILER Page Mapping When Using 4KB Pages

In any 128-MB object container, the 4KB page $P_{x,y}$ at column x ($0 \leq x < 256$) and row y ($0 \leq y < 128$), is found at an offset of $4096 \cdot (x + 256 \cdot y)$ bytes from the base address of the related object container.

Similarly, the page $P_{x,y}$ at column x ($0 \leq x < 256$) and row y ($0 \leq y < 128$), is translated by the LUT entry $E_x + 256 \cdot y$ found at the index $x + 256 \cdot y$.

6.2.2.6.2 Container Geometry and Page Mapping Summary

The TILER has a page size of 4096 bytes. The page $P_{x,y}$:

- has $\text{max}_x = 256$ and $\text{max}_y = 128$
- is found at an offset of: $4096 \cdot (x + \text{max}_x \cdot y)$ bytes from the base address of the related object container
- is translated by the entry found at the index $(x + \text{max}_x \cdot y)$ of the LUT table

6.2.2.7 Orientation

This section describes the eight on-the-fly orientation-related isometric transforms, corresponding to all available changes of orthonormal basis in the TILER container bi-dimensional space.

Figure 6-27 shows isometric transforms in the TILER container.

Mathematically speaking, all these transforms correspond to the composition of a 0° , 90° , 180° , or 270° rotation with an optional reflection. The nature of this orientation is based on the three following binary parameters:

- X to change the direction of the x axis of the TILER container
- Y to change the direction of the y axis of the TILER container
- S to swap the modified x and y axis

From now on, and in the rest of this document, the term orientation refers to any composition of a "quadrant" rotation with an optional horizontal - flip-flop - or vertical mirroring.

Figure 6-27. Isometric Transforms in the TILER Container

Selection of orientation:

1. For all initiators except, HD_VPSS, the tiled space is accessed in the 512 MB address range of (6000 0000h to 7FFF FFFFh). These initiators use the access the any of the 8 views by using the respective DMM_TILER_OR0 or DMM_TILER_OR1 registers.
2. For HD_VPSS, the TILER module supports its own 4-GB virtual addressing space, from address (1 0000 0000h to 1 FFFF FFFFh). These eight 512MB spaces correspond to the 8 available views. With multiple display, capture and transcode path, using the unique 512 MB address space, these ports of HD_VPSS can simultaneously generate access in any of the 8 views.

6.2.2.8 Tile Definition

A tile is a subdivision of a page, aimed at:

- Representing a 2D block to better balance the accesses in both directions
- Ensuring that any "tiled" access that fits within a tile is made atomic in the SDRAM controller, and fits in a single SDRAM memory page
- Minimising the number of SDRAM page openings per 2D block transfer

The tile is defined as a 1KB 2D block, and a 4KB page as an array of 2 lines of 2 tiles each, as described in section detailing a 4KB page.

When the considered page is in an interleaved DMM section, it is necessary that:

- the DMM memory interleaving size of tiled accesses is set to 1 KB - a tile size - so that any tiled request that fits within a tile, fits in a single SDRAM memory page
- any request that spans over 2 or 4 tiles, is distributed on a maximum number of SDRAM memory controllers

6.2.2.8.1 TILER Virtual Addressing

The TILER can be virtually accessed in four different modes, namely 8-bit, 16-bit, 32-bit and page modes. Each mode defines the element granularity to apply isometric transforms, as summarized in [Table 6-2](#).

Table 6-2. TILER Modes

Mode	Name	Granularity (element size)
0	8-bit tiled mode	8 bits
1	16-bit tiled mode	16 bits
2	32-bit tiled mode	32 bits
3	Page mode	4096 bytes

For instance, making a vertical mirroring of a 16-byte horizontal line containing the word 0001 0203 0405 0607 0809 0A0B 0C0D 0E0Fh, leads to:

- 0F0E 0D0C 0B0A 0908 0706 0504 0302 0100h in 8-bit tiled mode
- 0E0F 0C0D 0A0B 0809 0607 0405 0203 0001h in 16-bit tiled mode
- 0C0D 0E0F 0809 0A0B 0405 0607 0001 0203h in 32-bit tiled mode
- 0001 0203 0405 0607 0809 0A0B 0C0D 0E0Fh in page mode - unchanged as the element granularity is 4KB

Besides, as each of the eight orientations is available for any of the four modes, this gives 32 TILER addressing possibilities.

NOTE: The format that the TILER manages the tiled data is dictated by which 4 modes (8-,16-, 32-bit or paged) and which orientation (8 views) is used while accessing (read and write) the data.

As long as the data accessed is written and read in the same mode, it is assured that the response to the access will be correct. While accessing in the same mode, if written in one view and read back in the other view, then the read back data will be rotated and/or mirrored as per the view used.

6.2.2.8.2 Page Mode Virtual Addressing and Characteristics

When used in page mode, the 128-MiB TILER space is seen as an orientation-specific sequence of 32768 pages of 4 kiB each. The access sequence inside a page is left unchanged. Therefore, in page mode, the TILER is accessed similarly to any 128-MiB memory, with a 27-bit byte-based address.

Figure 6-28. Paged Mode Addressing

6.2.2.8.3 Tiled Mode Virtual Addressing and Characteristics

When used in tiled mode, the 128-MiB TILER space is seen as a giant frame-buffer - the container. The addressing and characteristics of this giant frame-buffer depends on:

- The tiled mode, which defines the considered atomic element size
- The orientation, which potentially swaps its x and y axis - and hence the container geometry

[Table 6-3](#) summarizes tiled mode container characteristics.

Table 6-3. Tiled Mode Container Characteristics

Orientation			Element Size (bits)	Width (elements)	Height (elements)	Stride (bytes)	
S	Y	X				Progressive	Interlaced
0	x	x	8	16384	8192	16384	32768
			16	16384	4096	32768	65536
			32	8192	4096	32768	65536
1	x	x	8	8192	16384	8192	16384
			16	4096	16384	8192	16384
			32	4096	8192	16384	32768

As a result, the coordinate (x0, y0) of a pixel in an oriented view is translated in a virtual address as shown in [Figure 6-29](#) and [Figure 6-30](#), for all the four orientations.

Figure 6-29. Tiled Mode Addressing in 0° or 180° Orientations, (S = 0)

Bit	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
8-bit tiled mode	y ₀											x ₀															
16-bit tiled mode	y ₀											x ₀															
32-bit tiled mode	y ₀											x ₀															

Figure 6-30. Tiled Mode Addressing in 90° or 270° Orientations, (S = 1)

Bit	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
8-bit tiled mode	y ₀											x ₀															
16-bit tiled mode	y ₀ x ₀											x ₀															
32-bit tiled mode	y ₀											x ₀															

Having understood the characteristic of the tiled container and the how the data is stored in bi-dimensional manner, it is easy to understand how stride is calculated. Stride is calculated as the number bytes between pixel (m,n) and pixel (m,(n+1)), where m = x co-ordinate of the image buffer, n = y co-ordinate of the image buffer.

For S = 0, that is, all views with 0° and 180°:

- 8-bit mode: stride_8bitmode = 4 bytes per sub-tile × 1 byte height of a sub-tile line × 8 sub-tiles per tile × 2 tiles per page × 256 pages = 4 × 1 × 8 × 2 × 256 = 16KB
- 16-bit mode: stride_16bitmode = 4 bytes per sub-tile × 2 bytes height of a sub-tile line × 8 sub-tiles per tile × 2 tiles per page × 256 pages = 4 × 2 × 8 × 2 × 256 = 32KB
- 32-bit mode: stride_32bitmode = 4 bytes per sub-tile × 2 bytes height of a sub-tile line × 8 sub-tiles per tile × 2 tiles per page × 256 pages = 4 × 2 × 8 × 2 × 256 = 32KB

For S = 1, that is, all views with 90° and 270°:

- 8-bit mode: stride_8bitmode = 4 bytes per sub-tile × 1 byte height of a sub-tile line × 8 sub-tiles per tile × 2 tiles per page × 128 pages = 4 × 1 × 8 × 2 × 128 = 8KB
- 16-bit mode: stride_16bitmode = 4 bytes per sub-tile × 1 byte height of a sub-tile line × 8 sub-tiles per tile × 2 tiles per page × 128 pages = 4 × 1 × 8 × 2 × 128 = 16KB
- 32-bit mode: stride_32bitmode = 4 bytes per sub-tile × 2 bytes height of a sub-tile line × 8 sub-tiles per tile × 2 tiles per page × 128 pages = 4 × 2 × 8 × 2 × 128 = 16KB

6.2.2.8.4 Element Ordering in the TILER Container

This section highlights how elements - 8-bit data, 16-bit data, 32-bit data or 4-kiB page - are ordered in the container. In other words, this section highlights how the path of incrementing virtual addresses is mapped in the container.

It is interesting to note that whatever the mode, and hence the element size, the sequence for ordering the elements in their related container is strictly similar and only depends on the related orientation. In other words:

- Mode is about element granularity
- Orientation is about change of orthonormal basis for ordering the elements in the mode-specific container

A corollary to the previous statements is that in a given mode the internal structure of an element is unchanged whatever the orientation. In page mode for instance, the offset of a word inside a page is invariant by orientation; the content of a page is always accessed in the same manner.

In the next sections, the natural container orthonormal basis is referenced as: (X_n, Y_n) and the oriented orthonormal basis as: (X_o, Y_o) .

6.2.2.8.4.1 Natural View or 0° View (Orientation 0)

This orientation defined by $S = 0$, $Y = 0$, and $X = 0$ and means that the operated change of basis is:

$$X_0 = X_n$$

$$Y_0 = Y_n$$

In any TILER mode, the elements are then ordered from left-to-right and then from top-to-bottom in their container, as shown in Figure 6-31 and Figure 6-32.

Figure 6-31. Tiled Mode Ordering of Elements in Natural View

Figure 6-32. Page Mode Ordering of Elements in Natural View

6.2.2.8.4.2 0° View with Vertical Mirror or 180° View with Horizontal Mirror (Orientation 1)

This orientation defined by $S = 0$, $Y = 0$, and $X = 1$ and means that the operated change of basis is:

$$X_0 = -X_n$$

$$Y_0 = Y_n$$

In any TILER mode, the elements are then ordered from right-to-left and then from top-to-bottom in their container, as shown in Figure 6-33 and Figure 6-34.

Figure 6-33. Tiled Mode Ordering of Elements in 0° View with Vertical Mirror

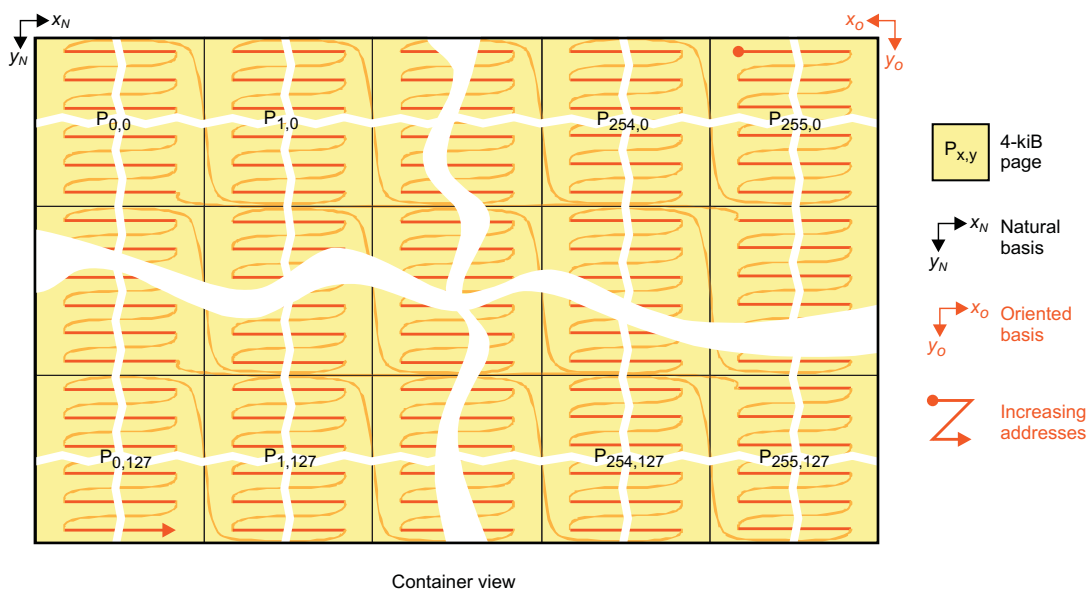

Figure 6-34. Page Mode Ordering of Elements in 0° View with Vertical Mirror

6.2.2.8.4.3 0° View with Horizontal Mirror or 180° View with Vertical Mirror (Orientation 2)

This orientation defined by $S = 0$, $Y = 1$, and $X = 0$ and means that the operated change of basis is:

$$X_0 = X_n$$

$$Y_0 = -Y_n$$

In any TILER mode, the elements are then ordered from left-to-right and then from bottom-to-top in their container, as shown in Figure 6-35 and Figure 6-36.

Figure 6-35. Tiled Mode Ordering of Elements in 0° View with Horizontal Mirror

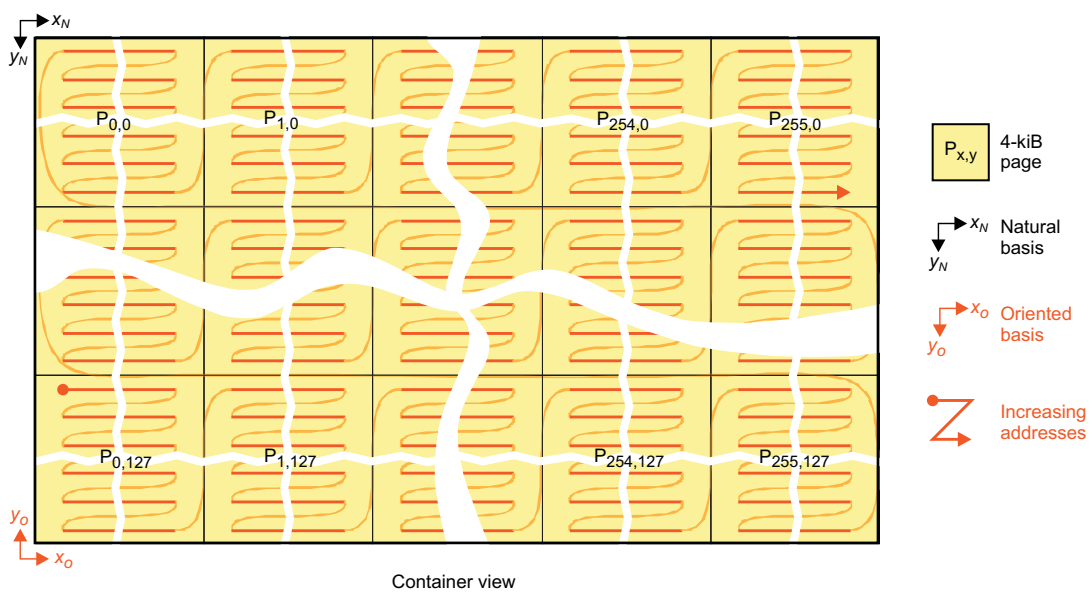

Figure 6-36. Page Mode Ordering of Elements in 0° View with Horizontal Mirror

6.2.2.8.4.4 180° View (Orientation 3)

This orientation defined by $S = 0$, $Y = 1$, and $X = 1$ and means that the operated change of basis is:

$$X_0 = -X_n$$

$$Y_0 = -Y_n$$

In any TILER mode, the elements are then ordered from right-to-left and then from bottom-to-top in their container, as shown in Figure 6-37 and Figure 6-38.

Figure 6-37. Tiled Mode Ordering of Elements in 180° View

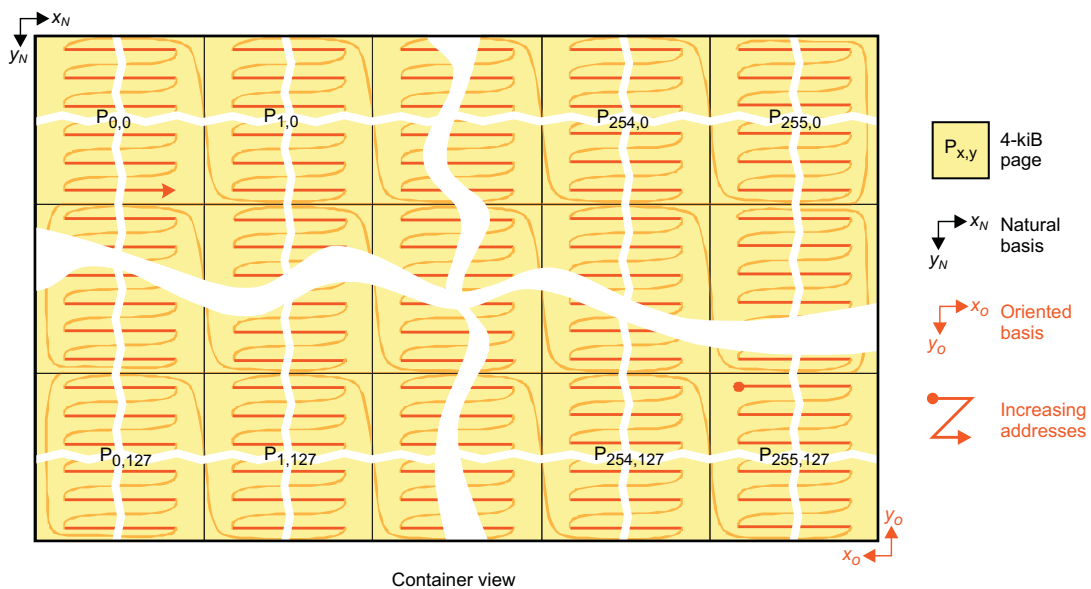

Figure 6-38. Page Mode Ordering of Elements in 180° View

6.2.2.8.4.5 90° View with Vertical Mirror or 270° View with Horizontal Mirror (Orientation 4)

This orientation defined by $S = 1$, $Y = 0$, and $X = 0$ and means that the operated change of basis is:

$$X_0 = Y_n$$

$$Y_0 = X_n$$

In any TILER mode, the elements are then ordered from top-to-bottom and then from left-to-right in their container, as shown in Figure 6-39 and Figure 6-40.

Figure 6-39. Tiled Mode Ordering of Elements in 90° View with Vertical Mirror

Figure 6-40. Page Mode Ordering of Elements in 90° View with Vertical Mirror

6.2.2.8.4.6 270° View (Orientation 5)

This orientation defined by $S = 1$, $Y = 0$, and $X = 1$ and means that the operated change of basis is:

$$X_0 = -Y_n$$

$$Y_0 = -X_n$$

In any TILER mode, the elements are then ordered from top-to-bottom and then from right-to-left in their container, as shown in Figure 6-41 and Figure 6-42.

Figure 6-41. Tiled Mode Ordering of Elements in 270° View

Figure 6-42. Page Mode Ordering of Elements in 270° View

6.2.2.8.4.7 90° View (Orientation 6)

This orientation defined by $S = 1$, $Y = 1$, and $X = 0$ and means that the operated change of basis is:

$$X_0 = -Y_n$$

$$Y_0 = X_n$$

In any TILER mode, the elements are then ordered from bottom-to-top and then from left-to-right in their container, as shown in Figure 6-43 and Figure 6-44.

Figure 6-43. Tiled Mode Ordering of Elements in 90° View

Figure 6-44. Page Mode Ordering of Elements in 90° View

6.2.2.8.4.8 90° View with Horizontal Mirror or 270° View with Vertical Mirror (Orientation 7)

This orientation defined by $S = 1$, $Y = 1$, and $X = 1$ and means that the operated change of basis is:

$$X_0 = -Y_n$$

$$Y_0 = -X_n$$

In any TILER mode, the elements are then ordered from bottom-to-top and then from right-to-left in their container, as shown in Figure 6-45 and Figure 6-46.

Figure 6-45. Tiled Mode Ordering of Elements in 90° View with Horizontal Mirror

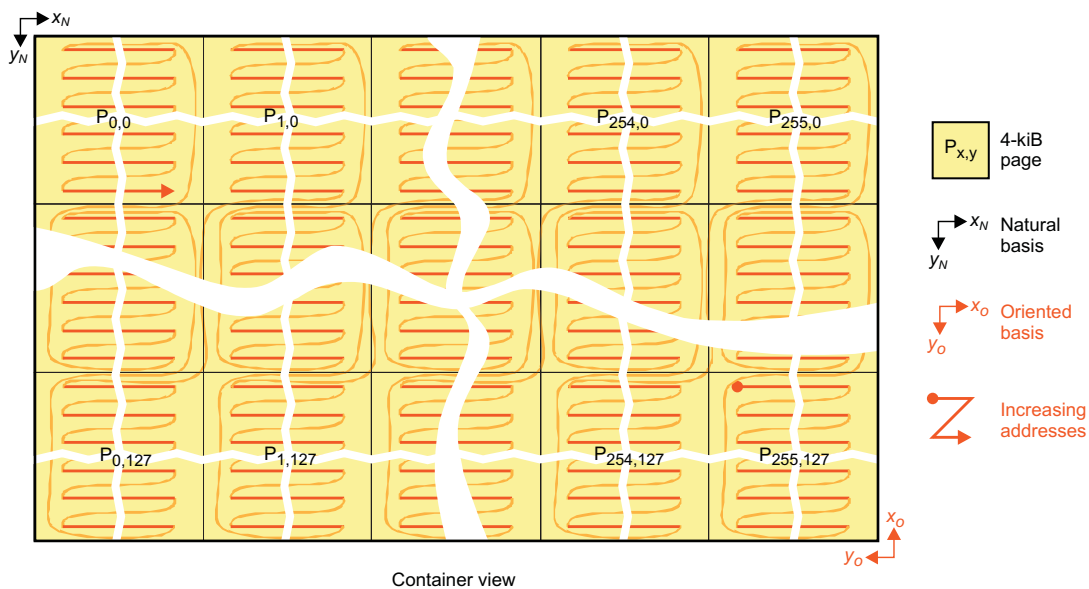

Figure 6-46. Page Mode Ordering of Elements in 90° View with Horizontal Mirror

6.3 Use Case

6.3.1 DMM Basic Register Setup

This section describes basic steps to initialize the DMM, in the device.

1. Set base address, DMM_PAT_VIEW_MAP_BASE to value 8000 0000h, which corresponds to base SDRAM address in the device memory map.
2. Program the four PAT views, by writing DMM_PAT_VIEW_MAP__0..3 registers. By default, all the four PAT views are having value of 0, which implies Direct access translation for all the four tiled modes of (8,16,32-bit and paged mode) and all the four containers will overlap with their base address mapped to 8000 0000h.
3. Program PAT views for all initiators, indexed by ConnID, by programming the DMM_PAT_VIEW__0..1 registers. There are 4 possible views available in device. Default is for all initiators to use PAT view 0.
4. Program PEG priority for all the initiators. By default - all are having priority = 0.
5. Program the TILER orientation for all the initiators, by writing to DMM_TILER_OR__0..1 registers. By default - all will access tiled data in Orientation = 0, which is the normal view.
6. Program Section mapping, based on the SDRAM configuration of the system, which depends on the size of the SDRAM on one or both the banks.
 - Example 1: Symmetrical DDRs on both EMIF banks. Each size = 512MB to add up to 1GB of total SDRAM memory. In all DMM_LISA_MAP__0..3 registers, program value 8064 0300h, which implies 1GB section starting from System address : 8000 0000h, mapped to 0000 0000h of both EMIF0 and EMIF1, with interleaving of 128 bytes enabled. Note that the above example uses only one DMM section and the three other are identical. There are other ways to define up-to 4 sections and configure each differently

6.3.1.1 PAT Direct Access Translation with Distinct 128 MB Containers for Each of the 4 Modes

Following is a simplistic use case, bypassing the LUTs for address translation and setting aside a chunk of 128MB contiguous memory, with base address 128MB aligned, for each of the 4 modes (8, 16,32-bit and paged mode). The same addresses will be used by all initiators in the system.

Configure PAT view 0:

Program DMM_PAT_VIEW_MAP__0 to a value of 0302 0100h. Here : 8-bit mode container will be mapped to 8000 0000h. 16-bit mode container will be mapped to 8800 0000h. 32-bit mode container will be mapped to 9000 0000h. Paged mode container will be mapped to 9800 0000h.

Configure all initiators to use PAT view 0:

Program DMM_PAT_VIEW__0..1 to a value of 0.

6.3.2 Simple LUT Bypass Use Case: Arrangement of Video Buffers

This section describes one possible arrangement of H.264 video buffers which are in YUV 420 format. Setup is as follows:

1. The buffers size if 1920 × 1080
2. The Luma buffers are allocated in the 8-bit mode container
3. The Chroma buffers are allocated in the 16-bit mode container
4. The H.264 algorithm needs 32 bytes of padding on each side for Luma buffer and 16 bytes padding in each side for a chroma buffer
5. All buffers are allocated on a 4K aligned address

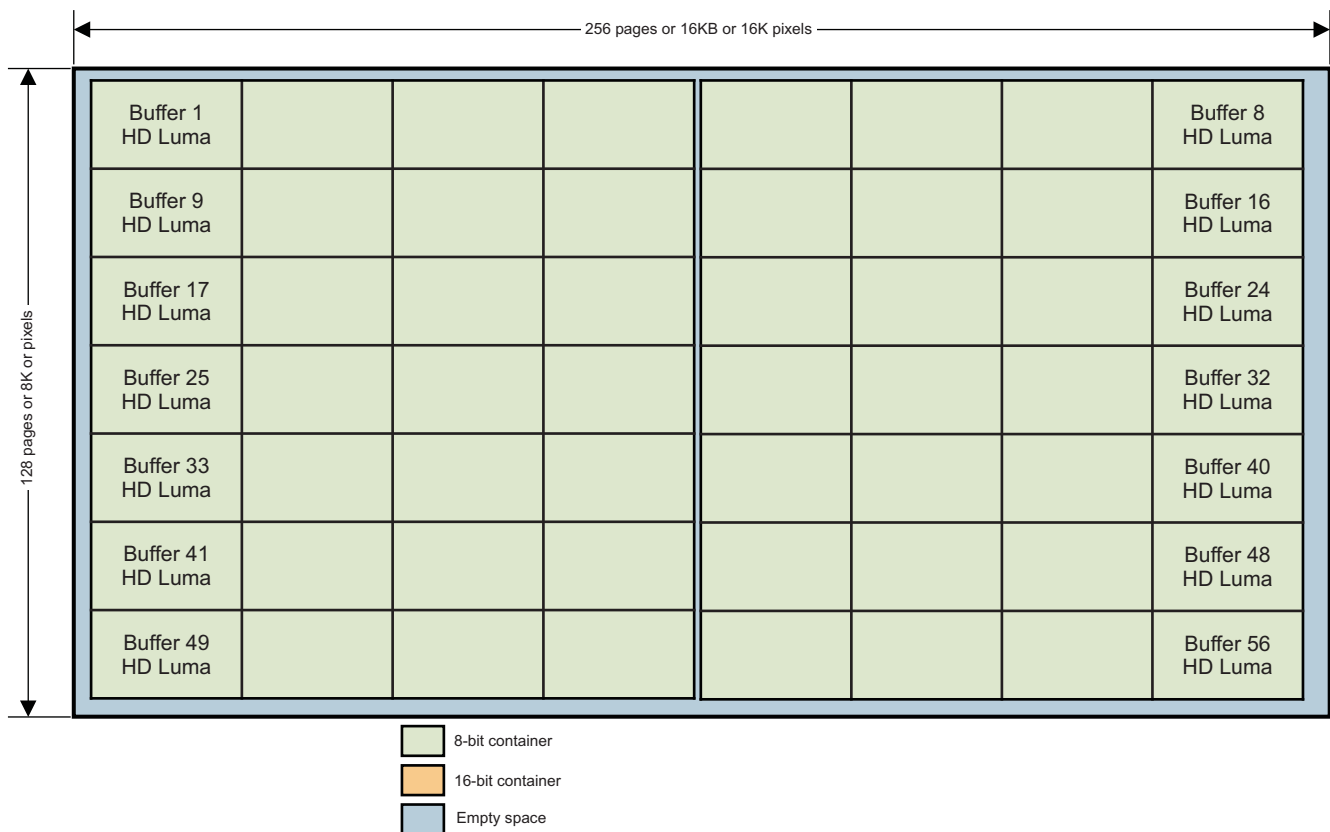

6.3.2.1 Luma Buffers

In 8-bit tiled mode (Figure 6-47), each 4K page is arranged as 64-pixels wide and 64-pixels high, where each pixel is of size 8-bits. In YUV 420 format, the Luma buffer of the image is 1920 × 1080 and each pixel is 8-bits. Thus, each buffer is 1920 bytes wide. With a pad of 32 bytes on each side, the buffer is (1920 + 64 =) 1984-bytes wide. So one video buffer needs (1984/64 =) 31 pages, along the width of the tiler container. So the tiler container can fit (256/31 ~) 8 buffers, along its width.

Similarly, with a pad of 32 bytes on top and bottom, the buffer is (1080 + 64 =) 1144. Rounding it to (1144 + 8 =) 1152, so that buffer is allocated on page boundary. So one video buffer needs (1152/64 =) 18 pages, along the height of the tiler container. So the tiler container can fit (128/18 ~) 7 buffers, along its height.

Figure 6-47. Buffer Arrangement for HD Luma Buffers in 128MB 8-bit Mode Container

Simple Use Case: Buffer arrangement in a 128-MB contiguous memory dedicated for 8-bit mode buffers

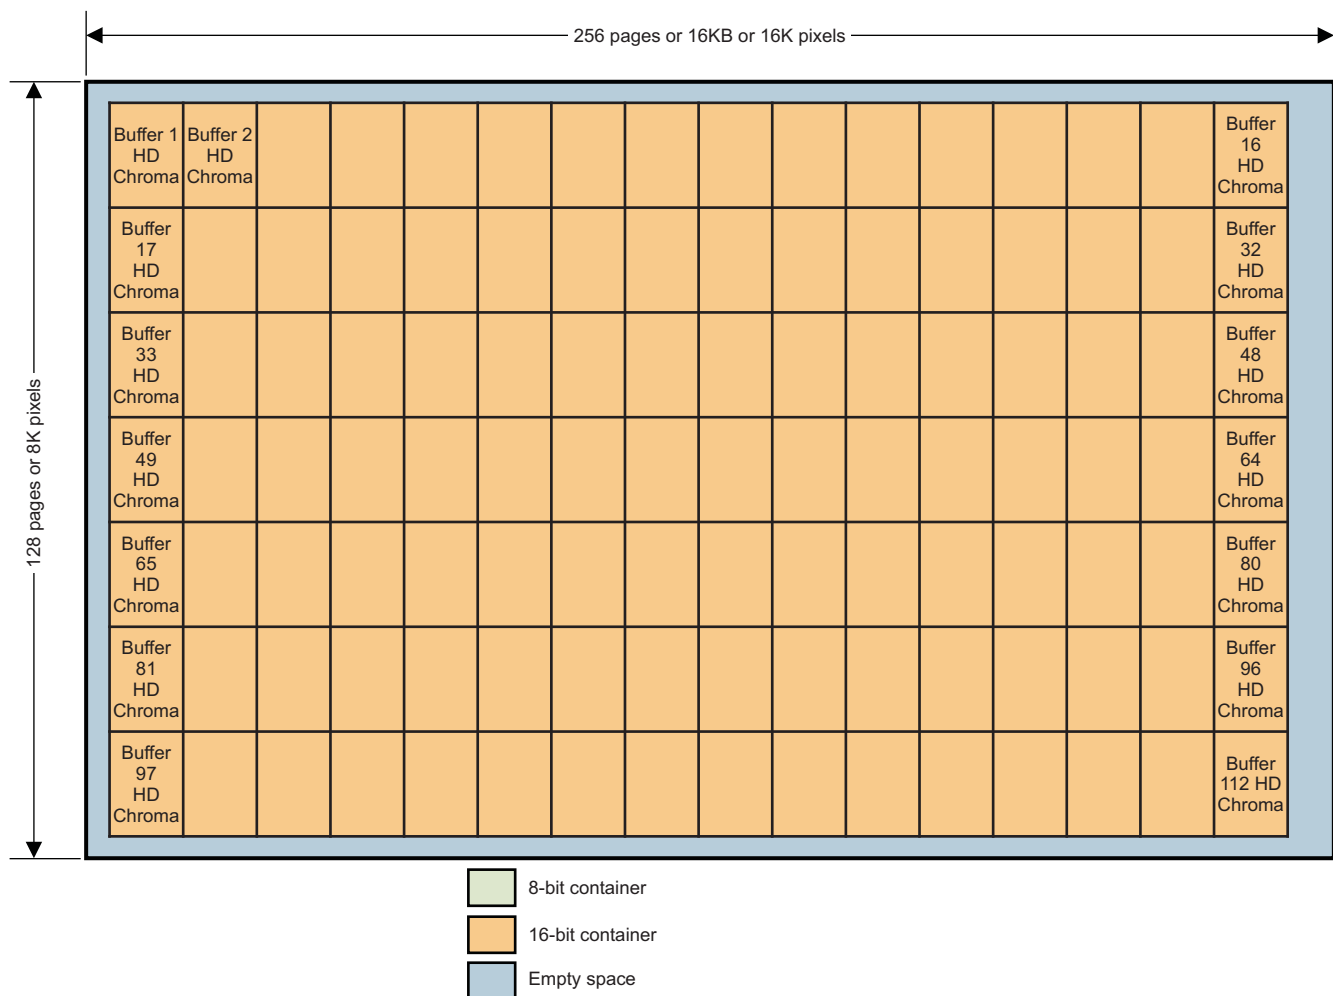

6.3.2.2 Chroma Buffers

In 16-bit tiled mode (Figure 6-48), each 4K page is arranged as 64-pixels wide and only 32-pixels high, where each pixel is of size 16-bits. In YUV 420 format, the Chroma buffer of the image is 960 × 540 and each pixel is 16-bits. Thus, each buffer is 960-bytes wide. With a pad of 16 bytes on each side, the buffer is (960 + 32 =) 992-bytes wide. Rounding it to (992 + 32 =) 1024, so that buffer is allocated on page boundary. So one video buffer needs (1024/64 =) 16 pages, along the width of the tiler container. So the tiler container can fit (256/16 =) 16 buffers, along its width.

Similarly, with a pad of 16 bytes on top and bottom, the buffer is (540 + 32 =) 572. Rounding it to (572 + 4 =) 576, so that buffer is allocated on page boundary. So one video buffer needs (576/32 =) 18 pages, along the height of the tiler container. So the tiler container can fit (128/18 ~) 7 buffers, along its height.

Figure 6-48. Buffer Arrangement for HD Chroma Buffers in 128MB 16-bit Mode Container

Simple Use Case: Buffer arrangement in a 128-MB contiguous memory dedicated for 16-bit mode buffers

NOTE: The above scheme of Luma and Chroma buffer arrangement can be optimized further, by allocating buffers on sub-tile boundary, instead of page boundary (which is required when using LUT for address translation).

6.3.3 LUT Refill Using the PAT Refill Engines

There are of size 256 × 128 elements, in the device.

There are four refill engines, along with their own set of registers, to program the LUTs.

Also in this section are described in five different ways to program the LUT.

1. Simple manual area refill
2. Single auto-configured area refill
3. Chained auto-configured area refill
4. Synchronised auto-configured area refill
5. Cyclic synchronised auto-configured area refill

Some of the guidelines, in programming the LUTs are mentioned below:

1. Entry table must be in DDR and cannot be split between 2 EMIF banks, when data interleaving enabled.
2. The data table should start from address 16-byte aligned.
3. With one set of descriptor, up to 64 LUT entries can be programmed, in any 2D area dimension.

6.3.3.1 PAT Memory Mapped Refill Descriptors

A PAT descriptor is a singly-linked list node as shown in Figure 6-49, containing:

- a description of the LUT area to reload
- a description of how to reload the defined LUT area
- a pointer to the location where the corresponding LUT entries are stored

Figure 6-49. PAT Descriptor Node

The PAT descriptor node and the entry data pointer must both be 16-byte aligned. A typical 'C' language description of this node is as follows:

```
struct PAT_desc {
    struct PAT_desc *next;
    u32_t          area;
    u32_t          ctrl;
    PAT_data      *data;
} __attribute__((aligned(16)));
```

6.3.3.1.1 PAT Area Refill Description

The area refill description is actually describing the top-left and bottom right corner of the PAT vector table as shown in Figure 6-50.

Figure 6-50. PAT Area Description

6.3.3.1.2 PAT Data Description

The pointer to the address in SDRAM, containing the memory based Data table, should be 16 byte aligned. Each field in this table is a 32 bit value, corresponding to the value to be programmed in one LUT entry. Though it is a 32 bit value, only 19 bits [30:12] are relevant. Bit 31 and bits [0:11] are ignored by the PAT refill engine.

6.3.3.1.3 PAT Memory Dump

This section presents how to dump the PAT LUT. This has to be done using the direct access mode of PAT, following the below steps:

1. Set at least one of the refill engine to direct LUT access mode. This has to be done using DMM_PAT_CONFIG register. Only bit 0 to 3 are used for mode of refill engine 0 to 3. (Value 0 is normal mode, value 1 is direct LUT access mode).
2. Set system coordinates we would like to read/write in the LUT. This has to be done using DMM_PAT_AREA_x. x is the refill engine index that has to be coherent with the refill engine used in direct mode (DMM_PAT_CONFIG). Only (x0,y0) is used in direct mode.
3. Select the LUT_ID using DMM_PAT_CTRL_x register.
4. Read (or write) the data in DMM_PAT_DATA_x register. x is the refill engine index.

6.3.3.1.4 PAT Refill Direction

The DMM_PAT_CTRL_x.DIRECTION field gives the “order” of the area refill with the same “SYX” encoding as in the TILER orientations:

- 0: from left to right then from top to bottom
- 1: from right to left then from top to bottom
- 2: from left to right then from bottom to top
- 3: from right to left then from bottom to top
- 4: from top to bottom then from left to right
- 5: from top to bottom then from right to left
- 6: from bottom to top then from left to right
- 7: from bottom to top then from right to left

This feature allows the initiator HD_VPSS to start an access to an on going refill area. In this case, the direction field is set in accordance with the orientation accesses made by the initiators. The DMM_PAT_STATUS_x.ERROR is asserted to 1 if an access is done to a not yet refilled page.

6.3.3.2 Simple Manual Area Refill

These steps have to be performed to create the 16-byte aligned memory-mapped entry table containing all entries of the defined area, as seen in [Figure 6-51](#).

- Write the DMM_PAT_AREA_i register with the relevant (x0, y0) (x1, y1) area definition
- Write the DMM_PAT_DATA_i register with the physical address of the created entry table
- Write the DMM_PAT_CTRL_i register with the requested refill direction and assert the

DMM_PAT_CTRL_i[0] START bit:

- The refill is done when the DMM_PAT_STATUS_i[3] DONE bit is set.
- A new refill can be initiated when the DMM_PAT_STATUS_i[0] READY bit is set.

Figure 6-51. DMM Simple Manual Area Refill

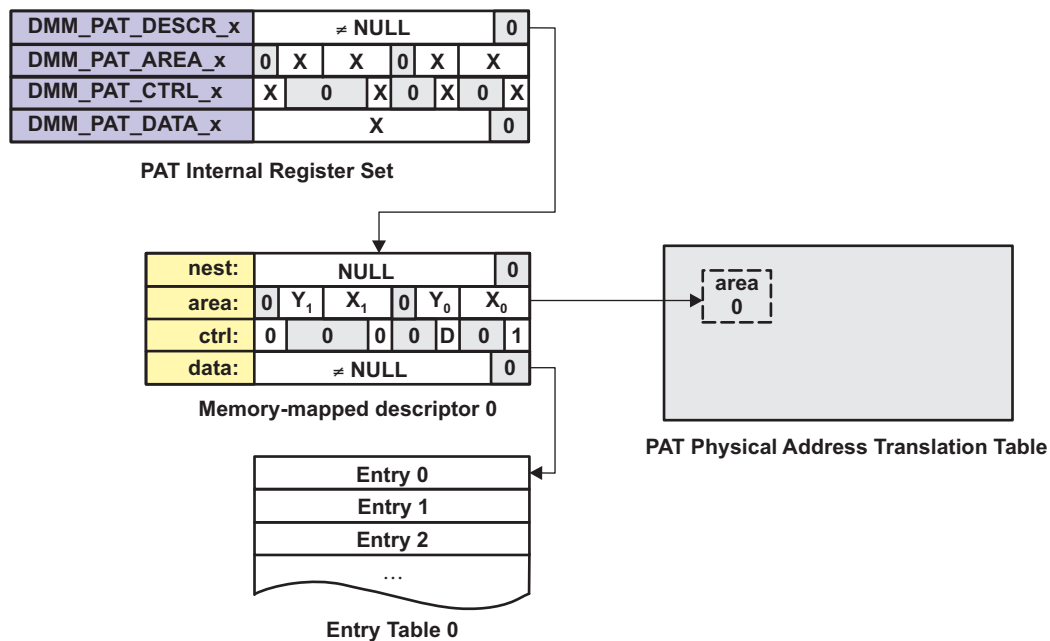

6.3.3.3 Single Auto-Configured Area Refill

These steps have to be performed to create the 16-byte aligned memory-mapped entry table containing all entries of the defined area, as seen in [Figure 6-52](#).

1. Create a 16-byte aligned memory-mapped descriptor structure where:
 - (a) the next field is set to NULL
 - (b) the area field is set with the relevant (x0, y0) (x1, y1) area definition
 - (c) the ctrl field is set with the requested direction D and the start bit asserted to start refilling as soon as this descriptor enters the PAT refill engine
 - (d) the data field is set to the physical address of the created entry table
2. The DMM_PAT_DESCR_i register with the physical address of the created descriptor.
3. The refill is done when the DMM_PAT_STATUS_i[3] DONE bit is set.
4. A new refill can be initiated when the DMM_PAT_STATUS_i[0] READY bit is set.

Figure 6-52. DMM Single Auto-configured Area Refill

6.3.3.4 Chained Auto-Configured Area Refill

These steps have to be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area, as seen in Figure 6-53.

1. Create one 16-byte aligned memory-mapped descriptor structures per area where:
 - (a) the next field is set to the physical address of the next descriptor or NULL for the last one
 - (b) the area field is set with the relevant (x0, y0) (x1, y1) area definition
 - (c) the ctrl field is set with the requested direction D and the START bit asserted to start refilling as soon as the previous area refill is done
 - (d) the data field is set to the physical address of the corresponding entry table
2. Write the DMM_PAT_DESCR_i register with the physical address of the first created descriptor.
3. Each area refill is done when the DMM_PAT_STATUS_i[3] DONE bit is set.
4. All area refills are done when the DMM_PAT_STATUS_i[0] READY bit is set.
5. A new refill can be initiated when the DMM_PAT_STATUS_i[0] READY bit is set.

Figure 6-53. DMM Chained Auto-configured Area Refill

6.3.3.5 Synchronised Auto-configured Area Refill

These steps have to be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area, as seen in [Figure 6-54](#).

1. Create one 16-byte aligned memory-mapped descriptor structures per area where:
 - (a) the next field is set to the physical address of the next descriptor or NULL for the last one
 - (b) the area field is set with the relevant (x0, y0) (x1, y1) area definition
 - (c) the ctrl field is set with the synchronising initiator identifier I, the SYNC bit asserted, the requested direction D, and the START bit asserted to start refilling as soon as the previous area refill is done and initiator I has made one access in the previous area
 - (d) the data field is set to the physical address of the corresponding entry table
2. Write the DMM_PAT_DESCR_i register with the physical address of the first created descriptor.
3. Each area refill is done when the DMM_PAT_STATUS_i[3] DONE bit is set.
4. All area refills are done when the DMM_PAT_STATUS_i[0] READY bit is set.
5. A new refill can be initiated when the DMM_PAT_STATUS_i[0] READY bit is set.

Figure 6-54. DMM Synchronised Auto-configured Area Refill

6.3.3.6 Cyclic Synchronised Auto-Configured Area Refill

These steps have to be performed to create one 16-byte aligned memory-mapped entry table per area containing the entries for the corresponding area, as seen in Figure 6-55.

1. Create one 16-byte aligned memory-mapped descriptor structures per area where:
 - (a) the next field is set to the physical address of the next descriptor in the circular list
 - (b) the area field is set with the relevant (x0, y0) (x1, y1) area definition
 - (c) the ctrl field is set with the synchronising initiator identifier I, the SYNC bit asserted, the requested direction D, and the START bit asserted to start refilling as soon as the previous area refill is done and initiator I has made one access in the previous area
 - (d) the data field is set to the physical address of the corresponding entry table
2. Write the DMM_PAT_DESCR_i register with the physical address of the initial descriptor.
3. Each area refill is done when the DMM_PAT_STATUS_i[3] DONE bit is set.
4. A new refill can be initiated by writing any value to the DMM_PAT_DESCR_i to abort the current one.

Figure 6-55. DMM Cyclic Synchronised Auto-configured Area Refill

6.3.4 Address Management Using LISA Sections

In the device, there are either one or two memory controllers (EMIFs).

6.3.4.1 DMM Sections

The DMM section definition is certainly the very first step in the DMM software configuration, as it is about defining the system address map to be used when accessing the SDRAM controllers.

A DMM section description fits in a single 32-bit register (DMM_LISA_MAP_x), where:

- SYS_ADDR defines the base address of the decoding range for the section
- SYS_SIZE defines the size of the section. Note that the encoding of this parameter is the number of bits actually used in the upper 8-bits of the incoming system address.
- SDRC_ADDR defines the physical base address of the section in the external memory controller
- SDRC_ADDRSPC defines the address space used on the SDRAM controller when hitting this section. The address space feature is not supported.
- SDRC_MAP defines the target memory controllers for this section. A section may hit a one or two controllers. The section is not used if this parameter is set to zero.
- SDRC_INTL defines the granularity of the interleaving if the section is mapped on more than one memory controllers

A couple of examples are given in the next subsections.

6.3.4.1.1 Case 1: Two Memory Controllers, 2GB DDR Symmetrical Distribution

Use Case: In this example we assume 2GB of external memory, spread evenly between 2 SDRAM controllers.

Table 6-4. Case 1 Memory Controllers

System Address Range	Memory Controller	EMIF Address Range
8000 0000-FFFF FFFFh	1 and 2, interleaved at 256 Bytes	0000 0000h-7FFF FFFFh

Configuration:

Table 6-5. Controller Configuration

Bit	Field	Section 0
31-24	SYS_ADDR	80h (incoming System Address MSB)
22-20	SYS_SIZE	7h (2 GB)
19-18	SDRC_INTL	2h (256 bytes interleaving)
17-16	SDRC_ADDRSPC	0 (Unused Reserved field)
8	SDRC_MAP	3h (Map to both EMIF0 and EMIF1)
7-0	SDRC_ADDR	0 (SDRC address MSB)

NOTE: Section 1, Section 2 and Section 3 - identical to Section 0.

How DMM decodes and translates:

- To check if an address hits a section, use the eight upper address bits of the address and mask them with the hit mask ($2^8 - 2^7 = 80h$). If the result is equal to SYS_ADDR, the section is hit.
- To define the physical address to be issued to the memory controller, use the eight upper address of the system address, mask them with the address mask ($2^{\text{SYS_SIZE}} - 1$), and then OR them with SDRC_ADDR. This will give the resulting eight upper physical address bits. All lower address bits are forwarded unchanged.
- If interleaving enabled, the physical address generation is modified. In case of a 256 bytes interleaving, the first chunk of 256 bytes is mapped to the first controller, the second chunk to the second controller, and so on. This results in system address bit 8 to be decoded as the SDRAM controller ID, 0 for the first controller and 1 for the second one (system address bit 7 would be used for interleaving at 128 bytes boundary, and bit 9 for 512 bytes). This bit is not included in the computed physical address, meaning the upper system address bits 9 to 31 are shifted to bits 8 to 30 when generating the physical address.

Example with above configuration:

- Incoming access's System address 99AE 37F0h:
- Hit mask: $2^8 - 2^7 = 80h$
- Masked upper address bits: $80h \text{ AND } 80h = 80h$ (the SYS_ADDR), thus hits section 0
- Address mask: $2^7 - 1 = 7Fh$
- Masked upper address bits: $99h \text{ AND } 7Fh = 19h$
- Full masked address: 19AE 37F0h
- Bit 8 is 1 -> targets the second memory controller
- Full masked shifted address (suppressing bit 8): 0CD7 1BF0h
- OR upper physical address bits with SDRC_ADDR: 0CD7 1BF0h
- Physical address: 0CD7 1BF0h

This request will be forwarded to address 0CD7 1BF0h, of the second memory controller, that is, EMIF1.

6.3.4.1.2 Case 2: Two Memory Controllers, 1152 MB (1 GB + 128 MB) DDR Symmetrical Distribution

In this example we assume 2GB of external memory, spread evenly between two EMIF controllers.

Table 6-6. Case 2 Memory Controllers

System Address Range	SDRAM Controller	EMIF Address Range
8000 0000h-C7FF FFFFh	1 and 2, interleaved at 256 Bytes	0000 0000h-47FF FFFFh

Configuration:

Table 6-7. Controller Configuration

Bit	Field	Section 0	Section 1
31-24	SYS_ADDR	80h (incoming System Address MSB)	C0h (incoming System Address MSB)
22-20	SYS_SIZE	6h (1 GB)	3h (128 MB)
19-18	SDRC_INTL	2h (256 bytes interleaving)	1 (128 bytes interleaving)
17-16	SDRC_ADDRSPC	0 (Unused Reserved field)	0 (Unused Reserved field)
8	SDRC_MAP	3h (Map to both EMIF0 and EMIF1)	3h (Map to both EMIF0 and EMIF1)
7-0	SDRC_ADDR	0 (SDRC address MSB)	20h (SDRC address MSB)

NOTE: Section 2 and Section 3 are identical to Section 1.

How DMM decodes and translates:

Identical to [Section 6.3.4.1.1](#).

See [Figure 6-56](#) for System Address Memory Range and its mapping to EMIFs.

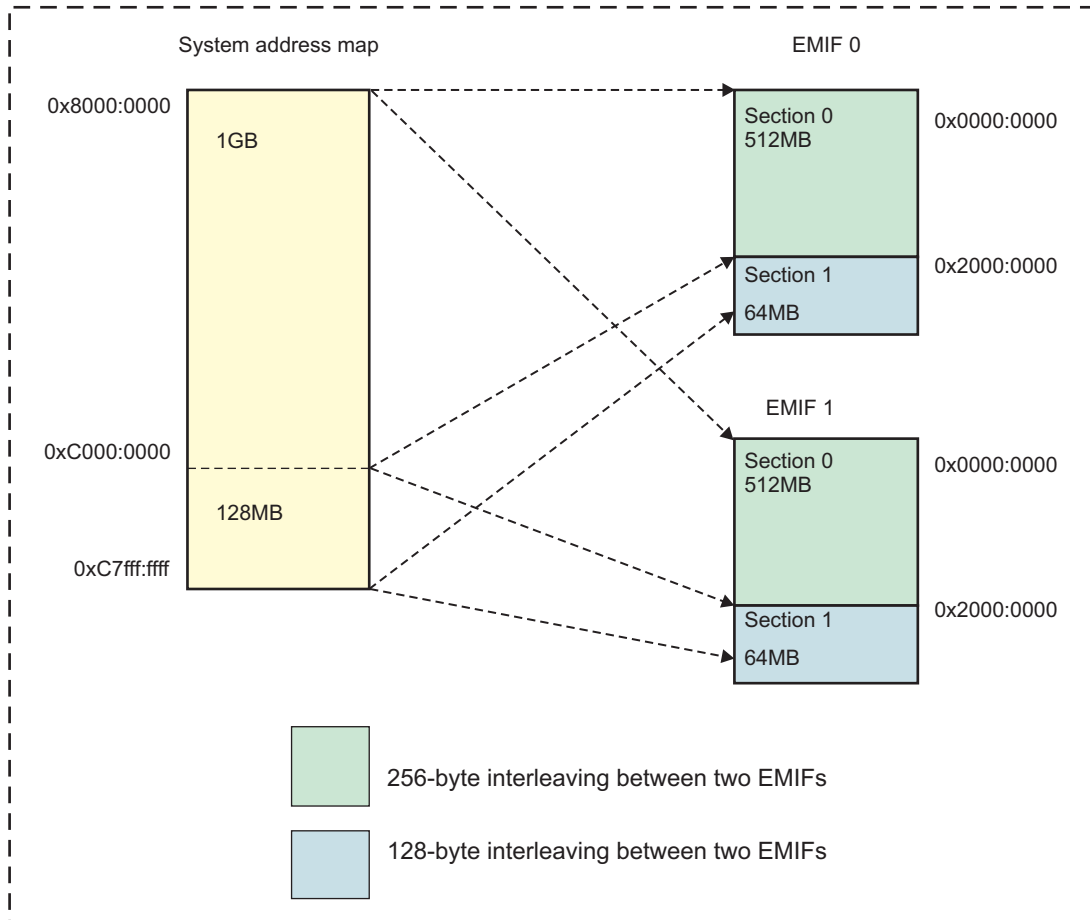

Example with above configuration:

Incoming accesses System address C022 34C0h:

1. Upper address bits: C0h
2. Hit mask: $2^8 - 2^3 = F8h$
3. Masked upper address bits: C0h AND F8h = C0h (the SYS_ADDR) , thus hits section 1
4. Address mask: $2^3 - 1 = 7h$
5. Masked upper address bits: C0h AND 7h = 0
6. Full masked address: 0022 34C0h
7. Bit 7 is 1 -> targets the second memory controller
8. Full masked shifted address (suppressing bit 7): 0011 1A60h
9. OR upper physical address bits with SDRC_ADDR: 0011 1A60h
10. Physical address: 0011 1A60h

This request will be forwarded to address 0011 1A60h, of the second memory controller; that is, EMIF1.

Figure 6-56. DMM Section Use-Case 2

6.3.4.1.3 Case 3: Two SDRAM Controllers, 1152 MB (1 GB + 128 MB) DDR Asymmetrical Distribution

NOTE: For optimal system performance, symmetric configuration is HIGHLY recommended. Unless dictated by system cost and other constraints, Asymmetrical distribution of memory should not be considered.

There are many ways to configure the section mapping in this use case.

Option 1: Asymmetrical section of EMIF0 is mapped to system address C000 0000h-C7FF FFFFh, higher portion of the SDRAM in system memory map.

Table 6-8. Section Mapping Option 1

Bit	Field	Section 0	Section 1
31-24	SYS_ADDR	80h (incoming System Address MSB)	88h (incoming System Address MSB)
22-20	SYS_SIZE	3h (128 MB)	6h (1 GB)
19-18	SDRC_INTL	0 (No interleaving)	2h (256 bytes interleaving)
17-16	SDRC_ADDRSPC	0 (Unused Reserved field)	0 (Unused Reserved field)
8	SDRC_MAP	1 (Map to EMIF0)	3h (Map to both EMIF0 and EMIF1)
7-0	SDRC_ADDR	20h (SDRC address MSB)	0 (SDRC address MSB)

Option 2: Asymmetrical section of EMIF0 is mapped to system address 8000 0000h-87FF FFFFh, Lower portion of the SDRAM in system memory map.

Table 6-9. Section Mapping Option 2

Bit	Field	Section 0	Section 1
31-24	SYS_ADDR	80h (incoming System Address MSB)	C0h (incoming System Address MSB)
22-20	SYS_SIZE	6h (1 GB)	3h (128 MB)
19-18	SDRC_INTL	2h (256 bytes interleaving)	0 (No interleaving)
17-16	SDRC_ADDRSPC	0 (Unused Reserved field)	0 (Unused Reserved field)
8	SDRC_MAP	3h (Map to both EMIF0 and EMIF1)	1 (Map to EMIF0)
7-0	SDRC_ADDR	0 (SDRC address MSB)	20h (SDRC address MSB)

6.4 DMM/TILER Registers

Table 6-10 lists the DMM/TILER registers.

Table 6-10. DMM/TILER Registers

Address Offset	Register Name	Section
0	DMM_REVISION	Section 6.4.1

6.4.1 DMM Revision Register: DMM_REVISION

The DMM Revision register is shown in [Figure 6-57](#) and described in [Table 6-11](#).

Figure 6-57. DMM_REVISION Register

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 6-11. DMM_REVISION Register Field Descriptions

Bit	Field	Value	Description	Type
31-30	SCHEME	1	Used to distinguish between old scheme and current.	R
29-28	Reserved	0	Reserved	R
27-16	FUNC	0	Software compatibility level	R
15-11	RRTL	0	RTL Version (R)	R
10-8	XMAJOR	0	Major Revision (X)	R
7-6	CUSTOM	0	Special DMM version	R
5-0	YMINOR	8h	Minor Revision (Y)	R

6.4.2 DMM Clock Management Configuration: DMM_SYSCONFIG

The DMM Clock Management Configuration register is shown in [Figure 6-58](#) and described in [Table 6-12](#).

Figure 6-58. DMM_SYSCONFIG Register

31	Reserved	4	3	2	1	0
R-0				IDLEMODE	Rsvd	
R-0				R/W-2h	R-0	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 6-12. DMM_SYSCONFIG Register Field Descriptions

Bit	Field	Value	Description	Type
31-4	Reserved	0	Reserved	R
3-2	IDLEMODE	0	Configuration of the local target state management mode.	R/W
		0	Force-idle mode. Backup mode, for debug only.	
		1h	No idle mode. Backup mode, for debug only.	
		2h	Smart-idle mode: local target's idle state eventually follows systems IDLE request.	
		3h	Reserved	
1-0	Reserved	0	Reserved	R

6.4.3 LISA Configuration Locking Register: DMM_LISA_LOCK

The LISA Configuration Locking register is shown in [Figure 6-59](#) and described in [Table 6-13](#).

Figure 6-59. DMM_LISA_LOCK Register

31	Reserved	1	0
R-0			LOCK
R-0			R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 6-13. DMM_LISA_LOCK Register Field Descriptions

Bit	Field	Value	Description	Type
31-1	Reserved	0	Reserved	R
0	LOCK		DMM lock map	R/W
		R0	DMM_LISA_MAP__x un-locked	
		W0	No effect (clear on reset only)	
		R1	DMM_LISA_MAP__xlocked	
		W1	Locking DMM_LISA_MAP__x registers	

6.4.4 DMM LISA MAP Registers: DMM_LISA_MAP_0-DMM_LISA_MAP_3

The DMM LISA MAP register is shown in [Figure 6-60](#) and described in [Table 6-14](#).

Figure 6-60. DMM_LISA_MAP Registers

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 6-14. DMM_LISA_MAP Registers Field Descriptions

Bit	Field	Value	Description	Type
31-24	SYS_ADDR	0	DMM system section address MSB	R/W
23	Reserved	0	Reserved	R
22-20	SYS_SIZE	0h 1h 2h 3h 4h 5h 6h 7h	DMM system section size 16-MB section 32-MB section 64-MB section 128-MB section 256-MB section 512-MB section 1-GB section 2-GB section	R/W
19-18	SDRC_INTL	0h 1h 2h 3h	SDRAM controller interleaving mode No interleaving 128-byte interleaving 256-byte interleaving 512-byte interleaving	R/W
17-16	SDRC_ADDRSPC	0h	Reserved. Should be 0.	R/W
15-10	Reserved	0	Reserved	R
9-8	SDRC_MAP	0h 1h 2h 3h	SDRAM controller mapping Un-mapped Mapped on SDRC 0 only (not interleaved) Mapped on SDRC 1 only (not interleaved) Mapped on SDRC 0 and SDRC 1 (interleaved)	R/W
7-0	SDRC_ADDR	0h	SDRAM controller address MSB	R/W

6.4.5 DMM TILER Orientation Registers: DMM_TILER_OR0-DMM_TILER_OR1

The DMM TILER Orientation register is shown in [Figure 6-61](#) and described in [Table 6-15](#).

Figure 6-61. DMM_TILER_OR Registers

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 6-15. DMM_TILER_OR Registers Field Descriptions

Bit	Field	Value	Description	Type
31	W7	0	Write-enable for OR7 bit-field; OR7 field is unchanged	R/W
30-28	OR7	0	Orientation for initiator 8.n+7	R/W
27	W6	0	Write-enable for OR6 bit-field; OR6 field is unchanged	R/W
26-24	OR6	0	Orientation for initiator 8.n+6	R/W
23	W5	0	Write-enable for OR5 bit-field; OR5 field is unchanged	R/W
22-20	OR5	0	Orientation for initiator 8.n+5	R/W
19	W4	0	Write-enable for OR4 bit-field; OR4 field is unchanged	R/W
18-16	OR4	0	Orientation for initiator 8.n+4	R/W
15	W3	0	Write-enable for OR3 bit-field; OR3 field is unchanged	R/W
14-12	OR3	0	Orientation for initiator 8.n+3	R/W
11	W2	0	Write-enable for OR2 bit-field; OR2 field is unchanged	R/W
10-8	OR2	0	Orientation for initiator 8.n+2	R/W
7	W1	0	Write-enable for OR1 bit-field; OR1 field is unchanged	R/W
6-4	OR1	0	Orientation for initiator 8.n+1	R/W
3	W0	0	Write-enable for OR0 bit-field; OR0 field is unchanged	R/W
2-0	OR0	0	Orientation for initiator 8.n+0	R/W

6.4.6 DMM PAT Configuration Register: DMM_PAT_CONFIG

The DMM PAT Configuration register is shown in [Figure 6-62](#) and described in [Table 6-16](#).

Figure 6-62. DMM_PAT_CONFIG Register

31	Reserved			4	3	2	1	0
R-0				MODE3	MODE2	MODE1	MODE0	
				R/W-0	R/W-0	R/W-0	R/W-0	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 6-16. DMM_PAT_CONFIG Register Field Descriptions

Bit	Field	Value	Description	Type
31-4	Reserved	0	Reserved	R
3	MODE3	0	Mode of Refill Engine 3 0 : Normal Mode 1h : Direct LUT access	R/W
2	MODE2	0	Mode of Refill Engine 1 0 : Normal Mode 1h : Direct LUT access	R/W
1	MODE1	0	Mode of Refill Engine 2 0 : Normal Mode 1h : Direct LUT access	R/W
0	MODE0	0	Mode of Refill Engine 0 0 : Normal Mode 1h : Direct LUT access	R/W

6.4.7 DMM PAT View Registers: DMM_PAT_VIEW_0-DMM_PAT_VIEW_2

The DMM PAT View register is shown in [Figure 6-63](#) and described in [Table 6-17](#).

Figure 6-63. DMM_PAT_VIEW Registers

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

6.4.16 DMM PAT Descriptor Registers: DMM_PAT_DESCR_0-DMM_PAT_DESCR_3

The DMM PAT Descriptor register is shown in [Figure 6-72](#) and described in [Table 6-26](#).

- Physical address of the next table refill descriptor
- Writing to this register aborts the current ongoing area reload
- Write also resets the corresponding DMM_PAT_AREA_x, DMM_PAT_CTRL_x and DMM_PAT_DATA_x registers
- The descriptor address must be in the DDR and not any other internal memory

Figure 6-72. DMM_PAT_DESCR Registers

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 6-26. DMM_PAT_DESCR Registers Field Descriptions

Bit	Field	Value	Description	Type
31-4	ADDR	0	Physical address of the next table refill descriptor.	R/W
3-0	Reserved	0	Reserved	R

6.4.17 DMM PAT Area Geometry Registers: DMM_PAT_AREA_0-DMM_PAT_AREA_3

The DMM PAT Area Geometry register is shown in [Figure 6-73](#) and described in [Table 6-27](#).

Figure 6-73. DMM_PAT_AREA Registers

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

7.7 DDR2/DDR3 SDRAM Device Configuration Steps.....	1195
7.8 DDR2/DDR3 Configuration Registers.....	1196

7.1 Introduction

This document describes the DDR2 and DDR3 memory controller specifications and general information.

7.1.1 Purpose of the Peripheral

The DDR2 and DDR3 memory controller is used to interface with JESD79-2E and JESD79-3C standard-compliant DDR2 and DDR3 SDRAM devices, respectively. Memory types such as DDR1 SDRAM, SDR SDRAM, SBSRAM, and asynchronous memories are not supported.

7.1.2 Features Supported

The DDR2 and DDR3 memory controller supports the following features:

- JESD79-2E standard compliant DDR2 SDRAM
- JESD79-3C standard compliant DDR3 SDRAM
- 1024 Mbyte memory space
- Data bus width of 32 or 16 bits
- CAS latencies(DDR2): 3,4,5,6 and 7
- CAS latencies(DDR3): 5,6,7,8,9,10 and 11
- Internal banks DDR2 and DDR3: 1,2,4,8
- Capable of supporting two chip select signals (refer to the device data manual for the exact number of chip selects supported)
- Burst length:8
- Burst type: Sequential
- Page sizes: 256, 512, 1024 and 2048 word
- SDRAM auto-initialization on configuration change
- Self-refresh and power-down modes for low power
- Periodic ZQ calibration (DDR3 only)
- Self-refresh mode
- Prioritized refresh
- Programmable refresh rate and backlog counter
- Programmable timing parameters
- Little endian
- Software write/read leveling (calibration)
- Support for fly-by topology board routing for DDR3 interfaces via leveling
- ODT on DDR2 and DDR3
- Class of service support

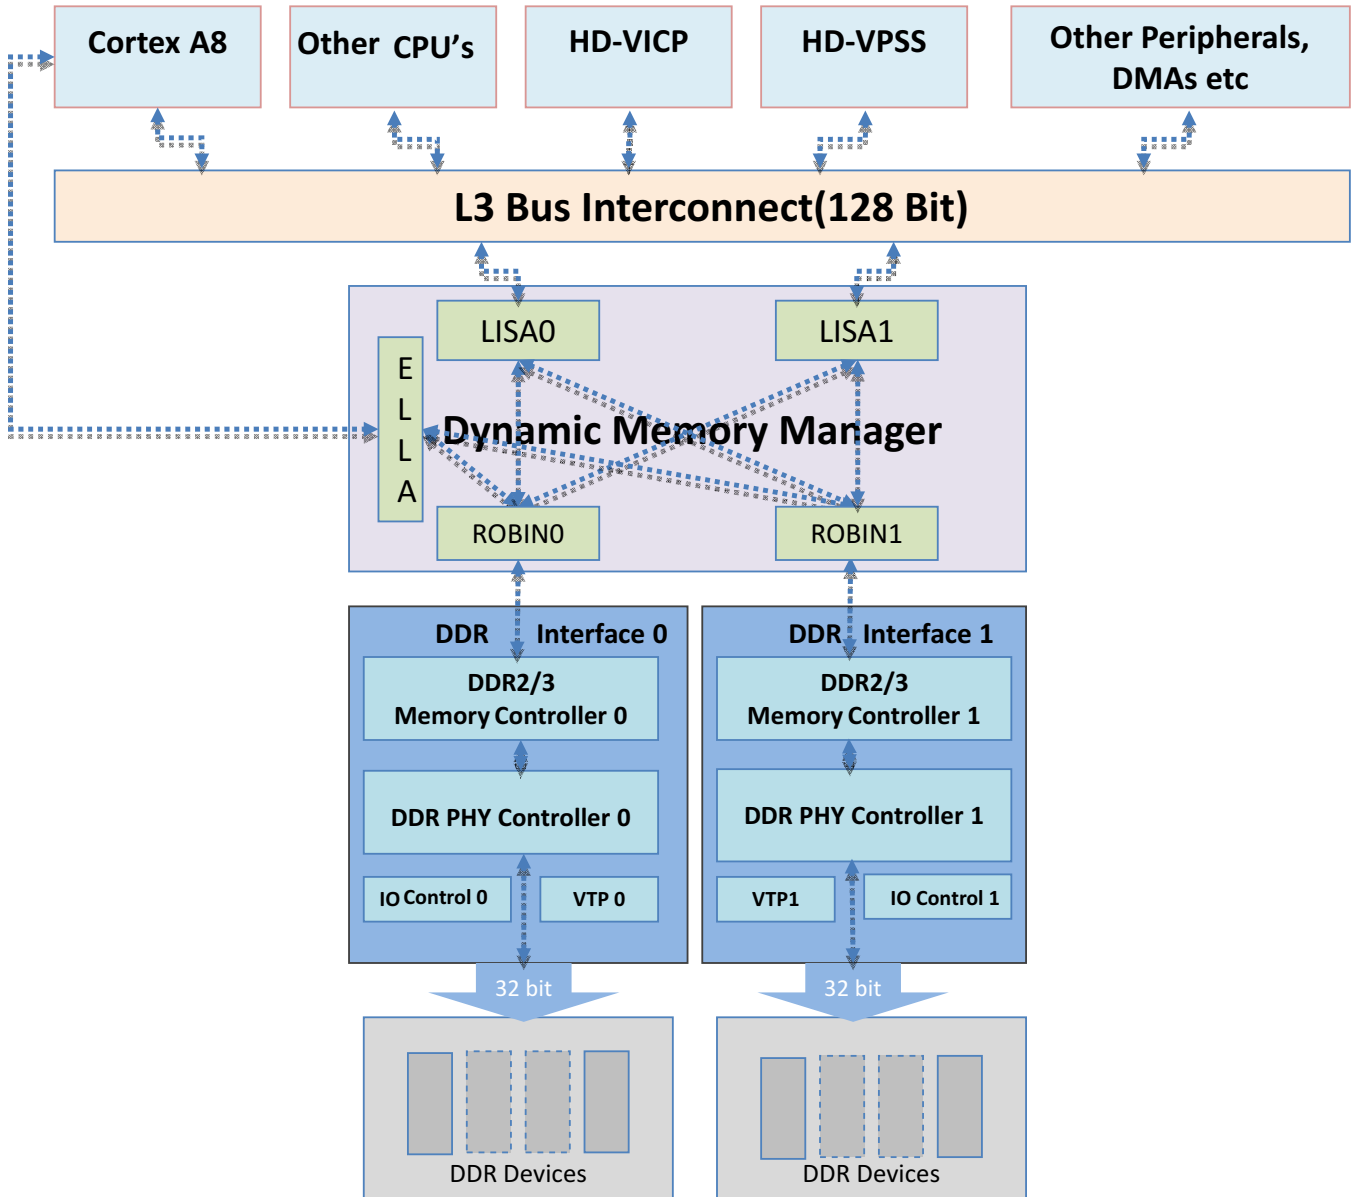

7.1.3 Features Not Supported

- DDR1, LPDDR1, and LPDDR2 memory types
- Burst Length other than 8
- Interleave burst type
- OCD calibration for DDR2
- DDR3 burst chop support

7.2 Architecture

[Figure 7-1](#) shows the DDR subsystem interconnection to the rest of the system and the data paths. Please refer to the *DMM/TILER* chapter in the TRM for a detailed description of the dynamic memory controller. This chapter focuses only on the DDR subsystem and various sub-blocks inside the DDR subsystem.

Figure 7-1. DDR Block Diagram

The DDR2/DDR3 memory controllers and their associated PHYs provide the physical interface to external DDR2 or DDR3 memory devices. Data, which is read from or written to external memories by internal initiators (for example, Cortex A8, HD-VPSS, etc), is managed internally by the Dynamic Memory Manager (DMM).

In the most common usage case, the DMM acts to transparently interleave memory accesses across the two DDR interfaces on a 128B, 256B or 512B boundary. For example, the EDMA could write an 8KB block of consecutive addresses to external memory space and if 512B interleaving is enabled, the DMM would cause the write to be interleaved across both DDR interfaces on 256B boundaries. Likewise, when the same 8KB block of addresses is read back from external memory, the DMM would interleave the reads from appropriate sub-blocks so that the original data set is read back. This interleaving process substantially improves memory efficiency and is transparent to the memory requestors.

It is also possible to operate with interleaving function deactivated in which case the two external DDR interfaces can be mapped to different address spaces.

7.2.1 Signal Descriptions

The DDR2 and DDR3 memory controller signals are shown in Figure 7-2 and described in Table 7-1. The following features are included:

- The maximum width for the data bus (DDR[x]_D[31:0]) is 32-bits
- The address bus (DDR[x]_A[14:0]) is 15-bits wide with an additional 3-bank address pins (DDR[x]_BA[2:0])
- Two differential output clocks (DDR[x]_CLK and $\overline{\text{DDR[x]_CLK}}$ driven by internal clock sources
- Command signals: Row and column address strobe ($\overline{\text{DDR[x]_RAS}}$ and $\overline{\text{DDR[x]_CAS}}$), write enable strobe ($\overline{\text{DDR[x]_WE}}$), data strobe (DDR[x]_DQS[3:0] and $\overline{\text{DDR[x]_DQS[3:0]}}$), and data mask (DDR[x]_DQM[3:0]).
- Two chip-select signals ($\overline{\text{DDR[x]_CS[1:0]}}$) and one clock enable signal (DDR[x]_CKE)
- Two on-die termination output signals (DDR[x]_ODT[1:0])

Figure 7-2. DDR2 and DDR3 Memory Controller Signals

Table 7-1. DDR2 and DDR3 Memory Controller Signal Descriptions

Pin	Description
DDR[x]_D[31:0]	Bidirectional data bus. Input for data reads and output for data writes.
DDR[x]_A[14:0]	External address output.
$\overline{\text{DDR[x]_CS[1:0]}}$	Chip select output. Allows two banks of DDR2 and DDR3.
DDR[x]_DQM[3:0]	Active-low output data mask.
DDR[x]_CLK/ $\overline{\text{DDR[x]_CLK}}$	Differential clock outputs. All DDR2 and DDR3 interface signals are synchronous to these clocks.
DDR[x]_CKE	Clock enable. Used to select power-down and self-refresh operations.
$\overline{\text{DDR[x]_CAS}}$	Active-low column address strobe.
$\overline{\text{DDR[x]_RAS}}$	Active-low row address strobe.
$\overline{\text{DDR[x]_WE}}$	Active-low write enable.
DDR[x]_DQS[3:0]/ $\overline{\text{DDR[x]_DQS[3:0]}}$	Differential data strobe bidirectional signals. Edge-aligned inputs on reads and center-aligned outputs on writes.

Table 7-1. DDR2 and DDR3 Memory Controller Signal Descriptions (continued)

Pin	Description
DDR[x]_ODT[1:0]	ODT[1:0] On-die termination signals to external DDR2 and DDR3 SDRAM per chip select.
DDR[x]_BA[2:0]	Bank-address control outputs.
DDR[x]_VREF	Memory Controller reference voltage. This voltage must be supplied externally. See the device-specific data manual for more details.
DDR[x]_VTP	DDR2 and DDR3 VTP Compensation Resistor Connection.
DDR[x]_RST	Reset output. Asynchronous reset for DDR3 devices.

7.2.2 Memory Map

Please see the device-specific data manual for information describing the device memory map.

7.2.3 Clock Control

The DDR2/DDR3 clock is derived directly from the DDR PLL's VCO output. The frequency of DDR[x]_CLK can be determined by using the following formula:

$$\text{DDR}[x]_{\text{CLK}} \text{ frequency} = (\text{DDRPLL input clock frequency} \times \text{multiplier}) / ((\text{pre-divider} + 1) \times \text{post-divider})$$

The second output clock of the DDR2/DDR3 memory controller $\overline{\text{DDR}[x]_{\text{CLK}}}$, is the inverse of DDR[x]_CLK. You can change the multiplier, pre-divider and post-divider to get the desired DDR[x]_CLK frequency.

Where x=0,1

For detailed information on DDRPLL, see the chip level resources.

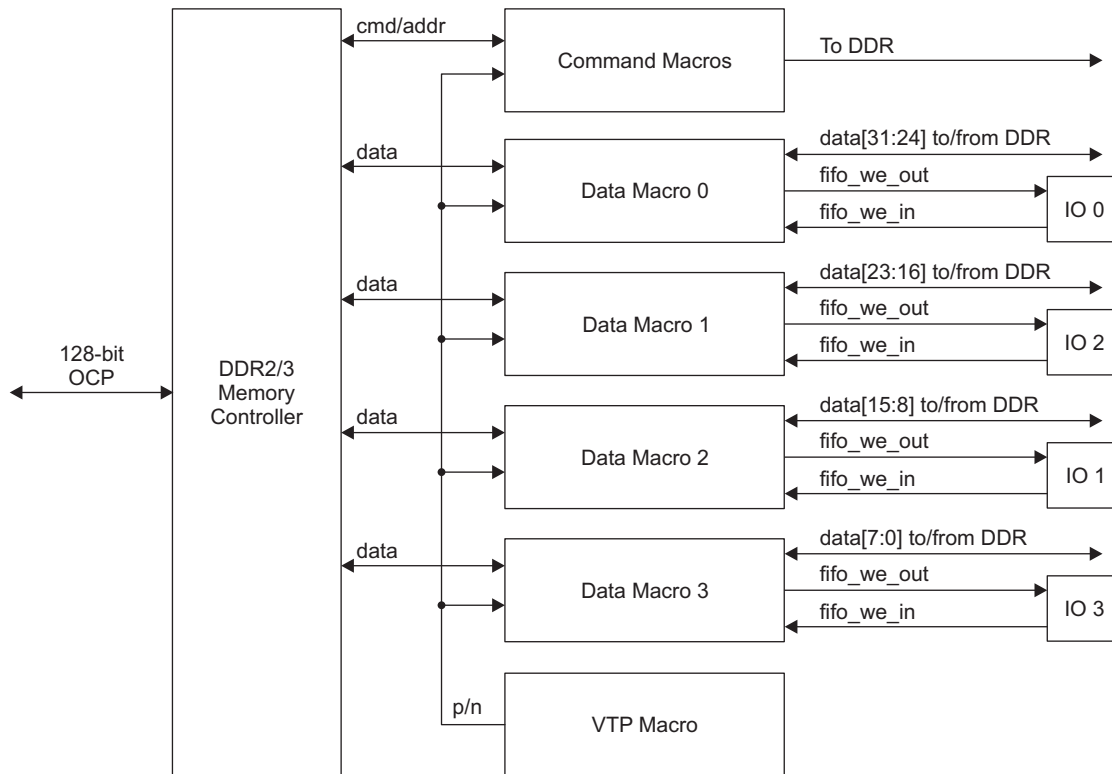

7.2.4 DDR2/DDR3 Memory Controller Subsystem Overview

The DDR2/DDR3 memory controller can gluelessly interface to most standard DDR2/DDR3 SDRAM devices and supports such features as self-refresh mode and prioritized refresh. In addition, it provides flexibility through programmable parameters such as the refresh rate, CAS latency, and many SDRAM timing parameters. The DDR2/DDR3 subsystem consists of the following:

- DDR2/DDR3 memory controller
- Command macro
- Data macro
- VTP controller macro
- IO's for DQS gate

The subsystem supports JEDEC standard-compliant DDR2 and DDR3 devices. It does not support CAS latency of two for DDR2 due to data and command macro limitations. It supports a 128-bit wide OCP interface on the core side for programmability. The subsystem can be used to connect to 16- or 32-bit memory devices.

[Figure 7-3](#) shows the DDR2/DDR3 subsystem block diagram.

Figure 7-3. DDR2/DDR3 Subsystem Block Diagram

Where

fifo_we_out = DQS enable output for timing match between DQS and system (Memory) clock.

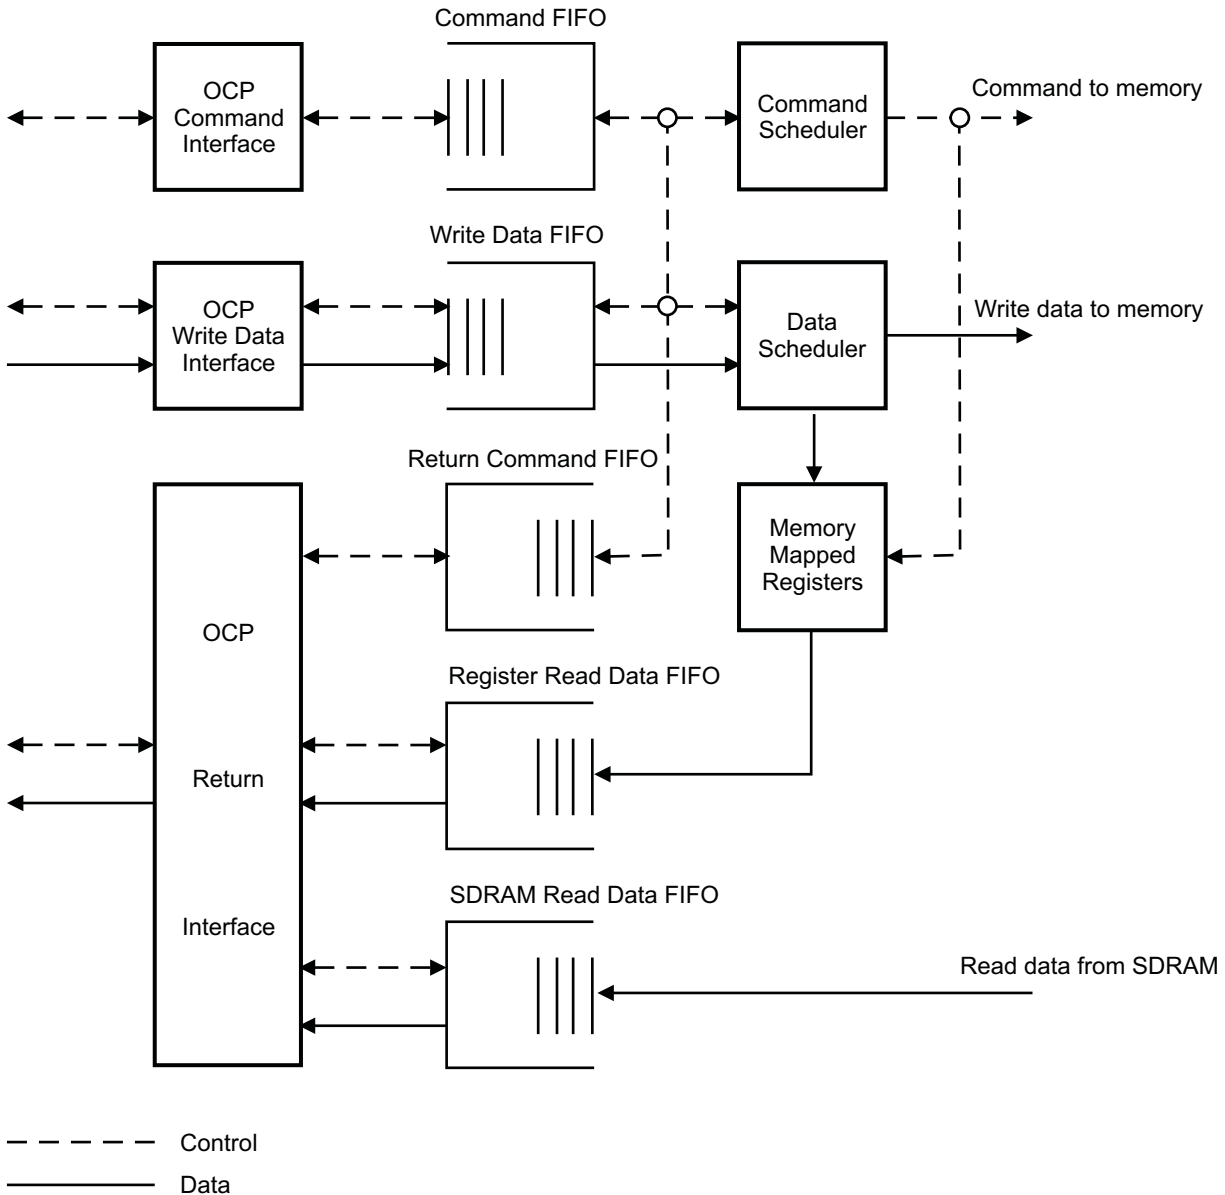

fifo_we_in = DQS enable input for timing match between DQS and system (Memory) clock.

7.2.4.1 DDR2/DDR3 Memory Controller Interface

To move data efficiently from on-chip resources to the external DDR2/DDR3 SDRAM device, the DDR2/DDR3 memory controller makes use of a command FIFO, a write data FIFO, a return command FIFO, and two read data FIFOs. The purpose of each FIFO is described below.

Figure 7-4 shows the block diagram of the DDR2/DDR3 memory controller FIFOs. Commands, write data, and read data arrive at the DDR2/DDR3 memory controller parallel to each other. The same peripheral bus is used to write and read data from external memory as well as internal memory-mapped registers.

Figure 7-4. DDR2/DDR3 Memory Controller FIFO Block Diagram

The command FIFO stores all the commands coming in on the OCP command interface.

The Write Data FIFO stores the write data for all the write transactions coming in on the OCP write data interface.

The Return Command FIFO stores all the return transactions that are to be issued to the OCP return interface. These include the write status return and the read data return commands.

There are two Read Data FIFOs that store the read data to be sent to the OCP return interface. One Read Data FIFO stores read data from the memory mapped registers and other Read Data FIFO stores read data from external memory.

7.2.4.2 Data Macro

The data macro consists of eight data channels, one pair of complementary strobes (one pair for 8 bits of data), and one data mask channel (one for eight bits of data).

The data macros consists of PHY data macro, DLLs and IOs integrated into a macro.

The data macro is a bidirectional interface. It is used to transmit data from the memory controller to the external memory chip during a write operation and receive data from memory and transmit it to the memory controller during a read operation.

During a write operation, the data macro translates 32/16-bit words from memory controller to 8-bit words and transmits them at double the bit rate to the memory along with the strobe. The strobe is center-aligned to the data. Data can be prevented from writing to the memory using data mask signal.

During a read operation, the data macro receives 8-bit DDR data along with the strobe and converts it to 32/16-bit words and transmits them to the memory controller along with the read-valid signals.

7.2.4.3 Command Macro

It consists of the PHY command macro, DLLs and the IOs integrated together. The command macro acts as a unidirectional macro that transmits address and control bits from memory controller to the memory chip. The clocks $\text{DDR}[x]_{\text{CLK}}$ and $\overline{\text{DDR}}[x]_{\text{CLK}}$ are used by the memory to register the command and address transmitted on the transmit channels. All address and control signals are transmitted clock-centered with respect to $\text{DDR}[x]_{\text{CLK}}$ and $\overline{\text{DDR}}[x]_{\text{CLK}}$. The memory, on the positive edge of $\text{DDR}[x]_{\text{CLK}}$ and the negative edge of $\overline{\text{DDR}}[x]_{\text{CLK}}[x]$, samples all address and control signals.

7.2.4.4 VTP Controller Macro

The VTP controller macro evaluates silicon performance at current voltage, temperature, and process (VTP) to enable IO drivers to set constant predetermined output driver impedance. The controller operates by comparing driver impedances to the external reference resistor and adjusting driver impedance to obtain an impedance match. The VTP controller supports the following features:

- The VTP controller generates information regarding the voltage, temperature, and process(VTP) on a chip to be shared with the device's IO drivers
- Requires a clock input from the core running at 20 MHz or less
- Requires 56 clock cycles to guarantee the VTP outputs are initially set after reset is removed
- Can be used in static or dynamic update mode of operation
- The VTP controller has internal noise filtering which allows it to control spurious update requests due to noise

Impedance of the drivers and terminations must be updated often even while in operation. In such scenarios where voltage and temperature are variables VTP macro can be configured in dynamic update mode. In contrast, static mode of operation does not allow dynamic calibration of IO impedance, and hence consumes lesser power compared to dynamic update mode.

It is possible that under noisy conditions, dynamic update controller can generate too frequent update requests. Noise can cause the controller to request a change in the impedance that can again be quickly reversed on subsequent clock cycles. To prevent the controller from making excessive numbers of impedance changes, a digital filter is included which can be configured to regulate the update rate. For example, if the user configures the filter value as $F2=0, F1=1$ and $F0=1$, then an impedance update will be performed only if four successive update requests are generated from the VTP controller. It is recommended to use a filter value of 011'b.

Table 7-2 shows the configuration details of the digital filter.

Table 7-2. Digital Filter Configuration

F2	F1	F0	Description
0	0	0	Off
0	0	1	Update on 2 consecutive update requests
0	1	0	Update on 3 consecutive update requests
0	1	1	Update on 4 consecutive update requests
1	0	0	Update on 5 consecutive update requests
1	0	1	Update on 6 consecutive update requests
1	1	0	Update on 7 consecutive update requests

Table 7-2. Digital Filter Configuration (continued)

F2	F1	F0	Description
1	1	1	Update on 8 consecutive update requests

7.2.4.5 DQS-Gate IOs

To effectively model the I/O delay on the DQS gating signal during a read request (the DQS receiver and the CLK driver I/Os), the signal is expected to be looped on a single I/O connecting `fifo_we_in` to `fifo_we_out`. The board and memory delay, being fairly constant across PTV variations, are calibrated within the IDID using a compensated delay line. The loop-back is done at the die level without bringing the signals out to the package level. Each data macro supports delay compensation independent of each other.

The data and command macros are responsible for system level flight time compensation. The following controls are supported by the DDR2/DDR3 controller subsystem:

- Aligning DDR[x]_DQS w.r.t DDR[x]_CLK during Write Cycle. To produce a given amount of skew to center the DDR[x]_DQS signals versus the SDRAM clock (DDR[x]_CLK) the DATA0/1/2/3_REG_PHY_WR_DQS_SLAVE_RATIO_0 registers must be programmed. The value to be loaded in these registers is calculated through the following formula:
Data Macro 0/1/2/3 Write DQS Slave Ratio Register = $256 \times ([\text{command delay}] - [\text{DDR}[x]_DQS \text{ delay}]) / \text{DDR}[x]_CLK \text{ clock period}$.
- Aligning ADDR/CMD w.r.t DDR[x]_CLK
- Aligning DDR[x]_DQ[31:0] w.r.t DDR[x]_DQS during write operation
- Offset DDR[x]_D[31:0] w.r.t DDR[x]_DQS during read operation
- Align FIFO WE window

7.2.5 Address Mapping

Each DDR2/DDR3 memory controller views external DDR2/DDR3 SDRAM as one continuous block of memory. This statement is true regardless of the number of memory devices located on the chip select space. The DDR2/DDR3 memory controller receives DDR2/DDR3 memory access requests along with a 32-bit logical address from the rest of the system. In turn, this memory controller uses the logical address to generate a row/page, column, and bank address for the DDR2/DDR3 SDRAM. The number of column, row, and bank address bits used is determined by the IBANK, RSIZE, and PAGESIZE fields (see [Table 7-3](#)). The DDR2/DDR3 memory controller uses up to 15 bits for the row/page address.

Table 7-3. IBANK, RSIZE and PAGESIZE Fields Information

Bit Field	Bit Value	Bit Description
RSIZE		Defines the number of address lines to be connected to DDR2/DDR3 memory device
	0	9 row bits
	1h	10 row bits
	2h	11 row bits
	3h	12 row bits
	4h	13 row bits
	5h	14 row bits
PAGESIZE	6h	15 row bits
		Defines the page size of each page of the external DDR2/DDR3 memory device
	0	256 words (requires 8 column address bits)
	1h	512 words (requires 9 column address bits)
	2h	1024 words (requires 10 column address bits)
IBANK	3h	2048 words (requires 11 column address bits)
		Defines the number of internal banks on the external DDR2/DDR3 memory device
	0	1 bank

Table 7-3. IBANK, RSIZE and PAGESIZE Fields Information (continued)

Bit Field	Bit Value	Bit Description
	1h	2 banks
	2h	4 banks
	3h	8 banks
EBANK		Defines whether DDR2/DDR3 memory controller accesses will use 1 or 2 chip selects
	0	CS0 only
	1h	CS0, CS1

When addressing SDRAM, if the IBANK_POS field in the SDRAM Config register is set to 0, and the EBANK_POS field in the SDRAM Config 2 register is also set to 0, the DDR2/DDR3 memory controller uses the three fields, IBANK, EBANK and PAGESIZE in the SDRAM Config register to determine the mapping from source address to SDRAM row, column, bank, and chip select.

If the IBANK_POS field in the SDRAM Config register is set to 1, 2, or 3, or the EBANK_POS field in the SDRAM Config 2 register is set to 1, the DDR2/DDR3 memory controller uses the four fields - IBANK, EBANK, PAGESIZE, and ROWSIZE in the SDRAM Config register to determine the mapping from source address to SDRAM row, column, bank, and chip select.

In all cases, the DDR2/DDR3 memory controller considers its SDRAM address space to be a single logical block, regardless of the number of physical devices or whether the devices are mapped across 1 or 2 memory controller chip selects.

7.2.5.1 Address Mapping when IBANK_POS=0 and EBANK_POS=0

For IBANK_POS=0 and EBANK_POS=0, the effect of address mapping scheme is that, as the source address increments across DDR2/DDR3 memory device page boundaries, the DDR2/DDR3 controller moves onto the same page in the next bank in the current device DDR[x]_CS[0]. This movement along the banks of the current proceeds to the same page in the next device (if EBANK=1, DDR[x]_CS[1]) and proceeds through the same page in all its banks before moving over to the next page in the first device (DDR[x]_CS[0]). The DDR2/DDR3 controller exploits this traversal across internal banks and chip selects while remaining on the same page, to maximize the number of open DDR2/DDR3 memory device banks within the overall memory device space.

Thus, the DDR2/DDR3 controller can keep a maximum of 16 banks (eight internal banks across two chip selects) open at a time, and can interleave among all of them.

Table 7-4. OCP Address to DDR2/DDR3 Address Mapping for IBANK_POS=0 and EBANK_POS=0

Logical Address			
Row Address	Chip Select	Bank Address	Column Address
	# of bits defined by EBANK of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by PAGESIZE of SDRCR
15 bits	EBANK=0 => 0 bits	IBANK=0 => 0 bits	PAGESIZE=0 => 8 bits
	EBANK=1 => 1 bit	IBANK=1 => 1 bit	PAGESIZE=1 => 9 bits
		IBANK=2 => 2 bits	PAGESIZE=2 => 10 bits
		IBANK=3 => 3 bits	PAGESIZE=3 => 11 bits

7.2.5.2 Address Mapping when IBANK_POS= 1 and EBANK_POS = 0

For IBANK_POS= 1 and EBANK_POS = 0, the interleaving of banks within a device (per chip select) is limited to four banks. However, it can still interleave banks between the two chip selects. Thus, the DDR2/DDR3 controller can keep a maximum of 16 banks (8 internal banks across two chip selects) open at a time, but can only interleave among eight of them.

Table 7-5. OCP Address to DDR2/DDR3 Address Mapping for IBANK_POS=1 and EBANK_POS=0

Logical Address				
Bank Address[2]	Row Address	Chip Select	Bank Address[1:0]	Column Address
# of bits defined by IBANK of SDRCR	# of bits defined by RSIZE of SDRCR	# of bits defined by EBANK of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by PAGESIZE of SDRCR
IBANK=0 => 0 bits	RSIZE=0 => 9 bits	EBANK=0 => 0 bits	IBANK=0 => 0 bits	PAGESIZE=0 => 8 bits
IBANK=1 => 0 bits	RSIZE=1 => 10 bits	EBANK=1 => 1 bit	IBANK=1 => 1 bit	PAGESIZE=1 => 9 bits
IBANK=2 => 0 bits	RSIZE=2 => 11 bits		IBANK=2 => 2 bits	PAGESIZE=2 => 10 bits
IBANK=3 => 1 bit	RSIZE=3 => 12 bits		IBANK=3 => 3 bits	PAGESIZE=3 => 11 bits
	RSIZE=4 => 13 bits			
	RSIZE=5 => 14 bits			
	RSIZE=6 => 15 bits			

7.2.5.3 Address Mapping when IBANK_POS=2 and EBANK_POS = 0

For IBANK_POS=2 and EBANK_POS = 0, the interleaving of banks within a device (per chip select) is limited to two banks. However, it can still interleave banks between the two chip selects. Thus, the DDR2/DDR3 controller can keep a maximum of 16 banks (eight internal banks across two chip selects) open at a time, but can only interleave among four of them.

Table 7-6. OCP Address to DDR2/DDR3 Address Mapping for IBANK_POS=2 and EBANK_POS=0

Logical Address				
Bank Address[2:1]	Row Address	Chip Select	Bank Address[0]	Column Address
# of bits defined by IBANK of SDRCR	# of bits defined by RSIZE of SDRCR	# of bits defined by EBANK of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by PAGESIZE of SDRCR
IBANK=0 => 0 bits	RSIZE=0 => 9 bits	EBANK=0 => 0 bits	IBANK=0 => 0 bits	PAGESIZE=0 => 8 bits
IBANK=1 => 0 bits	RSIZE=1 => 10 bits	EBANK=1 => 1 bit	IBANK=1 => 1 bit	PAGESIZE=1 => 9 bits
IBANK=2 => 1 bit	RSIZE=2 => 11 bits		IBANK=2 => 1 bit	PAGESIZE=2 => 10 bits
IBANK=3 => 2 bits	RSIZE=3 => 12 bits		IBANK=3 => 1 bit	PAGESIZE=3 => 11 bits
	RSIZE=4 => 13 bits			
	RSIZE=5 => 14 bits			
	RSIZE=6 => 15 bits			

7.2.5.4 Address Mapping when IBANK_POS= 3 and EBANK_POS = 0

For IBANK_POS= 3 and EBANK_POS = 0, the DDR2/DDR3 controller cannot interleave banks within a device (per chip select). However, it can still interleave banks between the two chip selects. Thus, the DDR2/DDR3 controller can keep a maximum of 16 banks (eight internal banks across two chip selects) open at a time, but can only interleave among two of them.

Table 7-7. OCP Address to DDR2/DDR3 Address Mapping for IBANK_POS=3 and EBANK_POS=0

Logical Address			
Bank Address	Row Address	Chip Select	Column Address
# of bits defined by IBANK of SDRCR	# of bits defined by RSIZE of SDRCR	# of bits defined by EBANK of SDRCR	# of bits defined by PAGESIZE of SDRCR
IBANK=0 => 0 bits	RSIZE=0 => 9 bits	EBANK=0 => 0 bits	PAGESIZE=0 => 8 bits
IBANK=1 => 1 bit	RSIZE=1 => 10 bits	EBANK=1 => 1 bit	PAGESIZE=1 => 9 bits
IBANK=2 => 2 bits	RSIZE=2 => 11 bits		PAGESIZE=2 => 10 bits
IBANK=3 => 3 bits	RSIZE=3 => 12 bits		PAGESIZE=3 => 11 bits
	RSIZE=4 => 13 bits		
	RSIZE=5 => 14 bits		
	RSIZE=6 => 15 bits		

7.2.5.5 Address Mapping when IBANK_POS = 0 and EBANK_POS = 1

For IBANK_POS = 0 and EBANK_POS = 1, the DDR2/DDR3 memory controller interleaves among all the banks within a device (per chip select). However, the DDR2/DDR3 memory controller cannot interleave banks between the two chip selects. Thus, the DDR2/DDR3 memory controller can keep a maximum of 16 banks (eight internal banks across two chip selects) open at a time, but can only interleave among 8 of them.

Table 7-8. OCP Address to DDR2/DDR3 Address Mapping for IBANK_POS=0 and EBANK_POS=1

Logical Address			
Chip Select	Row Address	Bank Address	Column Address
# of bits defined by EBANK of SDRCR	# of bits defined by RSIZE of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by PAGESIZE of SDRCR
EBANK=0 => 0 bits	RSIZE=0 => 9 bits	IBANK=0 => 0 bits	PAGESIZE=0 => 8 bits
EBANK=1 => 1 bit	RSIZE=1 => 10 bits	IBANK=1 => 1 bit	PAGESIZE=1 => 9 bits
	RSIZE=2 => 11 bits	IBANK=2 => 2 bits	PAGESIZE=2 => 10 bits
	RSIZE=3 => 12 bits	IBANK=3 => 3 bits	PAGESIZE=3 => 11 bits
	RSIZE=4 => 13 bits		
	RSIZE=5 => 14 bits		
	RSIZE=6 => 15 bits		

7.2.5.6 Address Mapping when IBANK_POS = 1 and EBANK_POS = 1

For IBANK_POS = 1 and EBANK_POS = 1, the interleaving of banks within a device (per chip select) is limited to four banks. Also, the DDR2/DDR3 memory controller cannot interleave banks between the two chip selects. Thus, the DDR2/DDR3 memory controller can keep a maximum of 16 banks (eight internal banks across two chip selects) open at a time, but can only interleave among four of them.

Table 7-9. OCP Address to DDR2/DDR3 Address Mapping for IBANK_POS=1 and EBANK_POS = 1

Logical Address				
Chip Select	Bank Address[2]	Row Address	Bank Address[1:0]	Column Address
# of bits defined by EBANK of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by RSIZE of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by PAGESIZE of SDRCR
EBANK=0 => 0 bits	IBANK=0 => 0 bits	RSIZE=0 => 9 bits	IBANK=0 => 0 bits	PAGESIZE=0 => 8 bits
EBANK=1 => 1 bit	IBANK=1 => 0 bits	RSIZE=1 => 10 bits	IBANK=1 => 1 bit	PAGESIZE=1 => 9 bits
	IBANK=2 => 0 bits	RSIZE=2 => 11 bits	IBANK=2 => 2 bits	PAGESIZE=2 => 10 bits
	IBANK=3 => 1 bit	RSIZE=3 => 12 bits	IBANK=3 => 2 bits	PAGESIZE=3 => 11 bits
		RSIZE=4 => 13 bits		
		RSIZE=5 => 14 bits		
		RSIZE=6 => 15 bits		

7.2.5.7 Address Mapping when IBANK_POS = 2 and EBANK_POS = 1

For IBANK_POS = 2 and EBANK_POS = 1, the interleaving of banks within a device (per chip select) is limited to two banks. Also, the DDR2/DDR3 memory controller cannot interleave banks between the two chip selects. Thus, the DDR2/DDR3 memory controller can keep a maximum of 16 banks (eight internal banks across two chip selects) open at a time, but can only interleave among two of them.

Table 7-10. OCP Address to DDR2/DDR3 Address Mapping for IBANK_POS=2 and EBANK_POS = 1

Logical Address				
Chip Select	Bank Address[2:1]	Row Address	Bank Address[0]	Column Address

Table 7-10. OCP Address to DDR2/DDR3 Address Mapping for IBANK_POS=2 and EBANK_POS = 1 (continued)

Logical Address				
Chip Select	Bank Address[2:1]	Row Address	Bank Address[0]	Column Address
EBANK=0 => 0 bits	IBANK=0 => 0 bits	RSIZE=0 => 9 bits	IBANK=0 => 0 bits	PAGESIZE=0 => 8 bits
EBANK=1 => 1 bit	IBANK=1 => 0 bits	RSIZE=1 => 10 bits	IBANK=1 => 1 bit	PAGESIZE=1 => 9 bits
	IBANK=2 => 1 bit	RSIZE=2 => 11 bits	IBANK=2 => 1 bit	PAGESIZE=2 => 10 bits
	IBANK=3 => 2 bits	RSIZE=3 => 12 bits	IBANK=3 => 1 bit	PAGESIZE=3 => 11 bits
		RSIZE=4 => 13 bits		
		RSIZE=5 => 14 bits		
		RSIZE=6 => 15 bits		

7.2.5.8 Address Mapping when IBANK_POS = 3 and EBANK_POS = 1

For IBANK_POS = 3 and EBANK_POS = 1, the DDR2/DDR3 memory controller cannot interleave banks within a device (per chip select) or between the two chip selects. Thus, the DDR2/DDR3 memory controller can keep a maximum of 16 banks (eight internal banks across two chip selects) open at a time, but cannot interleave among of them.

Table 7-11. OCP Address to DDR2/DDR3 Address Mapping for IBANK_POS=3 and EBANK_POS=1

Logical Address			
Chip Select	Bank Address	Row Address	Column Address
# of bits defined by EBANK of SDRCR	# of bits defined by IBANK of SDRCR	# of bits defined by RSIZE of SDRCR	# of bits defined by PAGESIZE of SDRCR
EBANK=0 => 0 bits	IBANK=0 => 0 bits	RSIZE=0 => 9 bits	PAGESIZE=0 => 8 bits
EBANK=1 => 1 bit	IBANK=1 => 1 bit	RSIZE=1 => 10 bits	PAGESIZE=1 => 9 bits
	IBANK=2 => 2 bits	RSIZE=2 => 11 bits	PAGESIZE=2 => 10 bits
	IBANK=3 => 3 bits	RSIZE=3 => 12 bits	PAGESIZE=3 => 11 bits
		RSIZE=4 => 13 bits	
		RSIZE=5 => 14 bits	
		RSIZE=6 => 15 bits	

Since the DDR2/DDR3 memory controller interleaves among less number of banks when IBANK_POS!= 0 or EBANK_POS= 1, these cases are lower in performance than the IBANK_POS= 0 case. Thus these cases are only recommended to be used along with partial array self-refresh where performance can be traded off for power savings.

7.2.6 Performance Management

7.2.6.1 Command Ordering and Scheduling

The DDR2/DDR3 memory controller performs command re-ordering and scheduling in an attempt to achieve efficient transfers with maximum throughput. The goal is to maximize the utilization of the data, address, and command buses while hiding the overhead of opening and closing DDR2/DDR3 SDRAM rows. Command re-ordering takes place within the command FIFO.

The DDR2/DDR3 memory controller examines all the commands stored in the command FIFO to schedule commands to the external memory. All commands from same master will complete in order, regardless of the master priority. The memory controller does not guarantee ordering between commands from different masters. However, the memory controller will maintain data coherency. Therefore, the memory controller will block a command, regardless of master priority, if that command is to the same block address (2048 bytes) as an older command. Thus, the memory controller might have one or more pending read or write for each master. Among all pending reads, the memory controller selects all reads that have their corresponding SDRAM banks already open. Similarly, among all pending writes, the memory controller selects all writes that have their corresponding SDRAM banks already open.

As a result of the above reordering, at any point of time the memory controller might have several pending reads and writes that have their corresponding banks open. The memory controller then selects the highest priority read from pending reads, and the highest priority write from pending writes. If two or more commands have the highest priority, the memory controller selects the oldest command. As a result, the memory controller might now have a final read and a final write command. The memory controller will pick either the read or the write command depending on the value programmed in the Read Write Execution Threshold register. The memory controller will keep executing reads until the read threshold is met and then switch to executing writes. The memory controller will then keep executing writes until the write threshold is met and then switch back to executing reads. The memory controller will satisfy meeting the threshold values only if that type of command is available for execution, otherwise it will switch to the other type. Similarly, the memory controller will satisfy meeting the threshold value only if the FIFOs for that type have space (Read Data FIFO for reads and Write Status FIFO for writes), otherwise it will switch to the other type.

The memory controller completes executing an OCP command before it switches to another command.

All the accesses to an SDRAM are pipe-lined to maximize the external bus utilization. In other words accesses to an SDRAM are issued back to back such that there are minimum idle cycles between any two accesses. This includes the scheduling listed above to minimize the overhead of opening and closing of SDRAM banks. All of these is done while fulfilling the access timing requirements of an SDRAM.

Besides commands received from on-chip resources, the DDR2/DDR3 memory controller also issues refresh commands. The DDR2/DDR3 memory controller attempts to delay refresh commands as long as possible to maximize performance while meeting the SDRAM refresh requirements. As the DDR2/DDR3 memory controller issues read, write, and refresh commands to DDR2/DDR3 SDRAM device, it follows the priority scheme shown in [Table 7-12](#).

Table 7-12. DDR2/DDR3 Memory Controller Commands Priority

Priority Level	Command Description
0 (Highest priority)	SDRAM refresh request due to Refresh Must level of refresh urgency reached (Section 7.2.6.5)
1	Request for a read or a write.
2	SDRAM Activate commands.
3	SDRAM Deactivate commands.
4	SDRAM Deep Power-Down request.
5	SDRAM clock stop or Power-Down request.
6	SDRAM refresh request due to Refresh May or Release level of refresh urgency reached (Section 7.2.6.5)
7 (Lowest priority)	SDRAM self-refresh request.

7.2.6.2 Command Starvation

The reordering and scheduling rules listed above may lead to command starvation, which is the prevention of certain commands from being processed by the DDR2/DDR3 memory controller. Command starvation results from the following conditions:

- A continuous stream of high-priority read commands can block a low-priority write command
- A continuous stream of DDR2/DDR3 SDRAM commands to a row in an open bank can block commands to the closed row in the same bank.

To avoid these conditions, the DDR2/DDR3 memory controller can momentarily raise the priority of the oldest command in the command FIFO after a set number of transfers have been made. The COS_COUNT_1, COS_COUNT_2 field in the Peripheral Bus Burst Priority Register (PBBPR) sets the number of the transfers that must be made before the DDR2/DDR3 memory controller will raise the priority of the oldest command. See the [Section 7.2.6.4](#) section for more details.

NOTE: Leaving the COS bits at their default value (FFh) in the PBBPR register disables this feature of the DDR2/DDR3 memory controller. This means commands can stay in the command FIFO indefinitely. Therefore, these bits should be set to FEh immediately following reset, to enable this feature with the highest level of allowable memory transfers. It is suggested that system-level prioritization be set to avoid placing high-bandwidth masters on the highest priority levels. These bits can be left as FEh unless advanced bandwidth/prioritization control is required.

7.2.6.3 Possible Race Condition

A race condition may exist when certain masters write data to the DDR2/DDR3 memory controller. For example, if master A passes a software message via a buffer in DDR2/DDR3 memory and does not wait for indication that the write completes, when master B attempts to read the software message it may read stale data and therefore receive an incorrect message. In order to confirm that a write from master A has landed before a read from master B is performed, master A must wait for the write completion status from the DDR2/DDR3 memory controller before indicating to master B that the data is ready to be read. If master A does not wait for indication that a write is complete, it must perform the following workaround:

1. Perform the required write.
2. Perform a dummy write to the DDR2/DDR3 memory controller module ID and revision register.
3. Perform a dummy read to the DDR2/DDR3 memory controller module ID and revision register.
4. Indicate to master B that the data is ready to be read after completion of the read in step 3.

The completion of the read in step 3 ensures that the previous write was done.

For a list of the master peripherals that need this workaround, see the device-specific data manual.

7.2.6.4 Class of Service (COS)

The commands in the Command FIFO can be mapped to 2 classes of service namely 1 and 2. The mapping of commands to a particular class of service can be done based on the priority or the connection ID. [Table 7-83](#) shows the master connection IDs for the various initiators in the system, as seen by the DDR controllers.

The mapping based on priority can be done by setting the appropriate values in the Priority to Class of Service Mapping register (PRI_COS_MAP). [Table 7-12](#) shows the priority of the commands issued by the DDR2/DDR3 memory controller.

The mapping based on connection ID can be done by setting the appropriate values of connection ID and the masks in the Connection ID to Class of Service Mapping registers (CONNID_COS_1_MAP and CONNID_COS_2_MAP).

There are three connection ID and mask values that can be set for each class of service. In conjunction with the masks, each class of service can have a maximum of 144 connection IDs mapped to it. For example, a connection ID value of 0xFF, along with a mask value of 0x3, will map all connection IDs from 0xF8 to 0xFF to that particular class of service.

Each class of service has an associated latency counter (COS_COUNT). The value of this counter can be set in the Peripheral Bus Burst Priority Register (PBBPR). When the latency counter for a command expires, that is, reaches the value programmed for the class of service to which the command belongs, that command will be the one that is executed next. If there is more than one command that has expired latency counters, the command with the highest priority will be executed first. One exception to this rule is, if the oldest command in the queue has an expired PR_OLD_COUNT, that command will be executed first, irrespective of priority or class of service. This is done to prevent a continuous block effect.

The connection ID mapping allows the same connection ID to be put in both class of service 1 and 2. Also, a transaction might belong to one class of service if viewed by connection ID and might belong to another class of service if viewed by priority. In these cases, the command will belong to both class of service. The DDR2/DDR3 memory controller will try executing the command as soon as possible, when the smaller of the two counters (COS_COUNT_1 or COS_COUNT_2) expire.

7.2.6.5 Refresh Scheduling

The DDR2/DDR3 memory controller issues autorefresh (REFR) commands to DDR2/DDR3 SDRAM devices at a rate defined in the refresh rate (REFRESH_RATE) bit field in the SDRAM refresh control register (SDRFC). A refresh interval counter is loaded with the value of the REFRESH_RATE bit field and decrements by 1 each cycle until it reaches zero. Once the interval counter reaches zero, it reloads with the value of the REFRESH_RATE bit. Each time the interval counter expires, a refresh backlog counter increments by 1. Conversely, each time the DDR2/DDR3 memory controller performs a REFR command, the backlog counter decrements by 1. This means the refresh backlog counter records the number of REFR commands the DDR2/DDR3 memory controller currently has outstanding.

The DDR2/DDR3 memory controller issues REFR commands based on the level of urgency. The level of urgency is defined below. Whenever the refresh level of urgency is reached, the DDR2/DDR3 memory controller issues a REFR command before servicing any new memory access requests. Following a REFR command, the DDR2/DDR3 memory controller waits T_RFC cycles, defined in the SDRAM timing 1 register (SDRTIM1), before rechecking the refresh urgency level.

The refresh counters do not operate when the SDRAM memory is in self-refresh mode.

Table 7-13. Refresh Modes

Urgency Level	Description
Refresh May	Backlog count is greater than 0. Indicates there is a backlog of REFR commands, when the DDR2/DDR3 memory controller is not busy it will issue the REFR command.
Refresh Release	Backlog count is greater than 4. Indicates that the refresh backlog of REFR commands is getting high and when DDR2/DDR3 memory controller is not busy it should issue the REFR command.
Refresh Must	Backlog count is greater than 7. Indicates that the refresh backlog of REFR commands is getting excessive and DDR2/DDR3 memory controller should perform an auto refresh cycle before servicing any new memory access requests.

The DDR2/DDR3 memory controller starts servicing new memory accesses after Refresh Release level is cleared. If any of the commands in the Command FIFO have class of service latency counters that are expired, the DDR2/DDR3 memory controller will not wait for Refresh Release level to be cleared but will only perform one refresh command and exit the refresh state.

7.2.7 Performance Counter Usage

There are two performance counters on each memory controller that can be configured to monitor the DDR bandwidth utilization by various masters in the system. The PERF_CNT_1 and PERF_CNT_2 registers can be used to monitor or calculate the EMIF bandwidth and efficiency. These counters can be configured to count events such as total SDRAM accesses, SDRAM activates, reads, writes, etc. Each counter counts events independent of the other counter. In addition to the ability to count events, the counters can also be configured to filter the events from a particular master based on the Master Connection ID (MConnID). The events to be counted and the filter enabling can be configured using the PERF_CNT_CFG register. The filter value to be used can be configured using the PERF_CNT_SEL register. Each counter can be configured independently.

[Table 7-14](#) shows all the events that can be counted and whether or not a filter can be applied to that particular event.

Table 7-14. Performance Counter Filter Configuration

CNTRn_CFG	CNTRn_MCONNID_EN	Description
0x0	0x0 or 0x1	Count total SDRAM accesses.
0x1	0x0 or 0x1	Count total SDRAM activates.
0x2	0x0 or 0x1	Count total reads.
0x3	0x0 or 0x1	Count total writes.
0x4 - 0xF	0x0	Reserved for future use.

Note: The DDR performance counters do NOT count the bytes but the events (commands from various masters). As different commands could be for different byte counts, the performance counter values may not directly correlate with the amount of data that is being transferred. However performance counters can be effectively used to monitor the DDR bus utilization by different masters.

Example 1

PERF_CNT_1 register needs to count all write accesses from master 0x7. To enable counting writes, the CNTR1_CFG field in the PERF_CNT_CFG register must be set to 0x3. The MCONNID1 field in the PERF_CNT_SEL must be set to 0x7. Finally, to enable filtering, the CNTR1_MCONNID_EN bit in the PERF_CNT_CFG register must be set to 0x1.

With the above configuration, PERF_CNT_1 will count every write made to the DDR from master 0x7. This will not include accesses from other masters and will not include commands other than writes.

Example 2

PERF_CNT_2 register needs to count total accesses to SDRAM irrespective of masters. To enable counting all SDRAM accesses, the CNTR2_CFG field in the PERF_CNT_CFG must be set to 0x0. Finally, to disable filtering, the CNTR1_MCONNID_EN bit in the PERF_CNT_CFG register must be set to 0x0.

With the above configuration, PERF_CNT_2 will count every access made to the DDR. This will include all accesses from all masters.

7.2.8 DDR3 Software Write/Read Leveling

The memory controller supports only software leveling. Software leveling is a procedure by which the time delays between DDR3 signals can be compensated by appropriate values programmed in the corresponding slave ratio registers of the DDR PHY. For description of these registers, see [Table 7-66](#). Software leveling can be done independently for each data and command macro. When software leveling is used there is no need to enable the leveling feature of the external DDR3 SDRAM, which is controlled by one of its MR registers. However, during write leveling the ODT function must be on. Proper ODT values must be turned on at the external memory side by setting Rtt_Nom (A9,A6,A2) bits in external DDR3 MR1 register.

For more information about the concept of the software leveling, see <http://processors.wiki.ti.com/index.php/TI814x-DDR3-Init-U-Boot>.

7.2.9 PRCM Sequence for DDR2/DDR3 Memory Controller

The memory controller clock, reset and power are handled by the device PRCM module. Refer to the Power Reset Clock Management (PRCM) chapter for the PRCM register details.

7.2.10 Interrupt Support

The controller supports generation of an error interrupt if an unsupported command or a command with unsupported addressing mode is received. The controller supports only Idle, Write, Read, and WriteNonPost commands and only incrementing, wrapping, and 2-dimensional block addressing modes.

7.2.11 EDMA Event Support

The DDR2/DDR3 memory controller is a DMA slave peripheral and therefore does not generate EDMA events. Data read and write requests may be made directly by masters including the EDMA controller.

7.2.12 Emulation Considerations

The DDR2/DDR3 memory controller will remain fully functional during emulation halts to allow emulation access to external memory.

7.2.13 Power Management

This section defines the power management capabilities and requirements.

7.2.13.1 Self-Refresh Mode

The DDR2/DDR3 memory controller supports self-refresh mode for low power. The memory controller automatically puts the SDRAM into self-refresh after the memory controller is idle for SR_TIM number of DDR clock cycles and the LP_MODE field is set to 2. The LP_MODE and SR_TIM fields can be programmed in the Power Management Control register (PMCR). The memory controller will complete all pending refreshes before it puts the SDRAM into self-refresh. Therefore, after the expiration of SR_TIM, the memory controller will start issuing refreshes to complete the refresh backlog, and then issue a SELF-REFRESH command to the SDRAM.

In self-refresh mode, the memory controller automatically stops the clocks DDR[x]_CLK to the SDRAM. The memory controller maintains DDR[x]_CKE low to maintain the self-refresh state. When the SDRAM is in self-refresh, the memory controller services register accesses as normal. If the LP_MODE field is set not equal to 2, or an SDRAM access is requested while it is in self-refresh, and T_CKE + 1 cycles have elapsed since the SELF-REFRESH command was issued, the memory controller will bring the SDRAM out of self-refresh. The value of T_CKE is taken from SDRAM Timing 2 register.

Exit sequence of self-refresh mode for the DDR2 device: The memory controller:

- Enables clocks
- Drives DDR[x]_CKE high
- Waits for T_XSNR + 1 cycles. The value of T_XSNR is taken from SDRAM Timing 2 register
- If the DDR_DISABLE_DLL bit in the SDRAM Config register is 1, issues a LOAD MODE REGISTER command to the extended mode register 1 with the DDR address lines set as follows:

Bits	Value	Description
DDR[x]_A[15:13]	0x0	Reserved
DDR[x]_A[12]	0x0	Output buffer enabled
DDR[x]_A[11]	0x0	RDQS disable
DDR[x]_A[10]	DDR2_DDQS	Differential DQS enable value from SDRAM Config register
DDR[x]_A[9:7]	0x0	Exit OCD calibration mode
DDR[x]_A[6]	DDR_TERM[1]	DDR2 termination resistor value from SDRAM Config register
DDR[x]_A[5:3]	0x0	Additive latency = 0
DDR[x]_A[2]	DDR_TERM[0]	DDR2 termination resistor value from SDRAM Config register
DDR[x]_A[1]	SDRAM_DRIVE	SDRAM drive strength from SDRAM Config register
DDR[x]_A[0]	0x1	Disable DLL

- Starts an auto-refresh cycle in the next cycle.
- Enters its idle state and can issue any other commands except a write or a read. A write or a read will only be issued after T_XSRD + 1 clock cycles have elapsed since DDR[x]_CKE is driven high. The value of T_XSRD is taken from SDRAM Timing 2 register.

Exit sequence of self-refresh mode for DDR3 device: The memory controller:

- Enables clocks.
- Drives DDR[x]_CKE high.
- Waits for T_XSNR + 1 cycles. The value of T_XSNR is taken from SDRAM Timing 2 register.
- If the DDR_DISABLE_DLL bit in the SDRAM Config register is 1, issues a LOAD MODE REGISTER command to the extended mode register 1 with the DDR address lines set as follows:

Bits	Value	Description
DDR[x]_A[15:13]	0x0	Reserved
DDR[x]_A[12]	0x0	Output buffer enabled
DDR[x]_A[11]	0x0	TDQS disable
DDR[x]_A[10]	0x0	Reserved
DDR[x]_A[9]	DDR_TERM[2]	DDR3 termination resistor value from SDRAM Config register
DDR[x]_A[8]	0x0	Reserved
DDR[x]_A[7]	0x0	External DDR3 write leveling feature disabled
DDR[x]_A[6]	DDR_TERM[1]	DDR3 termination resistor value from SDRAM Config register
DDR[x]_A[5]	SDRAM_DRIVE[1]	SDRAM drive strength from SDRAM Config register
DDR[x]_A[4:3]	0x0	Additive latency = 0
DDR[x]_A[2]	DDR_TERM[0]	DDR3 termination resistor value from SDRAM Config register
DDR[x]_A[1]	SDRAM_DRIVE[0]	SDRAM drive strength from SDRAM Config register
DDR[x]_A[0]	0x1	Disable DLL

- Starts an auto-refresh cycle in the next cycle.
- Enters its idle state and can issue any other commands except a write or a read. A write or a read will only be issued after $T_{XSRD} + 1$ clock cycles have elapsed since $DDR[x]_{CKE}$ is driven high. The value of T_{XSRD} is taken from SDRAM Timing 2 register.

7.2.13.2 Power-Down Mode

The memory controller also supports power-down mode for low power. The memory controller automatically puts the SDRAM into power-down mode after the memory controller is idle for PD_TIM number of DDR clock cycles and the LP_MODE field is set to 4. The LP_MODE and PD_TIM fields can be programmed in the Power Management Control register (PMCR). If the Refresh Must level is not reached before the entry into power-down, the memory controller will not precharge all banks before issuing the POWER-DOWN command. This will result in SDRAM entering active power-down mode.

If the Refresh Must level is reached before the entry into power-down, the memory controller will precharge all banks and issue refreshes until the Refresh Release Level is reached before issuing the POWER-DOWN command. This will result in SDRAM entering precharge power-down mode.

In power-down mode, the memory controller does not stop the clocks $DDR[x]_{CLK}$ to the SDRAM. The memory controller maintains $DDR[x]_{CKE}$ low to maintain the power-down state.

When the SDRAM is in power-down, the memory controller services register accesses as normal. If the LP_MODE field is set not equal to 4, or an SDRAM access is requested, or the Refresh Must level is reached while the SDRAM is in power-down, the memory controller will bring the SDRAM out of power-down.

Exit sequence of power-down mode for DDR2 and DDR3: The memory controller

- Drives $DDR[x]_{CKE}$ high after $T_{CKE} + 1$ cycles have elapsed since the POWER-DOWN command was issued. The value of T_{CKE} is taken from SDRAM Timing 2 register.
- Waits for $T_{XP} + 1$ cycles. The value of T_{XP} is taken from SDRAM Timing 2 register.
- Enters its idle state and can issue any commands.

7.2.13.3 EMIF PHY Clock Gating

The clock to the DDR2/DDR3 PHY can be gated off to achieve power saving. Refer to the EMIF0/1 Clock Gate Control register ($EMIF_{CLK_GATE}$).

7.3 DDR PHY

7.3.1 Functional Overview

DDR PHY is a fully digital, flexible and advanced solution designed to get ultimate performance from the memory interface. The DDR PHY supports:

- Bi-directional DQS
- Software write/read leveling

DDR PHY consists of three separate blocks:

- Control Block (Address and Command Block)
- Byte-wide data block
- Master DLL block

The control block handles all the address and command signals. The primary function of the PHY control block is to control the timing of the generation of all the SDRAM address and control signals such as CKE, ODT, CSN, RASN, CASN, WEN, BA (bank address) and ADDR (column/row address). The data slices or macros contain the data signal path and the slave DLLs for write data, write DQS, and read DQS. The master DLL block controls the Ratio logic functions which are used to adjust the signal timing for each signal edge. The operations of these blocks are explained in detail in the following sections.

7.3.2 Data Slice Block

The data slice block contains all the logic required to support read and write interface for a single memory data slice of 8 bits. It handles the DQ, DM, DQS, FIFO_WE signals. The block has data macro and multi-rank ratio logic.

7.3.3 Master DLL

The master DLL measures the cycle period in terms of a number of taps and passes this number through the ratio logic to the slave delay lines. The DLL is comprised of a delay line, an FSM, a clock divider, a phase detector and output filter. The FSM sends different control values to the delay line until phase detector detects transition from 0 to 1. When cross is detected, control values are provided to output filter which generates dll lock as well as final full cycle delay value. The master DLL manages on-chip variation (OCV) and continuously monitors core clock over PVT.

7.3.4 Ratio Logic Block

The ratio logic takes the output from the master DLL, which indicates the number of delay taps required to form a full-cycle shift, and scales it by an input ratio value in the range of 0 to 511 in units of 1/256th of a clock cycle. The result from ratio logic is the number of delay taps for slave delay line.

7.3.5 Command Write, Write, and Read Operation

7.3.5.1 Memory Clock inversion Feature

This is a feature for pushing out the DDR[x]_CLK and the corresponding address/command by one half cycle, enabled by asserting CMD0/1/2_PHY_INVERT_CLKOUT_0. There is no need to configure this register if one of the following conditions is met:

- There is no fly-by routing on the board.
- There is no multiple fanout on DDR[x]_CLK (multiple ranks).

7.3.5.2 Write Operation

On a write operation, the DDR PHY accepts signals synchronous to the core or memory clock from controller. DDR[x]_CLK/DDR[x]_CLK are generated inside the DDR PHY and sent out edge-aligned with DDR[x]_CLK/DDR[x]_CLK for DDR2 operation, and delayed from core clock by software write leveling delay for DDR3 operation. DDR[x]_D[31:0] and DDR[x]_DQM[3:0] are phase shifted by approximately 90 degrees with respect to DDR[x]_DQS[3:0].

7.3.5.3 Read Operation

For a read operation, the DDR[x]_D[31:0] signal sent by memory is edge-aligned with DDR[x]_DQS[3:0], so DDR[x]_DQS[3:0] must be shifted by PHY data slice to center-align DDR[x]_D[31:0] with DDR[x]_DQS[3:0]. This is approximately a 90-degree phase shift, with the exact shift dependent on the result of read DQS eye training in DDR3 applications, or register programming for DDR2 applications. After DDR[x]_D[31:0] is sampled by DDR[x]_DQS[3:0] and converted from DDR to SDR domain, the sampled data is re-synchronized by the core clock through a FIFO. Read data is then sent to the controller along with a data-valid signal.

7.4 Electrical Characteristics Control

7.4.1 Output Impedance Calibration

The DDR2/DDR3 controller supports automatic output impedance calibration for DDR3. The ZQ calibration can be enabled per chip select by setting ZQ_CS0EN and ZQ_CS1EN fields in the SDRAM Output Impedance Calibration Config register. The DDR2/DDR3 memory controller supports following three types of ZQ calibration commands:

- ZQINIT – ZQ calibration command during initialization
- ZQCS – ZQ calibration short command
- ZQCL – ZQ calibration long command

For DDR3, the memory controller will automatically issue a ZQINIT command during initialization. The memory controller will wait and block any other command for $(ZQ_ZQINIT_MULT+1)*(ZQ_ZQCL_MULT+1)*(T_ZQCS+1)$ number of clock DDR3 clock cycles every time a ZQINIT command is issued.

The memory controller periodically issues a ZQCS command every time ZQ_REFINTERVAL expires. In other words, the ZQ_REFINTERVAL defines the interval between ZQCS commands. The memory controller will wait and block any other command for (T_ZQCS+1) number of DDR3 clock cycles every time a ZQCS command is issued.

If the ZQ_SFEXITEN field is set to a 1, the memory controller will issue a ZQCL command every time it exits Self-Refresh, Active Power-Down, and Precharge Power-Down. The memory controller will wait and block any other command for $(ZQ_ZQCL_MULT+1)*(T_ZQCS+1)$ number of clock DDR clock cycles every time a ZQCL command is issued.

If a separate calibration resistor is used per device, the ZQ calibration can be performed simultaneously over both the chip selects. To enable ZQ calibration to be performed simultaneously over both chip selects, the ZQ_DUALCALEN field must be set to a 1. If ZQ_DUALCALEN is set to a 0, the EMIF will perform ZQ calibration per chip select serially.

7.4.2 IO Configuration and Slew Rate Control

On this device, programmability is given to control the output driver strength/impedance and slew rate.

Where Rext is the external resistor between device VTP pin and ground. Recommended value is 50 Ohm with 1% tolerance.

The IO output Impedance for each DDR interface is configurable through the corresponding DDRn_IO_CTRL Control Registers, described in this document.

The supported output impedance settings are shown in [Table 7-15](#). The recommended IO buffer impedance setting is 0b011.

Table 7-15. Output Impedance Settings

I2	I1	I0	Output Impedance (Ron)	Ron for Rext=50 Ohms	Drive Strength (mA) for Rext=50 Ohms
0	0	0	1.6*Rext	80	5
0	0	1	1.33*Rext	67	6

Table 7-15. Output Impedance Settings (continued)

I2	I1	I0	Output Impedance (Ron)	Ron for Rext=50 Ohms	Drive Strength (mA) for Rext=50 Ohms
0	1	0	1.14*Rext	57	7
0	1	1	Rext	50	8 Recommended Setting
1	0	0	0.88*Rext	44	9
1	0	1	0.80*Rext	40	10
1	1	0	0.73*Rext	36	11
1	1	1	0.67*Rext	33	12

To achieve optimal noise/frequency trade off, the slew rate of the output signal can also be programmed using the slew rate control bits of the corresponding DDRn_IO_CTRL Control Registers described in this document. [Table 7-16](#) shows the programmable slew-rate settings. The recommended value is 00'b.

Table 7-16. Programmable Slew-rate Settings

SR1	SR0	Description
0	0	Fastest Slew Rate Recommended Setting
0	1	Fast Slew Rate
1	0	Slow Slew Rate
1	1	Slowest Slew Rate

7.4.3 ODT Control

The DDR2/DDR3 controller supports ODT programming. ODT means On-Die-Termination. It involves terminating the data transfer at the receive end using switchable on-chip resistances. ODT may be required for better system level signal integrity and performance. ODT strength level is a function of output driver strength. [Table 7-17](#) shows the ODT settings.

For a data write to the DDR3 memory, the ODT is controlled through appropriate bits in MR1 register of the DDR3 memory. These are the A9, A6 and A2 bits which are configured by DDR_TERM field in the SDRCR register. When ODT is configured, the external device switches on the terminating resistances in response to the ODT output signal of the DDR2/DDR3 memory controller.

For a data read from the DDR3 memory, the ODT function is controlled in the applications processor's PHY. When it performs a memory read, the internal terminating resistances are switched on to terminate the signal at the PHY receiver if the ODT is enabled in the PHY.

The READ ODT for each DDR interface is configurable through the corresponding DDRPHYCR registers described in the register description section of this document.

Table 7-17. ODT Settings

ODT1	ODT0	Description
0	0	ODT off
0	1	Reserved
1	0	Termination=Ron (eg., Rth = 50 ohms with Ron=50 ohms)
1	1	Termination=2*Ron (eg., Rth = 100 ohms with Ron=50 ohms)

Refer to DDR PHY Control Register (DDRPHYCR) and DDR PHY Control Shadow register (DDRPHYCSR) for register programming.

7.5 DDR2/DDR3 SDRAM Memory Initialization

7.5.1 DDR2 SDRAM Memory Initialization

After cold reset, if the MEMTYPE field in the SDRCCR is equal to 2 and the INITREF_DIS bit in the SDRRCR is set to 0, DDR2/DDR3 controller performs DDR2 SDRAM initialization sequence as follows.

1. Drives DDR[x]_CKE low
2. After 16 SDRAM refresh rate intervals, issues a NOP command with DDR[x]_CKE held high. The SDRAM refresh rate is as defined in SDRRCR.
3. Issues PRECHARGE command with DDR[x]_A[10] held high to indicate all banks.
4. Issues a LOAD MODE REGISTER command to the extended mode register 2(DDR[x]_BA[2:0]=2h) with DDR[x]_A[x] set as follows:

Bits	Value	Description
DDR[x]_A[15:8]	0x0	Reserved
DDR[x]_A[7]	SRT	Self-Refresh temperature range from SDRAM Refresh Control register
DDR[x]_A[6:4]	0x0	Reserved
DDR[x]_A[3]	0x0	DCC disable
DDR[x]_A[2:0]	PASR	Partial array self-refresh from SDRAM Refresh Control register

5. Issues a LOAD MODE REGISTER command to the extended mode register 3(DDR[x]_BA[2:0]=3h) with DDR[x]_A[x]=0h.
6. Issues a LOAD MODE REGISTER command to the extended mode register 1(DDR[x]_BA[2:0]=0x1) with DDR[x]_A[x] set as follows:

Bits	Value	Description
DDR[x]_A[15:13]	0x0	Reserved
DDR[x]_A[12]	0x0	Output buffer enabled
DDR[x]_A[11]	0x0	RDQS disable
DDR[x]_A[10]	DDR2_DDQS	Differential DQS enable value from SDRAM Config register
DDR[x]_A[9:7]	0x0	Exit OCD calibration mode
DDR[x]_A[6]	DDR_TERM[1]	DDR2 termination resistor value from SDRAM Config register
DDR[x]_A[5:3]	0x0	Additive latency = 0
DDR[x]_A[2]	DDR_TERM[0]	DDR2 termination resistor value from SDRAM Config register
DDR[x]_A[1]	SDRAM_DRIVE	SDRAM drive strength from SDRAM Config register
DDR[x]_A[0]	0x0	Enable DLL

7. Issues a LOAD MODE REGISTER command to the mode register (DDR[x]_BA[2:0]=0x0) with DDR[x]_A[x] set as follows:

Bits	Value	Description
DDR[x]_A[15:13]	0x0	Reserved
DDR[x]_A[12]	0x0	Fast exit active power-down exit time
DDR[x]_A[11:9]	T_WR[2:0]	Write recovery for auto precharge from SDRAM Timing 1 register
DDR[x]_A[8]	0x1	DLL reset
DDR[x]_A[7]	0x0	Normal mode
DDR[x]_A[6:4]	CL[2:0]	CAS latency from SDRAM Config register
DDR[x]_A[3]	0x0	Sequential burst type
DDR[x]_A[2:0]	0x3	Burst length of 8

8. After 267 clock cycles, issues a PRECHARGE command with DDR[x]_A[10] held high to indicate all banks.
9. After two AUTO REFRESH commands, issues LOAD MODE REGISTER command to the mode register(DDR[x]_BA[2:0]=0h) with DDR[x]_A bits set as follows:

Bits	Value	Description
DDR[x]_A[15:9]	Equal to step 7	
DDR[x]_A[8]	0x0	DLL not reset
DDR[x]_A[7:0]	Equal to step 7	

10. Issues a LOAD MODE REGISTER command to the extended mode register 1(DDR[x]_BA[2:0]=1h) with DDR[x]_A bits set as follows:

Bits	Value	Description
DDR[x]_A[15:10]	Equal to step 6	
DDR[x]_A[9:7]	0x7	Default OCD calibration
DDR[x]_A[6:0]	Equal to step 6	

11. Issues a LOAD MODE REGISTER command to the extended mode register 1(DDR[x]_BA[2:0]) with DDR[x]_A bits equal to step 6.

12. If the DDR_DISABLE_DLL bit in the SDRAM Config register is 1, issues a LOAD MODE REGISTER command to extended mode register 1(DDR[x]_BA[2:0]=1h) with DDR[x]_A bits, set as follows:

Bits	Value	Description
DDR[x]_A[15:1]	Equal to step 6	
DDR[x]_A[0]	0x1	Disable DLL

13. The DDR2/DDR3 controller enters its idle state.

The controller also performs the initialization sequence whenever the SDRCR is written, if already INITREF_DIS bit of SDRRCR is set to 1. But in this case, the controller starts at step 3.

7.5.2 DDR3 SDRAM Memory Initialization

After cold reset, if the MEMTYPE field in the SDRCR is equal to 3 and the INITREF_DIS bit in the SDRRCR is set to 0, DDR2/DDR3 controller performs DDR3 SDRAM initialization sequence as follows.

1. Drives DDR[x]_CKE low.
2. After 16 SDRAM refresh rate intervals, issues a NOP command with DDR[x]_CKE held high. The SDRAM refresh rate is as defined in SDRRCR.
3. Issues a LOAD MODE REGISTER command to the extended mode register 2(DDR[x]_BA[2:0]=2h) with DDR[x]_A[x] set as follows:

Bits	Value	Description
DDR[x]_A[15:11]	0x0	Reserved
DDR[x]_A[10:9]	DYN_ODT	Dynamic ODT value from SDRAM Config register
DDR[x]_A[8]	0x0	Reserved
DDR[x]_A[7]	SRT	Self-Refresh temperature range from SDRAM Refresh Control register
DDR[x]_A[6]	ASR	Auto self-refresh enable from SDRAM Refresh Control register
DDR[x]_A[5:3]	CWL	CAS write latency from SDRAM Config register
DDR[x]_A[2:0]	PASR	Partial array self-refresh from SDRAM Refresh Control register

4. Issues a LOAD MODE REGISTER command to the extended mode register 3(DDR[x]_BA[2:0]=3h) with DDR[x]_A[15:0]=0h.
5. Issues a LOAD MODE REGISTER command to the extended mode register 1(DDR[x]_BA[2:0]=0x1) with DDR[x]_A[x] set as follows:

Bits	Value	Description
DDR[x]_A[15:13]	0x0	Reserved
DDR[x]_A[12]	0x0	Output buffer enabled
DDR[x]_A[11]	0x0	TDQS disable
DDR[x]_A[10]	0x0	Reserved

Bits	Value	Description
DDR[x]_A[9]	DDR_TERM[2]	DDR3 termination resistor value from SDRAM Config register
DDR[x]_A[8]	0x0	Reserved
DDR[x]_A[7]	0x0	External DDR3 write leveling feature disabled
DDR[x]_A[6]	DDR_TERM[1]	DDR3 termination resistor value from SDRAM Config register
DDR[x]_A[5]	SDRAM_DRIVE[1]	SDRAM drive strength from SDRAM Config register
DDR[x]_A[4:3]	0x0	Additive latency = 0
DDR[x]_A[2]	DDR_TERM[0]	DDR3 termination resistor value from SDRAM Config register
DDR[x]_A[1]	SDRAM_DRIVE[0]	SDRAM drive strength from SDRAM Config register
DDR[x]_A[0]	0x0	DDR_DISABLE_DLL value from SDRAM Config register

- Issues a LOAD MODE REGISTER command to the mode register 0(DDR[x]_BA[2:0]=0x0) with DDR[x]_A[x] set as follows:

Bits	Value	Description
DDR[x]_A[15:13]	0x0	Reserved
DDR[x]_A[12]	0x0	Fast exit active power-down exit time
DDR[x]_A[11:9]	T_WR[2:0]	Write recovery for auto precharge from SDRAM Timing 1 register
DDR[x]_A[8]	0x1	DLL reset
DDR[x]_A[7]	0x0	Normal mode
DDR[x]_A[6:4]	CL[3:1]	CAS latency from SDRAM Config register
DDR[x]_A[3]	0x0	Sequential burst type
DDR[x]_A[2]	CL[0]	CAS latency from SDRAM Config register
DDR[x]_A[1:0]	0x0	Burst length of 8

- Issues a ZQCL command to start long ZQ calibration.
- Issues an AUTO REFRESH command.
- The memory controller enters its idle state.

The controller also performs the initialization sequence, whenever the SDRRCR is written, if the INITREF_DIS bit of the SDRRCR register is set to 0x1. But in this case, the controller starts at step 3.

7.6 Interfacing the DDR2/DDR3 Memory Controller to DDR Memory Devices

The following sections describe the architecture of the DDR2/DDR3 memory controller and how to configure it to perform read and write operations to DDR2/DDR3 SDRAM devices. Refer the device-specific data manual to get details of supported configurations and topologies.

7.6.1 Configuring DDR2/DDR3 Memory Controller Registers to Meet DDR2 SDRAM Specifications

The DDR2/DDR3 memory controller allows a high degree of programmability for shaping DDR2 accesses. This provides the DDR2/DDR3 memory controller with the flexibility to interface with a variety of DDR2 devices. By programming the SDRAM Configuration Register (SDRCR), SDRAM Refresh Control Register (SDRRCR), SDRAM Timing 1 Register (SDRTIM1), SDRAM Timing 2 Register (SDRTIM2), and SDRAM Timing 3 Register (SDRTIM3), the DDR2/DDR3 memory controller can be configured to meet the data sheet specification for JESD79-2E compliant DDR2 SDRAM devices.

As an example, the following sections describe how to configure each of these registers for access to two 1Gb, 16-bit wide DDR2 SDRAM devices, where each device has the following configuration:

- SDRAM Clock Frequency : 400 MHz
- SDRAM Data Rate : 800 MHz
- Number of banks: 8
- Page size: 1024 words

- CAS latency: 5

7.6.1.1 Programming the SDRAM Configuration Register (SDRCR)

The SDRAM configuration register (SDRCR) contains register fields that configure the DDR2 memory controller to match the data bus width, CAS latency, number of banks, and page size of the attached DDR2 memory. [Table 7-18](#) shows the resulting SDRCR configuration.

Table 7-18. SDRCR Configuration

Field	Value	Function Selection
SDRAM_TYPE	2h	To select DDR2 Memory Type
DDR_TERM	1h	To select 75 ohm termination register
DDR2_DDQS	1h	To select Differential Ended DQS
DDR_DISABLE_DLL	0h	Enable DLL for Normal Operation
SDRAM_DRIVE	0h	To select a drive strength
NARROW_MODE	0h	To configure the DDR2 memory controller for a 32-bit data bus width
CL	5h	To select CAS latency of 5
IBANK	3h	To select 8 internal DDR2 banks
EBANK	0h	To select single chip select, CS0
PAGESIZE	2h	To select 1024-word page size

7.6.1.2 Programming the SDRAM Refresh Control Register (SDRRCR)

The SDRAM refresh control register (SDRRCR) configures the DDR2 memory controller to meet the refresh requirements of the attached DDR2 device. SDRRCR also allows the DDR2 memory controller to enter and exit self refresh. In this example, we assume that the DDR2 memory controller is in self-refresh mode.

The RR field in SDRRCR is defined as the rate at which the attached DDR2 device is refreshed in DDR2 cycles. The value of this field may be calculated using the following equation:

$$\text{Refresh_Rate} = \text{DDR2 clock frequency (in MHz)} \times \text{DDR2 memory fresh rate (in } \mu\text{s)}$$

[Table 7-19](#) displays the DDR2-800 refresh rate specification.

Table 7-19. DDR2-800 Refresh Rate Specification

Symbol	Value	Description
tREF	7.8 μ s	Average Periodic Refresh Interval

Therefore, the value for the Refresh Rate (RR) can be calculated as follows:

$$RR = 400\text{MHz} \times 7.8\mu\text{s} = 3120 = \text{C30h}$$

[Table 7-20](#) shows the RR calculated value.

Table 7-20. Refresh Rate Calculated Value

Field	Value	Function Selection
INITREF_DIS	0h	To enable DDR3 Initialization and Refreshes
RR	C30h	Set to C30h DDR2 clock cycles to meet the DDR2 memory refresh rate requirement

7.6.1.3 Configuring SDRAM Timing Registers (SDRTIM1, SDRTIM2 and SDTIM3)

The SDRAM timing 1 register (SDRTIM1), SDRAM timing 2 register (SDRTIM2), and SDRAM timing 3 register (SDTIM3) configure the DDR2 memory controller to meet the data sheet timing parameters of the attached DDR2 device. Each field in SDRTIM1, SDRTIM2 and SDTIM3 register corresponds to a timing parameter in the DDR2 data sheet specification. [Table 7-21](#), [Table 7-22](#), and [Table 7-23](#) display the register field name and corresponding DDR2 data sheet parameter name, along with the data sheet value. These tables also provide a formula to calculate the register field value and displays the resulting calculation. Each of the equations include a minus 1 because the register fields are defined in terms of $DDR2||$ clock cycles minus 1.

Table 7-21. SDRTIM1 Configuration

Register Field Name	DDR3 SDRAM Data Sheet Parameter Name	Description	Example Data Sheet Value	Unit	Formula (Register Field Must be \geq)	Field Value
T_RP	tRP	Precharge command to refresh or activate command	15	ns	$(tRP \times fDDR[x]_{CLK}) - 1$	5
T_RCD	tRCD	Activate command to read/write command	15	ns	$(tRCD \times fDDR[x]_{CLK}) - 1$	5
T_WR	tWR	Write recovery time	15	ns	$(tWR \times fDDR[x]_{CLK}) - 1$	5
T_RAS	tRAS	Active to precharge command	40	ns	$(tRAS \times fDDR[x]_{CLK}) - 1$	15
T_RC	tRC	Activate to Activate command in the same bank	55	ns	$(tRC \times fDDR[x]_{CLK}) - 1$	21
T_RRD	tRRD/tFAW	Activate to Activate command in a different bank	50 (For x16 mode)	ns	$(tFAW \times fDDR[x]_{CLK}/4) - 1$ for 8 bank DDR3 memory	4
T_WTR	tWTR	Write to read command delay	7.5	ns	$(tWTR \times fDDR[x]_{CLK}) - 1$	2

Table 7-22. SDRTIM2 Configuration

Register Field Name	DDR3 SDRAM Data Sheet Parameter Name	Description	Example Data Sheet Value	Unit	Formula(Register Field Must be \geq)	Field Value
T_XP	tXP	Exit precharge power-down to any non-read command	2	ns	$(tXP \times fDDR[x]_{CLK}) - 1$	1
T_XSNR	tXSNR	Exit self-refresh to a non-read command	137.5	ns	$(tXSNR \times fDDR[x]_{CLK}) - 1$	54
T_XSRD	tXSRD	Exit self-refresh to a read command	200	tCK	$(tXSRD - 1)$	199
T_RTP	tRTP	Read to precharge command delay	7.5	ns	$(tRTP \times fDDR[x]_{CLK}) - 1$	2
T_CKE	tCKE	CKE minimum pulse width (high and low pulse width)	3	tCK	$(tCKE - 1)$	2

Table 7-23. SDRTIM3 Configuration

Register Field Name	DDR3 SDRAM Data Sheet Parameter Name	Description	Example Data Sheet Value	Unit	Formula(Register Field Must be \geq)	Field Value
T_RFC	tRFC	Auto-refresh to active/auto-refresh command time	127.5	ns	$(tRFC \times fDDR[x]_{CLK}) - 1$	50

Table 7-23. SDRTIM3 Configuration (continued)

Register Field Name	DDR3 SDRAM Data Sheet Parameter Name	Description	Example Data Sheet Value	Unit	Formula(Register Field Must be \geq)	Field Value
T_RASMAX		Maximum number of refresh rate intervals from Active to Precharge command			This field must be programmed to 0xF for DDR2/DDR3	15

7.6.1.4 Configuring the DDR PHY Control Register

The DDR2/DDR3 PHY control register (DDRPHYCR) contains a read latency (RL) and ODT fields that need to be configured properly for the DDR2 memory controller to register data properly.

Table 7-24. DDR2/DDR3 Memory Controller Control Register (DDRPHYCR)

Field	Value	Description
DYN_PWRDN_EN	1	When set to 1, dynamic power down is enabled. IO receiver is powered down when not doing any reads
IDLE_LOCAL_ODT	0x0	ODT off (recommended value)
RD_LOCAL_ODT	0x2	Read ODT (recommended value)
READ_LATENCY	8	CL + 4 cycles selected. Should be CL + 1 \leq RL \leq CL + 7 cycles.

The value to write to register DDRPHYCR is 0x00170208.

7.6.1.5 Configuring the DDR IO Control Register(DDRn_IO_CTRL)

The DDR2/DDR3 IO_CTRL register has to be configured with appropriate values to select the IO output impedance and Slew rates. A high precision 50 Ohm resistor should be connected between VTP pin and ground in order to achieve the output impedance as mentioned below.

Table 7-25. Configuring DDRn_IO_CTRL

Field	Value	Function Selection
CS_SLEW	0h	Fastest slew rate for chip select
CS_Impedance	3h	Chip select signal impedance = 50 Ohms (=8mA Drive Strength)
CMD_SLEW	0h	Fastest slew rate for command lines
CMD_Impedance	3h	Command lines impedance = 50 Ohms (=8mA drive strength)
DATA_SLEW	0h	Fastest slew rate for data pins
DATA_Impedance	3h	Data impedance = 50 Ohms (=8mA Drive Strength)

The value to write to DDRn_IO_CTRL register is 0x00030303.

7.6.2 Configuring DDR2/DDR3 Memory Controller Registers to Meet DDR3 SDRAM Specifications

This section describes the memory controller setup for DDR3. The following sections describe how to configure each of the registers for access to four 1Gb, 8-bit wide DDR3 SDRAM devices, where each device has the following configuration:

- SDRAM Clock Frequency : 400 MHz
- SDRAM Data Rate : 800 MHz
- Number of banks: 8
- Page size: 1024 words
- CAS latency: CL = 6

7.6.2.1 Programming the SDRAM Configuration Register (SDRCR)

The SDRAM configuration register (SDRCR) contains register fields that configure the DDR3 memory controller to match the data bus width, CAS latency, number of banks, and page size of the attached DDR3 memory. [Table 7-26](#) shows the resulting SDRCR configuration.

Table 7-26. SDRCR Configuration

Field	Value	Function Selection
SDRAM_TYPE	3h	To select DDR3 Memory Type
DDR_TERM	1h	To select RZQ/4
DDR2_DDQS	1h	To select Differential Ended DQS (DDR3 only supports differential ended)
DYN_ODT	2h	DDR3 Dynamic ODT (RZQ/2)
DDR_DISABLE_DLL	0h	0h Enable DLL for Normal Operation
SDRAM_DRIVE	0h	To select a drive strength of RZQ/6
CWL	0h	DDR3 CAS Write Latency of 5
NARROW_MODE	0h	To configure the DDR3 memory controller for a 32-bit data bus width
CL	4h	To select CAS latency of 6
IBANK	3h	To select 8 internal DDR3 banks
EBANK	0h	To select single chip select, CS0
PAGESIZE	2h	To select 1024-word page size

The value to write to register SDRCR is 0x61C01032.

7.6.2.2 Programming the SDRAM Refresh Control Register (SDRRCR)

The SDRAM refresh control register (SDRRCR) configures the DDR3 memory controller to meet the refresh requirements of the attached DDR3 device. SDRRCR also allows the DDR3 memory controller to enter and exit self refresh. In this example, we assume that the DDR3 memory controller is in self-refresh mode.

The RR field in SDRRCR is defined as the rate at which the attached DDR3 device is refreshed in DDR3 cycles. The value of this field may be calculated using the following equation:

$$\text{Refresh_Rate} = \text{DDR2/DDR3 clock frequency (in MHz)} \times \text{DDR2/DDR3 fresh rate (in } \mu\text{s)}$$

[Table 7-27](#) displays the DDR3-800 refresh rate specification.

Table 7-27. Periodic Refresh Interval Specification

Symbol	Value	Description
tREF	7.8μs	Average Periodic Refresh Interval

$$\text{RR} = 400\text{MHz} \times 7.8\mu\text{s} = 3120 = \text{C30h}$$

[Table 7-28](#) shows the SDRRCR configuration.

Table 7-28. SDRRCR Configuration

Field	Value	Function Selection
INITREF_DIS	0h	Enable SDRAM initialization and Refreshes
SRT	0h	Normal Operating Temperature range
ASR	1h	Auto Self Refresh Enable
PASR	0h	Full Array Refresh
REFRESH_RATE	C30h	Refresh Rate

The value to write to register SDRRCR register is 0x1000C30.

7.6.2.3 Configuring SDRAM Timing Registers (SDRTIM1, SDRTIM2, SDTRIM3)

The SDRAM timing 1 register (SDRTIM1), SDRAM timing 2 register (SDRTIM2), and SDRAM timing 3 register (SDRTIM3) configure the DDR3 memory controller to meet the data sheet timing parameters of the attached DDR3 device. Each field in SDRTIM1, SDRTIM2 and SDTIM3 corresponds to a timing parameter in the DDR3 data sheet specification. [Table 7-29](#), [Table 7-30](#), and [Table 7-31](#) display the register field name and corresponding DDR3 data sheet parameter name along with the data sheet value. These tables also provide a formula to calculate the register field value and displays the resulting calculation. Each of the equations include a minus 1 because the register fields are defined in terms of DDR3 clock cycles minus 1.

Table 7-29. SDRTIM1 Configuration

Register Field Name	DDR3 SDRAM Datasheet Parameter Name	Description	Example Datasheet Value	Unit	Formula (Register Field must be ≥)	Field Value
T_RP	tRP	Precharge command to refresh or activate command	13.75	ns	$(tRP/DDR[X]_{CLK} \text{ period})-1$	5
T_RCD	tRCD	Activate command to read/write command	13.75	ns	$(tRCD/DDR[X]_{CLK} \text{ period})-1$	5
T_WR	tWR	Write recovery time	15	ns	$(tWR/DDR[X]_{CLK} \text{ period})-1$	5
T_RAS	tRAS	Active to precharge command	35	ns	$(tRAS/DDR[X]_{CLK} \text{ period})-1$	13
T_RC	tRC	Activate to Activate command in the same bank	48.75	ns	$(tRC/DDR[X]_{CLK} \text{ period})-1$	19
T_RRD	tRRD or tFAW	Activate to Activate command in a different bank	35	ns	$(tFAW/(4*DDR[X]_{CLK} \text{ period})) - 1$	3
T_WTR	tWTR	Write to read command delay	10	ns	$(tWTR/DDR[X]_{CLK} \text{ period})-1$	3

The value to write to register SDRTIM1 is 0x0AAAD4DB.

Table 7-30. SDRTIM2 Configuration

Register Field Name	DDR3 SDRAM Datasheet Parameter Name	Description	Example Datasheet Value	Unit	Formula (Register Field must be \geq)	Field Value
T_XP	tXP	Exit precharge power-down to any non-read command	3	tCK	tXP - 1	2
T_XSNR	tXSNR	Exit self-refresh to a non-read command	120	ns	(tXSNR/DDR[X]_CLK period)-1	47
T_XSRD	tXSRD	Exit self-refresh to a read command	512	tCK	tXSRD - 1	511
T_RTP	tRTP	Read to precharge command delay	10	ns	(tRTP/DDR[X]_CLK period)-1	3
T_CKE	tCKE	CKE minimum pulse width (high and low pulse width)	3	tCK	tCKE - 1	2

The value to write to register SDRTIM2 is 0x202F7FDA.

Table 7-31. SDRTIM3 Configuration

Register Field Name	DDR3 SDRAM Datasheet Parameter Name	Description	Example Datasheet Value	Unit	Formula (Register Field must be \geq)	Field Value
T_PDLL_UL		Number of cycles for DLL to unlock		tCK	This field must be written with 5	5
T_CSTA	tCSTA	Write-to-write or read-to-read data phase	1	tCK	tCSTA - 1	0
T_ZQCS	tZQCS	Number of cycles for ZQCS command	64	tCK	tZQCS - 1	63
T_RFC	tRFC	Auto-refresh to active/auto-refresh command time	110	ns	(tRFC/DDR[X]_CLK period)-1	43
T_RAS_MAX		Maximum number of refresh rate intervals from Active to Precharge command				15

The value to write to register SDRTIM3 is 0x501F82BF.

7.6.2.4 Configuring the DDR PHY Control Register

The DDR2/DDR3 PHY control register (DDRPHYCR) contains a read latency (RL) and ODT fields that needs to be configured properly for the DDR3 memory controller to register data properly.

Table 7-32. PHY Control Register (DDRPHYCR)

Field	Value	Function Selection
DYN_PWRDN_EN	1h	Power down IO receiver when not performing a read
RDEYE_LVL_DIS	1h	Disable read eye auto-leveling
GATE_LVL_DIS	1h	Disable read gate auto-leveling
WR_LVL_DIS	1h	Disable write auto-leveling
PHY_RST	0h	PHY in functional mode
IDLE_LOCAL_ODT	0h	ODT off
RD_LOCAL_ODT	2h	50 Ohms Read ODT termination
READ_LATENCY	9h	CL + 4 cycles selected. Should be CL + 1 <= RL <= CL + 7 cycles.

The value to write to register DDRPHYCR is 0x00170209.

7.6.2.5 Configuring the ZQCR Control Register

The DDR3 ZQCR register has to be configured with appropriate values to enable periodic ZQ calibration.

The ZQ Refresh interval can be calculated with the following equation:

$$ZQ \text{ Refresh Interval} = 0.5\% / ((Tsens \times Tdriftrate) + (Vsens \times Vdriftrate)).$$

As per the DDR3 specification, the maximum values for Tsens and Vsens are as follows:

$$Tsens = 1.5\%/^{\circ}\text{C}$$

$$Vsens = 0.15\%/mV$$

The temperature and voltage drift rates depend on the system environment. For illustrative purpose the following values are assumed.

$$Tdriftrate = 1.2^{\circ}\text{C/s}$$

$$Vdriftrate = 10 \text{ mV/s}$$

$$ZQ \text{ calibration Interval} = 0.5\% / ((1.5\%/^{\circ}\text{C} \times 1.2^{\circ}\text{C/s}) + (0.15\%/mV \times 10 \text{ mV/s})) = 151.515\text{ms approx.}$$

$$\text{Number of Refresh periods to make up for the ZQ calibration Interval} = 151.515\text{ms} / 7.8\mu\text{s} = 19425 = 0x4BE1.$$

Table 7-33. ZQCR Configuration

Field	Value	Function Selection
ZQ_CS1EN	0h	Disable ZQ calibration for CS1
ZQ_CS0EN	1h	Enable ZQ calibration for CS0
ZQ_DUALCALEN	0h	Disable dual calibration
ZQ_SEFXITEN	1h	ZQCL enabled after a Self Refresh Exit
ZQ_ZQINIT_MULT	1h	number of ZQCL intervals that make up a ZQINIT interval - 1
ZQ_ZQCL_MULT	3h	Number of ZQCS intervals that make up a ZQCL interval - 1
ZQ_REFINTERVAL	4BE1h	Number of refresh intervals to make up the delay between ZQ commands

The value to write to ZQCR register is 0x50074BE1.

7.6.2.6 Configuring the DR IO Control Register (DDR n_IO_CTRL)

The DDR2/DDR3 IO_CTRL register has to be configured with appropriate values to select the IO output impedance and Slew rates. A high precision 50 Ohm resistor should be connected between VTP pin and ground in order to achieve the output impedance as mentioned below.

Table 7-34. DDR2/DDR3 IO_CTRL Configuration

Field	Value	Function Selection
CS_SLEW	0h	Fastest Slew Rate for Chip Select
CS_IMPEDENCE	3h	Chip Select signal impedance = 50 Ohms (=8mA Drive Strength)
CMD_SLEW	0h	Fastest Slew Rate for Command lines
CMD_IMPEDENCE	3h	Command lines impedance = 50 Ohms (=8mA Drive Strength)
DATA_SLEW	0h	Fastest Slew Rate for Data pins
DATA_IMPEDENCE	3h	Data impedance = 50 Ohms (=8mA Drive Strength)

The value to write to DDRn_IO_CTRL register is 0x00030303.

7.7 DDR2/DDR3 SDRAM Device Configuration Steps

The following are recommended steps to initialize connected SDRAM devices:

1. Configure the DDR ADPLL to generate the desired frequency of operation. (Refer to the device's Technical Reference Manual for ADPLL configuration details).
2. Perform the PRCM sequences for DDR controllers and DMM (refer to the device's Technical Reference Manual for DMM details)
3. Configure the DDR related Control module registers (IO impedance, Slew Rate, and more).
4. Perform VTP0/1 calibration.
5. Configure DDR0/1 PHY registers with calculated ratio values based on the board routing delays (see DDR2/DDR3 PHY register for details). Note that in case of a DDR2-based system, the default PHY register configurations need not be changed if the DDR PCB layout guidelines in the device-specific data manual are followed strictly.
6. Program LISA/PAT mapping registers of DMM for the desired address mapping, interleaving/non-interleaving configurations, etc.
7. Program DDR memory controller MMRs (For configuring PHY read latency, device type, various timing parameters, addressing modes etc. Please note that all MMRs are initialized with proper configurations before clearing the INITREF_DIS bit, as the same triggers the SDRAM device initialization procedure. Refer to DDR2/DDR3 SDRAM Memory initialization section for more detailed register configuration procedure.

7.8 DDR2/DDR3 Configuration Registers

7.8.1 DDR2/DDR3 Memory Controller Registers

Table 7-35 lists the memory-mapped registers for the DDR2/DDR3 memory controller.

Table 7-35. DDR2/DDR3 Memory Controller Registers

Address Offset	Acronym	Register Description	Section
4h	SDRSTAT	SDRAM Status Register	Section 7.8.1.1
8h	SDRCR	SDRAM Configuration Register	Section 7.8.1.2
Ch	SDRCR2	SDRAM Configuration Register 2	Section 7.8.1.3
10h	SDRRCR	SDRAM Refresh Control Register	Section 7.8.1.4
14h	SDRRCR2	SDRAM Refresh Control Shadow Register	Section 7.8.1.5

7.8.1.1 SDRAM Status Register (SDRSTAT)

The SDRAM status register (SDRSTAT) is shown and described in the figure and table below.

Figure 7-5. SDRAM Status Register (SDRSTAT)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-36. SDRAM Status Register (SDRSTAT) Field Descriptions

Bit	Field	Value	Description
31	BE	0 1	Defines whether the memory controller is in big or little endian mode. Little Endian
30	DUAL_CLK_MODE	0 1	Dual Clock mode. Defines whether the ocp_clk and m_clk are asynchronous. Not sync Sync
29	FAST_INIT	0 1	Fast Init. Defines whether the memory controller fast initialization mode has been enabled. Disabled Enabled
28-3	Reserved		Reserved
2	PHY_DLL_READY	0 1	DDR PHY Ready. Reflects the value active high that defines whether the DDR PHY is ready for normal operation.
1-0	Reserved		Reserved

7.8.1.2 SDRAM Configuration Register(SDRCCR)

The SDRAM configuration register (SDRCCR) is described in the figure and table below.

Figure 7-6. SDRAM Configuration Register (SDRCR)

31	29	28	27	26	24	23	22	21	20	19	18	17	16				
SDRAM_TYPE		IBANK_POS		DDR_TERM		DDR2_DDQS		DYN_ODT		DDR_DISABLE_DLL		SDRAM_DRIVE		CWL			
R/W-2		R/W-0		R/W-0		R/W-1		R/W-0		R/W-0		R/W-0		R/W-0			
15				14		13				10		9		8

ROWSIZE		IBANK				EBANK				PAGESIZE							
R/W-0		R/W-2				R/W-0				R/W-0							

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-37. SDRAM Configuration Register (SDRCR) Field Descriptions

Bit	Field	Value	Description
31-29	SDRAM_TYPE	0 1h 2h 3h	SDRAM Type Selection Reserved Reserved DDR2 DDR3 All other values are reserved
28-27	IBANK_POS	0 1	Internal Bank position selection Set 0,1,2,3. Refer to Table 7-4 to Table 7-11 for more details
26-24	DDR_TERM	0 1h 2h 3h 1h 2h 3h 4h 5h	DDR2 & DDR3 termination resistor value Disable For DDR2 Only : 75 Ohm (Recommended) 150 Ohm 50 Ohm For DDR3 Only RZQ/4 (Recommended value of external resistor RZQ is 240 ohm) Reserved Reserved Reserved Reserved
23	DDR2_DDQS	0 1	DDR2 Differential DQS Enable Single Ended DQS Differential Ended DQS Note: DDR3 supports only Differential DQS
22-21	DYN_ODT	0 1h 2h	Controls the Dynamic ODT on the DDR3 device side. Refer to DDRPHYCR for configuring the ODT on the DDR PHY side. OFF RZQ/4 RZQ/2 (Recommended value of external resistor RZQ is 240 ohm)
20	DDR_DISABLE_DLL	0 1	Disable DLL Select Enable DLL for Normal Operation. This bit must be set to low for normal operation. Disable DLL
19-18	SDRAM_DRIVE		SDRAM Drive strength. Configures output drive impedance control value of the DDR2/DDR3 SDRAM memory

Table 7-37. SDRAM Configuration Register (SDRCR) Field Descriptions (continued)

Bit	Field	Value	Description
		0	For DDR2 Full drive strength
		1h	Reduced drive strength
		0	For DDR3 RZQ/6 drive strength
		1h	RZQ/7 drive strength
17-16	CWL	0	DDR3 CAS Write Latency CWL of 5
		1h	CWL of 6
		2h	CWL of 7
		3h	CWL of 8
			For DDR2: NA
15-14	NARROW_MODE	0	Data Bus Width 32 bits
		1	16 bits
13-10	CL		CAS Latency
			For DDR2 CAS Latency
		2	CAS latency of 2
		3	CAS latency of 3
		4	CAS latency of 4
		5	CAS latency of 5
		6	CAS latency of 6
		7	CAS latency of 7
			For DDR3 CAS Latency ⁽¹⁾
		2	CAS latency of 5
		4	CAS latency of 6
		6	CAS latency of 7
		8	CAS latency of 8
		10	CAS latency of 9
		12	CAS latency of 10
		14	CAS latency of 11
9-7	ROWSIZE	0	Row Size Selection. Don't care if both EBANK_POS and IBANK_POS are 0. 9 Rows bits
		1h	10 Rows bits
		2h	11 Rows bits
		3h	12 Rows bits
		4h	13 Rows bits
		5h	14 Rows bits
		6h	15 Rows bits
		7h	Reserved
6-4	IBANK	0	Bank Selection. Defines number of internal banks on the external DDR2/DDR3 memory. 1 Bank
		1h	2 Banks
		2h	4 Banks
		3h	8 Banks
		6-7h	Reserved

⁽¹⁾ DDR3 devices typically specify Max and Min allowable CAS latency. EMIF must be set to an acceptable value within that range.

Table 7-37. SDRAM Configuration Register (SDRCR) Field Descriptions (continued)

Bit	Field	Value	Description
3	EBANK	0	Chip Selection. Defines whether SDRAM accesses will use 1 or 2 chip selects CS0 only
		1	CS0, CS1
2-0	PAGESIZE		Page Size Selection. Defines the page size of each page of the external DDR2/DDR3 memory
		0	256 word page requiring 8 column address bits
		1h	512 word page requiring 9 column address bits
		2h	1024 word page requiring 10 column address bits
		3h	2048 word page requiring 11 column address bits

7.8.1.3 SDRAM Configuration Register 2 (SDRCR2)

The SDRAM Configuration Register 2 (SDRCR2) is shown in the figure and table below.

Figure 7-7. SDRAM Configuration Register 2 (SDRCR2)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-38. SDRAM Configuration Register 2 (SDRCR2) Field Descriptions

Bit	Field	Value	Description
31-28	Reserved	0	Reserved
27	EBANK_POS	0	Assign external bank address bits from lower OCP address bits
		1	Assign external bank address bits from higher OCP address bits
26-0	Reserved	0	Reserved

7.8.1.4 SDRAM Refresh Control Register (SDRRCR)

The SDRAM Refresh Control Register (SDRRCR) is described in the figure and table below.

Figure 7-8. SDRAM Refresh Control Register (SDRRCR)

31	30	29	28	27	26	24	23	16
INITREF_DIS	Rsvd	SRT	ASR	Rsvd	PASR	Reserved		
R/W-1	R/W-0	R/W-0	R/W-0	R-0	R/W-0	R-0		
15	Refresh_Rate							0
R/W-1388h								

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-39. SDRAM Refresh Control Register (SDRRCR) Field Descriptions

Bit	Field	Value	Description
31	INITREF_DIS	0 1	Initialization and Refresh Disable Enable SDRAM Initialization and Refreshes Disable SDRAM Initialization and Refreshes but carries out SDRAM Write/Read transactions.
30	Reserved	0h	Reserved
29	SRT	0 1	DDR2 and DDR3 Self Refresh Temperature Range Normal Operating Temperature range Extended Operating Temperature range For DDR3, this bit must be set to '0' if ASR is set to 1. A write to this field will cause the DDR2/DDR3 to start the initialization sequence
28	ASR	0 1	DDR3 Auto Self Refresh Enable Manual Self Refresh reference indicated by SRT field Auto Self Refresh Enable A write to this field causes the DDR3 to start the SDRAM initialization sequence.
27	Reserved		Reserved
26-24	PASR	0h 1h or 5h 2h or 6h 3h or 7h 4h	Partial Array Self Refresh. These bits determine what portion of the array will be refreshed with the external memory is in partial array self refresh mode. These bits gets loaded into the EMR of the external DDR2/DDR3 memory during initialization. If the external memory does not support Partial Array Self Refresh, this field should be set to 0h. A write to this field will cause the EMIF to start the SDRAM initialization sequence. For DDR2/DDR3 set Full Array 1/2 Array 1/4 Array 1/8 Array 3/4 Array to be refreshed. A write to this field will cause the memory controller to start the SDRAM initialization sequence.
23-16	Reserved		Reserved
15-0	REFRESH_RATE	1388h	Refresh rate. Defines the rate at which the attached DDR2/DDR3 devices are refreshed. The value of this field is calculated with the following equation: $Refresh_Rate = DDR2/DDR3\ clock\ frequency\ (in\ MHz) \times DDR2/DDR3\ refresh\ rate\ (in\ \mu s)$ Where DDR2/DDR3 refresh rate is derived from DDR2/DDR3 data sheet

7.8.1.5 SDRAM Refresh Control Shadow Register (SDRRCSR)

The SDRAM Refresh Control Shadow Register (SDRRCSR) is shown in the figure and table below.

Figure 7-9. SDRAM Refresh Control Shadow Register (SDRRCSR)

31	16	15	0
Reserved		REFRESH_RATE_SHDW	
R-0		R/W-1388h	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-40. SDRAM Refresh Control Shadow Register (SDRRCSR) Field Descriptions

Bits	Field	Value	Description
31-16	Reserved		Reserved
15-0	REFRESH_RATE_SHDW	1388h	Shadow field for refresh rate in SDRRCR. This field is loaded into the REFRESH_RATE_SHDW field in SDRRCR when Slave Idle Acknowledge(SIdleAck) is asserted.

7.8.1.6 SDRAM Timing 1 Register (SDRTIM1)

The SDRAM Timing 1 Register (SDRTIM1) is described in the figure and table below.

Figure 7-10. SDRAM Timing 1 Register (SDRTIM1)

31	29	28	25	24	21	20	17
Reserved		T_RP		T_RCD		T_WR	
R-0		R/W-4h		R/W-4h		R/W-4h	
16	12	11	6	5	3	2	0
T_RAS		T_RC			T_RRD		T_WTR
R/W-11h		R/W-16h			R/W-3h		R/W-1h

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-41. SDRAM Timing 1 Register (SDRTIM1) Field Descriptions

Bit	Field	Value	Description
31-29	Reserved		Reserved
28-25	T_RP	4h	Specifies the minimum number of DDR[X]_CLK cycles from a precharge command to a refresh or activate command, minus 1. Corresponds to tRP AC timing parameter in the DDR2/DDR3 data sheet. Calculated by $T_RP=(tRP/DDR[X]_CLK\ period)-1$
24-21	T_RCD	4h	Specifies the minimum number of DDR[X]_CLK cycles from an activate command to read or write command, minus 1. Corresponds to tRCD AC timing parameter in the DDR2/DDR3 data sheet. Calculated by $T_RP=(tRCD/DDR[X]_CLK\ period)-1$
20-17	T_WR	4h	Specifies the minimum number of DDR[X]_CLK cycles from the last write transfer to a pre-charge command, minus 1. Corresponds to tWR AC timing parameter in the DDR2/DDR3 data sheet. Calculated by $T_RP=(tWR/DDR[X]_CLK\ period)-1$
16-12	T_RAS	11h	Specifies the minimum number of DDR[X]_CLK cycles from an active command to a pre-charge command, minus 1. Corresponds to tRAS AC timing parameter in the DDR2/DDR3 data sheet. Calculated by $T_RP=(tRAS/DDR[X]_CLK\ period)-1$
11-6	T_RC	16h	Specifies the minimum number of DDR[X]_CLK cycles from an active command to an active command, minus 1. Corresponds to tRC AC timing parameter in the DDR2/DDR3 data sheet. Calculated by $T_RP=(tRC/DDR[X]_CLK\ period)-1$
5-3	T_RRD	3h	Specifies the minimum number of DDR[X]_CLK cycles from an activate command to an activate command in a different bank, minus 1. Corresponds to tRRD AC timing parameter in the DDR2/DDR3 data sheet. Calculated by $T_RRD=(tRRD/DDR[X]_CLK\ period)-1$ For an 8-bank DDR2 or DDR3 this field must be equal to $((tFAW/(4*DDR[X]_CLK))-1)$
2-0	T_WTR	1h	Specifies the minimum number of DDR[X]_CLK cycles from the last write to a read command, minus 1. Corresponds to the tWTR AC timing parameter in the DDR2/DDR3 data sheet. Calculated by $T_WTR=(tWTR/DDR[X]_CLK\ period)-1$

7.8.1.7 SDRAM Timing 1 Shadow Register (SDRTIM1SR)

The SDRAM Timing 1 Shadow Register (SDRTIM1SR) is described in the figure and table below.

Figure 7-11. SDRAM Timing 1 Shadow Register (SDRTIM1SR)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-42. SDRAM Timing 1 Shadow Register (SDRTIM1SR) Field Descriptions

Bit	Field	Value	Description
31-29	Reserved		Reserved
28-25	T_RP_SHDW	4h	Shadow field for T_RP in SDRTIMR1. This field is loaded into T_RP field in SDRAM Timing 1 Register when SldleAck is asserted.
24-21	T_RCD_SHDW	4h	Shadow field for T_RCD in SDRTIMR1. This field is loaded into T_RCD field in SDRAM Timing 1 Register when SldleAck is asserted.
20-17	T_WR_SHDW	4h	Shadow field for T_WR in SDRTIMR1. This field is loaded into T_WR field in SDRAM Timing 1 Register when SldleAck is asserted.
16-12	T_RAS_SHDW	11h	Shadow field for T_RAS in SDRTIMR1. This field is loaded into T_RAS field in SDRAM Timing 1 Register when SldleAck is asserted.
11-6	T_RC_SHDW	16h	Shadow field for T_RC in SDRTIMR1. This field is loaded into T_RC field in SDRAM Timing 1 Register when SldleAck is asserted.
5-3	T_RRD_SHDW	3h	Shadow field for T_RRD in SDRTIMR1. This field is loaded into T_RRD field in SDRAM Timing 1 Register when SldleAck is asserted.
2-0	T_WTR_SHDW	1h	Shadow field for T_WTR in SDRTIMR1. This field is loaded into T_WTR field in SDRAM Timing 1 Register when SldleAck is asserted.

7.8.1.8 SDRAM Timing 2 Register (SDRTIM2)

The SDRAM Timing 2 Register (SDRTIM2) is shown in the figure and table below.

Figure 7-12. SDRAM Timing 2 Register (SDRTIM2)

31	30	28	27	25	24	16			
Rsvd	T_XP	Reserved			T_XSNR				
R-0	R/W-1h	R-0			R/W-8Bh				
15					6	5	3	2	0
T_XSRD					T_RTP		T_CKE		
R/W-C7h					R/W-1h		R/W-2h		

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-43. SDRAM Timing 2 Register (SDRTIM2) Field Descriptions

Bit	Field	Value	Description
31	Reserved		Reserved
30-28	T_XP	1h	Specifies the minimum number of DDR[X]_CLK cycles from power down exit to any other command except read command, minus 1. For DDR2, this field must be greater than tXP or tCKE. Corresponds to tXP or tCKE AC timing parameter in the DDR2/DDR3 data sheet.
27-25	Reserved		Reserved
24-16	T_XSNR	0-8Bh	Specifies the minimum number of DDR[X]_CLK cycles from a self-refresh exit to any other command except a read command, minus 1. Corresponds to tXSNR/tXS AC timing parameter in the DDR2/DDR3 data sheet. Calculated by $T_XSNR = (tXSNR / DDR[X]_CLK \text{ period}) - 1$
15-6	T_XSRD	0-C7h	Specifies the minimum number of DDR[X]_CLK cycles from a self-refresh exit to a read command, minus 1. Corresponds to tXSRD/tXSDLL AC timing parameter in the DDR2/DDR3 data sheet. Calculated by $T_XSRD = (tXSRD \text{ or } tXSDLL) - 1$
5-3	T_RTP	1h	Specifies the minimum number of DDR[X]_CLK cycles from a last read command to a precharge command, minus 1. Corresponds to tRTP AC timing parameter in the DDR2/DDR3 data sheet. Calculated by $T_RTP = (tRTP / DDR[X]_CLK \text{ period}) - 1$
2-0	T_CKE	2h	Specifies the minimum number of DDR[X]_CLK cycles between transitions on the DDR[X]_CKE[X] pin, minus 1. Corresponds to the tCKE AC timing parameter in the DDR2 data sheet. Calculated by $T_CKE = (tCKE / DDR[X]_CLK \text{ period}) - 1$

7.8.1.9 SDRAM Timing 2 Shadow Register (SDRTIM2SR)

The SDRAM Timing 2 Shadow Register (SDRTIM2SR) is shown in the figure and table below.

Figure 7-13. SDRAM Timing 2 Shadow Register (SDRTIM2SR)

31	30	28	27	25	24	16
Rsvd	T_XP_SHDW	Reserved			T_XSNR_SHDW	
R-0	R/W-1h	0h			R/W-8Bh	
15	T_XSRD_SHDW			6	5	3
R/W-C7h				T_RTP_SHDW		2
				R/W-1h		0
				T_CKE_SHDW		R/W-2h

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-44. SDRAM Timing 2 Shadow Register (SDRTIM2SR) Field Descriptions

Bit	Field	Value	Description
31	Reserved	0	Reserved
30-28	T_XP_SHDW	1h	Shadow field for T_XP in SDRTIMR2. This field is loaded into the T_XP field in the SDRAM Timing 2 Register when SIdleAck is asserted.
27-25	Reserved	0h	Reserved
24-16	T_XSNR_SHDW	8Bh	Shadow field for T_XSNR in SDRTIMR2. This field is loaded into the T_XSNR field in the SDRAM Timing 2 Register when SIdleAck is asserted.
15-6	T_XSRD_SHDW	C7h	Shadow field for T_XSRD in SDRTIMR2. This field is loaded into the T_XSRD field in the SDRAM Timing 2 Register when SIdleAck is asserted.
5-3	T_RTP_SHDW	1h	Shadow field for T_RTP in SDRTIMR2. This field is loaded into the T_RTP field in the SDRAM Timing 2 Register when SIdleAck is asserted.
2-0	T_CKE_SHDW	2h	Shadow field for T_CKE in SDRTIMR2. This field is loaded into the T_CKE field in the SDRAM Timing 2 Register when SIdleAck is asserted.

7.8.1.10 SDRAM Timing 3 Register (SDRTIM3)

The SDRAM Timing 3 Register (SDRTIM3) is shown in the figure and table below.

Figure 7-14. SDRAM Timing 3 Register (SDRTIM3)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-45. SDRAM Timing 3 Register (SDRTIM3) Field Descriptions

Bit	Field	Value	Description
31-28	T_PDLL_UL	5h	Specifies number of DDR[X]_CLK cycles for PHY DLL to unlock. A value of N will be equal to N x 128 clocks. This field must be written with a value of 5.
27-24	T_CSTA	0h	Specifies the minimum number of DDR[X]_CLK cycles between write-to-write or read-to-read data phases to different chip selects, minus one. This is a don't care when only one chip select is being used. Refer the device data manual for the number of supported chip selects.
23-21	T_CKESR	7h	Specifies the minimum number of DDR[x]_CLK cycles for which the memory must remain in self refresh, minus one.
20-15	T_ZQCS	0-3Fh	Specifies the minimum number of DDR[X]_CLK cycles for a ZQCS command, minus one. This is applicable only for DDR3. Corresponds to tZQCS=(tZQCS-1) Where tZQCS in DDR clock cycles.
14-13	Reserved	3h	Reserved
12-4	T_RFC	0-82h	Specifies the minimum number of DDR[X]_CLK cycles from Refresh or Load Mode to Refresh or Activate, minus one. Calculated by $T_RFC = (tRFC / DDR[x]_CLK \text{ period}) - 1$
3-0	T_RAS_MAX	0-Fh	Specifies the maximum number of refresh rate intervals from Active to Precharge command. This field must be programmed to Fh for DDR2/DDR3 SDRAM types.

7.8.1.11 SDRAM Timing 3 Shadow Register (SDRTIM3SR)

The SDRTIM3SR is shown in the figure and table below.

Figure 7-15. SDRAM Timing 3 Shadow Register (SDRTIM3SR)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-46. SDRAM Timing 3 Shadow Register (SDRTIM3SR) Field Descriptions

Bit	Field	Value	Description
31-28	T_PDLL_UL_SHDW	0h	Shadow field for T_PDLL_UL in SDRTIMR3. This field is loaded into T_PDLL_UL field in SDRAM Timing 3 Register when SldleAck is asserted. This field must be written with a value of 5
27-24	T_CSTA_SHDW	0-h	Shadow field for T_CSTA in SDRTIMR3. This field is loaded into T_CSTA field in SDRAM Timing 3 Register when SldleAck is asserted.
23-21	Reserved	7h	Reserved
20-15	T_ZQCS_SHDW	0-3Fh	Shadow field for T_ZQCS in SDRTIMR3. This field is loaded into T_ZQCS field in SDRAM Timing 3 Register when SldleAck is asserted.
14-13	Reserved	3h	Reserved
12-4	T_RFC_SHDW	0-1FFh	Shadow field for T_RFC in SDRTIMR3. This field is loaded into T_RFC field in SDRAM Timing 3 Register when SldleAck is asserted.
3-0	T_RAS_MAX_SHDW	0-Fh	Shadow field for T_RAS_MAX in SDRTIMR3. This field is loaded into T_RASMAX field in SDRAM Timing 3 Register when SldleAck is asserted.

7.8.1.12 Power Management Control Register (PMCR)

The Power Management Control Register (PMCR) is shown in the figure and table below.

Figure 7-16. Power Management Control Register (PMCR)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-47. Power Management Control Register (PMCR) Field Descriptions

Bit	Field	Value	Description
31-16	Reserved		Reserved
15-12	PD_TIM		Power Management timer for Power Down. The DDR controller puts the external SDRAM in Power-Down mode after the DDR controller is idle for these number of DDR clock cycles and if LP_MODE field is set to 4h.
		0	Immediately enter Power down Mode
		1h	After 16 DDR cycles
		2h	After 32 DDR cycles
		3h	After 64 DDR cycles
		4h	After 128 DDR cycles
		5h	After 256 DDR cycles
		6h	After 512 DDR cycles
		7h	After 1024 DDR cycles
		8h	After 2048 DDR cycles
		9h	After 4096 DDR cycles
		Ah	After 8192 DDR cycles
		Bh	After 16384 DDR cycles
		Ch	After 32768 DDR cycles
		Dh	After 65536 DDR cycles
		Eh	After 131072 DDR cycles
		Fh	After 262144 DDR cycles
11	DPD_DEN		Deep Power Down Enable
		0	Normal Operation
		1	Overrides LP_MODE field setting
10-8	LP_MODE		Automatic Power Management Enable
		1h	Clock Stop Mode
		2h	Self Refresh Mode
		4h	Power Down Mode
		0, 3h, 5h-7h	Disable Automatic power management

Table 7-47. Power Management Control Register (PMCR) Field Descriptions (continued)

Bit	Field	Value	Description
7-4	SR_TIM		Power Management timer for Self Refresh. The DDR controller puts the external SDRAM in Self Refresh Mode after the DDR controller is idle for these number of DDR clock cycles and if LP_MODE is set to 2. When Self refresh mode is enabled, it is required to program this bit fields with a value of 7 or higher to avoid sending more Refresh commands to the DDR memory than allowed maximum during a refresh period.
		0	Immediately enter Self Refresh Mode
		1h	Enter Self Refresh Mode after 16 DDR Clocks
		2h	Enter Self Refresh Mode after 32 DDR Clocks
		3h	Enter Self Refresh Mode after 64 DDR Clocks
		4h	Enter Self Refresh Mode after 128 DDR Clocks
		5h	Enter Self Refresh Mode after 256 DDR Clocks
		6h	Enter Self Refresh Mode after 512 DDR Clocks
		7h	Enter Self Refresh Mode after 1024 DDR Clocks
		8h	Enter Self Refresh Mode after 2048 DDR Clocks
		9h	Enter Self Refresh Mode after 4096 DDR Clocks
		Ah	Enter Self Refresh Mode after 8192 DDR Clocks
		Bh	Enter Self Refresh Mode after 16384 DDR Clocks
		Ch	Enter Self Refresh Mode after 32768 DDR Clocks
		Dh	Enter Self Refresh Mode after 65536 DDR Clocks
		Eh	Enter Self Refresh Mode after 131072 DDR Clocks
		Fh	Enter Self Refresh Mode after 262144 DDR Clocks
3-0	CS_TIM		Power Management timer for Clock Stop. The DDR controller puts the external SDRAM in clock stop mode after the DDR controller is idle for these number of DDR clock cycles and if LP_MODE field is set to 1.
		0	Immediately enter Clock Stop Mode
		1h	Enter Clock Stop Mode after 16 clocks
		2h	Enter Clock Stop Mode after 32 clocks
		3h	Enter Clock Stop Mode after 64 clocks
		4h	Enter Clock Stop Mode after 128 clocks
		5h	Enter Clock Stop Mode after 256 clocks
		6h	Enter Clock Stop Mode after 512 clocks
		7h	Enter Clock Stop Mode after 1024 clocks
		8h	Enter Clock Stop Mode after 2048 clocks
		9h	Enter Clock Stop Mode after 4096 clocks
		Ah	Enter Clock Stop Mode after 8192 clocks
		Bh	Enter Clock Stop Mode after 16384 clocks
		Ch	Enter Clock Stop Mode after 32768 clocks
		Dh	Enter Clock Stop Mode after 65536 clocks
		Eh	Enter Clock Stop Mode after 131072 clocks
		Fh	Enter Clock Stop Mode after 262144 clocks

7.8.1.13 Power Management Control Shadow Register (PMCSR)

The Power Management Control Shadow Register (PMCSR) is shown in the figure and table below.

Figure 7-17. Power Management Control Shadow Register (PMCSR)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-48. Power Management Control Shadow Register (PMCSR) Field Descriptions

Bit	Field	Value	Description
31-16	Reserved		Reserved
15-12	PD_TIM_SHDW	0h	Shadow field for PD_TIM in PMCR. This field is loaded into PD_TIM field in Power Management Control Register when SideAck is asserted.
11-8	Reserved		Reserved
7-4	SR_TIM_SHDW	0h	Shadow field for SR_TIM in PMCR. This field is loaded into SR_TIM field in Power Management Control Register when SideAck is asserted.
3-0	CS_TIM_SHDW	0h	Shadow field for CS_TIM in PMCR. This field is loaded into CS_TIM field in Power Management Control Register when SideAck is asserted.

7.8.1.14 Peripheral Bus Burst Priority Register (PBBPR)

The Peripheral Bus Burst Priority Register (PBBPR) is shown in the figure and table below.

Figure 7-18. Peripheral Bus Burst Priority Register (PBBPR)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-49. Peripheral Bus Burst Priority Register (PBBPR) Field Descriptions

Bit	Field	Value	Description
31-24	Reserved		Reserved
23-16	COS_COUNT_1	FFh	Priority Raise Counter for class of service 1. Number of module clock cycles after which the DDR2/DDR3 memory controller momentarily raises the priority of the class of service 1 commands in the Command FIFO. Memory transfer clock cycles programmed will be N x 16 clocks.
15-8	COS_COUNT_2	FFh	Priority Raise Counter for class of service 2. Number of module clock cycles after which the DDR2/DDR3 memory controller momentarily raises the priority of the class of service 1 commands in the Command FIFO. Memory transfer clock cycles programmed will be N x 16 clocks.
7-0	PR_OLD_COUNT	FFh	Priority Raise Old Counter. Number of clock cycles after which the DDR2/DDR3 memory controller momentarily raises the priority of the oldest command in the Command FIFO. Memory transfer clock cycles programmed will be N x 16 clocks.

7.8.1.15 Performance Counter 1 Register (PERF_CNT_1)

The Performance Counter 1 register (PERF_CNT_1) is shown in the figure and table below.

Figure 7-19. Performance Counter 1 Register (PERF_CNT_1)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-50. Performance Counter 1 Register (PERF_CNT_1) Field Descriptions

Bit	Field	Value	Description
31-0	COUNTER1		32-bit counter that can be configured as specified in the Performance Counter Config Register and Performance Counter Master Region Select Register.

7.8.1.16 Performance Counter 2 Register (PERF_CNT_2)

The Performance Counter 2 register (PERF_CNT_2) is shown in the figure and table below.

Figure 7-20. Performance Counter 2 Register (PERF_CNT_2)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-51. Performance Counter 2 Register (PERF_CNT_2) Field Descriptions

Bit	Field	Value	Description
31-0	COUNTER2		32-bit counter that can be configured as specified in the Performance Counter Config Register and Performance Counter Master Region Select Register.

7.8.1.17 Performance Counter Config Register (PERF_CNT_CFG)

The Performance Counter Config register (PERF_CNT_CFG) is shown in the figure and table below.

Figure 7-21. Performance Counter Config Register (PERF_CNT_CFG)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-52. Performance Counter Config Register (PERF_CNT_CFG) Field Descriptions

Bit	Field	Value	Description
31	CNTR2_MCONNID_EN		MConnID filter enable for Performance Counter 2 register
30	Reserved		Reserved
29-20	Reserved		Reserved
19-16	CNTR2_CFG		Filter configuration for Performance Counter 2. Refer to Section 7.8.1.16 for details
15	CNTR1_MCONNID_EN		MConnID filter enable for Performance Counter 1 register
14	Reserved		Reserved
13-4	Reserved		Reserved
3-0	CNTR1_CFG		Filter configuration for Performance Counter 1. Refer to Table 7-14 for details.

7.8.1.18 Performance Counter Master Region Select Register (PERF_CNT_SEL)

The Performance Counter Master Region Select register (PERF_CNT_SEL) is shown in the figure and table below.

Figure 7-22. Performance Counter Master Region Select Register (PERF_CNT_SEL)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-53. Performance Counter Master Region Select Register (PERF_CNT_SEL) Field Descriptions

Bit	Field	Value	Description
31-24	MCONNID2		MConnID for Performance Counter2 register.
23-18	Reserved		Reserved
17-16	Reserved		Reserved
15-8	MCONNID1		MConnID for Performance Counter1 register
7-2	Reserved		Reserved
1-0	Reserved		Reserved

7.8.1.19 End of Interrupt Register (EOI)

The End of Interrupt Register (EOI) is shown in the figure and table below.

Figure 7-23. End of Interrupt Register (EOI)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-54. End of Interrupt Register (EOI) Field Descriptions

Bit	Field	Value	Description
31-1	Reserved		Reserved
0	EOI	0	Software End of Interrupt Control. System OCP Interrupt
		1	Reserved

7.8.1.20 System OCP Interrupt RAW Status Register (SOIRSR)

The System OCP Interrupt RAW Status Register (SOIRSR) is shown in the figure and table below.

Figure 7-24. System OCP Interrupt RAW Status Register (SOIRSR)

LEGEND: R = Read only; WOS = Write 1 to set, write of 0 has no effect; -n = value after reset

Table 7-55. System OCP Interrupt RAW Status Register (SOIRSR) Field Descriptions

Bit	Field	Value	Description
31-1	Reserved		Reserved
0	ERR_SYS	0 1	Raw status of system OCP interrupt for command or address error. Writing a 0 has no effect. Write 1 to set the raw status.

7.8.1.21 System OCP Interrupt Status Register (SOISR)

The System OCP Interrupt Status Register (SOISR) is shown in the figure and table below.

Figure 7-25. System OCP Interrupt Status Register (SOISR)

LEGEND: R = Read only; WOC = Write 1 to clear, write of 0 has no effect; -n = value after reset

Table 7-56. System OCP Interrupt Status Register (SOISR) Field Descriptions

Bit	Field	Value	Description
31-1	Reserved		Reserved
0	ERR_SYS	0 1	Enabled status of system OCP interrupt for SDRAM command or address error. Writing a 0 has no effect. Write 1 to clear the status after interrupt has been serviced (raw status gets cleared, i.e., even if not enabled).

7.8.1.22 System OCP Interrupt Enable Set Register (SOIESR)

The System OCP Interrupt Enable Set Register (SOIESR) is shown in the figure and table below.

Figure 7-26. System OCP Interrupt Enable Set Register (SOIESR)

LEGEND: R = Read only; WOS = Write 1 to set, a write of 0 has no effect; -n = value after reset

Table 7-57. System OCP Interrupt Enable Set Register (SOIESR) Field Descriptions

Bit	Field	Value	Description
31-1	Reserved		Reserved
0	ERRSYSSET		Enable set for system OCP interrupt for SDRAM command or address error. Write a 1 to set ERRSYSSET and the ERRSYSCLR bit in the System OCP Interrupt Enable Clear Register.
		0	Interrupt is not Enabled
		1	Interrupt is enabled.

7.8.1.23 System OCP Interrupt Enable Clear Register (SOIECR)

The System OCP Interrupt Enable Clear Register (SOIECR) is shown in the figure and table below.

Figure 7-27. System OCP Interrupt Enable Clear Register (SOIECR)

LEGEND: R/W = Read/Write; R = Read only; WOC = Write 1 to clear, a write of 0 has no effect; -n = value after reset

Table 7-58. System OCP Interrupt Enable Clear Register (SOIECR) Field Descriptions

Bit	Field	Value	Description
31-1	Reserved	0	Reserved
0	ERRSYSCLR		Enable Clear for system OCP interrupt for SDRAM command or address error. Write a 1 to Clear ERRSYSCLR and the ERRSYSSET bit in the System OCP Interrupt Enable Set Register
		0	No effect
		1	Interrupt is enabled.

7.8.1.24 SDRAM Output Impedance Calibration Configuration Register (ZQCR)

The SDRAM Output Impedance Calibration Configuration Register (ZQCR) is shown in the figure and table below.

Figure 7-28. SDRAM Output Impedance Calibration Configuration Register (ZQCR)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-59. SDRAM Output Impedance Calibration Configuration Register (ZQCR) Field Descriptions

Bit	Field	Value	Description
31	ZQ_CS1EN		Writing a 1 enables ZQ calibration for CS1
30	ZQ_CS0EN		Writing a 1 enables ZQ calibration for CS0
29	ZQ_DUALCALEN		ZQ Dual Calibration Enable. Allows both ranks (chip selects) to be ZQ calibrated simultaneously. Setting this bit requires both chip selects to have a separate calibration resistor per device.
28	ZQ_SFEXITEN	0 1	ZQCL on Self-Refresh, Active Power-Down and Precharge Power-Down exit enable. Writing a 1 enables the issuing of ZQCL on Self-Refresh, Active Power-Down and Precharge Power Down exit.
27-20	Reserved		Reserved
19-18	ZQ_ZQINIT_MULT		Indicates number of ZQCL intervals that make up a ZQINIT interval, minus 1
17-16	ZQ_ZQCL_MULT		Indicates number of ZQCS intervals that make up a ZQCL interval, minus 1
15-0	ZQ_REFINTERVAL		Number of refresh periods between ZQCS commands. Supports between one refresh period to 256 ms between ZQCS calibration commands. Refresh period is defined by REFRESH_RATE field in SDRAM Refresh Control Register.

7.8.1.25 DDR PHY Control Register (DDRPHYCR)

The DDR PHY Control Register (DDRPHYCR) is shown in the figure and table below.

Figure 7-29. DDR PHY Control Register (DDRPHYCR)

31				21				20		19	18		17		16	
Reserved				DYN_PWRDN_				Rsvd		RDEYE_LVL_		GATE_LVL_		WR_LVL_DIS		
R-0				R/W-0				R-0		R/W-0		R/W-0		R/W-0		
15		14	13		12		11	10		9	8	7		5	4	0
PHY_		Rsvd	IDLE_LOCAL_		Reserved		RD_LOCAL_		Reserved		READ_LATENCY					
RST			ODT				ODT									
R/W-0		R/W-0	R/W-0		R-0		R/W-0		R-0		R/W-0				R/W-0	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-60. DDR PHY Control Register (DDRPHYCR) Field Descriptions

Bit	Field	Value	Description
31-21	Reserved	0	Reserved
20	DYN_PWRDN_EN	0	Enables dynamically powering down the IO Receiver when not performing a read. This will help in reducing DDR IO power. It is recommended to set this bit to '1' always.
19	Reserved	0	Reserved
18	RDEYE_LVL_DIS	0	When set to 1, read eye auto-leveling is disabled. This is applicable only for DDR3
17	GATE_LVL_DIS	0	When set to 1, read gate auto-leveling is disabled. This is applicable only for DDR3
16	WR_LVL_DIS	0	When set to 1, write auto-leveling is disabled. This is applicable only for DDR3
15	PHY_RST	0	When set to 1, DDR PHY is reset .Both data and command macros will be reset
14	Reserved	0	Reserved
13-12	IDLE_LOCAL_ODT	0	This bit fields specify the ODT selection on the DDR Controller side when the breceiver is powered down. IDLE_LOCAL_ODT is applicable only when DYN_PWRDN_EN is set to '1'. Please refer to Table1-16 for the supported ODT termination values. Recommended value is 0x0 [ODT OFF]
11-10	Reserved	0	Reserved
9-8	RD_LOCAL_ODT	0	This bit fields specifies the ODT selection on the DDR PHY side during READ. To control the ODT on the DDR device side, refer to the SDRCCR register details. Please refer to Table1-16 for the supported ODT termination values. Recommended value is 0x2 [50 Ohms termination]
7-5	Reserved	0	Reserved
4-0	READ_LATENCY	0	Defines the latency for read data from DDR SDRAM in number of 1x cycles. The value applied should be equal to the required value minus one. The maximum read latency supported by the DDR PHY is equal to CAS latency plus 7 clock cycles. The minimum read latency must be equal to CAS latency plus 1 clock cycles.

7.8.1.26 DDR PHY Control Shadow Register (DDRPHYCSR)

The DDR PHY Control Shadow Register (DDRPHYCSR) is shown in the figure and table below.

Figure 7-30. DDR PHY Control Shadow Register (DDRPHYCSR)

31 Reserved				21 DYN_PWRDN_ EN		20 Rsvd	19 RDEYE_LVL_ DIS		18 GATE_LVL_ DIS		17 WR_LVL_ DIS		16
R-0				R/W-0		R/W-0	R/W-0		R/W-0		R/W-0		R/W-0
15 PHY_RST		14 Reserved		13 IDLE_LOCAL_ ODT		12 Reserved		11 RD_LOCAL_ ODT		9 Reserved		8 READ_LATENCY	
R/W-0		R/W-0		R/W-0		R/W-0		R/W-0		R/W-0		R/W-0	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-61. DDR PHY Control Shadow Register (DDRPHYCSR) Field Descriptions

Bit	Field	Value	Description
31-21	Reserved		Reserved
20	DYN_PWRDN_EN		Shadow field for DYN_PWRDN_EN in DDRPHYCR. This field is loaded into DYN_PWRDN_EN field in DDR PHY Control Register when SldleAck is asserted
19	Reserved		Reserved
18	RDEYE_LVL_DIS		Shadow field for RDEYE_LVL_DIS in DDRPHYCR. This field is loaded into RDEYE_LVL_DIS field in DDR PHY Control Register when SldleAck is asserted.
17	GATE_LVL_DIS		Shadow field for GATE_LVL_DIS in DDRPHYCR. This field is loaded into GATE_LVL_DIS field in DDR PHY Control Register when SldleAck is asserted.
16	WR_LVL_DIS		Shadow field for WR_LVL_DIS in DDRPHYCR. This field is loaded into WR_LVL_DIS field in DDR PHY Control Register when SldleAck is asserted
15	PHY_RST		Shadow field for PHY_RST in DDRPHYCR. This field is loaded into PHY_RST field in DDR PHY Control Register when SldleAck is asserted.
14	Reserved		Reserved
13-12	IDLE_LOCAL_ODT		This bit fields specify the ODT selection on the DDR Controller side when the breceiver is powered down. IDLE_LOCAL_ODT is applicable only when DYN_PWRDN_EN is set to '1'. Please refer to Table1-16 for the supported ODT termination values.
11-10	Reserved		Recommended value is 0x0 [ODT OFF]
9-8	RD_LOCAL_ODT		This bit fields specifies the ODT selection on the DDR PHY side during READ. To control the ODT on the DDR device side, refer to the SDRCR register details. Please refer to Table1-16 for the supported ODT termination values.
7-5	Reserved		Recommended value is 0x2 [50 Ohms termination]
4-0	READ_LATENCY		Shadow field for READ_LATENCY in DDRPHYCR. This field is loaded into READ_LATENCY field in DDR PHY Control Register when SldleAck is asserted.

7.8.1.27 Priority to Class of Service Mapping Register (PRI_COS_MAP)

The Priority to Class of Service Mapping Register (PRI_COS_MAP) is shown in the figure and table below.

Figure 7-31. Priority to Class of Service Mapping Register (PRI_COS_MAP)

31	30													16	
PRI_COS_MAP_EN		Reserved													
R/W-0		R-0													
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0								

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-62. Priority to Class of Service Mapping Register (PRI_COS_MAP) Field Descriptions

Bit	Field	Value	Description
31	PRI_COS_MAP_EN	0	Disable mapping
		1	Enable priority to class of service mapping
30-16	Reserved		Reserved
15-14	PRI_7_COS	0 or 3	Class of service for commands with priority of 7. Setting a value of 0 or 3 will not assign any class of service.
		1 or 2	Commands with priority 7 is mapped to class of service 1 or 2
13-12	PRI_6_COS	0 or 3	Class of service for commands with priority of 6. Setting a value of 0 or 3 will not assign any class of service.
		1 or 2	Commands with priority 6 is mapped to class of service 1 or 2
11-10	PRI_5_COS	0 or 3	Class of service for commands with priority of 5. Setting a value of 0 or 3 will not assign any class of service.
		1 or 2	Commands with priority 5 is mapped to class of service 1 or 2
9-8	PRI_4_COS	0 or 3	Class of service for commands with priority of 4. Setting a value of 0 or 3 will not assign any class of service.
		1 or 2	Commands with priority 4 is mapped to class of service 1 or 2
7-6	PRI_3_COS	0 or 3	Class of service for commands with priority of 3. Setting a value of 0 or 3 will not assign any class of service.
		1 or 2	Commands with priority 3 is mapped to class of service 1 or 2
5-4	PRI_2_COS	0 or 3	Class of service for commands with priority of 2. Setting a value of 0 or 3 will not assign any class of service.
		1 or 2	Commands with priority 2 is mapped to class of service 1 or 2
3-2	PRI_1_COS	0 or 3	Class of service for commands with priority of 1. Setting a value of 0 or 3 will not assign any class of service.
		1 or 2	Commands with priority 1 is mapped to class of service 1 or 2
1-0	PRI_0_COS	0 or 3	Class of service for commands with priority of 0. Setting a value of 0 or 3 will not assign any class of service.
		1 or 2	Commands with priority 0 is mapped to class of service 1 or 2

7.8.1.28 Connection ID to Class of Service 1 Mapping Register (CONNID_COS_1_MAP)

The Connection ID to Class of Service 1 Mapping Register(CONNID_COS_1_MAP) is shown in the figure and table below.

Figure 7-32. Connection ID to Class of Service 1 Mapping Register(CONNID_COS_1_MAP)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-63. Connection ID to Class of Service 1 Mapping Register(CONNID_COS_1_MAP) Field Descriptions

Bit	Field	Value	Description
31	CONNID_COS_1_MAP_EN	0 1	Connection ID to class of service Disable mapping Enable connection ID to class of service
30-23	CONNID_1_COS_1		Connection ID value 1 for class of service 1.
22-20	MSK_1_COS_1	0 1 2 3 4 5 6 7	Mask for connection ID value 1 for class of service 1. Disable masking Mask connection ID bit 0 Mask connection ID bits 1:0 Mask connection ID bits 2:0 Mask connection ID bits 3:0 Mask connection ID bits 4:0 Mask connection ID bits 5:0 Mask connection ID bits 6:0
19-12	CONNID_2_COS_1		Connection ID value 2 for class of service 1

9-2	CONNID_3_COS_2		Connection ID value 3 for class of service 2.
1-0	MSK_3_COS_2	0 1 2 3	Mask for connection ID value 3 for class of service 2 Disable masking Mask connection ID bit 0 Mask connection ID bits 1:0 Mask connection ID bits 2:0

7.8.1.30 Read Write Execution Threshold Register (RD_WR_EXEC_THRSH)

The Read Write Execution Threshold Register (RD_WR_EXEC_THRSH) is shown in the figure and table below.

Figure 7-34. Read Write Execution Threshold Register (RD_WR_EXEC_THRSH)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-65. Read Write Execution Threshold Register (RD_WR_EXEC_THRSH) Field Descriptions

Bit	Field	Value	Description
31-13	Reserved		Reserved
12-8	WR_THRSH	3h	Write Threshold. Number of SDRAM write bursts after which the DDR2/DDR3 memory controller arbitration will switch to executing read commands. The value programmed is always minus one the required number.
7-5	Reserved		Reserved
4-0	RD_THRSH	5h	Read Threshold. Number of SDRAM read bursts after which the DDR2/DDR3 memory controller arbitration will switch to executing write commands. The value programmed is always minus one the required number.

7.8.2 DDR2/DDR3 PHY Registers

Table 7-66 lists the memory-mapped registers for the DDR2/DDR3 PHY. Configure the DDR PHY Control Register for calibration of board delay and other parameters to get the SDRAM device working at a different speed. See the device-specific data manual for the base memory address of these registers.

Table 7-66. Memory-Mapped Registers for DDR2 and DDR3 PHY

Register Name	Type	Description	Reset	Offset
CMD0_REG_PHY_CTRL_SLAVE_RATIO_0	RW	DDR PHY Command 0 Address/Command Slave Ratio Register	0x80	0x01C
CMD0_REG_PHY_DLL_LOCK_DIFF_0	RW	DDR PHY Command 0 Address/Command DLL Lock Difference Register	0x4	0x028
CMD0_REG_PHY_INVERT_CLKOUT_0	RW	DDR PHY Command 0 Invert Clockout Selection Register	0x0	0x02C
CMD1_REG_PHY_CTRL_SLAVE_RATIO_0	RW	DDR PHY Command 1 Address/Command Slave Ratio Register	0x80	0x050

7.8.2.1 DDR PHY Command 0/1/2 Address/Command Slave Ratio Register (CMD0/1/2_REG_PHY_CTRL_SLAVE_RATIO_0)

The DDR PHY Command 0/1/2 Address/Command Slave Ratio Register (CMD0/1/2_REG_PHY_CTRL_SLAVE_RATIO_0) is shown in the figure and table below.

Figure 7-35. DDR PHY Command 0/1/2 Address/Command Slave Ratio Register (CMD0/1/2_REG_PHY_CTRL_SLAVE_RATIO_0)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-67. DDR PHY Command 0/1/2 Address/Command Slave Ratio Register (CMD0/1/2_REG_PHY_CTRL_SLAVE_RATIO_0) Field Descriptions

Bit	Field	Value	Description
31-10	Reserved		Reserved
9-0	CMD_SLAVE_RATIO	0-80h	Ratio value for address/command launch timing in DDR PHY macro. This is the fraction of a clock cycle represented by the shift to be applied to the read DQS in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 to get the delay value for the slave delay line.

7.8.2.2 DDR PHY Command 0/1/2 Address/Command DLL Lock Difference Register (MD0/1/2_REG_PHY_DLL_LOCK_DIFF_0)

The DDR PHY Command 0/1/2 Address/Command DLL Lock Difference Register (CMD0/1/2_REG_PHY_DLL_LOCK_DIFF_0) is shown in the figure and table below.

Figure 7-36. DDR PHY Command 0/1/2 Address/Command DLL Lock Difference Register (CMD0/1/2_REG_PHY_DLL_LOCK_DIFF_0)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-68. DDR PHY Command 0/1/2 Address/Command DLL Lock Difference Register (CMD0/1/2_REG_PHY_DLL_LOCK_DIFF_0) Field Descriptions

Bit	Field	Value	Description
31-4	Reserved		Reserved
3-0	DLL_LOCK_DIFF	0-4h	The max number of delay line taps variation allowed while maintaining the master DLL lock. This is calculated as total jitter/ delay line tap size, where total jitter is half of (incoming clock jitter (pp) + delay line jitter (pp)).

7.8.2.3 DDR PHY Command 0/1/2 Invert Clockout Selection Register (CMD0/1/2_REG_PHY_INVERT_CLKOUT_0)

The CDDR PHY Command 0/1/2 Invert Clockout Selection Register(CMD0/1/2_REG_PHY_INVERT_CLKOUT_0) is shown in the figure and table below.

Figure 7-37. DDR PHY Command 0/1/2 Invert Clockout Selection Register (CMD0/1/2_REG_PHY_INVERT_CLKOUT_0)

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-69. DDR PHY Command 0/1/2 Invert Clockout Selection Register(CMD0/1/2_REG_PHY_INVERT_CLKOUT_0) Field Descriptions

Bit	Field	Value	Description
31-1	Reserved	0	Reserved
0	INVERT_CLK_SEL	0	Inverts the polarity of DRAM clock. Core clock is passed on to DRAM
		1	inverted core clock is passed on to DRAM

7.8.2.4 DDR PHY Data Macro 0/1/2/3 Read DQS Slave Ratio Register (DATA0/1/2/3_REG_PHY_RD_DQS_SLAVE_RATIO_0)

The DDR PHY Data Macro 0/1/2/3 Read DQS Slave Ratio Register(DATA0/1/2/3_REG_PHY_RD_DQS_SLAVE_RATIO_0) is shown in the figure and table below.

**Figure 7-38. DDR PHY Data Macro 0/1/2/3 Read DQS Slave Ratio Register
(DATA0/1/2/3_REG_PHY_RD_DQS_SLAVE_RATIO_0)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-70. DDR PHY Data Macro 0/1/2/3 Read DQS Slave Ratio Register
(DATA0/1/2/3_REG_PHY_RD_DQS_SLAVE_RATIO_0) Field Descriptions**

Bit	Field	Value	Description
31-20	Reserved		Reserved
19-10	RD_DQS_SLAVE_RATIO_CS1	40h	Ratio value for Read DQS slave DLL for CS1. This is the fraction of a clock cycle represented by the shift to be applied to the read DQS in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 to get the delay value for the slave delay line.
9-0	RD_DQS_SLAVE_RATIO_CS0	40h	Ratio value for Read DQS slave DLL for CS0. This is the fraction of a clock cycle represented by the shift to be applied to the read DQS in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 to get the delay value for the slave delay line.

7.8.2.5 DDR PHY Data Macro 0/1/2/3 Write DQS Slave Ratio Register (DATA0/1/2/3_REG_PHY_WR_DQS_SLAVE_RATIO_0)

The DDR PHY Data Macro 0/1/2/3 Write DQS Slave Ratio Register(DATA0/1/2/3_REG_PHY_WR_DQS_SLAVE_RATIO_0) is shown in the figure and table below.

**Table 7-71. DDR PHY Data Macro 0/1/2/3 Write DQS Slave Ratio Register

(DATA0/1/2/3_REG_PHY_FIFO_WE_SLAVE_RATIO_0) Field Descriptions**

Bit	Field	Value	Description
31-20	Reserved	0	Reserved
19-10	RD_DQS_GATE_SLAVE_RATIO_CS1	0h	Ratio value for fifo we for CS1.
9-0	RD_DQS_GATE_SLAVE_RATIO_CS0	0h	Ratio value for fifo we for CS0.

**7.8.2.7 DDR PHY Data Macro 0/1/2/3 Write Data Slave Ratio Register
(DATA0/1/2/3_REG_PHY_WR_DATA_SLAVE_RATIO_0)**

The DDR PHY Data Macro 0/1/2/3 Write Data Slave Ratio Register (DATA0/1/2/3_REG_PHY_WR_DATA_SLAVE_RATIO_0) is shown in the figure and table below.

**Figure 7-40. DDR PHY Data Macro 0/1/2/3 Write Data Slave Ratio Register
(DATA0/1/2/3_REG_PHY_WR_DATA_SLAVE_RATIO_0)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-74. DDR PHY Data Macro 0/1/2/3 Write Data Slave Ratio Register
(DATA0/1/2/3_REG_PHY_WR_DATA_SLAVE_RATIO_0) Field Descriptions**

Bit	Field	Value	Description
31-20	Reserved	40h	Reserved
19-10	WR_DATA_SLAVE_RATIO_CS1	40h	Ratio value for write data slave DLL for CS1. Memory-Mapped Registers for DDR2/3 This is the fraction of a clock cycle represented by the shift to be applied to the write DQ muxes in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 to get the delay value for the slave delay line.
9-0	WR_DATA_SLAVE_RATIO_CS0	40h	Ratio value for write data slave DLL for CS0. This is the fraction of a clock cycle represented by the shift to be applied to the write DQ muxes in units of 256ths. In other words, the full-cycle tap value from the master DLL will be scaled by this number over 256 to get the delay value for the slave delay line.

7.8.2.8 DDR PHY Data Macro 0/1/2/3 Delay Selection Register (DATA0/1/2/3_REG_PHY_USE_RANK0_DELAYS)

The DATA0/1/2/3_REG_PHY_USE_RANK0_DELAYS is shown in [Figure 7-41](#) and described in [Table 7-75](#).

**Figure 7-41. DDR PHY Data Macro 0/1/2/3 Delay Selection Register
(DATA0/1/2/3_REG_PHY_USE_RANK0_DELAYS)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-75. DDR PHY Data Macro 0/1/2/3 Delay Selection Register
(DATA0/1/2/3_REG_PHY_USE_RANK0_DELAYS) Field Descriptions**

Bit	Field	Value	Description
31-1	Reserved	0	Reserved
0	PHY_USE_RANK0_DELAYS_0	0 1	Delay Selection Each Rank uses its own delay. (Recommended). This is applicable only in case of DDR3 Rank 0 delays are used for all ranks. This must be set to 1 for DDR2.

7.8.2.9 DDR PHY Data Macro 0/1/2/3 DLL Lock Difference Register (DATA0/1/2/3_REG_PHY_DLL_LOCK_DIFF_0)

The DDR PHY Data Macro 0/1/2/3 DLL Lock Difference (DATA0/1/2/3_REG_PHY_DLL_LOCK_DIFF_0) register is shown in [Figure 7-42](#) and described in [Table 7-76](#).

**Figure 7-42. DDR PHY Data Macro 0/1/2/3 DLL Lock Difference Register
(DATA0/1/2/3_REG_PHY_DLL_LOCK_DIFF_0)**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 7-76. DDR PHY Data Macro 0/1/2/3 DLL Lock Difference Register
(DATA0/1/2/3_REG_PHY_DLL_LOCK_DIFF_0) Field Descriptions**

Bit	Field	Value	Description
31-4	Reserved		Reserved
3-0	DLL_LOCK_DIFF	0-4h	Lock Difference The max number of delay line taps variation allowed while maintaining the master DLL lock. This should always be written with the default value of 4h.

7.8.3 DDR Related Control Module Registers

This section describes the EMIF PHY Clock Gate, VTP and DDR IO configuration registers which reside in the device control module register map. Refer below register description for more details. See the device-specific data manual for the base memory address of these registers.

Table 7-77. DDR Related Control Module Registers

Register Name	Type	Register Description	Register Reset	Address Offset
EMIF_CLK_GATE	RW	EMIF0/1 PHY Clock gate Control Register	0xC	0x694
DDR0_IO_CTRL	RW	DDR Memory Controller_0 IO Control Register	0x02131313	0xE04
DDR1_IO_CTRL	RW	DDR Memory Controller_1 IO Control Register	0x02131313	0xE08
DDR_VTP_CTRL_0	RW	DDR VTP Control Register	0x67	0xE0C
DDR_VTP_CTRL_1	RW	DDR VTP Control Register	0x67	0xE10

7.8.3.1 EMIF0/1 Clock Gate Control Register

The EMIF0/1 Clock Gate Control Register (EMIF_CLK_GATE) described in the figure and table below.

Figure 7-43. EMIF0/1 Clock Gate Control Register

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-78. EMIF0/1 Clock Gate Control Register Field Descriptions

Bit	Field	Value	Description
31-4	Reserved	0	Reserved
3	DDR1_CKE_STATUS	1	CKE status for DDR1
2	DDR0_CKE_STATUS	1	CKE status for DDR0
1	DDRPHY1_CLK_GATE	0	Enables/disables the clock to the DDR1 PHY . DDR1 PHY clock enabled (running)
		1	DDR1 PHY clock disabled (stopped)
0	DDRPHY0_CLK_GATE	0	Enables/disables the clock to the DDR0 PHY DDR0 PHY clock enabled (running)
		1	DDR0 PHY clock disabled (stopped)

7.8.3.2 DDR Memory Controller0_IO Control Register (DDR0_IO_CTRL)

The DDR Memory Controller_0 IO Control Register (DDR0_IO_CTRL) is shown in the figure and table below.

Figure 7-44. DDR Memory Controller0_IO Control Register (DDR0_IO_CTRL)

31	30	29	21	20	19	18	16	
DDR3 RST_ DEF_ VAL	DDR_WUCLK_ DISABLE	Reserved			CS_SLEW	CS_impedance		
R/W- 0h	R/W-0h	R-0			R/W-2h	R/W- 3h		
15	13	12	11	10	8	7	5	
Reserved		CMD_SLEW	CMD_impedance		Reserved		DATA_SLEW	DATA_impedance
R-0		R/W-2h	R/W-3h		R-0		R/W-2h	R/W-3h

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-79. DDR Memory Controller0_IO Control Register (DDR0_IO_CTRL) Field Descriptions

Bit	Field	Value	Description
31	DDR3_RST_DEF_VAL		DDR3 reset control
		0	Normal operation. If a reset occurs on the DDR controller, the DDR[x]_RST signal will also go active (low) to reset the DDR3 memory.
		1	If a reset occurs on the DDR controller, the DDR[x]_RST signal will NOT go active (low).
30	DDR_WUCLK_DISABLE		Disables the internal 32 kHz wakeup clock used to clock the DDR memory controller subsystem before the DDR controller is configured. This clock may be disabled once the DDR controller has been configured, enabled and DDR initialization is complete.
		0	Wakeup clock to the DDR controller is enabled (running)
		1	Wakeup clock to the DDR controller is disabled (stopped)
29-21	Reserved		Reserved
20-19	CS_SLEW [1:0]	2h	Selects the slew rate of CS pins. Recommended slew rate value is 0x0
18-16	CS_impedance [2:0]	3h	Selects the Output impedance(Drive Strength) of chip select pin. Please refer to Table1-14 for the supported O/P impedance values. Recommended O/P impedance value is 0x3 (8mA Drive strength)
15-13	Reserved		Reserved
12-11	CMD_SLEW [1:0]	2h	Selects the slew rate of command/address pins. Recommended slew rate value is 0x0.
10-8	CMD_impedance [2:0]	3h	Selects the Output impedance(Drive Strength) of command/address pins. Please refer to Table1-14 for the supported O/P impedance values. Recommended O/P impedance value is 0x3 (8mA Drive strength)
7-5	Reserved		Reserved
4-3	DATA_SLEW [1:0]	2h	Selects the slew rate of data pins. Recommended slew rate value is 0x0
2-0	DATA_impedance [2:0]	3h	Selects the Output impedance(Drive Strength) of Data pins. Please refer to Table1-14 for the supported O/P impedance values. Recommended O/P impedance value is 0x3 (8mA Drive strength)

7.8.3.3 DDR Memory Controller1_IO Control Register (DDR1_IO_CTRL)

The DDR Memory Controller_1 IO Control Register (DDR1_IO_CTRL) is shown in the figure and table below.

Figure 7-45. DDR Memory Controller1_IO Control Register (DDR1_IO_CTRL)

31	30	29	21	20	19	18	16	
DDR3_RST_DEF_VAL	DDR_WUCLK_DISABLE	Reserved			CS_SLEW	CS_impedance

R-0		R/W-2h	R/W-3h		R-0		R/W-2h	R/W-3h

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-80. DDR Memory Controller1_IO Control Register (DDR1_IO_CTRL) Field Descriptions

Bit	Field	Value	Description
31	DDR3_RST_DEF_VAL		DDR3 reset control
		0	Normal operation. If a reset occurs on the DDR controller, the DDR[x]_RST signal will also go active (low) to reset the DDR3 memory.
		1	If a reset occurs on the DDR controller, the DDR[x]_RST signal will NOT go active (low).
30	DDR_WUCLK_DISABLE		Disables the internal 32 kHz wakeup clock used to clock the DDR memory controller subsystem before the DDR controller is configured. This clock may be disabled once the DDR controller has been configured, enabled and DDR initialization is complete.
		0	Wakeup clock to the DDR controller is enabled (running)
		1	Wakeup clock to the DDR controller is disabled (stopped)
29-21	Reserved		Reserved
20-19	CS_SLEW [1:0]	2h	Selects the slew rate of CS pins. Recommended slew rate value is 0x0
18-16	CS_impedance [2:0]	3h	Selects the Output impedance(Drive Strength) of chip select pin. Please refer to Table1-14 for the supported O/P impedance values. Recommended O/P impedance value is 0x3 (8mA Drive strength)
15-13	Reserved		Reserved
12-11	CMD_SLEW [1:0]	2h	Selects the slew rate of command/address pins. Recommended slew rate value is 0x0.
10-8	CMD_impedance [2:0]	3h	Selects the Output impedance(Drive Strength) of command/address pins. Please refer to Table1-14 for the supported O/P impedance values. Recommended O/P impedance value is 0x3 (8mA Drive strength)
7-5	Reserved		Reserved
4-3	DATA_SLEW [1:0]	2h	Selects the slew rate of data pins. Recommended slew rate value is 0x0
2-0	DATA_impedance [2:0]	3h	Selects the Output impedance(Drive Strength) of Data pins. Please refer to Table1-14 for the supported O/P impedance values. Recommended O/P impedance value is 0x3 (8mA Drive strength)

7.8.3.4 DDR VTP Control Register (DDR_VTP_CTRL_0)

The DDR VTP Control Register (DDR_VTP_CTRL_0) is shown in the figure and table below.

Figure 7-46. DDR VTP Control Register (DDR_VTP_CTRL_0)

31	Reserved						16
R-0							
15	7	6	5	4	3	1	0
Reserved		ENABLE	READY	LOCK	FILTER	CLRz	
R-0		R/W-1h	R/W-1h	R/W-0	R/W-3h	R/W-1h	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 7-81. DDR VTP Control Register (DDR_VTP_CTRL_0) Field Descriptions

Bit	Field	Value	Description
31-7	Reserved	0	Reserved
6	ENABLE	0	VTP macro enable
		0	VTP macro in bypass mode
		1	Enabled
5	READY	0	IO training sequence completion status
		0	IO training is not completed
		1	IO training is completed
4	LOCK	0	Dynamic Update Locking
		0	Dynamic update enabled based on VTP variations.
		1	Dynamic impedance update is disabled and VTP macro powered down.
3-1	FILTER	0	Digital filter bits to control the update rate.
		1h	Update on 2 consecutive update requests
		2h	Update on 3 consecutive update requests
