The number of samples on the left side and right side used for computing the noise average is configured using CFAR_AVG_LEFT and CFAR_AVG_RIGHT registers and the number of guard cells is configured using CFAR_GUARD_INT register (Figure 7-123). The number of samples used for left side noise averaging is given by 2*CFAR_AVG_LEFT. The number of samples used for right side noise averaging is given by 2*CFAR_AVG_RIGHT. The number of guard cells that are ignored on each side of the cell under test is given by CFAR_GUARD_INT. For example as shown in Figure 7-124, if CFAR_AVG_LEFT = CFAR_AVG_RIGHT = 16, and CFAR_GUARD_INT = 3, then it means that the most immediate three samples each to the left and right of the cell under test are skipped and then, 32 samples on the left and 32 samples on the right side are used for noise averaging. Note that even though the term noise averaging is used here, the actual implementation simply adds the noise samples first and the “averaging” is done as a divide by a power-of- 2 as specified in a separate register, CFAR_NOISE_DIV. These registers are described in Section 9.1.

Note: The CFAR engine also supports a special “constant threshold mode” of CFAR detection. In this special mode, the detection threshold value to compare with each cell-under-test is based on a user configurable constant – CFAR_DET_THR. This detection threshold value is independent of “surrounding noise level”, and the detection comparison depends only CFAR_DET_THR, CFAR_THR_SCALE, and CFAR_LOG_MODE. This mode of operation can be achieved by setting the engine in CFAR-CA mode and additionally setting CFAR_AVG_LEFT = CFAR_AVG_RIGHT = 0. In this constant threshold mode, CFAR_THRESH scalefactor is multiplied with CFAR_DET_THR in the linear mode, and in the logarithmic mode the threshold scale factor is added.

In case of CFAR-CA, the valid values for CFAR_AVG_LEFT and CFAR_AVG_RIGHT is any number between 0 and 63 (except 1), which means that the number of samples each on the left side and right side used for noise averaging can be one of 0, 4, 6, 8, 10, 12, 14, … 124, 126. The values of CFAR_AVG_LEFT and CFAR_AVG_RIGHT can be different in cyclic mode of CFAR and need to be equal in non-cyclic mode (both are described in a later section).

However, in the case of CFAR-OS, the valid values for CFAR_AVG_LEFT and CFAR_AVG_RIGHT are highly restricted. They need to be equal (i.e., same window size on left and right sides) and further, the only values supported for these registers in CFAR-OS mode are: 0, 4, 6, 8, 12, 16, 24 and 32 (which corresponds to number of samples being 0, 8, 12, 16, 24, 32, 48 and 64 on either side). Note that the register CFAR_NOISE_DIV, which is used in CFAR-CA for noise “averaging”, is not applicable in case of CFAR-OS.

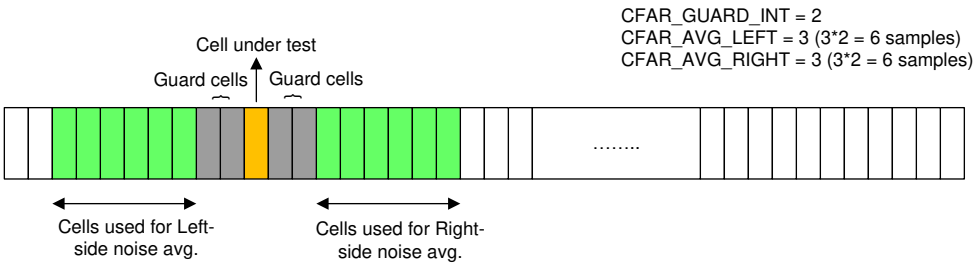

Figure 7-124. CFAR-CA: Cells Used for Surrounding Noise Average

As mentioned earlier, the CFAR_THRESH register specifies the threshold scaling factor. This is an 18-bit register whose value is used to either multiply or add to the 'surrounding noise average' to determine the threshold used for detection of the present cell under test. If logarithmic mode is disabled (in magnitude or magnitude-squared mode), then the register value is multiplied with the surrounding noise average to determine the threshold, else it is added to the surrounding noise average. In the former case, this 18-bit register is interpreted as a 14.4 value and supports a range of values from 1/16 to 2^14-1. In the latter case (logarithmic mode), the 18-bit register is interpreted as a 7.11 value.

The CFAR engine supports a few output formats that are described next.

7.4.8.1.2 CFAR Engine – Output Formats

As part of CFAR detection, the cells that exceed the threshold are noted and this 'Detected Peaks list' is sent to the destination memory. Since the output format of the core computational unit is 24-bits I and 24-bits Q, the detected peaks list is formatted into 'I' and 'Q' channels as shown in Figure 7-125 below. The 24-bit I channel contains the index at which the peak is detected, with the MSB 12 bits containing the iteration number (corresponding to BCNT counter value) and the LSB 12 bits containing the sample index number (corresponding to SRCACNT counter value). The 24-bit Q channel contains the surrounding noise level value or the cell under test value of that detected peak. This is chosen based on CFAR_OUT_MODE register setting. Instead of 'Detected Peaks list', it is also possible for the CFAR engine to send out the raw 'surrounding noise level' value for each cell. This is called 'Raw output mode'.

Figure 7-125 and Table 7-92 show the different output formats available.

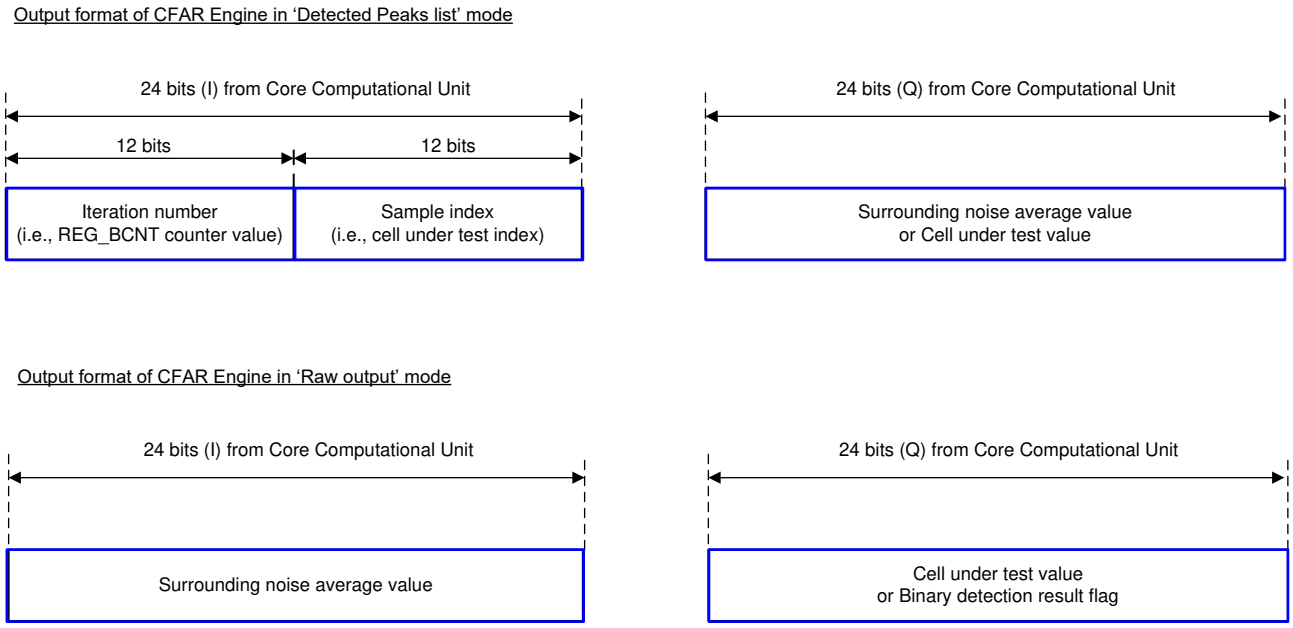

Figure 7-125. CFAR Engine Output Format

In detected peaks list mode, only the detected peaks are output to the destination memory. In this case, the read-only register CFARPEAKCNT indicates how many peaks have been totally detected, so that the main processor can read that many locations from the destination memory. In this mode, the number of peaks stored in the destination memory is limited to a maximum of 4095, or DSTACNT, whichever is smaller. If more peaks are detected beyond this number, they wrap around and circularly overwrite the same locations in the destination memory. Also, in this mode, the register DSTBINDX is not applicable and is ignored.

While detecting peaks, if 'peak grouping' is required, then it can be enabled using CFAR_GROUPING_EN register. In this case, a peak is declared as detected only if it the cell under test exceeds the threshold, as well as, if the cell under test exceeds the two neighboring cells to its immediate left and right (the peak is a local maximum).

Further, there is a special mode of the CFAR Engine called "Dominant peaks mode". This mode can be used to create a modified copy of the range FFT output, where the range FFT bins corresponding to large objects are kept as is, and the range FFT bins which do not correspond to large objects are masked (zeroed out). In this special mode of the CFAR engine, the CFAR engine takes complex (I & Q) input samples and the CFAR engine outputs values that are simply equal to its input values at the sample indices corresponding to the detected peaks, and outputs zeros at all other sample indices. This thereby gives an output array which is the same as the input array AND'ed with the binary CFAR peak detection flags. Note that this special mode is only meaningful when the CFAR input is complex , i.e., when CFAR_INP_MODE = 0. The purpose of this "Dominant Peaks mode" is to re-construct interference affected samples, where this mode can be used to extract the FFT output bins corresponding to large peaks and later, doing an IFFT on this output to re-construct the time domain signal corresponding only to dominant peaks.

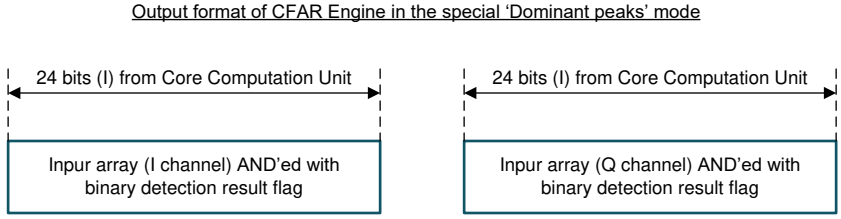

Figure 7-126. CFAR Engine Output Format in Dominant Peaks Mode

Table 7-92. CFAR Output Modes and Register Settings

CFAROutput Mode	IChannel Output	QChannel Output	Register Settings (CFAR_ADV_OUT_MODE, CFAR_OUT_MODE)
Rawoutput mode (all cells are output)	Surrounding noiselevel	Cellunder test value	(0,00)
	Surrounding noiselevel	Binary detectionresult flag (0 or 1)	(0,01)
Detectedpeaks list mode (only detected peaks are output)	Peak index	Surrounding noiselevel value	(0,10)
	Peak index	Cellunder test value	(0,11)
Dominant peaks mode	Reserved	Reserved	(1,00)
	Input array (I channel) AND'ed with binary detection result flag	Input array (Q channel) AND'ed with binary detection result flag	(1,01)

7.4.8.1.3 CFAR Engine – Cyclic vs. Non-Cyclic

The register CFAR_CYCLIC specifies whether the CFAR detector needs to work in cyclic mode or in non-cyclic mode. In general, the programmed number of samples for noise level computation (specified by CFAR_AVG_RIGHT and CFAR_AVG_LEFT) are available fully only for the cells under test which are in the middle of the input array (Figure 7-127). For first several cells under test, the available number of samples to the left is lesser than the programmed number. Similarly, for the last several cells under test, the available number of samples to the right is lesser than programmed.

In cyclic mode (Figure 7-128), this is handled by wrapping around the edges in a circular manner. For a cell under test near the left edge, some samples from the right edge (circular wrap around the edge) are fetched to collect the programmed CFAR_AVG_LEFT number of left side samples for noise level computation. Similarly, for a cell under test near the right edge, an appropriate number of samples from the left edge are used (again, circular wrap around the edge).

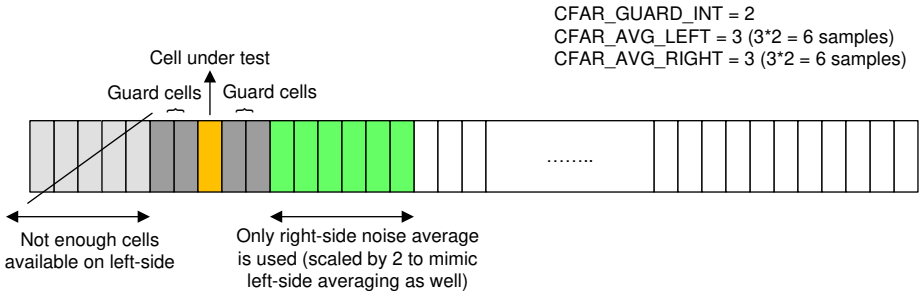

Figure 7-127. Handling of Samples Near the Edge in Non-Cyclic Mode

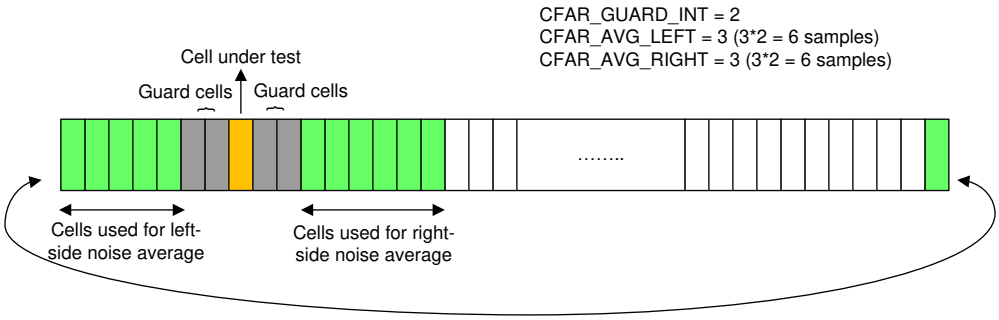

Figure 7-128. Handling of Samples Near the Edge in Cyclic Mode

This cyclic CFAR implementation is accomplished through a combination of a few register settings within the CFAR engine, as well as in the input and output formatter blocks. Specifically, the input formatter is configured to send additional samples (repeat samples) in a circular manner wrapping around the left and right edges. This is achieved by using the A-dimension circular shift (SRCA_CIRCSHIFT) and wrap-around (SRCA_CIRCSHIFTWRAP) registers in the input formatter, such that the required number of extra samples at both edges are streamed into the CFAR engine. The cyclic CFAR mode only works when the number of cells under test is a power of 2.

For example, if the number of cells under test is 256, the average number of left and right noise samples is 32 each and the number of guard cells is 3 on either side. Then, the registers need to be programmed as shown in Table 7-93.

Table 7-93. Configuration Example for CFAR Cyclic Mode

Module	RegisterSetting	Comments
CFAREngine	CFAR_GUARD_INT= 3	3guard cells on either side
	CFAR_AVG_LEFT= 16 CFAR_AVG_RIGHT= 16	32samples on left side and 32 samples on right side for noise averaging
Input Formatter	SRCACNT =325	255+ (32+3) + (32+3), where 255 is the usually configured value of SRCACNT for a 256 sample vector, plus 32+3 additional samples for circular repeat at either end
	SRCA_CIRCSHIFT= 221	256– (32+3), which is the starting offset for the circular shift, so that samples are streamed into CFAR engine start from this point
	SRCA_CIRCSHIFTWRAP= 8 SRC_CIRCSHIFTWRAP3X = 0	The circularwrap-around happens when SRCACNT counter value reaches 2^SRCA_CIRCSHIFTWRAP = 256
Output Formatter	REG_DST_SKIP_INIT= 0	Noneed to skip any samples at Output Formatter even though extra samples are fed into CFAR engine, because CFAR engine automatically strips out the extra samples
	DSTACNT= 255	256outputs corresponding to 256 cells

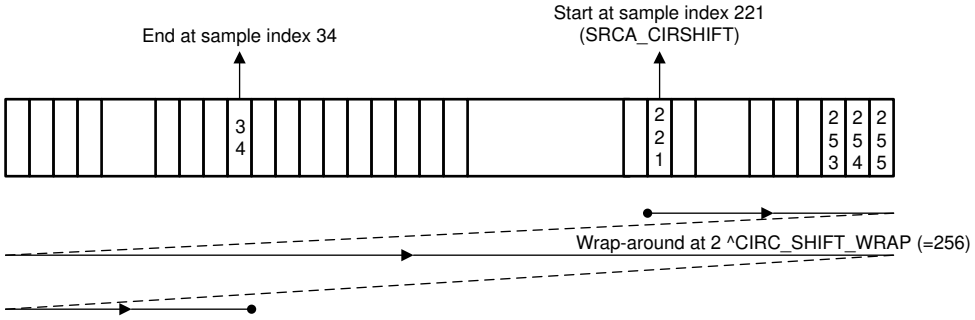

Figure 7-129. Input Formatter Sample Streaming for the Cyclic CFAR Example

However, the handling of edge samples in non-cyclic mode of CFAR is different. It is explained below – first for CFAR-CA and then for CFAR-OS versions.

In non-cyclic mode of CFAR-CA, if the number of available samples on the left for any cell under test is lesser than CFAR_AVG_LEFT, then the noise average is computed solely from the right side. This is done by calculating the noise sum as twice the right side noise sum. Similarly, if the number of available samples on the right is lesser than CFAR_AVG_RIGHT, then the noise average is computed solely from the left side. This is done by calculating the noise sum as twice the left side noise sum. It is required that the CFAR_AVG_LEFT and CFAR_AVG_RIGHT be programmed equally in non-cyclic mode – otherwise, the noise computation for the edge samples is not ideal.

In non-cyclic mode of CFAR-OS, the edge samples are handled as follows. For the cells under test that are near the edges, the number of available surrounding samples for sorting is lesser than programmed (CFAR_AVG_LEFT or CFAR_AVG_RIGHT). These available samples are first sorted and the Kth lowest value is selected as the noise level. It should be noted that this Kth lowest sample in the available samples may result in a sub-optimal noise level for edge samples than non-edge samples because the number of available samples is lesser for edge samples than for non-edge samples. A minor variant for better handling this edge sample case can be enabled by setting the register CFAR_OS_NONCYC_VARIANT_EN to 1. In that case, available samples are first sorted. But instead of using the programmed K value directly for noise sample selection from the sorted array, a proportionally scaled down value is used based on the number of available surrounding samples for each cell under test. This is illustrated in Table 7-94 below, where, L represents the programmed

CFAR_AVG_LEFT (same as CFAR_AVG_RIGHT) and K represents the programmed CFAR_OS_KVAL. It is required that the CFAR_AVG_LEFT and CFAR_AVG_RIGHT be programmed equally in non-cyclic mode.

Table 7-94. Internal K Value used in CFAR-OS Non-Cyclic Mode

No. of available samples on one side (excluding guard)	No. of available samples on the other side (excluding guard)	Internal K value used for noise sample selection (CFAR_OS_NON_CYC_ VARIANT_EN = 0)	Internal K value used for noise sample selection (CFAR_OS_NON_CYC_ VARIANT_EN = 1)
L	0 to floor(L/4)-1	K	floor (4K/8)
L	floor(L/4) to floor(2L/4)-1	K	floor (5K/8)
L	floor(2L/4) to floor(3L/4)-1	K	floor (6K/8)
L	floor(3L/4) to floor(4L/4)-1	K	floor (7K/8)
L	L	K	K

In general, it is expected that CFAR Engine will be used for arrays much larger than the configured left and right window and guard lengths. Specifically, the ACNT should exceed the sum of configured left and right window and guard lengths.

7.4.8.2 CFAR Engine – Register Descriptions

Table 7-95 lists all the registers of the CFAR engine block.

Table 7-95. CFAR Engine Registers

Register.field	Width	Parameter-Set? (Y/N)	Description
CFAR_AVG_LEFT	6	Y	Number of left-side samples for noise level computation: This register is used to specify the number of samples used for noise level computation to the left of the cell under test. The number of samples used for noise level computation is equal to the value of this register multiplied by 2. For example, if this register value is 15, then the number of left- side samples used for averaging is 30. The maximum number that is possible is 126. A value of zero in this register means that the noise samples on the left side are not used for noise level computation. The valid values for this register are different for CFAR-CA and CFAR-OS modes: In CFAR-CA (and its variants CFAR-CAGO and CFAR-CASO), valid values for this register are 0, 2, 3, 4, …63 (Note that avalue of 1 is not supported). This corresponds to number of samples equal to 0, 4, 6, 8, 10, 12, 14, … 124, or 126. In CFAR-OS mode, valid values for this register are restricted to 0, 4, 6, 8, 12, 16, 24, 32 only (which corresponds to number of samples equal to 0, 8, 12, 16, 24, 32, 48 or 64).
CFAR_AVG_RIGHT	6	Y	Numberof right-side samples for noise level computation: This registeris very similar to the above, except that this register specifies the averaging to the right of the cell under test. In most cases, it is expected that CFAR_AVG_RIGHT has the same value as CFAR_AVG_LEFT. In non-cyclic modes of CFAR, CFAR_AVG_RIGHT must be programmed equal to CFAR_AVG_LEFT.

Table 7-95. CFAR Engine Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
CFAR_GUARD_INT	3	Y	Numberof guard cells: This registerspecifies the number of guard cells to ignore on either side of the cell under test. If this register value is 3, then three guard cells on the left side and three guard cells on the right side are ignored. Only the noise samples beyond this guard region are used for calculating the surrounding noise level.
CFAR_OS_KVALUE	7	Y	K-th value for ordered statistic: This register is useful only in CFAR-OS mode, where it indicates the parameter K. From the sorted list of left and right noise samples, the K'th lowest value is used as the noise sample. This is a zero-based count – for instance, if this register value is 27, then the 28th lowest element in the sorted array is selected. Note that since CFAR-OS supports a maximum of 64 samples each on left and right side, the maximum size of the vector to sort is 128, and hence the maximum valid value of CFAR_OS_KVALUE register is 127.
CFAR_OS_NON_CYC_VARIANT_EN	1	Y	Enable scaling of K value for edge samples in non-cyclic CFAR-OS: This is useful only in CFAR-OS in non-cyclic mode. Setting this to 1 enables a variant where the K value used for noise sample selection for edge samples is scaled down proportional to the number of available neighboring samples at edges.
CFAR_THRESH .cfar_thresh	18	N	Threshold scalefactor: This registeris used to specify the threshold scale factor. This value is used to either multiply or add to the 'surrounding noise level' to determine the threshold used for detection of the present cell under test. If logarithmic CFAR mode is disabled (in magnitude or magnitude-squared mode), then the register value is multiplied with the surrounding noise level to determine the threshold, else it is added to the surrounding noise level. In the former case, this 18-bit register is interpreted as a 14.4 value. In the latter case (logarithmic mode), the 18-bit register is interpreted as a 7.11 value.
CFAR_DET_THRESH.cfar_det_thresh	24	N	Constant detection threshold value in constant threshold mode: This register is applicable only in constant threshold mode of CFAR (i.e. only in CFAR-CA mode and only if CFAR_AVG_LEFT = CFAR_AVG_RIGHT = 0). In this special mode, this register specifies the detection threshold value used to compare with cell under test. The detection threshold value is held constant, and scaled by CFAR_THRESH linearly or logarithmically

Table 7-95. CFAR Engine Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
CFAR_LOG_MODE	1	Y	CFARlinear or logarithmic mode: This registeris one of the registers used to specify whether the CFAR detector operates in linear or logarithmic mode. If this register bit is set, then the CFAR detector operates in logarithmic mode, which means that the threshold scale factor is added to (instead of multiplied with) the surrounding noise level value to determine the threshold. Note that this mode is meaningful only when the input samples to the CFAR detector are log- magnitude samples (see CFAR_INP_MODE as well). If this register bit is 0, then the logarithmic mode is disabled, in which case, the threshold scale factor is multiplied with (instead of added to) the surrounding noise level to determine the threshold. This mode is meaningful when magnitude or magnitude-squared samples are fed to the CFAR detector.
CFAR_INP_MODE	1	Y	CFARengine input mode: This registerbit specifies whether the inputs to the CFAR engine are complex samples or real values (the real values are already magnitude, magnitude-squared or log-magnitude numbers that can be directly sent to CFAR detection process). If this register bit is 1, then the input samples are real values and are directly sent to CFAR detection. If this register bit is 0, then the inputs are complex samples and hence either magnitude or magnitude- squared or log-magnitude computation is required prior to CFAR detection. Which of the three, viz., magnitude or magnitude-squared or log-magnitude is done, is selected by CFAR_ABS_MODE register described below.
CFAR_ABS_MODE	2	Y	CFARmagnitude, mag-squared or log-mag mode: This registeris used to specify which of the three computations, namely Magnitude, Mag- squared or Log-Magnitude, is enabled inside the CFAR engine prior to CFAR detection. This register is only relevant when CFAR_INP_MODE is 0 (complex samples are fed to CFAR engine). 00b– Magnitude-squared 01b – Not valid 10b– Magnitude (using JPL approximation) 11b– Log2-Magnitude (using LUT approximation)

Table 7-95. CFAR Engine Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
CFAR_OUT_MODE	2	Y	CFARengine output mode: The MSBbit of this register selects whether the CFAR Engine outputs all the noise average values for all the cells (‘Raw output’ mode), or whether the CFAR Engine outputs only the detected peaks (‘Detected Peaks List’ mode). The LSB bit specifies the content of the 24-bit ‘I’ and ‘Q’ channel outputs logged in destination memory. If CFAR_ADV_OUT_MODE is set to 1 (special mode called “Dominant peaks”), this register should be set to 1. Refermain description section for details.
CFAR_ADV_OUT_MODE	1	Y	CFARengine special output mode (Dominant peaks mode): This register bit enables the special “Dominant peaks” mode of the CFAR engine. In this mode, the CFAR engine outputs the input array (I and Q) samples corresponding detected peak locations as is and suppresses the non-detected peak locations (sends zeros).
CFAR_GROUPING_ EN	1	Y	CFARpeak grouping enable: This registerbit specifies whether peak grouping should be enabled. When this register bit is 0, peak grouping is disabled, which means that a peak is declared as detected as long as the cell under test exceeds the threshold. On the other hand, if this register bit is 1, then a peak is declared as detected only if it the cell under test exceeds the threshold, as well as, if the cell under test exceeds the two neighboring cells to its immediate left and right (local maximum).
CFAR_NOISE_DIV	4	Y	CFARnoise average division factor: This parameter is applicable only in CFAR-CA modes and it is not applicable in CFAR-OS mode. This registerspecifies the division factor with which the noise sum calculated from the left and right noise windows are divided, in order to get the final surrounding noise average value. The division factor is equal to 2^ CFAR_NOISE_DIV. Therefore, only powers-of-2 division are possible, even though the number of samples specified in CFAR_AVG_LEFT and CFAR_AVG_RIGHT are not restricted to powers of 2. The surrounding noise average value obtained after the division is multiplied or added with CFAR_THRESH to determine the final threshold used to compare the cell under test for detection. The maximum allowed value for this register is 8, which gives a division factor of 256.

Table 7-95. CFAR Engine Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
CFAR_CA_MODE	2	Y	CFARnoise averaging mode: This registerconfigures the noise averaging mode in the CFAR detector from one of these options – CFAR-CA, CFAR-CAGO, CFAR-CASO, CFAR-OS. 00b– CFAR-CA 01b– CFAR-CAGO 10b– CFAR-CASO 11b– CFAR-OS
CFAR_CYCLIC	1	Y	CFARcyclic vs. non-cyclic mode: This registerbit specifies whether the CFAR detector needs to work in cyclic mode or in non-cyclic mode. When this register bit is 0, the CFAR detector works in non-cyclic mode and when it is 1, it works in cyclic mode. Refer main description section for details on how to configure and use cyclic mode.
CFAR_PEAKCNT.cfar_peakcnt	12	N	CFARdetected peak count: This isa read-only register that contains the number of detected peaks that are logged in the destination memory, when CFAR Engine is configured in 'Detected Peaks List' mode. In the Detected Peaks List mode, since only the detected peaks are logged in the destination memory, this read-only register provides the number of detected peaks that are logged to the main processor, so that the main processor can determine how many entries to read from the destination memory.

7.4.9 Core Computational Unit – Statistics

This section describes the statistics block present in the core computational unit.

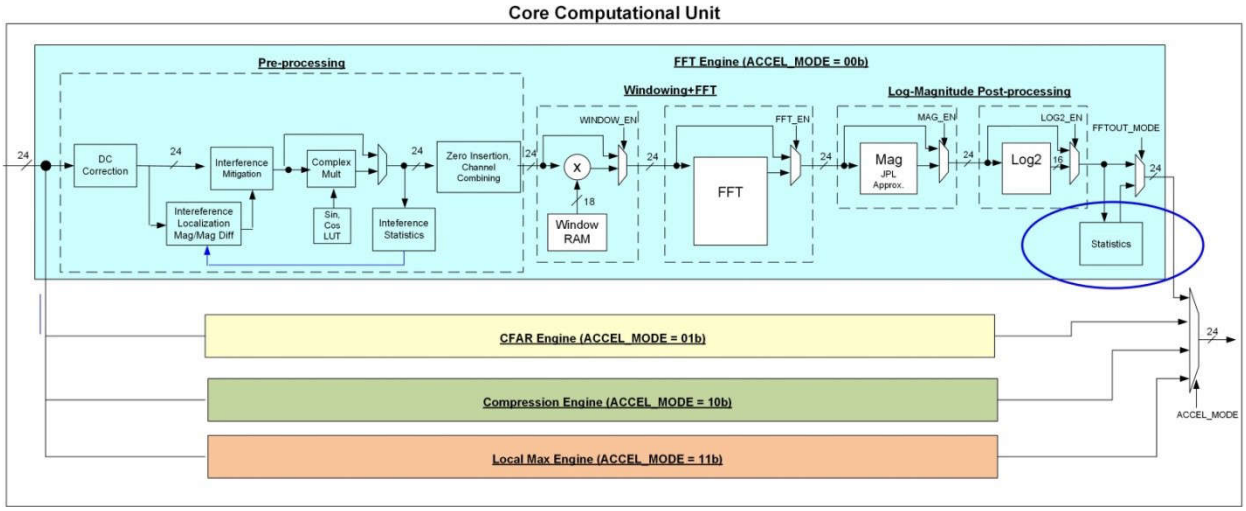

Figure 7-130. Statistics Block

7.4.9.1 Statistics Block

The corecomputational unit has a statistics computation block at the end of the FFT Engine path as shown in Figure 7-130. It can be used to compute a few simple statistics of the samples output by the core computational unit. It supports computing statistics on 1- and 2-dimensional array inputs.

With 1-dimensional array input, it can compute sum and maximum of samples. It also supports a few advanced features, with 2-dimensional array inputs. It can compute 2 arrays of maxima (one in each dimension) and multiple histograms or cumulative distribution functions (CDFs) of the input samples (one histogram for each sample index).

The simple basic mode of operation is described first. The advanced features are described in separate later sub-sections.

7.4.9.1.1 Basic Statistics Block – Operation

The 24-bit I and 24-bit Q output of the core computational unit goes to a statistics computation block. The purpose of this block is to find the maximum and sum (average) of the output samples

The sum and max statistics are computed on a 'per-iteration' basis (the sum and max values are logged at the end of each iteration) and the computation is reset for the next iteration. The sum and max values are logged in register-sets (see MAXn_VALUE, MAXn_INDEX, ISUMn, QSUMn register-sets), which can be read by the main processor. However, only four such registers are provided for each statistic and therefore, the sum and max values can be logged in these registers only for up to a maximum of four iterations.

The max statistics register-set comprises four read-only registers of 24 bits each, named MAXn_VALUE, for recording max values, and four read-only registers each 12 bits unsigned, named MAXn_INDEX, for recording the max indices. The sum statistics register-set contains four registers of 36 bits each, named ISUMn, for I-sum statistics, and 4 registers of 36 bits each, named QSUMn, for Q-sum statistics.

For larger number (>4) of iterations, either the sum or the max value can be sent to the destination memory for each iteration, which allows the statistic to be available even for cases with more than four iterations. The logging of the statistic into the destination memory is enabled using FFT_OUTPUT_MODE register described below.

The MSB bit of the FFT_OUTPUT_MODE (Table 8) register selects whether the default (main) output of the core computational unit goes to the destination memory, or the statistics block output. If the MSB of this 2-bit register is 0, then it selects the default mode of operation, where the main output (FFT or Log-Mag result) is sent to the destination memory. If the MSB is 1, then it selects the statistics output mode, where either the sum or max statistic is sent to the destination memory (one value per iteration). Whether the sum or max is sent to memory is dependent on the LSB bit. If the LSB bit is 0, then the statistic value that is sent is the max value (useful in conjunction with Log-Mag enabled to find the biggest peak and peak index per iteration). Here, the I output is the maximum value itself and the Q output is the index (location) of the maximum value. If the LSB bit is 1, then the statistic value that is sent is the sum value (useful for DFT mode, as well as for mean squared or mean of absolute values computation).

Table 7-96. Statistics Output Modes

FFT_OUTPUT_MODE Register	IChannel Output	QChannel Output
00b– Default output mode	Main output of core computational unit	
10b– Max statistics output (One output per iteration)	MaxValue	MaxIndex
11b– Sum statistics output (One output per iteration)	Sum ofI values	Sum ofQ values

The max statistic records the maximum value (and its index) of the magnitude or log-magnitude samples corresponding to every iteration. The sum statistic records the sum of the magnitude or log-magnitude or the complex output samples corresponding to each iteration. If the main output of the core computational unit is the complex FFT output (ABS EN=0 and LOG2EN=0), then the sum statistics is the complex sum.

The complex sum statistics mode is useful when used in conjunction with the complex multiplier block in DFT mode or vector multiplication mode. For example, the sum statistic computed here, together with the DFT mode of the complex multiplier block, enable DFT computation for the desired number of bins (iterations). When the desired number of bins is more than 4, the sum statistic can be sent to destination memory (instead of the main data output that is normally sent to the destination memory).

Notethat when the sum statistics is logged into the destination memory, it goes through the Output Formatter block as only 24-bits each for I and Q (same bit-width as the primary FFT outputs). Hence, the computed sum statistics value of 36-bits width, needs to be scaled down by right-shifting the appropriate number of LSBs (using FFTSUMDIV register) before sending to output formatter. Thus, when logging the statistics in destination memory, the sum statistics is to be used as an “average” value, rather than a “sum” value itself.

The FFTSUMDIV register specifies the number of bits to right-shift the sum statistic before it is written to destination memory. The internal sum statistic register is 36-bits wide (allowing 12 bits of MSB growth of the 24-bit data path), but this statistics value needs to be scaled down to 24 bits to match the data path width going to the Output Formatter. This register specifies how many LSBs to drop to convert the sum statistics to 24-bit value. Note that when ABS_EN = 1, unsigned saturation is implemented, else the saturation is signed. The FFTSUMDIV register specifies how many LSBs to drop to convert the sum statistics to 24-bit value. Therefore, it is recommended that this register is configured to drop an appropriate number of LSBs such that incorrect saturation in case of magnitude sum is avoided.

Notethat in statistics output mode, the registers DSTACNT, DSTAINDX, DSTBINDX, DST16b32b and DSTREAL are not meant to be used, since it is known that there is only one value to be written to destination memory for every iteration in a specific format. It is recommended that in this mode, DSTACNT be programmed to a value of 0, DSTAINDX and DSTBINDX are both programmed to a value of 8 bytes, DST16b32b is set to 1 and DSTREAL is reset to 0. The statistics is then always logged in the destination memory as consecutive 32-bit I and Q samples, irrespective of whether sum statistic or max statistic is being logged.

7.4.9.1.2 Statistics Block – Register Descriptions

Table 7-97 lists all the registers of the statistics block.

Table 7-97. Statistics Block Registers

Register.field	Width	Parameter-Set? (Y/N)	Description
MAX<n>_VALUE.max<n>_value n=1..4	24	N	Max value: These registers contain the max value on a per-iteration basis. These registers are meaningful only when Magnitude or Log-Magnitude is enabled. Only the max values for up to four iterations are recorded in these registers. For larger number of iterations, use statistics output mode (FFT_OUTPUT_MODE below).
MAX<n>_INDEX.max<n>_index n=1..4	12	N	Maxindex: These registerscontain the max index on a per-iteration basis, corresponding to each max value in the MAXn_VALUE registers.

Table 7-97. Statistics Block Registers (continued)

Register.field	Width	Parameter-Set? (Y/N)	Description
I_SUM<n>_LSB. I_sum<n>_lsb I_SUM<n>_MSB.i_sum<n>_msb Q_SUM<n>_LSB. Q_sum<n>_lsb Q_SUM<n>_MSB. Q_sum<n>_msb	32 4 32 4		Sum statistics: These registerscontain the sum of the I outputs and Q outputs on a per-iteration basis. Only the statistics for up to four iterations are recorded in these registers. For larger number of iterations, use statistics output mode (FFT_OUTPUT_MODE below). Note that both for sum and max the results of last iteration are placed in <n=1> register, the penultimate in <n=2> and so on.
FFT_OUTPUT_ MODE	2	Y	FFT Path outputmode: This registerspecifies the output mode of the FFT path. Instead of the default mode where the main output of the core computational unit is sent to the destination memory, this register can be configured such that either the max or sum statistics can be sent to the destination memory. 00b– Default mode (main output) 10b – Max statistics output mode 11b – Sum statistics output mode
FFTSUMDIV.fftsumdiv	5	N	Right-shiftingfor Sum statistic: This registerspecifies the number of bits to right-shift the sum statistic before it is written to destination memory. The internal sum statistic register is 36-bits wide (allowing 12 bits of MSB growth of the 24-bit data path), but this statistics value needs to be scaled down to 24 bits to match the data path width going to the Output Formatter. This register specifies how many LSBs to drop to convert the sum statistics to 24-bit value.

7.4.9.1.3 Advanced Statistics – 2-Dimensional Maxima

The Statistics block can be used to compute 2 arrays (one in each dimension) of maxima on the input samples. This feature can be enabled by setting the register, MAX2D_EN to 1.

For each iteration, the maximum value observed and the corresponding sample index are stored in per-iteration RAMs. Similarly, for each sample index, the maximum value observed over all the iterations and the corresponding iteration index are stored in per-sample RAMs. Thus, as shown in Figure 7-131 the results include (value, location) pairs stored on a per-iteration basis and per-sample index basis. These RAMs are a part of the

Advanced Statisitics Memories. This feature supports SRCACNT (samples) in the range of 1 to 255 and BCNT (iteration) in the range of 0 to 1023.

The processor as well as the local maxima computation engine can access the Advanced Statistics Memories. This allows the 2D maxima to be used as thresholds in the local maxima computation steps.

Local Maxima peak detector can be configured to use the max value RAMs as arrays of thresholds. The max value and max index RAMs can also be read and modified by the CPU/DSP. This allows flexible and application specific control on the peak detection thresholds. The data read/write format for the 2Dmax output RAMs are described in the table of Advanced Statistics Memories (Table 7-100).

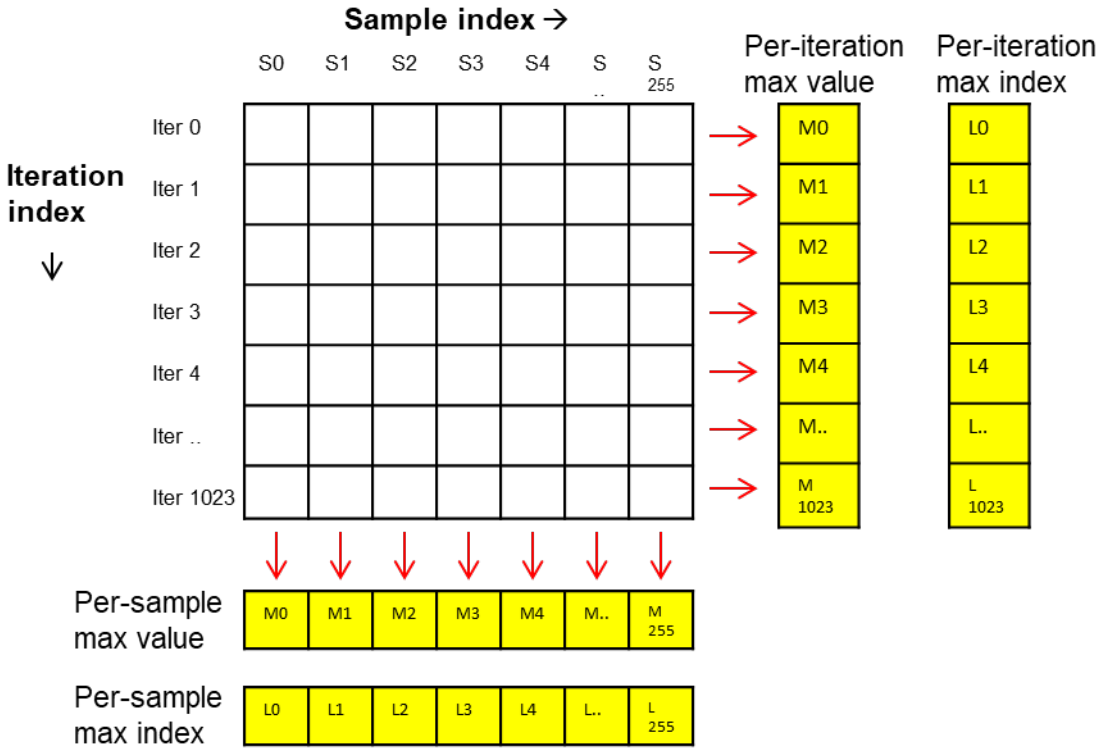

Figure 7-131. 2D Max Advanced Statistics Computation

7.4.9.1.4 Advanced Statistics – Histograms, CDF, and CDF Count Threshold

The Statistics block can compute the histograms or CDFs of the input samples. The statistics block can also be used to calculate a detection threshold based on the CDF.

The histogram function operates on a 2-D matrix of input samples. The ACNT (or 2^FFT_SIZE) number of samples received in a single iteration constitute the “sample” dimension. BCNT+1 iterations of the sample dimension data are received, which constitutes the “iteration” dimension. One histogram is computed for each sample index using values received across all iterations corresponding to that sample index as shown in figure below.

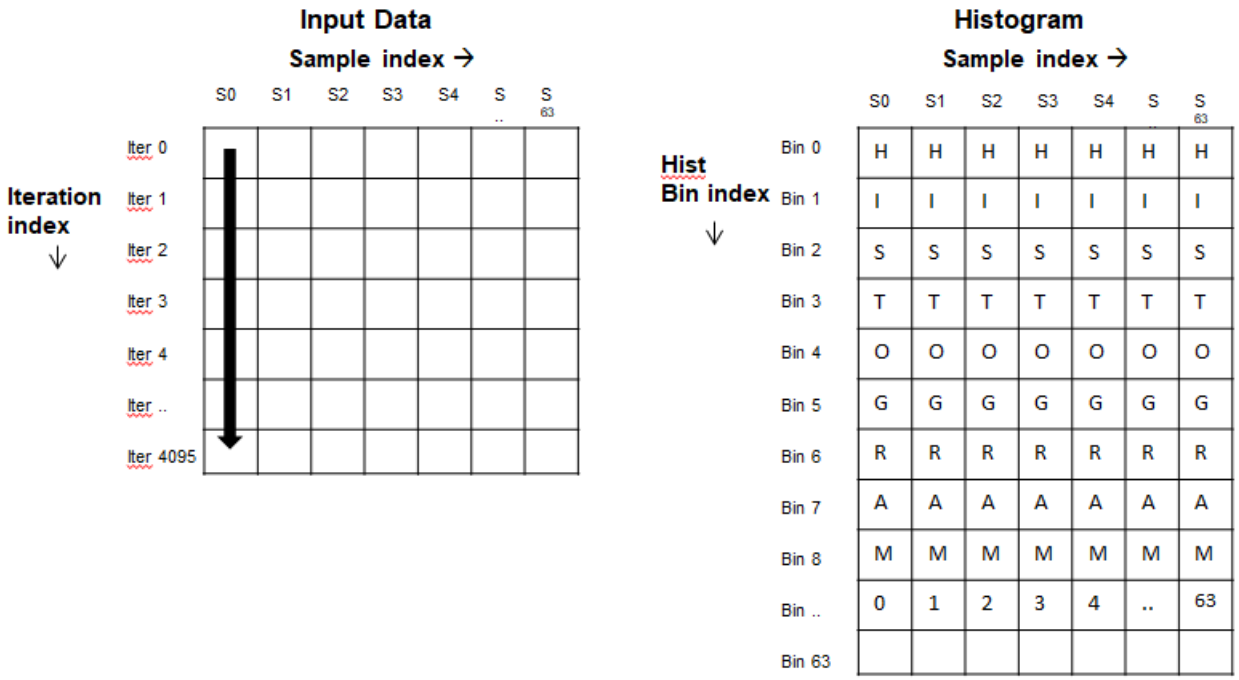

Figure 7-132. Advanced Statistics Histogram Computation

The results are stored in corresponding RAMs which are part of the Advanced Statistics Memories. The register HIST_MODE can be used to enable this feature and select the exact operation mode as mentioned in the table below. MEM_INIT_START bit 13 & 14 should be set to start the Histogram Memory initialization. MEM_INIT_DONE bit 13 & 14 indicates the histogram Memory initialization completion. If 2-D FFT feature is enabled in any parameter set, it is recommended that the advanced 2D statistics feature be disabled in that parameter set.

Table 7-98. Histogram Operating Modes

HIST_MODE	Histogram Statistics Computation
00	Disabled: In this mode, the histogram computation is totally bypassed and the Histogram RAM is retained in its existing state.
01	Histogram computation mode: In this mode, histograms are computed, one histogram per sample index. The histograms are stored in the Histogram RAM.
10	CDF count computation mode: In this mode, CDF counts are computed, one CDF per sample index. The CDF count range (0, number of iterations programmed) maps to the CDF range (0, 1). The CDFs are stored in the Histogram RAM. The CDF count computation needs additional computation time over and above the histogram computation mode. The number of histogram bins times the number of histograms is the number of additional cycles..

Table 7-98. Histogram Operating Modes (continued)

HIST_MODE	Histogram Statistics Computation
11	CDF threshold computation mode: In this mode, histograms are computed similar to the histogram computation mode. Additionally, for the purpose of computing a detection threshold, information about the histogram bin at which the corresponding CDF would just exceed the programmed register, CDF_CNT_THRESH, is calculated and reported through CDF_CNT_BINNUM. The corresponding CDF and histogram values at that bin are reported through CDF_CNT_CDFVAL and CDF_CNT_HISTVAL.

The histograms are computed on a per-sample-index basis. Up to 64 histograms can be computed. The valid range of SRCACNT for this feature is 1 to 63. The histogram size (number of bins) is programmable (from 8 to 64, in powers of 2) using the register HIST_SIZE_SEL. The bins are uniformly spaced. It should be noted that histogram resolution is optimal if input is in log-magnitude mode rather than linear-magnitude. Since the log-magnitude mode gives outputs with high precision (in 5.11u format, i.e. 5 integer bits, 11 fractional bits, unsigned), they can be scaled down through a programmable right shift before histogram computation, using the register HIST_SCALE_SEL. Valid values for HIST_SCALE_SEL are 7, 8, 9, 10, 11, 12 and 13. The HIST_SIZE_SEL and the HIST_SCALE_SEL registers are explained in Figure 7-133.

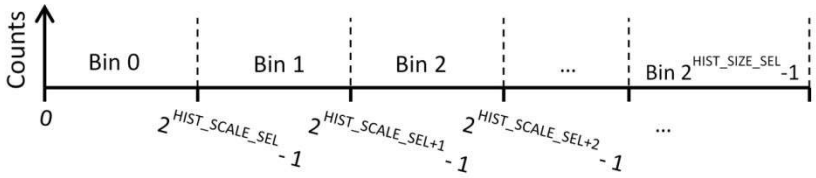

Figure 7-133. HIST_SCALE_SEL and HIST_SCALE_VAL Configuration

It should be noted that the input samples that exceed the highest bin are counted in the histogram's highest bin index. Also, if any bin's count (i.e. the number of occurrences) exceeds the bit-width allocated in the histogram output memory, then the count is clipped to the maximum level.

As an illustration, if SRCACNT = 31, BCNT = 767, HIST_SIZE_SEL = 4, HIST_SCALE_SEL = 10, and HIST_MODE = 0b01, then 32 histograms, each with 16 bins are computed and stored in the Histogram RAM. The bins correspond to the input ranges, [0 to 1023], [1024 to 2047], …, [14*1024 to 15*1024 -1], [>/= 15*1024]. In each of the 32 histograms, the sum of all bin values will match 768. This example assumes that the pre-processing block's channel combining and zero insertion features are not enabled. If they are enabled, then the number of histograms will match the resultant number of samples in A-dimension after the channel combining and zero insertion operations.

The contents of the Histogram RAM can be read by the CPU/DSP and may be utilized to update the threshold arrays for Local Maxima peak detection. The Histogram RAM can be read with the format explained in table of the Advanced Statistics Memories (Table 7-101).Histogram RAMs needs to be initialized before enabling histogram/CDF/Threshold operations in any parameter set. This can be done by setting the MEM_INIT_START_HIST_ODD_RAM and MEM_INIT_START_HIST_EVEN_RAM self-clearing bits described in register description below.

In HIST_MODE = 0b11, the CDF_CNT_BINNUM (bin number where CDF just exceeds the programmed CDF_CNT_THRESH) for each sample is stored along with the corresponding CDF_CNT_CDFVAL and CDF_CNT_HISTVAL. These values are stored in the CDF Threshold RAM which can be read with the format as explained in the Advanced Statistics Memories (Table 7-101).

7.4.9.1.5 Advanced Statistics Block – Register Descriptions

Table 7-99 lists all the registers of the statistics block.

Table 7-99. Advanced Statistics – Control Registers

Register	Width	Parameter Set	Description
MAX2D_EN	1	Yes	2-Dimensional Maxima Computation Enable: If this bit is set to 1, one maxima (and corresponding index) array for A dimension and another for B dimension are computed and stored in the per-sample and per-iteration RAMs.
HIST_MODE	2	Yes	Histogram Computation Mode: 00: Disable 01: Histogram computation mode 10: CDF computation mode 11: CDF threshold computation mode Refer to the earlier section for details.
HIST_SCALE_SEL	4	Yes	Histogram Input Scale Select: This register isused to select the input scaling before histogram computation. It provides a way to control the resolution of the histogram bins by right-shifting the input sample values before histogram computation. If this register is set to X (and Y=2^X), then the histogram bin ranges are [0, Y-1], [Y, 2Y–1] and so on. Valid values for this register are X=7, 8, 9, 10, 11, 12, and 13.
HIST_SIZE_SEL	4	Yes	Histogram Size Select: This register is used to select the histogram size (number of bins). The size is configurable in powers of 2. The number of histogram bins is 2^HIST_SIZE_SEL. Valid values of this register are 3, 4, 5, and 6. They correspond to histogram sizes of 8, 16, 32, and 64.
CDF_CNT_THRESH.cdf_cnt_thresh	12	No	This register is applicable in CDF count threshold mode of operation. CDF is computed over the histogram till the value of the CDF just exceeds the CDF_CNT_THRESH specified by the user. This register can take values from 0 to BCNT. CDF count threshold value is same for all samples indices (histograms). Value of ‘0’ is not valid.

Table 7-99. Advanced Statistics – Control Registers (continued)

Register	Width	Parameter Set	Description
MEM_INIT_START	32	No	Writing 1'b1 to bit locations – 13 & 14 would start the memory initialization for the Histogram Memory. These are self-clearing bits Bit 13 : MEM_INIT_START_HIST_ODD_RAM Bit 14 : MEM_INIT_START_HIST_EVEN_RAM
MEM_INIT_DONE	32	No	When the memory initialization is complete, then bit locations 13 & 14 shall be 1b'1 Bit 13 : MEM_INIT_DONE_HIST_ODD_RAM Bit 14 : MEM_INIT_DONE_HIST_EVEN_RAM

Table 7-100 lists the contents of the Advanced Statistics Memory.

Table 7-100. Contents of Advanced Statistics Memory Output

RAM content	Width	Description
MAXVAL_ARRAY_DIM1 [1024] DSS_HWA_2DSTAT_ITER_VAL_RAM	24 bits each	2-D Maxima Array – maximum values of each iteration: The maximum value across samples in each iteration is recorded here (one value per iteration, first address corresponding to first iteration).
MAXLOC_ARRAY_DIM1 [1024] DSS_HWA_2DSTAT_SMPL_VAL_RAM	10 bits each	2-D Maxima Array – maximum locations corresponding to each iteration: The sample index at which the maximum value occurred in each iteration is recorded here (one value per iteration, first address corresponding to first iteration).
MAXVAL_ARRAY_DIM2 [256] DSS_HWA_2DSTAT_ITER_IDX_RAM	24 bits each	2-D Maxima Array – maximum values corresponding to each sample index: The maximum value across the iterations for each sample index is recorded here (one value per sample index, first address corresponding to first sample index).
MAXLOC_ARRAY_DIM2[256] DSS_HWA_2DSTAT_SMPL_VAL_RAM	10 bits each	2-D Maxima Array – maximum locations corresponding to each sample:: The iteration count at which the maximum value occurred corresponding to each sample is recorded here (one value per sample index, first address corresponding to first sample index).
DSS_HWA_HIST_RAM HIST_OUT_ARRAY[64][64]	12 bits each	Histogram Output Corresponding to each Sample Index: The number of occurrences in each histogram bin is recorded here for different sample indices.

Table 7-100. Contents of Advanced Statistics Memory Output (continued)

RAM content	Width	Description
DSS_HWA_HIST_THRESH_RAM CDF_CNT_BINNUM [64]	6 bits each	If CDF count threshold mode is enabled: the bin number at which the specified count (CDF_CNT_THRESH) is just exceeded is stored in this register for all the sample indices.
DSS_HWA_HIST_THRESH_RAM CDF_CNT_CDFVAL [64]	12 bits each	Valid when CDF count threshold mode is enabled. This stores the CDF count at CDF_CNT_BINNUM bin for all the sample indices.
CDF_CNT_HISTVAL [64] DSS_HWA_HIST_THRESH_RAM	12 bits each	Valid when CDF count threshold mode is enabled. This stores the Histogram count at CDF_CNT_BINNUM bin for all the sample indices.

Table 7-101 lists the read/write format for Advanced Statistics Memories.

Table 7-101. Advanced Statistics Memories Format

7.4.10 Core Computational Unit – Local Maxima Engine

The Core Computation Unit includes a Local Maxima Engine, which can be enabled by setting ACCEL_MODE = 011b.

In context of Radar signal processing, Local Maxima Engine is useful in a peak detection step where each sample/bin (Cell Under Test (CUT)) is compared against detection threshold(s), and also compared against

the neighboring samples and the CUT is declared as a valid local peak if the sample amplitude exceeds the detection threshold and is “more than or equal to” the neighboring cells. Local maxima computations are done on a 2D matrix. Typically, local maxima are computed after the Angle FFT, on the Doppler-Beam/angle “2D” plane (2D Local Maxima).

The output of the local maxima computations is stored into the destination memory as a bit pattern, where each bit indicates whether the specific sample/CUT was detected as a valid local peak or not. More details on this are given in the later section of the document. The detection thresholds can either be configured into the configuration registers or in the Advanced Statistics Memory (borrowed from the Statistics module), in case there are individual thresholds for the different rows and columns of the 2D matrix.

7.4.10.1 Local Maxima Engine – Operation

Figure 7-134 shows an example of 2D plane (eg. Dopplers-Beams plane) used for Local maxima computations. A 3x3 matrix (CUT and all its neighboring samples) is needed to compute the local maxima. To keep the scheme simple and efficient from memory access perspective (as the input samples for local maxima computations are fetched from the memory), a 3x4 matrix (shown as red box in Figure) is fetched.

Every cycle, four consecutive samples (16-bit x 4 = 64bits) are picked from the memory and this is repeated three times across three row vectors (doppler bins) to fetch the 3x4 matrix data. This box keeps on moving to the right (computation wise) till the last group of four samples are fetched. By the end of this process, we get a bit-pattern of size (bits) equivalent to the number of columns (i.e., beams), with each bit indicating whether the specific bin was a local peak or not. This scheme is repeated for each doppler vector to get the bit-pattern output for the complete 2D plane.

Samples are fetched using the three-dimension addressing scheme built-in to the Input Formatter (the dimensions denoted by A, B and C) by configuring the configuration registers accordingly. For Local Maxima operation, there are restrictions on the maximum sizes of these dimensions. The number of columns (achieved through dimension B) has to be one of these supported values: 8, 12, 16, 24, 32, 48, 64, 96, 128, 192, 256. The number of rows (achieved through dimension C) can be any value between 3 and 1024.

Typically, for CUT processing at the edges, wrap-around around these dimensions would be required (cyclic mode of operation). This is achieved using the configuration registers SRCB_CIRCSHIFTWRAP, SRC_CIRCSHIFTWRAP3X and WRAP_COMB. If non-cyclic mode of operation is desired (i.e., for the edge samples, the neighboring cells should not be wrapped around), then LM_DIMB_NONCYCLIC and LM_DIMC_NONCYCLIC register bits can be set. In this case, the unavailable neighbouring samples will be considered as masked out.

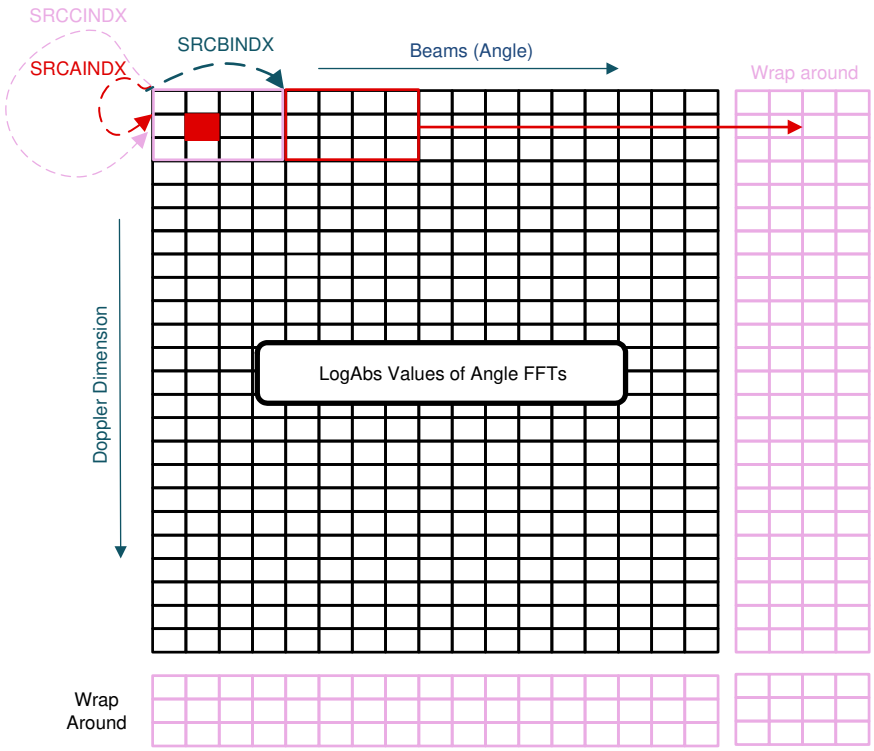

Figure 7-134. Local Maxima Engine A, B and C-Dimension Usage

Below is the example of the configuration values of each of these registers accessing the samples from the source memory for Local maxima computations for a 256x12 matrix. Note that though SRCACNT and SRCBINDX values are part of configuration registers, for the local maxima functionality, the values shall always be fixed to the values of 2 and 8 respectively, as shown below in Figure 7-135. The other registers are calculated easily as a function of the number of beams (number of columns) and number of Doppler (number of rows) as shown in the figure. Note that these configurations are irrespective of whether cyclic or non-cyclic mode of operation. It is important that in Local Maxima Engine mode of operation, the registers of Input Formatter and Output Formatter listed in figure below are programmed exactly as per the calculations shown.

Register	Value
SRCACNT	2
SRCAINDX	NumCols * 2
BCNT	NumCols / 4
SRCBINDX	8
CCNT	NumRows - 1
SRCCINDX	NumCols * 2
SRCREAL	0
SRC16b32b	1
WRAP_COMB	NumCols * NumRow * 2
SRC_CIRCSHIFTWRAP3X	010b if NumCols is one of {12, 24, 48, 96, 192}, 000b if NumCols if one of {8, 16, 32,64,128, 256}
SRCB_CIRCSHIFTWRAP	log2(NumColls/12) if NumCols is one of {12, 24, 48, 96, 192}, log2(NumCols/4) if NumCols is one of {8, 16, 32, 64, 128, 256}
DSTREAL	1
DSTACNT	ceil(NumCols/32) - 1
DSTAINDX	4
DSTBINDX	4 * ceil(NumCols/32)
DST16b32b	1

Figure 7-135. Local Maxima Engine Configuration

7.4.10.2 Local Maxima Engine – Operating Mode Configurations

Local maxima computations involve comparing each CUT with several values. The values that can be compared with are the 8 neighboring (adjacent right/left/top/bottom/diagonal) samples in the 2D matrix, row-threshold and a column-threshold. Each of these comparisons can be enabled or disabled through the configuration registers LM_NEIGH_BITMASK (8-bit) and LM_THRESH_BITMASK (2-bit).

The row- and column-thresholds can be selected from software configurable registers DIMB_THRESH_VALUE and DIMC_THRESH_VALUE or Maxima Arrays from Advanced Statistics RAM. This selection can be made through the register LM_THRESH_MODE. Further, if the Maxima Arrays from Advanced Statistics RAM are selected for determining thresholds, then the Local Maxima engine has provision for adding 24-bit signed offsets (one in each dimension). This can be useful in log-mode of operation, to convert the maxima arrays to row- and column-thresholds for peak detection. The offsets are programmable through the registers, MAX2D_OFFSET_DIM1 and MAX2D_OFFSET_DIM2. As these offsets are *added* to the Maxima Arrays from Advanced Statistics RAM to derive the detection thresholds, typically, these registers are expected to be set to negative values.

Figure 7-136 and Figure 7-137 illustrate the thresholding and comparisons in Local Maxima. The result of the Local Maxima comparisons is a 2D bit pattern. Each bit in it indicates whether the corresponding (row, column) CUT either exceeded *or equaled* each of the values it was compared against. A value of 0 in the result bit indicates that at least one of these values exceeded the CUT and 1 indicates otherwise.

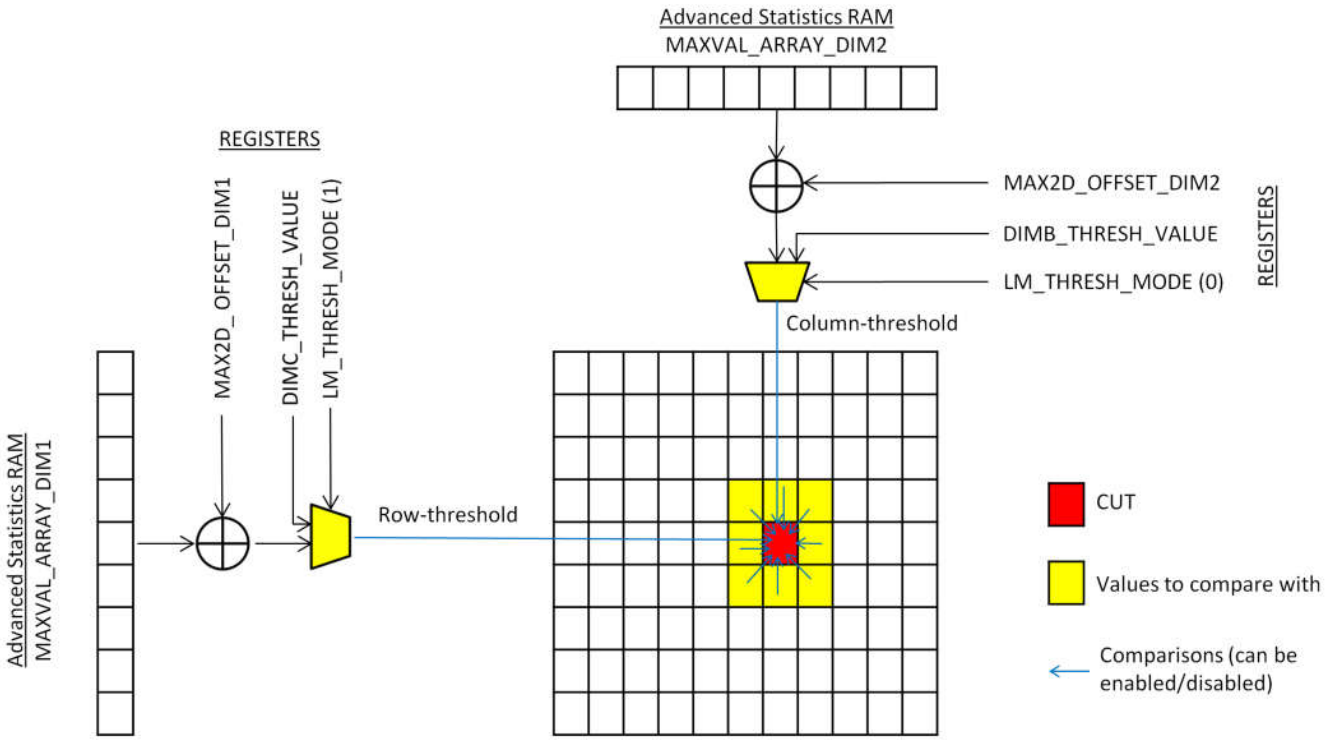

Figure 7-136. Local Maxima – Example Operating Mode Configurations

LM_NEIGH_BITMASK (0)	LM_NEIGH_BITMASK (1)	LM_NEIGH_BITMASK (2)
LM_NEIGH_BITMASK (7)	CUT	LM_NEIGH_BITMASK (3)
LM_NEIGH_BITMASK (6)	LM_NEIGH_BITMASK (5)	LM_NEIGH_BITMASK (4)

Figure 7-137. Local Maxima – Bitmask Configuration

7.4.10.3 Local Maxima Engine – Output Write Pattern

The output of the local maxima computations is first shifted to a local shift register of 256 bits. The output is pushed on to the local memory in HWA only once the computations worth one full row is completed. So, 256 puts a restriction on the maximum number of bins can be used in a particular row.

The output bit pattern is stored in the destination memory packed as 32-bit words, with the LSB bit corresponding to B-dimension (column) count of 0. In case when the output of a vector is not a multiple of 32 bits, the remaining bits in the last 32-bit word would be irrelevant bits and shall be ignored (set to ‘0’). If the number of bits per Doppler row is less than 32, for example 16, then 16 LSB of a 32b word are populated with bitmask and the remaining 16b are set to ‘0’.

This mechanism is described in the below diagrams Figure 7-138 and Figure 7-139.

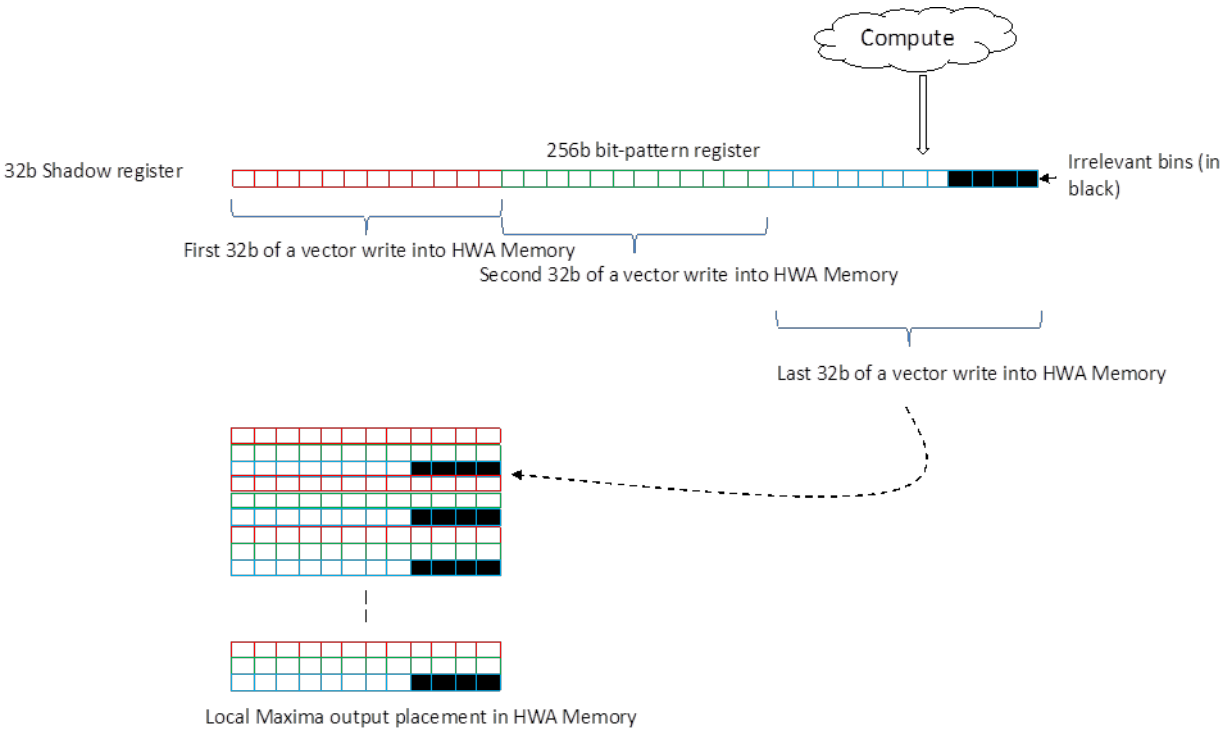

Figure 7-138. Local Maxima Output Write Pattern

(a) for 16 angles, the lower half-word is relevant, the upper is all zeros

Row i	16b'0	16b
Row I + 1	16b'0	16b

(b) for 48 angles, 3 half-words are relevant, the 4th is all zeros.

Row i	16b	16b
	16b'0	16b
Row I + 1	16b	16b
	16b'0	16b

7.4.10.4 Local Maxima Engine – Register Descriptions

Table 7-102. Local Maxima Engine – Registers

Register	Width	Parameter Set	Description
LM_NEIGH_BITMASK	8	Y	Neighbour bitmask for CUT comparison: Bit mask for the 8 neighbouring cells (adjacent left/right/top/left/ diagonal) to enable or disable the comparison with cell under test. Starting from left top corner and moving in a clock-wise direction. If a bit is set to 1, then the corresponding comparison is disabled.

Table 7-102. Local Maxima Engine – Registers (continued)

Register	Width	Parameter Set	Description
LM_THRESH_BITMASK	2	Y	Enable/Disable for detection threshold comparison: 00b: Enable CUT comparison with detection threshold in both dimensions 01b: Enable CUT comparison with detection threshold in column dimension only (B-dimension threshold) 10b: Enable CUT comparison with detection threshold in row dimension only (C-dimension threshold) 11b: Disable CUT comparison with detection thresholds in both dimensions
LM_THRESH_MODE	2	Y	Threshold source selection: This 2-bit register is used to indicate whether the detection threshold is provided by a software register, or derived from the built-in Advanced Statistics RAM. The LSB of this register corresponds to column dimension (B-dimension), and the MSB corresponds to row dimension (C-dimension). If the register bit is 0, then the threshold is taken from software configured register (DIMB_THRESH_VALUE, DIMC_THRESH_VALUE), whereas if the register bit is 1, then the threshold is taken from the built-in Advanced Statistics RAM, with an offset addition (see registers MAX2D_OFFSET_DIM1, MAX2D_OFFSET_DIM2). .
LM_THRESH_VAL.dimb_thresh_val	16	N	SW configurable column threshold register: Refer description of LM_THRESH_MODE for more details.
LM_THRESH_VAL.dimc_thresh_val	16	N	SW configurable row threshold register: Refer description of LM_THRESH_MODE for more details.

Table 7-102. Local Maxima Engine – Registers (continued)

Register	Width	Parameter Set	Description
MAX2D_OFFSET_DIM1.max2d_offset_dim1	24	N	Offset for row thresholds from Advanced Statistics RAM: Offset to be added to dimension 1 Maxima results (from Advanced Statistics) to derive row thresholds for Local Maxima computation.
MAX2D_OFFSET_DIM2.max2d_offset_dim2	24	N	Offset for column thresholds from Advanced Statistics RAM: Offset to be added to dimension 2 Maxima results (from Advanced Statistics) to derive column thresholds for Local Maxima computation.
LM_DIMB_NONCYCLIC	1	Y	Dimension B Non Cyclic: 1: Non-cyclic mode of Local Maxima detection (i.e., for the edge samples, the neighboring cells will not be wrapped around) 0: Cyclic mode of Local Maxima detection (i.e., for the edge samples, the neighboring cells will be wrapped around)
LM_DIMC_NONCYCLIC	1	Y	Dimension C Non Cyclic: 1: Non-cyclic mode of Local Maxima detection (i.e., for the edge samples, the neighboring cells will not be wrapped around) 0: Cyclic mode of Local Maxima detection (i.e., for the edge samples, the neighboring cells will be wrapped around)

7.4.11 Context Switching

The state machine supports an advanced feature called ”Context Switching” that allows a sequence of operations running in the hardware accelerator to be interrupted, in order to run a different (higher priority) sequence of operations, before returning back to resume execution of the original sequence. This state machine feature is useful when Doppler FFT, detection and angle FFT processing of a radar frame is still running, while the chirps for the subsequent frame have already started. In such a case, it is possible for the hardware accelerator to perform the Doppler FFT, detection and angle FFT processing in one context (a.k.a the background context), while permitting “context switching” to an alternate context (a.k.a the high priority context) to perform inline range FFT processing as and when new chirp ADC data samples are received.

7.4.11.1 Context Switching – Operation

The context switching feature of the state machine can be enabled by setting the CS_ENABLE register bit. This register is a common (static) register that controls the overall enabling/disabling of the feature.

The background context execution is programmed and configured using PARAM_START_IDX, PARAM_END_IDX, and NUMLOOPS registers as before. The high priority context is programmed using additional parameter-sets that are configured using PARAM_START_IDX_ALT, PARAM_END_IDX_ALT and

ALT_NUMLOOPS registers (refer to Table 7-98). Normally, the state machine executes the parameter-sets in the background (low-priority) context by looping through the parameter-sets between PARAM_START_IDX and PARAM_END_IDX, until a context switch is triggered. Whenever a context switch from background context to high priority context happens, the state machine jumps to PARAM_START_IDX_ALT and executes the parameter-sets from PARAM_START_IDX_ALT to PARAM_END_IDX_ALT for ALT_NUMLOOPS number of times and returns back to resume execution of the background context from where it left off.

The context switch from background context to high priority context is triggered based on the settings of CS_TRIGMODE and CS_TRIGSRC registers. Specifically, CS_TRIGMODE can be configured to trigger context switch based on a DMA completion, or based on a CSI2 line/frame end event. Refer the register description section for details of these registers.

It is important to note that the context switch only happens at the end of execution of a parameter-set and never in the middle of execution of a parameter-set. Also, the context switch is allowed to happen at the end of a parameter-set only if CONTEXTSW_EN register bit in the parameter-set is set. If this register is not set, then context switch will not happen at the end of that parameter-set. CONTEXTSW_EN should only be set in the parameter-sets corresponding to background context.

Context switch from the high priority context back to the background context typically occurs after the completion of all parameter-sets in the high priority context. But if an early exit is needed, i.e. after the execution of a certain high priority parameter-set, the register FORCED_CONTEXTSW_EN in that parameter-set can be set. This forces a context switch to the background context, without the need for any explicit context switch trigger. In such a case, when the next context switch trigger occurs, the high priority context execution resumes from where it left off. FORCED_CONTEXTSW_EN should be set only in the parameter-sets corresponding to the high priority context, and can be used for debug purposes. It can also be used when a large time gap is expected between execution of one high priority parameter-set and the next (e.g. due to the timing of the associated trigger sources), and it is desired that this time gap be used for some background context execution.[SK1]

Generally, for most computations, there is no ‘state information’ that carries forward across parameter-sets – i.e., each parameter-set is independent of the other. However, there are four specific items – namely, DC estimation accumulators, Interference statistics accumulators, TWID_INCR_DELTA_FRAC execution count and Recursive window execution count, which have state information in the form of accumulator value or execution count value that is applicable across parameter-sets. Therefore, while using the context switching feature, appropriate care has to be taken by the user to ensure that these features do not conflict when used in both the background context and high-priority context at the same time. The solution to this is to use these features only in one context at a time (eg. DC estimation and compensation can be used only in range FFT context), or to avoid jumping context between certain back-to-back parameter-sets (eg. Avoid jumping context between Interference statistics estimation and Interference mitigation steps), or to use the processor to save and restore state information (where possible). Also, care should be taken by the user to ensure that the usage of source and destination (ACCEL_MEMx) memories is mutually exclusive between the two contexts, so that there is no unintentional overwriting of the memory bank that is still under use by the background context by some computations of the high-priority context.

The operation of the state machine featuring the context switch capability is shown in . In the figure, Context1 and Thread1 indicate the background context (states shown in left side of the figure) and Context2 and Thread2 indicate the high-priority thread (states shown in right side of the figure). FSM_STATE indicates which state the HWA is currently in and is detailed in register description table below.

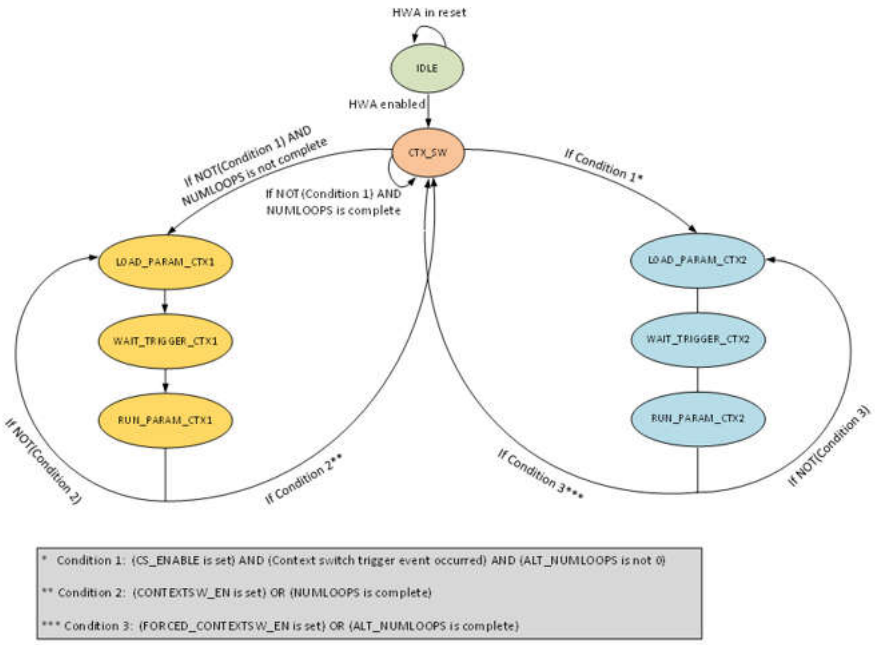

Figure 7-140. Context Switching State Machine

Whenever the NUMLOOPS of the background context completes, the state machine raises a loop complete interrupt (DSS_HWA_THREAD1_LOOP_INT). For every time the ALT_NUMLOOPS of the high-priority context completes, the state machine raises a different loop complete interrupt (DSS_HWA_THREAD2_LOOP_INT).

The accelerator's execution always begins with the background thread and proceeds to the high priority context upon receiving context switch trigger. If the application needs the operations to begin directly with the high priority context, then the user can define a "No Operation" parameter set in the background context and set CONTEXT_SW_EN in it, to indirectly achieve this.

Note that when the background context completes (i.e., NUMLOOPS is done), the state machine does not automatically move to IDLE state and remains in the CTX_SW state. This state means that the high-priority context switch can still happen even after all the operations for the background context are complete. The only way to make the state machine go back to IDLE state is by disabling the hardware accelerator completely.
In typical frame-by-frame processing applications, the host may disable the accelerator after the background context is completed and the necessary number of calls of the high priority context have been completed for one frame (counted by the host), and if necessary reconfigure the accelerator and trigger it again to restart the process.

Note that the accelerator's execution always begins with the background thread and proceeds to the high priority context upon receiving context switch trigger. If the application needs the operations to begin directly with the high priority context, then the user can define a "No Operation" parameter set in the background context and set CONTEXT_SW_EN in it, to indirectly achieve this.

7.4.11.2 State Machine – Context Switching – Register Descriptions

Table 7-103. Context Switching – Registers

Register	Width	Parameter Set	Description
CS_CONFIG.cs_enable	1	N	Context Switching Enable: 0: Disable context switching feature. 1: Enable context switching feature.

Table 7-103. Context Switching – Registers (continued)

Register	Width	Parameter Set	Description
PARAM_RAM_IDX_ALT.param_start_idx	10	N	Parameter-set start index for high-priority context: When context switch from background context to high-priority context happens, the state machine starts execution of high-priority context at the parameter-set indicated by this register. Valid range: 0-63
PARAM_RAM_IDX_ALT.param_end_idx	10	N	Parameter-set stop index for high-priority context: When running the high-priority context, this register indicates the last parameter-set in the sequence, before looping back to PARAM_START_IDX_ALT. Valid range: 0-63
PARAM_RAM_LOOP_ALT.numloops	12	N	Number of loops for high-priority context: This register specifies how many times (loops) for which the parameter-sets corresponding to the high-priority context are executed before returning back to resume the background context.
CS_CONFIG.cs_trigmode	4	N	Trigger mode selection for context switch: 0000b: Reserved 0001b: Reserved 0010b: Reserved 0011b: DMA-based trigger (used in conjunction with CS_TRIGSRC) 0100b: Hardware trigger (used in conjunction with CS_TRIGSRC) 0101b: Software trigger (used in conjunction with CS_FW2ACC_TRIG) Other values : Reserved
CS_CONFIG.cs_trgsrc	4	N	Trigger source for context switch: When CS_TRIGMODE = 0011b (i.e., in case of DMA-based trigger mode), this register specifies which DMA channel (i.e., which bit in DMA2CS_TRIG register) to wait for being set in order to perform context switch to high-priority context. When CS_TRIGMODE = 0100b (i.e., in case of hardware trigger mode), this register specifies which CSI2 trigger signal (out of the 20 possible trigger signals) to wait for in order to switch to high-priority context. The 20 signals are listed below, with CS_TRIGSRC = 0 corresponding to the last signal in the list: {CSI2A_FRAME_START[1:0], CSI2A_LINE_END[7:0], CSI2B_FRAME_START[1:0], CSI2B_LINE_END[7:0]}

Table 7-103. Context Switching – Registers (continued)

Register	Width	Parameter Set	Description
CONTEXTSW_EN	1	Y	Context switch enable register: This register is used in the background context. If this register is set to 1 in a parameter-set, then the state machine checks for a context switch trigger at the end of that parameter-set execution. If a trigger is found, the higher priority parameter-sets start executing. On returning from the higher priority context the next background parameter-set is run.
FORCED_CONTEXTSW_EN	1	Y	Forced context switch enable register: This register can be used in the higher priority context. If this register is set to 1 in a parameter-set, then the higher priority execution is interrupted after this parameter-set. And the execution switches to the next background parameter-set. Later when a context switch trigger is received the higher priority thread resumes from the parameter-set after the parameter-set having FORCED_CONTEXTSW_EN set.
CS_FW2ACC_TRIG.fw2hwa_trigger_cs	1	N	Software context switch trigger: When CS_TRIGMODE = 0101b, this register bit can be set by software to trigger a context switch.
FSM_STATE.FSM_STATE	3	N	3'b000: State Machine is in IDLE state 3'b111: State machine is in context switch state 3'b001: State machine is in thread 1 Load params state 3'b010: State machine is in thread 1 wait trigger state 3'b011: State machine is in thread 1 run state 3'b100: State machine is in thread 2 Load params state 3'b101: State machine is in thread 2 wait trigger state 3'b110: State machine is in thread 2 run state

7.4.12 Compression Engine

The accelerator includes a Compression Engine, which can compress or uncompress data in order to reduce storage RAM size requirements. For example, after range dimension FFT of the received RX data, the FFT results can be input to the Compression Engine and its output can be stored in a relatively smaller RAM in the device (e.g. L3 RAM). And before performing any Doppler FFT processing, the data can be retrieved from the RAM, input to the Compression Engine for uncompression, and then fed to any further Doppler FFT processing steps.

7.4.13 Radar Hardware Accelerator Registers

7.4.13.1 DSS_HWA_CFG Registers

DSS_HWA_CFG Registers lists the memory-mapped registers for the DSS_HWA_CFG registers. All register offset addresses not listed in DSS_HWA_CFG Registers should be considered as reserved locations and the register contents should not be modified.

Table 7-104. DSS_HWA_CFG Registers

Offset	Register Name	Register Notes	Section
0h	PID	PID register	PID Register (Offset = 0h) [Reset = 61800214h]

Table 7-104. DSS_HWA_CFG Registers (continued)

Offset	Register Name	Register Notes	Section
4h	PARAM_RAM_IDX		PARAM_RAM_IDX Register (Offset = 4h) [Reset = X]

Complex bit access types are encoded to fit into small table cells. Table 7-105 shows the codes that are used for access types in this section.

Table 7-105. DSS_HWA_CFG Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		

Table 7-105. DSS_HWA_CFG Access Type Codes (continued)

Access Type	Code	Description
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

7.4.13.1.1 PID Register (Offset = 0h) [Reset = 61800214h]

PID is shown in the figure and described in the table.

Return to the Summary Table.

dma2hwa_trigger																															
R/W-0h																															

Table 7-113. DMA2HWA_TRIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	dma2hwa_trigger	R/W	0h	DMA trigger register: This register is relevant whenever DMA triggered mode is used (i.e., TRIGMODE = 011b). Whenever a DMA channel has finished copying input samples into the local memory of the accelerator and wants to trigger the accelerator, the procedure to follow is to use a second linked DMA channel to write a 16-bit one-hot signature into this register to trigger the accelerator. In DMA triggered mode, the State Machine keeps monitoring this 32-bit register and waits as long as a specific bit (see DMA2ACC_CHANNEL_TRIGSRC) in this register is zero. The second linked DMA channel writes a one-hot signature that sets the specific bit, so that the State Machine gets triggered and starts the accelerator operations for that parameter-set. It s a Self clearing bit

7.4.13.1.9 SIGDMACHnDONE Register (Offset = 24h +4h*Nn) [Reset = 1h]

SIGDMACH**n**DONE where n goes from 0-31 is shown in the figure and described in the table.

Return to the Summary Table.

Table 7-209. DITHER_TWID_EN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	dither_twid_en	R/W	0h	Twiddle factor dithering enable: This register-bit is used to enable and disable dithering of twiddle factors in the FFT. The twiddle factors are 24-bits wide (24-bits for each I and Q), but they are quantized to 21-bits before twiddle factor multiplication. This quantization is implemented with dithering on the LSB, to avoid periodic quantization pattern affecting SFDR performance of the FFT. TI recommends keeping this register bit set to 1 (for example, dithering enabled), with appropriate LSFR seed loaded (see the following).

7.4.13.1.106 FFT_CLIP Register (Offset = 538h) [Reset = X]

FFT_CLIP is shown in the figure and described in the table.

RESERVED																			fft_clip												
R-X																			R-0h											

Table 7-210. FFT_CLIP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-13	RESERVED	R	X	
12-0	fft_clip	R	0h	FFT Clip Status (read-only): This is a read-only status register, which indicates any saturation/clipping events that have happened in the FFT butterfly stages. Note that each of the individual butterfly stages in the FFT can be programmed to either saturate the MSB or round the LSB. Whenever saturation of MSB is used in any stage, there is a possibility that that stage can saturate or clip samples. In that case, this saturation event is indicated in the corresponding bit in this status register, so that the Cortex-R4F processor can read it. If multiple FFTs are performed, this status register includes any saturation events happening in any of them. This status register can only be cleared by the R4F, by setting another single-bit register CLR_FFTCLIP, so that the saturation status indication gets cleared back to 0 and any subsequent saturation events can be freshly monitored. The MSB of this register indicates clip status corresponding to the radix 3 butterfly.

7.4.13.1.107 CLR_FFTCLIP Register (Offset = 53Ch) [Reset = X]

CLR_FFTCLIP is shown in the figure and described in the table.

PROC1	MSS R5FSS0_CORE1
PROC2	HSM M4F
PROC3	DSS C66x DSP
PROC4	DSS M4F

Note

There is an MPU at every Mailbox that can be used to partition the mailbox memory between the Controllers/cores. This gives some flexibility over a fixed allocation scheme.

8.1.1 Maibox Message Scheme

The mailbox architecture is a distributed architecture with the Mailbox memory present in the Receiving processors Subsystem. The following is the processor numbering for AM273x

Table 8-2. Mailbox Processor ID

Processor	ID
MSS_CR5A	0
HSM_CM4	2
RSS_CR4	3

The processor which wishes to send a message to another processor writes the message to the mailbox memory space, then interrupts the receiver processor. The receiver processor acknowledges the interrupt, then reads the message from the mailbox memory space. The receiver informs the sender that the message is read by an interrupt, which is acknowledged back by the sender. The sender must not initiate another message to the same receiver until the previously initiated mailbox interaction with the same receiver is complete.

1. SENDER writes the message in the RECEIVER mailbox.
2. SENDER triggers an interrupt to RECEIVER by writing 1 to <SENDER_SS>_CTRL: <SENDER>_MBOX_WRITE_DONE [RECEIVER]. Note: It is writing to its own CTRL space.
3. SENDER polls <RECEIVER_SS>_CTRL: <RECEIVER>_MBOX_READ_REQ[SENDER] and keeps writing 1'b1 to <SENDER_SS>_CTRL: <SENDER>_MBOX_WRITE_DONE [RECEIVER] until the read value is 1'b1.
4. RECEIVER gets a single interrupt for all interprocessor communication, which is an aggregated interrupt. RECEIVER reads the register <RECEIVER_SS>_CTRL::<RECEIVER>_MBOX_READ_REQ and sees bit [SENDER] is 0x1.
5. RECEIVER waits for some 60-70 clock cycles before going to next step.
6. RECEIVER writes to 0x1 to <RECEIVER_SS>>_CTRL::<RECEIVER>_MBOX_READ_REQ [SENDER] to clear the interrupt.
7. RECEIVER reads the message.
8. RECEIVER writes to 0x1 to <RECEIVER_SS>>_CTRL::<RECEIVER>_MBOX_READ_DONE_ACK[SENDER] to generate an acknowledgment interrupt to SENDER. SENDER gets a single interrupt for all interprocessor communication, which is an aggregated ACK interrupt.
9. RECEIVER polls the <SENDER_SS>_CTRL: <SENDER>_MBOX_READ_DONE and keeps writing 1'b1 to <RECEIVER_SS>_CTRL: <RECEIVER>_MBOX_READ_DONE_ACK [SENDER] until the read value is 1'b1.
10. SENDER reads the register <SENDER_SS>_CTRL:<SENDER>_MBOX_READ_DONE and sees bit [RECEIVER] is 0x1.
11. SENDER waits for some 60-70 clock cycles before going to next step.
12. SENDER writes 0x1 to <SENDER_SS>_CTRL:<SENDER>_MBOX_READ_DONE [RECEIVER] to clear the interrupt.

Mailbox message example (message from MSS CR5 C0 to RSS):

1. MSS CR5_C0 writes the message in the RSS mailbox.
2. MSS triggers an interrupt to RSS by writing 1 to MSS_CTRL: MSS_CR5A_MBOX_WRITE_DONE [3]. Note: It is writing to its own CTRL space.
3. MSS CR5_C0 polls the RSS_PROC_CTRL:RSS_MBOX_READ_REQ[0] and keeps writing 1 to MSS_CTRL: MSS_CR5A_MBOX_WRITE_DONE [3] until the read value is 1.
4. RSS gets a single interrupt for all interprocessor communication, which is an aggregated interrupt. RSS reads the register RSS_PROC_CTRL::RSS_MBOX_READ_REQ and sees bit [0] is 0x1.
5. RSS waits for some 60-70 clock cycles.
6. RSS writes to 0x1 to RSS_PROC_CTRL::RSS_MBOX_READ_REQ [0] to clear the interrupt.
7. RSS reads the message.

8. RSS writes to 0x1 to RSS_PROC_CTRL::RSS_MBOX_READ_DONE_ACK [0] to generate an acknowledgment interrupt to MSS CR5 C0.
9. RSS polls the MSS_CTRL:: MSS_CR5A_MBOX_READ_DONE[3] and keeps writing 1 to RSS_PROC_CTRL::RSS_MBOX_READ_DONE_ACK [0] until the read value is 1.
10. MSS CR5 C0 gets a single interrupt for all interprocessor communication, which is an aggregated ACK interrupt. MSS CR5 C0 reads the register MSS_CTRL:: MSS_CR5A_MBOX_READ_DONE and sees bit [3] is 0x1.
11. MSS CR5 C0 waits for some 60-70 clock cycles.
12. MSS CR5 C0 writes 0x1 to MSS_CTRL:: MSS_CR5A_MBOX_READ_DONE [3] to clear the interrupt.

Every processor is always writing to its own control space.

Each processor has only 2 interrupts (aggregated): <PROC>MBOX_READ_REQ and <PROC>MBOX_READ_ACK to its interrupt controller.

Scheme ensures the number of mailbox interrupts to a processor is always only 2, regardless of the number of procs in the SoC.

Chapter 9
Interrupts

This section lists the various interrupts sources supported in the different subsystem of AM273x device

9.1 Main Subsystem Cortex R5F Interrupt Map

Table 9-1. Main Subsystem Cortex R5F Interrupt Map

Interrupt Number	Define Name	Description
0	MSS_ESM_LO	ESM Low Priority Interrupt
1	MSS_ESM_HI	ESM High Priority Interrupt
2	CR5SS_STC_DONE	Cortexr5ss subsystem STC complete interrupt
3	MSS_RTIA_INT0	RTIA compare interrupt
4	MSS_RTIA_INT1	RTIA compare interrupt
5	MSS_RTIA_INT2	RTIA compare interrupt
6	MSS_RTIA_INT3	RTIA compare interrupt
7	MSS_RTIA_OVERFLOW_INT0	RTIA overflow interrupt
8	MSS_RTIA_OVERFLOW_INT1	RTIA overflow interrupt
9	MSS_RTIB_INT0	RTIB compare interrupt
10	MSS_RTIB_INT1	RTIB compare interrupt
11	MSS_RTIB_OVERFLOW_INT0	RTIB overflow interrupt
12	MSS_RTIB_OVERFLOW_INT1	RTIB overflow interrupt
13	MSS_RTIC_INT0	RTIC compare interrupt
14	MSS_RTIC_INT1	RTIC compare interrupt
15	MSS_RTIC_OVERFLOW_INT0	RTIC overflow interrupt
16	MSS_RTIC_OVERFLOW_INT1	RTIC overflow interrupt
17	MSS_WDT_INT0	WDT compare interrupt
18	MSS_WDT_INT1	WDT compare interrupt
19	MSS_WDT_INT2	WDT compare interrupt
20	MSS_WDT_INT3	WDT compare interrupt
21	MSS_WDT_OVERFLOW_INT0	WDT over flow interrupt
22	MSS_WDT_OVERFLOW_INT1	WDT over flow interrupt
23	MSS_WDT_TB_INT	WDT time base interrupt
24	MSS_MCRC_INT	Interrupt from MCRC
25	MSS_DCCA_INT	MSS_DCCA Clock compare done interrupt
26	MSS_DCCB_INT	MSS_DCCB Clock compare done interrupt
27	MSS_DCCC_INT	MSS_DCCC Clock compare done interrupt
28	MSS_DCCD_INT	MSS_DCCD Clock compare done interrupt
29	MSS_CCCA_INT	MSS_CCCA dual clock compare done interrupt
30	MSS_CCCB_INT	MSS_CCCB dual clock compare done interrupt
31	MSS_SPIA_INT0	MSS_SPIA level 0 interrupt
32	MSS_SPIA_INT1	MSS_SPIA level 1 interrupt

Table 9-1. Main Subsystem Cortex R5F Interrupt Map (continued)

Interrupt Number	Define Name	Description
33	MSS_SPIB_INT0	MSS_SPIB level 0 interrupt
34	MSS_SPIB_INT1	MSS_SPIB level 1 interrupt
35	MSS_QSPI_INT	MSS_QSPI interrupt
36	MSS_GIO_INT0	MSS_GIO high-level Interrupt
37	MSS_GIO_INT1	MSS_GIO low-level interrupt
38	MSS_ETPWMA_INT0	MSS_ETPWMA Interrupt 0 which is a output to pad
39	MSS_ETPWMA_INT1	MSS_ETPWMA Interrupt 1 which is a output to pad
40	MSS_ETPWMB_INT0	MSS_ETPWMB Interrupt 0 which is a output to pad
41	MSS_ETPWMB_INT1	MSS_ETPWMB Interrupt 1 which is a output to pad
42	MSS_ETPWMC_INT0	MSS_ETPWMC Interrupt 0 which is a output to pad
43	MSS_ETPWMC_INT1	MSS_ETPWMC Interrupt 1 which is a output to pad
44	MSS_MCANA_INT0	MSS_MCANA first interrupt
45	MSS_MCANA_INT1	MSS_MCANA second interrupt
46	MSS_MCANA_FE_INT1	MSS_MCANA message filter interrupt1
47	MSS_MCANA_FE_INT2	MSS_MCANA message filter interrupt2
48	MSS_MCANB_INT0	MSS_MCANB first interrupt
49	MSS_MCANB_INT1	MSS_MCANB second interrupt
50	MSS_MCANB_FE_INT1	MSS_MCANB message filter interrupt1
51	MSS_MCANB_FE_INT2	MSS_MCANB message filter interrupt2
52	MSS_I2C_INT	MSS_I2C interrupt
53	MSS_SCIA_INT0	MSS_SCIA level0 input
54	MSS_SCIA_INT1	MSS_SCIA level1 input
55	MSS_SCIB_INT0	MSS_SCIB level0 input
56	MSS_SCIB_INT1	MSS_SCIB level1 input
57	TOP_PBIST_DONE_INT	TOP_PBIST done interrupt
58	MSS_GIO_PAD_INT0	Interrupt Triger from GIO[0][0]
59	MSS_GIO_PAD_INT1	Interrupt Triger from GIO[0][1]
60	MSS_GIO_PAD_INT2	Interrupt Triger from GIO[0][2]
61	MSS_GIO_PAD_INT3	Interrupt Triger from GIO[0][3]
62	MSS_MCANA_FE_INT3	MSS_MCANA message filter interrupt3
63	MSS_MCANA_FE_INT4	MSS_MCANA message filter interrupt4
64	MSS_MCANA_FE_INT5	MSS_MCANB message filter interrupt5
65	MSS_MCANA_FE_INT6	MSS_MCANA message filter interrupt6
66	MSS_MCANA_FE_INT7	MSS_MCANB message filter interrupt7
67	MSS_TPCC_A_INTAGG	MSS_TPCC_A Aggregated Functional Interrupt
68	MSS_TPCC_B_INTAGG	MSS_TPCC_B Aggregated Functional Interrupt
69	MSS_TPCC_A_ERRAGG	MSS_TPCC_A Agregated Error Interrupt
70	MSS_TPCC_B_ERRAGG	MSS_TPCC_B Agregated Error Interrupt
71	MSS_GPADC_IFM_DONE	MSS_GPADC ifm done interrupt
72	MSS_CPSW_TH_TRSH_INT	MSS CPSW T-host threshold interrupt
73	MSS_CPSW_TH_INT	MSS CPSW T-host interrupt
74	MSS_CPSW_FH_INT	MSS CPSW F-host interrupt
75	MSS_CPSW_MISC_INT	MSS CPSW interrupt
76	RESERVED	RESERVED
77	MSS_CR5A_MBOX_READ_REQ	Aggregated interrupt to MSS CR5A from other processor asking it to read

Table 9-1. Main Subsystem Cortex R5F Interrupt Map (continued)

Interrupt Number	Define Name	Description
78	MSS_CR5A_MBOX_READ_ACK	Aggregated interrupt to MSS CR5A from other processor saying the reading from their mailbox is done.
79	MSS_CR5B_MBOX_READ_REQ	Aggregated interrupt to MSS CR5B from other processor asking it to read
80	MSS_CR5B_MBOX_READ_ACK	Aggregated interrupt to MSS CR5B from other processor saying the reading from their mailbox is done.
81	RESERVED	RESERVED
82	TOP_DEBUGSS_TXDATA_AVAIL	Interrupt from TOP_DEBUGSS
83	MSS_CR5A_PMU_INT	Pmu Interrupt from MSS_CR5A
84	MSS_CR5B_PMU_INT	Pmu Interrupt from MSS_CR5B
85	MSS_CR5A_FPU_INT	Floating point expection from MSS_CR5A
86	MSS_CR5B_FPU_INT	Floating point expection from MSS_CR5B
87	RESERVED	RESERVED
88	CR5A_CTI_IRQ	IRQ request from CTI module from CR5A

40	DSS_RTIA_OVERFLOW_0	DSS_RTIA Overflow 0
41	DSS_RTIA_OVERFLOW_1	DSS_RTIA Overflow 1
42	DSS_CM4_STC_DONE	DSS_CM4 STC Done interrupt
43	DSS_CM4_PERIPH_ACCESS_ERR AGG	Aggregation of access-errros from DSS CM4 peripherals. See Error access Response Section for more details
44	DSS_CM4_ACCESS_ERR_AGG	Write access error on the processor AHB Master ports
45	DSS_CM4_CTI_TRIGOUT2	DSS CM4 CTI Trigout 2
46	DSS_CM4_CTI_TRIGOUT3	DSS CM4 CTI Trigout 3
47	Reserved	Reserved
48	Reserved	Reserved
49	DSS_TPCC_A_INTAGG	DSS_TPCC_A Aggregated Functional Interrupt
50	DSS_TPCC_B_INTAGG	DSS_TPCC_B Aggregated Functional Interrupt
51	DSS_TPCC_C_INTAGG	DSS_TPCC_C Aggregated Functional Interrupt
52	DSS_DSP_SW_INT0	Software Interrupt from DSS_CTRL.DSS_SW_INT[0]
53	DSS_DSP_SW_INT1	Software Interrupt from DSS_CTRL.DSS_SW_INT[1]
54	MSS_CR5_SW_INT0	Software Interrupt from MSS_CTRL

Table 9-3. DSP Subsystem Cortex M4 Interrupt Map (continued)

Interrupt Number	Define Name	Description
55	MSS_CR5_SW_INT1	Software Interrupt from MSS_CTRL
56	RCSS_GIO_INT0	RCSS_GIO high-level Interrupt
57	RCSS_GIO_INT1	RCSS_GIO low-level interrupt
58	RCSS_SPIA_INT0	RCSS SPI A Interrupt 0
59	RCSS_SPIA_INT1	RCSS SPI A Interrupt 1
60	RCSS_SPIB_INT0	RCSS SPI B Interrupt 0
61	RCSS_SPIB_INT1	RCSS SPI B Interrupt 1
62	RCSS_GIO_PAD_INT0	Interrupt Triger from RCSS_GIO[0][2]
63	RCSS_GIO_PAD_INT1	Interrupt Triger from RCSS_GIO[0][3]

9.4 Main Subsystem ESM Interrupt Map

Table 9-4. Main Subsystem ESM Interrupt Map Group 1

ESM GROUP1	Define Name	Description
127:124	RESERVED	RESERVED
123	ANA_WU_AND_CLK_STATUS_ERR	Aggregated Error from ANA_WU_STATUS_REG and ANA_CLK_STATUS_REG
122	MSS_BUS_SAFETY_CR5B_AHB	AHB bridges safety Error for Cr5B
		- Comparision Error of all outputs from AHB bridge of CR5A
121	MSS_BUS_SAFETY_CR5A_AHB	AHB bridges safety Error for Cr5A
		- Comparision Error of all outputs from AHB bridge of CR5A
120	MSS_BUS_SAFETY_SCRP	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		-Comparision Error of all outputs from VBUSP_SCR of MSS
119	MSS_BUS_SAFETY_MSS2MDO	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
118	MSS_BUS_SAFETY_DMM_SLAVE	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
117	MSS_BUS_SAFETY_DMM_MST	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
116	MSS_BUS_SAFETY_GPADC	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
115	MSS_BUS_SAFETY_RET_RAM	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control

Table 9-4. Main Subsystem ESM Interrupt Map Group 1 (continued)

ESM GROUP1	Define Name	Description
114	MSS_BUS_SAFETY_MBOX	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
113	RESERVED	RESERVED
112	RESERVED	RESERVED
111	RESERVED	RESERVED
110	MSS_BUS_SAFETY_HSM_SLAVE	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
108 to 109	RESERVED	RESERVED
107	MSS_BUS_SAFETY_MCRC	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
106	MSS_BUS_SAFETY_QSPI	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
105	MSS_BUS_SAFETY_SEC_TPTC_A1_WR	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
104	MSS_BUS_SAFETY_SEC_TPTC_A1_RD	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
103	MSS_BUS_SAFETY_SEC_TPTC_A0_WR	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
102	MSS_BUS_SAFETY_SEC_TPTC_A0_RD	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
101	MSS_BUS_SAFETY_TPTC_B0_WR	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
100	MSS_BUS_SAFETY_TPTC_A1_WR	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
99	MSS_BUS_SAFETY_TPTC_A0_WR	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control

Table 9-4. Main Subsystem ESM Interrupt Map Group 1 (continued)

ESM GROUP1	Define Name	Description
98	MSS_BUS_SAFETY_TPTC_B0_RD	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
97	MSS_BUS_SAFETY_TPTC_A1_RD	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
96	MSS_BUS_SAFETY_TPTC_A0_RD	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
95	MSS_BUS_SAFETY_CPSW	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
94	MSS_BUS_SAFETY_HSM_MST	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
93	MSS_BUS_SAFETY_DAP_RS232	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control

74	RESERVED	RESERVED
73	MSS_MPU_PCRA_PROT_ERR	MPU Protection Error for MSS_MPU_(X)_ADDR_ERR
72	MSS_MPU_QSPI_PROT_ERR	MPU Protection Error for MSS_MPU_(X)_ADDR_ERR
71	MSS_MPU_CR5A_SLV_PROT_ERR	MPU Protection Error for MSS_MPU_(X)_ADDR_ERR
70	MSS_MPU_CR5B_SLV_PROT_ERR	MPU Protection Error for MSS_MPU_(X)_ADDR_ERR
69	MSS_MPU_HSM_SLV_PROT_ERR	MPU Protection Error for MSS_MPU_(X)_ADDR_ERR
68	MSS_CPSW_SERR	Cpsw memories Single bit error pulse
67	MSS_CPSW_UERR	Cpsw memories Double bit error pulse
66	MSS_BUS_SAFETY_SEC_AGG_ERR	Aggregated error for SEC from all Nodes in MSS_SCR
64 to 65	RESERVED	RESERVED
63	ANA_LIMP_MODE	Error signal from analog if the CLK monitor finds the
		REF CLK to be outside the permissible range of frequency
62	MSS_MCRC_ERR	MCRC Comparision Error
61	MSS_DCCA_ERR	DCCA frequency comparision error
60	MSS_DCCB_ERR	DCCB frequency comparision error
59	MSS_DCCC_ERR	DCCC frequency comparision error
58	MSS_DCCD_ERR	DCCD frequency comparision error
57	MSS_CCCA_ERR	CCCA frequency comparision error
56	MSS_CCCB_ERR	CCCB frequency comparision error
55	MSS_SPIA_SERR	Single Bit correctable error indication for
		MIBSPI-A multi-buffer
54	MSS_SPIB_SERR	Single Bit correctable error indication for
		MIBSPI-B multi-buffer
53	MSS_SPIA_UERR	Multi Bit uncorrectable error indication for
		MIBSPI-A muti-buffer
52	MSS_SPIB_UERR	Multi Bit uncorrectable error indication for
		MIBSPI-B muti-buffer
51	MSS_MCANA_SERR	Single Bit correctable error indication for MCANA Message Memory
50	MSS_MCANA_UERR	Multi Bit uncorrectable error indication for MCANA Message Memory
49	MSS_MCANA_TS_ERR	MCANA Timestamping Error
48	MSS_MCANB_SERR	Single Bit correctable error indication for MCANB Message Memory
47	MSS_MCANB_UERR	Multi Bit uncorrectable error indication for MCANB Message Memory

Table 9-4. Main Subsystem ESM Interrupt Map Group 1 (continued)

ESM GROUP1	Define Name	Description
46	MSS_MCANB_TS_ERR	MCANB Timestamping Error
45	PAD_NERROR_IN	Reserved
44	MSS_TCMA_CR5A_SERR	Single Bit correctable error indication for ATCM of CR5A
43	MSS_TCMB1_CR5A_SERR	Single Bit correctable error indication for B1TCM of CR5A
42	MSS_TCMB0_CR5A_SERR	Single Bit correctable error indication for B0TCM of CR5A
41	MSS_TCMA_CR5B_SERR	Single Bit correctable error indication for ATCM of CR5B
40	MSS_TCMB1_CR5B_SERR	Single Bit correctable error indication for B1TCM of CR5B
39	MSS_TCMB0_CR5B_SERR	Single Bit correctable error indication for B0TCM of CR5B
38	MSS_CR5A_ITAG_SERR	Single Bit correctable error indication for Cache ITAG of CR5A
37	MSS_CR5A_IDATA_SERR	Single Bit correctable error indication for Cache IDATA of CR5A
36	MSS_CR5A_DTAG_SERR	Single Bit correctable error indication for Cache DTAG of CR5A
35	MSS_ CR5A _DDATA_ SERR	Single Bit correctable error indication for Cache DDATA of CR5A
34	MSS_CR5B_ITAG_SERR	Single Bit correctable error indication for Cache ITAG of CR5B
33	MSS_CR5B_IDATA_SERR	Single Bit correctable error indication for Cache IDATA of CR5B
32	MSS_CR5B_DTAG_SERR	Single Bit correctable error indication for Cache DTAG of CR5B
31	MSS_ CR5B _DDATA_ SERR	Single Bit correctable error indication for Cache DDATA of CR5B
30	MSS_TPCC_A_AGG_ERR	MSS_TPCC_A Aggregated Error Interrupt
		- TPCC Error
		- TPCC MPU Error
		- TPTC Error for all TPTCs connected to TPCC
		- Read and Write Config Space Access error to TPCC
		- Read and Write Config Space Access error or all TPTCs connected to TPCC
29	MSS_TPCC_B_AGG_ERR	MSS_TPCC_B Aggregated Error Interrupt
		- TPCC Error
		- TPCC MPU Error
		- TPTC Error for all TPTCs connected to TPCC
		- Read and Write Config Space Access error to TPCC
		- Read and Write Config Space Access error or all TPTCs connected to TPCC
28	RESERVED	RESERVED
27	EFUSE_ERR	Reserved for efuse errors
26	MSS_STC_ERR	STC Error indication for MSS Cortexr5ss
25	MSS_CCMR5_ST_ERR	CORTEXR5-Sub System Self test error for CCMR5 (comparator module)

Table 9-4. Main Subsystem ESM Interrupt Map Group 1 (continued)

ESM GROUP1	Define Name	Description

Chapter 10

Data Movement Architecture

10.1 Enhanced Direct Memory Access (EDMA)

This section describes the Enhanced Direct Memory Access (EDMA) controller. For features applicable to the EDMA instances in the device, see the device-specific Integration section. The primary purpose of the EDMA controller is to service data transfers programmed between two memory-mapped follower endpoints on the device. The EDMA controller consists of two principle blocks:

- EDMA channel controllers: EDMA_TPCC
- EDMA transfer controllers: EDMA_TPTC

Devices can have multiple instances of EDMA channel controllers, each associated with multiple EDMA transfer controllers.

The EDMA channel controller serves as the user interface for the EDMA controller. The EDMA_TPCC includes parameter RAM (PaRAM), channel control registers, and interrupt control registers. The EDMA_TPCC serves to prioritize incoming software requests or events from peripherals, and submits transfer requests (TR) to the EDMA transfer controller.

The EDMA transfer controllers are responsible for data movement. The transfer request packets (TRP) submitted by the EDMA_TPCC contain the transfer context, based on which the transfer controller issues read/write commands to the source and destination addresses programmed for a given transfer.

10.1.1 EDMA Module Overview

The enhanced direct memory access module, also called EDMA, performs high-performance data transfers between two target endpoints, memories and peripheral devices without microprocessor unit (MPU) or digital signal processor (DSP) support during transfer. EDMA transfer is programmed through a logical EDMA channel, which allows the transfer to be optimally tailored to the requirements of the application.

The EDMA controller is based on two major principal blocks:

- EDMA third-party channel controller (EDMA_TPCC)
- EDMA third-party transfer controller (EDMA_TPTC)

Figure 10-1 shows an overview of the EDMA module.

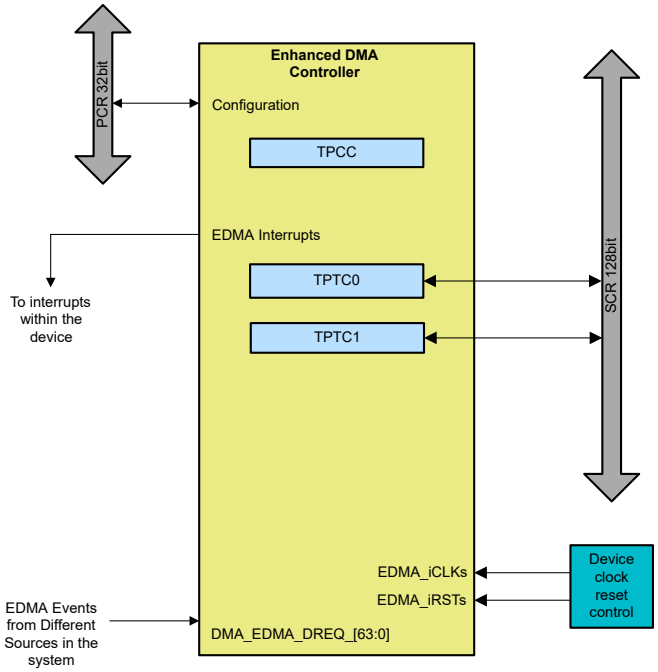

Figure 10-1. EDMA Module Overview

Note

When connecting to DSS, the SCR is 128 bit. When connecting to MSS and RCSS, the SCR is 64 bit.

For EDMA instances available on the device, see the device-specific integration section.

The **TPCC** is a high flexible channel controller that serves as both a user interface and an event interface for the EDMA controller. The EDMA_TPCC serves to prioritize incoming software requests or events from peripherals, and submits transfer requests (TRs) to the transfer controller.

The **TPTC** performs read and write transfers by EDMA ports to the target peripherals, as programmed in the Active and Pending set of the registers. The transfer controllers are responsible for data movement, and issue read/write commands to the source and destination addresses programmed for a given transfer in the EDMA_TPCC.

10.1.1.1 EDMA Features

This section shows generic EDMA features. For features applicable to the EDMA instances in the device, see the device-specific Integration section.

The EDMA_TPCC channel controller has the following features:

- Fully orthogonal transfer description:
  - Three transfer dimensions
  - A-synchronized transfers: one dimension serviced per event
  - AB-synchronized transfers: two dimensions serviced per event
  - Independent indexes on source and destination
  - Chaining feature allowing a 3-D transfer based on a single event.
- Flexible transfer definition:
  - Increment or FIFO transfer addressing modes
  - Linking mechanism allows automatic PaRAM set update
  - Chaining allows multiple transfers to execute with one event
- Interrupt generation for the following:
  - Transfer completion
  - Error conditions
- Debug visibility:
  - Queue water marking/threshold
  - Error and status recording to facilitate debug
- 64 DMA request channels:
  - Event synchronization
  - Manual synchronization (CPUs write to event set registers EDMA_TPCC_ESR and EDMA_TPCC_ESRH).
  - Chain synchronization (completion of one transfer triggers another transfer).
- Eight QDMA channels:
  - QDMA channels trigger automatically upon writing to a parameter RAM (PaRAM) set entry.
  - Support for programmable QDMA channel to PaRAM mapping.
- Each PaRAM set can be used for a DMA channel, QDMA channel, or link set.
- Multiple transfer controllers/event queues.
- 16 event entries per event queue.

The **EDMA_TPTC** transfer controller has the following features:

- 64-bit wide read and write ports per TC
- Supports two-dimensional transfers with independent indexes on source and destination (EDMA_TPCC manages the third dimension)
- Support for increment or constant addressing mode transfers
- Interrupt and error support
- Memory-Mapped Register (MMR) bit fields are fixed position in 32-bit MMR regardless of endianness

10.1.2 EDMA Integration

This section describes modules integration in the device, including information about clocks, resets, and hardware requests.

10.1.2.1 EDMA Integration in MSS

The MSS has 2 TPCCs and 3 TPTCs, as shown in Figure 10-2.

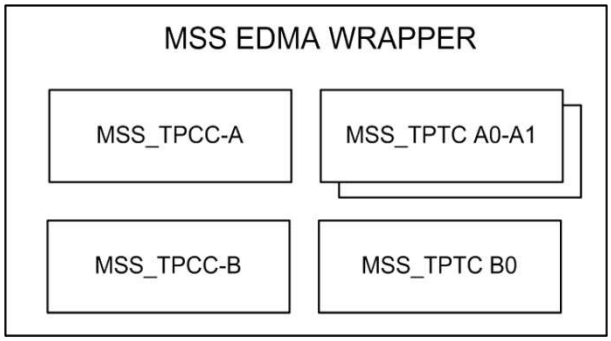

Figure 10-2. MSS EDMA Wrapper

Table 10-1 and Table 10-2 list the configuration for the TPCCs and TPTCs in the MSS.

Table 10-1. MSS TPCC Configuration

Parameters	TPCC_A	TPCC_B
DMA Ch	64	64
Param Entires	128	128
QDMA Ch	8	8
Event queues	2	2
Mem Protection	Yes	Yes
Channel Mapping	Yes	Yes
Num TCs	2	1

Table 10-2. MSS TPTC Configuration

Parameters	TPTCA0-A1-B0
FIFO Size	512
TR Pipe Depth	2
Bus Width	8
Read Cmd Num	8
Write Cmd Num	8
RAM ECC	1

10.1.2.2 EDMA Integration in DSS

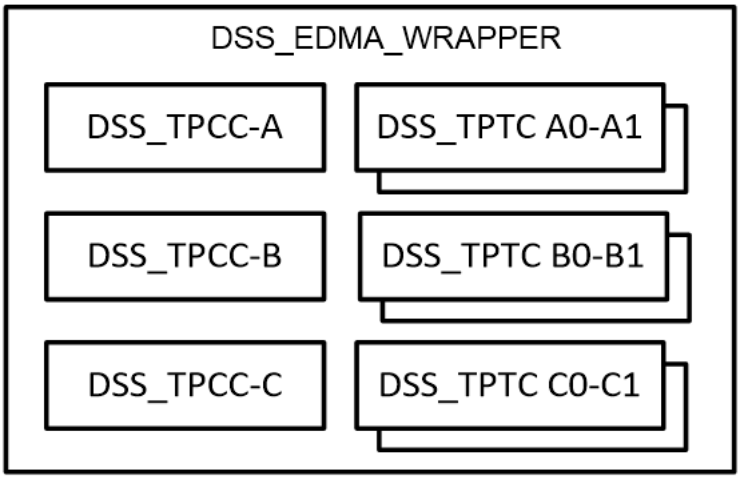

Figure 10-3. DSS EDMA Wrapper Block Diagram

The DSS has 3 TPCCs and 6 TPTCs.

Note

TPTC-C2, TPTC-C3, TPTC-C4, and TPTC-C5 modules and their functionality are not supported in this family of devices. *Any information regarding these modules has been retained in the documentation solely for the purpose of clarifying memory map read/write attributes. Features noted as "not supported" must not be used.*

Table 10-3 and Table 10-4 list the configuration for the TPCCs and TPTCs in the DSS.

Table 10-3. DSS TPCC Configuration

Parameters	TPCC_A	TPCC_B	TPCC_C
DMA Ch	64	64	64
Param Entires	128	128	256

10.1.2.2.1 Max Burst Length

The max burst length for each TPTC can be controlled from the DSS_CTRL register space.

10.1.2.3 EDMA Error Interrupt Aggregator

The following interrupts are aggregated and sent to the processor:

- TPCC Error
- TPCC MPU Error
- TPTCs Error
- TPCC Read and Write Config Space Access Error
- TPTCs Read and Write Config Space Access Error

Table 10-5. TPCC Error Interrupt Aggregators

TPCC	Interrupt	Registers Space
MSS_TPCC_A	MSS_TPCC_A_ERRAGG	MSS_CTRL::MSS_TPCC_A_ERRAGG_MASK MSS_CTRL::MSS_TPCC_A_ERRAGG_STATUS MSS_CTRL::MSS_TPCC_A_ERRAGG_STATUS_RAW
MSS_TPCC_B	MSS_TPCC_B_ERRAGG	MSS_CTRL::MSS_TPCC_B_ERRAGG_MASK MSS_CTRL::MSS_TPCC_B_ERRAGG_STATUS MSS_CTRL::MSS_TPCC_B_ERRAGG_STATUS_RAW
DSS_TPCC_A	DSS_TPCC_A_ERRAGG	DSS_CTRL::DSS_TPCC_A_ERRAGG_MASK DSS_CTRL::DSS_TPCC_A_ERRAGG_STATUS DSS_CTRL::DSS_TPCC_A_ERRAGG_STATUS_RAW
DSS_TPCC_B	DSS_TPCC_B_ERRAGG	DSS_CTRL::DSS_TPCC_B_ERRAGG_MASK DSS_CTRL::DSS_TPCC_B_ERRAGG_STATUS DSS_CTRL::DSS_TPCC_B_ERRAGG_STATUS_RAW
DSS_TPCC_C	DSS_TPCC_C_ERRAGG	DSS_CTRL::DSS_TPCC_C_ERRAGG_MASK DSS_CTRL::DSS_TPCC_C_ERRAGG_STATUS DSS_CTRL::DSS_TPCC_C_ERRAGG_STATUS_RAW
RCSS_TPCC_A	RCSS_TPCC_A_ERRAGG	RCSS_CTRL::RCSS_TPCC_A_ERRAGG_MASK RCSS_CTRL::RCSS_TPCC_A_ERRAGG_STATUS RCSS_CTRL::RCSS_TPCC_A_ERRAGG_STATUS_RAW
HSM_TPCC_A	HSM_TPCC_A_ERRAGG	HSM_CTRL::HSM_TPCC_A_ERRAGG_MASK HSM_CTRL::HSM_TPCC_A_ERRAGG_STATUS HSM_CTRL::HSM_TPCC_A_ERRAGG_STATUS_RAW

Note

HSM TPCC and TPTC is available only for M4.

For an event to generate an interrupt to the processor, the corresponding bit field must be unmasked in TPCC_x_ERRAGG_MASK.

An interrupt processor can read the TPCC_x_ERRAGG_STATUS register to detect which event triggered the interrupt.

The interrupt can be cleared by writing 0x1 to the corresponding bit in TPCC_x_ERRAGG_STATUS. The software must ensure that all the aggregated interrupts are cleared so that the level interrupt is deserted before exiting the ISR. Only then is it ensured that a new pulse interrupt is generated to the processor. Thus, after clearing the software, the user should read the register to confirm a value of 0x0.

The register TPCC_x_ERRAGG_STATUS_RAW is set on an event irrespective of the value in TPCC_x_ERRAGG_MASK. This field can be cleared by writing 0x1 to the corresponding bit in TPCC_x_ERRAGG_STATUS_RAW

10.1.2.4 EDMA Functional Interrupt Aggregator

The following EDMA interrupts are aggregated and sent to the processor:

- TPCC Completion Interrupt
- TPCC Completion Region Interrupts
- TPTCs Completion Interrupt

TPCC Interrupt Aggregators lists the associated interrupt and registers for each TPCC instance

Table 10-6. TPCC Interrupt Aggregators

TPCC	Interrupt	Registers Space
MSS_TPCC_A	MSS_TPCC_A_INTAGG	MSS_CTRL::MSS_TPCC_A_INTAGG_MASK MSS_CTRL::MSS_TPCC_A_INTAGG_STATUS MSS_CTRL::MSS_TPCC_A_INTAGG_STATUS_RAW
MSS_TPCC_B	MSS_TPCC_B_INTAGG	MSS_CTRL::MSS_TPCC_B_INTAGG_MASK MSS_CTRL::MSS_TPCC_B_INTAGG_STATUS MSS_CTRL::MSS_TPCC_B_INTAGG_STATUS_RAW
DSS_TPCC_A	DSS_TPCC_A_INTAGG	DSS_CTRL::DSS_TPCC_A_INTAGG_MASK DSS_CTRL::DSS_TPCC_A_INTAGG_STATUS DSS_CTRL::DSS_TPCC_A_INTAGG_STATUS_RAW
DSS_TPCC_B	DSS_TPCC_B_INTAGG	DSS_CTRL::DSS_TPCC_B_INTAGG_MASK DSS_CTRL::DSS_TPCC_B_INTAGG_STATUS DSS_CTRL::DSS_TPCC_B_INTAGG_STATUS_RAW
DSS_TPCC_C	DSS_TPCC_C_INTAGG	DSS_CTRL::DSS_TPCC_C_INTAGG_MASK DSS_CTRL::DSS_TPCC_C_INTAGG_STATUS DSS_CTRL::DSS_TPCC_C_INTAGG_STATUS_RAW

Table 10-6. TPCC Interrupt Aggregators (continued)

TPCC	Interrupt	Registers Space
RCSS_TPCC_A	RCSS_TPCC_A_INTAGG	RCSS_CTRL::RCSS_TPCC_A_INTAGG_MASK RCSS_CTRL::RCSS_TPCC_A_INTAGG_STATUS RCSS_CTRL::RCSS_TPCC_A_INTAGG_STATUS_RAW
RCSS_TPCC_B	RCSS_TPCC_B_INTAGG	RCSS_CTRL::RCSS_TPCC_B_INTAGG_MASK RCSS_CTRL::RCSS_TPCC_B_INTAGG_STATUS RCSS_CTRL::RCSS_TPCC_B_INTAGG_STATUS_RAW
HSM_TPCC_A	HSM_TPCC_A_INTAGG	HSM_CTRL::HSM_TPCC_A_INTAGG_MASK HSM_CTRL::HSM_TPCC_A_INTAGG_STATUS HSM_CTRL::HSM_TPCC_A_INTAGG_STATUS_RAW

For an event to generate an interrupt to the processor, the corresponding bit field must be unmasked in TPCC_x_INTAGG_MASK.

An interrupt processor can read the TPCC_x_INTAGG_STATUS register to detect which event triggered the interrupt.

The interrupt can be cleared by writing 0x1 to the corresponding bit in TPCC_x_INTAGG_STATUS. The software must ensure that all the aggregated interrupts are cleared so that the level interrupt is deserted before exiting the ISR. Only then is it ensured that a new pulse interrupt is generated to the processor. Thus, after clearing software, the user should read the register to confirm a value of 0x0.

The register TPCC_x_INTAGG_STATUS_RAW is set on an event irrespective of the value in TPCC_x_INTAGG_MASK. This field can be cleared by writing 0x1 to the corresponding bit in TPCC_x_INTAGG_STATUS_RAW.

10.1.2.5 EDMA Configuration

- The MSS has 2 channel controllers: MSS_TPCC-A and MSS_TPCC-B.
  - MSS_TPCC-A has two transfer controllers: MSS_TPTC-A0 and MSS_TPTC-A1.
  - MSS_TPCC-B has one transfer controller MSS_TPTC-B0
- The DSS has 3 channel controllers: DSS_TPCC-A, DSS_TPCC-B and DSS_TPCC-C.
  - Each channel controller has 2 transfer controllers
- RCSS has 1 channel controller: RCSS_TPCC-A
  - RCSS_TPCC-A has two transfer controllers: RCSS_TPTC-A0 and RCSS_TPTC-A1.

Table 10-7. EDMA3 Channel Controller Configuration

10.1.3 EDMA Controller Functional Description

This chapter discusses the architecture of the EDMA controller. The description contained in this section is generic to the EDMA module, and not all features mentioned here are supported by the device. See the EDMA integration section of the device to determine the applicability of these features.

10.1.3.1 Block Diagram

Figure 10-4 shows the functional block diagram of the EDMA controller.

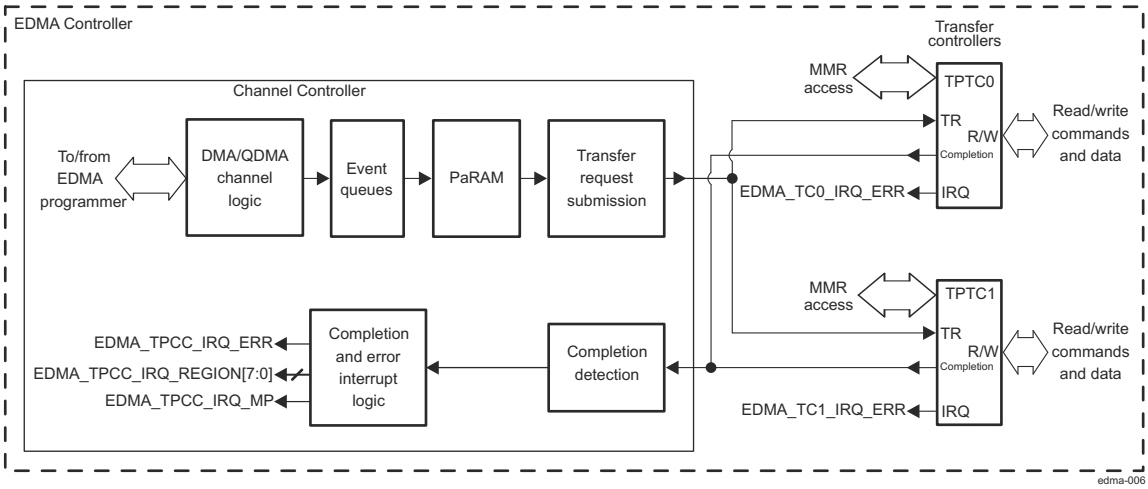

Figure 10-4. EDMA Controller Block Diagram

10.1.3.1.1 Third-Party Channel Controller

The TPCC is the EDMA transfer scheduler responsible for scheduling, arbitrating, and issuing user programmed transfers to the two TPTCs.

The functional block diagram below describes EDMA channel controller (EDMA_TPCC).

A. Although the block is depicted twice in EDMA Channel Controller Block Diagram, there is only one physical register set for the QDMA to PaRAM set mapping block.

The main blocks of the EDMA_TPCC are as follows:

- Parameter RAM (PaRAM): The PaRAM maintains parameter sets for channel and reload parameter sets. The PaRAM must be written with the transfer context for the desired channels and link parameter sets. EDMA_TPCC processes and sets based on a trigger event and submits a transfer request (TR) to the transfer controllers.
- EDMA event and interrupt processing registers: Allows mapping of events to parameter sets, enable/disable events, enable/disable interrupt conditions, and clearing interrupts.
- Completion detection: The completion detect block detects completion of transfers by the EDMA_TPTCs or follower peripherals. The completion of transfers can be used optionally to chain trigger new transfers or to assert interrupts.
- Event queues: Event queues form the interface between the event detection logic and the transfer request submission logic.
- Memory protection registers: Memory protection registers define the accesses (privilege level and requestor(s)) that are allowed to access the DMA channel shadow region view(s) and regions of PaRAM.

Other functions include the following:

- Region registers: Region registers allow DMA resources (DMA channels and interrupts) to be assigned to unique regions that different EDMA programmers own (for example, DSPs).
- Debug registers: Debug registers allow debug visibility by providing registers to read the queue status, controller status, and missed event status.

The EDMA_TPCC includes two channel types: DMA channels (64 channels) and QDMA channels (8 channels).

Each channel is associated with a given event queue/transfer controller and with a given PaRAM set. These channels are identical. The main difference between a DMA channel and a QDMA channel is the method that the system uses to trigger transfers.

- DMA channels are triggered by external events by the event set registers EDMA_TPCC_ESR and EDMA_TPCC_ESRH, or through chaining register EDMA_TPCC_CER.
- QDMA channels are triggered automatically (auto-triggered) by the CPU. QDMAs allow a minimum number of linear writes to be issued to the TPCC to force a series of transfers to occur.

The TPCC arbitrates among pending DMA and QDMA events with a fixed [64:1] and [8:1] priority encoder for these events, respectively (a low channel number corresponds to a high priority).

DMA events are always higher priority than QDMA events. The higher-priority event is placed in the event queue to await submission to the transfer controllers, which occurs at the earliest opportunity. Each event queue is serviced in FIFO order, with a maximum of 16 queued events per event queue. If more than one TPTC is ready to be programmed with a transmission request (TR), the event queues are serviced with fixed priority: Q0 is higher than Q1. When an event is ready to be queued and the event queue and the TC channel are empty, the event bypasses the event queue and goes directly to the PaRAM processing logic for submission to the appropriate TC. If the transfer request TR bus or PaRAM processing are busy, the bypass path is not used. The bypass is not used to dequeue for a higher-priority event.

Events are extracted from the event queue when the EDMA_TPTC is available for a new TR to be programmed into the EDMA_TPTC (signaled with the empty signal, indicating an empty program register set). As an event is extracted from the event queue, the associated PaRAM entry is processed and submitted to the TPTC as a TR. The TPCC updates the appropriate counts and addresses in the PaRAM entry in anticipation of the next trigger event for that PaRAM entry.

The EDMA_TPCC also has an error detection logic that causes an error interrupt generation on various error conditions (for example: missed events EDMA_TPCC_EMR and EDMA_TPCC_EMRH registers, exceeding event queue thresholds in EDMA_TPCC_CCERR register, etc.).

10.1.3.1.2 Third-Party Transfer Controller

The TPTC module is the EDMA transfer engine that generates transfers as programmed in dedicated working registers, using two dedicated controller ports: a read-only port and a write-only port.

Figure 10-5 shows a functional block diagram and of the EDMA transfer controller (EDMA_TPTC) and its connection to the EDMA_TPCC.

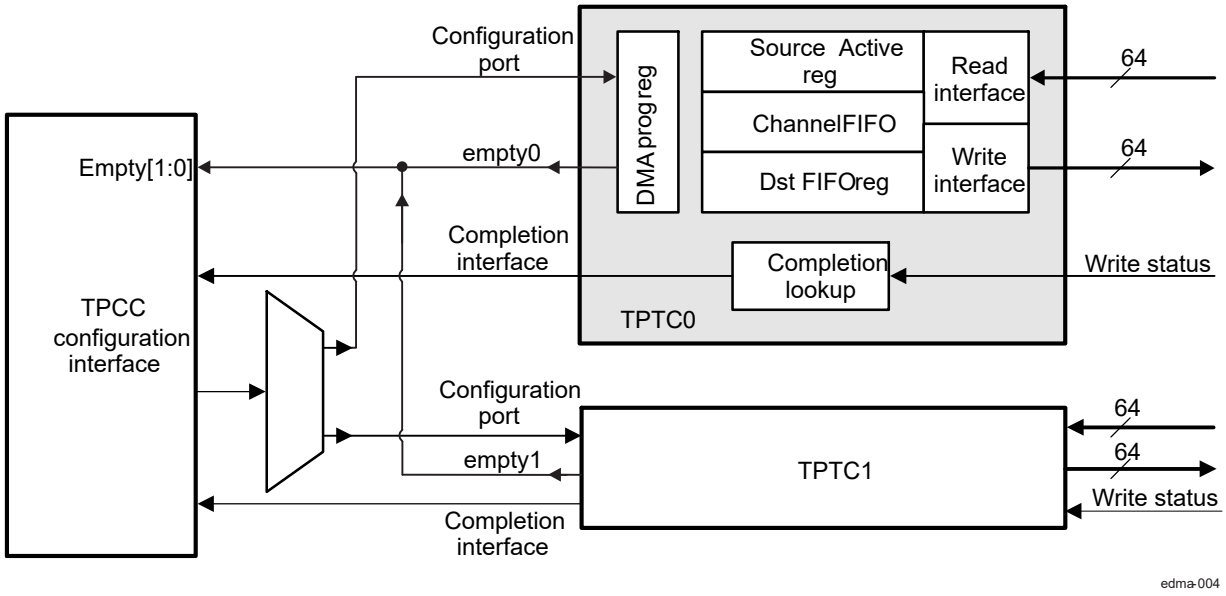

Figure 10-5. TPTC Block Diagram

Note

The port data bus width of the instances of the TPTC is fixed at 64 bits.

Two instances of the EDMA_TPTC generate concurrent traffic on the L3_VBUSM interconnect. Each TC controller consists of the following components:

- DMA Program Register Set: Stores the context for the DMA transfer that is loaded into the active register set when the current active register set completes. The CPU or TPCC programs the Program Register Set, not the active register set. For typical standalone operation, the CPU programs the Program Register while the TC services the Active register set. The Program Register set includes ownership control such that CPU software and the EDMA stay synchronized relative to one another.
- Source Active Register Set : Stores the context (src/dst/cnt/etc) for the DMA Transfer Request (TR) in progress in the Read Controller. The Active register set is split into independent Source and Destination, because the source interconnect controller and the destination interconnect controller operate independently of one another.
- Destination FIFO Register Set: Stores the context (src/dst/cnt/etc) for the DMA Transfer Request (TR) in progress, or pending, in the Write Controller. The pending register must allow the source controller to begin processing a new TR while the destination register set processes the previous TR.
- Channel FIFO: Temporary holding buffer for in-flight data. The read return data of the source peripheral is stored in the Data FIFO, and then is written to the destination peripheral by the write command/data bus.
- Read Controller/Interconnect Read Interface: The Interconnect read interface issues optimally sized read commands to the source peripheral, based on a burst size of 32 bytes and available landing space in the channel FIFO.
- Write controller/Interconnect Write interface: The local interconnect write interface issues optimally sized write commands to the destination peripheral, based on a burst size of 32 bytes and available data in the channel FIFO.
- Completion interface: sends completion codes to the EDMA_TPCC when a transfer completes and generates interrupts and chained events in the TPCC module.
- Configuration port: Target interface that provides read/write access to program registers and read access to all memory-mapped TPTC registers.

When one EDMA_TPTC module is idle and receive its first TR, DMA program register set receives the TR, where it transitions to the DMA source active set and the destination FIFO register set immediately. The second TR (if pending from EDMA_TPCC) is loaded into the DMA program set, ensuring it can start as soon as possible when the active transfer completes. As soon as the current active set is exhausted, the TR is loaded from the DMA program register set into the DMA source active register set as well as to the appropriate entry in the destination FIFO register set.

The read controller issues read commands controlled by the rules of command fragmentation and optimization. These are issued only when the data FIFO has space available for the data read. When sufficient data is in the data FIFO, the write controller starts issuing a write command again following the rules for command fragmentation and optimization.

Depending on the number of entries, the read controller can process up to two or four transfer requests ahead of the destination subject to the amount of free data FIFO.

10.1.3.2 Types of EDMA Controller Transfers

An EDMA transfer is always defined in terms of three dimensions. Figure 10-6 shows the three dimensions used by EDMA controller transfers. These three dimensions are defined as:

- 1st Dimension or Array (A): The 1st dimension in a transfer consists of EDMA_TPCC_ABCNT_n[15:0] ACNT contiguous bytes.
- 2nd Dimension or Frame (B): The 2nd dimension in a transfer consists of EDMA_TPCC_ABCNT_n[31:16] BCNT arrays of ACNT bytes. Each array transfer in the 2nd dimension is separated from each other by an index programmed using bit-fields EDMA_TPCC_BIDX_n[15:0] SBIDX or EDMA_TPCC_BIDX_n[31:16] DBIDX.
- 3rd Dimension or Block (C): The 3rd dimension in a transfer consists of CCNT frames of BCNT arrays of ACNT bytes. The Count for 3rd Dimension is defined in PaRAM memory EDMA_TPCC_CCNT_n[15:0] CCNT. Each transfer in the 3rd dimension is separated from the previous by an index programmed using EDMA_TPCC_CIDX_n[15:0] SCIDX or EDMA_TPCC_CIDX_n[31:16] DCIDX.

Note

The reference point for the index depends on the synchronization type. The amount of data transferred upon receipt of a trigger/synchronization event is controlled by the synchronization types (EDMA_TPCC_OPT_n[2] SYNCDIM bit). For these three dimensions, only two synchronization types are supported: A-synchronized transfers and AB-synchronized transfers.

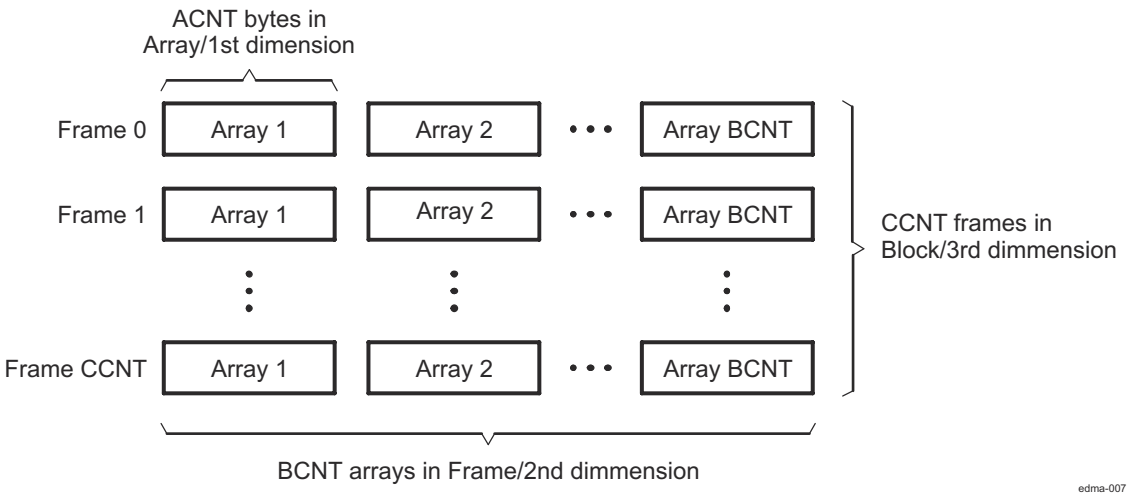

Figure 10-6. Definition of ACNT, BCNT, and CCNT

10.1.3.2.1 A-Synchronized Transfers

In an A-synchronized transfer, each EDMA sync event initiates the transfer of the 1st dimension of EDMA_TPCC_ABCNT_n[15:0] ACNT bytes, or one array of ACNT bytes. Each event/TR packet conveys the transfer information for one array only. Thus, BCNT × CCNT events are needed to completely service a PaRAM set.

Arrays are always separated by EDMA_TPCC_BIDX_n[15:0]SBIDX and EDMA_TPCC_BIDX_n[31:16] DBIDX, as shown in Figure 10-7, where the start address of Array N is equal to the start address of Array N – 1 plus source (SRC) or destination (DST) in EDMA_TPCC_BIDX_n register.

Frames are always separated by EDMA_TPCC_CIDX_n[15:0] SCIDX and EDMA_TPCC_CIDX_n[31:16] DCIDX. For A-synchronized transfers, after the frame is exhausted, the address is updated by adding SRCCIDX/DSTCIDX to the beginning address of the last array in the frame. As in Figure 10-7, SRCCIDX / DSTCIDX is the difference between the start of Frame 0 Array 3 to the start of Frame 1 Array 0.

Figure 10-7 shows an A-synchronized transfer of 3 (CCNT) frames of 4 (BCNT) arrays of n (ACNT) bytes. In this example, a total of 12 sync events (BCNT × CCNT) exhaust a PaRAM set. See Figure 10-7 for details on parameter set updates.

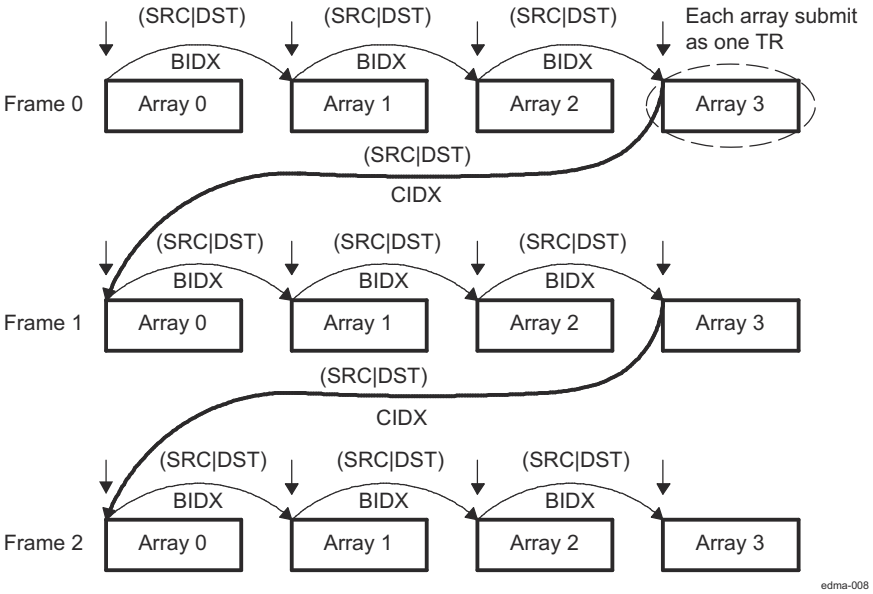

Figure 10-7. A-Synchronized Transfers (ACNT = n, BCNT = 4, CCNT = 3)

10.1.3.2.2 AB-Synchronized Transfers

In a AB-synchronized transfer, each EDMA sync event initiates the transfer of 2 dimensions or one frame. Each event/TR packet conveys information for one entire frame of BCNT_n arrays of ACNT_n bytes. Thus, EDMA_TPCC_CCNT_n events are needed to completely service a PaRAM set.

Arrays are always separated by EDMA_TPCC_BIDX_n[15:0] SBIDX and EDMA_TPCC_BIDX_n[31:16] DBIDX as shown in Figure 10-8. Frames are always separated by SRCCIDX and DSTCIDX.

Note that for AB-synchronized transfers, after a TR for the frame is submitted, the address update is to add EDMA_TPCC_CIDX_n[15:0] SCIDX / EDMA_TPCC_CIDX_n[31:16] DCIDX to the beginning address of the beginning array in the frame. This is different from A-synchronized transfers where the address is updated by adding SRCCIDX/DSTCIDX to the start address of the last array in the frame. See Section 10.1.3.3.6 for details on parameter set updates.

Figure 10-8 shows an AB-synchronized transfer of 3 (CCNT) frames of 4 (BCNT) arrays of *n* (ACNT) bytes. In this example, a total of 3 sync events (CCNT) exhaust a PaRAM set; that is, a total of 3 transfers of 4 arrays each completes the transfer.

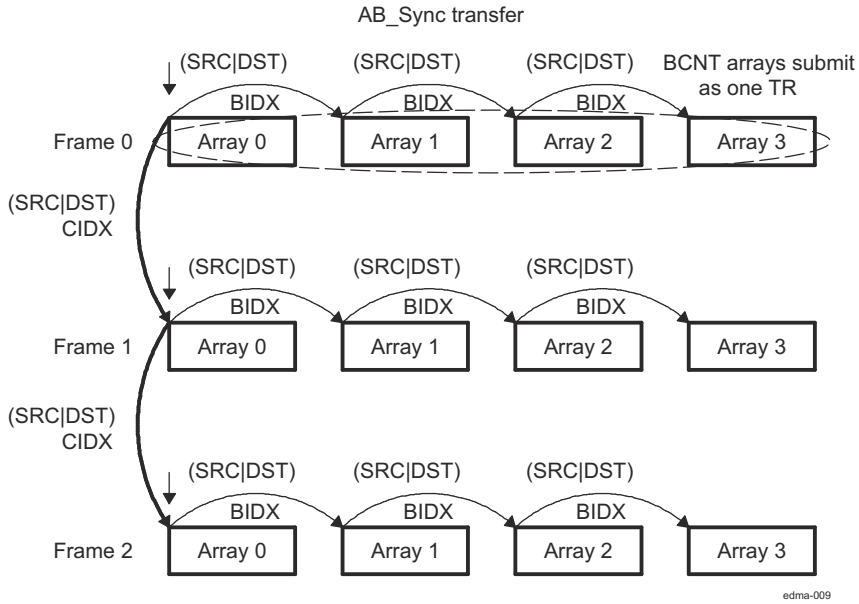

Figure 10-8. AB-Synchronized Transfers (ACNT = n, BCNT = 4, CCNT = 3)

Note

ABC-synchronized transfers are not directly supported. It can be logically achieved by chaining between multiple AB-synchronized transfers.

10.1.3.3 Parameter RAM (PaRAM)

The EDMA controller is a RAM-based architecture. The transfer context (source/destination addresses, count, indexes, etc.) for DMA or QDMA channels is programmed in a parameter RAM table in EDMA_TPCC. The PaRAM table is segmented into multiple PaRAM sets. Each PaRAM set includes eight four-byte PaRAM set entries (32-bytes total per PaRAM set), which includes typical DMA transfer parameters such as source address, destination address, transfer counts, indexes, options, etc.

The PaRAM structure supports flexible ping-pong, circular buffering, channel chaining, and auto-reloading (linking).

The contents of the PaRAM include the following:

- 128 PaRAM sets
- 64 channels that are direct mapped and can be used as link for QDMA sets if not used for DMA channels
- 8 channels remain for link or QDMA sets

By default, all channels map to PaRAM set to 0 and should be remapped before use by EDMA_TPCC_DCHMAPN_m and EDMA_TPCC_QCHMAPN_j registers. This can be done in the device boot flow.

Table 10-11. EDMA Parameter RAM Contents

PaRAM Set Number	Base Address	Parameters(1)
0	EDMA Base Address + 4000h to EDMA Base Address + 401Fh	PaRAM set 0
1	EDMA Base Address + 4020h to EDMA Base Address + 403Fh	PaRAM set 1
2	EDMA Base Address + 4040h to EDMA Base Address + 405Fh	PaRAM set 2
3	EDMA Base Address + 4060h to EDMA Base Address + 407Fh	PaRAM set 3
4	EDMA Base Address + 4080h to EDMA Base Address + 409Fh	PaRAM set 4
5	EDMA Base Address + 40A0h to EDMA Base Address + 40BFh	PaRAM set 5
6	EDMA Base Address + 40C0h to EDMA Base Address + 40DFh	PaRAM set 6
7	EDMA Base Address + 40E0h to EDMA Base Address + 40FFh	PaRAM set 7
8	EDMA Base Address + 4100h to EDMA Base Address + 411Fh	PaRAM set 8
9	EDMA Base Address + 4120h to EDMA Base Address + 413Fh	PaRAM set 9
...	...	...
63	EDMA Base Address + 47E0h to EDMA Base Address + 47FFh	PaRAM set 63
64	EDMA Base Address + 4800h to EDMA Base Address + 481Fh	PaRAM set 64
65	EDMA Base Address + 4820h to EDMA Base Address + 483Fh	PaRAM set 65
...	...	...
127	EDMA Base Address + 5000h to EDMA Base Address + 4FE0h	PaRAM set 127

(1) The device has 8 QDMA channels that can be mapped to any parameter set number from 0 to 127.

Note

AM273x has a maximum of 128 PaRAM sets. Additional tables and diagrams in this chapter may show a larger number (up to 511), however 128 is the maximum allowed number of entries.

10.1.3.3.1 PaRAM

Each parameter set of PaRAM is organized into eight 32-bit words or 32 bytes, as shown in PaRAM Set and described in EDMA Channel Parameter Description. Each PaRAM set consists of 16-bit and 32-bit parameters.

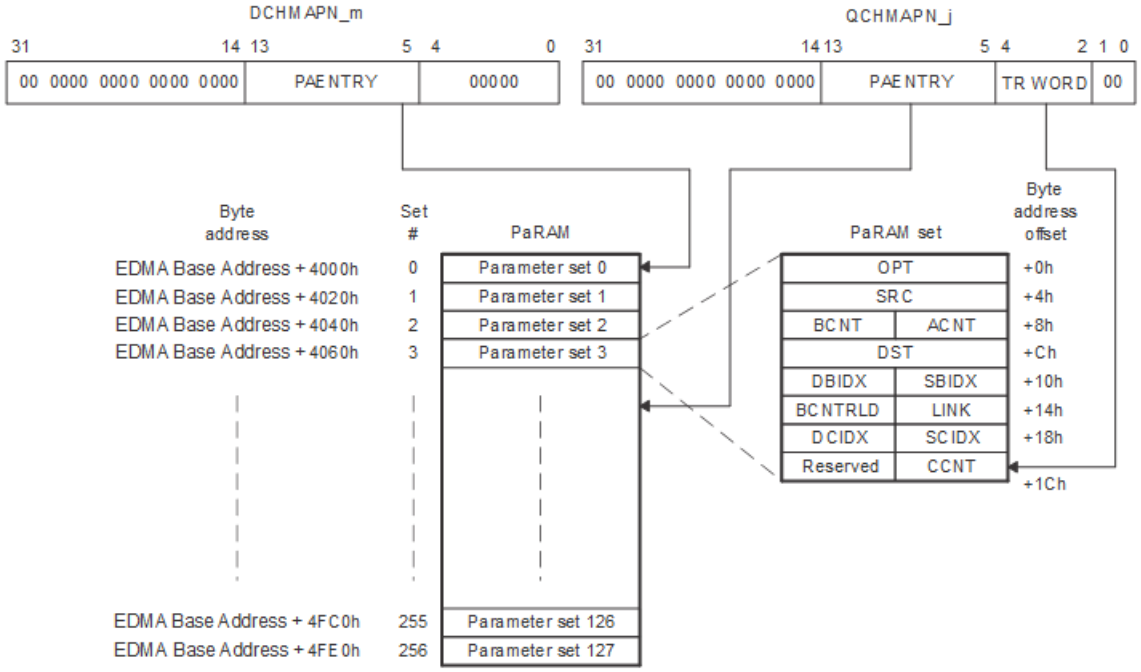

Figure 10-9. PaRAM Set

Note

Figure above is a representation of 128 bit entries. For device specific details please refer to EDMA configuration chapter.

Table 10-12. EDMA Channel Parameter Description

Offset Address (bytes)	Acronym	Parameter	Description
0h	OPT	Channel Options EDMA_TPCC_OPT_n register	Transfer configuration options
4h	SRC	Channel Source Address EDMA_TPCC_SRC_n register	The byte address from which data is transferred
8h(1)	ACNT	Count for 1st Dimension EDMA_TPCC_ABCNT_n[15:0] ACNT bit-field.	Unsigned value specifying the number of contiguous bytes within an array (first dimension of the transfer). Valid values range from 1 to 65 535.
	BCNT	Count for 2nd Dimension EDMA_TPCC_ABCNT_n[31:16] BCNT bit-field.	Unsigned value specifying the number of arrays in a frame, where an array is ACNT bytes. Valid values range from 1 to 65 535.
Ch	DST	Channel Destination Address EDMA_TPCC_DST_n register	The byte address to which data is transferred
10h(1)	SBIDX	Source BCNT Index EDMA_TPCC_BIDX_n[15:0] SBIDX bit-field.	Signed value specifying the byte address offset between source arrays within a frame (2nd dimension). Valid values range from –32 768 and 32 767.
	DBIDX	Destination BCNT Index EDMA_TPCC_BIDX_n[31:16] DBIDX bit-field.	Signed value specifying the byte address offset between destination arrays within a frame (2nd dimension). Valid values range from –32 768 and 32 767.
14h(1)	LINK	Link Address EDMA_TPCC_LNK_n[15:0] LINK bit-field	The PaRAM address containing the PaRAM set to be linked (copied from) when the current PaRAM set is exhausted. A value of FFFFh specifies a null link.
	BCNTRLD	BCNT Reload EDMA_TPCC_LNK_n[31:16] BCNTRLD bit-field	The count value used to reload BCNT when BCNT decrements to 0 (TR is submitted for the last array in 2nd dimension). Only relevant in A-synchronized transfers.
18h(1)	SCIDX	Source CCNT index. EDMA_TPCC_CIDX_n[15:0] SCIDX bit-field.	Signed value specifying the byte address offset between frames within a block (3rd dimension). Valid values range from –32 768 and 32 767. A-synchronized transfers: The byte address offset from the beginning of the last source array in a frame to the beginning of the first source array in the next frame. AB-synchronized transfers: The byte address offset from the beginning of the first source array in a frame to the beginning of the first source array in the next frame.
	DCIDX	Destination CCNT index. EDMA_TPCC_CIDX_n[31:16] DCIDX bit-field.	Signed value specifying the byte address offset between frames within a block (3rd dimension). Valid values range from –32 768 and 32 767. A-synchronized transfers: The byte address offset from the beginning of the last destination array in a frame to the beginning of the first destination array in the next frame. AB-synchronized transfers: The byte address offset from the beginning of the first destination array in a frame to the beginning of the first destination array in the next frame.
1Ch	CCNT	Count for 3rd Dimension. EDMA_TPCC_CCNT_n[15:0] CCNT bit-field.	Unsigned value specifying the number of frames in a block, where a frame is BCNT arrays of ACNT bytes. Valid values range from 1 to 65 535.
	Reserved	Reserved	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts cam result in undefined behavior.

(1) If OPT, SRC, or DST is the trigger word for a QDMA transfer, then it is required to do a 32-bit access to that field. Furthermore, it is recommended to perform only 32-bit accesses on the parameter RAM for best code compatibility. For example, switching the endianness of the processor swaps addresses of the 16-bit fields, but 32-bit accesses avoid the issue entirely.

10.1.3.3.2 EDMA Channel PaRAM Set Entry Fields

10.1.3.3.2.1 Channel Options Parameter (OPT)

This is the control register for TPCC channel configuration options. Refer to the EDMA_TPCC_OPT_n register bitfield description for additional details.

10.1.3.3.2.2 Channel Source Address (SRC)

The 32-bit source address parameter specifies the starting byte address of the source. For SAM in increment mode, there are no alignment restrictions imposed by EDMA. For SAM in FIFO addressing mode, it must program the source address to be aligned to a 256-bit aligned address (5 LSBs of address must be 0). If this rule is not observed, the EDMA_TPTC returns an error. Refer to Section 10.1.3.12.3 *Error Generation* for additional details.

10.1.3.3.2.3 Channel Destination Address (DST)

The 32-bit destination address parameter specifies the starting byte address of the destination. For DAM in increment mode, there are no alignment restrictions imposed by EDMA. For DAM in FIFO addressing mode, it must program the destination address to be aligned to a 256-bit aligned address (5 LSBs of address must be 0). If this rule is not observed, the EDMA_TPTC returns an error. Refer to *Error Generation* for additional details.

10.1.3.3.2.4 Count for 1st Dimension (ACNT)

EDMA_TPCC_ABCNT_n[15:0] ACNT represents the number of bytes within the 1st dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 1 and 65535. Therefore, the maximum number of bytes in an array is 65 535 bytes (64K – 1 bytes). ACNT must be greater than or equal to 1 for a TR to be submitted to EDMA_TPTC. A transfer with ACNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in EDMA_TPCC_OPT_n.

Refer to Section 10.1.3.3.5 *Dummy Versus Null Transfer Comparison* and Section 10.1.3.5.3 *Dummy or Null Completion* for details on dummy/null completion conditions.

10.1.3.3.2.5 Count for 2nd Dimension (BCNT)

EDMA_TPCC_ABCNT_n[15:0] BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation, valid values for BCNT are between 1 and 65 535. Therefore, the maximum number of arrays in a frame is 65 535 (64K – 1 arrays). A transfer with BCNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in EDMA_TPCC_OPT_n.

Refer to Section 10.1.3.3.5 *Dummy Versus Null Transfer Comparison* and Section 10.1.3.5.3 *Dummy or Null Completion* for details on dummy/null completion conditions.

10.1.3.3.2.6 Count for 3rd Dimension (CCNT)

EDMA_TPCC_CCNT_n[15:0] CCNT is a 16-bit unsigned value that specifies the number of frames in a block. Valid values for CCNT are between 1 and 65 535. Therefore, the maximum number of frames in a block is 65 535 (64K – 1 frames). A transfer with CCNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in EDMA_TPCC_OPT_n.

A CCNT value of 0 is considered either a null or dummy transfer.

Refer to Section 10.1.3.3.5 *Dummy Versus Null Transfer Comparison* and Section 10.1.3.5.3 *Dummy or Null Completion* for details on dummy/null completion conditions.

10.1.3.3.2.7 BCNT Reload (BCNTRLD)

EDMA_TPCC_LNK_n[31:16] BCNTRLD is a 16-bit unsigned value used to reload the EDMA_TPCC_ABCNT_n[15:0] BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-synchronized transfers. In this case, the EDMA_TPCC decrements the BCNT value by 1 on

each TR submission. When BCNT reaches 0, the EDMA_TPCC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value.

For AB-synchronized transfers, the EDMA_TPCC submits the BCNT in the TR and the EDMA_TPTC decrements BCNT appropriately. For AB-synchronized transfers, BCNTRLD is not used.

10.1.3.3.2.8 Source B Index (SBIDX)

EDMA_TPCC_BIDX_n[15:0] SBIDX is a 16-bit signed value (2s complement) used for source address modification between each array in the 2nd dimension. Valid values for EDMA_TPCC_BIDX_n[15:0] SBIDX are between –32 768 and 32 767. It provides a byte address offset from the beginning of the source array to the beginning of the next source array. It applies to both A-synchronized and AB-synchronized transfers. Some examples:

- EDMA_TPCC_BIDX_n[15:0] SBIDX = 0000h (0): no address offset from the beginning of an array to the beginning of the next array. All arrays are fixed to the same beginning address.
- EDMA_TPCC_BIDX_n[15:0] SBIDX = 0003h (+3): the address offset from the beginning of an array to the beginning of the next array in a frame is 3 bytes. For example, if the current array begins at address 1000h, the next array begins at 1003h.
- EDMA_TPCC_BIDX_n[15:0] SBIDX = FFFFh (–1): the address offset from the beginning of an array to the beginning of the next array in a frame is –1 byte. For example, if the current array begins at address 5054h, the next array begins at 5053h.

10.1.3.3.2.9 Destination B Index (DBIDX)

EDMA_TPCC_BIDX_n[31:16] DBIDX is a 16-bit signed value (2s complement) used for destination address modification between each array in the 2nd dimension. Valid values for EDMA_TPCC_BIDX_n[31:16] DBIDX are between –32 768 and 32 767. It provides a byte address offset from the beginning of the destination array to the beginning of the next destination array within the current frame. It applies to both A-synchronized and AB-synchronized transfers. Refer to Section 10.1.3.3.2.8 *Source B Index (SBIDX)* for examples.

10.1.3.3.2.10 Source C Index (SCIDX)

EDMA_TPCC_CIDX_n[15:0] SCIDX is a 16-bit signed value (2s complement) used for source address modification in the 3rd dimension. Valid values for EDMA_TPCC_CIDX_n[15:0] SCIDX are between –32 768 and 32 767. It provides a byte address offset from the beginning of the current array (pointed to by SRC address) to the beginning of the first source array in the next frame. It applies to both A-synchronized and AB-synchronized transfers.

Note

When SCIDX is applied, the current array in an A-synchronized transfer is the last array in the frame (Figure 10-7), while the current array in an AB-synchronized transfer is the first array in the frame (Figure 10-8).

10.1.3.3.2.11 Destination C Index (DCIDX)

EDMA_TPCC_CIDX_n[31:16] DCIDX is a 16-bit signed value (2s complement) used for destination address modification in the 3rd dimension. Valid values are between –32 768 and 32 767. It provides a byte address offset from the beginning of the current array (pointed to by DST address) to the beginning of the first destination array TR in the next frame. It applies to both A-synchronized and AB-synchronized transfers.

Note

When DCIDX is applied, the current array in an A-synchronized transfer is the last array in the frame (Figure 10-7), while the current array in a AB-synchronized transfer is the first array in the frame (Figure 10-8).

10.1.3.3.2.12 Link Address (LINK)

The EDMA_TPCC provides a mechanism, called linking, to reload the current PaRAM set upon its natural termination (that is, after the count fields are decremented to 0) with a new PaRAM set. The 16-bit parameter EDMA_TPCC_LNK_n[15:0] LINK specifies the byte address offset in the PaRAM from which the EDMA_TPCC loads/reloads the next PaRAM set during linking.

It must program the link address to point to a valid aligned 32-byte PaRAM set. The 5 LSBs of the LINK field should be cleared to 0.

The EDMA_TPCC ignores the upper 2 bits of the LINK entry, allowing the flexibility of programming the link address as either an absolute/literal byte address or use the PaRAM-base-relative offset address. Therefore, if it use the literal address with a range from 4000h to 7FFFh, it will be treated as a PaRAM-base-relative value of 0000h to 3FFFh.

It should check that the programed value in the EDMA_TPCC_LNK_n[15:0] LINK field is correctly, so that link update is requested from a PaRAM address that falls in the range of the available PaRAM addresses on the device.

Value of FFFFh in EDMA_TPCC_LNK_n[15:0] LINK bit-field is referred to as a NULL link that should cause the EDMA_TPCC to perform an internal write of 0 to all entries of the current PaRAM set, except for the EDMA_TPCC_LNK_n[15:0] LINK field is set to FFFFh. Also, see Section 10.1.3.5 *Completion of a DMA Transfer* for details on terminating a transfer.

10.1.3.3.3 Null PaRAM Set

A null PaRAM set is defined as a PaRAM set where all count fields (EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, and EDMA_TPCC_CCNT_n[15:0] CCNT) are cleared to 0. If a PaRAM set associated with a channel is a NULL set, then when serviced by the EDMA_TPCC, the bit corresponding to the channel is set in the associated event missed register (EDMA_TPCC_EMR, EDMA_TPCC_EMRH, or EDMA_TPCC_QEMR). This bit remains set in the associated secondary event register (EDMA_TPCC_SER, EDMA_TPCC_SERH, or EDMA_TPCC_QSER).
This implies that any future events on the same channel are ignored by the EDMA_TPCC and it is required to clear the bit in EDMA_TPCC_SER, EDMA_TPCC_SERH, or EDMA_TPCC_QSER for the channel. This is considered an error condition, since events are not expected on a channel that is configured as a null transfer.

10.1.3.3.4 Dummy PaRAM Set

A dummy PaRAM set is defined as a PaRAM set where at least one of the count fields (EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, or EDMA_TPCC_CCNT_n[15:0] CCNT) is cleared to 0 and at least one of the count fields is nonzero.

If a PaRAM set associated with a channel is a dummy set, then when serviced by the EDMA_TPCC, it will not set the bit corresponding to the channel (DMA/QDMA) in the event missed register (EDMA_TPCC_EMR, EDMA_TPCC_EMRH, or EDMA_TPCC_QEMR) and the secondary event register (EDMA_TPCC_SER, EDMA_TPCC_SERH, or EDMA_TPCC_QSER) bit gets cleared similar to a normal transfer. Future events on that channel are serviced. A dummy transfer is a legal transfer of 0 bytes.

10.1.3.3.5 Dummy Versus Null Transfer Comparison

There are some differences in the way the EDMA_TPCC logic treats a dummy versus a null transfer request. A null transfer request is an error condition, but a dummy transfer is a legal transfer of 0 bytes. A null transfer causes an error bit (E*n*) in EDMA_TPCC_EMR to get set and the E*n* bit in EDMA_TPCC_SER remains set, essentially preventing any further transfers on that channel without clearing the associated error registers.

Table 10-13 summarizes the conditions and effects of null and dummy transfer requests.

Table 10-13. Dummy and Null Transfer Request

Feature	Null TR	Dummy TR
EDMA_TPCC_EMR / EDMA_TPCC_EMRH / EDMA_TPCC_QEMR is set	Yes	No
EDMA_TPCC_SER / EDMA_TPCC_SERH / EDMA_TPCC_QSER remains set	Yes	No

Table 10-13. Dummy and Null Transfer Request (continued)

Feature	Null TR	Dummy TR
Link update (STATIC = 0 in EDMA_TPCC_OPT_n)	Yes	Yes
EDMA_TPCC_QER is set	Yes	Yes
EDMA_TPCC_IPR / EDMA_TPCC_IPRH, EDMA_TPCC_CER / EDMA_TPCC_CERH is set using early completion	Yes	Yes

10.1.3.3.6 Parameter Set Updates

When a TR is submitted for a given DMA/QDMA channel and its corresponding PaRAM set, the EDMA_TPCC is responsible for updating the PaRAM set in anticipation of the next trigger event. For events that are not final, this includes address and count updates; for final events, this includes the link update.

The specific PaRAM set entries that are updated depend on the channel's synchronization type (A-synchronized or AB-synchronized) and the current state of the PaRAM set. A B-update refers to the decrementing of EDMA_TPCC_ABCNT_n[31:16] BCNT in the case of A-synchronized transfers after the submission of successive TRs. A C-update refers to the decrementing of CCNT in the case of A-synchronized transfers after BCNT TRs for EDMA_TPCC_ABCNT_n[15:0] ACNT byte transfers have submitted. For AB-synchronized transfers, a C-update refers to the decrementing of EDMA_TPCC_CCNT_n[15:0] CCNT after submission of every transfer request.

Refer to Table 10-14 for details and conditions on the parameter updates. A link update occurs when the PaRAM set is exhausted, as described in Section 10.1.3.3.7 *Linking Transfers*.

After the TR is read from the PaRAM (and is in process of being submitted to EDMA_TPTC), the following fields are updated if needed:

- A-synchronized: BCNT, CCNT, SRC, DST.
- AB-synchronized: CCNT, SRC, DST.

The following fields are not updated (except for during linking, where all fields are overwritten by the link PaRAM set):

- A-synchronized: EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_LNK_n[31:16] BCNTRLD, EDMA_TPCC_BIDX_n[15:0] SBIDX, EDMA_TPCC_BIDX_n[31:16] DBIDX, EDMA_TPCC_CIDX_n[15:0] SCIDX, EDMA_TPCC_CIDX_n[31:16] DCIDX, EDMA_TPCC_OPT_n, EDMA_TPCC_LNK_n[15:0]LINK.
- AB-synchronized: EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, EDMA_TPCC_LNK_n[31:16] BCNTRLD, EDMA_TPCC_BIDX_n[15:0] SBIDX, EDMA_TPCC_BIDX_n[31:16] DBIDX, EDMA_TPCC_CIDX_n[15:0] SCIDX, EDMA_TPCC_CIDX_n[31:16] DCIDX, EDMA_TPCC_OPT_n, EDMA_TPCC_LNK_n[15:0]LINK.

Note

PaRAM updates only pertain to the information that is needed to properly submit the next transfer request to the EDMA_TPTC. Updates that occur while data is moved within a transfer request are tracked within the transfer controller, and is detailed in Section 10.1.3.12 *EDMA Transfer Controller (EDMA_TPTC)*. For A-synchronized transfers, the EDMA_TPCC always submits a TRP for EDMA_TPCC_ABCNT_n[15:0] ACNT bytes (EDMA_TPCC_ABCNT_n[31:16] BCNT = 1 and EDMA_TPCC_CCNT_n[15:0] CCNT = 1). For AB-synchronized transfers, the EDMA_TPCC always submits a TRP for EDMA_TPCC_ABCNT_n[15:0] ACNT bytes of BCNT arrays (EDMA_TPCC_CCNT_n[15:0] CCNT = 1). The EDMA_TPTC is responsible for updating source and destination addresses within the array based on EDMA_TPCC_ABCNT_n[15:0] ACNT and EDMA_TPCC_OPT_n[10:8] FWID. For AB-synchronized transfers, the EDMA_TPTC is also responsible to update source and destination addresses between arrays based on EDMA_TPCC_BIDX_n[15:0] SBIDX and EDMA_TPCC_BIDX_n[31:16] DBIDX.

Table 10-14 shows the details of parameter updates that occur within EDMA_TPCC for A-synchronized and AB-synchronized transfers.

Table 10-14. Parameter Updates in EDMA_TPCC (for Non-Null, Non-Dummy PaRAM Set)

	A-Synchronized Transfer			AB-Synchronized Transfer		
	B-Update	C-Update	Link Update	B-Update	C-Update	Link Update
Condition:	BCNT > 1	BCNT == 1 && CCNT > 1	BCNT == 1 && CCNT == 1	N/A	EDMA_TPCC_CCNT_n[15:0] CCNT > 1	EDMA_TPCC_CCNT_n[15:0] CCNT == 1
SRC	+= SBIDX	+= SCIDX	= Link.EDMA_TPCC_SRC_n	in EDMA_TPTC	+= SCIDX	= Link.EDMA_TPCC_SRC_n
DST	+= DBIDX	+= DCIDX	= Link.EDMA_TPCC_DST_n	in EDMA_TPTC	+= DCIDX	= Link.EDMA_TPCC_DST_n
ACNT	None	None	= Link.EDMA_TPCC_ABCNT_n[15:0] ACNT	None	None	= Link.EDMA_TPCC_ABCNT_n[15:0] ACNT
BCNT	–= 1	= BCNTRLD	= Link.EDMA_TPCC_ABCNT_n[31:16] BCNT	in EDMA_TPTC	N/A	= Link.EDMA_TPCC_ABCNT_n[31:16] BCNT
CCNT	None	–= 1	= Link.EDMA_TPCC_CCNT_n[15:0] CCNT	in EDMA_TPTC	-=1	= Link.EDMA_TPCC_CCNT_n[15:0] CCNT
SBIDX	None	None	= Link.EDMA_TPCC_BIDX_n[15:0] SBIDX	in EDMA_TPTC	None	= Link.EDMA_TPCC_BIDX_n[15:0] SBIDX
DBIDX	None	None	= Link.EDMA_TPCC_BIDX_n[31:16] DBIDX	None	None	= Link.EDMA_TPCC_BIDX_n[31:16] DBIDX
SCIDX	None	None	= Link.EDMA_TPCC_BIDX_n[15:0] SBIDX	in EDMA_TPTC	None	= Link.EDMA_TPCC_BIDX_n[15:0] SBIDX
DCIDX	None	None	= Link.EDMA_TPCC_BIDX_n[31:16] DBIDX	None	None	= Link.EDMA_TPCC_BIDX_n[31:16] DBIDX
LINK	None	None	= Link.EDMA_TPCC_LNK_n[15:0]LINK	None	None	= Link.EDMA_TPCC_LNK_n[15:0]LINK
BCNTRLD	None	None	= Link.EDMA_TPCC_LNK_n[31:16] BCNTRLD	None	None	= Link.EDMA_TPCC_LNK_n[31:16] BCNTRLD
OPT(1)	None	None	= LINK.EDMA_TPCC_OPT_n	None	None	= LINK.EDMA_TPCC_OPT_n

(1) In all cases, no updates occur if EDMA_TPCC_OPT_n[3] STATIC == 1 for the current PaRAM set.

Note

The EDMA_TPCC includes no special hardware to detect when an indexed address update calculation overflows/underflows. The address update will wrap across boundaries as programmed by the user. It should ensure that no transfer is allowed to cross internal port boundaries between peripherals. A single TR must target a single source/destination slave endpoint.

10.1.3.3.7 Linking Transfers

The EDMA_TPCC provides a mechanism known as linking, which allows the entire PaRAM set to be reloaded from a location within the PaRAM memory map (for both DMA and QDMA channels). Linking is especially useful for maintaining ping-pong buffers, circular buffering, and repetitive/continuous transfers with no CPU intervention. Upon completion of a transfer, the current transfer parameters are reloaded with the parameter set pointed that the 16-bit link address field of the current parameter set points to. Linking only occurs when the EDMA_TPCC_OPT_n[3] STATIC bit is cleared.

Note

It should always link a transfer (EDMA or QDMA) to another useful transfer. If it must terminate a transfer, then link the transfer to a NULL parameter set. Refer to Section 10.1.3.3.3 *Null PaRAM Set*.

The link update occurs after the current PaRAM set event parameters have been exhausted. An event's parameters are exhausted when the EDMA channel controller has submitted all of the transfers that are associated with the PaRAM set.

A link update occurs for null and dummy transfers depending on the state of the EDMA_TPCC_OPT_n[3] STATIC bit and the EDMA_TPCC_LNK_n[15:0] LINK field. In both cases (null or dummy), if the value of EDMA_TPCC_LNK_n[15:0] LINK is FFFFh, then a null PaRAM set (with all 0s and EDMA_TPCC_LNK_n[15:0] LINK set to FFFFh) is written to the current PaRAM set.
Similarly, if EDMA_TPCC_LNK_n[15:0] LINK is set to a value other than FFFFh, then the appropriate PaRAM location that EDMA_TPCC_LNK_n[15:0] LINK points to is copied to the current PaRAM set.

Once the channel completion conditions are met for an event, the transfer parameters that are located at the link address are loaded into the current DMA or QDMA channel's associated parameter set. This indicates that the EDMA_TPCC reads the entire set (eight words) from the PaRAM set specified by EDMA_TPCC_LNK_n[15:0] LINK and writes all eight words to the PaRAM set that is associated with the current channel. Figure 10-10 shows an example of a linked transfer.

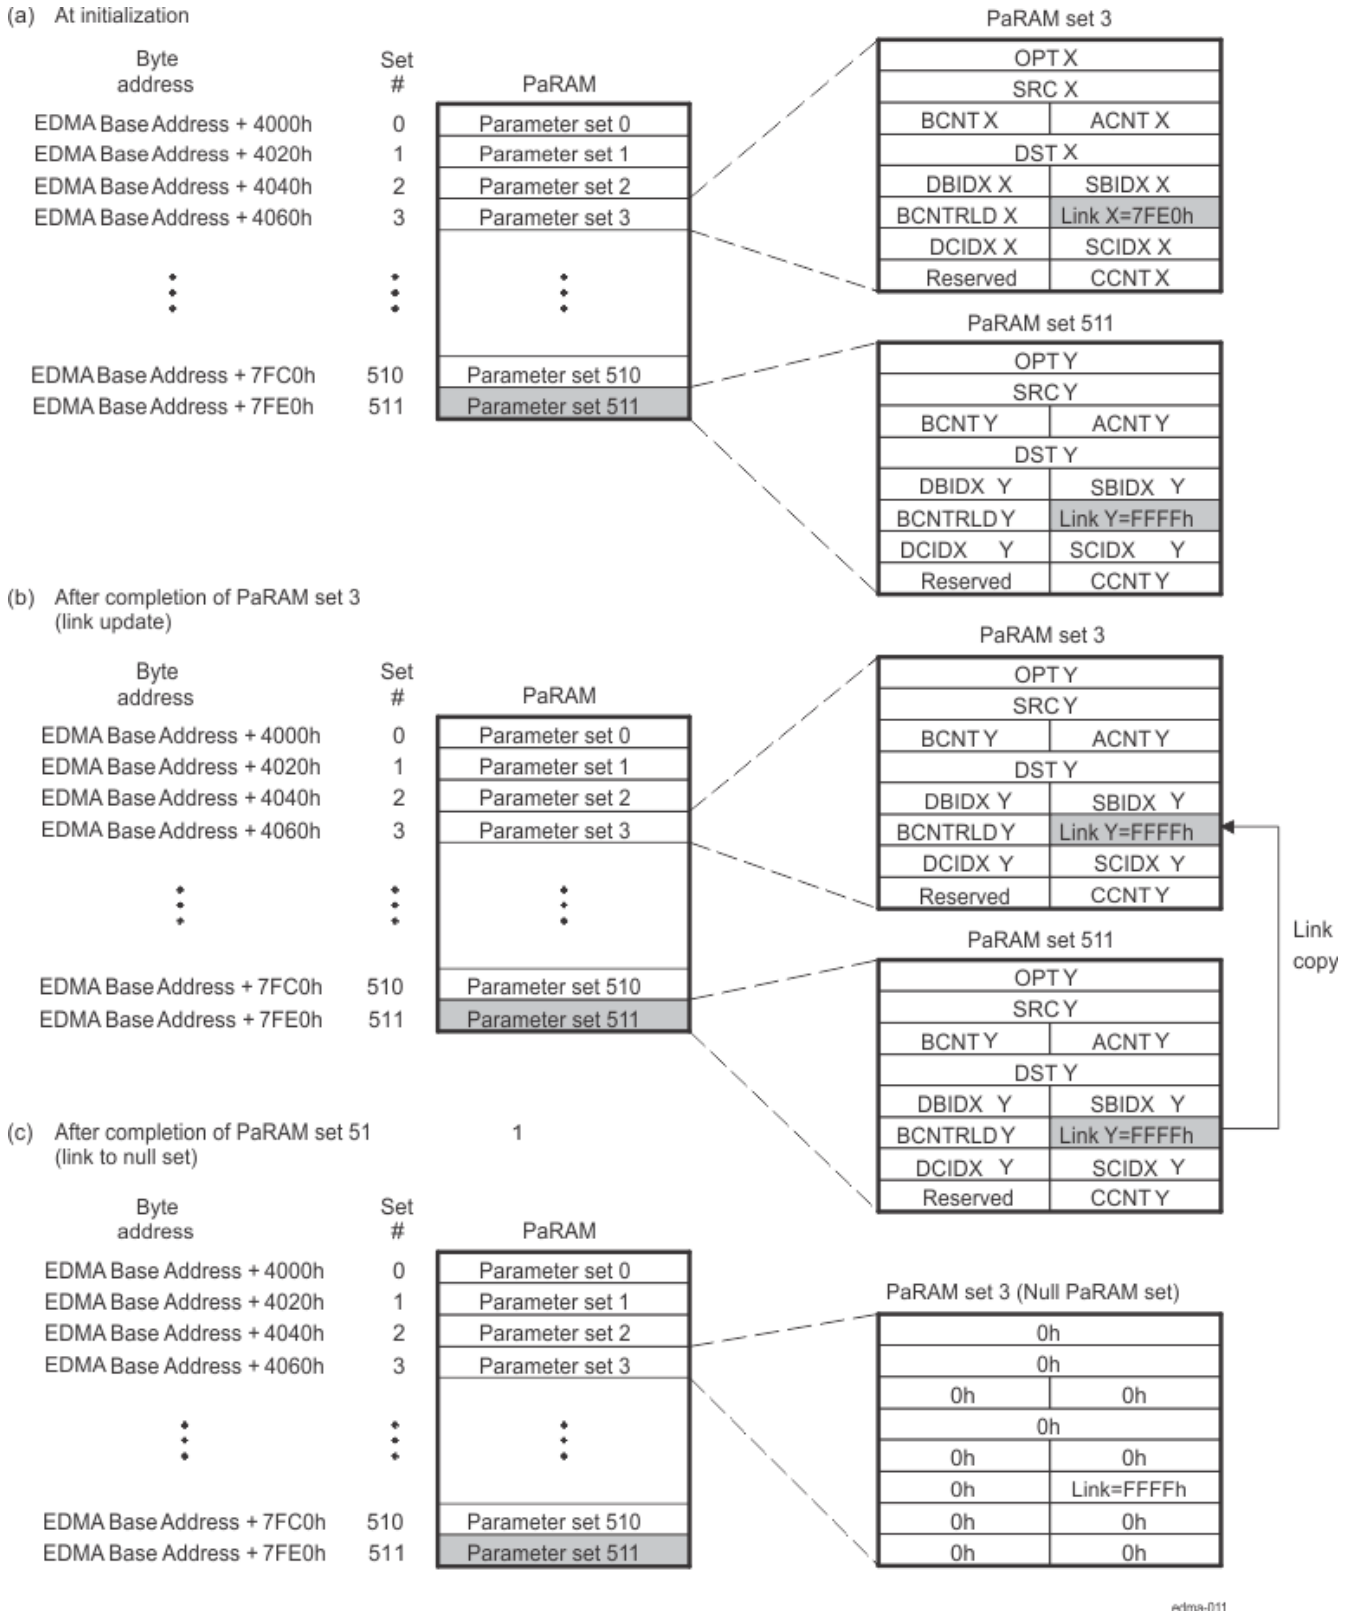

Figure 10-10. Linked Transfer

Note

AM273x has a maximum of 128 PaRAM sets. Additional tables and diagrams in this chapter may show a larger number (up to 511), however 128 is the maximum allowed number of entries.

Any PaRAM set in the PaRAM can be used as a link/reload parameter set. The PaRAM sets associated with peripheral synchronization events (refer to Section 10.1.3.6 *Event, Channel, and PaRAM Mapping*) only use for linking if the corresponding events are disabled.

If a PaRAM set location is defined as a QDMA channel PaRAM set (by EDMA_TPCC_QCHMAPN_j register), then copying the link PaRAM set into the current QDMA channel PaRAM set is recognized as a trigger event. It is latched in EDMA_TPCC_QER because a write to the trigger word was performed. This feature is used to create a linked list of transfers using a single QDMA channel and multiple PaRAM sets. Refer to Section 10.1.3.4.2 *QDMA Channels*.

Linking to itself replicates the behavior of auto-initialization, thus facilitating the use of circular buffering and repetitive transfers. After an EDMA channel exhausts its current PaRAM set, it reloads all of the parameter set entries from another PaRAM set, which is initialized with values that are identical to the original PaRAM set. Figure 10-11 shows an example of a linked to self transfer. Here, the PaRAM set 511 has the link field pointing to the address of parameter set 511 (linked to self).

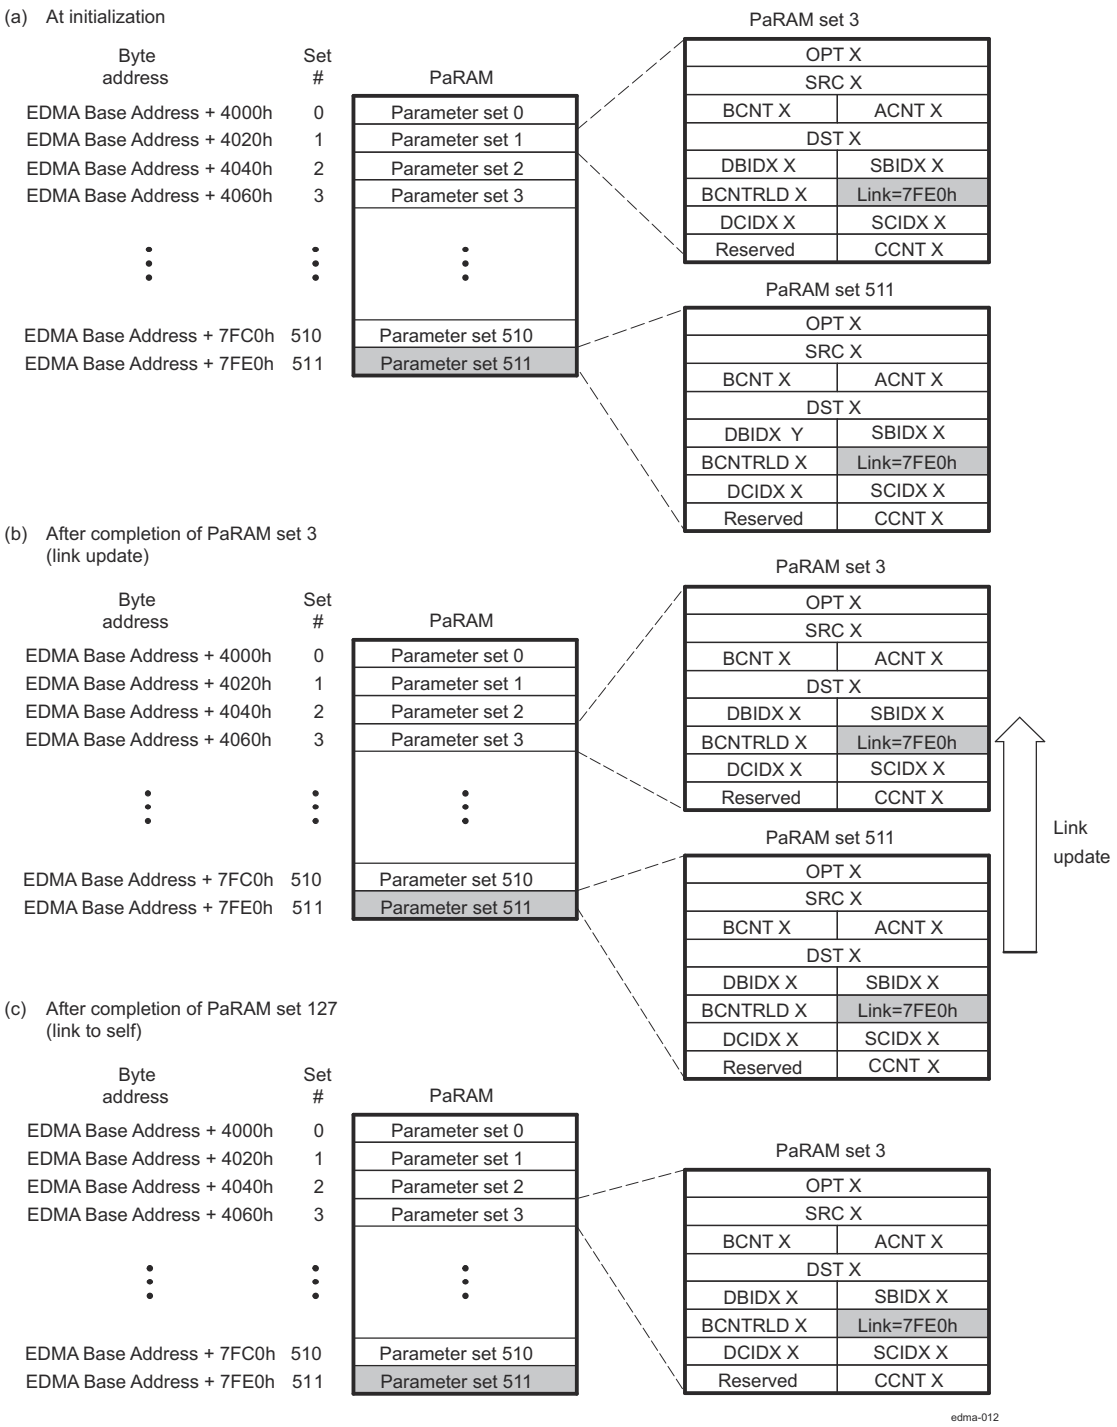

Figure 10-11. Link-to-Self Transfer

Note

If the in EDMA_TPCC_OPT_n[3] STATIC bit is set for a PaRAM set, then link updates are not performed.

10.1.3.3.8 Constant Addressing Mode Transfers/Alignment Issues

If either EDMA_TPCC_OPT_n[0] SAM or EDMA_TPCC_OPT_n[1] DAM is set (constant addressing mode), then the source or destination address must be aligned to a 256-bit aligned address, respectively, and the corresponding EDMA_TPCC_BIDX_n is an even multiple of 32 bytes (256 bits). The EDMA_TPCC does not recognize errors here, but the EDMA_TPTC asserts an error if this is not true. Refer to Section 10.1.3.12.3 *Error Generation*.

Note

The constant addressing (CONST) mode has limited applicability. The EDMA is configured for the constant addressing mode (EDMA_TPCC_OPT_n[0] SAM / EDMA_TPCC_OPT_n[1] DAM = 1) only if the transfer source or destination (on-chip memory, off-chip memory controllers, slave peripherals) support the constant addressing mode. If the constant addressing mode is not supported, the similar logical transfer can be achieved using the increment (INCR) mode (EDMA_TPCC_OPT_n[0] SAM / EDMA_TPCC_OPT_n[1] DAM =0) by appropriately programming the count and indices values.

10.1.3.3.9 Element Size

The EDMA controller does not use element-size and element-indexing. Instead, all transfers are defined in terms of all three dimensions: EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, and EDMA_TPCC_CCNT_n[15:0] CCNT. An element-indexed transfer is logically achieved by programming EDMA_TPCC_ABCNT_n[15:0] ACNT to the size of the element and EDMA_TPCC_ABCNT_n[31:16] BCNT to the number of elements that need to be transferred. For example: If there are 16-bit audio data and 256 audio samples that must be transferred to a serial port, therefore the EDMA_TPCC_ABCNT_n[15:0] ACNT = 2 (2 bytes) and EDMA_TPCC_ABCNT_n[31:16] BCNT = 256.

10.1.3.4 Initiating a DMA Transfer

There are multiple ways to initiate a programmed data transfer using the EDMA_TPCC channel controller. Transfers on DMA channels are initiated by three sources.

They are listed as follows:

- **Event-triggered transfer request** (this is the typical usage of EDMA controller): A peripheral, system, or externally-generated event triggers a transfer request.
- **Manually-triggered transfer request:**The CPU manually triggers a transfer by writing a 1 to the corresponding bit in the event set registers (EDMA_TPCC_ESR / EDMA_TPCC_ESRH).
- **Chain-triggered transfer request:** A transfer is triggered on the completion of another transfer or sub-transfer.

Transfers on QDMA channels are initiated by two sources. They are as follows:

- **Auto-triggered transfer request:** Writing to the programmed trigger word triggers a transfer.
- **Link-triggered transfer requests:** Writing to the trigger word triggers the transfer when linking occurs.

10.1.3.4.1 DMA Channels

10.1.3.4.1.1 Event-Triggered Transfer Request

When an event is asserted from a peripheral or device pins, it gets latched in the corresponding bit of the event register (EDMA_TPCC_ER[31:0] E*n* = 1). For more information about peripheral events to EDMA events mapping, refer to *the device data manual*.
If the corresponding event in the event enable register (EDMA_TPCC_EER) is enabled (EDMA_TPCC_EER[31:0] E*n* = 1), then the EDMA_TPCC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

If the PaRAM set is valid (not a NULL set), then a transfer request packet (TRP) is submitted to the EDMA_TPTC and the EDMA_TPCC_ER[31:0] E*n* bit is cleared. At this point, a new event can be safely received by the EDMA_TPCC.

If the PaRAM set associated with the channel is a NULL set (see Section 10.1.3.3.3 *Null PaRAM Set*), then no transfer request (TR) is submitted and the corresponding EDMA_TPCC_ER[31:0] E*n* bit is cleared and simultaneously the corresponding channel bit is set in the event miss register (EDMA_TPCC_EMR[31:0] E*n* = 1) to indicate that the event was discarded due to a null TR being serviced. Good programming practices should include cleaning the event missed error before re-triggering the DMA channel.

When an event is received, the corresponding event bit in the event register is set (EDMA_TPCC_ER[31:0] E*n* = 1), regardless of the state of EDMA_TPCC_EER[31:0] E*n*. If the event is disabled when an external event is received (EDMA_TPCC_ER[31:0] E*n* = 1 and EDMA_TPCC_EER[31:0] E*n* = 0), the EDMA_TPCC_ER[31:0] E*n* bit remains set. If the event is subsequently enabled (EDMA_TPCC_EER[31:0] E*n* = 1), then the pending event is processed by the EDMA_TPCC and the TR is processed/submitted, after which the EDMA_TPCC_ER[31:0] E*n* bit is cleared.

If an event is being processed (prioritized or is in the event queue) and another sync event is received for the same channel prior to the original being cleared (EDMA_TPCC_ER[31:0] E*n* != 0), then the second event is registered as a missed event in the corresponding bit of the event missed register (EDMA_TPCC_EMR[31:0] E*n* = 1).

10.1.3.4.1.2 Manually-Triggered Transfer Request

The CPU or any peripheral device module initiates a DMA transfer by writing to the event set register EDMA_TPCC_ESR. Writing a 1 to an event bit in the EDMA_TPCC_ESR results in the event being prioritized/queued in the appropriate event queue, regardless of the state of the EDMA_TPCC_EER[31:0] E*n* bit. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA_TPTC and the channel can be triggered again.

If the PaRAM set associated with the channel is a NULL set (see Section 10.1.3.3.3 *Null PaRAM Set*), then no transfer request (TR) is submitted and the corresponding EDMA_TPCC_ER[31:0] E*n* bit is cleared and simultaneously the corresponding channel bit is set in the event miss register EDMA_TPCC_EMR[31:0] E*n* = 1 to indicate that the event was discarded due to a null TR being serviced. Good programming practices should include clearing the event missed error before re-triggering the DMA channel.

If an event is being processed (prioritized or is in the event queue) and the same channel is manually set by a write to the corresponding channel bit of the event set register EDMA_TPCC_ESR[31:0] E*n* = 1 prior to the original being cleared EDMA_TPCC_ESR[31:0] E*n* = 0, then the second event is registered as a missed event in the corresponding bit of the event missed register EDMA_TPCC_EMR[31:0] E*n* = 1.

10.1.3.4.1.3 Chain-Triggered Transfer Request

Chaining is a mechanism by which the completion of one transfer automatically sets the event for another channel. When a chained completion code is detected, the value of which is dictated by the transfer completion code EDMA_TPCC_OPT_n[17:12] TCC of the PaRAM set associated with the channel, it results in the corresponding bit in the chained event register EDMA_TPCC_CER to be set EDMA_TPCC_CER[31:0] E[TCC] = 1).

Once a bit is set in EDMA_TPCC_CER, the EDMA_TPCC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA_TPTC and the channel can be triggered again.

If the PaRAM set associated with the channel is a NULL set (see Section 10.1.3.3.3 *Null PaRAM Set*), then no transfer request (TR) is submitted and the corresponding EDMA_TPCC_CER[31:0] E*n* bit is cleared and simultaneously the corresponding channel bit is set in the event miss register EDMA_TPCC_EMR[31:0] E*n* = 1 to indicate that the event was discarded due to a null TR being serviced. In this case, the error condition must

be cleared before the DMA channel can be re-triggered. Good programming practices might include clearing the event missed error before re-triggering the DMA channel.

If a chaining event is being processed (prioritized or queued) and another chained event is received for the same channel prior to the original being cleared EDMA_TPCC_CER[31:0] E*n* != 0), then the second chained event is registered as a missed event in the corresponding channel bit of the event missed register EDMA_TPCC_EMR[31:0] E*n* = 1.

Note

Chained event registers EDMA_TPCC_CER, event registers EDMA_TPCC_ER, and event set registers EDMA_TPCC_ESR operate independently. An event E*n* can be triggered by any of the trigger sources (event-triggered, manually-triggered, or chain-triggered).

10.1.3.4.2 QDMA Channels

10.1.3.4.2.1 Auto-Triggered and Link-Triggered Transfer Request

QDMA-based transfer requests are issued when a QDMA event gets latched in the QDMA event register EDMA_TPCC_QER[31:0] E*n* = 1. A bit corresponding to a QDMA channel is set in the QDMA event register EDMA_TPCC_QER when the following occurs:

- A CPU (or any device module) write occurs to a PaRAM address that is defined as a QDMA channel trigger word (programmed in the QDMA channel mapping register EDMA_TPCC_QCHMAPN_j for the particular QDMA channel and the QDMA channel is enabled via the QDMA event enable register EDMA_TPCC_QEER[31:0] E*n* = 1.
- EDMA_TPCC performs a link update on a PaRAM set address that is configured as a QDMA channel matches EDMA_TPCC_QCHMAPN_j settings and the corresponding channel is enabled via the QDMA event enable register EDMA_TPCC_QEER[31:0] E*n* = 1.

Once a bit is set in EDMA_TPCC_QER, the EDMA_TPCC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA_TPTC and the channel can be triggered again.

If a bit is already set in EDMA_TPCC_QER[31:0] E*n* = 1 and a second QDMA event for the same QDMA channel occurs prior to the original being cleared, the second QDMA event gets captured in the QDMA event miss register EDMA_TPCC_QEMR[7:0] E*n* = 1.

10.1.3.4.3 Comparison Between DMA and QDMA Channels

The primary difference between DMA and QDMA channels is the event/channel synchronization.

QDMA events are either auto-triggered or link triggered. Auto-triggering allows QDMA channels to be triggered by CPU(s) with a minimum number of linear writes to PaRAM. Link triggering allows a linked list of transfers to be executed, using a single QDMA PaRAM set and multiple link PaRAM sets.

A QDMA transfer is triggered when a CPU (or other device modules) writes to the trigger word of the QDMA channel parameter set (auto-triggered) or when the EDMA_TPCC performs a link update on a PaRAM set that has been mapped to a QDMA channel (link triggered).

Note

The CPUs triggered (manually triggered) DMA channels, in addition to writing to the PaRAM set, it is required to write to the event set register EDMA_TPCC_ESR to kick-off the transfer.

QDMA channels are typically for cases where a single event accomplishes a complete transfer since the CPU (or other device modules) must reprogram some portion of the QDMA PaRAM set in order to re-trigger the channel. QDMA transfers are programmed with EDMA_TPCC_ABCNT_n[31:0] BCNT =1 and

EDMA_TPCC_CCNT_n[15:0] CCNT = 1 for A-synchronized transfers, and EDMA_TPCC_CCNT_n[15:0] CCNT = 1 for AB-synchronized transfers.

Additionally, since linking is also supported (if EDMA_TPCC_OPT_n[3] STATIC = 0) for QDMA transfers, it allows to initiate a linked list of QDMAs, so when EDMA_TPCC copies over a link PaRAM set (including the write to the trigger word), the current PaRAM set mapped to the QDMA channel automatically recognizes as a valid QDMA event and initiate another set of transfers as specified by the linked set.

10.1.3.5 Completion of a DMA Transfer

A parameter set for a given channel is complete when the required number of transfer requests is submitted (based on receiving the number of synchronization events). The expected number of TRs for a non-null/non-dummy transfer is shown in Table 10-15 for both synchronization types along with state of the PaRAM set prior to the final TR being submitted. When the counts (EDMA_TPCC_ABCNT_n[31:0] BCNT and/or EDMA_TPCC_CCNT_n[15:0] CCNT) are this value, the next TR results in:

- Final chaining or interrupt codes sent by the transfer controllers (instead of intermediate).
- Link updates (linking to either null or another valid link set).

Table 10-15. Expected Number of Transfers for Non-Null Transfer

Sync Mode	Counts at time 0	Total # Transfers	Counts prior to final TR
A-synchronized	ACNT BCNT CCNT	(BCNT × CCNT) TRs of ACNT bytes each	EDMA_TPCC_ABCNT_n[31:0] BCNT == 1 && EDMA_TPCC_CCNT_n[15:0] CCNT == 1
AB-synchronized	ACNT BCNT CCNT	CCNT TRs for ACNT × BCNT bytes each	EDMA_TPCC_CCNT_n[15:0] CCNT == 1

The PaRAM OPT field must program with a specific transfer completion code TCC or EDMA_TPCC_OPT_n[17:12] TCC along with the other EDMA_TPCC_OPT_n fields ([22] TCCHEN, [20] TCINTEN, [23] ITCCHEN, and [21] ITCINTEN bits) to indicate whether the completion code is to be used for generating a chained event or/and for generating an interrupt upon completion of a transfer.

The specific EDMA_TPCC_OPT_n[17:12] TCC value (6-bit binary value) programmed dictates which of the 64-bits in the chain event register EDMA_TPCC_CER [TCC] and/or interrupt pending register EDMA_TPCC_IPR [TCC] is set.

It can selectively program whether the transfer controller sends back completion codes on completion of the final transfer request (TR) of a parameter set EDMA_TPCC_OPT_n[22] TCCHEN or EDMA_TPCC_OPT_n[20] TCINTEN, for all but the final transfer request (TR) of a parameter set EDMA_TPCC_OPT_n[23] ITCCHEN or EDMA_TPCC_OPT_n[21] ITCINTEN), or for all TRs of a parameter set (both). Refer to Section 10.1.3.8 *Chaining EDMA Channels* for details on chaining (intermediate/final chaining) and Section 10.1.3.9 *EDMA Interrupts* for details on intermediate/final interrupt completion.

A completion detection interface exists between the EDMA channel controller and transfer controller(s). This interface sends back information from the transfer controller to the channel controller to indicate that a specific transfer is completed. Completion of a transfer is used for generating chained events and/or generating interrupts to the CPU(s).

All DMA/QDMA PaRAM sets must also specify a link address value. For repetitive transfers such as ping-pong buffers, the link address value must point to another predefined PaRAM set. Alternatively, a non-repetitive transfer must set the link address value to the null link value. The null link value is defined as FFFFh. Refer to Section 10.1.3.3.7 *Linking Transfers* for more details.

Note

Any incoming events that are mapped to a null PaRAM set results in an error condition. The error condition must clear before the corresponding channel is used again. Refer to Section 10.1.3.3.5 *Dummy Versus Null Transfer Comparison*.

There are three ways the EDMA_TPCC gets updated/informed about a transfer completion: normal completion, early completion, and dummy/null completion. This applies to both chained events and completion interrupt generation.

10.1.3.5.1 Normal Completion

In normal completion mode EDMA_TPCC_OPT_n[11] TCCMODE = 0, the transfer or sub-transfer is considered to be complete when the EDMA channel controller receives the completion codes from the EDMA transfer controller. In this mode, the completion code to the channel controller is posted by the transfer controller after it receives a signal from the destination peripheral. Normal completion is typically used to generate an interrupt to inform the CPU that a set of data is ready for processing.

10.1.3.5.2 Early Completion

In early completion mode EDMA_TPCC_OPT_n[11] TCCMODE = 1, the transfer is considered to be complete when the EDMA channel controller submits the transfer request (TR) to the EDMA transfer controller. In this mode, the channel controller generates the completion code internally. Early completion is typically useful for chaining, as it allows subsequent transfers to be chained-triggered while the previous transfer is still in progress within the transfer controller, maximizing the overall throughput of the set of the transfers.

10.1.3.5.3 Dummy or Null Completion

This is a variation of early completion. Dummy or null completion is associated with a dummy set Section 10.1.3.3.4 or null set Section 10.1.3.3.3. In both cases, the EDMA channel controller does not submit the associated transfer request to the EDMA transfer controller(s). However, if the set (dummy/null) has the OPT field programmed to return completion code (intermediate/final interrupt/chaining completion), then it sets the appropriate bits in the interrupt pending registers EDMA_TPCC_IPR and EDMA_TPCC_IPRH or chained event register EDMA_TPCC_CER and EDMA_TPCC_CERH. The internal early completion path is used by the channel controller to return the completion codes internally (that is, EDMA_TPCC generates the completion code).

10.1.3.6 Event, Channel, and PaRAM Mapping

Several of the 64 DMA channels are tied to a specific hardware event, thus allowing events from device peripherals or external hardware (via the dma_evt[3:0] pins) to trigger transfers. A DMA channel typically requests a data transfer when it receives its event (apart from manually-triggered, chain-triggered, and other transfers). The amount of data transferred per synchronization event depends on the channel's configuration (EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, EDMA_TPCC_CCNT_n[15:0] CCNT, etc.) and the synchronization type (A-synchronized or AB-synchronized).

The association of an event to a channel is fixed within the EDMA Channel Controller, that is, each DMA channel has one specific event associated with it.

In an application, if a channel does not use the associated synchronization event or if it does not have an associated synchronization event (unused), that channel can be used for manually-triggered or chained-triggered transfers, for linking/reloading, or as a QDMA channel.

10.1.3.6.1 DMA Channel to PaRAM Mapping

The mapping between the DMA channel numbers and the PaRAM sets is programmable (see Section 10.1.3.3). The DMA channel mapping registers EDMA_TPCC_DCHMAPN_m in the EDMA_TPCC provide programmability that allows the DMA channels to be mapped to any of the PaRAM sets in the PaRAM memory map. Figure 10-12 illustrates the use of EDMA_TPCC_DCHMAPN_m. There is one EDMA_TPCC_DCHMAPN_m register per channel.

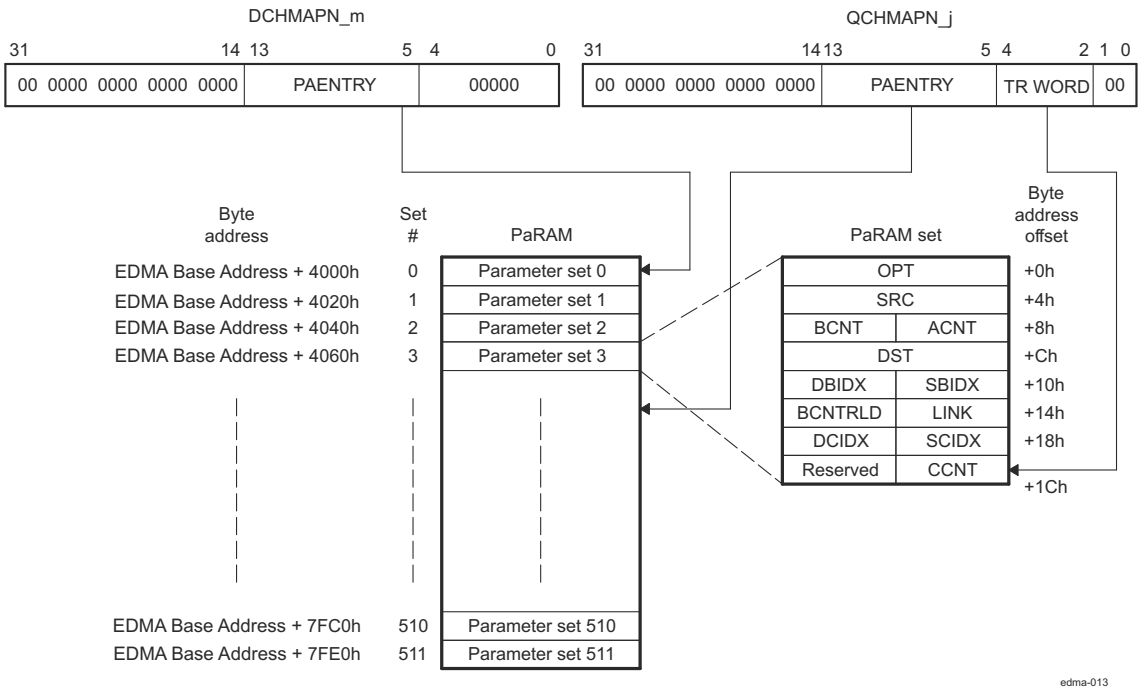

Figure 10-12. DMA Channel and QDMA Channel to PaRAM Mapping

Note

AM273x has a maximum of 128 PaRAM sets. Additional tables and diagrams in this chapter may show a larger number (up to 511), however 128 is the maximum allowed number of entries.

10.1.3.6.2 QDMA Channel to PaRAM Mapping

The mapping between the QDMA channels and the PaRAM sets is programmable. The QDMA channel mapping register EDMA_TPCC_QCHMAPN_j in the EDMA_TPCC allows to map the QDMA channels to any of the PaRAM sets in the PaRAM memory map. Figure 10-13 illustrates the use of EDMA_TPCC_QCHMAPN_j.

EDMA_TPCC_QCHMAPN_j[4:2] TRWORD bit-field allows to program the trigger word in the PaRAM set for the QDMA channel. A trigger word is one of the eight words in the PaRAM set. For a QDMA transfer to occur, a valid TR synchronization event for EDMA_TPCC is a write to the trigger word in the PaRAM set pointed to by EDMA_TPCC_QCHMAPN_j for a particular QDMA channel. By default, QDMA channels are mapped to PaRAM set 0.

It must appropriately re-map PaRAM set 0 before use.

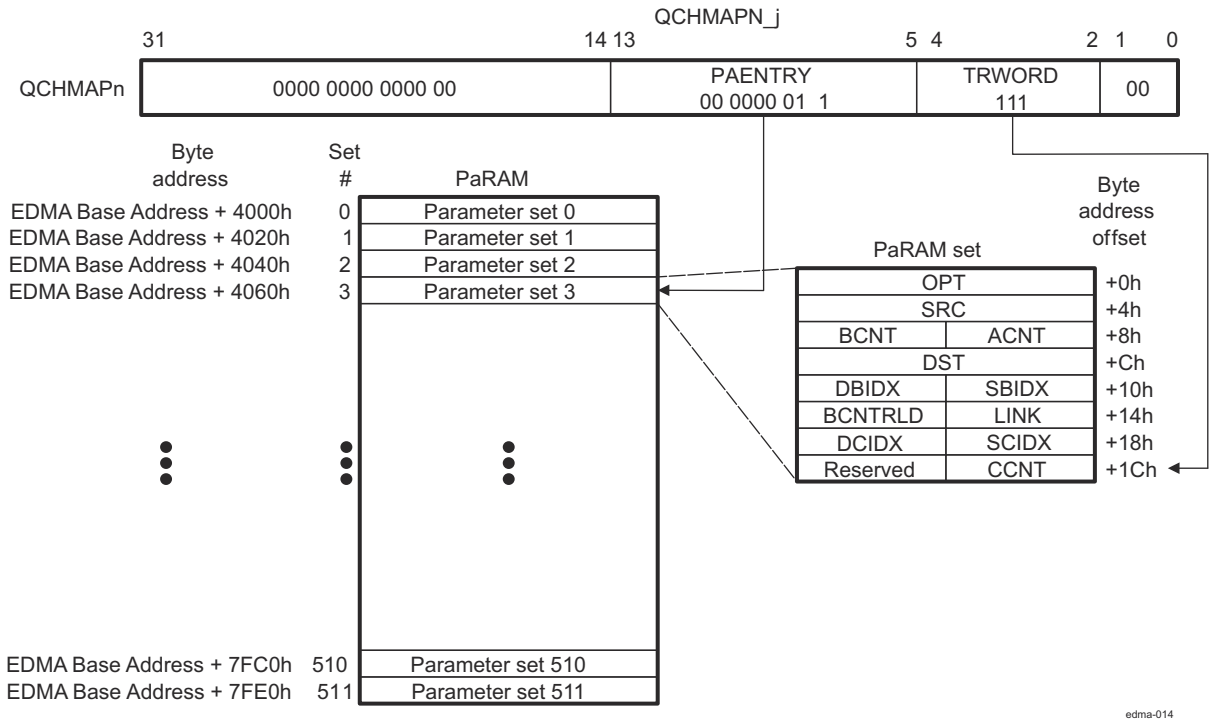

Figure 10-13. QDMA Channel to PaRAM Mapping

10.1.3.7 EDMA Channel Controller Regions

The EDMA channel controller divides its address space into eight regions. Individual channel resources are assigned to a specific region, where each region is typically assigned to a specific device module uses the EDMA controller.

Application software can use regions or to ignore them altogether. It can be used active memory protection in conjunction with regions so that only a specific device module which uses the EDMA (for example, privilege identification) or privilege level (for example, user vs. supervisor) is allowed access to a given region, and thus to a given DMA or QDMA channel. This allows robust system-level DMA code where each EDMA initiator only modifies the state of the assigned resources. Memory protection is described in Section 10.1.3.10 *Memory Protection*.

10.1.3.7.1 Region Overview

The EDMA channel controller memory-mapped registers are divided in three main categories:

1. Global registers
2. Global region channel registers
3. Shadow region channel registers

The global registers are located at a single/fixed location in the EDMA_TPCC memory map. These registers control EDMA resource mapping and provide debug visibility and error tracking information.

The channel registers (including DMA, QDMA, and interrupt registers) are accessible via the global channel region address range, or in the shadow *n* channel region address range(s). For example, the event enable register EDMA_TPCC_EER is visible at the global address of EDMA Base Address + 1020h or region addresses of EDMA Base Address + 2020h for region 0, EDMA Base Address + 2220h for region 1, … EDMA Base Address + 2E20h for region 7.

The DMA region access enable registers EDMA_TPCC_DRAEM_k and the QDMA region access enable registers EDMA_TPCC_QRAEN_k control the underlying control register bits that are accessible via the shadow region address space (except for EDMA_TPCC_IEVAL and EDMA_TPCC_IEVAL_RN_k registers). Table 10-16

lists the registers in the shadow region memory map. Refer to *EDMA_TPCC register mapping summary* for the complete global and shadow region memory maps.

Table 10-16. Shadow Region Registers

EDMA_TPCC_DRAEM_k	EDMA_TPCC_DRAEHM_k	EDMA_TPCC_QRAEN_k

Figure 10-14 illustrates the conceptual view of the regions.

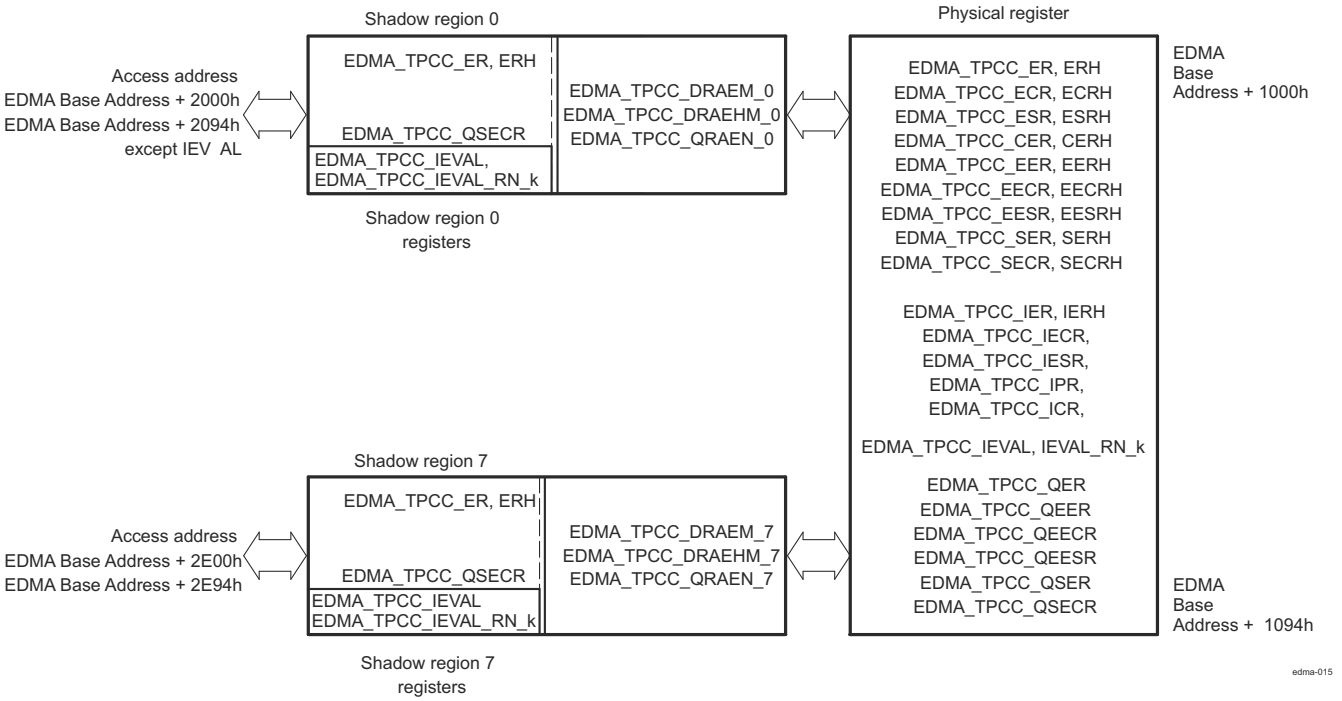

Figure 10-14. Shadow Region Registers

10.1.3.7.2 Channel Controller Regions

There are eight EDMA shadow regions (and associated memory maps). Associated with each shadow region are a set of registers defining which channels and interrupt completion codes belong to that region. These registers are user-programmed per region to assign ownership of the DMA/QDMA channels to a region.

- EDMA_TPCC_DRAEM_k and EDMA_TPCC_DRAEHM_k: One register pair exists for each of the shadow regions. The number of bits in each register pair matches the number of DMA channels (64 DMA channels). These registers need to be programmed to assign ownership of DMA channels and interrupt (or EDMA_TPCC_OPT_n[17:12] TCC codes) to the respective region. Accesses to DMA and interrupt registers via the shadow region address view are filtered through the DRAEM/DRAEHM pair. A value of 1 in the corresponding EDMA_TPCC_DRAEM_k[31:0] / EDMA_TPCC_DRAEHM_k[31:0] bit implies that the corresponding DMA interrupt channel is accessible; a value of 0 in the corresponding EDMA_TPCC_DRAEM_k[31:0] / EDMA_TPCC_DRAEHM_k[31:0] bit forces writes to be discarded and returns a value of 0 for reads.
- EDMA_TPCC_QRAEN_k: One register exists for every region. The number of bits in each register matches the number of QDMA channels (8 QDMA channels). These registers must be programmed to assign ownership of QDMA channels to the respective region. To enable a channel in a shadow region using shadow region 0 EDMA_TPCC_QEER, the corresponding bits in QRAE must be set or writing into EDMA_TPCC_QEESR there will be no the desired effect.
- EDMA_TPCC_MPPAN_k and EDMA_TPCC_MPPAG: One register exists for every region. This register defines the privilege level, requestor, and types of accesses allowed to a region's memory-mapped registers.

It is typical for an application to have a unique assignment of QDMA/DMA channels (and, therefore, a given bit position) to a given region.

The use of shadow regions allows restricted access to EDMA resources (DMA channels, QDMA channels, TCC, interrupts) by tasks in a system by setting or clearing bits in the EDMA_TPCC_DRAEM_k / EDMA_TPCC_QRAEN_k registers.

If exclusive access to any given channel / TCC code is required for a region, then only that region's EDMA_TPCC_DRAEM_k / EDMA_TPCC_QRAEN_k have the associated bit set.

Example 10-1. Resource Pool Division Across Two Regions

This example illustrates a resource pool division across two regions, assuming region 0 must be allocated 16 DMA channels (0-15) and 1 QDMA channel (0) and 32 TCC codes (0-15 and 48-63).

Region 1 needs to be allocated 16 DMA channels (16-32) and the remaining 7 QDMA channels (1-7) and TCC codes (16-47).

EDMA_TPCC_DRAEM_k should be equal to the OR of the bits that are required for the DMA channels and the TCC codes:

```
Region 0: DRAEHM, DRAEM = 0xFFFF0000, 0x0000FFFF QRAEN = 0x0000001
Region 1: DRAEHM, DRAEM = 0x0000FFFF, 0xFFFF0000 QRAEN = 0x00000FE
```

10.1.3.7.3 Region Interrupts

In addition to the EDMA_TPCC global completion interrupt, there is an additional completion interrupt line that is associated with every shadow region. Along with the interrupt enable register EDMA_TPCC_IER, DRAEM acts as a secondary interrupt enable for the respective shadow region interrupts. Refer to *Hardware Request* for more information about EDMA Interrupts.

10.1.3.8 Chaining EDMA Channels

The channel chaining capability for the EDMA allows the completion of an EDMA channel transfer to trigger another EDMA channel transfer. The purpose is to allow the ability to chain several events through one event occurrence.

Chaining is different from linking (Section 10.1.3.3.7 *Linking Transfers*). The EDMA link feature reloads the current channel parameter set with the linked parameter set. The EDMA chaining feature does not modify or update any channel parameter set. It provides a synchronization event to the chained channel (see Section 10.1.3.4.1.3 *Chain-Triggered Transfer Request*).

Chaining is achieved at either final transfer completion or intermediate transfer completion, or both, of the current channel. Consider a channel *m* (DMA/QDMA) required to chain to channel *n*. Channel number *n* (0-63) needs to be programmed into the EDMA_TPCC_OPT_n[17:12] TCC bit-field of channel *m* channel options parameter (OPT) set.

- If final transfer completion chaining EDMA_TPCC_OPT_n[22] TCCHEN = 1 is enabled, the chain-triggered event occurs after the submission of the last transfer request of channel *m* is either submitted or completed (depending on early or normal completion).

- If intermediate transfer completion chaining EDMA_TPCC_OPT_n[23] ITCCHEN = 1 is enabled, the chain-triggered event occurs after every transfer request, except the last of channel *m* is either submitted or completed (depending on early or normal completion).
- If both final and intermediate transfer completion chaining (EDMA_TPCC_OPT_n[22] TCCHEN = 1 and EDMA_TPCC_OPT_n[23] ITCCHEN = 1) are enabled, then the chain-trigger event occurs after every transfer request is submitted or completed (depending on early or normal completion).

Table 10-17 illustrates the number of chain event triggers occurring in different synchronized scenarios. Consider channel 31 programmed with EDMA_TPCC_ABCNT_n[15:0] ACNT = 3, EDMA_TPCC_ABCNT_n[31:16] BCNT = 4, EDMA_TPCC_CCNT_n[15:0] CCNT = 5, and EDMA_TPCC_OPT_n[17:12] TCC = 30.

Table 10-17. Chain Event Triggers

	(Number of chained event triggers on channel 30)	
Options	**A-Synchronized**	**AB-Synchronized**
EDMA_TPCC_OPT_n[22] TCCHEN = 1, EDMA_TPCC_OPT_n[23] ITCCHEN = 0	1 (Owing to the last TR)	1 (Owing to the last TR)
EDMA_TPCC_OPT_n[22] TCCHEN = 0, EDMA_TPCC_OPT_n[23] ITCCHEN = 1	19 (Owing to all but the last TR)	4 (Owing to all but the last TR)
EDMA_TPCC_OPT_n[22] TCCHEN = 1, EDMA_TPCC_OPT_n[23] ITCCHEN = 1	20 (Owing to a total of 20 TRs)	5 (Owing to a total of 5 TRs)

10.1.3.9 EDMA Interrupts

The EDMA interrupts are divided into 2 categories: transfer completion interrupts and error interrupts.

There are nine region interrupts, eight shadow regions and one global region. The transfer completion interrupts are listed in Table 10-18. The transfer completion interrupts and the error interrupts from the transfer controllers are all routed to the device interrupt controllers INTCs.

Table 10-18. EDMA Transfer Completion Interrupts

Name	Description
EDMA_TPCC_INT0	EDMA_TPCC Transfer Completion Interrupt Shadow Region 0
EDMA_TPCC_INT1	EDMA_TPCC Transfer Completion Interrupt Shadow Region 1
EDMA_TPCC_INT2	EDMA_TPCC Transfer Completion Interrupt Shadow Region 2
EDMA_TPCC_INT3	EDMA_TPCC Transfer Completion Interrupt Shadow Region 3
EDMA_TPCC_INT4	EDMA_TPCC Transfer Completion Interrupt Shadow Region 4
EDMA_TPCC_INT5	EDMA_TPCC Transfer Completion Interrupt Shadow Region 5
EDMA_TPCC_INT6	EDMA_TPCC Transfer Completion Interrupt Shadow Region 6
EDMA_TPCC_INT7	EDMA_TPCC Transfer Completion Interrupt Shadow Region 7

Table 10-19. EDMA Error Interrupts

Name	Description
EDMA_TPCC_ERRINT	EDMA_TPCC Error Interrupt
EDMA_TPCC_MPINT	EDMA_TPCC Memory Protection Interrupt
EDMA_TC0_ERRINT	TC0 Error Interrupt
EDMA_TC1_ERRINT	TC1 Error Interrupt

10.1.3.9.1 Transfer Completion Interrupts

The EDMA_TPCC is responsible for generating transfer completion interrupts to the CPU(s) (and other EDMA controllers). The EDMA generates a single completion interrupt per shadow region, as well as one for the global region on behalf of all 64 channels. The various control registers and bit fields facilitate EDMA interrupt generation.

The software architecture must either use the global interrupt or the shadow interrupts, but not both.

The transfer completion code EDMA_TPCC_OPT_n[17:12] TCC value is directly mapped to the bits of the interrupt pending register EDMA_TPCC_IPR / EDMA_TPCC_IPRH.

For example, if EDMA_TPCC_OPT_n[17:12] TCC = 10 0001b, EDMA_TPCC_IPRH[1] is set after transfer completion, and results in interrupt generation to the CPU(s) if the completion interrupt is enabled for the CPU. See Section 10.1.3.9.1.1 *Enabling Transfer Completion Interrupts* for details about enabling EDMA transfer completion interrupts.

When a completion code is returned (as a result of early or normal completions), the corresponding bit in EDMA_TPCC_IPR / EDMA_TPCC_IPRH registers is set if transfer completion interrupt (final/intermediate) is enabled in the channel options parameter (OPT) for a PaRAM set associated with the transfer.

Table 10-20. Transfer Complete Code (TCC) to EDMA_TPCC Interrupt Mapping

TCC values in EDMA_TPCC_OPT_n[17:12] TCC (EDMA_TPCC_OPT_n[20] TCINTEN / EDMA_TPCC_OPT_n[21] ITCINTEN = 1)	EDMA_TPCC_IPR Bit Set	TCC values in EDMA_TPCC_OPT_n[17:12] TCC (EDMA_TPCC_OPT_n[20] TCINTEN / EDMA_TPCC_OPT_n[21] ITCINTEN = 1)	EDMA_TPCC_IPRH Bit Set(1)
0	EDMA_TPCC_IPR[0]	20h	EDMA_TPCC_IPR[32] / EDMA_TPCC_IPRH[0]
1	EDMA_TPCC_IPR[1]	21h	EDMA_TPCC_IPR[33] / EDMA_TPCC_IPRH[1]
2h	EDMA_TPCC_IPR[2]	22h	EDMA_TPCC_IPR[34] / EDMA_TPCC_IPRH[2]
3h	EDMA_TPCC_IPR[3]	23h	EDMA_TPCC_IPR[35] / EDMA_TPCC_IPRH[3]
4h	EDMA_TPCC_IPR[4]	24h	EDMA_TPCC_IPR[36] / EDMA_TPCC_IPRH[4]
...	...	...	...
1Eh	EDMA_TPCC_IPR[30]	3Eh	EDMA_TPCC_IPR[62] / EDMA_TPCC_IPRH[30]
1Fh	EDMA_TPCC_IPR[31]	3Fh	EDMA_TPCC_IPR[63] / EDMA_TPCC_IPRH[31]

(1) Bit fields EDMA_TPCC_IPR [32-63] correspond to bits 0 to 31 in EDMA_TPCC_IPRH, respectively.

The transfer completion code (TCC) can program to any value for a DMA/QDMA channel. A direct relation between the channel number and the transfer completion code value does not need to exist. This allows multiple channels having the same transfer completion code value to cause a CPU to execute the same interrupt service routine (ISR) for different channels.

If the channel is used in the context of a shadow region and it intends for the shadow region interrupt to be asserted, then ensure that the bit corresponding to the TCC code is enabled in EDMA_TPCC_IER / EDMA_TPCC_IERH and in the corresponding shadow region's DMA region access registers (EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k).

Interrupt generation can be enabled at either final transfer completion or intermediate transfer completion, or both. Consider channel *m* as an example.

- If the final transfer interrupt (EDMA_TPCC_OPT_n[20] TCINTEN = 1) is enabled, the interrupt occurs after the last transfer request of channel *m* is either submitted or completed (depending on early or normal completion).
- If the intermediate transfer interrupt (EDMA_TPCC_OPT_n[21] ITCINTEN = 1) is enabled, the interrupt occurs after every transfer request, except the last TR of channel *m* is either submitted or completed (depending on early or normal completion).

- If both final and intermediate transfer completion interrupts (EDMA_TPCC_OPT_n[20] TCINTEN = 1, and EDMA_TPCC_OPT_n[21] ITCINTEN = 1) are enabled, then the interrupt occurs after every transfer request is submitted or completed (depending on early or normal completion).

Table 10-21 shows the number of interrupts that occur in different synchronized scenarios. Consider channel 31, programmed with ABCNT_n[15:0] ACNT = 3, EDMA_TPCC_ABCNT_n[31:16] BCNT = 4, EDMA_TPCC_CCNT_n[15:0]CCNT = 5, and EDMA_TPCC_OPT_n[17:12] TCC = 30.

Table 10-21. Number of Interrupts

Options	A-Synchronized	AB-Synchronized
EDMA_TPCC_OPT_n[20] TCINTEN = 1, EDMA_TPCC_OPT_n[21] ITCINTEN = 0	1 (Last TR)	1 (Last TR)
EDMA_TPCC_OPT_n[20] TCINTEN = 0, EDMA_TPCC_OPT_n[21] ITCINTEN = 1	19 (All but the last TR)	4 (All but the last TR)
EDMA_TPCC_OPT_n[20] TCINTEN = 1, EDMA_TPCC_OPT_n[21] ITCINTEN = 1	20 (All TRs)	5 (All TRs)

10.1.3.9.1.1 Enabling Transfer Completion Interrupts

For the EDMA channel controller to assert a transfer completion to the external environment, the interrupts must be enabled in the EDMA_TPCC. This is in addition to setting up the EDMA_TPCC_OPT_n[20] TCINTEN and EDMA_TPCC_OPT_n[21] ITCINTEN bits of the associated PaRAM set.

The EDMA channel controller has interrupt enable registers EDMA_TPCC_IER / EDMA_TPCC_IERH and each bit location in EDMA_TPCC_IER / EDMA_TPCC_IERH serves as a primary enable for the corresponding interrupt pending registers EDMA_TPCC_IPR / EDMA_TPCC_IPRH.

All of the interrupt registers (EDMA_TPCC_IER, EDMA_TPCC_IESR, EDMA_TPCC_IECR, and EDMA_TPCC_IPR) are either manipulated from the global DMA channel region, or by the DMA channel shadow regions. The shadow regions provide a view to the same set of physical registers that are in the global region.

The EDMA channel controller has a hierarchical completion interrupt scheme that uses a single set of interrupt pending registers EDMA_TPCC_IPR / EDMA_TPCC_IPRH and single set of interrupt enable registers EDMA_TPCC_IER / EDMA_TPCC_IERH. The programmable DMA region access enable registers EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k provides a second level of interrupt masking. The global region interrupt output is gated based on the enable mask that is provided by EDMA_TPCC_IER / EDMA_TPCC_IERH, see Figure 10-15

The region interrupt outputs are gated by EDMA_TPCC_IER and the specific EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k associated with the region.

Figure 10-15 shows the Interrupt diagram of the EDMA controller.

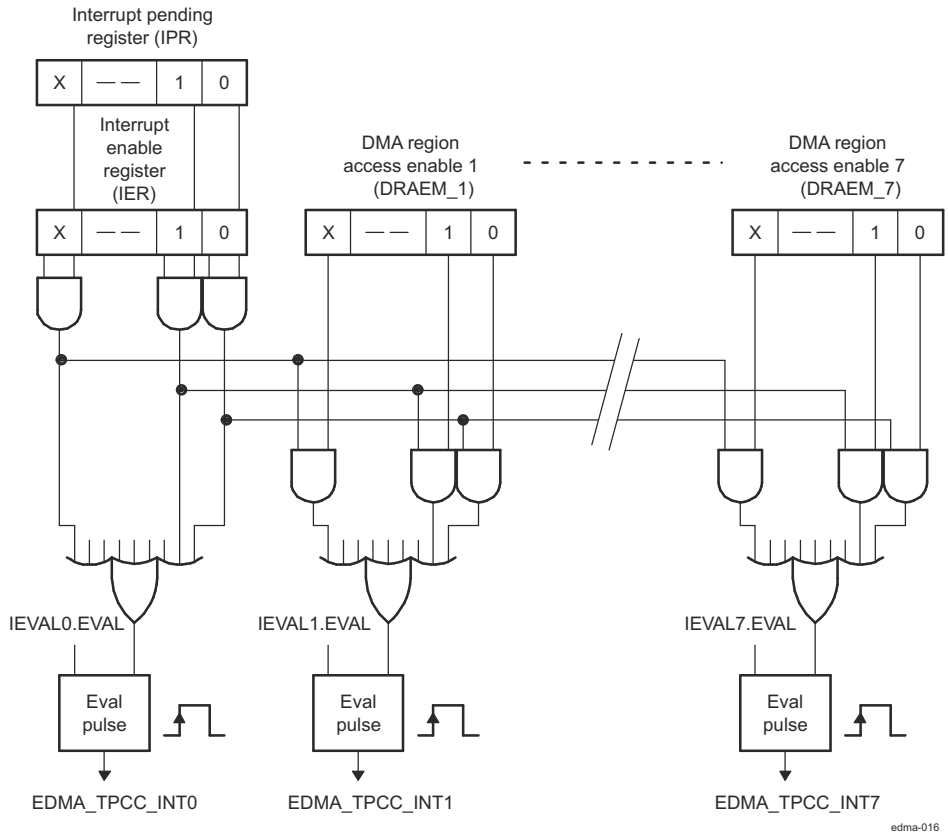

Figure 10-15. Interrupt Diagram

The EDMA_TPCC generates the transfer completion interrupts that are associated with each shadow region, the following conditions must be true:

- EDMA_TPCC_INT0: (EDMA_TPCC_IPR[0] E0 & EDMA_TPCC_IER[0] E0 & EDMA_TPCC_DRAEM_k.DRAEM_0[0] E0) | (EDMA_TPCC_IPR[1] E1 & EDMA_TPCC_IER[1] E1 & EDMA_TPCC_DRAEM_k.DRAEM_0[1] E1) | …|(EDMA_TPCC_IPRH[31] E63 & EDMA_TPCC_IERH[31] E63 & EDMA_TPCC_DRAEHM_k.DRAEHM_0[31] E63)
- EDMA_TPCC_INT1: (EDMA_TPCC_IPR[0] E0 & EDMA_TPCC_IER[0] E0 & EDMA_TPCC_DRAEM_k.DRAEM_1[0] E0) | (EDMA_TPCC_IPR[1] E1 & EDMA_TPCC_IER[1] E1 & EDMA_TPCC_DRAEM_k.DRAEM_1[1] E1) | …| (EDMA_TPCC_IPRH[31] E63 & EDMA_TPCC_IERH[31] E63 & EDMA_TPCC_DRAEHM_k.DRAEHM_1[31] E63)
- EDMA_TPCC_INT2: (EDMA_TPCC_IPR[0] E0 & EDMA_TPCC_IER[0] E0 & EDMA_TPCC_DRAEM_k.DRAEM_2[0] E0) | (EDMA_TPCC_IPR[1] E1 & EDMA_TPCC_IER[1] E1 & EDMA_TPCC_DRAEM_k.DRAEM_2[1] E1) | …|(EDMA_TPCC_IPRH[31] E63 & EDMA_TPCC_IERH[31] E63 & EDMA_TPCC_DRAEHM_k.DRAEHM_2[31] E63)....
- Up to EDMA_TPCC_INT7: (EDMA_TPCC_IPR[0] E0 & EDMA_TPCC_IER[0] E0 & EDMA_TPCC_DRAEM_k.DRAEM_7[0] E0) | (EDMA_TPCC_IPR[1] E1 & EDMA_TPCC_IER[1] E1 & EDMA_TPCC_DRAEM_k.DRAEM_7[1] E1) | …|(EDMA_TPCC_IPRH[31] E63 & EDMA_TPCC_IERH[31] E63 & EDMA_TPCC_DRAEHM_k.DRAEHM_7[31] E63)

Note

The EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k for all regions are expected to be set up at system initialization and to remain static for an extended period of time. The interrupt enable registers are used for dynamic enable/disable of individual interrupts.

Because there is no relation between the EDMA_TPCC_OPT_n[17:12] TCC value and the DMA/QDMA channel, it is possible, the DMA channel 0 to have the EDMA_TPCC_OPT_n[17:12] TCC = 63 in its associated PaRAM set. This mean that if a transfer completion interrupt is enabled (EDMA_TPCC_OPT_n[20] TCINTEN or EDMA_TPCC_OPT_n[21] ITCINTEN is set), then based on the TCC value, EDMA_TPCC_IPRH[31] E63 is set up on completion. For proper channel operations and interrupt generation using the shadow region map - program the EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k that is associated with the shadow region to have read/write access to both bit 0 (corresponding to channel 0) and bit 63 (corresponding to EDMA_TPCC_IPRH bit that is set upon completion).

10.1.3.9.1.2 Clearing Transfer Completion Interrupts

Transfer completion interrupts that are latched to the interrupt pending registers (EDMA_TPCC_IPR / EDMA_TPCC_IPRH) are cleared by writing a 1 to the corresponding bit in the interrupt pending clear register (EDMA_TPCC_ICR / EDMA_TPCC_ICRH). For example, a write of 1 to EDMA_TPCC_ICR[0] E0 clears a pending interrupt in EDMA_TPCC_IPR[0] E0.

If an incoming transfer completion code TCC (EDMA_TPCC_OPT_n[17:12] TCC) gets latched to a bit in EDMA_TPCC_IPR / EDMA_TPCC_IPRH, then additional bits that get set due to a subsequent transfer completion does not result in asserting the EDMA_TPCC completion interrupt. In order for the completion interrupt to be pulsed, the required transition is from a state where no enabled interrupts are set to a state where at least one enabled interrupt is set.

10.1.3.9.2 EDMA Interrupt Servicing

Upon completion of a transfer (early or normal completion), the EDMA channel controller sets the appropriate bit in the interrupt pending registers (EDMA_TPCC_IPR / EDMA_TPCC_IPRH), as the transfer completion codes specify. If the completion interrupts are appropriately enabled, then the CPU enters the interrupt service routine (ISR) when the completion interrupt is asserted.

After servicing the interrupt, the ISR should clear the corresponding bit in EDMA_TPCC_IPR/ EDMA_TPCC_IPRH, thereby enabling recognition of future interrupts. The EDMA_TPCC only asserts additional completion interrupts when all EDMA_TPCC_IPR / EDMA_TPCC_IPRH bits clear.

When one interrupt is serviced many other transfer completions may result in additional bits being set in EDMA_TPCC_IPR / EDMA_TPCC_IPRH, thereby resulting in additional interrupts. Each of the bits in EDMA_TPCC_IPR / EDMA_TPCC_IPRH may need different types of service therefore, the ISR must check all pending interrupts and continue until all of the posted interrupts are serviced appropriately.

Examples of pseudo code for a CPU interrupt service routine for an EDMA_TPCC completion interrupt are shown in Example 10-2 and Example 10-3.

The ISR routine in Example 10-2 is more exhaustive and incurs a higher latency.

Example 10-2. Interrupt Servicing

The pseudo code:

1. Reads the interrupt pending register EDMA_TPCC_IPR / EDMA_TPCC_IPRH.
2. Performs the operations needed.
3. Writes to the interrupt pending clear register EDMA_TPCC_ICR / EDMA_TPCC_ICRH to clear the corresponding EDMA_TPCC_IPR / EDMA_TPCC_IPRH bit(s).
4. Reads EDMA_TPCC_IPR / EDMA_TPCC_IPRH again:

a. If EDMA_TPCC_IPR / EDMA_TPCC_IPRH is not equal to 0, repeat from step 2 (implies occurrence of new event between step 2 to step 4).
b. If EDMA_TPCC_IPR / EDMA_TPCC_IPRH is equal to 0, assure that all of the enabled interrupts are inactive.

Note

An event may occur during step 4 while the EDMA_TPCC_IPR / EDMA_TPCC_IPRH bits are read as 0 and the application is still in the interrupt service routine. If this happens, a new interrupt is recorded in the device interrupt controller and a new interrupt generates as soon as the application exits in the interrupt service routine.

10.1.3.9.3

Example 10-3 is less rigorous, with less burden on the software in polling for set interrupt bits, but can occasionally cause a race condition as mentioned above.

Example 10-3. Interrupt Servicing

If any enabled and pending (possibly lower priority) interrupts are left, force the interrupt logic to reassert the interrupt pulse by setting the EDMA_TPCC_IEVAL[0] EVAL bit in the interrupt evaluation register.

The pseudo code is as follows:

1. Enters ISR.
2. Reads EDMA_TPCC_IPR / EDMA_TPCC_IPRH.
3. For the condition that is set in EDMA_TPCC_IPR / EDMA_TPCC_IPRH:
   a. Service interrupt as the application requires.
   b. Clear the bit for serviced conditions (others may still be set, and other transfers may have resulted in returning the TCC to EDMA_TPCC after step 2).
4. Reads EDMA_TPCC_IPR / EDMA_TPCC_IPRH prior to exiting the ISR:
   a. If EDMA_TPCC_IPR / EDMA_TPCC_IPRH is equal to 0, then exit the ISR.
   b. If EDMA_TPCC_IPR / EDMA_TPCC_IPRH is not equal to 0, then set EDMA_TPCC_IEVAL so that upon exit of ISR, a new interrupt triggers if any enabled interrupts are still pending.

10.1.3.9.4 Interrupt Evaluation Operations

The EDMA_TPCC has interrupt evaluate registers EDMA_TPCC_IEVAL that exist in the global region and in each shadow region. The registers in the shadow region are the only registers in the DMA channel shadow region memory map that are not affected by the settings for the DMA region access enable registers EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k. Writing a 1 to the EDMA_TPCC_IEVAL[0] EVAL bit in the registers that are associated with a particular shadow region results in pulsing the associated region interrupt (global or shadow), if any enabled interrupt (via EDMA_TPCC_IER / EDMA_TPCC_IERH) is still pending EDMA_TPCC_IPR / EDMA_TPCC_IPRH. This register assures that the CPU does not miss the interrupts (or the EDMA controller associated with the shadow region) if the software architecture chooses not to use all interrupts. Refer to Example 10-3 about the use of EDMA_TPCC_IEVAL in the EDMA interrupt service routine (ISR).

Similarly an error evaluation register EDMA_TPCC_EEVAL exists in the global region. Writing a 1 to the EDMA_TPCC_EEVAL[0] EVAL bit causes the pulsing of the error interrupt if any pending errors are in EDMA_TPCC_EMR / EDMA_TPCC_EMRH, EDMA_TPCC_QEMR, or EDMA_TPCC_CCERR. See Section 10.1.3.9.5 *Error Interrupts* for additional information regarding error interrupts.

Note

While using EDMA_TPCC_IEVAL for shadow region completion interrupts, check that the EDMA_TPCC_IEVAL operated upon is from that particular shadow region memory map.

10.1.3.9.5 Error Interrupts

The EDMA_TPCC error registers provide the capability to differentiate error conditions (event missed, threshold exceed, etc.). Additionally, setting the error bits in these registers results in asserting the EDMA_TPCC error interrupt. If the EDMA_TPCC error interrupt is enabled in the device interrupt controller(s), then it allows the CPU(s) to handle the error conditions.

The EDMA_TPCC has a single error interrupt (EDMA_TPCC_ERRINT) that is asserted for all EDMA_TPCC error conditions. There are four conditions that cause the error interrupt:

- DMA missed events: for all 64 DMA channels. DMA missed events are latched in the event missed registers EDMA_TPCC_EMR / EDMA_TPCC_EMRH.
- QDMA missed events: for all 8 QDMA channels. QDMA missed events are latched in the QDMA event missed register EDMA_TPCC_QEMR.
- Threshold exceed: for all event queues. These are latched in EDMA_TPCC error register EDMA_TPCC_CCERR.
- TCC error: for outstanding transfer requests that are expected to return completion code EDMA_TPCC_OPT_n[22] TCCHEN or EDMA_TPCC_OPT_n[23] TCINTEN bit is set to 1, exceeding the maximum limit of 63. This is also latched in the EDMA_TPCC error register EDMA_TPCC_CCERR.

Figure 10-16 illustrates the EDMA_TPCC error interrupt generation operation.

If any of the bits are set in the error registers due to any error condition, the EDMA_TPCC_ERRINT is always asserted, as there are no enables for masking these error events. Similar to transfer completion interrupts (EDMA_TPCC_INT), the error interrupt also only pulses when the error interrupt condition transitions from no errors being set to at least one error being set. If additional error events are latched prior to the original error bits clearing, the EDMA_TPCC does not generate additional interrupt.

To reduce the burden on the software, there is an error evaluate register EDMA_TPCC_EEVAL that allows re-evaluation of pending set error events/bits, similar to the interrupt evaluate register EDMA_TPCC_IEVAL. Unlike the EDMA_TPCC_IEVAL functionality, the EDMA_TPCC_EEVAL register must be written with ‘1’ after any error interrupts are serviced (even when all pending errors are cleared) in order for subsequent errors to trigger a new interrupt.

Note

It is good practice to enable the error interrupt in the device interrupt controller and to associate an interrupt service routine with it to address the various error conditions appropriately. Doing so puts less burden on the software (polling for error status), it provides a good debug mechanism for unexpected error conditions.

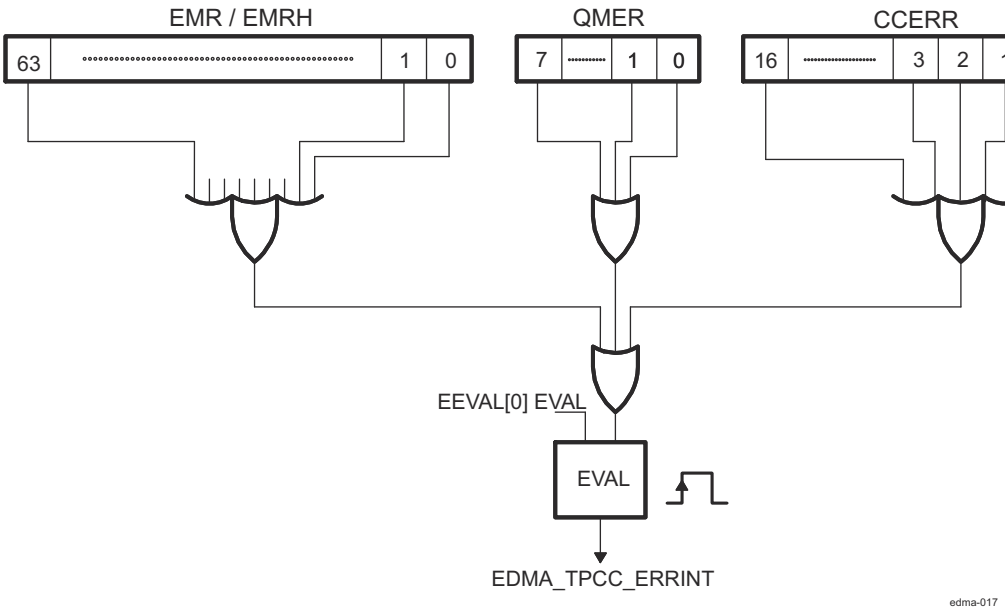

Figure 10-16. Error Interrupt Operation

10.1.3.10 Memory Protection

The EDMA channel controller supports two kinds of memory protection: active and proxy.

10.1.3.10.1 Active Memory Protection

Active memory protection is a feature that allows or prevents read and write accesses to the EDMA_TPCC registers. Active memory protection is achieved by a set of memory protection permissions attribute EDMA_TPCC_MPPAN_k registers.

The EDMA_TPCC register map is divided into three categories:

- a global region.
- a global channel region.
- eight shadow regions.

Each shadow region consists of the respective shadow region registers and the associated PaRAM. For more detailed information regarding the contents of a shadow region, refer to the associated Register Addendum.

Each of the eight shadow regions has an associated EDMA_TPCC_MPPAN_k registers that defines the specific requestor(s) and types of requests that are allowed to the regions resources.

The global channel region is also protected with a memory-mapped register EDMA_TPCC_MPPAG. The EDMA_TPCC_MPPAG applies to the global region and to the global channel region, except the other EDMA_TPCC_MPPAN_k registers themselves.

Table 10-22 shows the accesses that are allowed or not allowed to the EDMA_TPCC_MPPAG and EDMA_TPCC_MPPAN_k. The active memory protection uses the EDMA_TPCC_OPT_n[31] PRIV and EDMA_TPCC_OPT_n[27:24] PRIVID attributes of the EDMA peripheral modules. TheEDMA_TPCC_OPT_n[31] PRIV is the privilege level (i.e., user vs. supervisor).

The EDMA_TPCC_OPT_n[27:24] PRIVID refers to a privilege ID with a number that is associated with an EDMA peripheral modules.

Table 10-22. Allowed Accesses

Access	Supervisor	User
Read	Yes	Yes
Write	Yes	No

Table 10-23 describes the EDMA_TPCC_MPPAN_k register mapping for the shadow regions (which includes shadow region registers and PaRAM addresses).

The region-based EDMA_TPCC_MPPAN_k registers are used to protect accesses to the DMA shadow regions and the associated region PaRAM. Because there are eight regions, there are eight EDMA_TPCC_MPPAN_k region registers (MPPA[0-7]).

Table 10-23. MPPA Registers to Region Assignment

Register	Registers Protect	Address Range	PaRAM Protect(1)	Address Range
EDMA_TPCC_MPPAG	Global Range	0000h-1FFCh	N/A	N/A
EDMA_TPCC_MPPAN_k. MPPAN_0	DMA Shadow 0	2000h-21FCh	1st octant	4000h-47FCh
MPPAN_1	DMA Shadow 1	2200h-23FCh	2nd octant	4800h-4FFCh
MPPAN_2	DMA Shadow 2	2400h-25FCh	3rd octant	5000h-57FCh
MPPAN_3	DMA Shadow 3	2600h-27FCh	4th octant	5800h-5FFCh
MPPAN_4	DMA Shadow 4	2800h-29FCh	5th octant	6000h-67FCh
MPPAN_5	DMA Shadow 5	2A00h-2BFCh	6th octant	6800h-6FFCh
MPPAN_6	DMA Shadow 6	2C00h-2DFCh	7th octant	7000h-77FCh
MPPAN_7	DMA Shadow 7	2E00h-2FFCh	8th octant	7800h-7FFCh

(1) The PARAM region is divided into 8 regions referred to as an octant.

Example *Access denied.*

Write access to shadow region 7's event enable set register EDMA_TPCC_EESR:

1. The original value of the event enable register EDMA_TPCC_EER at address offset 0x1020 is 0x0.
2. The EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[7] NS is set to prevent user level accesses (EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[1] UW = 0, EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[2] UR = 0), but it allows supervisor level accesses (EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[4] SW = 1, EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[5] SR = 1) with a privilege ID of 0. (EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[10] AID0 = 1).
3. EDMA peripheral modules with a privilege ID of 0 attempts to perform a user-level write of a value of 0xFF00FF00 to shadow region 7's event enable set register EDMA_TPCC_EESR at address offset 0x2E30.

Note

The EDMA_TPCC_EER is a read-only register and the only way that write to it is by writing to the EDMA_TPCC_EESR. There is only one physical register for EDMA_TPCC_EER, EDMA_TPCC_EESR, etc. and that the shadow regions only provide to the same physical set.

4. Since the EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[1] UW = 0, though the privilege ID of the write access is set to 0, the access is not allowed and the EDMA_TPCC_EER is not written too.

Example *Access Allowed*

Write access to shadow region 7's event enable set register EDMA_TPCC_EESR:

1. The original value of the event enable register EDMA_TPCC_EER at address offset 0x1020 is 0x0.
2. The EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7 is set to allow user-level accesses (EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[1] UW = 1, EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[2] UR = 1) and supervisor-level accesses (EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[4] SW = 1, EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[5] SR = 1) with a privilege ID of 0. (EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[10] AID0 = 1).
3. EDMA peripheral modules with a privilege ID of 0, attempts to perform a user-level write of a value of 0xABCD0123 to shadow region 7's event enable set register EDMA_TPCC_EESR at address offset 0x2E30.

Note

The EDMA_TPCC_EER is a read-only register and the only way that write to it is by writing to the EDMA_TPCC_EESR. There is only one physical register for EDMA_TPCC_EER, EDMA_TPCC_EESR, etc. and that the shadow regions only provide to the same physical set.

4. Since the EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[1] UW = 1 and EDMA_TPCC_MPPAN_k. MPPAN_7[10] AID0 = 1, the user-level write access is allowed.
5. The accesse to shadow region registers are masked by their respective EDMA_TPCC_DRAEM_k register. In this example, the EDMA_TPCC_DRAEM_k. EDMA_TPCC_DRAEM_7 is set of 0x9FF00FC2.
6. The value finally written to EDMA_TPCC_EER is 0x8BC00102.

10.1.3.10.2 Proxy Memory Protection

Proxy memory protection allows an EDMA transfer programmed by a given peripheral module connected to EDMA, to have its permissions travel with the transfer through the EDMA_TPTC. The permissions travel along with the read transactions to the source and the write transactions to the destination endpoints. The EDMA_TPCC_OPT_n[31] PRIV bit and EDMA_TPCC_OPT_n[27:24] PRIVID bit is set with the peripheral module's PRIV value and PRIVID values, respectively, when any part of the PaRAM set is written.

The EDMA_TPCC_OPT_n[31] PRIV is the privilege level (i.e., user vs. supervisor). The EDMA_TPCC_OPT_n[27:24] PRIVID refers to a privilege ID with a number that is associated with an peripheral module connected to EDMA.

These options are part of the TR that are submitted to the transfer controller. The transfer controller uses the above values on their respective read and write command bus so that the target endpoints can perform memory protection checks based on these values.

Consider a parameter set that is programmed by a CPU in user privilege level for a simple transfer with the source buffer on an L2 page and the destination buffer on an L1D page. The EDMA_TPCC_OPT_n[31] PRIV is 0 for user-level and the CPU has a EDMA_TPCC_OPT_n[27:24] PRIVID to 0.

The PaRAM set is shown in Figure 10-17.

Figure 10-17. PaRAM Set Content for Proxy Memory Protection Example

(a) EDMA Parameters

Parameter Contents			Parameter	
0010 0007h			Channel Options Parameter (OPT)	
009F 0000h			Channel Source Address (SRC)	
0001h	0004h		Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
00F0 7800h			Channel Destination Address (DST)	
0001h	0001h		Destination BCNT Index (DBIDX)	Source BCNT Index (SBIDX)
0000h	FFFFh		BCNT Reload (BCNTRLD)	Link Address (LINK)
0001h	1000h		Destination CCNT Index (DCIDX)	Source CCNT Index (SCIDX)
0000h	0001h		Reserved	Count for 3rd Dimension (CCNT)

(b) Channel Options Parameter (OPT_n) Content

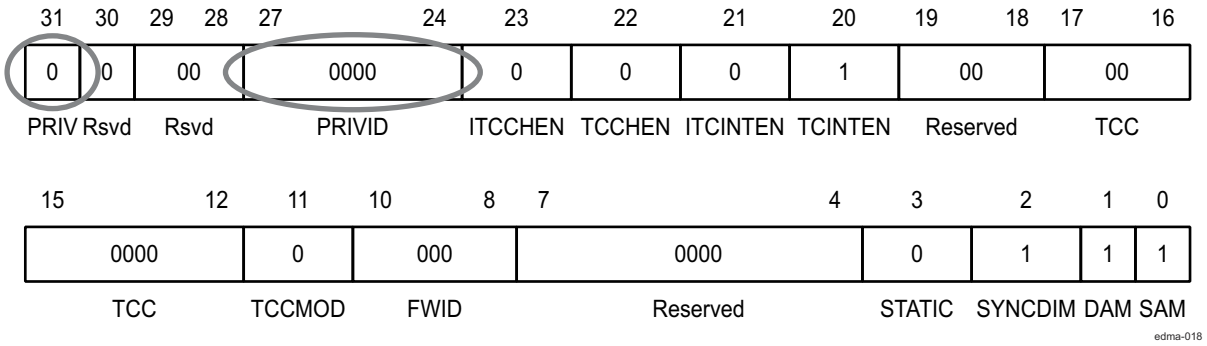

Figure 10-18. Channel Options Parameter (OPT) Example

The EDMA_TPCC_OPT_n[31] PRIV and EDMA_TPCC_OPT_n[27:24] PRIVID information travels along with the read and write requests that are issued to the source and destination memories.

For example, if the access attributes that are associated with the L2 page with the source buffer only allow supervisor read, write accesses (EDMA_TPCC_MPPAN_k[4] SW and EDMA_TPCC_MPPAN_k[5] SR), the user-level read request above is refused. Similarly, if the access attributes that are associated with the L1D page with the destination buffer only allow supervisor read and write accesses (EDMA_TPCC_MPPAN_k[4] SW, EDMA_TPCC_MPPAN_k[5] SR), the user-level write request above is refused. For the transfer to succeed, the source and destination pages must have user-read and user-write permissions, respectively, along with allowing accesses from a PRIVID = 0.

Because the privilege level and privilege identification travel with the read and write requests, EDMA acts as a proxy.

Figure 10-19 illustrates the propagation of EDMA_TPCC_OPT_n[31] PRIV and EDMA_TPCC_OPT_n[27:24] PRIVID at the boundaries of all the interacting entities (CPU, EDMA_TPCC, EDMA_TPTCs, and slave memories).

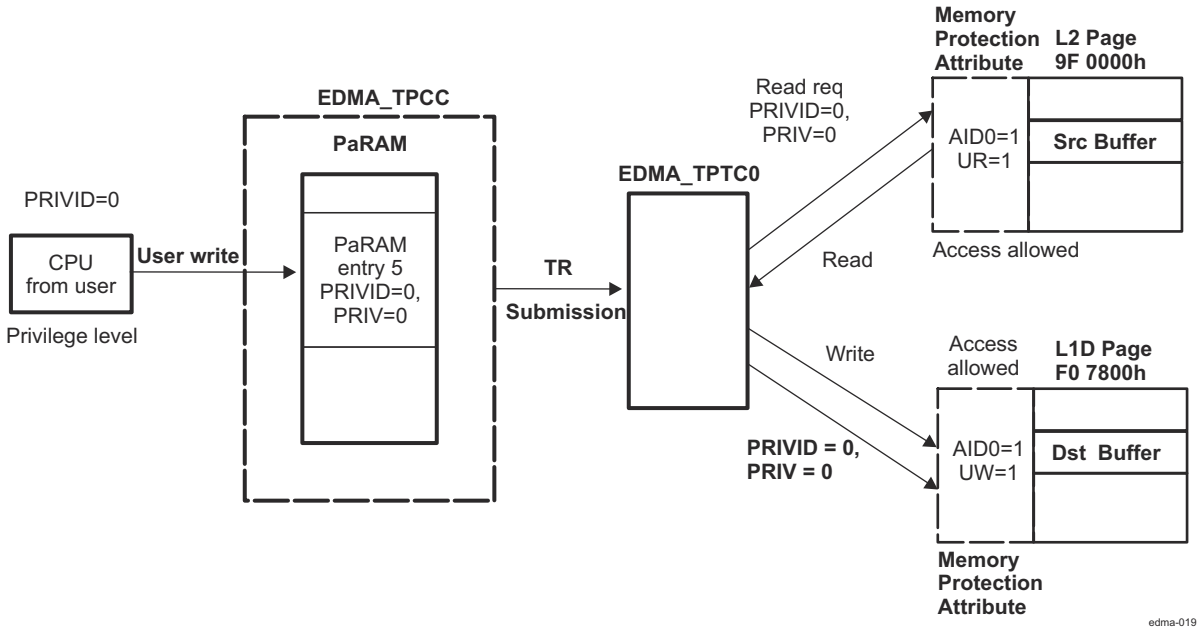

Figure 10-19. Proxy Memory Protection Example

10.1.3.11 Event Queue(s)

Event queues are a part of the EDMA channel controller. Event queues form the interface between the event detection logic in the EDMA_TPCC and the transfer request (TR) submission logic of the EDMA_TPCC. Each queue is 16 entries deep. Each event queue can queue a maximum of 16 events. If there are more than 16 events, then the events that cannot find a place in the event queue remain set in the associated event register and the CPU does not stall.

There are two event queues for the device: Queue0, Queue1. Events in Queue0 result in submission of its associated transfer requests (TRs) to TC0. The transfer requests that are associated with events in Queue1 are submitted to TC1.

An event that wins prioritization against other DMA and/or QDMA pending events is placed at the tail of the appropriate event queue. Each event queue is serviced in FIFO order. Once the event reaches the head of its queue and the corresponding transfer controller is ready to receive another TR, the event is de-queued and the PaRAM set corresponding to the de-queued event is processed and submitted as a transfer request packet (TRP) to the associated EDMA transfer controller.

Queue0 has highest priority and Queue1 has the lowest priority, if Queue0 and Queue1 both have at least one event entry and if both TC0 and TC1 can accept transfer requests, then the event in Queue0 is de-queued first and its associated PaRAM set is processed and submitted as a transfer request (TR) to TC0.

Refer to *Performance Considerations* for system-level performance considerations. All of the event entries in all of the event queues are software readable (not writeable) by accessing the event entry registers EDMA_TPCC_Q0E_p and EDMA_TPCC_Q1E_p. Each event entry register characterizes the queued event in terms of the type of event (manual, event, chained or auto-triggered) and the event number. Refer to the associated Register Addendum for EDMA_TPCC_Q0E_p / EDMA_TPCC_Q1E_p descriptions of the bit fields.

10.1.3.11.1 DMA/QDMA Channel to Event Queue Mapping

Each of the 64 DMA channels and eight QDMA channels are programmed independently to map to a specific queue, using the DMA queue number register EDMA_TPCC_DMAQNUMN_k and the QDMA queue number register EDMA_TPCC_QDMAQNUM. The mapping of DMA/QDMA channels is critical to achieving the desired performance level for the EDMA and most importantly, in meeting real-time deadlines. Refer to *System-level Performance Considerations*.

Note

If an event is ready to be queued and both the event queue and the EDMA transfer controller that is associated to the event queue are empty, then the event bypasses the event queue, and moves the PaRAM processing logic, and eventually to the transfer request submission logic for submission to the EDMA_TPTC. In this case, the event is not logged in the event queue status registers.

10.1.3.11.2 Queue RAM Debug Visibility

There are two event queues and each queue has 16 entries. These 16 entries are managed in a circular FIFO. There is a queue status register EDMA_TPCC_QSTATN_i associated with each queue. These along with all of the 16 entries per queue can be read via registers EDMA_TPCC_QSTATN_i and Q0E_p / Q1E_p, respectively.

These registers provide user visibility.

The event queue entry register (Q*x*E*y* Q0E_p / Q1E_p) uniquely identifies the specific event type (event-triggered, manually-triggered, chain-triggered, and QDMA events) along with the event number (for all DMA/QDMA event channels) that are in the queue or have been de-queued (passed through the queue).

Each of the 16 entries in the event queue are read using the EDMA_TPCC memory-mapped register. To see the history of the last 16 TRs that have been processed by the EDMA on a given queue, read the event queue registers. This provides user/software visibility and is helpful for debugging real-time issues (typically post-mortem), involving multiple events and event sources.

The queue status register (QSTAT*n* EDMA_TPCC_QSTATN_i) includes fields for the start pointer EDMA_TPCC_QSTATN_i[3:0] STRTPTR which provides the offset to the head entry of an event. It also includes a field called EDMA_TPCC_QSTATN_i[12:8] NUMVAL that provides the total number of valid entries residing in the event queue at a given instance of time. The EDMA_TPCC_QSTATN_i[3:0] STRTPTR is used to index appropriately into the 16 event entries. EDMA_TPCC_QSTATN_i[12:8] NUMVAL number of entries starting from STRTPTR are indicative of events still queued in the respective queue. The remaining entry must be read to determine what's already de-queued and submitted to the associated transfer controller.

10.1.3.11.3 Queue Resource Tracking

The EDMA_TPCC event queue includes watermarking/threshold logic that allows to keep track of maximum usage of all event queues. This is useful for debugging real-time deadline violations that may result from head-of-line blocking on a given EDMA event queue.

The maximum number of events are programed that the queue up in an event queue by programming the threshold value (between 0 to 15) in the queue watermark threshold A register EDMA_TPCC_QWMTHRA. The maximum queue usage is recorded actively in the watermark EDMA_TPCC_QSTATN_i[20:16] WM field of the queue status register, that keeps getting updated based on a comparison of number of valid entries, which is also visible in the EDMA_TPCC_QSTATN_i[12:8] NUMVAL bit and the maximum number of entries.

If the queue usage is exceeded, this status is visible in the EDMA_TPCC registers: the QTHRXCD*n* bits in the channel controller error register EDMA_TPCC_CCERR[7:0] and the EDMA_TPCC_QSTATN_i[24] THRXCD bit, where *n* stands for the event queue number. Any bits that are set in EDMA_TPCC_CCERR also generate an EDMA_TPCC error interrupt.

10.1.3.11.4 Performance Considerations

The device system bus infrastructure arbitrates bus requests from all of the controllers (TCs, CPU(S), and other bus controllers) to the shared target resources (peripherals and memories).

The priorities of transfer requests (read and write commands) from the EDMA transfer controllers with respect to other controllers are programmed using the Control Module registers. The EDMA_TPCC_QUEPRI register has no affect.

Therefore, the priority of unloading queues has a secondary affect compared to the priority of the transfers as they are executed by the EDMA_TPTC.

10.1.3.12 EDMA Transfer Controller (EDMA_TPTC)

The EDMA channel controller is the user-interface of the EDMA and the EDMA transfer controller (EDMA_TPTC) is the data movement engine of the EDMA controller. The EDMA_TPCC submits transfer requests (TR) to the EDMA_TPTC and the EDMA_TPTC performs the data transfers dictated by the TR, so the EDMA_TPTC is a slave to the EDMA_TPCC.

10.1.3.12.1 Architecture Details

10.1.3.12.1.1 Command Fragmentation

The TC read and write controllers in conjunction with the source and destination register sets are responsible for issuing optimally-sized reads and writes to the target endpoints. An optimally-sized command is defined by the transfer controller default burst size (DBS), which is defined in the *TPTC DBS Configuration registers*.

The EDMA_TPTC attempts to issue the largest possible command size as limited by the DBS value or the EDMA_TPCC_ABCNT_n[15:0] ACNT and EDMA_TPCC_ABCNT_n[31:16] BCNT value of the TR. EDMA_TPTC obeys the following rules:

- The read/write controllers always issue commands less than or equal to the DBS value.
- The first command of a 1D transfer command always aligns the address of subsequent commands to the DBS value.

Table 10-24 lists the TR segmentation rules that are followed by the EDMA_TPTC. In summary, if the EDMA_TPCC_ABCNT_n[15:0] ACNT value is larger than the DBS value, then the EDMA_TPTC breaks the EDMA_TPCC_ABCNT_n[15:0] ACNT array into DBS-sized commands to the source/destination addresses. Each EDMA_TPCC_ABCNT_n[31:16] BCNT number of arrays are then serviced in succession.

For BCNT arrays of ACNT bytes (that is, a 2D transfer), if the EDMA_TPCC_ABCNT_n[15:0] ACNT value is less than or equal to the DBS value, then the TR may be optimized into a 1D-transfer in order to maximize efficiency. The optimization takes place if the EDMA_TPTC recognizes that the 2D-transfer is organized as a single dimension (EDMA_TPCC_ABCNT_n[15:0] ACNT == EDMA_TPCC_BIDX_n) and the ACNT value is a power of 2.

Table 10-24 lists conditions in which the optimizations are performed.

Table 10-24. Read/Write Command Optimization Rules

ACNT ≤ DBS	ACNT is power of 2	BIDX = ACNT	BCNT ≤ 1023	SAM/DAM = Increment	Description
Yes	Yes	Yes	Yes	Yes	Optimized
No	x	x	x	x	Not Optimized
x	No	x	x	x	Not Optimized
x	x	No	x	x	Not Optimized
x	x	x	No	x	Not Optimized
x	x	x	x	No	Not Optimized

10.1.3.12.1.2 TR Pipelining

TR pipelining refers to the ability of the source active set to proceed ahead of the destination active set. Essentially, the reads for a given TR may already be in progress while the writes of a previous TR may not have completed.

The number of outstanding TRs is limited by the number of destination FIFO register entries.

TR pipelining is useful for maintaining throughput on back-to-back small TRs. It minimizes the startup overhead because reads start in the background of a previous TR writes.

Example 10-4. Command Fragmentation (DBS = 64)

The pseudo code:

1. EDMA_TPTCn_PCNT[15:0] ACNT = 8, EDMA_TPTCn_PCNT[31:16] BCNT = 8, EDMA_TPTCn_PBIDX[15:0] SBIDX = 8, EDMA_TPTCn_PBIDX[31:16] DBIDX = 10, EDMA_TPTCn_PSRC[31:0] SADDR = 64, EDMA_TPTCn_SADST[31:0] DADDR = 191

   Read Controller: This is optimized from a 2D-transfer to a 1D-transfer such that the read side is equivalent to EDMA_TPTCn_PCNT[15:0] ACNT = 64, EDMA_TPTCn_PCNT[31:16] BCNT = 1.

   Cmd0 = 64 byte

   Write Controller: Because DBIDX != ACNT, it is not optimized.

   Cmd0 = 8 byte, Cmd1 = 8 byte, Cmd2 = 8 byte, Cmd3 = 8 byte, Cmd4 = 8 byte, Cmd5 = 8 byte, Cmd6 = 8 byte, Cmd7 = 8 byte.
2. EDMA_TPTCn_PCNT[15:0] ACNT=128, EDMA_TPTCn_PCNT[31:16] BCNT = 1, EDMA_TPTCn_PSRC[31:0] SADDR = 63, EDMA_TPTCn_SADST[31:0] DADDR = 513

   Read Controller: Read address is not aligned.

   Cmd0 = 1 byte, (now the SADDR is aligned to 64 for the next command)

   Cmd1 = 64 bytes

   Cmd2 = 63 bytes

   Write Controller: The write address is also not aligned.

   Cmd0 = 63 bytes, (now the DADDR is aligned to 64 for the next command)

   Cmd1 = 64 bytes

   Cmd2 = 1 byte

10.1.3.12.1.3 Performance Tuning

By default, reads are as issued as fast as possible. In some cases, the reads issued by the EDMA_TPTC could fill the available command buffering for a target, delaying other (potentially higher priority) controllers from successfully submitting commands to that target. The rate at which read commands are issued by the EDMA_TPTC is controlled by the EDMA_TPTCn_RDRATE register. The EDMA_TPTCn_RDRATE register defines the number of cycles that the EDMA_TPTC read controller waits before issuing subsequent commands for a given TR, thus minimizing the chance of the EDMA_TPTC consuming all available target resources. The EDMA_TPTCn_RDRATE[2:0] RDRATE value must be set to a relatively small value if the transfer controller is targeted for high priority transfers and to a higher value if the transfer controller is targeted for low priority transfers.

In contrast, the Write Interface does not have any performance turning knobs because writes always have an interval between commands as write commands are submitted along with the associated write data.

10.1.3.12.2 Memory Protection

The transfer controller plays an important role in handling proxy memory protection. There are two access properties associated with a transfer: for instance, the privilege id (system-wide identification assigned to a controller) of the controller initiating the transfer, and the privilege level (user versus supervisor) used to program the transfer. This information is maintained in the PaRAM set when it is programmed in the channel controller. When a TR is submitted to the transfer controller, this information is made available to the EDMA_TPTC and used by the EDMA_TPTC while issuing read and write commands. The read or write commands have the same privilege identification, and privilege level as that programmed in the EDMA transfer in the channel controller.

10.1.3.12.3 Error Generation

Errors are generated if enabled under three conditions:

- EDMA_TPTC detection of an error signaled by the source or destination address.
- Attempt to read or write to an invalid address in the configuration memory map.
- Detection of a constant addressing mode TR violating the constant addressing mode transfer rules (the source/destination addresses and source/destination indexes must be aligned to 32 bytes).

Either or all error types may be disabled. If an error bit is set and enabled, the error interrupt for the concerned transfer controller is generated.

10.1.3.12.4 Debug Features

The DMA program register set, DMA source active register set, and the destination FIFO register set are used to derive a brief history of TRs serviced through the transfer controller.

Additionally, the EDMA_TPTC status register EDMA_TPTCn_TCSTAT has dedicated bit fields to indicate the ongoing activity within different parts of the transfer controller:

- The EDMA_TPTCn_TCSTAT[1] SRCACTV bit indicates whether the source active set is active.
- The EDMA_TPTCn_TCSTAT[6:4] DSTACTV bit indicates the number of TRs resident in the destination register active set at a given instance.
- The EDMA_TPTCn_TCSTAT[0] PROGBUSY bit indicates whether a valid TR is present in the DMA program set.

Note

If the TRs are in progression, it must realize that there is a chance that the values read from the EDMA_TPTC status registers will be inconsistent since the EDMA_TPTC changes the values of these registers due to ongoing activities.

It is recommended that to ensure no additional submission of TRs to the EDMA_TPTC in order to facilitate ease of debug.

10.1.3.12.4.1 Destination FIFO Register Pointer

The destination FIFO register pointer is implemented as a circular buffer with the start pointer being EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR and a buffer depth of usually 2 or 4. The EDMA_TPTC maintains two important status details in EDMA_TPTCn_TCSTAT that are used during advanced debugging, if necessary. The EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR is a start pointer, the index to the head of the destination FIFO register. The EDMA_TPTCn_TCSTAT[6:4] DSTACTV is a counter for the number of valid (occupied) entries. These registers are used to get a brief history of transfers.

Examples of some register field values and their interpretation:

- EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR = 0x0 and EDMA_TPTCn_TCSTAT[6:4] DSTACTV = 0x0 implies that no TRs are stored in the destination FIFO register.
- EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR = 0x1 and EDMA_TPTCn_TCSTAT[6:4] DSTACTV = 0x2 implies that two TRs are present. The first pending TR is read from the destination FIFO register entry 1 and the second pending TR is read from the destination FIFO register entry 2.
- EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR = 0x3 and EDMA_TPTCn_TCSTAT[6:4] DSTACTV = 0x2 implies that two TRs are present. The first pending TR is read from the destination FIFO register entry 3 and the second pending TR is read from the destination FIFO register entry 0.

10.1.3.13 Event Dataflow

This section summarizes the data flow of a single event, from the time the event is latched to the channel controller to the time the transfer completion code is returned. The following steps list the sequence of EDMA_TPCC activity:

1. Event is asserted from an external source (peripheral or external interrupt). This also is similar for a manually-triggered, chained-triggered, or QDMA-triggered event. The event is latched

into the EDMA_TPCC_ER[31:0]E*n* / EDMA_TPCC_ERH[31:0] E*n* (or EDMA_TPCC_CER[31:0] E*n* / EDMA_TPCC_CERH[31:0] E*n*, EDMA_TPCC_ESR[31:0] E*n* / EDMA_TPCC_ESRH[31:0] E*n*, EDMA_TPCC_QER[7:0] E*n*) bit.

2. Once an event is prioritized and queued into the appropriate event queue, the EDMA_TPCC_SER[31:0] E*n* \ EDMA_TPCC_SERH[31:0] E*n* (or EDMA_TPCC_QSER[7:0] E*n*) bit is set to inform the event prioritization / processing logic to disregard this event since it is already in the queue. Alternatively, if the transfer controller and the event queue are empty, then the event bypasses the queue.
3. The EDMA_TPCC processing and the submission logic evaluates the appropriate PaRAM set and determines whether it is a non-null and non-dummy transfer request (TR).
4. The EDMA_TPCC clears the EDMA_TPCC_ER[31:0] E*n*/ EDMA_TPCC_ERH[31:0] E*n* (or EDMA_TPCC_CER[31:0] E*n* / EDMA_TPCC_CERH[31:0] E*n*, EDMA_TPCC_ESR[31:0]E*n* / EDMA_TPCC_ESRH[31:0] E*n*, EDMA_TPCC_QER[31:0] E*n*) bit and the EDMA_TPCC_SER[31:0] E*n*/ EDMA_TPCC_SERH[31:0] E*n* bit as soon as it determines the TR is non-null. In the case of a null set, the EDMA_TPCC_SER[31:0] E*n*/ EDMA_TPCC_SERH[31:0] E*n* bit remains set. It submits the non-null/non-dummy TR to the associated transfer controller. If the TR was programmed for early completion, the EDMA_TPCC immediately sets the interrupt pending register (EDMA_TPCC_IPR[31:0] I[TCC] / EDMA_TPCC_IPRH[31:0] I[TCC] - 32).
5. If the TR was programmed for normal completion, the EDMA_TPCC sets the interrupt pending register (EDMA_TPCC_IPR[31:0] I[TCC] / EDMA_TPCC_IPRH[31:0] I[TCC]) when the EDMA_TPTC informs the EDMA_TPCC about completion of the transfer (returns transfer completion codes).
6. The EDMA_TPCC programs the associated EDMA_TPTC's Program Register Set with the TR.
7. The TR is then passed to the Source Active set and the DST FIFO Register Set, if both the register sets are available.
8. The Read Controller processes the TR by issuing read commands to the source slave endpoint. The Read Data lands in the Data FIFO of the EDMA_TPTC*n*.
9. As soon as sufficient data is available, the Write Controller begins processing the TR by issuing write commands to the destination slave endpoint.
10. This continues until the TR completes and the EDMA_TPTC*n* then signals completion status to the EDMA_TPCC.

10.1.3.14 EDMA Controller Prioritization

The EDMA controller has many implementation rules to deal with concurrent events/channels, transfers, etc. The following subsections detail various arbitration details whenever there might be occurrence of concurrent activity. Figure 10-20 shows the different places EDMA priorities come into play.

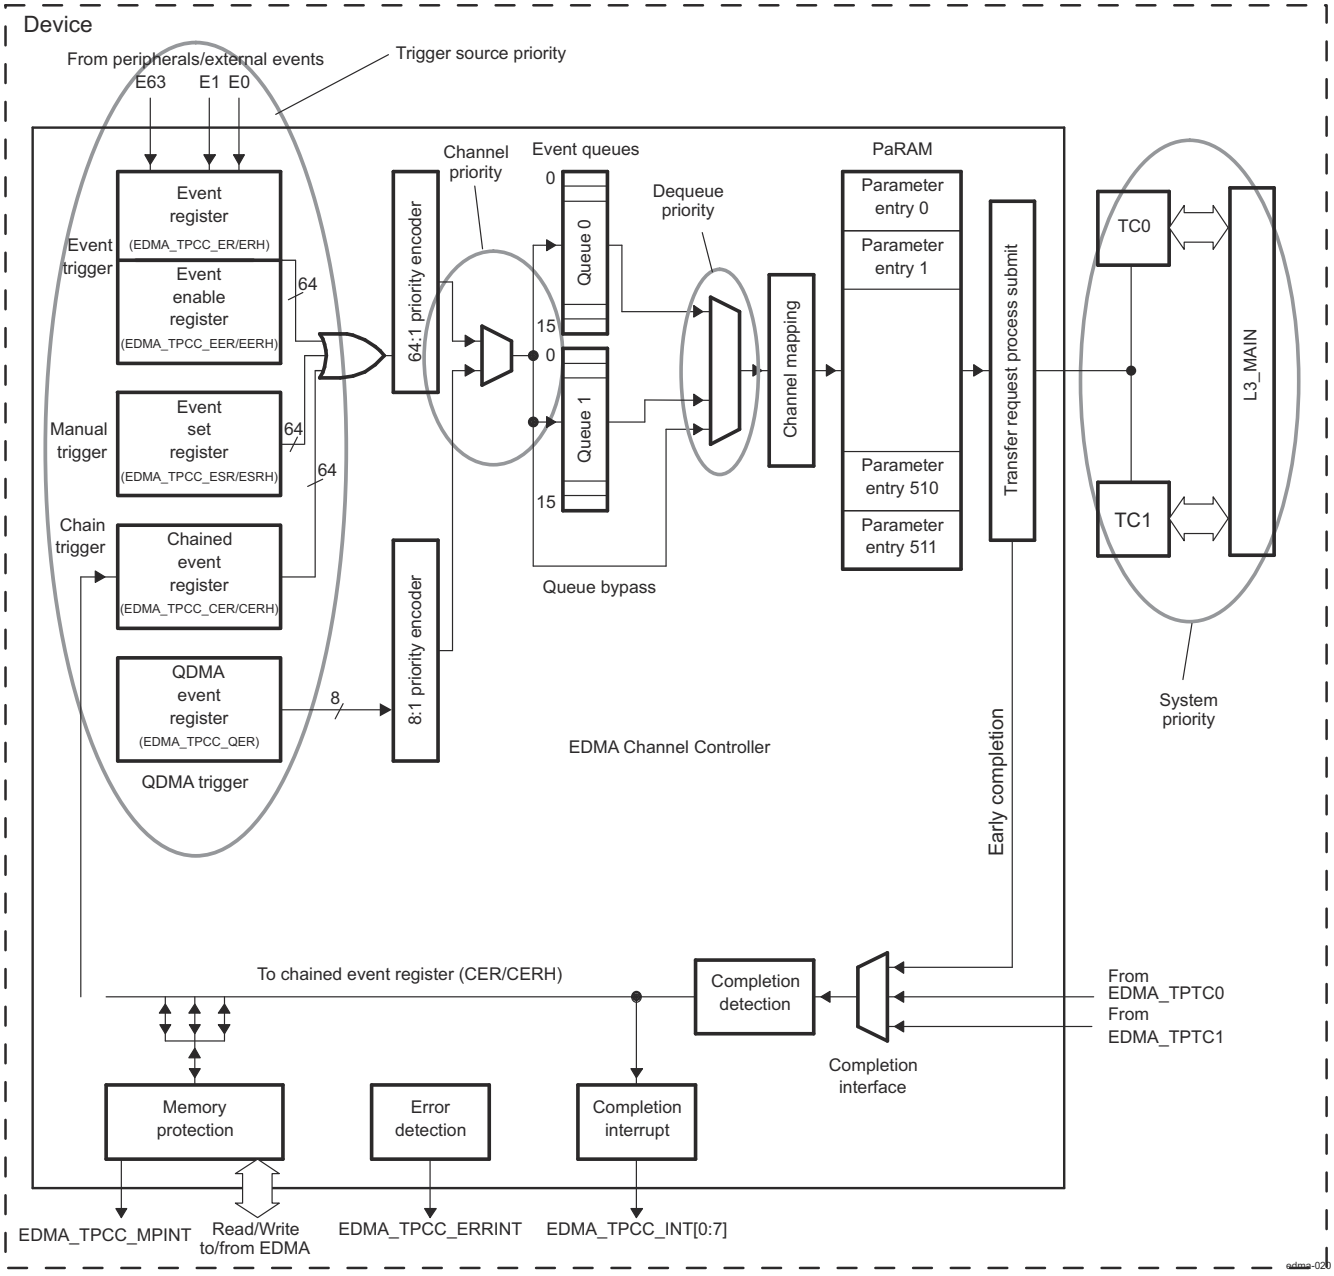

Figure 10-20. EDMA Prioritization

10.1.3.14.1 Channel Priority

The EDMA event registers EDMA_TPCC_ER and EDMA_TPCC_ERH capture up to 64 events, the QDMA event register EDMA_TPCC_QER captures QDMA events for all QDMA channels therefore, it is possible for events to occur simultaneously on the DMA/QDMA event inputs. For events arriving simultaneously, the event associated with the lowest channel number is prioritized for submission to the event queues (for DMA events, channel 0 has the highest priority and channel 63 has the lowest priority, for QDMA events, channel 0 has the highest priority and channel 7 has the lowest priority). This mechanism only sorts simultaneous events for submission to the event queues.

If a DMA and QDMA event occurs simultaneously, the DMA event always has prioritization against the QDMA event for submission to the event queues.

10.1.3.14.2 Trigger Source Priority

If a EDMA channel is associated with more than one trigger source (event trigger, manual trigger, and chain trigger), and if multiple events are set simultaneously for the same channel (EDMA_TPCC_ER[31:0] E*n* = 1, EDMA_TPCC_ESR[31:0] E*n* = 1 , EDMA_TPCC_CER[31:0] E*n* = 1) , then the EDMA_TPCC always services these events in the following priority order: event trigger (via EDMA_TPCC_ER) is higher priority than chain trigger (via EDMA_TPCC_CER) and chain trigger is higher priority than manual trigger (via EDMA_TPCC_ESR).

This implies that if for channel 0, both EDMA_TPCC_ER[0] E0 = 1 and EDMA_TPCC_CER[0] E0 = 1 at the same time, then the EDMA_TPCC_ER[0] E0 event is always queued before the EDMA_TPCC_CER[0] E0 event.

10.1.3.14.3 Dequeue Priority

The priority of the associated transfer request (TR) is further mitigated by which event queue is being used for event submission (dictated by EDMA_TPCC_DMAQNUMN_k and EDMA_TPCC_QDMAQNUM). For submission of a TR to the transfer request, events need to be de-queued from the event queues. Queue 0 has the highest dequeue priority and queue 1 the lowest.

10.1.3.15 Emulation Considerations

During debug when using the emulator, the CPU(s) may be halted on an execute packet boundary for single-stepping, benchmarking, profiling, or other debug purposes. During an emulation halt, the EDMA channel controller and transfer controller operations continue. Events continue to be latched and processed and transfer requests continue to be submitted and serviced.

Since EDMA is involved in servicing multiple controller and target peripherals, it is not feasible to have an independent behavior of the EDMA for emulation halts. EDMA functionality would be coupled with the peripherals it is servicing, which might have different behavior during emulation halts.

10.1.4 EDMA Transfer Examples

The EDMA channel controller performs a variety of transfers depending on the parameter configuration. The following sections provide a description and PaRAM configuration for some typical use case scenarios.

10.1.4.1 Block Move Example

The most basic transfer performed by the EDMA is a block move. During device operation it is often necessary to transfer a block of data from one location to another, usually between on-chip and off-chip memory.

In this example, a section of data is to be copied from external memory to internal L2 SRAM as shown in Figure 10-21.

The source address for the transfer is set to the start of the data block in external memory, and the destination address is set to the start of the data block in L2. If the data block is less than 64K bytes, the PaRAM configuration shown in Figure 10-22 holds true with the synchronization type set to A-synchronized and indexes cleared to 0. If the amount of data is greater than or equal to 64K bytes, EDMA_TPCC_ABCNT_n[31:16] BCNT and the B-indexes need to be set appropriately with the synchronization type set to AB-synchronized. The EDMA_TPCC_OPT_n[3] STATIC bit is set to prevent linking.

This transfer example may also be set up using QDMA. For successive transfer submissions, of a similar nature, the number of cycles used to submit the transfer are fewer depending on the number of changing transfer parameters. The QDMA trigger word must be programed to be the highest numbered offset in the PaRAM set that undergoes change.

Figure 10-22 shows the parameters Block Move transfer.

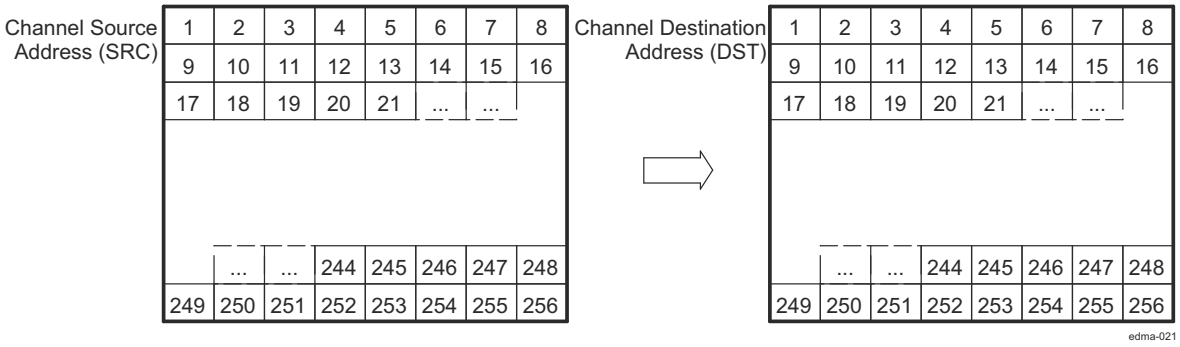

Figure 10-21. Block Move Example

Figure 10-22. Block Move Example PaRAM Configuration

(a) EDMA Parameters

Parameter Contents		Parameter	
0010 0008h		Channel Options Parameter (OPT)	
Channel Source Address (SRC)		Channel Source Address (SRC)	
0001h	FFFFh	Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
Channel Destination Address (DST)		Channel Destination Address (DST)	
0000h	0000h	Destination BCNT Index (DBIDX)	Source BCNT Index (SBIDX)
0000h	FFFFh	BCNT Reload (BCNTRLD)	Link Address (LINK)
0000h	0000h	Destination CCNT Index (DCIDX)	Source CCNT Index (SCIDX)
0000h	0001h	Reserved	Count for 3rd Dimension (CCNT)

(b)Channel Options Parameter (OPT) Content

- EDMA_TPCC_OPT_n[3] STATIC = 0x1
- EDMA_TPCC_OPT_n[20] TCINTEN = 0x1

10.1.4.2 Subframe Extraction Example

The EDMA can efficiently extract a small frame of data from a larger frame of data. By performing a 2D-to-1D transfer, the EDMA retrieves a portion of data for the CPU to process. In this example, a 640 × 480-pixel frame of video data is stored in external memory. Each pixel is represented by a 16-bit halfword. The CPU extracts a 16 × 12-pixel subframe of the image for processing. To facilitate more efficient processing time by the CPU, the EDMA places the subframe in internal L2 SRAM. Figure 10-23 shows the transfer of a subframe from external memory to L2.

The same PaRAM entry options are used for QDMA channels, as well as DMA channels. The EDMA_TPCC_OPT_n[3] STATIC bit is set to prevent linking. For successive transfers, only changed parameters need to be programmed before triggering the channel.

Figure 10-24 shows the parameters for Subframe Extraction transfer.

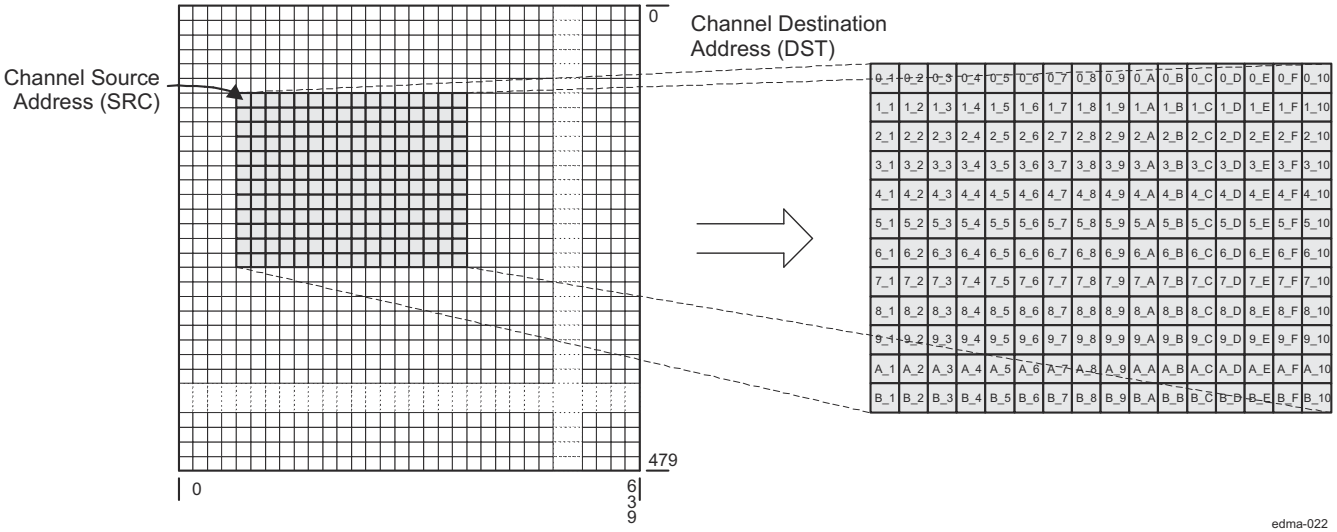

Figure 10-23. Subframe Extraction Transfer

Figure 10-24. Subframe Extraction Example PaRAM Configuration

(a) EDMA Parameters

Parameter Contents			Parameter	
0010 000Ch			Channel Options Parameter (OPT)	
Channel Source Address (SRC)			Channel Source Address (SRC)	
000Ch	0020h		Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
Channel Destination Address (DST)			Channel Destination Address (DST)	
0020h	0500h		Destination BCNT Index (DBIDX)	Source BCNT Index (SBIDX)
0000h	FFFFh		BCNT Reload (BCNTRLD)	Link Address (LINK)
0000h	0000h		Destination CCNT Index (DCIDX)	Source CCNT Index (SCIDX)
0000h	0001h		Reserved	Count for 3rd Dimension (CCNT)

(b) Channel Options Parameter (OPT) Content

- EDMA_TPCC_OPT_n[2] SYNCDIM = 0x1
- EDMA_TPCC_OPT_n[3] STATIC = 0x1
- EDMA_TPCC_OPT_n[20] TCINTEN = 0x1

10.1.4.3 Data Sorting Example

Many applications require the use of multiple data arrays, it is often desirable to have the arrays arranged such that the first elements of each array are adjacent, the second elements are adjacent, and so on. Often this is not how the data is presented to the device. Either data is transferred via a peripheral with the data arrays arriving one after the other or the arrays are located in memory with each array occupying a portion of contiguous memory spaces. For these instances, the EDMA can reorganize the data into the desired format.

To determine the parameter set values, the following need to be considered:

- ACNT - Program this to be the size in bytes of an element.
- BCNT - Program this to be the number of elements in a frame.
- CCNT - Program this to be the number of frames.
- SBIDX - Program this to be the size of the element or ACNT.
- DBIDX - CCNT × ACNT
- SCIDX - ACNT × BCNT
- DCIDX - ACNT

The synchronization type needs to be AB-synchronized and the EDMA_TPCC_OPT_n[3] STATIC bit is 0 to allow updates to the parameter set. It is advised to use normal EDMA channels for sorting.

It is not possible to sort this with a single trigger event. Instead, the channel can be programmed to be chained to itself. After BCNT elements get sorted, intermediate chaining could be used to trigger the channel again causing the transfer of the next BCNT elements and so on. Figure 10-26 shows the parameter set programming for this transfer, assuming channel 0 and an element size of 4 bytes.

Figure 10-25 shows the Data Sorting transfer

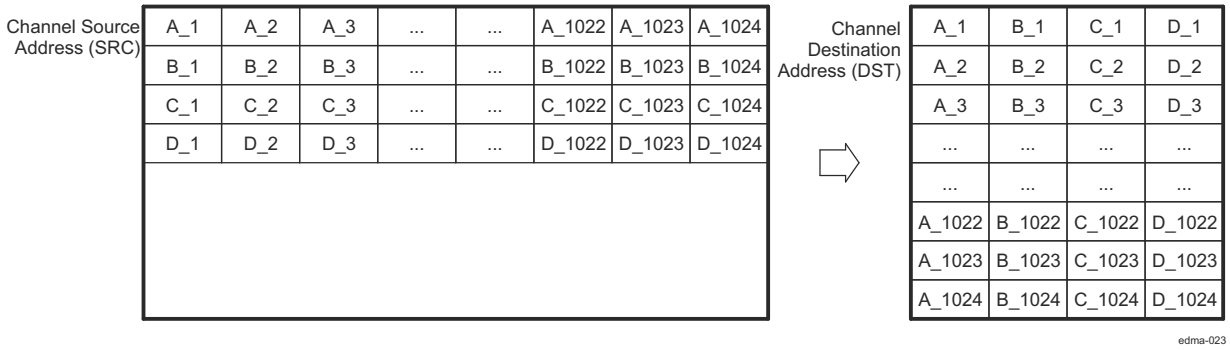

Figure 10-25. Data Sorting Example

Figure 10-26. Data Sorting Example PaRAM Configuration

(a) EDMA Parameters

Parameter Contents		Parameter	
0090 0004h		Channel Options Parameter (OPT)	
Channel Source Address (SRC)		Channel Source Address (SRC)	
0400h	0004h	Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
Channel Destination Address (DST)		Channel Destination Address (DST)	
0010h	0001h	Destination BCNT Index (DSTBIDX)	Source BCNT Index (SRCBIDX)
0000h	FFFFh	BCNT Reload (BCNTRLD)	Link Address (LINK)
0001h	1000h	Destination CCNT Index (DSTCIDX)	Source CCNT Index (SRCCIDX)
0000h	0004h	Reserved	Count for 3rd Dimension (CCNT)

(b) Channel Options Parameter (OPT) Content

- EDMA_TPCC_OPT_n[2] SYNCDIM = 0x1
- EDMA_TPCC_OPT_n[20] TCINTEN = 0x1
- EDMA_TPCC_OPT_n[23] ITCCHEN = 0x1

10.1.4.4 Setting Up an EDMA Transfer

The following list provides a quick guide for the typical steps involved in setting up a transfer.

1. Initiating a DMA/QDMA channel
   a. Determine the type of channel (QDMA or DMA) to be used.
   b. Channel mapping
      i. If using a QDMA channel, program the EDMA_TPCC_QCHMAPN_j with the parameter set number to which the channel maps and the trigger word.
      ii. If using a DMA channel, program the EDMA_TPCC_DCHMAPN_m with the parameter set number to which the channel maps.
   c. If the channel is being used in the context of a shadow region, ensure the EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k for the region is properly set up to allow read write accesses to bits in the event registers and interrupt registers in the Shadow region memory map. The subsequent steps in this process should be done using the respective shadow region registers. (Shadow region descriptions and usage are provided in Section 10.1.3.7.1.)
   d. Determine the type of triggering used.
      i. If external events are used for triggering (DMA channels), enable the respective event in EDMA_TPCC_EER / EDMA_TPCC_EERH by writing into EDMA_TPCC_EESR / EDMA_TPCC_EESRH.
      ii. If QDMA Channel is used, enable the channel in EDMA_TPCC_QEER by writing into EDMA_TPCC_QEESR.
   e. Queue setup
      i. If a QDMA channel is used, set up the EDMA_TPCC_QDMAQNUM to map the channel to the respective event queue.
      ii. If a DMA channel is used, set up the EDMA_TPCC_DMAQNUMN_k to map the event to the respective event queue.
2. Parameter set setup
   a. Program the PaRAM set number associated with the channel. Note that

Note

If it is a QDMA channel, the PaRAM entry that is configured as trigger word is written to last. Alternatively, enable the QDMA channel (step 1-d-ii above) just before the write to the trigger word.

3. Interrupt setup
   a. Enable the interrupt in the EDMA_TPCC_IER / EDMA_TPCC_IERH by writing into EDMA_TPCC_IESR / EDMA_TPCC_IESRH.
   b. Ensure the EDMA_TPCC completion interrupt (this refers to either the Global interrupt or the shadow region interrupt) is enabled properly in the Device Interrupt controller.
   c. Set up the interrupt controller properly to receive the expected EDMA interrupt.
4. Initiate transfer
   a. This step is highly dependent on the event trigger source:
      i. If the source is an external event coming from a peripheral, the peripheral will be enabled to start generating relevant EDMA events that can be latched to the EDMA_TPCC_ER transfer.
      ii. For QDMA events, writes to the trigger word (step 2-a above) will initiate the transfer.
      iii. Manually triggered transfers will be initiated by writes to the Event Set Registers EDMA_TPCC_ESR / EDMA_TPCC_ESRH.
      iv. Chained-trigger events initiate when a previous transfer returns a transfer completion code equal to the chained channel number.
5. Wait for completion
   a. If the interrupts are enabled as mentioned in step 3 above, then the EDMA_TPCC will generate a completion interrupt to the CPU whenever transfer completion results in setting the corresponding bits in the interrupt pending register EDMA_TPCC_IPR / EDMA_TPCC_IPRH. The set bits must be cleared in the EDMA_TPCC_IPR / EDMA_TPCC_IPRH by writing to corresponding bit in EDMA_TPCC_ICR / EDMA_TPCC_ICRH.

b. If polling for completion (interrupts not enabled in the device controller), then the application code can wait on the expected bits to be set in the EDMA_TPCC_IPR / EDMA_TPCC_IPRH. Again, the set bits in the EDMA_TPCC_IPR / EDMA_TPCC_IPRH must be manually cleared via EDMA_TPCC_ICR / EDMA_TPCC_ICRH before the next set of transfers is performed for the same transfer completion code values.

10.1.6 EDMA Debug Checklist and Programming Tips

This section lists some tips to keep in mind while debugging applications using the EDMA controller.

10.1.6.1 EDMA Debug Checklist

Table 10-30 provides some common issues and their probable causes and resolutions.

Table 10-30. Debug Checklist

Issue	Description/Solution
The transfer associated with the channel does not happen. The channel does not get serviced.	The EDMA_TPCC may not service a transfer request, even though the associated PaRAM set is programmed appropriately. Check for the following: 1) Verify that events are enabled, i.e., if an external/peripheral event is latched in Event Registers EDMA_TPCC_ER / EDMA_TPCC_ERH, check that the event is enabled in the Event Enable Registers EDMA_TPCC_EER / EDMA_TPCC_EERH. Similarly, for QDMA channels, check that QDMA events are appropriately enabled in the QDMA Event Enable Register EDMA_TPCC_QEER. 2) Verify that the DMA or QDMA Secondary Event Register EDMA_TPCC_SER / EDMA_TPCC_SERH / EDMA_TPCC_QSER bits corresponding to the particular event or channel are not set.
The Secondary Event Registers bits are set, not allowing additional transfers to occur on a channel.	It is possible that a trigger event was received when the parameter set associated with the channel/event was a NULL set for a previous transfer on the channel. This is typical in two cases: 1) QDMA channels: Typically if the parameter set is non-static and expected to be terminated by a NULL set (i.e., EDMA_TPCC_OPT_n[3] STATIC = 0x0, EDMA_TPCC_LNK_n[15:0] LINK = 0xFFFF), the parameter set is updated with a NULL set after submission of the last TR. Because QDMA channels are auto-triggered, this update caused the generation of an event. An event generated for a NULL set causes an error condition and results in setting the bits corresponding to the QDMA channel in the EDMA_TPCC_QEMR and EDMA_TPCC_QSER. This will disable further prioritization of the channel. 2) DMA channels used in a continuous mode: The peripheral may be set up to continuously generate infinite events (for instance, in case of McASP, every time the data shifts out from the DXR register, it generates an XEVT). The parameter set may be programmed to expect only a finite number of events and to be terminated by a NULL link. After the expected number of events, the parameter set is reloaded with a NULL parameter set. Because the peripheral will generate additional events, an error condition is set in the EDMA_TPCC_SER[31:0] E*n* and EDMA_TPCC_EMR[31:0] E*n* set, preventing further event prioritization. Check the number of events received is limited to the expected number of events for which the parameter set is programmed, or check the bits corresponding to particular channel or event are not set in the Secondary event registers (EDMA_TPCC_SER / EDMA_TPCC_SERH / EDMA_TPCC_QSER) and Event Missed Registers (EDMA_TPCC_EMR / EDMA_TPCC_EMRH / EDMA_TPCC_QEMR) before trying to perform subsequent transfers for the event/channel.

Table 10-30. Debug Checklist (continued)

Issue	Description/Solution
Completion interrupts are not asserted, or no further interrupts are received after the first completion interrupt.	Check the following: 1) The interrupt generation is enabled in the EDMA_TPCC_OPT_n of the associated PaRAM set (EDMA_TPCC_OPT_n[20] TCINTEN = 0x1 and/or EDMA_TPCC_OPT_n[20] ITCINTEN = 0x1). 2) The interrupts are enabled in the EDMA Channel Controller, via the Interrupt Enable Registers (EDMA_TPCC_IER / EDMA_TPCC_IERH). 3) The corresponding interrupts are enabled in the device interrupt controller. 4) The set interrupts are cleared in the interrupt pending registers (EDMA_TPCC_IPR / EDMA_TPCC_IPRH) before exiting the transfer completion interrupt service routine (ISR). See Section 10.1.3.9.1.2 *Clearing Transfer Complerion Interrupts* for details on writing EDMA ISRs. 5) If working with shadow region interrupts, make sure that the DMA Region Access registers (EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k) are set up properly, because the EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k registers act as secondary enables for shadow region completion interrupts, along with the EDMA_TPCC_IER / EDMA_TPCC_IERH registers. If working with shadow region interrupts, make sure that the bits corresponding to the transfer completion code EDMA_TPCC_OPT_n[17:12] TCC value are also enabled in the EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k registers. For instance, if the PaRAM set associated with Channel 0 returns a completion code of 63 EDMA_TPCC_OPT_n[17:12] TCC = 63, ensure that EDMA_TPCC_DRAEHM_k[31] E63 is also set for a shadow region completion interrupt because the interrupt pending register bit set will be EDMA_TPCC_IPRH[31] I63 (not EDMA_TPCC_IPR[0] I0).

10.1.6.2 EDMA Programming Tips

1. For several registers, the setting and clearing of bits needs to be done via separate dedicated registers. For example, the Event Register (EDMA_TPCC_ER / EDMA_TPCC_ERH) can only be cleared by writing a 1 to the corresponding bits in the Event Clear Registers (EDMA_TPCC_ECR / EDMA_TPCC_ECRH). Similarly, the Event Enable Register (EDMA_TPCC_EER / EDMA_TPCC_EERH) bits can only be set with writing of 0x1 to the Event Enable Set Registers (EDMA_TPCC_EESR / EDMA_TPCC_EESRH) and cleared with writing of 0x1 to the corresponding bits in the Event Enable Clear Register (EDMA_TPCC_EECR / EDMA_TPCC_EECRH).
2. Writes to the shadow region memory maps are governed by region access registers (EDMA_TPCC_DRAE / EDMA_TPCC_DRAEHM_k / EDMA_TPCC_QRAEN_k). If the appropriate channels are not enabled in these registers, read/write access to the shadow region memory map is not enabled.
3. When working with shadow region completion interrupts, ensure that the DMA Region Access Registers (EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k) for every region are set in a mutually exclusive way (unless it is a requirement for an application). If there is an overlap in the allocated channels and transfer completion codes (setting of Interrupt Pending Register bits) in the region resource allocation, it results in multiple shadow region completion interrupts.
   For example, if EDMA_TPCC_DRAEM_k.DRAEM_0[0] E0 and EDMA_TPCC_DRAEM_k.DRAEM_1[0] E0 are both set, then on completion of a transfer that returns a TCC = 0x0, they will generate both shadow region 0 and 1 completion interrupts.
4. While programming a non-dummy parameter set, ensure the EDMA_TPCC_CCNT_n[15:0] CCNT is not left to zero.
5. Enable the EDMA_TPCC error interrupt in the device controller and attach an interrupt service routine (ISR) to ensure that error conditions are not missed in an application and are appropriately addressed with the ISR.
6. Depending on the application, it can want to break large transfers into smaller transfers and use self-chaining to prevent starvation of other events in an event queue.
7. In applications where a large transfer is broken into sets of small transfers using chaining or other methods, it chooses to use the early chaining option to reduce the time between the sets of transfers and increase the throughput.
   However, keep in mind that with early completion, all data might have not been received at the end point when completion is reported because the EDMA_TPCC internally signals completion when the TR is submitted to the EDMA_TPTC, potentially before any data has been transferred.
8. The event queue entries can be observed to determine the last few events if there is a system failure (provided the entries were not bypassed).

10.1.7 EDMA Registers

10.1.7.1 TPCC Registers

Table 10-31 lists the TPCC registers. All register offset addresses not listed in Table 10-31 should be considered as reserved locations and the register contents should not be modified.

2-0	E0	R/W	0h	DMA Queue Number for event #0

10.1.7.1.5 QDMAQNUM Register (Offset = 260h) [reset = 0h]

QDMAQNUM is shown in Figure 10-31 and described in Table 10-36.

Return to the Table 10-31.

QDMA Queue Number Register Contains the Event queue number to be used for the corresponding QDMA Channel.

Figure 10-31. QDMAQNUM Register

31-7	RES29	R	0h	RESERVE FIELD
6-4	PRIQ1	R/W	0h	Priority Level for Queue 1 Dictates the priority level used for the OPTIONS field programmation for Qn TRs. Sets the priority used for TC read and write commands.
3	RES30	R	0h	RESERVE FIELD
2-0	PRIQ0	R/W	0h	Priority Level for Queue 0 Dictates the priority level used for the OPTIONS field programmation for Qn TRs. Sets the priority used for TC read and write commands.

10.1.7.1.8 EMR Register (Offset = 300h) [reset = 0h]

EMR is shown in Figure 10-34 and described in Table 10-39.

Return to the Table 10-31.

Event Missed Register: The Event Missed register is set if 2 events are received without the first event being cleared or if a Null TR is serviced. Chained events (CER) Set Events (ESR) and normal events (ER) are treated individually. If any bit in the EMR register is set (and all errors (including QEMR/CCERR) were previously clear) then an error will be signaled with TPCC error interrupt.

Bit	Field	Type	Reset	Description
31-17	RES33	R	0h	RESERVE FIELD
16	TCERR	R	0h	Transfer Completion Code Error: TCCERR = 0 : Total number of allowed TCCs outstanding has not been reached. TCCERR = 1 : Total number of allowed TCCs has been reached. TCCERR can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors were previously clear) then an error will be signaled with TPCC error interrupt.
15-8	RES34	R	0h	RESERVE FIELD
7	QTHRXCD7	R	0h	Queue Threshold Error for Q7: QTHRXCD7 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD7 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD7 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
6	QTHRXCD6	R	0h	Queue Threshold Error for Q6: QTHRXCD6 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD6 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD6 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.

Table 10-45. CCERR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	QTHRXCD5	R	0h	Queue Threshold Error for Q5: QTHRXCD5 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD5 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD5 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
4	QTHRXCD4	R	0h	Queue Threshold Error for Q4: QTHRXCD4 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD4 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD4 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
3	QTHRXCD3	R	0h	Queue Threshold Error for Q3: QTHRXCD3 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD3 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD3 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
2	QTHRXCD2	R	0h	Queue Threshold Error for Q2: QTHRXCD2 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD2 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD2 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
1	QTHRXCD1	R	0h	Queue Threshold Error for Q1: QTHRXCD1 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD1 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD1 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
0	QTHRXCD0	R	0h	Queue Threshold Error for Q0: QTHRXCD0 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD0 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD0 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.

10.1.7.1.15 CCERRCLR Register (Offset = 31Ch) [reset = 0h]

CCERRCLR is shown in Figure 10-41 and described in Table 10-46.

Return to the Table 10-31.

RES58				STRTPTR			
R-0h				R-0h			

Table 10-67. QSTATN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	RES55	R	0h	RESERVE FIELD
24	THRXCD	R	0h	Threshold Exceeded: THRXCD = 0 : Threshold specified by QWMTHR(A B).Qn has not been exceeded. THRXCD = 1 : Threshold specified by QWMTHR(A B).Qn has been exceeded. QSTATn.THRXCD is cleared via CCERR.WMCLRn bit.
23-21	RES56	R	0h	RESERVE FIELD
20-16	WM	R	0h	Watermark for Maximum Queue Usage: Watermark tracks the most entries that have been in QueueN since reset or since the last time that the watermark (WM) was cleared. QSTATn.WM is cleared via CCERR.WMCLRn bit. Legal values = 0x0 (empty) to 0x10 (full)
15-13	RES57	R	0h	RESERVE FIELD
12-8	NUMVAL	R	0h	Number of Valid Entries in QueueN: Represents the total number of entries residing in the Queue Manager FIFO at a given instant. Always enabled. Legal values = 0x0 (empty) to 0x10 (full)
7-4	RES58	R	0h	RESERVE FIELD
3-0	STRTPTR	R	0h	Start Pointer: Represents the offset to the head entry of QueueN in units of entries. Always enabled. Legal values = 0x0 (0th entry) to 0xF (15th entry)

10.1.7.1.37 QWMTHRA Register (Offset = 620h) [reset = 1010h]

QWMTHRA is shown in Figure 10-63 and described in Table 10-68.

Return to the Table 10-31.

Queue Threshold A for Q[3:0]: CCERR.QTHRXCDn and QSTATn.THRXCD error bit is set when the number of Events in QueueN at an instant in time (visible via QSTATn.NUMVAL) equals or exceeds the value specified by QWMTHRA.Qn. Legal values = 0x0 (ever used?) to 0x10 (ever full?) A value of 0x11 disables threshold errors.

16	QUEACTV0	R	0h	Queue 0 Active QUEACTV0 = 0 : No Evts are queued in Q0. QUEACTV0 = 1 : At least one TR is queued in Q0.
15-14	RES62	R	0h	RESERVE FIELD

Table 10-69. CCSTAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13-8	COMPACTV	R	0h	Completion Request Active: Counter that tracks the total number of completion requests submitted to the TC. The counter increments when a TR is submitted with TCINTEN or TCCHEN set to '1'. The counter decrements for every valid completion code received from any of the external TCs. The CC will not service new TRs if COMPACTV count is already at the limit. COMPACTV = 0 : No completion requests outstanding. COMPACTV = 1: Total of '1' completion request outstanding. ... COMPACTV = 63 : Total of 63 completion requests are outstanding. No additional TRs will be submitted until count is less than 63.
7-5	RES63	R	0h	RESERVE FIELD
4	ACTV	R	0h	Channel Controller Active: Channel Controller Active is a logical-OR of each of the ACTV signals. The ACTV bit must remain high through the life of a TR. ACTV = 0 : Channel is idle. ACTV = 1 : Channel is busy.
3	RES64	R	0h	RESERVE FIELD
2	TRACTV	R	0h	Transfer Request Active: TRACTV = 0 : Transfer Request processing/submission logic is inactive. TRACTV = 1 : Transfer Request processing/submission logic is active.
1	QEVTACTV	R	0h	QDMA Event Active: QEVTACTV = 0 : No enabled QDMA Events are active within the CC. QEVTACTV = 1 : At least one enabled DMA Event (ER & EER ESR CER) is active within the CC.
0	EVTACTV	R	0h	DMA Event Active: EVTACTV = 0 : No enabled DMA Events are active within the CC. EVTACTV = 1 : At least one enabled DMA Event (ER & EER ESR CER) is active within the CC.

10.1.7.1.39 AETCTL Register (Offset = 700h) [reset = 0h]

AETCTL is shown in Figure 10-65 and described in Table 10-70.

Return to the Table 10-31.

Table 10-72. AETCMD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RES68	R	0h	RESERVE FIELD
0	CLR	W	0h	AET Clear command: CPU write of '1' to the CLR bit causes the tpcc_aet output signal and AETSTAT.STAT register to be cleared. CPU write of '0' has no effect..

10.1.7.1.42 ER Register (Offset = 1000h) [reset = 0h]

ER is shown in Figure 10-68 and described in Table 10-73.

Return to the Table 10-31.

Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

10.1.7.1.48 CER Register (Offset = 1018h) [reset = 0h]

CER is shown in Figure 10-74 and described in Table 10-79.

Return to the Table 10-31.

Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

10.1.7.1.49 CERH Register (Offset = 101Ch) [reset = 0h]

CERH is shown in Figure 10-75 and described in Table 10-80.

Return to the Table 10-31.

Chained Event Register (High Part): If CERH.En bit is set (regardless of state of EERH.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CERH.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CERH.En bit is cleared when the corresponding event is prioritized and serviced. If the CERH.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CERH.En cannot be set or cleared via software.

10.1.7.1.50 EER Register (Offset = 1020h) [reset = 0h]

EER is shown in Figure 10-76 and described in Table 10-81.

Return to the Table 10-31.

Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

10.1.7.1.56 SER Register (Offset = 1038h) [reset = 0h]

SER is shown in Figure 10-82 and described in Table 10-87.

Return to the Table 10-31.

Secondary Event Register: The secondary event register is used along with the Event Register (ER) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

0	I32	R	0h	Interrupt associated with TCC #32

10.1.7.1.62 IECR Register (Offset = 1058h) [reset = 0h]

IECR is shown in Figure 10-88 and described in Table 10-93.

Return to the Table 10-31.

Int Enable Clear Register: CPU write of '1' to the IECR.In bit causes the IER.In bit to be cleared. CPU write of '0' has no effect..

0	I32	R	0h	Interrupt associated with TCC #32

10.1.7.1.68 ICR Register (Offset = 1070h) [reset = 0h]

ICR is shown in Figure 10-94 and described in Table 10-99.

Return to the Table 10-31.

Interrupt Clear Register: CPU write of '1' to the ICR.In bit causes the IPR.In bit to be cleared. CPU write of '0' has no effect. All IPR.In bits must be cleared before additional interrupts will be asserted by CC.

Table 10-101. IEVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RES69	R	0h	RESERVE FIELD
1	SET	W	0h	Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable (IERn) and status (IPRn). CPU write of '0' has no effect.
0	EVAL	W	0h	Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts (IERn) are still pending (IPRn). CPU write of '0' has no effect..

10.1.7.1.71 QER Register (Offset = 1080h) [reset = 0h]

QER is shown in Figure 10-97 and described in Table 10-102.

Return to the Table 10-31.

QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

10.1.7.1.72 QEER Register (Offset = 1084h) [reset = 0h]

QEER is shown in Figure 10-98 and described in Table 10-103.

Return to the Table 10-31.

QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

10.1.7.1.75 QSER Register (Offset = 1090h) [reset = 0h]

QSER is shown in Figure 10-101 and described in Table 10-106.

Return to the Table 10-31.

QDMA Secondary Event Register: The QDMA secondary event register is used along with the QDMA Event Register (QER) to provide information on the state of a QDMA Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

Figure 10-101. QSER Register

10.1.7.1.76 QSECR Register (Offset = 1094h) [reset = 0h]

QSECR is shown in Figure 10-102 and described in Table 10-107.

Return to the Table 10-31.

QDMA Secondary Event Clear Register: The secondary event clear register is used to clear the status of the QSER and QER register (note that this is slightly different than the SER operation which does not clear the ER.En register). CPU write of '1' to the QSECR.En bit clears the QSER.En and QER.En register fields. CPU write of '0' has no effect..

Figure 10-102. QSECR Register

10.1.7.1.77 ER_RN Register (Offset = 2000h) [reset = 0h]

ER_RN is shown in Figure 10-103 and described in Table 10-108.

Return to the Table 10-31.

Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

10.1.7.1.83 CER_RN Register (Offset = 2018h) [reset = 0h]

CER_RN is shown in Figure 10-109 and described in Table 10-114.

Return to the Table 10-31.

Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

10.1.7.1.85 EER_RN Register (Offset = 2020h) [reset = 0h]

EER_RN is shown in Figure 10-111 and described in Table 10-116.

Return to the Table 10-31.

Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

10.1.7.1.86 EERH_RN Register (Offset = 2024h) [reset = 0h]

EERH_RN is shown in Figure 10-112 and described in Table 10-117.

Return to the Table 10-31.

Event Enable Register (High Part): Enables DMA transfers for ERH.En pending events. ERH.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CERH) or Event Set Register (ESRH). Note that if a bit is set in ERH.En while EERH.En is disabled no action is taken. If EERH.En is enabled at a later point (and ERH.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EERH.En is not directly writeable. Events can be enabled via writes to EESRH and can be disabled via writes to EECRH register. EERH.En = 0: ER.En is not enabled to trigger DMA transfers. EERH.En = 1: ER.En is enabled to trigger DMA transfers.

10.1.7.1.93 SECR_RN Register (Offset = 2040h) [reset = 0h]

SECR_RN is shown in Figure 10-119 and described in Table 10-124.

Return to the Table 10-31.

Secondary Event Clear Register: The secondary event clear register is used to clear the status of the SER registers. CPU write of '1' to the SECR.En bit clears the SER register. CPU write of '0' has no effect.

RES76							
R-0h							
7	6	5	4	3	2	1	0
RES76						SET	EVAL
R-0h						W-0h	W-0h

Table 10-136. IEVAL_RN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RES76	R	0h	RESERVE FIELD
1	SET	W	0h	Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable (IERn) and status (IPRn). CPU write of '0' has no effect.
0	EVAL	W	0h	Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts (IERn) are still pending (IPRn). CPU write of '0' has no effect..

10.1.7.1.106 QER_RN Register (Offset = 2080h) [reset = 0h]

QER_RN is shown in Figure 10-132 and described in Table 10-137.

Return to the Table 10-31.

QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

Figure 10-132. QER_RN Register

10.1.7.1.107 QEER_RN Register (Offset = 2084h) [reset = 0h]

QEER_RN is shown in Figure 10-133 and described in Table 10-138.

Return to the Table 10-31.

QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

Table 10-143. OPT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PRIV	R	0h	Privilege level: privilege level (supervisor vs. user) for the host/cpu/dma that programmed this PaRAM Entry. Value is set with the vbus priv value when any part of the PaRAM Entry is written. Not writeable via vbus wdata bus. Is readable via VBus rdata bus. PRIV = 0 : User level privilege PRIV = 1 : Supervisor level privilege
30-28	RES83	R	0h	RESERVE FIELD
27-24	PRIVID	R	0h	Privilege ID: Privilege ID for the external host/cpu/dma that programmed this PaRAM Entry. This value is set with the vbus privid value when any part of the PaRAM Entry is written. Not writeable via vbus wdata bus. Is readable via VBus rdata bus.
23	ITCCHEN	R/W	0h	Intermediate transfer completion chaining enable: 0: Intermediate transfer complete chaining is disabled. 1: Intermediate transfer complete chaining is enabled.
22	TCCHEN	R/W	0h	Transfer complete chaining enable: 0: Transfer complete chaining is disabled. 1: Transfer complete chaining is enabled.
21	ITCINTEN	R/W	0h	Intermediate transfer completion interrupt enable: 0: Intermediate transfer complete interrupt is disabled. 1: Intermediate transfer complete interrupt is enabled (corresponding IER[TCC] bit must be set to 1 to generate interrupt)
20	TCINTEN	R/W	0h	Transfer complete interrupt enable: 0: Transfer complete interrupt is disabled. 1: Transfer complete interrupt is enabled (corresponding IER[TCC] bit must be set to 1 to generate interrupt)

Table 10-143. OPT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	WIMODE	R/W	0h	Backward compatibility mode: 0: Normal operation 1 : WI Backwards Compatibility mode forces BCNT to be adjusted by '1' upon TR submission (0 means 1 1 means 2 ...) and forces ACNT to be treated as a word-count (left shifted by 2 by hardware to create byte cnt for TR submission)
18	RES84	R	0h	RESERVE FIELD
17-12	TCC	R/W	0h	Transfer Complete Code: The 6-bit code is used to set the relevant bit in CER (bit CER[TCC]) for chaining or in IER (bit IER[TCC]) for interrupts.
11	TCCMODE	R/W	0h	Transfer complete code mode: Indicates the point at which a transfer is considered completed. Applies to both chaining and interrupt. 0: Normal Completion A transfer is considered completed after the transfer parameters are returned to the CC from the TC (which was returned from the peripheral). 1: Early Completion A transfer is considered completed after the CC submits a TR to the TC. CC generates completion code internally .
10-8	FWID	R/W	0h	FIFO width: Applies if either SAM or DAM is set to FIFO mode. Pass-thru to TC.
7-4	RES85	R	0h	RESERVE FIELD
3	STATIC	R/W	0h	Static Entry: 0: Entry is updated as normal 1: Entry is static Count and Address updates are not updated after TRP is submitted. Linking is not performed.
2	SYNCDIM	R/W	0h	Transfer Synchronization Dimension: 0: A-Sync Each event triggers the transfer of ACNT elements. 1: AB-Sync Each event triggers the transfer of BCNT arrays of ACNT elements
1	DAM	R/W	0h	Destination Address Mode: Destination Address Mode within an array. Pass-thru to TC. 0: INCR Dst addressing within an array increments. Dst is not a FIFO. 1: FIFO Dst addressing within an array wraps around upon reaching FIFO width.
0	SAM	R/W	0h	Source Address Mode: Source Address Mode within an array. Pass-thru to TC. 0: INCR Src addressing within an array increments. Source is not a FIFO. 1: FIFO Src addressing within an array wraps around upon reaching FIFO width.

10.1.7.1.113 SRC Register (Offset = 4004h) [reset = 0h]

SRC is shown in Figure 10-139 and described in Table 10-144.

Return to the Table 10-31.

Source Address

Figure 10-139. SRC Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SRC																															
R/W-0h																															

Table 10-144. SRC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SRC	R/W	0h	Source Address: The 32-bit source address parameters specify the starting byte address of the source . If SAM is set to FIFO mode then the user should program the Source address to be aligned to the value specified by the OPT.FWID field. No errors are recognized here but TC will assert error if this is not true.

10.1.7.1.114 ABCNT Register (Offset = 4008h) [reset = 0h]

ABCNT is shown in Figure 10-140 and described in Table 10-145.

Return to the Table 10-31.

A and B byte count

Figure 10-140. ABCNT Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BCNT																ACNT															
R/W-0h																R/W-0h															

Table 10-145. ABCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	BCNT	R/W	0h	BCNT : Count for 2nd Dimension: BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation valid values for BCNT can be anywhere between 1 and 65535. Therefore the maximum number of arrays in a frame is 65535 (64K-1 arrays). BCNT=1 means 1 array in the frame and BCNT=0 means 0 arrays in the frame. In normal mode a BCNT of '0' is considered as either a Null or Dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the programmed BCNT value will be incremented by '1' before submission to TC. I.e. 0 means 1 1 means 2 2 means 3 ...
15-0	ACNT	R/W	0h	ACNT : number of bytes in 1st dimension: ACNT represents the number of bytes within the first dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65535. Therefore the maximum number of bytes in an array is 65535 bytes (64K-1 bytes). ACNT must be greater than or equal to '1' for a TR to be submitted to TC. An ACNT of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the ACNT field represents a word count. The CC must internally multiply by 4 to translate the word count to a byte count prior to submission to the TC. The 2 MSBs of the 16-bit ACNT are reserved and should always be written as 'b00 by the user. If user writes a value other than 0 it will still be treated as 0 since the multiply-by-4 operation (to translate between a word count and a byte count) will drop the 2 msbits. For dummy and null transfer definition the ACNT definition will disregard the 2 msbits. I.e. a programmed ACNT value of 0x8000 in WI-mode will be treated as 0 byte transfer resulting in null or dummy operation dependent on the state of BCNT and CCNT.

10.1.7.1.115 DST Register (Offset = 400Ch) [reset = 0h]

DST is shown in Figure 10-141 and described in Table 10-146.

Return to the Table 10-31.

Destination Address

Figure 10-141. DST Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DST

Table 10-146. DST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	DST	R/W	0h	Destination Address: The 32-bit destination address parameters specify the starting byte address of the destination. If DAM is set to FIFO mode then the user should program the Destination address to be aligned to the value specified by the OPT.FWID field. No errors are recognized here but TC will assert error if this is not true.

10.1.7.1.116 BIDX Register (Offset = 4010h) [reset = 0h]

BIDX is shown in Figure 10-142 and described in Table 10-147.

Return to the Table 10-31.

Register description is not available

Figure 10-142. BIDX Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DBIDX																SBIDX															
R/W-0h																R/W-0h															

Table 10-147. BIDX Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	DBIDX	R/W	0h	Destination 2nd Dimension Index: DBIDX is a 16-bit signed value (2's complement) used for destination address modification in between each array in the 2nd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the destination array to the beginning of the next destination array within the current frame. It applies to both A-Sync and AB-Sync transfers.
15-0	SBIDX	R/W	0h	Source 2nd Dimension Index: SBIDX is a 16-bit signed value (2's complement) used for source address modification in between each array in the 2nd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the source array to the beginning of the next source array. It applies to both A-sync and AB-sync transfers.

10.1.7.1.117 LNK Register (Offset = 4014h) [reset = 0h]

LNK is shown in Figure 10-143 and described in Table 10-148.

Return to the Table 10-31.

Link and Reload parameters

Figure 10-143. LNK Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BCNTRLD																LINK															
R/W-0h																R/W-0h															

Table 10-148. LNK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	BCNTRLD	R/W	0h	BCNT Reload: BCNTRLD is a 16-bit unsigned value used to reload the BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-Sync'ed transfers. In this case the CC decrements the BCNT value by one on each TR submission. When BCNT (conceptually) reaches zero then the CC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value. For AB-synchronized transfers the CC submits the BCNT in the TR and therefore the TC is responsible to keep track of BCNT not thus BCNTRLD is a don't care field.
15-0	LINK	R/W	0h	Link Address: The CC provides a mechanism to reload the current PaRAM Entry upon its natural termination (i.e. after count fields are decremented to '0') with a new PaRAM Entry. This is called 'linking'. The 16-bit parameter LINK specifies the byte address offset in the PaRAM from which the CC loads/reloads the next PaRAM entry in the link. The CC should disregard the value in the upper 2 bits of the LINK field as well as the lower 5-bits of the LINK field. The upper two bits are ignored such that the user can program either the 'literal' byte address of the LINK parameter or the 'PaRAM base-relative' address of the link field. Therefore if the user uses the literal address with a range from 0x4000 to 0x7FFF it will be treated as a PaRAM-base-relative value of 0x0000 to 0x3FFF. The lower-5 bits are ignored and treated as 'b00000 thereby guaranteeing that all Link pointers point to a 32-byte aligned PaRAM entry. In the latter case (5-lsbs) behavior is undefined for the user (i.e. don't have to test it). In the former case (2 msbs) user should be able to take advantage of this feature (i.e. do have to test it). If a Link Update is requested to a PaRAM address that is beyond the actual range of implemented PaRAM then the Link will be treated as a Null Linkand all 0s plus 0xFFFF will be written to the current entry location. A LINK value of 0xFFFF is referred to as a NULL link which should cause the CC to write 0x0 to all entries of the current PaRAM Entry except for the LINK field which is set to 0xFFFF. The Priv/Privid/Secure state is overwritten to 0x0 when linking. MSBs and LSBS should not be masked when comparing against the 0xFFFF value. I.e. a value of 0x3FFE is a non-NULL PaRAM link field.

10.1.7.1.118 CIDX Register (Offset = 4018h) [reset = 0h]

CIDX is shown in Figure 10-144 and described in Table 10-149.

Return to the Table 10-31.

Register description is not available

Figure 10-144. CIDX Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DCIDX																SCIDX															
R/W-0h																R/W-0h															

Table 10-149. CIDX Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	DCIDX	R/W	0h	Destination Frame Index: DCIDX is a 16-bit signed value (2's complement) used for destination address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array (pointed to by DST address) to the beginning of the first destination array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when DCIDX is applied the current array in an A-sync transfer is the last array in the frame while the current array in a ABsync transfer is the first array in the frame.
15-0	SCIDX	R/W	0h	Source Frame Index: SCIDX is a 16-bit signed value (2's complement) used for source address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array (pointed to by SRC address) to the beginning of the first source array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when SCIDX is applied the current array in an A-sync transfer is the last array in the frame while the current array in a AB-sync transfer is the first array in the frame.

10.1.7.1.119 CCNT Register (Offset = 401Ch) [reset = 0h]

CCNT is shown in Figure 10-145 and described in Table 10-150.

Return to the Table 10-31.

C byte count

Figure 10-145. CCNT Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 10-150. CCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RES86	R	0h	RESERVE FIELD
15-0	CCNT	R/W	0h	CCNT : Count for 3rd Dimension: CCNT is a 16-bit unsigned value that specifies the number of frames in a block. Valid values for CCNT can be anywhere between 1 and 65535. Therefore the maximum number of frames in a block is 65535 (64K-1 frames). CCNT of '1' means '1' frame in the block and CCNT of '0' means '0' frames in the block. A CCNT value of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. WIMODE has no affect on CCNT operation.

10.1.7.2 TPTC Registers

Table 10-151 lists the TPTC registers. All register offset addresses not listed in Table 10-151 should be considered as reserved locations and the register contents should not be modified.

Table 10-151. TPTC Registers

Offset	Acronym	Register Name	Section
0h	PID	Peripheral ID Register	Section 11.1.7.2.1

Table 10-154. TCSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-14	RESERVED	R	X	
13-12	DFSTRTPTR	R	0h	Dst FIFO Start Pointer Represents the offset to the head entry of Dst Register FIFO in units of entries. Legal values = 0x0 to 0x3
11-9	RESERVED	R	X	
8	ACTV	R	1h	Channel Active Channel Active is a logical-OR of each of the BUSY/ACTV signals. The ACTV bit must remain high through the life of a TR. ACTV = 0 : Channel is idle. ACTV = 1 : Channel is busy.
7	RESERVED	R	X	
6-4	DSTACTV	R	0h	Destination Active State Specifies the number of TRs that are resident in the Dst Register FIFO at a given instant. Legal values are constrained by the DSTREGDEPTH parameter.
3	RESERVED	R	X	
2	WSACTV	R	0h	Write Status Active WSACTV = 0 : Write status is not pending. Write status has been received for all previously issued write commands. WSACTV = 1 : Write Status is pending. Write status has not been received for all previously issued write commands.

Table 10-154. TCSTAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	SRCACTV	R	0h	Source Active State SRCACTV = 0 : Source Active set is idle. Any TR written to Prog Set will immediately transition to Source Active set as long as the Dst FIFO Set is not full [DSTFULL == 1]. SRCACTV = 1 : Source Active set is busy either performing read transfers or waiting to perform read transfers for current Transfer Request.
0	PROGBUSY	R	0h	Program Register Set Busy PROGBUSY = 0 : Prog set idle and is available for programming. PROGBUSY = 1 : Prog set busy. User should poll for PROGBUSY equal to '0' prior to re-programming the Program Register set.

10.1.7.2.4 INTSTAT Register (Offset = 104h) [reset = X]

INTSTAT is shown in Figure 10-149 and described in Table 10-155.

Return to the Table 10-151.

Bit	Field	Type	Reset	Description
31-18	RESERVED	R	X	
17	TCCHEN	R	0h	Contains the OPT.TCCHEN value programmed by the user for the Read or Write transaction that resulted in an error.
16	TCINTEN	R	0h	Contains the OPT.TCINTEN value programmed by the user for the Read or Write transaction that resulted in an error.
15-14	RESERVED	R	X	
13-8	TCC	R	0h	Transfer Complete Code: Contains the OPT.TCC value programmed by the user for the Read or Write transaction that resulted in an error.
7-4	RESERVED	R	X	
3-0	STAT	R	0h	Transaction Status: Stores the non-zero status/error code that was detected on the read status or write status bus. MS-bit effectively serves as the read vs. write error code. If read status and write status are returned on the same cycle then the TC chooses non-zero version. If both are non-zero then write status is treated as higher priority. Encoding of errors matches the CBA spec.

10.1.7.2.12 ERRCMD Register (Offset = 130h) [reset = X]

ERRCMD is shown in Figure 10-157 and described in Table 10-163.

11.1 General Connectivity Peripherals

11.1.1 General-Purpose Input/Output (GIO) Module

This chapter describes the general-purpose input/output (GIO) module. The GIO module provides the family of devices with input/output (I/O) capability. The I/O pins are bidirectional and bit-programmable. The GIO module also supports external interrupt capability.

Note

The "GIO" module is also known as the "GPIO" module in other TI MCU and MPU devices. The two terms are used interchangeably and represent the general use I/O module of the device.

11.1.1.1 Overview

The The GIO module offers general-purpose input and output capability. It supports up to eight 8-bit ports for a total of up to 64 GIO terminals. Each of these 64 terminals can be independently configured as input or output and configured as required by the application. The GIO module also supports generation of interrupts whenever a rising edge or falling edge or any toggle is detected on up to 32 of these GIO terminals. Refer to the device datasheet for identifying the number of GIO ports supported and the GIO terminals capable of generating an interrupt.

The main features of the GIO module are summarized as follows:

- Allows each GIO terminal to be configured for general-purpose input or output functions
- Supports programmable pull directions on each input GIO terminal
- Supports GIO output in push/pull or open-drain modes
- Allows up to 32 GIO terminals to be used for generating interrupt requests

These 8-bit ports have the following names in *MSS_GIO Registers*:

- GIOA[7:0]
  - MSS_GIO 0 - 7
  - RCSS_GIO 32 - 39
- GIOB[7:0]
  - MSS_GIO 8 - 15
  - RCSS_GIO 40 - 47
- GIOC[7:0]
  - MSS_GIO 16 - 23
  - RCSS_GIO 48 - 55
- GIOD[7:0]
  - MSS_GIO 24 -31
  - RCSS_GIO 56 - 63

11.1.1.2 Quick Start Guide

The GIO module comprises two separate components: an input/output (I/O) block and an interrupt generation block. Figure 11-1 and Figure 11-2 show what you should do after reset to configure the GIO module as I/O or for generating interrupts.

In GIO interrupt service routine, you shall read the GIO offset register (GIOOFF1 or GIOOFF2, depending on high-/low-level interrupt) to clear the flag and find the pending interrupt GIO channel.

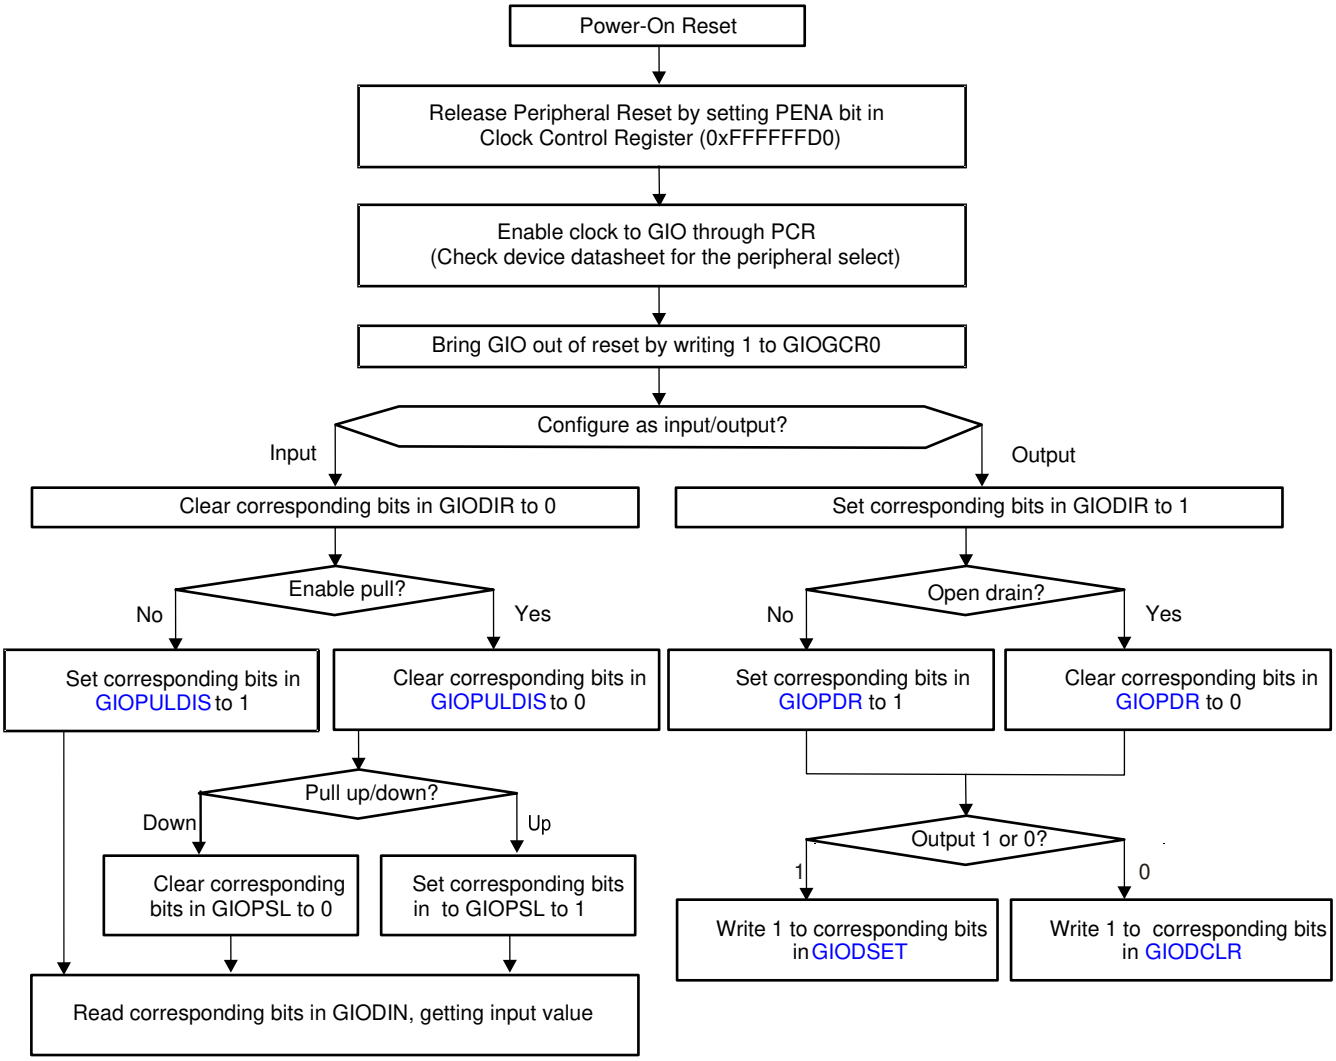

Figure 11-1. I/O Function Quick Start Flow Chart

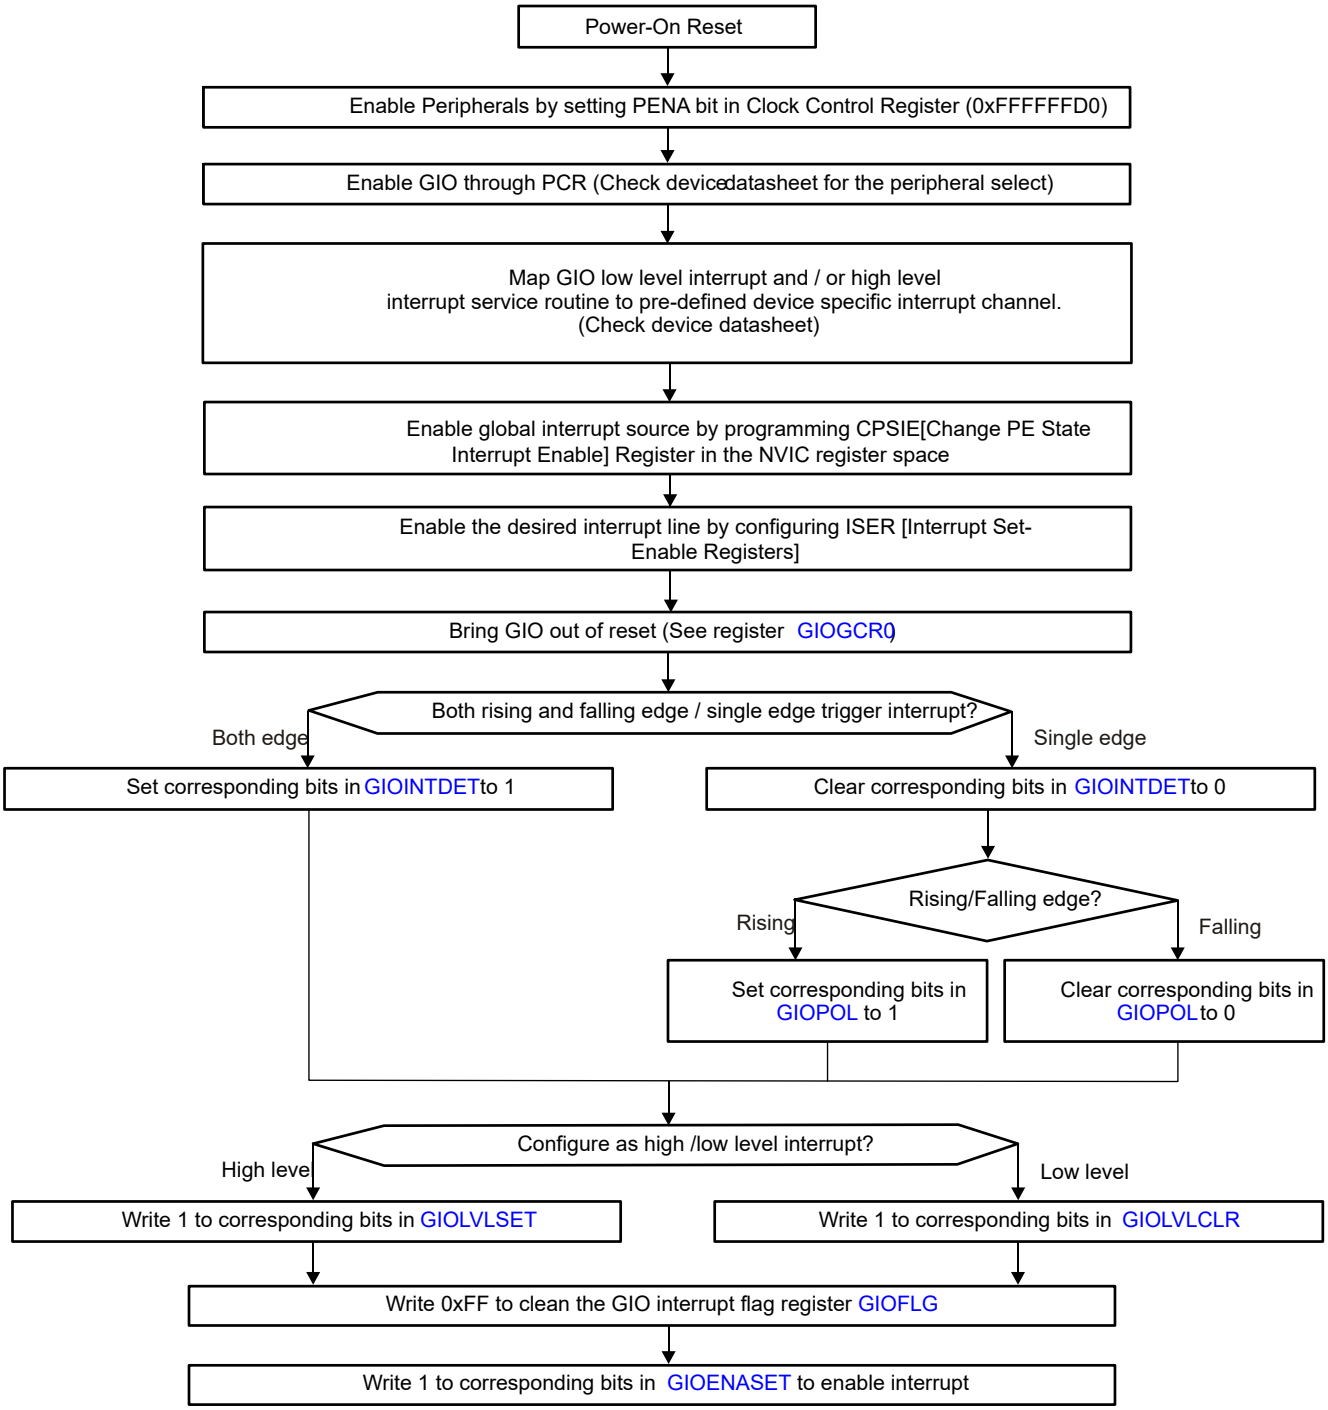

Figure 11-2. Interrupt Generation Function Quick Start Flow Chart

11.1.1.3 Functional Description of GIO Module

As shown in Figure 11-3, the GIO module comprises of two separate components: an input/output (I/O) block and an interrupt block.

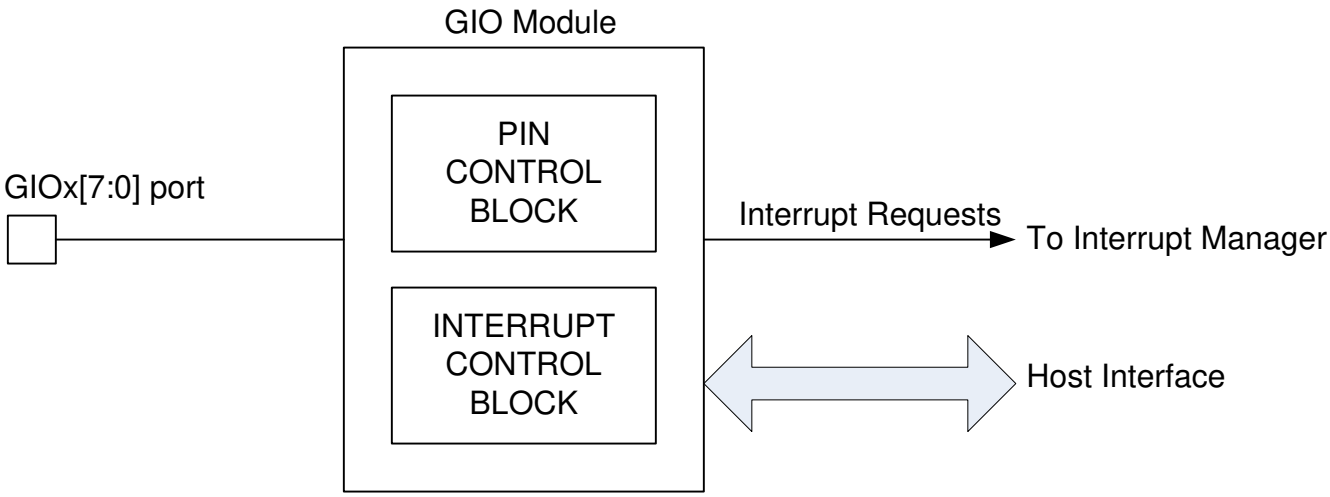

Figure 11-3. GIO Module Diagram

11.1.1.3.1 I/O Functions

The I/O block allows each GIO terminal to be configured for use as a general-purpose input or output in the application. The GIO module supports multiple registers to control the various aspects of the input and output functions. These are described as follows.

- Data direction (GIODIR)

  Configures GIO terminal(s) as input (default) or output through the GIODIRx registers.
- Data input (GIODIN)

  Reflects the logic level on GIO terminals in the GIODINx registers. A high voltage (V_{IH} or greater) applied to the pin causes a high value (1) in the data input register (GIODIN[7:0]). When a low voltage (V_{IL} or less) is applied to the pin, the data input register reads a low value (0). The V_{IH} and V_{IL} values are device specific and can be found in the device datasheet.
- Data output (GIODOUT)

  Configures the logic level to be output on GIO terminal(s) configured as outputs. A low value (0) written to the data output register forces the pin to a low output voltage (V_{OL} or lower). A high value (1) written to the data output register (GIODOUTx) forces the pin to a high output voltage (V_{OH} or higher) if the open drain functionality is disabled (GIOPDRx[7:0]). If open drain functionality is enabled, a high value (1) written to the data output register forces the pin to a high-impedance state (Z).
- Data set (GIODSET)

  Allows logic HIGH to be output on GIO terminal(s) configured as outputs by writing 1's to the required bits in the GIODSETx registers. If open drain functionality is enabled, a high value (1) written to the data output register forces the pin to a high-impedance state (Z). The GIODSETx registers eliminate the need for the application to perform a read-modify-write operation when it needs to set one or more GIO pin(s).
- Data clear (GIODCLR)

  Allows logic LOW to be output on GIO terminal(s) configured as outputs by writing 1s to the required bits in the GIODCLRx registers. The GIODCLRx registers eliminate the need for the application to perform a read-modify-write operation when it needs to clear one or more GIO pin(s).
- Open drain (GIOPDR)

Open drain functionality is enabled or disabled (default) using the open drain register GIOPDR[7:0] register. If open-drain mode output is enabled on a pin, a high value (1) written to the data output register (GIODOUTx[7:0]) forces the pin to a high impedance state (Z).

- Pull disable (GIOPULDIS)

  Disables the internal pull on GIO terminal(s) configured as inputs by writing to the GIOPULDISx registers.
- Pull select (GIOPSL)

  Selects internal pull down (default) or pull up on GIO terminal(s) configured as inputs by writing to the GIOPULSELx registers.

Refer to the specific device's datasheet to identify the number of GIO ports as well as the input and output functions supported. Some devices may not support the programmable pull controls. In that case, the pull disable and the pull select register controls will not work.

11.1.1.3.2 Interrupt Function

The GIO module supports up to 32 terminals to be configured for generating an interrupt to the host processor through the Interrupt Manager (NVIC/IM). The main functions of the interrupt block are:

- Select the GIO pin(s) that is/are used to generate interrupt(s)

  This is done via the interrupt enable set and clear registers, GIOENASET and GIOENACLR.
- Select the edge on the selected GIO pin(s) that is/are used to generate interrupt(s): rising/falling/both

  Rising or falling edge can be selected via the GIOPOL register. If interrupt is required to be generated on both rising and falling edges, this can be configured via the GIOINTDET register.
- Select the interrupt priority

  Low- or high-level interrupt can be selected through the GIOLVLSET and GIOLVLCLR registers.
- Individual interrupt flags are set in the GIOFLG register

The terminals on GIO ports A through D are all interrupt-capable and can be used to handle either general I/O functions or interrupt requests. Each interrupt request can be connected to the NVIC/IM at one of two different levels – High (or A) and Low (or B), depending on the NVIC/IM channel number. The NVIC/IM has an inherent priority scheme so that a request on a lower number channel has a higher priority than a request on a higher number channel. Refer the device datasheet to identify the NVIC/IM channel numbers for the GIO level A and level B interrupt requests. Also note that the interrupt priority of level A and level B interrupt handling blocks can be re-programmed in the NVIC/IM.

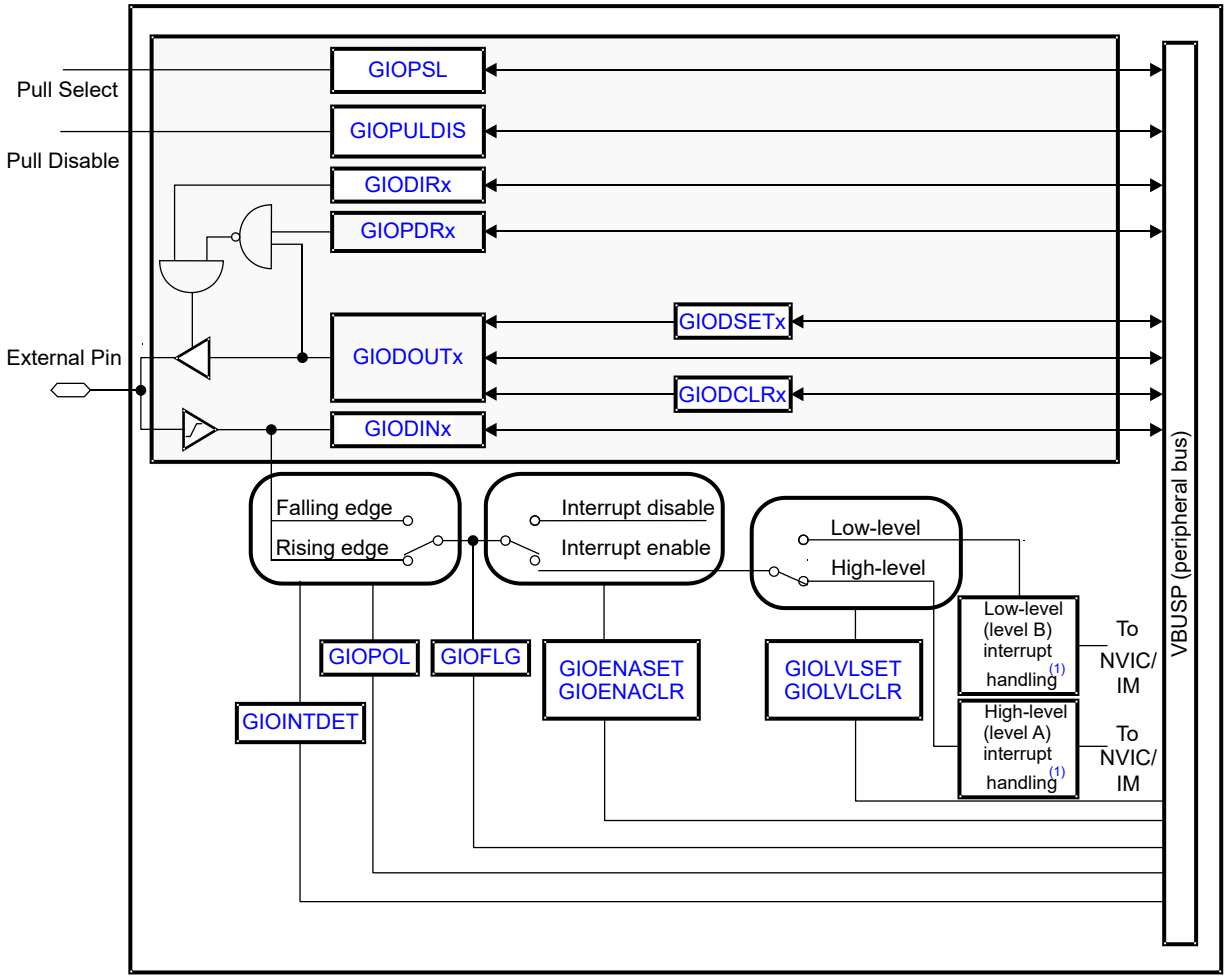
11.1.1.3.3 GIO Block Diagram

The GIO block diagram (Figure 11-4) represents the flow of information through a pin. The shaded area corresponds to the I/O block; the unshaded area corresponds to the interrupt block.

Figure 11-4. GIO Block Diagram

A. A single low-level-interrupt-handling block and a single high-level-interrupt-handling block service all of the interrupt-capable external pins, but only one pin can be serviced by an interrupt block at a time.

Figure 11-5.



11.1.1.4 Device Modes of Operation

The GIO module behaves differently in different modes of operation. There are two main modes:

- Emulation mode
- Power-down mode (low-power mode)

11.1.1.4.1 Emulation Mode

Emulation mode is used by debugger tools to stop the CPU at breakpoints to read registers.

Note

Emulation Mode and Emulation Registers

Emulation mode is a mode of operation of the device and is separate from the GIO emulation registers (GIOEMU1 and GIOEMU2). The contents of these emulation registers are identical to the contents of GIO offset registers (GIOOFF1 and GIOOFF2). Both emulation registers and GIO offset registers are NOT cleared when they are read in emulation mode. GIO offset registers are cleared when they are read in normal mode (other than emulation mode). The emulation registers are NOT cleared when they are read in normal mode. The intention for the emulation registers is that software can use them without clearing the flags.

During emulation mode:

- External interrupts are not captured because the NVIC/IM is unable to service interrupts.
- Any register can be read without affecting the state of the system.
- A write to a register still does affect the state of the system.

11.1.1.4.2 Power-Down Mode (Low-Power Mode)

In power-down mode, the clock signal to the GIO module is disabled. Thus, there is no switching and the only current draw comes from leakage current. In power-down mode, interrupt pins become level-sensitive rather than edge-sensitive. The polarity bit changes function from falling-edge-triggered to low-level-triggered and rising-edge-triggered to high-level-triggered. A corresponding level on an interrupt pin pulls the module out of low-power mode, if the interrupt is also enabled to wake up the device out of a low-power mode.

11.1.1.4.3 Interrupts

GIO generates aggregated interrupts for all inputs from PAD. Some of the interrupts to MSS_R5F are directly taken from GPIO-PAD.

MSS_GIO_INT0/1

MSS_GIO_PAD_INT0 from GPIO[0]

MSS_GIO_PAD_INT1 from GPIO[1]

MSS_GIO_PAD_INT2 from GPIO[2]

MSS_CTRL:: MSS_GIO_CFG_GIO:: MSS_GIO_CFG_GIO_CONFIG is used for selecting the edge that can give a trigger.

11.1.1.5 TOP_GIO Registers

Table 11-1 lists the memory-mapped registers for the TOP_GIO registers. All register offset addresses not listed in Table 11-1 should be considered as reserved locations and the register contents should not be modified.

Table 11-1. TOP_GIO Registers

Complex bit access types are encoded to fit into small table cells. Table 11-2 shows the codes that are used for access types in this section.

Table 11-2. TOP_GIO Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

11.1.1.5.1 GIOGCR Register (Offset = 0h) [Reset = 00000000h]

GIOGCR is shown in Table 11-3.

Return to the Summary Table.

GIO reset

Table 11-3. GIOGCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU0	R/W	0h	Reserved
0	RESET	R/W	0h	GIO reset

11.1.1.5.2 GIOPWDN Register (Offset = 4h) [Reset = 00000000h]

GIOPWDN is shown in Table 11-4.

Return to the Summary Table.

GIO power down mode register

Table 11-4. GIOPWDN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU	R/W	0h	Reserved
0	GIOPWDN	R/W	0h	Writing to the GIOPWDN bit is only allowed in privilege mode. Reading of the GIOPWDN bit is allowed in all modes. Privilege mode (write): 0 = Normal operation clocks enabled to GIO module 1 = Power-down mode User mode (write): Writes have no effect in user mode. User or privilege mode (read): 0 = Normal operation clocks enabled to GIO module 1 = Power-down mode

11.1.1.5.3 GIOINTDET Register (Offset = 8h) [Reset = 00000000h]

GIOINTDET is shown in Table 11-5.

Return to the Summary Table.

Interrupt detection select for pins [0:1] GIO[7:0].

Table 11-5. GIOINTDET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	GIOINTDET_3	R/W	0h	Interrupt detection select for pins GIOD [7:0].
23-16	GIOINTDET_2	R/W	0h	Interrupt detection select for pins GIOC [7:0].
15-8	GIOINTDET_1	R/W	0h	Interrupt detection select for pins GIOB [7:0].
7-0	GIOINTDET_0	R/W	0h	Interrupt detection select for pins GIOA [7:0].

11.1.1.5.4 GIOPOL Register (Offset = Ch) [Reset = 00000000h]

GIOPOL is shown in Table 11-6.

Return to the Summary Table.

Interrupt polarity select for pins [0:1] GIO[7:0].

Table 11-6. GIOPOL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	GIOPOL_3	R/W	0h	Interrupt polarity select for pins GIOD [7:0]
23-16	GIOPOL_2	R/W	0h	Interrupt polarity select for pins GIOC [7:0]
15-8	GIOPOL_1	R/W	0h	Interrupt polarity select for pins GIOB [7:0]
7-0	GIOPOL_0	R/W	0h	Interrupt polarity select for pins GIOA [7:0]

11.1.1.5.5 GIOENASET Register (Offset = 10h) [Reset = 00000000h]

GIOENASET is shown in Table 11-7.

Return to the Summary Table.

Interrupt enable for pins [0:1] GIO[7:0].

Table 11-7. GIOENASET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	GIOENASET_3	R/W	0h	Interrupt enable for pins GIOD [7:0]
23-16	GIOENASET_2	R/W	0h	Interrupt enable for pins GIOC [7:0]
15-8	GIOENASET_1	R/W	0h	Interrupt enable for pins GIOB [7:0]
7-0	GIOENASET_0	R/W	0h	Interrupt enable for pins GIOA [7:0]

11.1.1.5.6 GIOENACLR Register (Offset = 14h) [Reset = 00000000h]

GIOENACLR is shown in Table 11-8.

Return to the Summary Table.

Interrupt enable for pins [0:1] GIO[7:0].

Table 11-8. GIOENACLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	GIOENACLR_3	R/W	0h	Interrupt enable for pins GIOD [7:0]
23-16	GIOENACLR_2	R/W	0h	Interrupt enable for pins GIOC [7:0]
15-8	GIOENACLR_1	R/W	0h	Interrupt enable for pins GIOB [7:0]
7-0	GIOENACLR_0	R/W	0h	Interrupt enable for pins GIOA [7:0]

11.1.1.5.7 GIOLVLSET Register (Offset = 18h) [Reset = 00000000h]

GIOLVLSET is shown in Table 11-9.

Return to the Summary Table.

GIO high priority interrupt for pins [0:1] GIO[7:0].

Table 11-9. GIOLVLSET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	GIOLVLSET_3	R/W	0h	GIO high priority interrupt for pins GIOD [7:0]
23-16	GIOLVLSET_2	R/W	0h	GIO high priority interrupt for pins GIOC [7:0]
15-8	GIOLVLSET_1	R/W	0h	GIO high priority interrupt for pins GIOB [7:0]
7-0	GIOLVLSET_0	R/W	0h	GIO high priority interrupt for pins GIOA [7:0]

11.1.1.5.8 GIOLVLCLR Register (Offset = 1Ch) [Reset = 00000000h]

GIOLVLCLR is shown in Table 11-10.

Return to the Summary Table.

GIO low priority interrupt for pins [0:1] GIO[7:0].

Table 11-10. GIOLVLCLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	GIOLVLCLR_3	R/W	0h	GIO low priority interrupt for pins GIOD [7:0]
23-16	GIOLVLCLR_2	R/W	0h	GIO low priority interrupt for pins GIOC [7:0]
15-8	GIOLVLCLR_1	R/W	0h	GIO low priority interrupt for pins GIOB [7:0]
7-0	GIOLVLCLR_0	R/W	0h	GIO low priority interrupt for pins GIOA [7:0]

11.1.1.5.9 GIOFLG Register (Offset = 20h) [Reset = 00000000h]

GIOFLG is shown in Table 11-11.

Return to the Summary Table.

GIO flag for pins [0:1] GIO[7:0].

Table 11-11. GIOFLG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	GIOFLG_3	R/W	0h	GIO flag for pins GIOD [7:0]
23-16	GIOFLG_2	R/W	0h	GIO flag for pins GIOC [7:0]
15-8	GIOFLG_1	R/W	0h	GIO flag for pins GIOB [7:0]
7-0	GIOFLG_0	R/W	0h	GIO flag for pins GIOA [7:0]

11.1.1.5.10 GIOOFFA Register (Offset = 24h) [Reset = 00000000h]

GIOOFFA is shown in Table 11-12.

Return to the Summary Table.

Index bits for currently pending high-priority interrupt Register A

Table 11-12. GIOOFFA Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	NU1	R/W	0h	Reserved
5-0	GIOOFFA	R/W	0h	Index bits for currently pending high-priority interrupt Register A

11.1.1.5.11 GIOOFFB Register (Offset = 28h) [Reset = 00000000h]

GIOOFFB is shown in Table 11-13.

Return to the Summary Table.

Index bits for currently pending high-priority interrupt Register B

Table 11-13. GIOOFFB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	NU2	R/W	0h	Reserved
5-0	GIOOFFB	R/W	0h	Index bits for currently pending high-priority interrupt Register B

11.1.1.5.12 GIOEMUA Register (Offset = 2Ch) [Reset = 00000000h]

GIOEMUA is shown in Table 11-14.

Return to the Summary Table.

GIO emulation register A

Table 11-14. GIOEMUA Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	NU3	R/W	0h	Reserved
5-0	GIOEMUA	R/W	0h	GIO emulation register A

11.1.1.5.13 GIOEMUB Register (Offset = 30h) [Reset = 00000000h]

GIOEMUB is shown in Table 11-15.

Return to the Summary Table.

GIO emulation register B

Table 11-15. GIOEMUB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	NU4	R/W	0h	Reserved
5-0	GIOEMUB	R/W	0h	GIO emulation register B

11.1.1.5.14 GIODIRA Register (Offset = 34h) [Reset = 00000000h]

GIODIRA is shown in Table 11-16.

Return to the Summary Table.

GIO data direction of pins in Port A

Table 11-16. GIODIRA Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU5	R/W	0h	Reserved
7-0	GIODIRA	R/W	0h	GIO data direction of pins in Port A

11.1.1.5.15 GIODINA Register (Offset = 38h) [Reset = 00000000h]

GIODINA is shown in Table 11-17.

Return to the Summary Table.

GIO data input for pins in port A

Table 11-17. GIODINA Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU11	R/W	0h	Reserved
7-0	GIODINA	R/W	0h	GIO data input for pins in port A

11.1.1.5.16 GIODOUTA Register (Offset = 3Ch) [Reset = 00000000h]

GIODOUTA is shown in Table 11-18.

Return to the Summary Table.

GIO data output for pins in port A

Table 11-18. GIODOUTA Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU17	R/W	0h	Reserved
7-0	GIODOUTA	R/W	0h	GIO data output for pins in port A

11.1.1.5.17 GIOSETA Register (Offset = 40h) [Reset = 00000000h]

GIOSETA is shown in Table 11-19.

Return to the Summary Table.

GIO data set for port A

Table 11-19. GIOSETA Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU23	R/W	0h	Reserved
7-0	GIODSETA	R/W	0h	GIO data set for port A

11.1.1.5.18 GIOCLRA Register (Offset = 44h) [Reset = 00000000h]

GIOCLRA is shown in Table 11-20.

Return to the Summary Table.

GIO data clear for port A

Table 11-20. GIOCLRA Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU29	R/W	0h	Reserved
7-0	GIODCLRA	R/W	0h	GIO data clear for port A

11.1.1.5.19 GIOPDRA Register (Offset = 48h) [Reset = 00000000h]

GIOPDRA is shown in Table 11-21.

Return to the Summary Table.

GIO open drain for port A

Table 11-21. GIOPDRA Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU35	R/W	0h	Reserved
7-0	GIOPDRA	R/W	0h	GIO open drain for port A

11.1.1.5.20 GIOPULDISA Register (Offset = 4Ch) [Reset = 00000000h]

GIOPULDISA is shown in Table 11-22.

Return to the Summary Table.

GIO pul disable for port A

Table 11-22. GIOPULDISA Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU	R/W	0h	Reserved
7-0	GIOPULDISA	R/W	0h	GIO pull disable for port A

11.1.1.5.21 GIOPSLA Register (Offset = 50h) [Reset = 00000000h]

GIOPSLA is shown in Table 11-23.

Return to the Summary Table.

GIO pul select for port A

Table 11-23. GIOPSLA Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU35	R/W	0h	Reserved
7-0	GIOPSLA	R/W	0h	GIO pull select for port A

11.1.1.5.22 GIODIRB Register (Offset = 54h) [Reset = 00000000h]

GIODIRB is shown in Table 11-24.

Return to the Summary Table.

GIO data direction of pins in Port B

Table 11-24. GIODIRB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU6	R/W	0h	Reserved
7-0	GIODIRB	R/W	0h	GIO data direction of pins in Port B

11.1.1.5.23 GIODINB Register (Offset = 58h) [Reset = 00000000h]

GIODINB is shown in Table 11-25.

Return to the Summary Table.

GIO data input for pins in port B

Table 11-25. GIODINB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU12	R/W	0h	Reserved
7-0	GIODINB	R/W	0h	GIO data input for pins in port B

11.1.1.5.24 GIODOUTB Register (Offset = 5Ch) [Reset = 00000000h]

GIODOUTB is shown in Table 11-26.

Return to the Summary Table.

GIO data output for pins in port B

Table 11-26. GIODOUTB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU18	R/W	0h	Reserved
7-0	GIODOUTB	R/W	0h	GIO data output for pins in port B

11.1.1.5.25 GIOSETB Register (Offset = 60h) [Reset = 00000000h]

GIOSETB is shown in Table 11-27.

Return to the Summary Table.

GIO data set for port B

Table 11-27. GIOSETB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU24	R/W	0h	Reserved
7-0	GIODSETB	R/W	0h	GIO data set for port B

11.1.1.5.26 GIOCLRB Register (Offset = 64h) [Reset = 00000000h]

GIOCLRB is shown in Table 11-28.

Return to the Summary Table.

GIO data clear for port B

Table 11-28. GIOCLRB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU30	R/W	0h	Reserved
7-0	GIODCLRB	R/W	0h	GIO data clear for port B

11.1.1.5.27 GIOPDRB Register (Offset = 68h) [Reset = 00000000h]

GIOPDRB is shown in Table 11-29.

Return to the Summary Table.

GIO open drain for port B

Table 11-29. GIOPDRB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU36	R/W	0h	Reserved
7-0	GIOPDRB	R/W	0h	GIO open drain for port B

11.1.1.5.28 GIOPULDISB Register (Offset = 6Ch) [Reset = 00000000h]

GIOPULDISB is shown in Table 11-30.

Return to the Summary Table.

GIO pul disable for port B

Table 11-30. GIOPULDISB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU36	R/W	0h	Reserved
7-0	GIOPULDISB	R/W	0h	GIO pull disable for port B

11.1.1.5.29 GIOPSLB Register (Offset = 70h) [Reset = 00000000h]

GIOPSLB is shown in Table 11-31.

Return to the Summary Table.

GIO pul select for port B

Table 11-31. GIOPSLB Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU36	R/W	0h	Reserved
7-0	GIOPSLB	R/W	0h	GIO pull select for port B

11.1.1.5.30 GIODIRC Register (Offset = 74h) [Reset = 00000000h]

GIODIRC is shown in Table 11-32.

Return to the Summary Table.

GIO data direction of pins in Port C

Table 11-32. GIODIRC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU7	R/W	0h	Reserved
7-0	GIODIRC	R/W	0h	GIO data direction of pins in Port C

11.1.1.5.31 GIODINC Register (Offset = 78h) [Reset = 00000000h]

GIODINC is shown in Table 11-33.

Return to the Summary Table.

GIO data input for pins in port C

Table 11-33. GIODINC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU13	R/W	0h	Reserved
7-0	GIODINC	R/W	0h	GIO data input for pins in port C

11.1.1.5.32 GIODOUTC Register (Offset = 7Ch) [Reset = 00000000h]

GIODOUTC is shown in Table 11-34.

Return to the Summary Table.

GIO data output for pins in port C

Table 11-34. GIODOUTC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU19	R/W	0h	Reserved
7-0	GIODOUTC	R/W	0h	GIO data output for pins in port C

11.1.1.5.33 GIOSETC Register (Offset = 80h) [Reset = 00000000h]

GIOSETC is shown in Table 11-35.

Return to the Summary Table.

GIO data set for port C

Table 11-35. GIOSETC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU25	R/W	0h	Reserved
7-0	GIODSETC	R/W	0h	GIO data set for port C

11.1.1.5.34 GIOCLRC Register (Offset = 84h) [Reset = 00000000h]

GIOCLRC is shown in Table 11-36.

Return to the Summary Table.

GIO data clear for port C

Table 11-36. GIOCLRC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU31	R/W	0h	Reserved
7-0	GIODCLRC	R/W	0h	GIO data clear for port C

11.1.1.5.35 GIOPDRC Register (Offset = 88h) [Reset = 00000000h]

GIOPDRC is shown in Table 11-37.

Return to the Summary Table.

GIO open drain for port C

Table 11-37. GIOPDRC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU37	R/W	0h	Reserved
7-0	GIOPDRC	R/W	0h	GIO open drain for port C

11.1.1.5.36 GIOPULDISC Register (Offset = 8Ch) [Reset = 00000000h]

GIOPULDISC is shown in Table 11-38.

Return to the Summary Table.

GIO pul disable for port C

Table 11-38. GIOPULDISC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU37	R/W	0h	Reserved
7-0	GIOPULDISC	R/W	0h	GIO pull disable for port C

11.1.1.5.37 GIOPSLC Register (Offset = 90h) [Reset = 00000000h]

GIOPSLC is shown in Table 11-39.

Return to the Summary Table.

GIO pul select for port C

Table 11-39. GIOPSLC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU37	R/W	0h	Reserved
7-0	GIOPSLC	R/W	0h	GIO pull select for port C

11.1.1.5.38 GIODIRD Register (Offset = 94h) [Reset = 00000000h]

GIODIRD is shown in Table 11-40.

Return to the Summary Table.

GIO data direction of pins in Port D

Table 11-40. GIODIRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU8	R/W	0h	Reserved
7-0	GIODIRD	R/W	0h	GIO data direction of pins in Port D

11.1.1.5.39 GIODIND Register (Offset = 98h) [Reset = 00000000h]

GIODIND is shown in Table 11-41.

Return to the Summary Table.

GIO data input for pins in port D

Table 11-41. GIODIND Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU14	R/W	0h	Reserved
7-0	GIODIND	R/W	0h	GIO data input for pins in port D

11.1.1.5.40 GIODOUTD Register (Offset = 9Ch) [Reset = 00000000h]

GIODOUTD is shown in Table 11-42.

Return to the Summary Table.

GIO data output for pins in port D

Table 11-42. GIODOUTD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU20	R/W	0h	Reserved
7-0	GIODOUTD	R/W	0h	GIO data output for pins in port D

11.1.1.5.41 GIOSETD Register (Offset = A0h) [Reset = 00000000h]

GIOSETD is shown in Table 11-43.

Return to the Summary Table.

GIO data set for port D

Table 11-43. GIOSETD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU26	R/W	0h	Reserved
7-0	GIODSETD	R/W	0h	GIO data set for port D

11.1.1.5.42 GIOCLRD Register (Offset = A4h) [Reset = 00000000h]

GIOCLRD is shown in Table 11-44.

Return to the Summary Table.

GIO data clear for port D

Table 11-44. GIOCLRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU32	R/W	0h	Reserved
7-0	GIODCLRD	R/W	0h	GIO data clear for port D

11.1.1.5.43 GIOPDRD Register (Offset = A8h) [Reset = 00000000h]

GIOPDRD is shown in Table 11-45.

Return to the Summary Table.

GIO open drain for port D

Table 11-45. GIOPDRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU38	R/W	0h	Reserved
7-0	GIOPDRD	R/W	0h	GIO open drain for port D

11.1.1.5.44 GIOPULDISD Register (Offset = ACh) [Reset = 00000000h]

GIOPULDISD is shown in Table 11-46.

Return to the Summary Table.

GIO pul disable for port D

Table 11-46. GIOPULDISD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU38	R/W	0h	Reserved
7-0	GIOPULDISD	R/W	0h	GIO pull disable for port D

11.1.1.5.45 GIOPSLD Register (Offset = B0h) [Reset = 00000000h]

GIOPSLD is shown in Table 11-47.

Return to the Summary Table.

11.1.1.6 I/O Control Summary

The behavior of the output buffer and the pull control is summarized in Table 11-88.

Table 11-88. Output Buffer and Pull Control Behavior for GIO Pins

Module under Reset?	Pin Direction (GIODIR)(1) (2)	Open Drain Enable (GIOPDR)(1)	Pull Disable (GIOPULDIS)(1) (3)	Pull Select (GIOPSL)(1) (4)	Pull Control	Output Buffer(5)
Yes	X	X	X	X	Enabled	Disabled
No	0	X	0	0	Pull down	Disabled
No	0	X	0	1	Pull up	Disabled
No	0	X	1	0	Disabled	Disabled
No	0	X	1	1	Disabled	Disabled
No	1	0	X	X	Disabled	Enabled
No	1	1	X	X	Disabled	Enabled

(1) X = Don't care
(2) GIODIR = 0 for input; = 1 for output
(3) GIOPULDIS = 0 for enabling pull control; = 1 for disabling pull control
(4) GIOPSL= 0 for pull-down functionality; = 1 for pull-up functionality
(5) If open drain is enabled, output buffer will be disabled if a high level (1) is being output.

11.1.2 Inter-Integrated Circuit (I2C) Module

This chapter describes the inter-integrated circuit (I2C or I^2C) module. The I2C is a multi-Target communication module providing an interface between the Texas Instruments (TI) microcontroller and devices compliant with Philips Semiconductor I^2C-bus specification version 2.1 and connected by an I2C-bus. This module will support any Controller or Target I2C compatible device.

11.1.2.1 Overview

The I2C has the following features:

- Compliance to the Philips (now NXP Semiconductors) I^2C bus specification, v2.1 (*The I 2 C Specification,* Philips document number 9398 393 40011)
  - Bit/Byte format transfer
  - 7-bit and 10-bit device addressing modes
  - General call
  - START byte
  - Multi-controller transmitter/target receiver mode
  - Multi-controller receiver/target transmitter mode
  - Combined controller transmit/receive and receive/transmit mode
  - Transfer rates of 10 kbps up to 400 kbps (Fast mode transfer rate)
- Free data format
- Two DMA events (transmit and receive)
- DMA event enable/disable capability
- Seven interrupts that can be used by the CPU
- Operates with VBUS frequency from 6.7 MHz up
- Operates with module frequency between 6.7 MHz and 13.3 MHz
- Module enable/disable capability
- The SDA and SCL are optionally configurable as general purpose I/O
- Slew rate control of the outputs
- Open drain control of the outputs
- Programmable pullup/pulldown capability on the inputs
- Supports Ignore NACK mode

The device has three instances of I2C called:

- MSS_I2CA

- RCSS_I2CA
- RCSS_I2CB

Note

This I2C module does **not** support:

- High-speed (HS) mode (only supports up to 400 kbps (Fast mode))
- C-bus compatibility mode
- The combined format in 10-bit address mode (the I2C sends the target address second byte every time it sends the target address first byte)

11.1.2.1.1 Introduction to the I2C Module

The I2C module supports any target or controller I2C-compatible device. Figure 11-6 shows an example of multiple I2C serial ports connected for a two-way transfer from one device to another device.

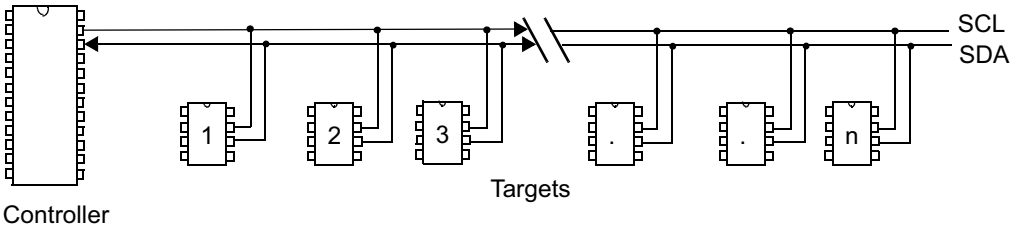

Figure 11-6. Multiple I2C Modules Connection Diagram

11.1.2.1.2 Functional Overview

The I2C module is a serial bus that supports multiple Controller devices. In multi Controller mode, one or more devices can be connected to the same bus and are capable of controlling the bus. Each I2C device on the bus is recognized by a unique address and can operate as either a transmitter or a receiver, depending on the function of the device. In addition to being a transmitter or receiver, a device connected to the I2C bus can also be considered a Controller or a Target when performing data transfers.

Note

A Controller device is the device that initiates the data transfer on a bus and generates the clock signal that permits the transfer. During the transmission, any device addressed by the Controller is considered the Target.

Data is communicated to devices interfacing to the I2C module using the serial data pin (SDA) and the serial clock pin (SCL) as shown in Figure 11-7. These two wires carry information between the device and the other devices connected to the I2C bus. Both SDA and SCL pins on the device are bidirectional. They must be connected to a positive supply voltage through a pull-up resistor. When the bus is free, both pins are high. The driver of these two pins has an open-drain configuration to perform the wired-AND function.

The device has a special mode that can be entered to ignore a NACK generated from non-compliant I2C devices that are incapable of generating an ACK.

The I2C module consists of the following Controller blocks:

- A serial Interface: one data pin (SDA) and one clock pin (SCL)
- The device register interface
  - Data registers to temporarily hold received data and transmitted data traveling between the SDA pin and the CPU or the DMA
  - Control and status registers
- A prescaler to divide down the input clock that is driven to the I2C module
- A peripheral bus interface to enable the CPU and DMA to access the I2C module registers

- An arbitrator to handle arbitration between the I2C module (when configured as a Controller) and another Controller
- Interrupt generation logic (interrupts can be sent to the CPU)
- A clock synchronizer that synchronizes the I2C input clock (from the system module) and the clock on the SCL pin, and synchronizes data transfers with controllers of different clock speeds.
- A noise filter on each of the two serial pins
- DMA event generation logic that synchronizes data reception and data transmission in the I2C module for DMA transmission

In Figure 11-7, the CPU or the DMA writes data for transmission to I2CDXR and reads received data from I2CDRR. When the I2C module is configured as a transmitter, data written to I2CDXR is copied to I2CXSR and shifted out one bit at a time. When the I2C module is configured as a receiver, received data is shifted into I2CRSR and then copied to I2CDRR.

When the I2C function is not needed, the pins may be controlled as general-purpose input/output (GPIO) pins. The I/O structure of each pin includes:

- programmable slew rate control of the outputs
- open drain mode
- programmable pull enable/disable on the input
- programmable pull up/pull down function on the input

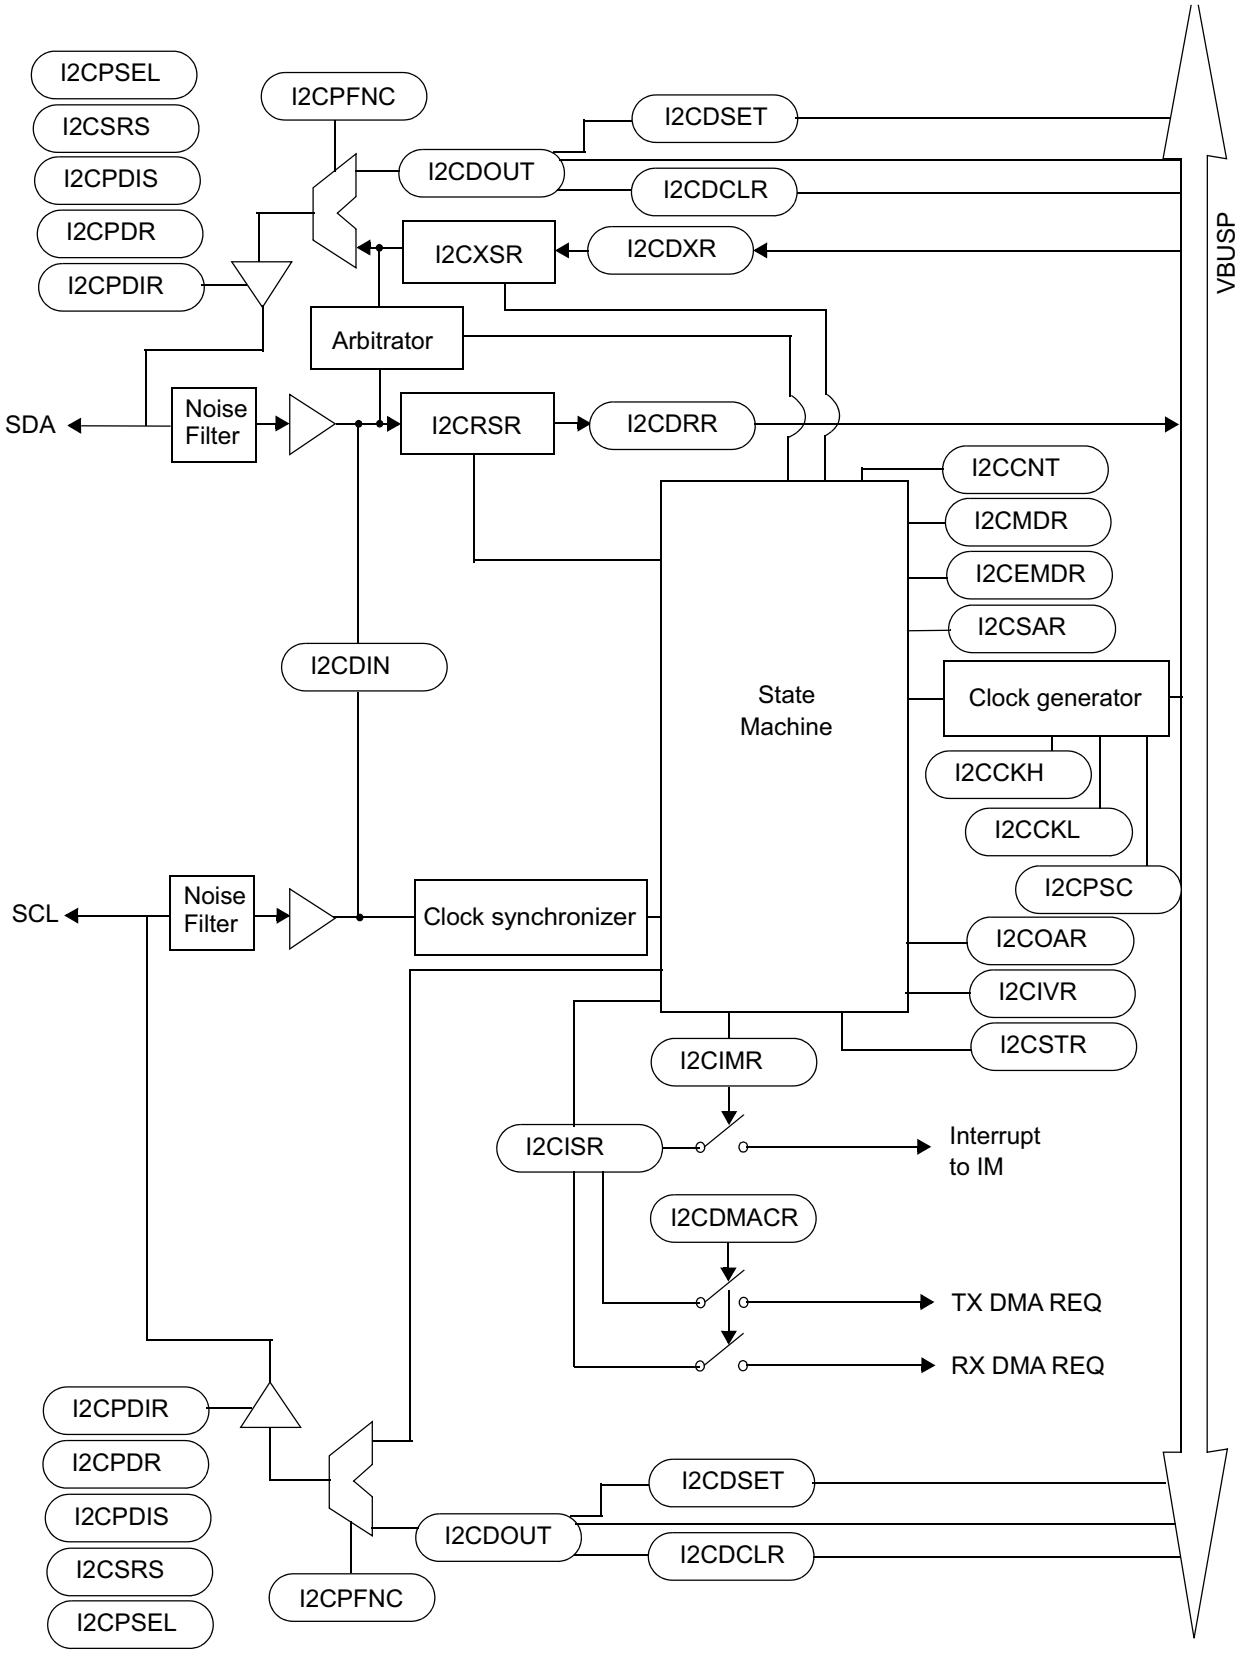

Figure 11-7. Simple I2C Block Diagram

11.1.2.1.3 Clock Generation

As shown in Figure 11-8, the I2C module uses the input clock generated from the device clock generator to generate the module clock and Controller clock. The I2C input clock is the device peripheral clock (VBUS_CLK). The clock is then divided twice more inside the I2C module to produce the module clock and the Controller clock.

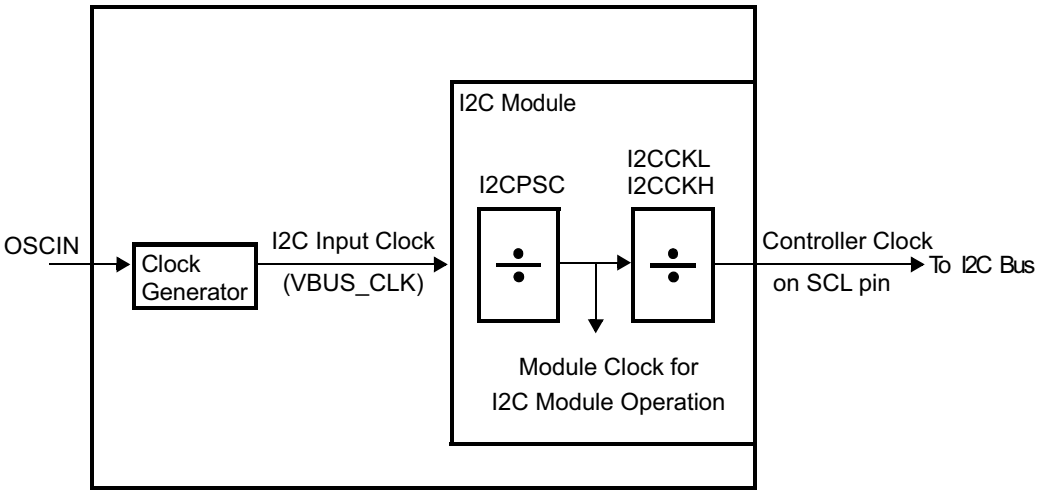

Figure 11-8. Clocking Diagram for the I2C Module

The module clock determines the frequency at which the I2C module operates. A programmable prescaler in the I2C module divides down the input clock to produce the module clock. To specify the divide-down value, initialize the I2CPSC field of the prescaler register, I2CPSC. The resulting frequency is:

$$ModuleClockFrequency - \frac{I2CInputClockFrequency}{(ICPSC + 1)} \quad (4)$$

The module clock frequency must be between 6.7MHz and 13.3MHz. The prescaler can only be initialized while the I2C module is in the reset state (IRS = 0 in I2CMDR). The prescaled frequency takes effect only when IRS is changed to 1. Changing the I2CPSC value while IRS = 1 has no effect.

The Controller clock appears on the SCL pin when the I2C module is configured to be a Controller on the I2C bus. This clock controls the timing of the communication between the I2C module and a secondary. As shown in Figure 11-8, a second clock divider in the I2C module divides down the module clock to produce the Controller clock. The clock divider uses the I2CCKL to divide down the low portion of the module clock signal and uses the I2CCKH to divide down the high portion of the module clock signal.

The resulting frequency is:

$$ControllerClockFrequency = \frac{ModuleClockFrequency}{(ICCLKL + d) + (ICCLKH + d)} \quad (5)$$

$$ControllerClockFrequency = \frac{I2CInputClockFrequency}{(ICPSC + 1)((ICCLKL + d) + (ICCLKH + d))} \quad (6)$$

where *d* depends on the value of I2CPSC:

I2CPSC	d
0	7
1	6

I2CPSC	d
Greater than 1	5

Note

The Controller clock frequency defined above does not include rise/fall time and latency of the synchronizer inside the module. The actual transfer rate will be slower than the value calculated from the formula above. Also, due to the nature of SCL synchronization, the SCL clock period could change if SCL synchronization is taking place.

11.1.2.2 I2C Module Operation

The following section discusses how the I2C module operates.

11.1.2.2.1 Input and Output Voltage Levels

One clock pulse is generated by the Controller device for each data bit transferred. Because of a variety of different technology devices that can be connected to the I2C-bus, the levels of logic 0 (low) and logic 1 (high) are not fixed and depend on the associated level of V_{CCIO}. For details, see the device specific data sheet.

11.1.2.2.2 I2C Module Reset Conditions

The I2C module can be reset in the following two ways:

- Through the global peripheral reset. A device reset causes a global peripheral reset.
- By clearing the $\overline{IRS}$ bit in the I2C mode register (I2CMDR). When the global peripheral reset is removed, the $\overline{IRS}$ bit is cleared to 0, keeping the I2C module in the reset state.

11.1.2.2.3 I2C Module Data Validity

The data on the SDA must be stable during the high period of the clock. See Figure 11-9. The high and low state of the data line, the SDA, can only change when the clock signal on the serial clock line (SCL) is low.

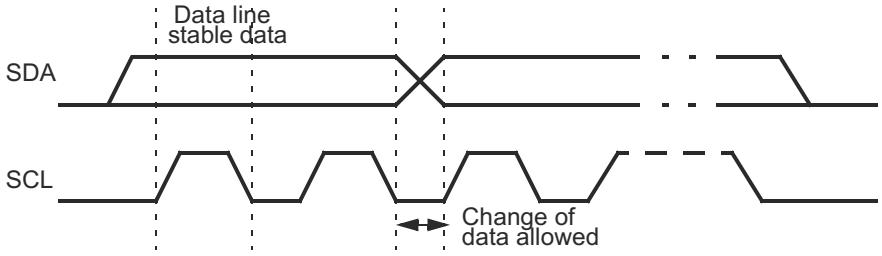

Figure 11-9. Bit Transfer on the I2C Bus

11.1.2.2.4 I2C Module Start and Stop Conditions

START and STOP conditions are generated by a primary I2C module.

- The START condition is defined as a high-to-low transition on the SDA line while SCL is high. A primary drives this condition to indicate the start of data transfer. The bus is considered to be busy after the START condition, and the bus busy bit (BB) in I2CSR is set to 1.
- The STOP condition is defined as a low-to-high transition on the SDA line while SCL is high. A primary drives this condition to indicate the end of data transfer. The bus is considered to be free after the STOP condition, therefore the BB bit in I2CSR is cleared to 0.

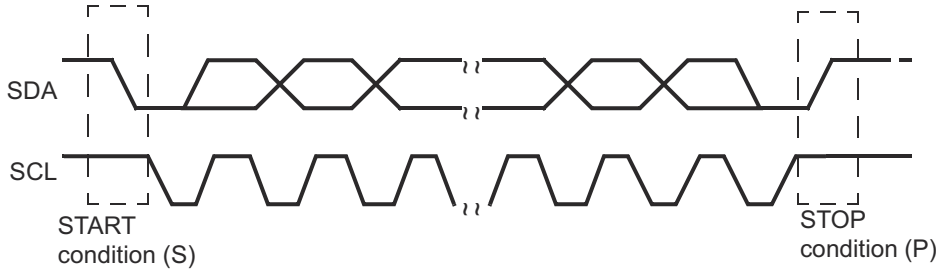

Figure 11-10. I2C Module START and STOP Conditions

For the I2C module to start a data transfer with a START condition, the primary mode bit (MST) and the START condition bit (STT) in the I2CMDR must both be set to 1. For the I2C module to end a data transfer with a STOP condition, the STOP condition bit (STP) must be set to 1. When the BB bit is set to 1 and the STT bit is set to 1, a repeated START condition is generated.

11.1.2.2.5 Serial Data Formats

The I2C module operates in byte data format. Each message put on the SDA line is 2 to 8-bits long. The number of messages that can be transmitted or received is unrestricted. The data is transferred with the most significant bit (MSB) first (Figure 11-11). Each message is followed by an acknowledge bit from the I2C if it is in receiver mode. The I2C module does not support little endian systems.

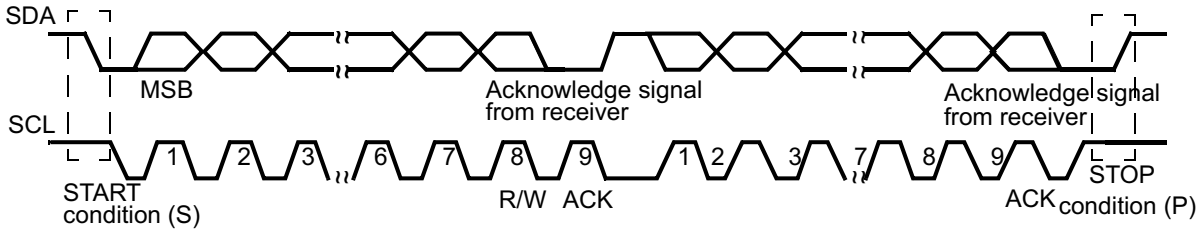

Figure 11-11. I2C Module Data Transfer

The first byte after a START condition (S) always consists of 8 bits that comprise either a 7-bit address plus the R/ $\overline{W}$ bit, or 8 data bits. The eighth bit, R/W, in the first byte determines the direction of the data. When the R/ $\overline{W}$ bit is 0, the Controller writes (transmits) data to a selected Target device; when the R/ $\overline{W}$ bit is 1, the Controller reads (receives) data from the Target device. In acknowledge mode, an extra bit dedicated for the acknowledgment (ACK) bit is inserted after each message.

The I2C module supports the following formats:

- 7-bit addressing format (Figure 11-12)
- 10-bit addressing format (Figure 11-13)
- 7-bit/10-bit addressing format with repeated START condition (Figure 11-14)
- Free-data format (Figure 11-15)

11.1.2.2.5.1 7-Bit Addressing Format

In the 7-bit addressing format (Figure 11-12), the first byte after the START condition consists of a 7-bit secondary address followed by the R/ $\overline{W}$ bit (in the LSB). The R/ $\overline{W}$ bit determines the direction of the data transfer:

- R/ $\overline{W}$ = 0: The primary writes (transmits) data to the addressed secondary.
- R/ $\overline{W}$ = 1: The primary reads (receives) data from the secondary.

An extra clock cycle dedicated for acknowledgement (ACK) is inserted after each byte. If the ACK is inserted by the secondary after the first byte from the primary, it is followed by n bits of data from the transmitter (primary or secondary, depending on the R/ $\overline{W}$ bit). The device I2C allows n to be a number between 2 to 8, programmable by the bit count (BC) field of I2CMDR. After the data bits have been transferred, the receiver inserts an ACK bit.

To select the 7-bit addressing format, write 0 to the expanded address enable (XA) bit of I2CMDR and make sure the free data format mode is off (FDF = 0 in I2CMDR).

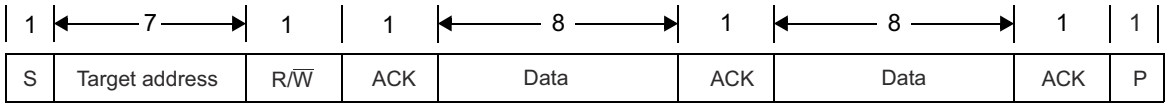

Figure 11-12. I2C Module 7-Bit Addressing Format

11.1.2.2.5.2 10-Bit Addressing Format

The 10-bit addressing format is similar to the 7-bit addressing format, but the primary sends the secondary address in two separate byte transfers. In the 10-bit addressing format (Figure 11-13), the first byte is 11110b, the two MSBs of the 10-bit secondary address, and the R/ $\overline{W}$ bit. The ACK bit is inserted after each byte. The second byte is the remaining 8 bits of the 10-bit secondary address. The secondary must send an acknowledgment after each of the two byte transfers. Once the primary has written the second byte to the secondary, the primary can either write data or use repeated a START condition to change the data direction.

To select the 10-bit addressing format, write 1 to the expanded address enable (XA) bit of I2CMDR and make sure the free data format mode is off (FDF = 0 in I2CMDR).

Figure 11-13. I2C Module 10-bit Addressing Format

11.1.2.2.5.3 Using the Repeated START Condition

At the end of each byte, the primary can drive another START condition (Figure 11-14). Using this capability, a primary can transmit/receive any number of data bytes before generating a STOP condition. The length of a data byte can be from 2 to 8 bits. The repeated START condition can be used with the 7-bit addressing, 10-bit addressing, or the free data formats.

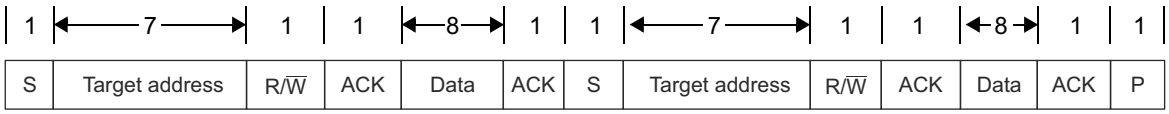

Figure 11-14. I2C Module 7-Bit Addressing Format with Repeated START

11.1.2.2.5.4 Free Data Format

In this format (Figure 11-15), the first byte after a START condition is a data byte. The ACK bit is inserted after each byte, followed by another 8 bits of data. No address or data direction bit is sent. Therefore, the transmitter and receiver must both support the free data format. The direction of data transmission (transmit or receive) remains constant throughout the transfer.

To select the free data format, write a 1 to the free data format (FDF) bit of the I2CMDR. The free data format is not supported in the digital loop back mode.

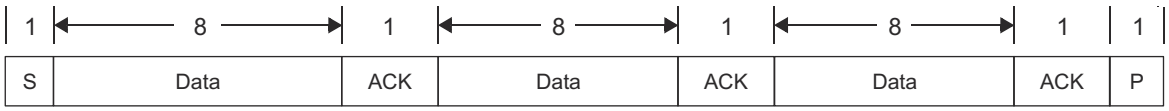

Figure 11-15. I2C Module in Free Data Format

11.1.2.2.6 NACK Bit Generation

When the I2C module is a receiver (Controller or Target), it can acknowledge or ignore bits sent by the transmitter. To ignore any new bits, the I2C module must send a no-acknowledge (NACK) bit during the acknowledge cycle on the bus. Table 11-89 summarizes the various ways a NACK can be generated.

Table 11-89. Ways to Generate a NACK Bit

I2C Module Condition	Basic NACK Bit Generation Options	Additional Option
Target receiver mode	Disable data transfers (STT = 0) Allow an overrun condition (RSFULL = 1) Reset the module (IRS = 0)	Set the NACKMOD bit before the rising edge of the last data bit you intend to receive.
Controller receiver mode and repeat mode (RM = 1)	Generate a STOP condition (STP = 1) Reset the module (IRS = 0)	Set the NACKMOD bit before the rising edge of the last data bit you intend to receive.
Controller receiver mode with non-repeat mode (RM = 0)	If STP = 1, allow the internal data counter to count down to 0 and thus force a STOP condition. If STP = 0, make STP = 1 to generate a STOP condition. Reset the module (IRS = 0)	Set the NACKMOD bit before the rising edge of the last data bit you intend to receive.

In some applications, the Target cannot generate the ACK signal. If the IGNACK bit is set in the I2CEMDR register, the resulting NACK will be ignored and the I2C block will continue the data transfer.

11.1.2.3 I2C Operation Modes

11.1.2.3.1 Controller Transmitter Mode

All primaries begin in this mode. The I2C module is a Controller and transmits control information and data to a Target. In this mode, data assembled in any of the addressing formats shown in Figure 11-12, Figure 11-13, or Figure 11-14 is shifted out onto the SDA pin and synchronized with the self-generated clock pulses on the SCL pin. The clock pulses are inhibited and the SCL pin is held low when the intervention of the device is required ($\overline{\text{XSMT}}$ = 0) after a byte has been transmitted.

Note

If the I2C is configured for two simultaneous Controller transmissions, wait until the MST and BB have been reset before performing the second Controller transmission.

Failure to wait for the MST and BB to reset will prevent the start condition on the second transfer from being issued and the bus BB will not be set. Typically the end of the first transfer is handled by polling BB. However, the MST bit is not reset at the same instant as the BB bit. As a result, when the second Controller transmission is initiated before the resetting of the MST, the MST bit for the second transfer is reset. This prevents the I2C from recognizing itself as the Controller, thus failing to occupy the bus.

11.1.2.3.2 Controller Receiver Mode

In this mode, the I2C module is a Controller and receives data from a Target. This mode can only be entered from the Controller transmitter mode (the I2C module must first transmit a command to the Target). In any of the addressing formats shown in Figure 11-12, Figure 11-13, or Figure 11-14, the Controller receiver mode is entered after the Target address byte and the R/ $\overline{\text{W}}$ bit have been transmitted (if the R/ $\overline{\text{W}}$ bit is 1). Serial data bits received on the SDA pin are shifted in with the self-generated clock pulses on the SCL pin. The clock pulses are inhibited and the SCL is held low when the intervention of the device is required (RSFULL = 1) after a byte has been received. At the end of the transfer, the Controller-receiver signals the end of data to the Target-transmitter by not generating an acknowledge on the last byte that was clocked out of the Target. The Target-transmitter then releases the data line allowing the Controller-receiver to generate a STOP condition or a repeated START condition.

In many applications, the size of the message is in the initial bytes of the message itself. Since the size of the message is not known to the Controller before the transmission/reception starts, the Controller must use the repeat mode to force the stop condition when the reception is completed. The repeat mode is enabled by setting the RM bit to 1. Due to the double buffer implementation on the receive side, the Controller must generate the stop condition (STP =1) after reading the (message size - 1)th data.

11.1.2.3.3 Target Transmitter Mode

In this mode, the I2C module is a Target and transmits data to a Controller. This mode can only be entered from the Target receiver mode (The I2C module must first receive a command from the Controller). In any of the addressing formats shown in Figure 11-12, Figure 11-13, or Figure 11-14, the Target transmitter mode is entered if the Target address byte is the same as its own address and the R/ $\overline{\text{W}}$ bit has been transmitted (if the R/ $\overline{\text{W}}$ bit is set to 1). The Target transmitter shifts the serial data out on the SDA pin with the clock pulses that are generated by the Controller device. The Target device does not generate the clock, but it can hold the SCL pin low when intervention of the device is required ($\overline{\text{XSMT}}$ = 0) after a byte has been transmitted.

11.1.2.3.4 Target Receiver Mode

In this mode, the I2C module is a Target and receives data from a Controller. All Target begin in this mode. Serial data bits received on the SDA pin are shifted in with the clock pulses that are generated by the Controller device. The Target device does not generate the clock, but it can hold the SCL pin low while intervention of the device is required (RSFULL = 1) after a byte has been received.

11.1.2.3.5 Free Run Mode

The I2C module can be placed in free run mode when the FREE bit (I2CMDR.14) is set to 1. This bit is primarily used on an emulator when encountering a break point while debugging software. When the FREE bit is set to

0, the I2C responds differently depending on whether the SCL is high or low. If the SCL is low, the I2C stops immediately and keeps driving the SCL low whether the I2C is the Controller transmitter or receiver. If the SCL is high, the I2C waits until the SCL becomes a low and then stops. If the I2C is a Target, it stops when the transmission/reception completes.

11.1.2.3.6 Ignore NACK Mode

The I2C module can be placed in the ignore NACK mode by setting the IGNACK bit in the I2CEMDR register. This mode allows an I2C module that is configured as a Controller transmitter to ignore a NACK from a Target device that is not capable of generating a proper ACK signal.

11.1.2.4 I2C Module Integrity

The following section discusses how the I2C module maintains priorities and order among signals and commands.

11.1.2.4.1 Arbitration

If two or more Controller transmitters simultaneously start a transmission on the same bus, an arbitration procedure is invoked. Figure 11-16 illustrates the arbitration procedure between two devices. The arbitration procedure uses the data presented on the SDA bus by the competing transmitters. The first Controller transmitter that generates a high is overruled by the other Controller that generates a low. The arbitration procedure gives priority to the device that transmits the serial data stream with the lowest binary value. The Controller transmitter that loses the arbitration switches to the Target receiver mode, sets the arbitration lost (AL) flag, and generates the arbitration-lost interrupt. The data transmitted by the other Controller module is salvaged, and the I2C continues to receive data from the Controller module. Should two or more devices send identical first bytes, arbitration continues on the subsequent bytes.

If, during a serial transfer, the arbitration procedure is still in progress when a repeated START condition or STOP condition is transmitted to I2C bus, the Controller transmitters involved must send the repeated START condition or STOP condition at the same position in the format frame. In other words, arbitration is not allowed between:

- A repeated START condition and a data bit
- A STOP condition and a data bit
- A repeated START condition and a STOP condition

Secondarys are not involved in the arbitration procedure.

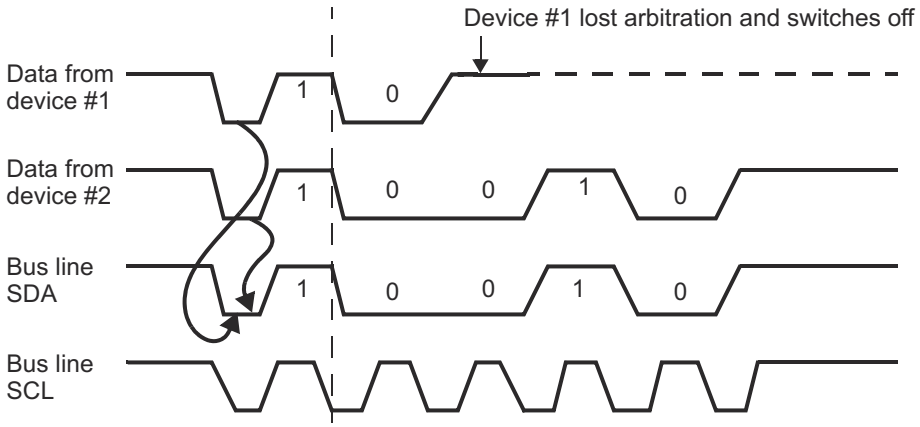

Figure 11-16. Arbitration Procedure Between Two Controller Transmitters

11.1.2.4.2 I2C Clock Generation and Synchronization

Under normal conditions only one Controller device generates the clock signal; the SCL. During the arbitration procedure, however, there are two or more Controller devices and the clock must be synchronized so that the data output can be compared. Figure 11-17 illustrates clock synchronization. The wired-AND property of the SCL line means that a device that first generates a low period on the SCL overrules the other devices. At this high-to-low transition, the clock generators of the other devices are forced to start their own low period. The SCL line is held low by the device with the longest low period. The other devices that finish their low periods must wait for the SCL line to be released before starting their high periods. A synchronized signal on the SCL is obtained where the slowest device determines the length of the low period and the fastest device determines the length of the high period.

If a device pulls down the clock line for a longer time, the result is that all clock generators must enter the wait state. In this way, a Target slows down a fast Controller and the slow device creates enough time to store a received byte or to prepare a byte to be transmitted.

Note

I2C Protocol Fault

The following conditions violate the clock spec as defined in the Philips I^2C bus specification, v2.1 (*The I 2 C Specification,* Philips document number 9398 393 40011), and will result in an I2C protocol fault: I2CCLKH = 2 I2CCLKL = 2I2CPSC = 2. This will cause the SDA data transition to occur while the SCL is high.

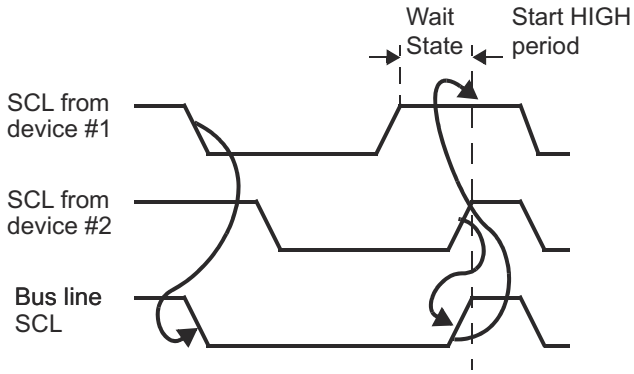

Figure 11-17. Synchronization of Two I2C Clock Generators During Arbitration

11.1.2.4.3 Prescaler

The I2C module is operated by the module clock. This clock is generated by way of the I2C prescaler block. The prescaler block consists of a 8-bit register, I2CPSC, used for dividing down the device peripheral clock (VBUS_CLK) to obtain a module clock between 6.7 MHz and 13.3 MHz.

11.1.2.4.4 Noise Filter

The noise filter is used to suppress any noises that are 50ns or less. It is designed to suppress noise with one module clock, assuming the lower and upper limits of the module clock are 6.7MHz and 13.3MHz, respectively.

11.1.2.5 Operational Information

The following section provides specific information about how the I2C module operates.

11.1.2.5.1 I2C Module Interrupts

The I2C module generates seven types of interrupts. These seven interrupts are accompanied with seven interrupt mask bits in the interrupt mask register (I2CIMR) and with seven interrupt flag bits in the status register (I2CSR).

11.1.2.5.1.1 I2C Interrupt Requests

The I2C module generates the interrupt requests described below. All requests are multiplexed through an arbiter into a single I2C interrupt request to the CPU. Each interrupt request has a flag bit and an enable bit. Interrupts must be enabled prior to the occurrence of the expected interrupt condition. When one of the specified events occurs, the flag bit is set. If the corresponding enable bit is 0, the interrupt request is blocked. If the enable bit is 1, the interrupt request is forwarded to the CPU as an I2C interrupt request. As an alternative, the CPU can poll all of the bits shown in Table 11-90.

Table 11-90. Interrupt Requests Generated by I2C Module

Flag	Name	Generated
AL	Arbitration-lost interrupt	Generated when the I2C module has lost an arbitration contest with another Controller-transmitter
NACK	No-acknowledge interrupt	Generated when the Controller I2C does not receive an acknowledge from the receiver
ARDY	Register-access-ready interrupt	Generated when the previously programmed address, data and command have been performed and the status bits have been updated. The interrupt is used to notify the device that the I2C registers are ready to be accessed.
RXRDY	Receive-data-ready interrupt	Generated when the received data in the receive-shift register (I2CSR) has been copied into the data receive register (I2CDRR). The RXRDY bit can also be polled by the device to determine when to read the received data in the I2CDRR.
TXRDY	Transmit-data-ready interrupt	Generated when the transmitted data has been copied from the data transmit register (I2CDXR) into the transmit-shift register (I2CXSR). The TXRDY bit can also be polled by the device to determine when to write the next data into I2CDXR.
SCD	Stop-condition-detect interrupt	Generated when a STOP condition has been detected.
AAS	Address-as-Target interrupt	Generated when the I2C has recognized its own Target address or an address of all zeroes.

11.1.2.5.2 DMA Controller Events

The I2C module has two events that use the DMA controller to synchronously read received data (I2CREVNT) from I2CDRR, and synchronously write data (I2CWEVNT) to the transmit buffer, I2CDXR. The read and write events have the same timing as I2CRRDY (I2CRINT) and I2CXRDY (I2CXINT), respectively.

The CPU or the DMA controller reads the received data from I2CDRR and writes the data to be transmitted to I2CDXR. The RXRDY bit is automatically cleared when the DMA controller reads the I2CDRR register, and the TXRDY bit is automatically cleared when the DMA controller writes to the I2CDXR register.

Data written to I2CDXR is copied to I2CXSR and shifted out from the SDA pin when the I2C module is configured as a transmitter. When the I2C module is configured as a receiver, received data is shifted into ICRSR and copied to I2CDRR, which can be read by the CPU or the DMA controller.

A transmit event (I2CWEVNT) is generated after a START condition in Controller transmitter mode. This ensures that the DMA gets an event even if no Target returns an ACK to the Target address following the START condition.

Note

Unexpected DMA transmit and receive event

An unexpected DMA transmit event (ICXEVT) and a DMA receive event (ICXRDY) are generated in 10-bit, Controller transmit, repeat mode. This event occurs soon after the start condition but before the first bit of the address is transmitted. In this event, no DMA activity should be initiated without the Target ACK being received.

11.1.2.5.3 I2C Enable/Disable

The I2C module can be enabled or disabled with the I2C reset enable bit (IRS) in the I2C module register (I2CMDR). This occurs in one of two ways:

- Write 0 to the I2C reset bit (IRS) in I2CMDR. All status bits are forced to the default values and the I2C mode remains disabled until IRS is changed to 1. The SDA and SCL pins are in the high impedance state.
- Initiate a device reset by driving the $\overline{\text{PORRST}}$ pin low. The entire device is reset and is held in the reset state until the pin is released and is driven high. When $\overline{\text{PORRST}}$ is released, all I2C module registers are reset to their default values. The IRS bit is forced to 0, which resets the I2C module. The I2C module stays in the reset state until a 1 is written to the IRS bit.

IRS must be 0 while the I2C module is being configured. Forcing IRS to 0 can be used to save power and also clear error conditions.

11.1.2.5.4 General Purpose I/O

Both of the I2C pins can be programmed to be general-purpose I/O pins via the I2C pin control registers (I2CPFNC, I2CDIR, I2CDOUT, and I2CDIN).

When the I2C module is not used, the I2C pins may be programmed to be either general purpose input or general-purpose output pins. This function is controlled in the I2CDIR and I2CPFNC registers. Note that each pin can be programmed to be either an I2C pin or a GIO pin.

If the I2C function is to be used, the application software must ensure that each pin is configured as an I2C pin and not a GIO pin, or else unexpected behavior may result.

11.1.2.5.5 Pull Up/Pull Down Function

I2C module pins can have either an active pull up or active pull down that makes it possible to leave the pins unconnected externally. The pins can be programmed to have the active pull function enabled or disabled by writing to the corresponding bit in the I2CPDIS register. Please see the device-specific data sheet for the default internal pull (pull-up, pull-down or no pull) on the pins.

The pull on the pins is programmable to a setting other than the default internal pull as specified in the data sheet. The pins can be programmed to have either an active pull up or an active pull down function by writing to the corresponding bit in I2CPSEL register. The pull up/pull down function is active on the pin only when the pull enabled is programmed in the I2CPDIS register.

The pull up/pull down functions are deactivated when a bidirectional pin is configured as an output. At system reset, the pull up function of all the pins is enabled. Please see the device-specific data sheet for the current supplied by the pull up/pull down.

11.1.2.5.6 Open Drain Function

The I2C pins can be programmed to include an open drain function when they are configured as output pins. This is done by writing to the corresponding bit of the I2CPDR register. When the open drain function is enabled, a low value (0) written to the data output register forces the pin to a low output voltage (V_{OL} or lower), whereas a high value (1) written to the data output register forces the pin to a high-impedance state. The open drain function is disabled when the pin is configured as an input pin.

11.1.2.6 MSS_I2C Registers

Table 11-91 lists the memory-mapped registers for the MSS_I2C registers. All register offset addresses not listed in Table 11-91 should be considered as reserved locations and the register contents should not be modified.

Table 11-91. MSS_I2C Registers

Offset	Acronym	Register Name	Section
0h	ICOAR	ICOAR	Go
4h	ICIMR	ICIMR	Go
8h	ICSTR	ICSTR	Go
Ch	ICCLKL	ICCLKL	Go
10h	ICCLKH	ICCLKH	Go
14h	ICCNT	ICCNT	Go

Complex bit access types are encoded to fit into small table cells. Table 11-92 shows the codes that are used for access types in this section.

Table 11-92. MSS_I2C Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

11.1.2.6.1 ICOAR Register (Offset = 0h) [Reset = 00000000h]

ICOAR is shown in Table 11-93.

Return to the Summary Table.

I2C Own Address register

Table 11-93. ICOAR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	NU	R/W	0h	Reserved
9-0	A9_A0	R/W	0h	Own address. Use in both 7- and 10-bit address mode. Note that usercan program the I2C own address to any value as long as it does notconflict with other components in the system.

11.1.2.6.2 ICIMR Register (Offset = 4h) [Reset = 00000000h]

ICIMR is shown in Table 11-94.

Return to the Summary Table.

I2C Interrupt Mask/Status register

Table 11-94. ICIMR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	NU	R/W	0h	Reserved
6	AAS	R/W	0h	Address As Slave interrupt mask bit. Setting a"1" to this bit unmasks the Address As Slave interrupt. Setting a"0" to this bit masks the Address As Slave interrupt.
5	SCD	R/W	0h	Stop Condition Detection mask bit. Setting a"1" to this bit unmasks the Stop Condition Detection interrupt. Setting a "0" to this bit masks the Stop Condition Detection interrupt.
4	ICXRDY	R/W	0h	Transmit Data Ready interrupt mask bit. Setting a"1" to this bit unmasks the Transmit Data Ready interrupt. Setting a"0" to this bit masks the Transmit Data Ready interrupt.
3	ICRRDY	R/W	0h	Receive Data Ready interrupt mask bit. Setting a"1" to this bit unmasks the Receive Data Ready interrupt. Setting a"0" to this bit masks the Receive Data Ready interrupt.
2	ARDY	R/W	0h	Register access ready interrupt mask bit. Setting a"1" to this bit unmasks the Register access ready interrupt. Setting a"0" to this bit masks the Register access ready interrupt.
1	NACK	R/W	0h	No Acknowledgement interrupt mask bit. Setting a"1" to this bit unmasks the No Acknowledgement interrupt. Setting a"0" to this bit masks the No Acknowledgement interrupt.
0	AL	R/W	0h	Arbitration Lost interrupt mask bit. Setting a"1" to this bit unmasks the Arbitration Lost interrupt. Setting a"0" to this bit masks the Arbitration Lost interrupt.

11.1.2.6.3 ICSTR Register (Offset = 8h) [Reset = 00000000h]

ICSTR is shown in Table 11-95.

Return to the Summary Table.

I2C Interrupt Status register

Table 11-95. ICSTR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	NU2	R/W	0h	Reserved
14	SDIR	R/W	0h	Slave Direction. This bit is clear to '0' indicating the I2C is a master transmitter/ receiver or a slave receiver. This bit is also clear by STOP condition or START condition. It is set to '1' when the I2C slave is a transmitter. In DLB mode (which the configuration should be master-transmitter slave-receiver) this bit is clear to '0'. Writing a"1" to this bit to clear it.
13	NACKSNT	R/W	0h	A No Acknowledge is sent due to NACKMOD is set to a"1". NACKSNT = 0: A No Acknowledge is not sent. NACKSNT = 1: A No Acknowledge is sent. Writing a"1" to this bit to clear it.
12	BB	R/W	0h	Bus Busy. This bit indicates the state of the serial bus. BB= 0: The bus is free. BB= 1: The bus is occupied. On reception of a"start" condition the device sets BB to 1. This bit is also set if the I2C detects SCL low state. BB is clear to 0 after reception of a"stop" condition. BB is kept to"0" regardless SCL state when the I2C is in reset (IRS_=0). If the IRS_ is set to"1" during transaction between other I2C devices the BB bit is set at the first falling edge of SCL or START condition. - (RW)
11	RSFULL	R/W	0h	Receive shift full. This bit indicates whether the receiver has experienced overrun. Overrun occurs when the receive shift register (ICRSR) is full and ICDRR has not been read since the ICRSR-to-ICDRR transfer. The FSM is holding for ICDRR read access. RSFULL is clear when reading the ICDRR. RSFULL is set to"1" when the I2C has recognized an overrun. The contents of ICDRR are NOT lost in this case. In repeat mode since double buffer (ICRSR and ICDRR) behaves like a single buffer RSFULL is set to"1" every time the data is received. RSFULL is clear as a result of reading the ICDRR. - (RW)
10	XSMT	R/W	0h	Transmit shift empty not. This bit indicates whether the transmitter has experienced underflow. Underflow occurs when the transmit shift register (ICXSR) is empty and ICDXR has not been loaded. The FSM is holding for ICDXR write access. XSMT_ is cleared when underflow has occurred. XSMT_ is set to"1" as a result of writing to ICDXR. In repeat mode if the I2C in master transmitter mode is holding transfer with XSMT_=0 (i.e. waiting for further action) and the STT or STP bit is set XSMT_ is set to"1" by hardware.

Table 11-95. ICSTR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	AAS	R/W	0h	Address As Slave. This bit is set to 1 by the device when it has recognized its own slave address or an address of all (8) zeros. The AAS bit is reset by stop condition or detection of any address byte that does not match ICOAR. - (RW)
8	AD0	R/W	0h	Address Zero Status: This bit is set to 1 by device if it detects the address of all (8) zeros (i.e. general call). The AD0 bit is reset to 0 (default value) when a"start" or"stop" condition is detected. - (RW)
7-6	NU1	R/W	0h	Reserved
5	SCD	R/W	0h	Stop Condition Detection bit SCD is set when the I2C sends or receives STOP condition. This bit is cleared by reading ICIVR (as 110) or writing '1' to itself.
4	ICXRDY	R/W	0h	Transmit Data Ready interrupt flag bit. ICXRDY is set to"1" is generated when the transmitted data has been copied from ICDXR to the transmit-shift register (ICXSR). ICRXDY is clear to"0" when the ICDXR is written. This bit can also be polled by the CPU to write a new transmitted data into the ICDXR. Write '1' to this bit will set it and DXR Write will clear it.
3	ICRRDY	R/W	0h	Receive Data Ready interrupt flag bit. ICRRDY is set to"1" when the received data has been copied from ICRSR into the ICDRR. ICRRDY is cleared to"0" when the ICDRR is read. This bit can also be polled by the CPU to read the received data in the ICDRR. Write '1' or DRR Read will clear it.
2	ARDY	R/W	0h	Register-access-ready interrupt flag bit. ARDY is generated by the hardware if the I2C is in the master mode when the previously programmed data and command has been performed and status bit has been updated. This flag is used by the CPU to let it knows that the I2C registers are ready to be accessed again. When RM=0 ARDY is set when the internal data count is passed 0 if STP register bit has not been set. When RM=1 ARDY is set at each byte end. If the I2C is in FDF mode(FDF=1) ARDY is set just after Start condition. This bit is automatically cleared by hardware when writing data to ICDXR in transmit mode reading data from ICDRR in receive mode or setting STT or STP bit. Write '1' will clear it.
1	NACK	R/W	0h	No-Acknowledgement interrupt flag bit. The No Acknowledge flag bit is set when the hardware in "master" mode detects no acknowledge has been received. This bit is NOT set by no-acknowledgement after Start byte Write '1' or Read the ICIVR (as 010) will clear it.
0	AL	R/W	0h	Arbitration-Lost interrupt flag bit. The Arbitration Lost flag bit is set to 1 when the device in the "master" mode senses it has lost an arbitration when two or more transmitters start a transmission almost simultaneously or when the I2C attempts to start a transfer while BB (bus busy) is 1. When this is set to 1 due to arbitration lost the MST/STT/STP bits are clear the I2C becomes a slave. Write '1' or Read the ICIVR (as 001) will clear it.

11.1.2.6.4 ICCLKL Register (Offset = Ch) [Reset = 00000000h]

ICCLKL is shown in Table 11-96.

Return to the Summary Table.

I2C Clock Divider Low register

Table 11-96. ICCLKL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU	R/W	0h	Reserved
15-0	ICCL15_ICCL0	R/W	0h	Low time I 2 C SCL Clock Division Factor. They are used to divide down the master clock to create the SCL low time transition frequency. This register must be configured while the I2C is still in reset (IRS_=0).

11.1.2.6.5 ICCLKH Register (Offset = 10h) [Reset = 00000000h]

ICCLKH is shown in Table 11-97.

Return to the Summary Table.

I2C Clock Divider High register

Table 11-97. ICCLKH Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU	R/W	0h	Reserved
15-0	ICCH15_ICCLH0	R/W	0h	High time I 2 C SCL Clock Division Factor. They are used to divide down the master clock to create the SCL high time transition frequency. This register must be configured while the I2C is still in reset (IRS_=0).

11.1.2.6.6 ICCNT Register (Offset = 14h) [Reset = 00000000h]

ICCNT is shown in Table 11-98.

Return to the Summary Table.

I2C Data Count register

Table 11-98. ICCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU	R/W	0h	Reserved
15-0	ICDC15_ICDC0	R/W	0h	Data count. This data count register is used to generate a Stop condition if a Stop condition is specified (STP=1). . ICCNT=1 data count is 1 :: :: ICCNT=0FFFFh data count is 65535 ICCNT=0data counter is 65536 Note that ICCNT is a don"t care when RM is set to 1.

11.1.2.6.7 ICDRR Register (Offset = 18h) [Reset = 00000000h]

ICDRR is shown in Table 11-99.

Return to the Summary Table.

I2C Data Receive register

Table 11-99. ICDRR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU	R/W	0h	Reserved
7-0	D7_D0	R/W	0h	Receive data

11.1.2.6.8 ICSAR Register (Offset = 1Ch) [Reset = 00000000h]

ICSAR is shown in Table 11-100.

Return to the Summary Table.

I2C Slave Address register

Table 11-100. ICSAR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	NU	R/W	0h	Reserved
9-0	A9_A0	R/W	0h	Slave address. Use in both 7- and 10-bit address mode.

11.1.2.6.9 ICDXR Register (Offset = 20h) [Reset = 00000000h]

ICDXR is shown in Table 11-101.

Return to the Summary Table.

I2C Data Transmit register

Table 11-101. ICDXR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU	R/W	0h	Reserved
7-0	D7_D0	R/W	0h	Transmit data

11.1.2.6.10 ICMDR Register (Offset = 24h) [Reset = 00000000h]

ICMDR is shown in Table 11-102.

Return to the Summary Table.

I2C Mode register

Table 11-102. ICMDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU2	R/W	0h	Reserved
15	NACKMOD	R/W	0h	No Acknowledge (NACK) mode. This bit is used to send an Acknowledge (ACK) or a No Acknowledge (NACK) to the transmitter. This bit is only applicable when the I2C is in receiver mode. In master receiver mode when the internal data count counter decrements to zero the I2C sends a NACK. The master receiver I2C finishes a transfer when it sends a NACK. The I2C ignores ICCNT when NACKMOD is '1'. The NACKMOD bit should be set before the rising edge of the last data bit (bit 8) if a NACK must be sent and this bit is cleared once a NACK has been sent. NACKMOD=0 the I2C sends an ACK to the transmitter during the acknowledge cycle. NACKMOD=1 the I2C sends a NACK to the transmitter during the acknowledge cycle.
14	FREE	R/W	0h	Free Running. This bit is used to determine the state of the I2C when a breakpoint is encountered in the HLL debugger. FREE= 0: (default) Stops immediately if SCL is low and keep driving SCL low whether I2C is master transmitter/receiver. If SCL is high I2C waits until SCL becomes low and then stops. If the I2C is a slave it will stop when the transmission/receiving completes. FREE= 1: The I2C runs free.
13	STT	R/W	0h	Start Condition (Master only mode). This bit can be set to a"1" by the CPU to generate a Start condition. In master mode when setting Start to"1" generates a Start condition. It is reset to "0" by the hardware after the Start condition has been generated. The Start/Stop bits can be configured to generate different transfer formats. Note that the STT and STP can be used to terminate the repeat mode. STT STP Conditions Bus Activities 1 0 Start S-A-D 0 1 Stop P 1 1 Start-Stop (ICCNT= n) S-A-D..(n)..D-P 1 0 Start (ICCNT= n) S-A-D..(n)..D
12	NU1	R/W	0h	Reserved for IDLEEN (IDLE Enable on 5509). - (RW)
11	STP	R/W	0h	Stop Condition (Master mode only). This bit can be set to a"1" by the CPU to generate a Stop condition. It is reset to "0" by the hardware after the Stop condition has been generated. The Stop condition is generated when ICCNT passes 0 when the I2C is in non-repeat mode(RM=0).

Table 11-102. ICMDR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	MST	R/W	0h	Master. MST= 0: The I 2 C peripheral is in the"slave" mode and clock is received from the"master" device. MST= 1: The I 2 C peripheral is in the"master" mode and it generates the clock. This bit is clear when the transfer completed.
9	TRX	R/W	0h	Transmitter. TRX= 0: The I 2 C is in the"receiver" mode and data on data line SDA is shifted into the data register ICDRR. TRX= 1: The I 2 C is in the"transmitter" mode and the data in ICDXR is shifted out on data line SDA. The operating modes (not in FDF mode) are defined as follows. In FDF mode TRX must be configured even if the I2C is in slave mode because there is no address/direction byte in FDF mode. _____ MST___TRX___Operating Modes _0_____x_____"slave receiver" _0_____x_____"slave transmitter" _1_____0_____"master receiver" _1_____1_____"master transmitter" _____
8	XA	R/W	0h	Expanded Address. XA= 0: (default) 7-bit address mode (normal address mode). XA= 1: 10-bit address mode (expanded address mode) Please note that XA needs to be configured even if the I2C is in slave mode.
7	RM	R/W	0h	Repeat Mode. This bit is set to a"1" by the CPU to put the I2C in the repeat mode. In this mode data is continuously transmitted out of the ICDXR until the STP bit is set to"1" regardless of ICCNT value. This bit is don"t care if the I2C is configured in slave mode. _____ __ RM___STT___STP___Conditions_____Bus Activities_____Mode _0_____0_____0_____Idle_____None_____NA _0_____0_____1_____Stop_____P_____NA _0_____1_____0_____(Re)Start_____S-A-D..(n)..D____Repeat n _0_____1_____1_____(Re)Start-Stop___S-A-D..(n)..D-P__Repeat n _1_____0_____0_____Idle_____none_____NA _1_____0_____1_____Stop_____P _____NA _1_____1_____0_____(Re)Start_____S-A-D-D-D..____Continuous _1_____1_____1_____Reserved_____None_____NA _____ __
6	DLB	R/W	0h	Digital Loop Back (in master transmit mode only). This bit is set to a"1" by the CPU to put the I2C in the loop back mode. In this mode data transmitted out of the ICDXR will be received in the ICDRR after ((CPU freq/I2C freq)8) CPU cycles via an internal path. The address of the ICOAR is output on SDA.
5	IRS	R/W	0h	I2C Reset Not. This can be set to a"0" by the CPU to put the I2C in reset or to a"1" to take the I2C out of reset. When this bit is reset to 0 all status bits in ICSTR and ICIVR are set to default values. Note that if this bit is reset during a transfer it can cause the I2C bus hang (SDA and SCL are tri-stated).

Table 11-102. ICMDR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	STB	R/W	0h	Start Byte (Master only mode). The Start Byte mode bit is set to 1 by the CPU to configure the I2C in Start byte mode the I2C sends "00000001" regardless ICSAR value. Refer to the Philip I2C spec for more details.
3	FDF	R/W	0h	Free Data Format. This bit can be set to"1" by the CPU to configure the I2C in Free Data Format mode. _____ FDF___MST___TRX_____Operating mode _0_____0_____x____Slave in non FDF mode _0_____1_____0____Master receive in non FDF mode _0_____1_____1____Master transmit in non FDF mode _1_____0_____0____Slave receiver in FDF mode _1_____0_____1____Slave transmitter in FDF mode _1_____1_____0____Master receiver in FDF mode _1_____1_____1____Master transmitter in FDF mode _____
2-0	BC2_BC1_BC0	R/W	0h	Bit Count : Bit Count 2, Bit Count 1 and Bit Count 0 define the number of bits starting from the lsb (excluding the acknowledge bit) of the next byte which are yet to be received or transmitted. _____ BC2_BC1_BC0__Bits/byte in FDF__Bits/byte w/ ACK _0___0___1_____NA (reserved)____ NA (reserved) _0___1___0_____2_____3_____ _0___1___1_____3_____4_____ _1___0___0_____4_____5_____ _1___0___1_____5_____6_____ _1___1___0_____6_____7_____ _1___1___1_____7_____8_____ _0___0___0_____8_____9_____ _____

11.1.2.6.11 ICIVR Register (Offset = 28h) [Reset = 00000000h]

ICIVR is shown in Table 11-103.

Return to the Summary Table.

I2C Interrupt Vector register

Table 11-103. ICIVR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	NU2	R/W	0h	Reserved.
11-8	TESTMD	R/W	0h	Reserved for internal testing.
7-3	NU1	R/W	0h	Reserved.
2-0	INTCODE	R/W	0h	Interrupt code. The binary-coded-interrupt vector indicates which interrupt has occurred. Reading the ICIVR clears the interrupt code except ARDY(011) RRDY(100) and XRDY(101). Interrupt code for ARDY RRDY and XRDY is cleared when ARDY ICRRDY and ICXRDY bits in the ICSTR is cleared to default value respectively. If other interrupts are pending a new interrupt is generated. If there are more than one interrupt flag reading the ICIVR clears the highest priority interrupt code. Reading the ICIVR also clears corresponding status bit in the ICSTR except ARDY ICRRDY ICXRDY and AAS. Note that users must read (clear) the ICIVR before doing another start otherwise the ICIVR could contain incorrect (old interrupt flags) value. _____ Interrupt Code_____Interrupt Occurred_____ _000_(default)_____None _001_(highest priority)____Arbitration Lost interrupt _010_____No Acknowledgement interrupt _011_____Register Access Ready interrupt _100_____Receive Data Ready interrupt _101_____Transmit Data Ready interrupt _110_____Stop Condition Detection _111_(lowest priority)_____Address As Slave - (RW) _____

11.1.2.6.12 ICEMDR Register (Offset = 2Ch) [Reset = 00000000h]

ICEMDR is shown in Table 11-104.

Return to the Summary Table.

I2C Extended Mode register

Table 11-104. ICEMDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved. - (RW)
1	IGNACK	R/W	0h	Ignore NACK mode IGNACK=0 The master transmitter will operate normally discontinue the data transfer and set the ARDY and NACK status bits when a NACK signal is received from the slave. IGNACK=1 The master transmitter will ignore a NACK received from the slave.
0	BCM	R/W	0h	Backward Compatibility Mode. This bit affects the I2C interrupt behavior. Refer to appendix A for details.

11.1.2.6.13 ICPSC Register (Offset = 30h) [Reset = 00000000h]

ICPSC is shown in Table 11-105.

Return to the Summary Table.

I2C Prescaler register

Table 11-105. ICPSC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU	R/W	0h	Reserved.
7-0	IPSC7_IPSC0	R/W	0h	8-bit prescaler to divide the system clock down to 4/8/12Mhz clock and used by the I2C module. This register must be initialized while the I2C is still in reset (IRS_=0). The value takes effect on the rising edge of IRS_.

11.1.2.6.14 ICPID1 Register (Offset = 34h) [Reset = 00000000h]

ICPID1 is shown in Table 11-106.

Return to the Summary Table.

I2C Peripheral ID register 1

Table 11-106. ICPID1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU	R/W	0h	Reserved.
15-8	CLASS	R/W	0h	Identifies the class of peripheral. This value should be 0x 01 - (RW)
7-0	REVISION	R/W	0h	Identifies the revision level of the I2C. This value should be incremented each time the design is revised. - (RW)

11.1.2.6.15 ICPID2 Register (Offset = 38h) [Reset = 00000000h]

ICPID2 is shown in Table 11-107.

Return to the Summary Table.

I2C Peripheral ID register 2

Table 11-107. ICPID2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU	R/W	0h	Reserved.
7-0	TYPE	R/W	0h	Identifies the type of peripheral. This value should be 0x 05 - (RW)

11.1.2.6.16 ICDMAC Register (Offset = 3Ch) [Reset = 00000000h]

ICDMAC is shown in Table 11-108.

Return to the Summary Table.

I2C DMA Control Register

Table 11-108. ICDMAC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved. - (RW)
1	TXDMAEN	R/W	0h	Transmit DMA enable. This bit controls the receive DMA event pin to the system. When this bit is 1 the DMA event is enabled and ICTEVT_POR pin is asserted when the DMA transfer is required. When this bit is 0 the ICTEVT_POR pin is never asserted. RXDMAEN= 0: DMA transmit event is disabled. RXDMAEN= 1: DMA transmit event is enabled. (Default)
0	RXDMAEN	R/W	0h	Receive DMA enable. This bit controls the receive DMA event pin to the system. When this bit is 1 the DMA event is enabled and ICREVT_POR pin is asserted when the DMA transfer is required. When this bit is 0 the ICREVT_POR pin is never asserted. RXDMAEN= 0: DMA receive event is disabled. RXDMAEN= 1: DMA receive event is enabled. (Default)

11.1.2.6.17 I2C_RESERVED1 Register (Offset = 40h) [Reset = 00000000h]

I2C_RESERVED1 is shown in Table 11-109.

Return to the Summary Table.

Reserved

Table 11-109. I2C_RESERVED1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	NU	R/W	0h	Reserved.

11.1.2.6.18 I2C_RESERVED2 Register (Offset = 44h) [Reset = 00000000h]

I2C_RESERVED2 is shown in Table 11-110.

Return to the Summary Table.

Reserved

Table 11-110. I2C_RESERVED2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	NU	R/W	0h	Reserved.

11.1.2.6.19 ICPFUNC Register (Offset = 48h) [Reset = 00000000h]

ICPFUNC is shown in Table 11-111.

Return to the Summary Table.

I2C Pin Function register

Table 11-111. ICPFUNC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU	R/W	0h	Reserved.
0	PFUNC0	R/W	0h	Controls the function of the I2C SCL and SDA pins. 0 = Pins function as SCL and SDA 1 = Pins functions as GPIO Note: No hardware protection is required to disable I2C function when the PFUNC[0] and IRS_ bits are both set to one. When PFUNC[0] is"1" (GPIO mode) the sub-module which controls the I2C function receives the value"1" for SCL and SDA. IRS_ can be set to"1" regardless of PFUNC[0] and the I2C function works whenever the IRS_ bit is"1". The user is expected to hold I2C in reset via IRS_ bit when changing to/from GPIO mode via the PFUNC[0] bit.

11.1.2.6.20 ICPDIR Register (Offset = 4Ch) [Reset = 00000000h]

ICPDIR is shown in Table 11-112.

Return to the Summary Table.

I2C Pin Direction register

Table 11-112. ICPDIR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDIR1	R/W	0h	Controls the direction of the I2C SDA pin when configured as GPIO. 0 = SDA pin functions as input 1 = SDA pin functions as output
0	PDIR0	R/W	0h	Controls the direction of the I2C SCL pin when configured as GPIO. 0 = SCL pin functions as input 1 = SCL pin functions as output

11.1.2.6.21 ICPDIN Register (Offset = 50h) [Reset = 00000000h]

ICPDIN is shown in Table 11-113.

Return to the Summary Table.

I2C Pin Data In register

Table 11-113. ICPDIN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDIN1	R/W	0h	Indicates the logic level present on the SDA pin. Reads: 0 = Logic low present at SDA pin regardless of PFUNC setting. 1 = Logic high present at SDA pin regardless of PFUNC setting. Writes: Writes have no effect. - (RW)
0	PDIN0	R/W	0h	Indicates the logic level present on the SCL pin. Reads: 0 = Logic low present at SCL pin regardless of PFUNC setting. 1 = Logic high present at SCL pin regardless of PFUNC setting. Writes: Writes have no effect - (RW)

11.1.2.6.22 ICPDOUT Register (Offset = 54h) [Reset = 00000000h]

ICPDOUT is shown in Table 11-114.

Return to the Summary Table.

I2C Pin Data Out register

Table 11-114. ICPDOUT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDOUT1	R/W	0h	Controls the level driven on the SDA pin when configured as GPIO output. Reads: Reads return register values not GPIO pin levels. Writes: 0 = SDA pin driven low 1 = SDA pin driven high. Note: If SDA is connected to an open-drain buffer at the chiplevel the I2C cannot drive SDA to high.
0	PDOUT0	R/W	0h	Controls the level driven on the SCL pin when configured as GPIO output. Reads: Reads return register values not GPIO pin levels. Writes: 0 = SCL pin driven low 1 = SCL pin driven high Note: If SCL is connected to an open-drain buffer at the chiplevel the I2C cannot drive SCL to high.

11.1.2.6.23 ICPDSET Register (Offset = 58h) [Reset = 00000000h]

ICPDSET is shown in Table 11-115.

Return to the Summary Table.

I2C Pin Data Set register

Table 11-115. ICPDSET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDSET1	R/W	0h	Used to set PDOUT[1] bit which corresponds to the SDA GPIO pin. Reads: Reads should return 0. User documentation should say reads are indeterminate. Writes: 0 = no effect 1 = PDOUT[1] bit is set to logic high.
0	PDSET0	R/W	0h	Used to set PDOUT[0] bit which corresponds to the SCL GPIO pin. Reads: Reads should return 0. User documentation should say reads are indeterminate. Writes: 0 = no effect 1 = PDOUT[0] bit is set to logic high.

11.1.2.6.24 ICPDCLR Register (Offset = 5Ch) [Reset = 00000000h]

ICPDCLR is shown in Table 11-116.

Return to the Summary Table.

I2C Pin Data Clear register

Table 11-116. ICPDCLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDCLR1	R/W	0h	Used to clear PDOUT[1] bit which corresponds to the SDA pin. Reads: Reads should return 0. User documentation should say reads are indeterminate. Writes: 0 = no effect 1 = PDOUT[1] bit is cleared to logic low.
0	PDCLR0	R/W	0h	Used to clear PDOUT[0] bit which corresponds to the SCL pin. Reads: Reads should return 0. User documentation should say reads are indeterminate. Writes: 0 = no effect 1 = PDOUT[0] bit is cleared to logic low.

11.1.2.6.25 ICPDRV Register (Offset = 60h) [Reset = 00000000h]

ICPDRV is shown in Table 11-117.

Return to the Summary Table.

I2C Pin Driver Mode Register

Table 11-117. ICPDRV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDRV1	R/W	0h	Used to select driver mode of output buffer for SDA pin. 0 = I2C mode. 1 = GPIO mode. Note: Value of this register is reflected on the PDRV_SDA_POR port. Actual function depends on I/O buffer and chip implementation.
0	PDRV0	R/W	0h	Used to select driver mode of output buffer for SCL pin. 0 = I2C mode. 1 = GPIO mode. Note: Value of this register is reflected on the PDRV_SCL_POR port. Actual function depends on I/O buffer and chip implementation.

11.1.2.7 Sample Waveforms

Figure 11-18 provides waveforms to illustrate the difference between normal operation and backward compatibility mode.

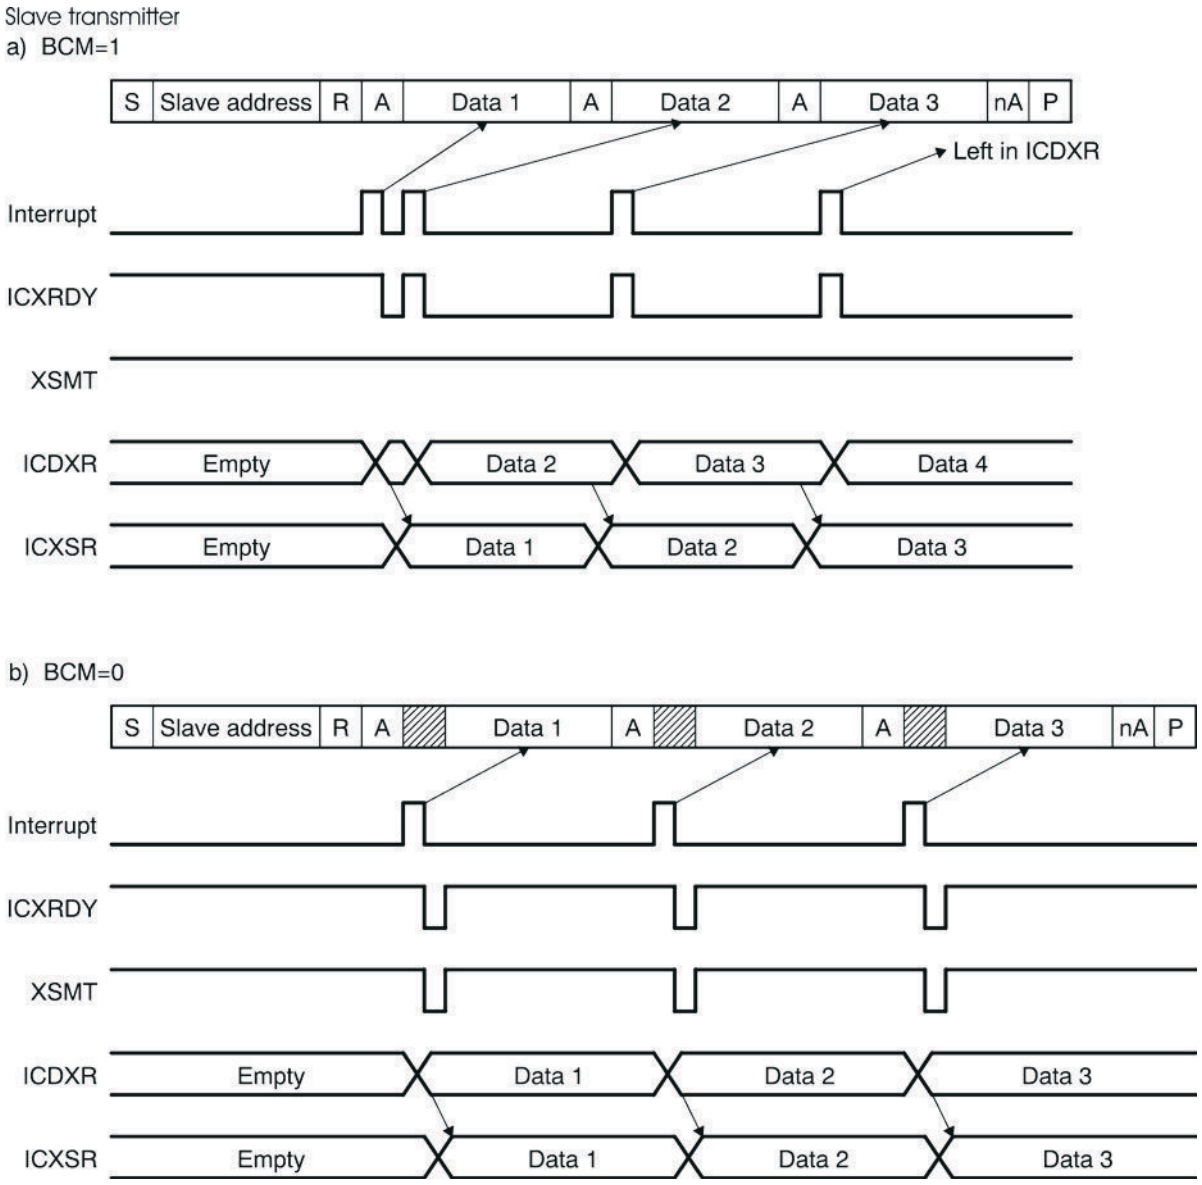

Figure 11-18. Difference between Normal Operation and Backward Compatibility Mode

11.1.3 UART/SCI

This chapter contains the description of the serial communication interface (SCI) module. The device contains 4 instances of UART:

- MSS_SCIA: Covered in MSS_SCI and DSS_SCI
- MSS_SCIB: Covered in MSS_SCI and DSS_SCI
- DSS_SCIA: Covered in MSS_SCI and DSS_SCI
- RCSS_SCI_A: Covered in RCSS SCI UART Overview

All 4 instances have a max VBUS speed of 200MHz and a max baud rate of 10MHz.

11.1.3.1 MSS_SCI and DSS_SCI

11.1.3.1.1 Introduction

The SCI module is a universal asynchronous receiver-transmitter that implements the standard nonreturn to zero format. The SCI can be used to communicate, for example, through an RS-232 port or over a K-line.

11.1.3.1.1.1 SCI Features

The following are the features of the SCI module:

- Standard universal asynchronous receiver-transmitter (UART) communication
- Supports full- or half-duplex operation
- Standard nonreturn to zero (NRZ) format
- Double-buffered receive and transmit functions
- Supports two individually enabled interrupt lines: level 0 and level 1
- Configurable frame format of 3 to 13 bits per character based on the following:
  - Data word length programmable from one to eight bits
  - Additional address bit in address-bit mode
  - Parity programmable for zero or one parity bit, odd or even parity
  - Stop programmable for one or two stop bits
- Asynchronous communication mode with no CLK pin
- Two multiprocessor communication formats allow communication between more than two devices
- Sleep mode is available to free CPU resources during multiprocessor communication and then wake up to receive an incoming message
- The 24-bit programmable baud rate supports 2^{24} different baud rates provide high accuracy baud rate selection
- Capability to use Direct Memory Access (DMA) for transmit and receive data
- Four error flags and Five status flags provide detailed information regarding SCI events
- Two external pins: SCIRX and SCITX

Note

SCI module does not support UART Hardware Flow Control. This feature can be implemented in Software using a General Purpose I/O pin.

11.1.3.1.1.2 Block Diagram

Three Major components of the SCI Module are:

- Transmitter
- Baud Clock Generator
- Receiver

Transmitter (TX) contains two major registers to perform double buffering:

- The transmitter data buffer register (SCITD) contains data loaded by the CPU to be transferred to the shift register for transmission.
- The transmitter shift register (SCITXSHF) loads data from the data buffer (SCITD) and shifts data onto the SCITX pin, one bit at a time.

Baud Clock Generator

- A programmable baud generator produces a baud clock scaled from VCLK.

Receiver (RX) contains two major registers to perform double buffering:

- The receiver shift register (SCIRXSHF) shifts data in from the SCIRX pin one bit at a time and transfers completed data into the receive data buffer.
- The receiver data buffer register (SCIRD) contains received data transferred from the receiver shift register

The SCI receiver and transmitter are double-buffered, and each has its own separate enable and interrupt bits. The receiver and transmitter can each be operated independently or simultaneously in full duplex mode.

To ensure data integrity, the SCI checks the data it receives for breaks, parity, overrun, and framing errors. The bit rate (baud) is programmable to over 16 million different rates through a 24-bit baud-select register. Figure 11-19 shows the detailed SCI block diagram.

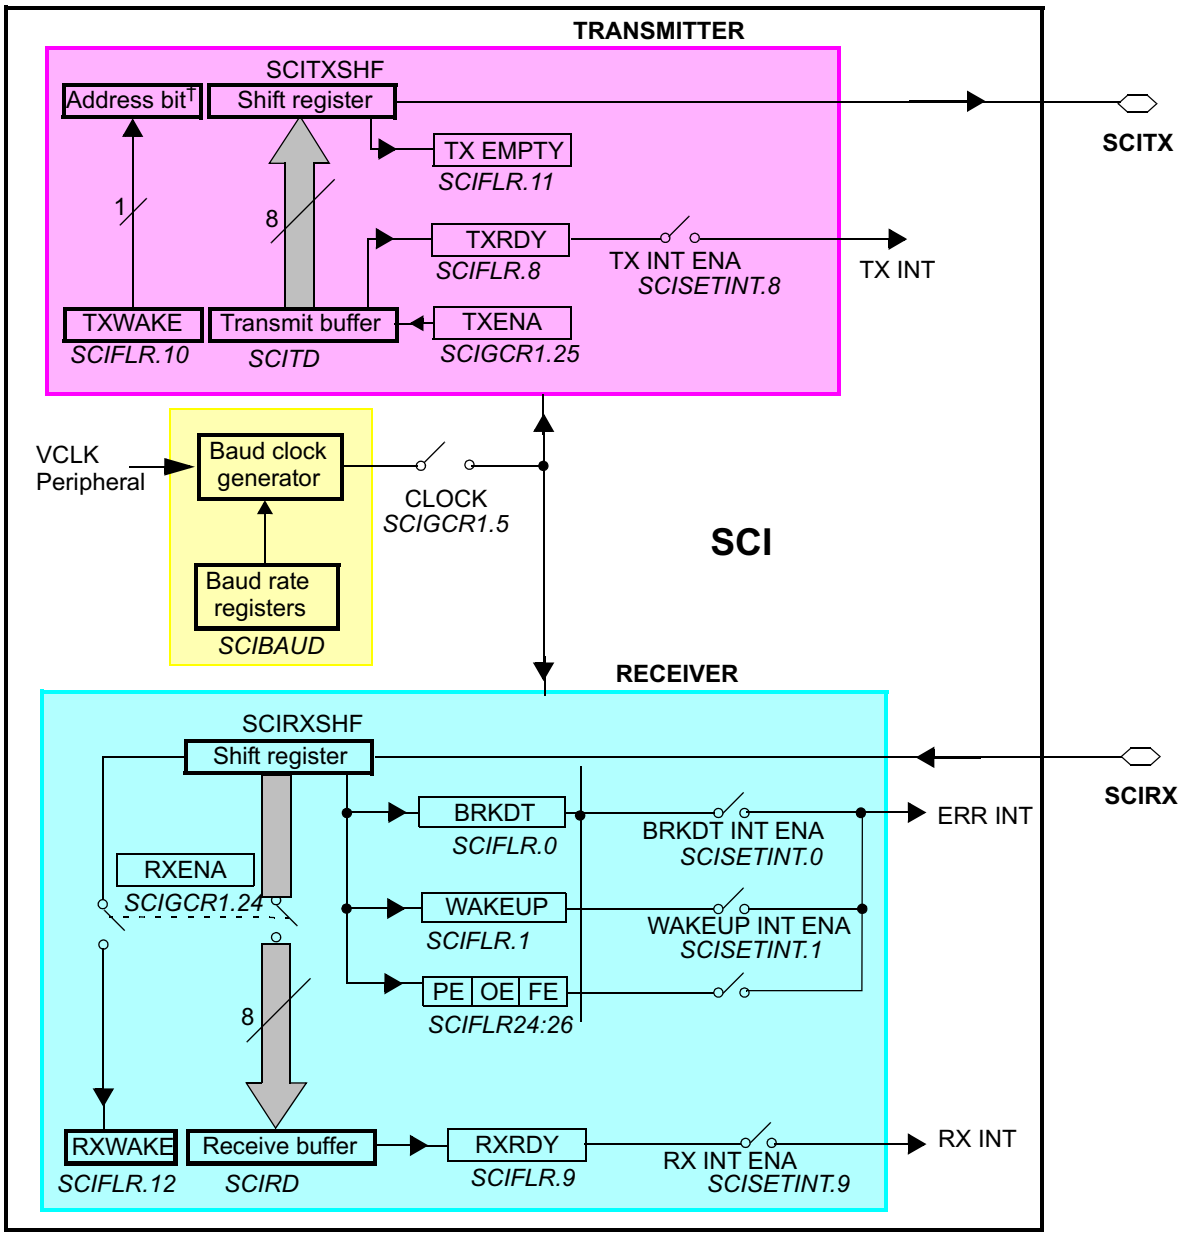

Figure 11-19. Detailed SCI Block Diagram

Note

UART Receiver and UART Transmitter pins attributes can be found in the AM273x Microcontroller data sheet

11.1.3.1.2 SCI Communication Formats

The SCI module can be configured to meet the requirements of many applications. Because communication formats vary depending on the specific application, many attributes of the SCI are user configurable. The list below describes these configuration options:

- SCI Frame format
- SCI Timing modes
- SCI Baud rate
- SCI Multiprocessor modes

11.1.3.1.2.1 SCI Frame Formats

The SCI uses a programmable frame format. All frames consist of the following:

- One start bit
- One to eight data bits
- Zero or one address bit
- Zero or one parity bit
- One or two stop bits

The frame format for both the transmitter and receiver is programmable through the bits in the SCIGCR1 register. Both receive and transmit data is in nonreturn to zero (NRZ) format, which means that the transmit and receive lines are at logic high when idle. Each frame transmission begins with a start bit, in which the transmitter pulls the SCI line low (logic low). Following the start bit, the frame data is sent and received least significant bit first (LSB).

An address bit is present in each frame if the SCI is configured to be in address-bit mode but is not present in any frame if the SCI is configured for idle-line mode. The format of frames with and without the address bit is illustrated in Figure 11-20.

A parity bit is present in every frame when the PARITY ENA bit is set. The value of the parity bit depends on the number of one bits in the frame and whether odd or even parity has been selected via the PARITY ENA bit. Both examples in Figure 11-20 have parity enabled.

All frames include one stop bit, which is always a high level. This high level at the end of each frame is used to indicate the end of a frame to ensure synchronization between communicating devices. Two stop bits are transmitted if the STOP bit in SCIGCR1 register is set. The examples shown in Figure 11-20 use one stop bit per frame.

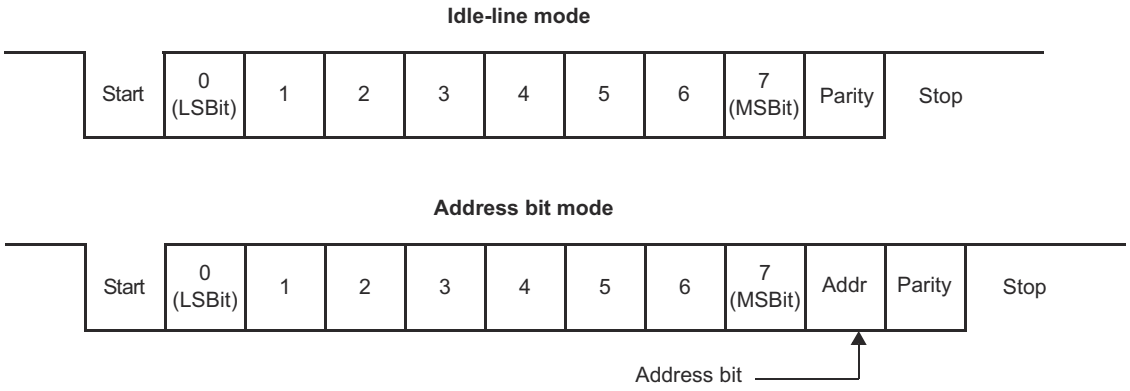

Figure 11-20. Typical SCI Data Frame Formats

11.1.3.1.2.2 SCI Timing Mode

The SCI can be configured to use asynchronous or isosynchronous timing using TIMING MODE bit in SCIGCR1 register.

11.1.3.1.2.2.1 Asynchronous Timing Mode

The asynchronous timing mode uses only the receive and transmit data lines to interface with devices using the standard universal asynchronous receiver- transmitter (UART) protocol.

In the asynchronous timing mode, each bit in a frame has a duration of 16 SCI baud clock periods. Each bit therefore consists of 16 samples (one for each clock period). When the SCI is using asynchronous mode, the baud rates of all communicating devices must match as closely as possible. Receive errors result from devices communicating at different baud rates.

With the receiver in the asynchronous timing mode, the SCI detects a valid start bit if the first four samples after a falling edge on the SCIRX pin are of logic level 0. As soon as a falling edge is detected on SCIRX, the SCI assumes that a frame is being received and synchronizes itself to the bus.

To prevent interpreting noise as Start bit SCI expects SCIRX line to be low for at least four contiguous SCI baud clock periods to detect a valid start bit. The bus is considered idle if this condition is not met. When a valid start bit is detected, the SCI determines the value of each bit by sampling the SCIRX line value during the seventh, eighth, and ninth SCI baud clock periods. A majority vote of these three samples is used to determine the value stored in the SCI receiver shift register. By sampling in the middle of the bit, the SCI reduces errors caused by propagation delays and rise and fall times and data line noises. Figure 11-21 illustrates how the receiver samples a start bit and a data bit in asynchronous timing mode.

The transmitter transmits each bit for a duration of 16 SCI baud clock periods. During the first clock period for a bit, the transmitter shifts the value of that bit onto the SCITX pin. The transmitter then holds the current bit value on SCITX for 16 SCI baud clock periods.

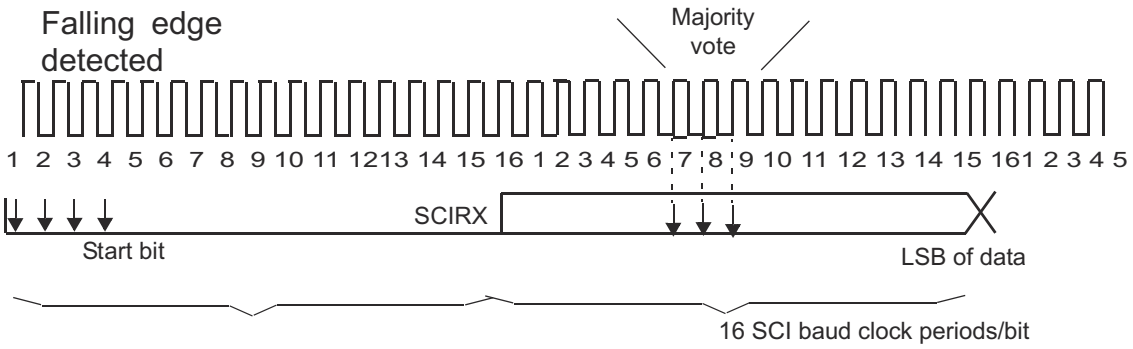

Figure 11-21. Asynchronous Communication Bit Timing

11.1.3.1.2.2.2 Isosynchronous Timing Mode

In isosynchronous timing mode, each bit in a frame has a duration of exactly 1 baud clock period and therefore consists of a single sample. With this timing configuration, the transmitter and receiver are required to make use of the SCICLK pin to synchronize communication with other SCI. **This mode is not fully supported on this device because SCICLK pin is not available.**

11.1.3.1.2.3 SCI Baud Rate

The SCI has an internally generated serial clock determined by the peripheral VCLK and the prescalers BAUD. The SCI uses the 24-bit integer prescaler BAUD value of the BRS register to select the required baud rates.

In asynchronous timing mode, the SCI generates a baud clock according to the following formula:

$$\textit{Asynchronous baud value} = \frac{\text{VCLK Frequency}}{16 * (\text{BAUD} + 1)}$$

For BAUD = 0,

$$\textit{Asynchronous baud value} = \frac{\text{VCLK Frequency}}{32} \quad (7)$$

In isosynchronous timing mode, the SCI generates a baud clock according to the following formula:

$$\textit{Isosynchronous baud value} = \frac{\text{VCLK Frequency}}{\text{BAUD} + 1}$$

For BAUD = 0,

$$\textit{Isosynchronous baud value} = \frac{\text{VCLK Frequency}}{32} \quad (8)$$

11.1.3.1.2.4 SCI Multiprocessor Communication Modes

In some applications, the SCI may be connected to more than one serial communication device. In such a multiprocessor configuration, several frames of data may be sent to all connected devices or to an individual device. In the case of data sent to an individual device, the receiving devices must determine when they are being addressed. When a message is not intended for them, the devices can ignore the following data. When only two devices make up the SCI network, addressing is not needed, so multiprocessor communication schemes are not required.

SCI supports two multiprocessor Communication Modes which can be selected using COMM MODE bit:

- Idle-Line Mode
- Address Bit Mode

When the SCI is not used in a multiprocessor environment, software can consider all frames as data frames. In this case, the only distinction between the idle-line and address-bit modes is the presence of an extra bit (the address bit) in each frame sent with the address-bit protocol.

The SCI allows full-duplex communication where data can be sent and received via the transmit and receive pins simultaneously. However, the protocol used by the SCI assumes that only one device transmits data on the same bus line at any one time. No arbitration is done by the SCI.

Note

Avoid Transmitting Simultaneously on the Same Serial Bus

The system designer must ensure that devices connected to the same serial bus line do not attempt to transmit simultaneously. If two devices are transmitting different data, the resulting bus conflict could damage the device..

11.1.3.1.2.4.1 Idle-Line Multiprocessor Modes

In idle-line multiprocessor mode, a frame that is preceded by an idle period (10 or more idle bits) is an address frame. A frame that is preceded by fewer than 10 idle bits is a data frame. Figure 11-22 illustrates the format of several blocks and frames with idle-line mode.

There are two ways to transmit an address frame using idle-line mode:

Method 1: In software, deliberately leave an idle period between the transmission of the last data frame of the previous block and the address frame of the new block.

Method 2: Configure the SCI to automatically send an idle period between the last data frame of the previous block and the address frame of the new block.

Although Method 1 is only accomplished by a delay loop in software, Method 2 can be implemented by using the transmit buffer and the TXWAKE bit in the following manner:

Step 1 : Write a 1 to the TXWAKE bit.

Step 2 : Write a dummy data value to the SCITD register. This triggers the SCI to begin the idle period as soon as the transmitter shift register is empty.

Step 3 : Wait for the SCI to clear the TXWAKE flag.

Step 4 : Write the address value to SCITD.

As indicated by Step 3, software should wait for the SCI to clear the TXWAKE bit. However, the SCI clears the TXWAKE bit at the same time it sets TXRDY (that is, transfers data from SCITD into SCITXSHF). Therefore, if the TX INT ENA bit is set, the transfer of data from SCITD to SCITXSHF causes an interrupt to be generated at the same time that the SCI clears the TXWAKE bit. If this interrupt method is used, software is not required to poll the TXWAKE bit waiting for the SCI to clear it.

When idle-line multiprocessor communications are used, software must ensure that the idle time exceeds 10 bit periods before addresses (using one of the methods mentioned above), and software must also ensure that data frames are written to the transmitter quickly enough to be sent without a delay of 10 bit periods between frames. Failure to comply with these conditions will result in data interpretation errors by other devices receiving the transmission.

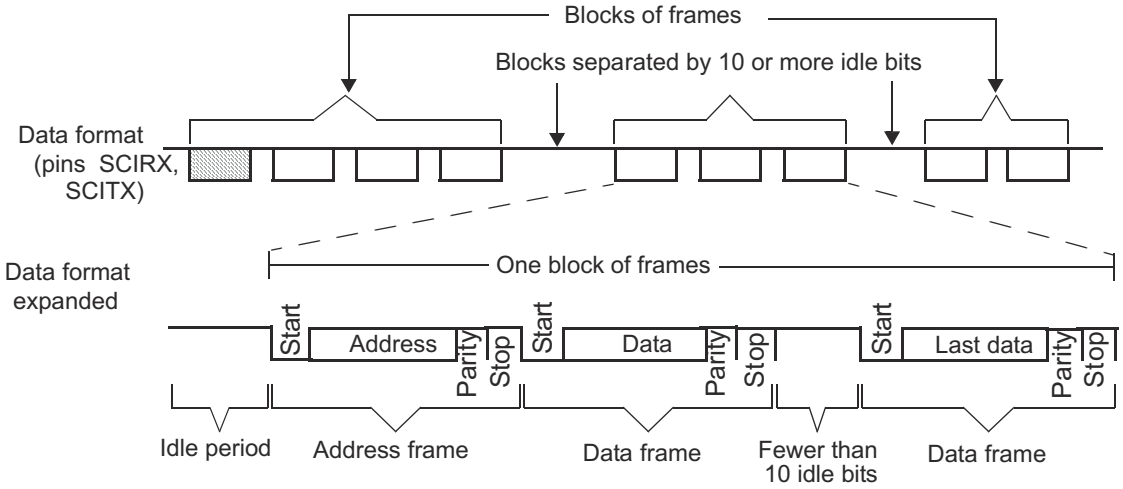

Figure 11-22. Idle-Line Multiprocessor Communication Format

11.1.3.1.2.4.2 Address-Bit Multiprocessor Mode

In the address-bit protocol, each frame has an extra bit immediately following the data field called an address bit. A frame with the address bit set to 1 is an address frame; a frame with the address bit set to 0 is a data frame. The idle period timing is irrelevant in this mode. Figure 11-23 illustrates the format of several blocks and frames with the address-bit mode.

When address-bit mode is used, the value of the TXWAKE bit is the value sent as the address bit. To send an address frame, software must set the TXWAKE bit. This bit is cleared as the contents of the SCITD are shifted from the TXWAKE register so that all frames sent are data except when the TXWAKE bit is written as a 1.

No dummy write to SCITD is required before an address frame is sent in address-bit mode. The first byte written to SCITD after the TXWAKE bit is written to 1 is transmitted with the address bit set when address-bit mode is used.

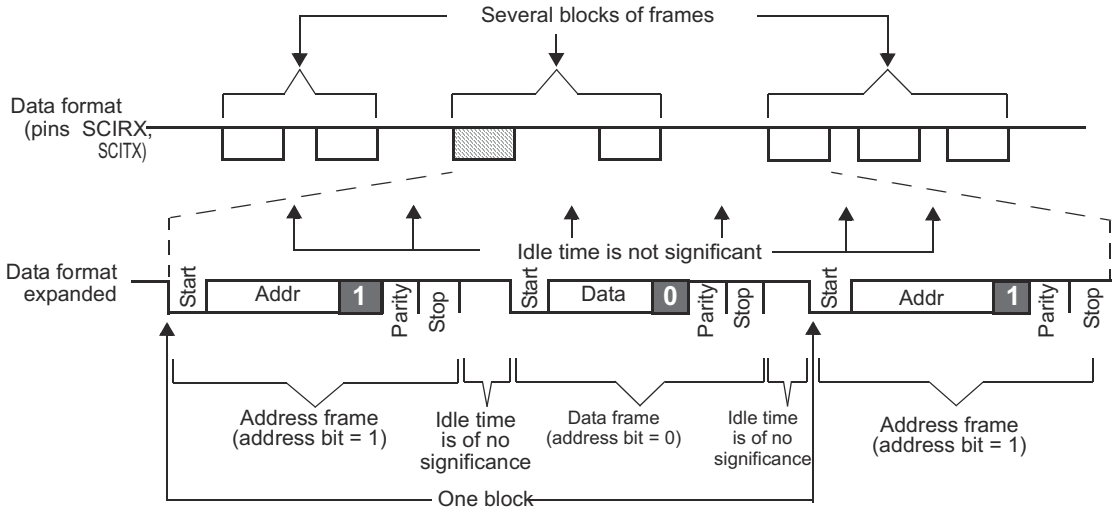

Figure 11-23. Address-Bit Multiprocessor Communication Format

11.1.3.1.3 SCI Interrupts

The SCI module has two interrupt lines, level 0 and level 1, to the interrupt manager (NVIC/IM) module (see Figure 11-24). Two offset registers SCIINTVECT0 and SCIINTVECT1 determine which flag triggered the interrupt according to the respective priority encoders. Each interrupt condition has a bit to enable and disable the interrupt in the SCISETINT and SCICLRINT registers, respectively.

Each interrupt also has a bit that can be set as interrupt level 0 (INT0) or as interrupt level 1 (INT1). By default, interrupts are in interrupt level 0. SCISETINTLVL sets a given interrupt to level1. SCICLEARINTLVL resets a given interrupt level to the default level 0.

The interrupt vector registers SCIINTVECT0 and SCIINTVECT1 return the vector of the pending interrupt line INT0 or INT1. If more than one interrupt is pending, the interrupt vector register holds the highest priority interrupt.

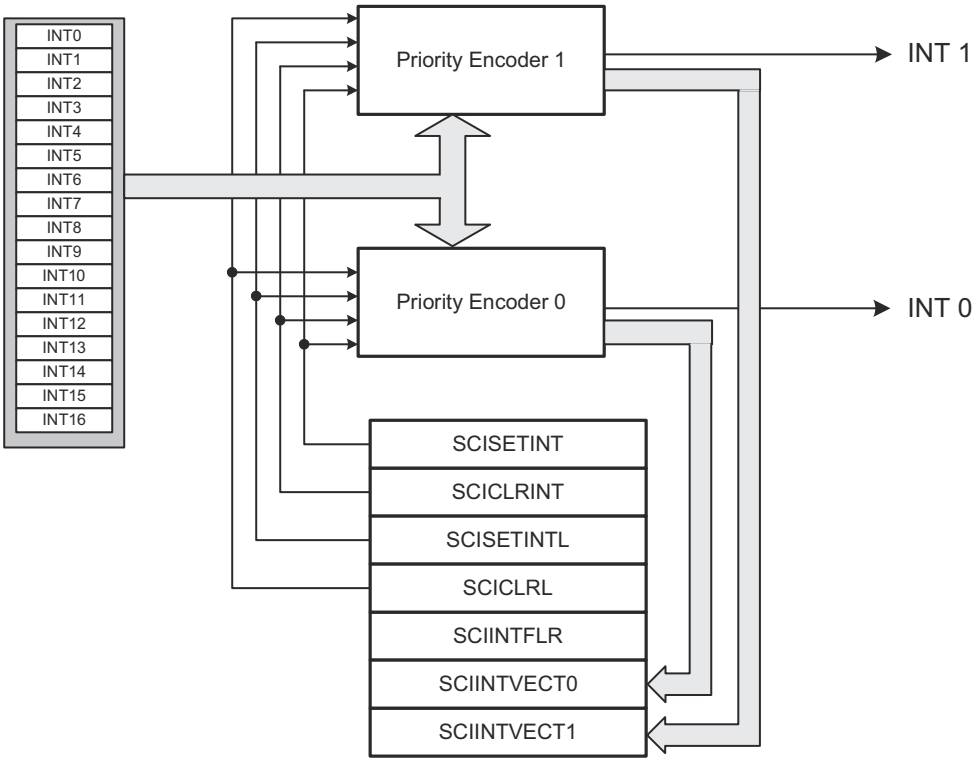

Figure 11-24. General Interrupt Scheme

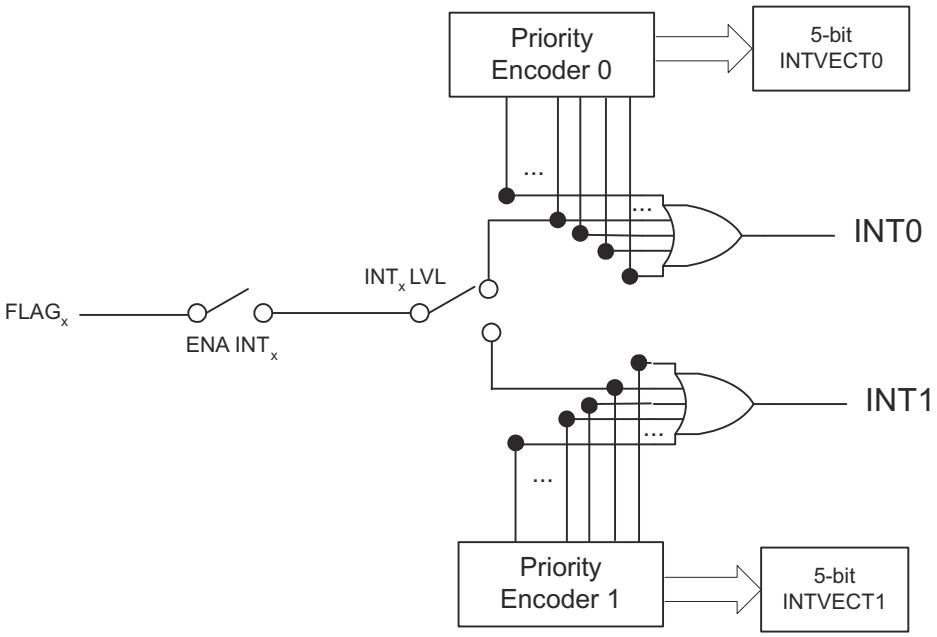

Figure 11-25. Interrupt Generation for Given Flags

11.1.3.1.3.1 Transmit Interrupt

To use transmit interrupt functionality, SET TX INT bit must be enabled and SET TX DMA bit must be cleared. The transmit ready (TXRDY) flag is set when the SCI transfers the contents of SCITD to the shift register, SCITXSHF. The TXRDY flag indicates that SCITD is ready to be loaded with more data. In addition, the SCI sets the TX EMPTY bit if both the SCITD and SCITXSHF registers are empty. If the SET TX INT bit is set, then a transmit interrupt is generated when the TXRDY flag goes high. Transmit Interrupt is not generated immediately after setting the SET TX INT bit unlike transmit DMA request. Transmit Interrupt is generated only after the first transfer from SCITD to SCITXSHF, that is first data has to be written to SCITD by the User before any interrupt gets generated. To transmit further data the user can write data to SCITD in the transmit Interrupt service routine.

Writing data to the SCITD register clears the TXRDY bit. When this data has been moved to the SCITXSHF register, the TXRDY bit is set again. The interrupt request can be suspended by setting the CLR TX INT bit; however, when the SET TX INT bit is again set to 1, the TXRDY interrupt is asserted again. The transmit interrupt request can be eliminated until the next series of values is written to SCITD, by disabling the transmitter via the TXENA bit, by a software reset SWnRST, or by a device hardware reset.

11.1.3.1.3.2 Receive Interrupt

The receive ready (RXRDY) flag is set when the SCI transfers newly received data from SCIRXSHF to SCIRD. The RXRDY flag therefore indicates that the SCI has new data to be read. Receive interrupts are enabled by the SET RX INT bit. If the SET RX INT is set when the SCI sets the RXRDY flag, then a receive interrupt is generated. The received data can be read in the Interrupt Service routine.

On a device with both SCI and a DMA controller, the bits SET RX DMA ALL and SET RX DMA must be cleared to select interrupt functionality.

11.1.3.1.3.3 WakeUp Interrupt

SCI sets the WAKEUP flag if bus activity on the RX line either prevents power-down mode from being entered, or RX line activity causes an exit from power-down mode. If enabled (SET WAKEUP INT), wakeup interrupt is triggered once WAKEUP flag is set.

11.1.3.1.3.4 Error Interrupts

The following error detection features are supported with Interrupt by the SCI module:

- Parity errors (PE)
- Frame errors (FE)
- Break Detect errors (BRKDT)
- Overrun errors (OE)

If any of these errors (PE, FE, BRKDT, OE) is flagged, an interrupt for the flagged errors will be generated if enabled. A message is valid for both the transmitter and the receiver if there is no error detected until the end of the frame. Each of these flags is located in the receiver status (SCIFLR) register. Further details on these flags are explained in SCIFLR register description.

The SCI module supports the following 7 interrupts as listed in Table 11-118.

Table 11-118. SCI Interrupts

Offset (1)	Interrupt
0	Reserved
1	Wakeup
2	Reserved
3	Parity error
4	Reserved
5	Reserved
6	Frame error
7	Break detect error
8	Reserved
9	Overrun error
10	Reserved
11	Receive
12	Transmit
13-15	Reserved

(1) Offset 1 is the highest priority. Offset 16 is the lowest priority.

11.1.3.1.4 SCI DMA Interface

DMA requests for receive (RXDMA request) and transmit (TXDMA request) are available for the SCI module. Refer to the DMA module chapter for DMA module configurations.

11.1.3.1.4.1 Receive DMA Requests

This DMA functionality is enabled/disabled by the CPU using the SET RX DMA/CLR RX DMA bits, respectively.

The receiver DMA request is set when a frame is received successfully and DMA functionality has been previously enabled. The RXRDY flag is set when the SCI transfers newly received data from the SCIRXSHF register to the SCIRD buffer. The RXRDY flag therefore indicates that the SCI has new data to be read. Receive DMA requests are enabled by the SET RX INT bit.

Parity, overrun, break detect, wakeup, and framing errors generate an error interrupt request immediately upon detection, if enabled, even if the device is in the process of a DMA data transfer. The DMA transfer is postponed until the error interrupt is served. The error interrupt can delete this particular DMA request by reading the receive buffer.

In multiprocessor mode, the SCI can generate receiver interrupts for address frames and DMA requests for data frames. This is controlled by an extra select bit SET RX DMA ALL.

If the SET RX DMA ALL bit is set and the SET RX DMA bit is set when the SCI sets the RXRDY flag, then a receive DMA request is generated for address and data frames.

If the SET RX DMA ALL bit is cleared and the SET RX DMA bit is set when the SCI sets the RXRDY flag upon receipt of a data frame, then a receive DMA request is generated. Receive interrupt requests are generated for address frames.

In multiprocessor mode with the SLEEP bit set, no DMA is generated for received data frames. The software must clear the SLEEP bit before data frames can be received. Table 11-119 specifies the bit values for DMA requests in multiprocessor modes.

Table 11-119. DMA and Interrupt Requests in Multiprocessor Modes

SET RX INT	SET RX DMA	SET RX DMA ALL	ADDR FRAME INT	ADDR FRAME DMA	DATA FRAME INT	DATA FRAME DMA
0	0	x	N	N	N	N
0	1	0	Y	N	N	Y
0	1	1	N	Y	N	Y
1	0	x	Y	N	Y	N
1	1	0	Y	N	Y	Y
1	1	1	Y	Y	Y	Y

In multiprocessor mode, the SCI can generate receiver interrupts for address frames and DMA requests for data frames or DMA requests for both. This is controlled by the SET RX DMA ALL bit.

In multiprocessor mode with the SLEEP bit set, no DMA is generated for received data frames. The software must clear the SLEEP bit before data frames can be received.

11.1.3.1.4.2 Transmit DMA Requests

DMA functionality is enabled and disabled by the CPU with the SET TX DMA and CLR TX DMA bits, respectively.

The TXRDY flag is set when the SCI transfers the contents of SCITD to SCITXSHF. The TXRDY flag indicates that SCITD is ready to be loaded with more data. In addition, the SCI sets the TX EMPTY bit if both the SCITD and SCITXSHF registers are empty.

Transmit DMA requests are enabled by the setting SET TX DMA and SET TX INT bits. If the SET TX DMA bit is set, then a TX DMA request is sent to the DMA when data is written to SCITD and TXRDY is set. The DMA will write the first byte to the transmit buffer.

11.1.3.1.5 SCI Configurations

Before the SCI sends or receives data, its registers should be properly configured. Upon power-up or a system-level reset, each bit in the SCI registers is set to a default state. The registers are writable only after the RESET bit in the SCIGCR0 register is set to 1. Of particular importance is the SWnRST bit in the SCIGCR1 register. The SWnRST is an active-low bit initialized to 0 and keeps the SCI in a reset state until it is programmed to 1. Therefore, all SCI configuration should be completed before a 1 is written to the SWnRST bit.

The following list details the configuration steps that software should perform prior to the transmission or reception of data. As long as the SWnRST bit is cleared to 0 the entire time that the SCI is being configured, the order in which the registers are programmed is not important.

- Enable SCI by setting the RESET bit to 1.
- Clear the SWnRST bit to 0 before SCI is configured.
- Select the desired frame format by programming the SCIGCR1 register.
- Set both the RX FUNC and TX FUNC bits in SCIPIO0 to 1 to configure the SCIRX and SCITX pins for SCI functionality.
- Select the baud rate to be used for communication by programming the BRS register.
- Set the CLOCK bit in SCIGCR1 to 1 to select the internal clock.
- Set the CONT bit in SCIGCR1 to 1 to make SCI not halt for an emulation breakpoint until its current reception or transmission is complete (this bit is used only in an emulation environment).
- Set LOOP BACK bit in SCIGCR1 to 1 to connect the transmitter to the receiver internally (this feature is used to perform a self-test).
- Set the RXENA bit in SCIGCR1 to 1, if data is to be received.
- Set the TXENA bitin SCIGCR1 to 1, if data is to be transmitted.
- Set the SWnRST bit to 1 after SCI is configured.
- Perform receiving or transmitting data (see Section 11.1.3.1.5.1 and Section 11.1.3.1.5.2).

11.1.3.1.5.1 Receiving Data

The SCI receiver is enabled to receive messages if both the RX FUNC bit and the RXENA bit are set to 1. If the RX FUNC bit is not set, the SCIRX pin functions as a general-purpose I/O pin rather than as an SCI function pin. After a valid idle period is detected, data is automatically received as it arrives on the SCIRX pin.

SCI sets the RXRDY bit when it transfers newly received data from SCIRXSHF to SCIRD. The SCI clears the RXRDY bit after the new data in SCIRD has been read. Also, as data is transferred from SCIRXSHF to SCIRD, the SCI sets the FE, OE, or PE flags if any of these error conditions were detected in the received data. These error conditions are supported with configurable interrupt capability. The wakeup and break-detect status bits are also set if one of these errors occurs, but they do not necessarily occur at the same time that new data is being loaded into SCIRD.

You can receive data by:

1. Polling Receive Ready Flag
2. Receive Interrupt
3. DMA

In polling method, software can poll for the RXRDY bit and read the data from SCIRD register once RXRDY is set high. The CPU is unnecessarily overloaded by selecting the polling method. To avoid this, you can use either the interrupt or DMA method. To use the interrupt method, the SET RX INT bit is set. To use the DMA method, the SET RX DMA bit is set. Either an interrupt or a DMA request is generated the moment the RXRDY bit is set.

11.1.3.1.5.2 Transmitting Data

The SCI transmitter is enabled if both the TX FUNC bit and the TXENA bit are set to 1. If the TX FUNC bit is not set, the SCITX pin functions as a general-purpose I/O pin rather than as an SCI function pin. Any value written to the SCITD before TXENA is set to 1 is not transmitted. Both of these control bits allow for the SCI transmitter to be held inactive independently of the receiver.

SCI waits for data to be written to SCITD, transfers it to SCITXSHF, and transmits the data. The TXRDY and TX EMPTY bits indicate the status of the transmit buffers. That is, when the transmitter is ready for data to be written to SCITD, the TXRDY bit is set. Additionally, if both SCITD and SCITXSHF are empty, then the TX EMPTY bit is also set.

You can transmit data by:

1. Polling Transmit Ready Flag
2. Transmit Interrupt
3. DMA

In polling method, software can poll for the TXRDY bit to go high before writing the data to the SCITD register. The CPU is unnecessarily overloaded by selecting the polling method. To avoid this, you can use either the interrupt or DMA method. To use the interrupt method, the SET TX INT bit is set. To use the DMA method, the SET TX DMA bit is set. Either an interrupt or a DMA request is generated the moment the TXRDY bit is set. When the SCI has completed transmission of all pending frames, the SCITXSHF register and SCITD are empty, the TXRDY bit is set, and an interrupt/DMA request is generated, if enabled. Because all data has been transmitted, the interrupt/DMA request should be halted. This can either be done by disabling the transmit interrupt (CLR TX INT) / DMA request (CLR TX DMA bit) or by disabling the transmitter (clear TXENA bit).

Note

The TXRDY flag cannot be cleared by reading the corresponding interrupt offset in the SCIINTVECT0 or SCIINTVECT1 register.

11.1.3.1.6 MSS_SCI Registers

Table 11-120 lists the memory-mapped registers for the MSS_SCI registers. All register offset addresses not listed in Table 11-120 should be considered as reserved locations and the register contents should not be modified.

Table 11-120. MSS_SCI Registers

24	RXENA	R/W	0h	Allows the receiver to transfer data from the shift buffer to the receive buffer
23-18	RESERVED	R	0h	Reserved
17	CONT	R/W	0h	This bit has an effect only when a program is being debugged with an emulator, and it determines how the SCI operates when the program is suspended
16	LOOP_BACK	R/W	0h	Enable bit for loopback mode
15-10	RESERVED	R	0h	Reserved
9	POWERDOWN	R/W	0h	When the POWERDOWN bit is set, the SCI attempts to enter local low-power mode
8	SLEEP	R/W	0h	In a multiprocessor configuration, this bit controls the receive sleep function. Clearing this bit brings the SCI out of sleep mode
7	SW_nRESET	R/W	0h	Software reset (active low)
6	RESERVED	R	0h	Reserved
5	CLOCK	R/W	0h	SCI internal clock enable
4	STOP	R/W	0h	SCI number of stop bits
3	PARITY	R/W	0h	SCI parity odd/even selection
2	PARITY_ENA	R/W	0h	SCI parity enable
1	TIMING_MODE	R/W	0h	SCI timing mode bit (0=Isosynchronous timing, 1=Asynchronous timing)
0	COMM_MODE	R/W	0h	SCI communication mode bit (0=Idle-line mode, 1=Address-bit mode)

11.1.3.1.6.3 RESERVED1 Register (Offset = 8h) [Reset = 00000000h]

RESERVED1 is shown in Table 11-124.

Return to the Summary Table.

Reserved

Table 11-124. RESERVED1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RESERVED	R	0h	Reserved

11.1.3.1.6.4 SCISETINT Register (Offset = Ch) [Reset = 00000000h]

SCISETINT is shown in Table 11-125.

Return to the Summary Table.

SCI Set Interrupt Register

Table 11-125. SCISETINT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26	SET_FE_INT	R/W	0h	Set Framing-Error Interrupt User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
25	SET_OE_INT	R/W	0h	Set Overrun-Error Interrupt User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
24	SET_PE_INT	R/W	0h	Set Parity Interrupt User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
23-19	RESERVED	R	0h	Reserved
18	SET_RX_DMA_ALL	R/W	0h	Determines if a separate interrupt is generated for the address frames sent in multiprocessor communications User and privilege mode (read): 0 = DMA request is disabled for address frames (RX interrupt request is enabled for address frames) 1 = DMA request is enabled for address and data frames User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request for address and data frames
17	SET_RX_DMA	R/W	0h	To select receiver DMA requests, this bit must be set. If it is cleared, interrupt requests are generated depending on bit SCISETINT.9 User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request
16	SET_TX_DMA	R/W	0h	To select DMA requests for the transmitter, this bit must be set. If it is cleared, interrupt requests are generated depending on SET TX INT bit (SCISETINT.8) User and privilege mode (read): 0 = TX interrupt request selected 1 = TX DMA request selected User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
15-10	RESERVED	R	0h	Reserved
9	SET_RX_INT	R/W	0h	Receiver interrupt enable:Setting this bit enables the SCI to generate a receive interrupt after a frame has been completely received and the data is being transferred from SCIRXSHF to SCIRD. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt

Table 11-125. SCISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	SET_TX_INT	R/W	0h	Set Transmitter interrupt. Setting this bit enables the SCI to generate a transmit interrupt as data is being transferred from SCITD to SCITXSHF and the TXRDY bit is being set. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
7-2	RESERVED	R	0h	Reserved
1	SET_WAKEUP_INT	R/W	0h	Set Wake-up interrupt User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
0	SET_BRKDT_INT	R/W	0h	Set Break-detect interrupt. Setting this bit enables the SCI to generate an error interrupt if a break condition is detected on the SCIRX pin. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt

11.1.3.1.6.5 SCICLEARINT Register (Offset = 10h) [Reset = 00000000h]

SCICLEARINT is shown in Table 11-126.

Return to the Summary Table.

SCI Clear Interrupt Register

Table 11-126. SCICLEARINT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26	CLR_FE_INT	R/W	0h	Clear Framing-Error Interrupt: Setting this bit disables the SCI module to generate an interrupt when there is a Framing error. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
25	CLR_OE_INT	R/W	0h	Clear Overrun-Error Interrupt. This bit disables the SCI overrun interrupt when set. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
24	CLR_PE_INT	R/W	0h	Clear Parity Interrupt. Setting this bit disables the SCI Parity error interrupt. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
23-19	RESERVED	R	0h	Reserved
18	CLR_RX_DMA_ALL	R/W	0h	User and privilege mode (read): 0 = DMA request is disabled for address frames (RX interrupt request is enabled for address frames). DMA request is enabled for data frames. 1 = DMA request is enabled for address and data frames User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request for address frames
17	CLR_RX_DMA	R/W	0h	Clear RX DMA request. This bit disalbes the receive DMA request when set. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request
16	CLR_TX_DMA	R/W	0h	Clear TX DMA request. This bit disables the transmit DMA request when set. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request
15-10	RESERVED	R	0h	Reserved
9	CLR_RX_INT	R/W	0h	Clear Receiver interrupt. This bit disables the receiver interrupt when set. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt

Table 11-126. SCICLEARINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	CLR_TX_INT	R/W	0h	Clear Transmitter interrupt. This bit disables the transmitter interrupt when set. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
7-2	RESERVED	R	0h	Reserved
1	CLR_WAKEUP_INT	R/W	0h	Clear Wake-up interrupt. This bit disables the wakeup interrupt when set. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
0	CLR_BRKDT_INT	R/W	0h	Clear Break-detect interrupt. This bit disables the Break-detect interrupt when set. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt

11.1.3.1.6.6 SCISETINTLVL Register (Offset = 14h) [Reset = 00000000h]

SCISETINTLVL is shown in Table 11-127.

Return to the Summary Table.

SCI Set Interrupt Level Register

Table 11-127. SCISETINTLVL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26	SET_FE_INT_LVL	R/W	0h	Clear Framing-Error Interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Clear interrupt level to line INT1
25	SET_OE_INT_LVL	R/W	0h	Clear Overrun-Error Interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Clear interrupt level to line INT1
24	SET_PE_INT_LVL	R/W	0h	Clear Parity Error Interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Clear interrupt level to line INT1
23-19	RESERVED	R	0h	Reserved

8	SET_TX_INT_LVL	R/W	0h	Clear Transmitter interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Clear interrupt level to line INT1
7-2	RESERVED	R	0h	Reserved

Table 11-127. SCISETINTLVL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	SET_WAKEUP_INT_LVL	R/W	0h	Clear Wake-up interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Clear interrupt level to line INT1
0	SET_BRKDT_INT_LVL	R/W	0h	Clear Break-detect interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Clear interrupt level to line INT1

11.1.3.1.6.7 SCICLEARINTLVL Register (Offset = 18h) [Reset = 00000000h]

SCICLEARINTLVL is shown in Table 11-128.

Return to the Summary Table.

SCI Clear Interrupt Level Register

Table 11-128. SCICLEARINTLVL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26	CLR_FE_INT_LVL	R/W	0h	Clear Framing-Error Interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Reset interrupt level to line INT0
25	CLR_OE_INT_LVL	R/W	0h	Clear Framing-Error Interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Reset interrupt level to line INT0
24	CLR_PE_INT_LVL	R/W	0h	Clear Framing-Error Interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Reset interrupt level to line INT0
23-19	RESERVED	R	0h	Reserved
18	CLR_RX_DMA_ALL_INT_LVL	R/W	0h	Clear receive DMA ALL interrupt level. User and privilege mode (read): 0 = RX interrupt request for address frames is mapped to INT0 line. 1 = RX interrupt request for address frames is mapped to INT1 line. User and privilege mode (write): 0 = Leaves the corresponding bit unchanged. 1 = Reset interrupt level to line INT0.
17-16	RESERVED	R	0h	Reserved
15	CLR_INC_BR_INT_LVL	R/W	0h	
14-10	RESERVED	R	0h	Reserved
9	CLR_RX_INT_LVL	R/W	0h	Clear Receiver interrupt level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Reset interrupt level to line INT0
8	CLR_TX_INT_LVL	R/W	0h	Clear Transmitter interrupt level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Reset interrupt level to line INT0
7-2	RESERVED	R	0h	Reserved

Table 11-128. SCICLEARINTLVL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	CLR_WAKEUP_INT_LVL	R/W	0h	Clear Wake-up interrupt level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Reset interrupt level to line INT0
0	CLR_BRKDT_INT_LVL	R/W	0h	Clear Break-detect interrupt level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Reset interrupt level to line INT0

11.1.3.1.6.8 SCIFLR Register (Offset = 1Ch) [Reset = 00000904h]

SCIFLR is shown in Table 11-129.

Return to the Summary Table.

SCI Flags Register

Table 11-129. SCIFLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26	FE	R/W	0h	SCI framing error flag Read: 0=No framing error detected 1=Framing error detected Write: 0=No effect 1=Clears this bit to 0
25	OE	R	0h	SCI overrun error flag This bit is set when the transfer of data from SCIRXSHF to SCIRD overwrites unread data already in SCIRD
24	PE	R	0h	SCI parity error flag. This bit is set when a parity error is detected in the received data
23-13	RESERVED	R	0h	Reserved
12	RXWAKE	R	0h	Receiver wake-up detect flag. The SCI sets this bit to indicate that the data currently in SCIRD is an address
11	TX_EMPTY	R	1h	Transmitter empty flag. The value of this flag indicates the contents of the transmitter's buffer register (SCITD) and shift register (SCITXSHF)
10	TXWAKE	R/W	0h	SCI transmitter wake-up method select. The TXWAKE bit controls whether the data in SCITD should be sent as an address or data frame using multiprocessor communication format
9	RXRDY	R	0h	SCI receiver ready flag. The receiver sets this bit to indicate that the SCIRD contains new data and is ready to be read by the CPU or DMA.
8	TXRDY	R	1h	Transmitter buffer register ready flag. When set, this bit indicates that the transmit buffer register (SCITD) is ready to receive another character.
7-4	RESERVED	R	0h	Reserved
3	Bus_busy_flag	R	0h	This bit indicates whether the receiver is in the process of receiving a frame.
2	IDLE	R	1h	SCI receiver in idle state. While this bit is set, the SCI looks for an idle period to resynchronize itself with the bit stream.
1	WAKEUP	R	0h	Wake-up flag. This bit is set by the SCI when receiver or transmitter activity has taken the module out of power-down mode.
0	BRKDT	R	0h	SCI break-detect flag. This bit is set when the SCI detects a break condition on the SCIRX pin.

11.1.3.1.6.9 SCIINTVECT0 Register (Offset = 20h) [Reset = 00000000h]

SCIINTVECT0 is shown in Table 11-130.

Return to the Summary Table.

SCI Interrupt Offset Vector 0 Register

Table 11-130. SCIINTVECT0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	INTVECT0	R	0h	Interrupt vector offset for INT0

11.1.3.1.6.10 SCIINTVECT1 Register (Offset = 24h) [Reset = 00000000h]

SCIINTVECT1 is shown in Table 11-131.

Return to the Summary Table.

SCI Interrupt Offset Vector 1 Register

Table 11-131. SCIINTVECT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	INTVECT1	R	0h	Interrupt vector offset for INT1

11.1.3.1.6.11 SCICHAR Register (Offset = 28h) [Reset = 00000000h]

SCICHAR is shown in Table 11-132.

Return to the Summary Table.

SCI Character Control Register

Table 11-132. SCICHAR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2-0	CHAR	R/W	0h	Sets the SCI data length from 1 to 8 bits

11.1.3.1.6.12 SCIBAUD Register (Offset = 2Ch) [Reset = 00000000h]

SCIBAUD is shown in Table 11-133.

Return to the Summary Table.

SCI Baud Rate Selection Register

Table 11-133. SCIBAUD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	0h	Reserved
23-0	BAUD	R/W	0h	SCI 24-bit baud selection

11.1.3.1.6.13 SCIED Register (Offset = 30h) [Reset = 00000000h]

SCIED is shown in Table 11-134.

Return to the Summary Table.

Receiver Emulation Data Buffer

Table 11-134. SCIED Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	Reserved
7-0	ED	R	0h	Receiver Emulation Data Buffer

11.1.3.1.6.14 SCIRD Register (Offset = 34h) [Reset = 00000000h]

SCIRD is shown in Table 11-135.

Return to the Summary Table.

Receiver Data Buffer

Table 11-135. SCIRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	Reserved
7-0	RD	R	0h	Contains received data.

11.1.3.1.6.15 SCITD Register (Offset = 38h) [Reset = 00000000h]

SCITD is shown in Table 11-136.

Return to the Summary Table.

Transmit Data Buffer Register

Table 11-136. SCITD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	Reserved
7-0	TD	R/W	0h	Contains Data to be transmitted. This is pushed to SCITXSHF(shift register) when TXENA bit is set in SCRGCR1 register.

11.1.3.1.6.16 SCIPIO0 Register (Offset = 3Ch) [Reset = 00000000h]

SCIPIO0 is shown in Table 11-137.

Return to the Summary Table.

SCI Pin I/O Control Register 0

Table 11-137. SCIPIO0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_FUNC	R/W	0h	Defines the function of pin SCITX. 0=SCITX is a general-purpose digital I/O pin. 1=SCITX is the SCI transmit pin. 0=SCIRX is a general-purpose digital I/O pin. 1=SCIRX is the SCI receive pin.
1	RX_FUNC	R/W	0h	Determines the data direction on the SCIRX pin if it is configured with general-purpose I/O functionality (RX FUNC = 0). See Table 12 for bit values. 0=SCIRX is a general-purpose input pin. 1=SCIRX is a general-purpose output pin
0	CLK_FUNC	R/W	0h	Clock function. Defines the function of pin SCICLK. 0=SCICLK is a general-purpose digital I/O pin. 1=SCICLK is the SCI serial clock pin. Determines the data direction on the SCICLK pin. The direction is defined differently depending upon the value of the CLK FUNC bit

11.1.3.1.6.17 SCIPIO1 Register (Offset = 40h) [Reset = 00000000h]

SCIPIO1 is shown in Table 11-138.

Return to the Summary Table.

SCI Pin I/O Control Register 1

Table 11-138. SCIPIO1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_DIR	R/W	0h	Determines the data direction on the SCITX pin if it is configured with general-purpose I/O functionality (TX FUNC = 0). See Table 11 for bit values. 0=SCITX is a general-purpose input pin. 1=SCITX is a general-purpose output pin
1	RX_DIR	R/W	0h	Determines the data direction on the SCIRX pin if it is configured with general-purpose I/O functionality (RX FUNC = 0). See Table 12 for bit values. 0=SCIRX is a general-purpose input pin. 1=SCIRX is a general-purpose output pin
0	CLK_DIR	R/W	0h	Clock data direction. Determines the data direction on the SCICLK pin. The direction is defined differently depending upon the value of the CLK FUNC bit

11.1.3.1.6.18 SCIPIO2 Register (Offset = 44h) [Reset = 00000000h]

SCIPIO2 is shown in Table 11-139.

Return to the Summary Table.

SCI Pin I/O Control Register 2

Table 11-139. SCIPIO2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_DATA_IN	R/W	0h	Contains current value on the SCITX pin. 0=SCITX value is logic low. 1=SCITX value is logic high.
1	RX_DATA_IN	R/W	0h	Contains current value on the SCIRX pin. 0=SCIRX value is logic low. 1=SCIRX value is logic high.
0	CLK_DATA_IN	R/W	0h	Contains the current value on pin SCICLK. 0=Pin SCICLK value is logic low. 1=Pin SCICLK value is logic high.

11.1.3.1.6.19 SCIPIO3 Register (Offset = 48h) [Reset = 00000000h]

SCIPIO3 is shown in Table 11-140.

Return to the Summary Table.

SCI Pin I/O Control Register 3

Table 11-140. SCIPIO3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_DATA_OUT	R/W	0h	Contains the data to be output on pin SCITX if the following conditions are met: TX FUNC = 0 (SCITX pin is a general-purpose I/O.) TX DATA DIR = 1 (SCITX pin is a general-purpose output.) 0=Output value on SCITX is a 0 (logic low). 1=Output value on SCITX is a 1 (logic high).
1	RX_DATA_OUT	R/W	0h	Contains the data to be output on pin SCIRX if the following conditions are met: RX FUNC = 0 (SCIRX pin is a general-purpose I/O.) RX DATA DIR = 1 (SCIRX pin is a general-purpose output.) 0=Output value on SCIRX is 0 (logic low). 1=Output value on SCIRX is 1 (logic high).
0	CLK_DATA_OUT	R/W	0h	Contains the data to be output on pin SCICLK if the following conditions are met: CLK FUNC = 0 (SCICLK pin is a general-purpose I/O.) CLK DATA DIR = 1 (SCICLK pin is a general-purpose output.) 0=Output value on SCICLK is a 0 (logic low). 1=Output value on SCICLK is a 1 (logic high).

11.1.3.1.6.20 SCIPIO4 Register (Offset = 4Ch) [Reset = 00000000h]

SCIPIO4 is shown in Table 11-141.

Return to the Summary Table.

SCI Pin I/O Control Register 4

Table 11-141. SCIPIO4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_DATA_SET	R/W	0h	Sets the data to be output on pin SCITX if the following conditions are met: TX FUNC = 0 (SCITX pin is a general-purpose I/O.) TX DATA DIR = 1 (SCITX pin is a general-purpose output.)
1	RX_DATA_SET	R/W	0h	Sets the data to be output on pin SCIRX if the following conditions are met: RX FUNC = 0 (SCIRX pin is a general-purpose I/O.) RX DATA DIR = 1 (SCIRX pin is a general-purpose output.)
0	CLK_DATA_SET	R/W	0h	Sets the data to be output on pin SCICLK if the following conditions are met: CLK FUNC = 0 (SCICLK pin is a general-purpose I/O.) CLK DATA DIR = 1 (SCICLK pin is a general-purpose output.)

11.1.3.1.6.21 SCIPIO5 Register (Offset = 50h) [Reset = 00000000h]

SCIPIO5 is shown in Table 11-142.

Return to the Summary Table.

SCI Pin I/O Control Register 5

Table 11-142. SCIPIO5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_DATA_CLR	R/W	0h	Clears the data to be output on pin SCITX if the following conditions are met: TX FUNC = 0 (SCITX pin is a general-purpose I/O.) TX DATA DIR = 1 (SCITX pin is a general-purpose output.)
1	RX_DATA_CLR	R/W	0h	Clears the data to be output on pin SCITX if the following conditions are met: TX FUNC = 0 (SCITX pin is a general-purpose I/O.) TX DATA DIR = 1 (SCITX pin is a general-purpose output.)
0	CLK_DATA_CLR	R/W	0h	Clears the data to be output on pin SCITX if the following conditions are met: TX FUNC = 0 (SCITX pin is a general-purpose I/O.) TX DATA DIR = 1 (SCITX pin is a general-purpose output.)

11.1.3.1.6.22 SCIPIO6 Register (Offset = 54h) [Reset = 00000000h]

SCIPIO6 is shown in Table 11-143.

Return to the Summary Table.

SCI Pin I/O Control Register 6

Table 11-143. SCIPIO6 Register Field Descriptions

SCIIODCTRL is shown in Table 11-155.

Return to the Summary Table.

SCI IO DFT Control

Table 11-155. SCIIODCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26	FEN	R/W	0h	Frame Error Enable. User and Privileged Mode Reads and Writes: 1 = This bit is used to create a Frame Error. The stop bit received is ANDed with '0' and passed to the stop bit check circuitry. 0 = No effect.
25	PEN	R/W	0h	Parity Error Enable. User and Privileged Mode Reads and Writes: 1 = This bit is used to create a Parity Error. The parity bit received is toggled so that a parity error occurs. 0 = No effect
24	BRKDT_ENA	R/W	0h	Break Detect Error Enable. User and Privileged Mode Reads and Writes: 1 = This bit is used to create BRKDT Error. The stop bit of the frame is ANDed with '0' and passed to the RSM so that a frame error occurs. Then the RX pin is forced to continuous low for 10 TBITS so that a BRKDT error occurs. 0 = No effect.
23-21	RESERVED	R	0h	Reserved
20-19	PIN_SAMPLE_MASK	R/W	0h	PIN SAMPLE MASK These bits define the sample number at which the TX Pin value that is being transmitted will be inverted to verify the receive pin samples majority detection circuitry. PIN SAMPLE MASK: 00 -- No Mask, 01 -- Invert the TX Pin value at 7th SCLK, 10 -- Invert the TX Pin value at 8th SCLK, 11 -- Invert the TX Pin value at 9th SCLK.
18-16	TX_SHIFT	R/W	0h	These bits define the delay by which the value on TX pin is delayed so that the value on RX Pin is asynchronous. (Not applicable to Start Bit) TX SHIFT: 000 -- No Delay, 001 -- Delay by 1 SCLK, 010 -- Delay by 2 SCLKs, 011 -- Delay by 3 SCLKs, 100 -- Delay by 4 SCLKs, 101 -- Delay by 5 SCLKs, 110 -- Delay by 6 SCLKs, 111 -- No Delay.
15-12	RESERVED	R	0h	Reserved
11-8	IODFTENA	R/W	0h	These bits define the delay by which the value on TX pin is delayed so that the value on RX Pin is asynchronous. (Not applicable to Start Bit) TX SHIFT: 000 -- No Delay, 001 -- Delay by 1 SCLK, 010 -- Delay by 2 SCLKs, 011 -- Delay by 3 SCLKs, 100 -- Delay by 4 SCLKs, 101 -- Delay by 5 SCLKs, 110 -- Delay by 6 SCLKs, 111 -- No Delay.
7-2	RESERVED	R	0h	Reserved

Table 11-155. SCIIODCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	LBP_ENA	R/W	0h	Module loopback enable. user and privileged mode reads: Write only in privileged mode: write/ read : 1=Analog loopback is enabled in module I/O DFT mode(when IODFTENA = 1010) 0=Digital loopback is enabled.
0	RXP_ENA	R/W	0h	Module Analog loopback through receive pin enable. user and privileged mode reads: Write only in privileged mode: write/ read : 1=Analog loopback through receive pin. 0=Analog loopback through transmit pin.

11.1.3.1.7 SCI GPIO Functionality

The following sections apply to all device pins that can be configured as functional or general-purpose I/O pins.

11.1.3.1.7.1 GPIO Functionality

Figure 11-26 illustrates the GPIO functionality.

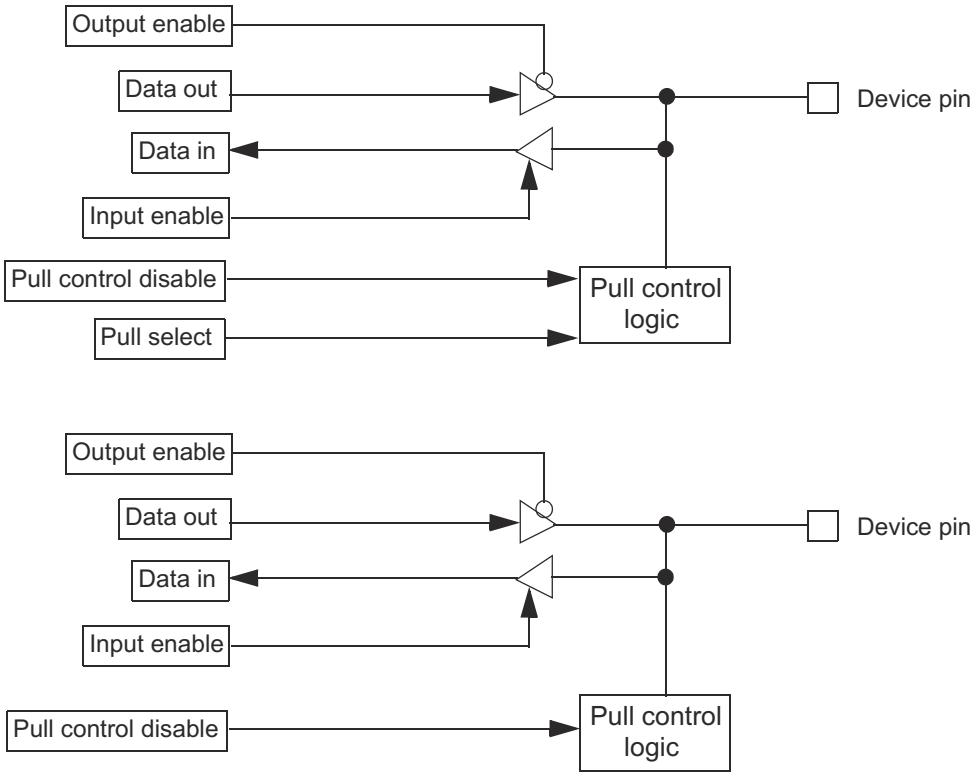

Figure 11-26. GPIO Functionality

11.1.3.1.7.2 Under Reset

The following apply if a device is under reset:

- Pull control. The reset pull control on the pins is enabled.
- Input buffer. The input buffer is enabled.
- Output buffer. The output buffer is disabled.

11.1.3.1.7.3 Out of Reset

The following apply if the device is out of reset:

- Pull control. The pull control is enabled by clearing the PD (pull control disable) bit in the SCIPIO7 register (SCIPIO7 Register (Offset = 58h) [Reset = 00000000h]). In this case, if the PSL (pull select) bit in the SCIPIO8 register (Section 12.1.3.1.6.24) is set, the pin will have a pull-up. If the PSL bit is cleared, the pin will have a pull-down. If the PD bit is set in the control register, there is no pull-up or pull-down on the pin.
- Input buffer. The input buffer is always enabled in functional mode.

Note

The pull-disable logic depends on the pin direction. It is independent of whether the device is in I/O or functional mode. If the pin is configured as output or transmit, then the pulls are disabled automatically. If the pin is configured as input or receive, the pulls are enabled or disabled depending on bit PD in the pull disable register SCIPIO7 (Section 12.1.3.1.6.23).

- Output buffer. A pin can be driven as an output pin if the TX DIR bit is set in the pin direction control register (SCIPIO1; Section 12.1.3.1.6.17) AND the open-drain feature is not enabled in the SCIPIO6 register (Section 12.1.3.1.6.22).

11.1.3.1.7.4 Open-Drain Feature Enabled on a Pin

The following apply if the open-drain feature is enabled on a pin:

- The output buffer is enabled, if a low signal is being driven on to the pin.
- The output buffer is disabled (the direction control signal DIR is internally forced low), if a high signal is being driven on to the pin.

Note

The open-drain feature is available only in I/O mode (SCIPIO0; Section 12.1.3.1.6.16).

11.1.3.1.7.5 Summary

The behavior of the input buffer, output buffer, and the pull control is summarized in Table 11-156.

Table 11-156. Input Buffer, Output Buffer, and Pull Control Behavior as GPIO Pins

Device under Reset?	Pin Direction (DIR) (1) (2)	Pull Disable (PULDIS) (1) (3)	Pull Select (PULSEL) (1) (4)	Pull Control	Output Buffer	Input Buffer
Yes	X	X	X	Enabled	Disabled	Enabled
No	0	0	0	Pull down	Disabled	Enabled
No	0	0	1	Pull up	Disabled	Enabled
No	0	1	0	Disabled	Disabled	Enabled
No	0	1	1	Disabled	Disabled	Enabled
No	1	X	X	Disabled	Enabled	Enabled

(1) X = Don't care
(2) DIR = 0 for input, = 1 for output
(3) PULDIS = 0 for enabling pull control
= 1 for disabling pull control
(4) PULSEL= 0 for pull-down functionality
= 1 for pull-up functionality

11.1.3.2 RCSS_SCI

11.1.3.2.1 RCSS SCI UART Overview

The RCSS SCI module is a universal asynchronous receiver-transmitter that includes an Infrared Data Association (IrDA), Serial InfraRed (SIR) protocol ENcoder/DECoder (ENDEC). RCSS SCI's UART Technical Reference Manual can be found here, and the registers are included in the next section.

11.1.3.2.2 RCSS_SCI Registers

RCSS_SCI Registers lists the memory-mapped registers for the RCSS_SCI registers. All register offset addresses not listed in *RCSS_SCI Registers* should be considered as reserved locations and the register contents should not be modified.

Table 11-157. RCSS_SCI Registers

Offset	Acronym	Register Name	Section
0h	UARTDR	Data Register	Go
4h	UARTRSR_ECR	Receive Status Register	Go
18h	UARTFR	Flag Register	Go
20h	UARTILPR	IrDA Low-Power Counter Register	Go
24h	UARTIBRD	Integer Baud Rate Register	Go
28h	UARTFBRD	Fractional Baud Rate Register	Go
2Ch	UARTLCR_H	Line Control Register	Go
30h	UARTCR	Control Register	Go
34h	UARTIFLS	Interrupt FIFO Level Select Register	Go
38h	UARTIMSC	Interrupt Mask Set/Clear Register	Go
3Ch	UARTRIS	Raw Interrupt Status Register	Go
40h	UARTMIS	Masked Interrupt Status Register	Go
44h	UARTICR	Interrupt Clear Register	Go
48h	UARTDMACR	DMA Control Register	Go
FE0h	UARTPERIPHID0	Peripheral Identification Register 0	Go
FE4h	UARTPERIPHID1	Peripheral Identification Register 1	Go
FE8h	UARTPERIPHID2	Peripheral Identification Register 2	Go
FECh	UARTPERIPHID3	Peripheral Identification Register 3	Go
FF0h	UARTPCELLID0	PrimeCell Identification Registers 0	Go
FF4h	UARTPCELLID1	PrimeCell Identification Registers 1	Go
FF8H	UARTPCELLID2	PrimeCell Identification Registers 2	Go
FFCh	UARTPCELLID3	PrimeCell Identification Registers 3	Go

Complex bit access types are encoded to fit into small table cells. *RCSS_SCI Access Type Codes* shows the codes that are used for access types in this section.

Table 11-158. MSS_SCI Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

11.1.3.2.2.1 UARTDR Register (Offset = 0h) [Reset = 00000000h]

UARTDR is shown in UARTDR Register Field Description

Return to the Summary Table.

The UARTDR register is the Data Register

Table 11-159. UARTDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R	0h	Reserved
11	OE	R/W	0h	Overrun error. This bit is set to 1 if data is received and the receive FIFO is already full.This is cleared to 0 once there is an empty space in the FIFO and a new character can be written to it.
10	BE	R/W	0h	Break error. This bit is set to 1 if a break condition was detected, indicating that the received data inputwas held LOW for longer than a full-word transmission time (defined as start, data, parity and stopbits).In FIFO mode, this error is associated with the character at the top of the FIFO. When a break occurs,only one 0 character is loaded into the FIFO. The next character is only enabled after the receive datainput goes to a 1 (marking state), and the next valid start bit is received.
9	PE	R/W	0h	Parity error. When set to 1, it indicates that the parity of the received data character does not match theparity that the EPS and SPS bits in the Line Control Register, UARTLCR. In FIFO mode, this error is associated with the character at the top of the FIFO.
8	FA	R/W	0h	Framing error. When set to 1, it indicates that the received character did not have a valid stop bit (a validstop bit is 1). In FIFO mode, this error is associated with the character at the top of the FIFO
0	DATA	R/W	0h	Receive data character & Transmit data character

11.1.3.2.2.2 UARTRSR_ECR Register (Offset = 4h) [Reset = 00000000h]

UARTRSR_ECR is shown in UARTRSR_ECR Regsiter Field Descriptions

Return to the Summary Table.

The UARTRSR_ECR is the Receive Status Register/Error Clear Register

Table 11-160. UARTRSR_ECR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3	OE	R/W	0h	Overrun error. This bit is set to 1 if data is received and the FIFO is already full.This bit is cleared to 0 by a write to UARTECR.The FIFO contents remain valid because no more data is written when the FIFO is full, only the contentsof the shift register are overwritten. The CPU must now read the data, to empty the FIFO
2	BE	R/W	0h	Break error. This bit is set to 1 if a break condition was detected, indicating that the received data inputwas held LOW for longer than a full-word transmission time (defined as start, data, parity, and stop bits).This bit is cleared to 0 after a write to UARTECR.In FIFO mode, this error is associated with the character at the top of the FIFO. When a break occurs,only one 0 character is loaded into the FIFO. The next character is only enabled after the receive datainput goes to a 1 (marking state) and the next valid start bit is received
1	PE	R/W	0h	Parity error. When set to 1, it indicates that the parity of the received data character does not match theparity that the EPS and SPS bits in the Line Control Register, UARTLCR_H. This bit is cleared to 0 by a write to UARTECR. In FIFO mode, this error is associated with the character at the top of the FIFO.
0	FE	R/W	0h	Framing error. When set to 1, it indicates that the received character did not have a valid stop bit (a validstop bit is 1).This bit is cleared to 0 by a write to UARTECR.In FIFO mode, this error is associated with the character at the top of the FIFO.

11.1.3.2.2.3 UARTFR Register (Offset = 18h) [Reset = 00000090h]

UARTFR is shown in UARTFR Register Field Descriptions.

Return to the Summary Table.

The UARTFR is the Flag Register

Table 11-161. UARTFR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RESERVED	R	0h	Reserved
8	RI	R	0h	Ring indicator. This bit is the complement of the UART ring indicator, nUARTRI, modem status input. That is, the bit is 1 when nUARTRI is LOW.
7	TXFE	R	1h	Transmit FIFO empty. The meaning of this bit depends on the state of the FEN bit in the Line Control Register, UARTLCR_H. If the FIFO is disabled, this bit is set when the transmit holding register is empty.If the FIFO is enabled, the TXFE bit is set when the transmit FIFO is empty. This bit does not indicate if there is data in the transmit shift register.
6	RXFF	R	0h	Receive FIFO full. The meaning of this bit depends on the state of the FEN bit in the UARTLCR_H Register. If the FIFO is disabled, this bit is set when the receive holding register is full. If the FIFO is enabled, the RXFF bit is set when the receive FIFO is full.
5	TXFF	R	0h	Transmit FIFO full. The meaning of this bit depends on the state of the FEN bit in the UARTLCR_H Register. If the FIFO is disabled, this bit is set when the transmit holding register is full. If the FIFO is enabled, the TXFF bit is set when the transmit FIFO is full.
4	RXFE	R	0h	Receive FIFO empty. The meaning of this bit depends on the state of the FEN bit in the UARTLCR_H Register. If the FIFO is disabled, this bit is set when the receive holding register is empty. If the FIFO is enabled, the RXFE bit is set when the receive FIFO is empty.
3	BUSY	R	0h	UART busy. If this bit is set to 1, the UART is busy transmitting data. This bit remains set until the complete byte, including all the stop bits, has been sent from the shift register. This bit is set as soon as the transmit FIFO becomes non-empty, regardless of whether the UART is enabled or not.
2	DCD	R	0h	Data carrier detect. This bit is the complement of the UART data carrier detect, nUARTDCD, modem status input. That is, the bit is 1 when nUARTDCD is LOW.
1	DSR	R	0h	Data set ready. This bit is the complement of the UART data set ready, nUARTDSR, modem status input. That is, the bit is 1 when nUARTDSR is LOW.
0	CTS	R	0h	Clear to send.

11.1.3.2.2.4 UARTILPR Register (Offset = 20h) [Reset = 00000000h]

UARTILPR is shown in UARTILPR Register Field Descriptions.

Return to the Summary Table.

UARTILPR is the IrDA Low-Power Counter Registers

Table 11-162. UARTTILPR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
7-0	ILPDVSR	R/W	0h	8-bit low-power divisor value. NOTE Zero is an illegal value. Programming a zero value results in no IrLPBaud16 pulses being generated

11.1.3.2.2.5 UARTIBRD Register (Offset = 24h) [Reset = 00000000h]

UARTIBRD is shown in UARTIBRD Register Field Descriptions

Return to the Summary Table.

UARTIBRD is the Integer Baud Rate Register

Table 11-163. UARTIBRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	Reserved
7-0	BAUD_DIVINT	R/W	0h	The fractional baud rate divisor

11.1.3.2.2.6 UARTFBRD Register (Offset = 28h) [Reset = 00000000h]

UARTFBRD is shown in UARTFBRD Register Field Descriptions

Return to the Summary Table.

UARTFBRD Fractional Baud Rate Register

Table 11-164. UARTFBRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R	0h	Reserved
5-0	BAUD_DIVFRAC	R/W	0h	The fractional baud rate divisor. Baud rate divisor BAUDDIV = (FUARTCLK/(16*Baud rate)) where FUARTCLK is the UART reference clock frequency. If the required baud rate is 230400 and UARTCLK = 4MHz then: • Baud Rate Divisor = (4*106)/(16*230400) = 1.085 • This means BRDI = 1 and BRDF = 0.085. • Therefore, fractional part, m = integer((0.085*64)+0.5) = 5 • Generated baud rate divider = 1+5/64 = 1.078 • Generated baud rate = (4*106)/(16*1.078) = 231911 • Error = (231911-230400)/230400*100 = 0.656% • The maximum error using a 6-bit UARTFBRD Register = 1/64*100 = 1.56%. • This occurs when m = 1, and the error is cumulative over 64 clock ticks.

11.1.3.2.2.7 UARTLCR_H Register (Offset = 2Ch) [Reset = 00000000h]

UARTLCR_H is shown in UARTLCR_H Register Field Descriptions

Return to the Summary Table.

UARTLCR_H is the Line Control Register

Table 11-165. UARTLCR_H Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	Reserved
7	SPS	R/W	0h	Stick parity select. 0 = stick parity is disabled 1 = if the EPS bit is 0 then the parity bit is transmitted and checked as a 1 & if the EPS bit is 1 then the parity bit is transmitted and checked as a 0. This bit has no effect when the PEN bit disables parity checking and generation
6:5	WLEN	R/W	0h	Word length. These bits indicate the number of data bits transmitted or received in a frame as follows b11 = 8 bits b10 = 7 bits b01 = 6 bits b00 = 5 bits
4	FEN	R/W	0h	Enable FIFOs: 0 = FIFOs are disabled (character mode) that is, the FIFOs become 1-byte-deep holding registers 1 = transmit and receive FIFO buffers are enabled (FIFO mode)
3	STP2	R/W	0h	Two stop bits select. If this bit is set to 1, two stop bits are transmitted at the end of the frame. The receive logic does not check for two stop bits being received.
2	EPS	R/W	0h	Even parity select. Controls the type of parity the UART uses during transmission and reception: 0 = odd parity. The UART generates or checks for an odd number of 1s in the data and parity bits. 1 = even parity. The UART generates or checks for an even number of 1s in the data and parity bits. This bit has no effect when the PEN bit disables parity checking and generation
1	PEN	R/W	0h	Parity enable: 0 = parity is disabled and no parity bit added to the data frame 1 = parity checking and generation is enabled
0	BRK	R/W	0h	Send break. If this bit is set to 1, a low-level is continually output on the UARTTXD output, after completing transmission of the current character. For the proper execution of the break command, the software must set this bit for at least two complete frames. For normal use, this bit must be cleared to 0.

11.1.3.2.2.8 UARTCR Register (Offset = 30h) [Reset = 00000300h]

UARTCR is shown in UARTCR Regsiter Field Description

Return to the Summary Table.

UARTCR is the Control Register

Table 11-166. UARTCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	Reserved
15	CTSEN	R/W	0h	CTS hardware flow control enable. If this bit is set to 1, CTS hardware flow control is enabled. Data is only transmitted when the nUARTCTS signal is asserted
14	RTSEN	R/W	0h	RTS hardware flow control enable. If this bit is set to 1, RTS hardware flow control is enabled. Data is only requested when there is space in the receive FIFO for it to be received
13	OUT2	R/W	0h	This bit is the complement of the UART Out2 (nUARTOut2) modem status output. That is, when the bit is programmed to a 1, the output is 0. For DTE this can be used as Ring Indicator (RI).
12	OUT1	R/W	0h	This bit is the complement of the UART Out1 (nUARTOut1) modem status output. That is, when the bit is programmed to a 1 the output is 0. For DTE this can be used as Data Carrier Detect (DCD).
11	RTS	R/W	0h	Request to send. This bit is the complement of the UART request to send, nUARTRTS, modem status output. That is, when the bit is programmed to a 1 then nUARTRTS is LOW
10	DTR	R/W	0h	Data transmit ready. This bit is the complement of the UART data transmit ready, nUARTDTR, modem status output. That is, when the bit is programmed to a 1 then nUARTDTR is LOW
9	RXE	R/W	1h	Receive enable. If this bit is set to 1, the receive section of the UART is enabled. Data reception occurs for either UART signals or SIR signals depending on the setting of the SIREN bit. When the UART is disabled in the middle of reception, it completes the current character before stopping
8	TXE	R/W	1h	Transmit enable. If this bit is set to 1, the transmit section of the UART is enabled. Data transmission occurs for either UART signals, or SIR signals depending on the setting of the SIREN bit. When the UART is disabled in the middle of transmission, it completes the current character before stopping.
7	LBE	R/W	0h	Loopback enable. If this bit is set to 1 and the SIREN bit is set to 1 and the SIRTEST bit in the Test Control Register, UARTTCR on page 4-5 is set to 1, then the nSIROUT path is inverted, and fed through to the SIRIN path. The SIRTEST bit in the test register must be set to 1 to override the normal half-duplex SIR operation. This must be the requirement for accessing the test registers during normal operation, and SIRTEST must be cleared to 0 when loopback testing is finished. This feature reduces the amount of external coupling required during system test. If this bit is set to 1, and the SIRTEST bit is set to 0, the UARTTXD path is fed through to the UARTRXD path. In either SIR mode or UART mode, when this bit is set, the modem outputs are also fed through to the modem inputs. This bit is cleared to 0 on reset, to disable loopback.
6-3	RESERVED	R/W	0h	Reserved
2	SIRLP	R	0h	SIR low-power IrDA mode. This bit selects the IrDA encoding mode. If this bit is cleared to 0, low-level bits are transmitted as an active high pulse with a width of 3/16th of the bit period. If this bit is set to 1, low-level bits are transmitted with a pulse width that is 3 times the period of the IrLPBaud16 input signal, regardless of the selected bit rate. Setting this bit uses less power, but might reduce transmission distances.

Table 11-166. UARTCR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	SIREN	R/W	0h	SIR enable: 0 = IrDA SIR ENDEC is disabled. nSIROUT remains LOW (no light pulse generated), and signal transitions on SIRIN have no effect. 1 = IrDA SIR ENDEC is enabled. Data is transmitted and received on nSIROUT and SIRIN. UARTTXD remains HIGH, in the marking state. Signal transitions on UARTRXD or modem status inputs have no effect. This bit has no effect if the UARTEN bit disables the UART.
0	UARTEN	R/W	0h	UART enable: 0 = UART is disabled. If the UART is disabled in the middle of transmission or reception, it completes the current character before stopping. 1 = the UART is enabled. Data transmission and reception occurs for either UART signals or SIR signals depending on the setting of the SIREN bit

11.1.3.2.2.9 UARTIFLS Register (Offset = 34h) [Reset = 0000000Ah]

UARTIFLS is shown in UARTIFLS Register Field Descriptions

Return to the Summary Table.

UARTIFLS is the Interrupt FIFO Level Select Register

Table 11-167. UARTIFLS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
5-3	RXIFSEL	R/W	1h	Receive interrupt FIFO level select. The trigger points for the receive interrupt are as follows: • b000 = Receive FIFO becomes ≥ 1/8 full • b001 = Receive FIFO becomes ≥ 1/4 full • b010 = Receive FIFO becomes ≥ 1/2 full • b011 = Receive FIFO becomes ≥ 3/4 full • b100 = Receive FIFO becomes ≥ 7/8 full • b101-b111 = reserved
2-0	TXIFLSEL	R/W	2h	Transmit interrupt FIFO level select. The trigger points for the transmit interrupt are as follows: • b000 = Transmit FIFO becomes ≤ 1/8 full • b001 = Transmit FIFO becomes ≤ 1/4 full • b010 = Transmit FIFO becomes ≤ 1/2 full • b011 = Transmit FIFO becomes ≤ 3/4 full • b100 = Transmit FIFO becomes ≤ 7/8 full • b101-b111 = reserved

11.1.3.2.2.10 UARTIMSC Register (Offset = 38h) [Reset = 00000000h]

UARTIMSC is shown in UARTIMSCR Register Field Description.

Return to the Summary Table.

UARTIMSC is the Interrupt Mask Set/Clear Register

Table 11-168. UARTIMSC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R	0h	Reserved
10	OEIM	R/W	0h	Overrun error interrupt mask. A read returns the current mask for the UARTOEINTR interrupt.On a write of 1, the mask of the UARTOEINTR interrupt is set. A write of 0 clears the mask.
9	BEIM	R/W	0h	Break error interrupt mask. A read returns the current mask for the UARTBEINTR interrupt. On a write of 1, the mask of the UARTBEINTR interrupt is set. A write of 0 clears the mask.
8	PEIM	R/W	0h	Parity error interrupt mask. A read returns the current mask for the UARTPEINTR interrupt.On a write of 1, the mask of the UARTPEINTR interrupt is set. A write of 0 clears the mask.
7	FEIM	R/W	0h	Framing error interrupt mask. A read returns the current mask for the UARTFEINTR interrupt.On a write of 1, the mask of the UARTFEINTR interrupt is set. A write of 0 clears the mask/
6	RTIM	R/W	0h	Receive timeout interrupt mask. A read returns the current mask for the UARTRTINTR interrupt.On a write of 1, the mask of the UARTRTINTR interrupt is set. A write of 0 clears the mask.
5	TXIM	R/W	0h	Transmit interrupt mask. A read returns the current mask for the UARTTXINTR interrupt.On a write of 1, the mask of the UARTTXINTR interrupt is set. A write of 0 clears the mask.
4	RXIM	R/W	0h	Receive interrupt mask. A read returns the current mask for the UARTRXINTR interrupt.On a write of 1, the mask of the UARTRXINTR interrupt is set. A write of 0 clears the mask.
3	DSRMIM	R/W	0h	nUARTDSR modem interrupt mask. A read returns the current mask for the UARTDSRINTR interrupt.On a write of 1, the mask of the UARTDSRINTR interrupt is set. A write of 0 clears the mask.
2	DCDMIM	R/W	0h	nUARTDCD modem interrupt mask. A read returns the current mask for the UARTDCDINTR interrupt.On a write of 1, the mask of the UARTDCDINTR interrupt is set. A write of 0 clears the mask.
1	CTSMIM	R/W	0h	nUARTCTS modem interrupt mask. A read returns the current mask for the UARTCTSINTR interrupt. On a write of 1, the mask of the UARTCTSINTR interrupt is set. A write of 0 clears the mask.
0	RIMIM	R/W	0h	nUARTRI modem interrupt mask. A read returns the current mask for the UARTRIINTR interrupt.On a write of 1, the mask of the UARTRIINTR interrupt is set. A write of 0 clears the mask.

11.1.3.2.2.11 UARTRIS Register (Offset = 3Ch) [Reset = 00000000h]

UARTRIS is shown in uARTRIS Register Field Descriptions

Return to the Summary Table.

UARTRIS is the Raw Interrupt Status Register

Table 11-169. UARTRIS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R	0h	Reserved
9	OERIS	R	0h	Overrun error interrupt status. Returns the raw interrupt state of the UARTOEINTR interrupt. BERIS Break error interrupt status. Returns the raw interrupt state of the UARTBEINTR interrupt.
8	PERIS	R	0h	Parity error interrupt status. Returns the raw interrupt state of the UARTPEINTR interrupt.
7	FERIS	R	0h	Framing error interrupt status. Returns the raw interrupt state of the UARTFEINTR interrupt.
6	RTSIS	R	0h	Receive timeout interrupt status. Returns the raw interrupt state of the UARTRTINTR interrupt.
5	TXRIS	R	0h	Transmit interrupt status. Returns the raw interrupt state of the UARTTXINTR interrupt.
4	RXRIS	R	0h	Receive interrupt status. Returns the raw interrupt state of the UARTRXINTR interrupt.
3	DSRRMIS	R	0h	nUARTDSR modem interrupt status. Returns the raw interrupt state of the UARTDSRINTR interrupt
2	DCDRMIS	R	0h	nUARTDCD modem interrupt status. Returns the raw interrupt state of the UARTDCDINTR interrupt
1	CTSRMIS	R	0h	nUARTCTS modem interrupt status. Returns the raw interrupt state of the UARTCTSINTR interrupt.
0	RIRMIS	R	0h	nUARTRI modem interrupt status. Returns the raw interrupt state of the UARTRIINTR interrupt.

11.1.3.2.2.12 UARTMIS Register (Offset = 40h) [Reset = 00000000h]

UARTMIS is shown in UARTMIS Register Field Descriptions

Return to the Summary Table.

UARTMIS is the Masked Interssupt Status Regsiter

Table 11-170. UARTMIS Register Field Descriptions

Bit	Field	Type	Reset	Description

11.1.4 Multi-Buffered Serial Peripheral Interface Module (MibSPI) with Parallel Pin Option (MibSPIP)

This chapter provides the specifications for a 16-bit configurable synchronous multi-buffered multi-pin serial peripheral interface (MibSPI). This chapter also provides the specifications for MibSPI with Parallel Pin Option (MibSPIP). The MibSPI is a programmable-length shift register used for high-speed communication between external peripherals or other microcontrollers.

Throughout this chapter, all references to SPI also apply to MibSPI/MibSPIP, unless otherwise noted.

Note

This chapter describes a superset implementation of the MibSPI/SPI modules that includes features and functionality that may not be available on some devices. Device-specific content that should be determined by referencing the datasheet includes DMA functionality, MibSPI RAM size, number of transfer groups, number of chip selects, parallel mode support, and availability of 5-pin operation ($\overline{\text{SPIENA}}$).

11.1.4.1 Overview

The MibSPI/MibSPIP is a high-speed synchronous serial input/output port that allows a serial bit stream of programmed length (2 to 16 bits) to be shifted in and out of the device at a programmed bit-transfer rate. Typical applications for the SPI include interfacing to external peripherals, such as I/Os, memories, display drivers, and analog-to-digital converters.

The SPI has the following attributes:

- 16-bit shift register
- Receive buffer register
- 11-bit baud clock generator
- Serial clock (SPICLK) pin
- 1 SPIPOCI/SPIPICO pin for data transfer, with programmable pin direction
- SPI enable ($\overline{\text{SPIENA}}$) pin
- Up to 6 peripheral chip select ($\overline{\text{SPICS}}$) pins
- SPICLK can be internally-generated (and driven) or received from an external clock source
- Each word transferred can have a unique format
- SPI pins can be used as functional or digital Input/Output pins (GIOs)

Note

PICO - Peripheral In Controller Out Pin
POCI - Peripheral Out Controller In Pin
SPICS - SPI Chip Select Pin
SPIENA - SPI Enable Pin

This device has for instances of MibSPI:

- MSS_MIBSPIA
- MSS_MIBSPIB
- RCSS_MIBSPIA
- RCSS_MIBSPIB

11.1.4.1.1 Word Format Options

Each word transferred can have a unique format. Several format characteristics are programmable for each word transferred:

- SPICLK frequency
- Character length (2 to 16 bits)
- Phase (with and without delay)
- Polarity (high or low)
- Parity enabled/disabled
- Chip Select(CS) timers for setup and hold
- Shift direction (Most-Significant Bit (MSB) first or Least-Significant Bit (LSB) first)
- Multi-pin parallel modes

11.1.4.1.2 Multi-buffering (Mib) Support

The MibSPI has a programmable buffer memory that enables programmed transmission to be completed without CPU intervention. The buffers are combined in different Transfer Groups (TGs) that can be triggered by external events (timers, Input/Output activity, and so on) or by the internal tick counter. The internal tick counter supports periodic trigger events. Each buffer of the MibSPI can be associated with different DMA channels in different TGs, allowing the user to move data between internal memory and an external controller with minimal CPU interaction.

11.1.4.1.2.1 Multi-buffer Mode

Multi-buffer Mode is an extension to the SPI. In multi-buffer mode, many extended features are configurable:

- Number of buffers for each peripheral (or data source/destination, up to 128 buffers supported) or group (up to 8 groupings)
- Triggers for each group, trigger types, trigger sources for individual groups (14 external trigger sources and 1 internal trigger source supported)
- Memory fault detection via an internal parity circuit
- Number of DMA-controlled buffers and number of DMA request channels (up to 8 for each of transmit and receive)
- Number of DMA transfers for each buffer (up to 65536 words for up to 8 buffers)
- Uninterrupted DMA buffer transfer (NOBREAK buffer)

11.1.4.1.2.2 Compatibility Mode

Compatibility Mode of the MibSPI makes it behave exactly like a standard platform SPI module and ensures full compatibility with other SPIs. All features in compatibility mode of the MibSPI are directly applicable to a SPI. Multi-buffer Mode features are not available in Compatibility Mode.

Note

The SPIDAT0 register is not accessible in the multi-buffer mode of MibSPI. It is only accessible in compatibility mode.

11.1.4.1.3 Transmission Lock (Multi-Buffer Mode Controller Only)

Some peripheral devices require transmission of a command followed by data. In this case the SPI transaction should not be interrupted by another group transfer. The LOCK bit within each buffer allows a consecutive transfer to happen without being interrupted by another higher-priority group transfer.

11.1.4.2 Operating Modes

The SPI can be configured via software to operate as either a controller or a peripheral. The CONTROLLER bit (SPIGCR1[0]) selects the configuration of the SPIPICO and SPIPOCI pins. CLKMOD bit (SPIGCR1[1]) determines whether an internal or external clock source will be used.

The chip select ($\overline{\text{SPICS}}$) pins are used when communicating with multiple peripheral devices or, with a single peripheral device, to delimit messages containing a leading register address. When a write occurs to SPIDAT1 in controller mode, the $\overline{\text{SPICS}}$ pins are automatically driven to select the specified peripheral device.

Handshaking mechanism, provided by the $\overline{\text{SPIENA}}$ pin, enables a peripheral SPI to delay the generation of the clock signal supplied by the controller if it is not prepared for the next exchange of data.

Note

If in the peripheral mode of operation and configured in either 3-pin or 4-pin (without $\overline{\text{SPIENA}}$) modes, there must be a minimum of 8 VCLK cycles of delay between the last SPICLK and the start of the SPICLK for the next buffer transmit. In general, this equates to a VCLK/SPICLK ratio of ≤16 requiring a minimum of 1 SPICLK delay between transmissions.

11.1.4.2.1 Pin Configurations

The SPI supports data connections as shown in Table 11-181.

Note

1. When the SPICS signals are disabled, the chip select field in the transmit data is not used.
2. When the SPIENA signal is disabled, the SPIENA pin is ignored in controller mode, and not driven as part of the SPI transaction in peripheral mode.

Table 11-181. Pin Configurations

Pin	Controller Mode		Peripheral Mode	
SPICLK	Drives the clock to external devices		Receives the clock from the external controller	
SPIPSOCI	Receives data from the external peripheral		Sends data to the external controller	
SPIPICO	Transmits data to the external peripheral		Receives data from the external controller	
SPIENA	**SPIENA disabled:** GIO	**SPIENA enabled:** Receives ENA signal from the external peripheral	**SPIENA disabled:** GIO	**SPIENA enabled:** Drives ENA signal from the external controller
SPICS	**SPICS disabled:** GIO	**SPICS enabled:** Selects one or more peripheral devices	**SPICS disabled:** GIO	**SPICS enabled:** Receives the CS signal from the external controller

11.1.4.2.2 Data Handling

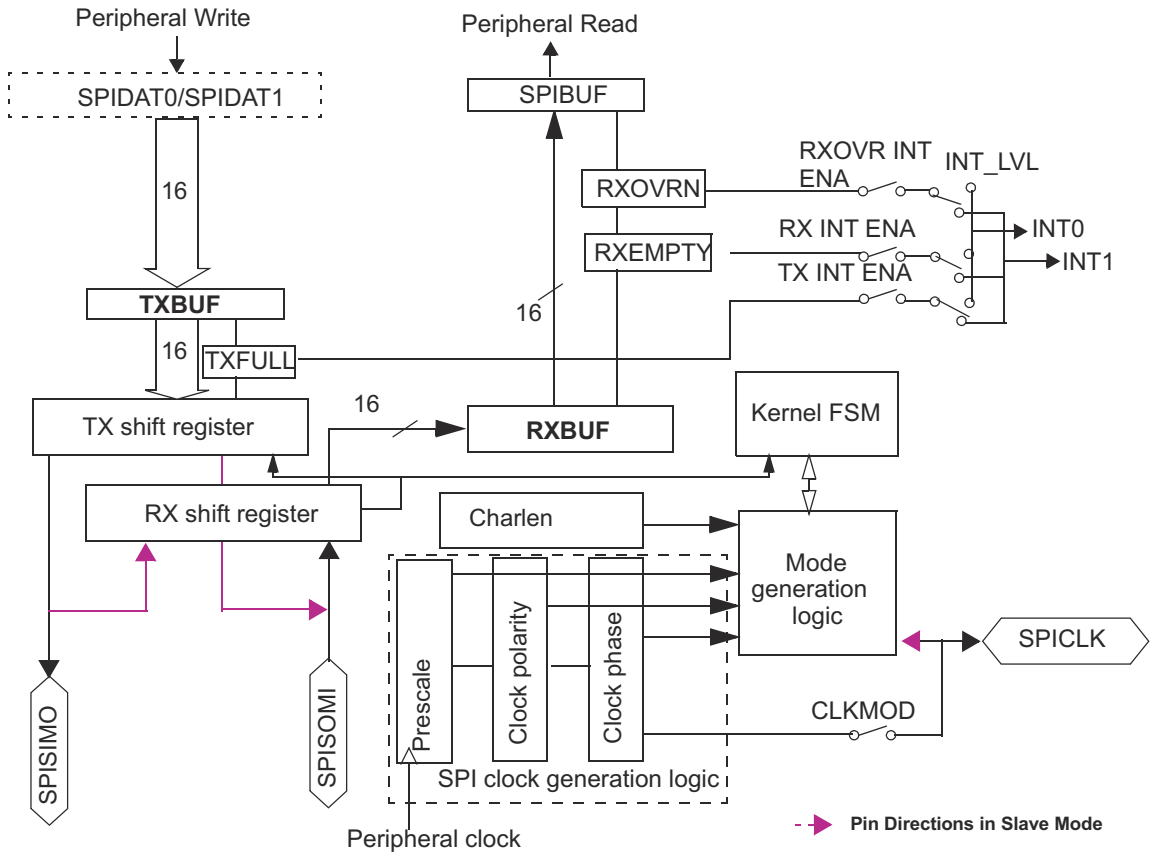
Figure 11-27 shows the SPI transaction hardware. TXBUF and RXBUF are internal buffers that are intended to improve the overall throughput of data transfer. TXBUF is a transmit buffer, while RXBUF is a receive buffer.

11.1.4.2.2.1 Data Sequencing when SPIDAT0 or SPIDAT1 is Written

- If both the TX shift register and TXBUF are empty, then the data is directly copied to the TX shift register. For devices with DMA, if DMA is enabled, a transmit DMA request (TX_DMA_REQ) is generated to cause the next word to be fetched. If transmit interrupts are enabled, a transmitter-empty interrupt is generated.
- If the TX shift register is already full or is in the process of shifting and if TXBUF is empty then the data written to SPIDAT0 / SPIDAT1 is copied to TXBUF and TXFULL flag is set to 1 at the same time.
- When a shift operation is complete, data from the TXBUF (if it is full) is copied into TX shift register and the TXFULL flag is cleared to 0 to indicate that next data can be fetched. A transmit DMA request (if enabled) or a transmitter-empty interrupt (if enabled) is generated at the same time.

11.1.4.2.2.2 Data Sequencing when All Bits Shifted into RXSHIFT Register

- If both SPIBUF and RXBUF are empty, the received data in RX shift register is directly copied into SPIBUF and the receive DMA request (if enabled) is generated and the receive-interrupt (if enabled) is generated. The RXEMPTY flag in SPIBUF is cleared at the same time.
- If SPIBUF is already full at the end of receive completion, the RX shift register contents is copied to RXBUF. A receive DMA request is generated, if enabled. The receive complete interrupt line remains high.
- If SPIBUF is read by the CPU or DMA and if RXBUF is full, then the contents of RXBUF are copied to SPIBUF as soon as SPIBUF is read. RXEMPTY flag remains cleared, indicating that SPIBUF is still full.
- If both SPIBUF and RXBUF are full, then RXBUF will be overwritten and the RXOVR interrupt flag is set and an interrupt is generated, if enabled.



1 This is a representative diagram, which shows three-pin mode hardware.
2 TXBUF, RXBUF, and SHIFT_REGISTER are user-invisible registers.
3 SPIDAT0 and SPIDAT1 are user-visible, and are physically mapped to the contents of TXBUF.
4 SPISIMO, SPISOMI, SPICLK pin directions depend on the Master or Slave Mode.

Figure 11-27. SPI Functional Logic Diagram

11.1.4.2.2.3 Three-Pin Mode

In controller mode configuration (MASTER = 1 and CLKMOD = 1), the SPI provides the serial clock on the SPICLK pin. Data is transmitted on the SPISIMO pin and received on the SPISOMI pin (see Figure 11-28).

Data written to the shift register (SPIDAT0 / SPIDAT1) initiates data transmission on the SPISIMO pin, MSB first. Simultaneously, received data is shifted through the SPISOMI pin into the LSB of the SPIDAT0 register. When the selected number of bits have been transmitted, the received data in the shift register is transferred to the SPIBUF register for the CPU to read. Data is stored right-justified in SPIBUF.

See Section 11.1.4.2.2.1 and Section 11.1.4.2.2.2 for details about the data handling for transmit and receive operations.

In peripheral mode configuration (MASTER = 0 and CLKMOD = 0), data shifts out on the SPIPOCI pin and in on the SPIPICO pin. The SPICLK pin is used as the input for the serial shift clock, which is supplied from the external network controller. The transfer rate is defined by this clock.

Data written to the SPIDAT0 or SPIDAT1 register is transmitted to the network when the SPICLK signal is received from the network controller. To receive data, the SPI waits for the network controller to send the SPICLK signal and then shifts data on the SPISIMO pin into the RX shift register. If data is to be transmitted by the peripheral simultaneously, it must be written to the SPIDAT0 or SPIDAT1 register before the beginning of the SPICLK signal.

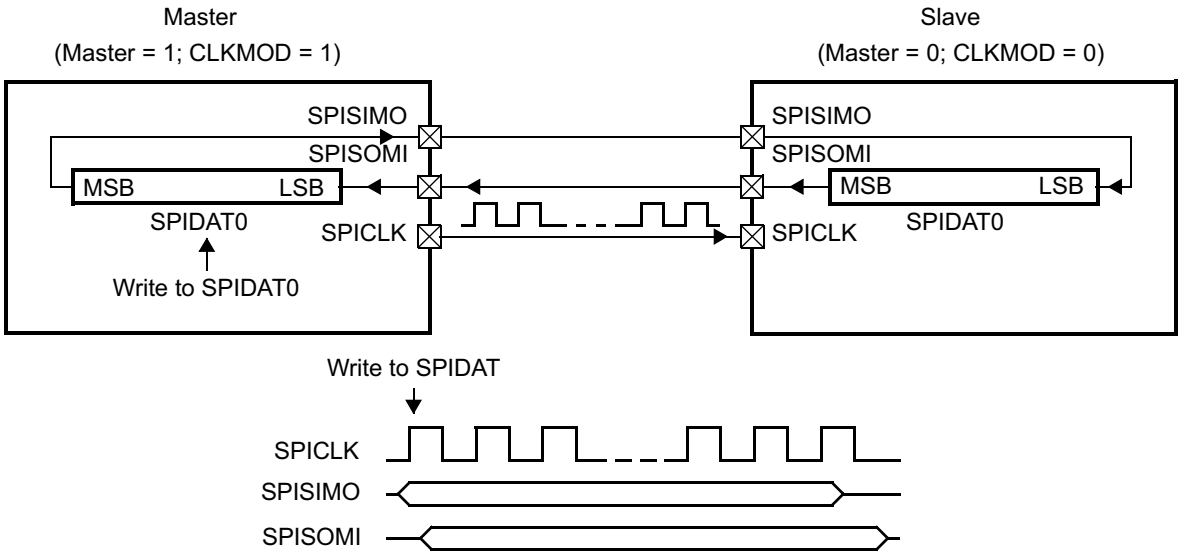


Figure 11-28. SPI Three-Pin Operation

11.1.4.2.3 Operation with $\overline{\text{SPICS}}$

In controller mode, each chip select signal is used to select a specific peripheral. In peripheral mode, the chip select signal is used to enable and disable the transfer. Chip-select functionality is enabled by setting one of the $\overline{\text{SPICS}}$ pins as a chip select. It is disabled by setting all $\overline{\text{SPICS}}$ pins as GIOs in SPIPC0.

11.1.4.2.3.1 Multiple Chip Selects

The $\overline{\text{SPICS}}$ pins that are used must be configured as functional pins in the SPIPC0 register. The default pattern to be put on the $\overline{\text{SPICS}}$ when all the peripherals are deactivated is set in the SPIDEF register. This pattern allows different peripherals with different chip-select polarity to be activated by the SPI.

The controller-mode SPI is capable of driving either 0 or 1 as the active value for any $\overline{\text{SPICS}}$ output pin. The drive state for the $\overline{\text{SPICS}}$ pins is controlled by the CSNR field of SPIDAT1. The pattern that is driven will select the peripheral to which the transmission is dedicated.

In peripheral mode, the SPI can only be selected by an active value of 0 on any of its selected $\overline{\text{SPICS}}$ input pins.

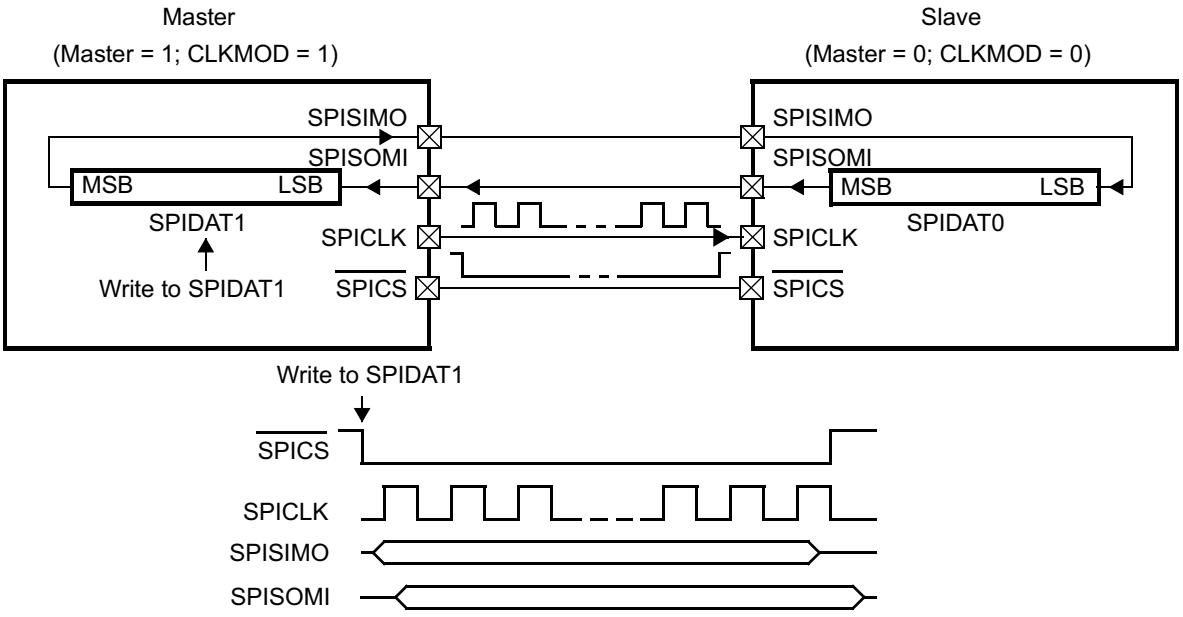

Figure 11-29. Operation with $\overline{\text{SPICS}}$

11.1.4.2.4 Operation with SPIENA

The SPIENA operates as a WAIT signal pin. For both the peripheral and the controller, the SPIENA pin must be configured to be functional (SPIPC0[8] = 1). In this mode, an active-low signal from the peripheral on the SPIENA pin allows the controller SPI to drive the clock pulse stream. A high signal tells the controller to hold the clock signal (and delay SPI activity).

If the SPIENA pin is in high-impedance mode (ENABLE_HIGHZ = 1), the peripheral will put SPIENA into the high-impedance once it completes receiving a new character. If the SPIENA pin is in push-pull mode (ENABLE_HIGHZ = 0), the peripheral will drive SPIENA to 1 once it completes receiving a new character. The peripheral will drive SPIENA low again for the next word to transfer, after new data is written to the peripheral TX shift register.

In controller mode (CLKMOD = 1), if the SPIENA pin is configured as functional, then the pin acts as an input pin. If configured as a peripheral SPI and as functional, the SPIENA pin acts as an output pin.

Note

During a transfer, if a peripheral-mode SPI detects a deassertion of its chip select before its internal character length counter overflows, then it places SPISOMI and SPIENA (if ENABLE_HIGHZ bit is set to 1) in high-impedance mode. Once this condition has occurred, if a SPICLK edge is detected while the chip select is deasserted, then the SPI stops that transfer and sets an DLENERR error flag and generates an interrupt (if enabled).

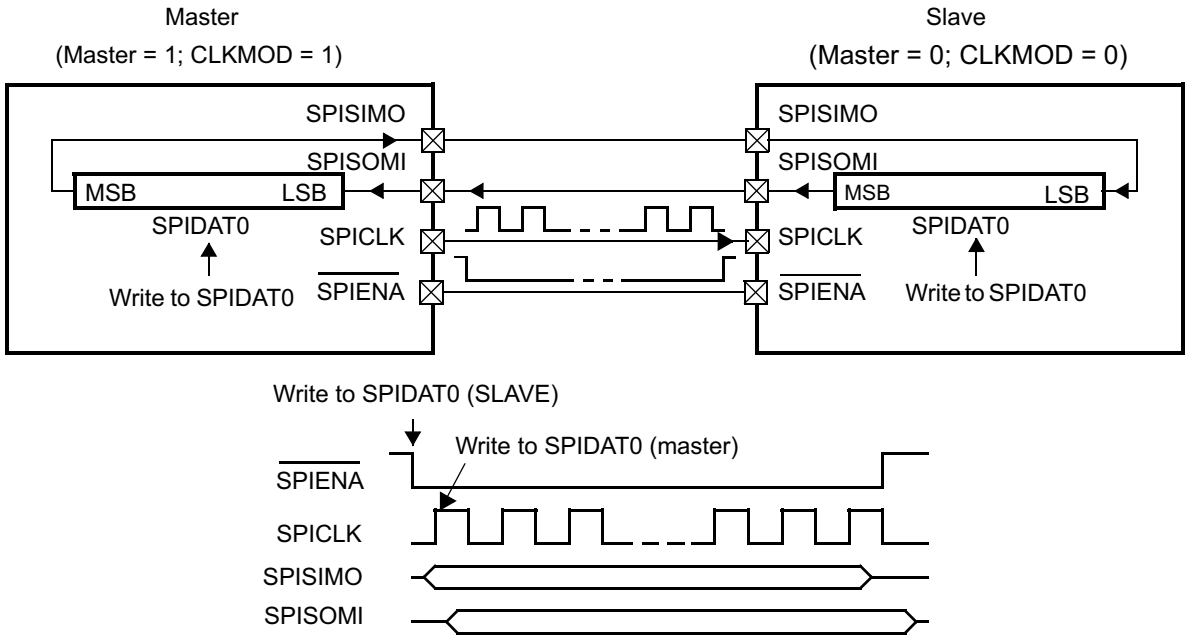

Figure 11-30. Operation with SPIENA

11.1.4.2.5 Five-Pin Operation (Hardware Handshaking)

Five-pin operation combines the functionality of three-pin mode, plus the enable pin and one or more chip select pins. The result is full hardware handshaking. To use this mode, both the $\overline{\text{SPIENA}}$ pin and the required number of $\overline{\text{SPICS}}$ pins must be configured as functional pins.

If the $\overline{\text{SPIENA}}$ pin is in high-impedance mode (ENABLE_HIGHZ = 1), the peripheral SPI will put this signal into the high-impedance state by default. The peripheral will drive the signal $\overline{\text{SPIENA}}$ low when new data is written to the peripheral shift register and the peripheral has been selected by the controller ($\overline{\text{SPICS}}$ is low).

If the $\overline{\text{SPIENA}}$ pin is in push-pull mode (ENABLE_HIGHZ = 0), the peripheral SPI drives this pin high by default when it is in functional mode. The peripheral SPI will drive the $\overline{\text{SPIENA}}$ signal low when new data is written to the peripheral shift register (SPIDAT0/SPIDAT1) and the peripheral is selected by the controller ($\overline{\text{SPICS}}$ is low). If the peripheral is deselected by the controller ($\overline{\text{SPICS}}$ goes high), the peripheral $\overline{\text{SPIENA}}$ signal is driven high.

Note

Push-pull mode of the $\overline{\text{SPIENA}}$ pin can be used only when there is a single peripheral in the system. When multiple SPI peripheral devices are connected to the common $\overline{\text{SPIENA}}$ pin, all of the peripherals should configure their $\overline{\text{SPIENA}}$ pins in high-impedance mode.

In controller mode, if the $\overline{\text{SPICS}}$ pins are configured as functional pins, then the pins will be in output mode. A write to the controller's SPIDAT1/SPIDAT0 register will automatically drive the $\overline{\text{SPICS}}$ signals low. The controller will drive the $\overline{\text{SPICS}}$ signals high again after completing the transfer of the bits of the data.

In peripheral mode (CLKMOD = 0), the $\overline{\text{SPICS}}$ pins act as SPI functional inputs.

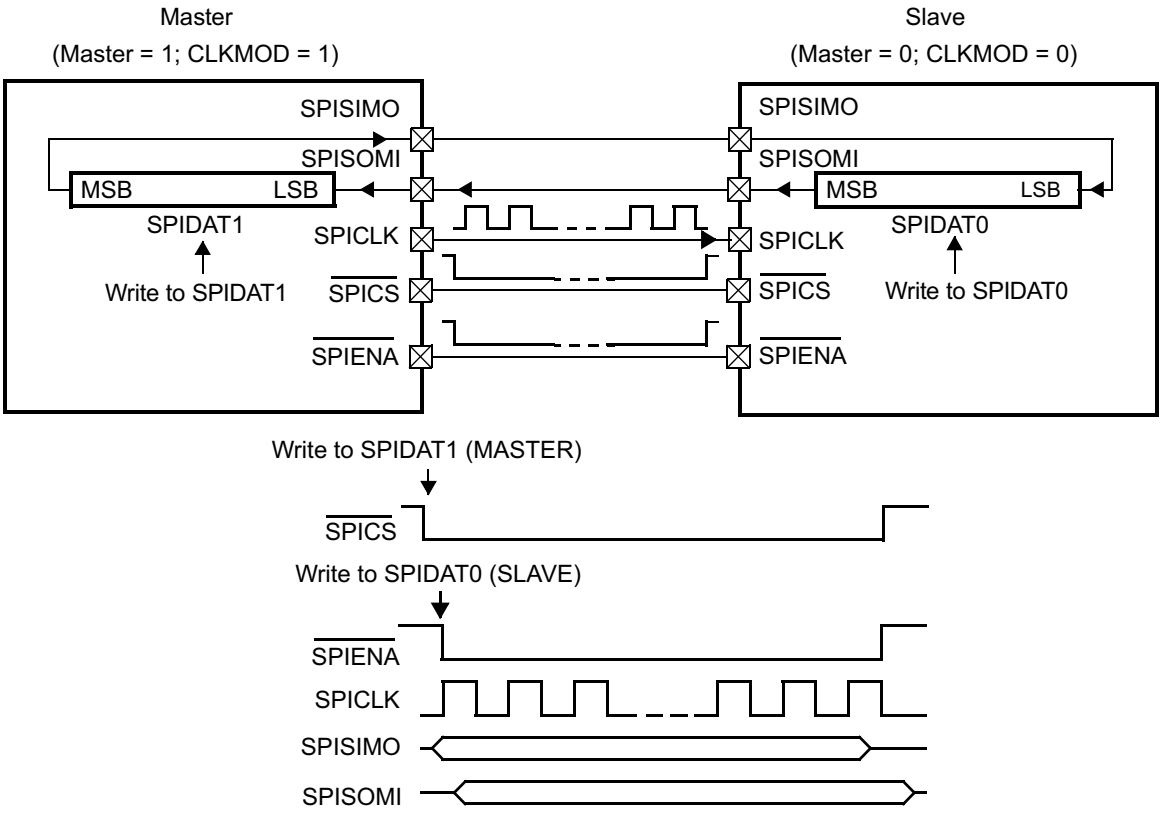

Figure 11-31. SPI Five-Pin Option with $\overline{\text{SPIENA}}$ and $\overline{\text{SPICS}}$

11.1.4.2.6 Data Formats

To support multiple different types of peripherals in one SPI network, four independent data word formats are implemented that allow configuration of individual data word length, polarity, phase, and bit rate. Each word transmitted can select which data format to use via the bits DFSEL[1:0] in its control field from one of the four data word formats. Same data format can be supported on multiple chip selects.

Data formats 0, 1, 2, and 3 can be configured through SPIFMTx control registers.

Each SPI data format includes the standard SPI data format with enhanced features:

- Individually-configurable shift direction can be used to select MSB first or LSB first, whereas the position of the MSB depends on the configured data word length.
- Receive data is automatically right-aligned, independent of shift direction and data word length. Transmit data has to be written right-aligned into the SPI and the internal shift register will transmit according to the selected shift direction and data word length for correct transfer.
- To increase fault detection of data transmission and reception, an odd or even parity bit can be added at the end of a data word. The parity generator can be enabled or disabled individually for each data format. If a received parity bit does not match with the locally calculated parity bit, the parity error flag (PARITYERR) is set and an interrupt is asserted (if enabled).

Since the controller-mode SPI can drive two consecutive accesses to the same peripheral, an 8-bit delay counter is available to satisfy the delay time for data to be refreshed in the accessed peripheral. The delay counter can be programmed as part of the data format.

CHARLEN[4:0] specifies the number of bits (2 to 16) in the data word. The CHARLEN[4:0] value directs the state control logic to count the number of bits received or transmitted to determine when a complete word is transferred.

Data word length **must** be programmed to the same length for both the **controller** and the **peripheral**. However, when chip selects are used, there may be multiple targets with different lengths in the system.

Note

Data must be right-justified when it is written to the SPI for transmission irrespective of its character length or word length.

Figure 11-32 shows how a 12-bit word (0xEC9) needs to be written to the transmit buffer to be transmitted correctly.

Figure 11-32. Format for Transmitting an 12-Bit Word

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
x	x	x	x	1	1	1	0	1	1	0	0	1	0	0	1

Note

The received data is always stored right-justified regardless of the character length or direction of shifting and is padded with leading 0s when the character length is less than 16 bits.

Figure 11-33 shows how a 10-bit word (0x0A2) is stored in the buffer once it is received.

Figure 11-33. Format for Receiving an 10-Bit Word

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	0	1	0	1	0	0	0	1	0

11.1.4.2.7 Clocking Modes

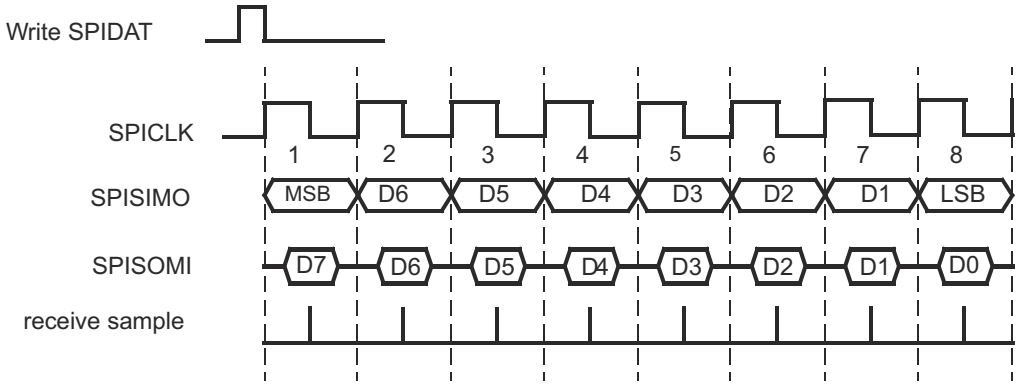
SPICLK may operate in four different modes, depending on the choice of phase (delay/no delay) and the polarity (rising edge/falling edge) of the clock.

The data input and output edges depend on the values of both POLARITY and PHASE as shown in Table 11-182.

Table 11-182. Clocking Modes

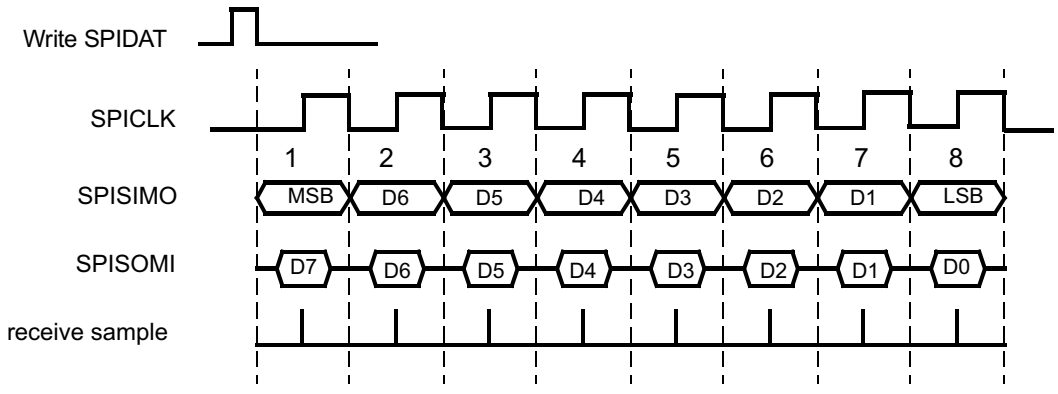
POLARITY	PHASE	Action
0	0	Data is output on the rising edge of SPICLK. Input data is latched on the falling edge.
0	1	Data is output one half-cycle before the first rising edge of SPICLK and on subsequent falling edges. Input data is latched on the rising edge of SPICLK.
1	0	Data is output on the falling edge of SPICLK. Input data is latched on the rising edge.
1	1	Data is output one half-cycle before the first falling edge of SPICLK and on subsequent rising edges. Input data is latched on the falling edge of SPICLK.

Figure 11-34 to Figure 11-37 illustrate the four possible configurations of **SPICLK** corresponding to each mode. Having four signal options allows the SPI to interface with many different types of serial devices.



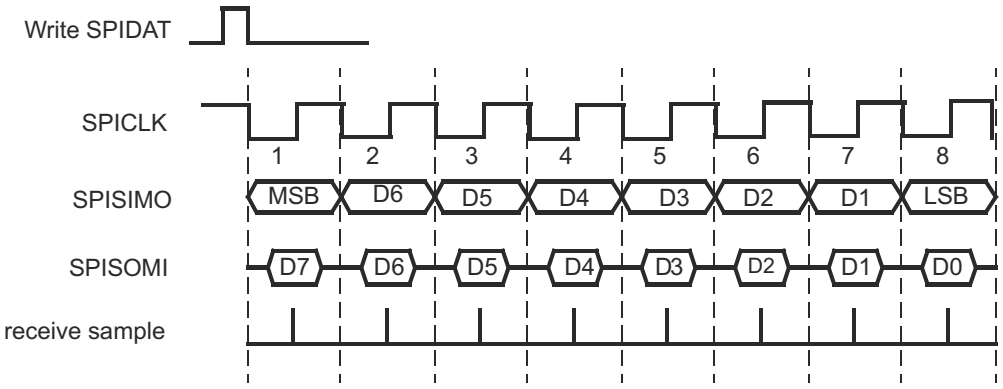
Data is output on the rising edge of SPICLK.
Input data is latched on the falling edge of SPICLK.

Figure 11-34. Clock Mode with Polarity = 0 and Phase = 0



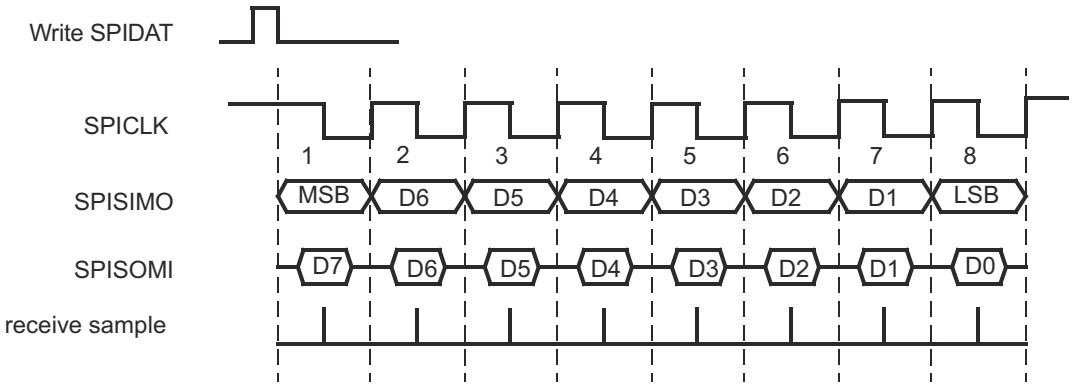
Data is output one-half cycle before the first rising edge of SPICLK and on subsequent falling edges of SPICLK
Input data is latched on the rising edge of SPICLK

Figure 11-35. Clock Mode with Polarity = 0 and Phase = 1



Data is output on the falling edge of SPICLK.
Input data is latched on the rising edge of SPICLK.

Figure 11-36. Clock Mode with Polarity = 1 and Phase = 0



Data is output one-half cycle before the first falling edge of SPICLK and on the subsequent rising edges of SPICLK.
Input data is latched on the falling edge of SPICLK.

Figure 11-37. Clock Mode with Polarity = 1 and Phase = 1

11.1.4.2.8 Data Transfer Example

Figure 11-38 illustrates a SPI data transfer between two devices using a character length of five bits.

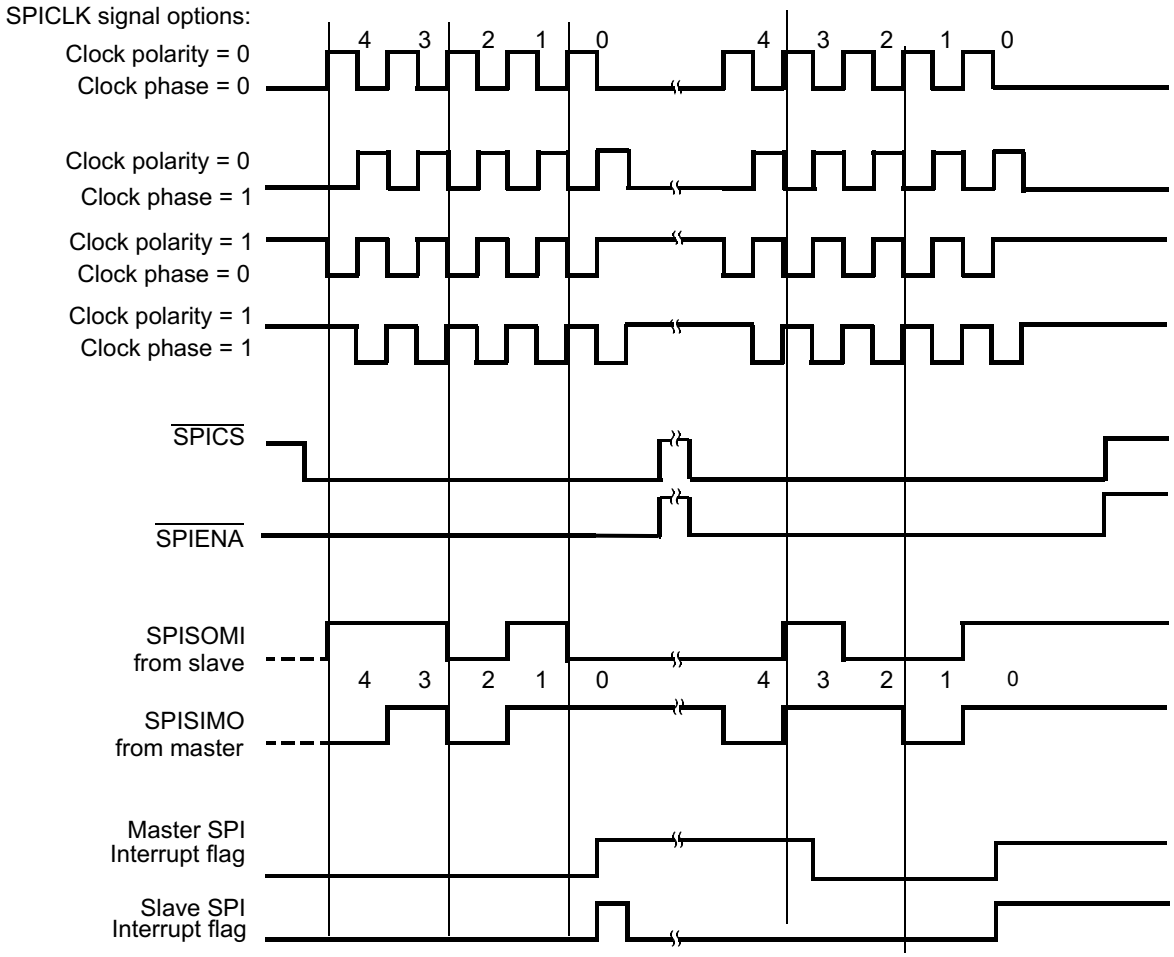


Figure 11-38. Five Bits per Character (5-Pin Option)

11.1.4.2.9 Decoded and Encoded Chip Select (Controller Only)

In this device, the SPI can connect to up to 6 individual peripheral devices using chip-selects by routing one wire to each peripheral. The 6 chip selects in the control field are directly connected to the 6 pins. The default value of each chip select (not active) can be configured via the register CSDEF. During a transmission, the value of the chip select control field (CSNR) of the SPIDAT1 register (SPIDAT1) is driven on the $\overline{\text{SPICS}}$ pins. When the transmission finishes, the default chip-select value (defined by the CSDEF register) is put on the $\overline{\text{SPICS}}$ pins.

The SPI can support more than 6 slaves by using encoded chip selects. To connect the SPI with encoded slaves devices, the CSNR field allows multiple active $\overline{\text{SPICS}}$ pins at the same time, which enables encoded chip selects from 0 to 16. To use encoded chip selects, all 6 chip select lines have to be connected to each peripheral device and each peripheral needs to have a unique chip-select address. The CSDEF register is used to provide the address at which slaves devices are all de-selected.

Users can combine decoded and encoded chip selects. For example, *n* $\overline{\text{SPICS}}$ pins can be used for encoding an *n*-bit address and the remaining pins can be connected to decoded-mode slaves.

11.1.4.2.10 Variable Chip Select Setup and Hold Timing (Controller Only)

In order to support slow peripheral devices, a delay counter can be configured to delay data transmission after the chip select is activated. A second delay counter can be configured to delay the chip select deactivation after the last data bit is transferred. Both delay counters are clocked with the peripheral clock (VCLK).

If a particular data format specifically does not require these additional set-up or hold times for the chip select pins, then they can be disabled in the corresponding SPIFMTx register.

11.1.4.2.11 Hold Chip-Select Active

Some peripheral devices require the chip select signal to be held continuously active during several consecutive data word transfers. Other peripheral devices require the chip select signal to be deactivated between consecutive data word transfers.

CSHOLD is programmable in both controller and peripheral modes of the multi-buffer mode of SPI. However, the meaning of CSHOLD in controller mode and peripheral mode are different.

Note

If the CSHOLD bit is set within the current data control field, the programmed hold time and the following programmed set-up time will not be applied between transactions.

11.1.4.2.11.1 CSHOLD Bit in Controller Mode

Each word in a controller-mode SPI can be individually initialized for one of the two modes via the CSHOLD bit in its control field.

If the CSHOLD bit is set in the control field of a word, the chip select signal will not be deactivated until the next control field is loaded with new chip select information. Since the chip-select is maintained active between two transfers, the chip-select hold delay (T2CDELAY) is not applied at the end of the current transaction, and the chip-select set-up time delay (C2TDELAY) is not applied as well at the beginning of the following transaction. However, the wait delay (WDELAY) will be still applied between the two transactions, if the WDEL bit is set within the control field.

Figure 11-39 shows the SPI pins when a controller-mode SPI transfers a word that has its CSHOLD bit set. The chip-select pins will not be deasserted after the completion of this word. If the next word to transmit has the same chip-select number (CSNR) value, the chip select pins will be maintained until the completion of the second word, regardless of whether the CSHOLD bit is set or not.

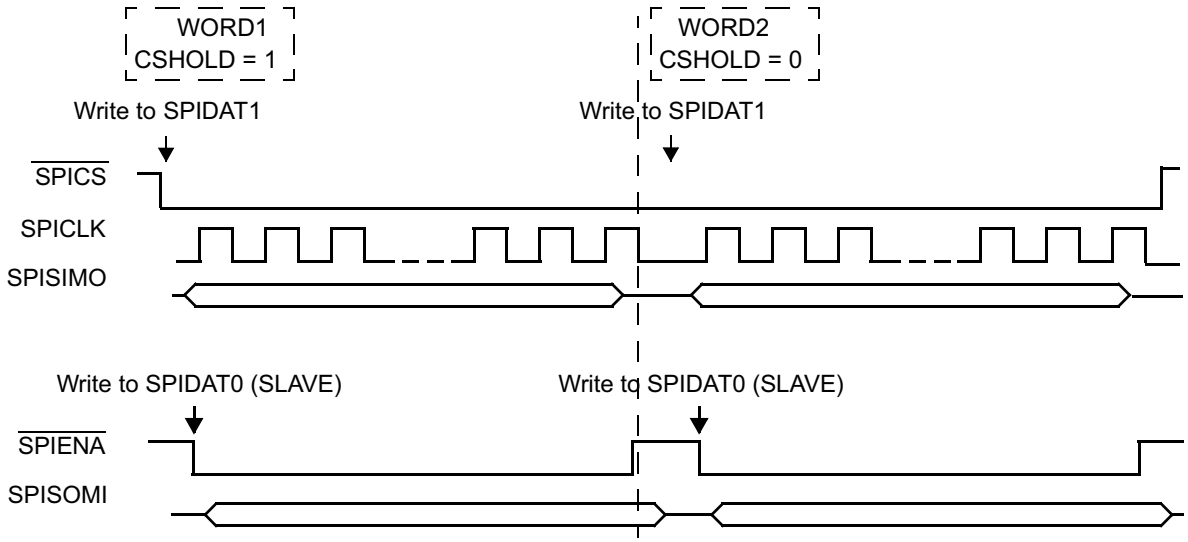

Figure 11-39. Typical Diagram when a Buffer in controller is in CSHOLD Mode (SPI-SPI)

11.1.4.2.11.2 CSHOLD Bit in Peripheral Mode (Multi-buffered Mode)

If the CSHOLD bit in a buffer is set to 1, then the MibSPI does not wait for the $\overline{\text{SPICS}}$ pins to be de-activated at the end of the shift operation to copy the received data to the receive RAM. With this feature, it is possible for a peripheral in multi-buffer mode to do multiple data transfers without requiring the $\overline{\text{SPICS}}$ pins to be deasserted between two buffer transfers.

If the CSHOLD bit in a buffer is cleared to 0 in a peripheral MibSPI, even after the shift operation is done, the MibSPI waits until the $\overline{\text{SPICS}}$ pin (if functional) is deasserted to copy the received data to the RXRAM.

If the CSHOLD bit is maintained as 0 across all the buffers, then the peripheral in multi-buffer mode requires its $\overline{\text{SPICS}}$ pins to be deasserted between any two buffer transfers; otherwise, the peripheral SPI will be unable to respond to the next data transfer.

Note

In compatibility mode, the peripheral does not require the $\overline{\text{SPICS}}$ pin to be deasserted between two buffer transfers. The CSHOLD bit of the peripheral will be ignored in compatibility mode.

11.1.4.2.12 Detection of Peripheral Desynchronization (Controller Only)

When a peripheral supports generation of an enable signal (ENA), desynchronization can be detected. With the enable signal a peripheral indicates to the controller that it is ready to exchange data. A desynchronization can occur if one or more clock edges are missed by the peripheral. In this case, the peripheral may block the SOMI line until it detects clock edges corresponding to the next data word. This would corrupt the data word of the desynchronized peripheral and the consecutive data word. A configurable 8-bit time-out counter (T2EDELAY), which is clocked with SPICLK, is implemented to detect this peripheral malfunction. After the transmission has finished (end of last bit transferred: either last data bit or parity bit) the counter is started. If the ENA signal generated by the peripheral does not become inactive before the counter overflows, the DESYNC flag is set and an interrupt is asserted (if enabled).

Note

Inconsistency of Desynchronization Flag in Compatibility Mode MibSPI

Because of the nature of this error, under some circumstances it is possible for a desync error detected for the previous buffer to be visible in the current buffer. This is due to the fact that receive completion flag/interrupt will be generated when the buffer transfer is completed. But desync will be detected after the buffer transfer is completed. So, if VBUS controller reads the received data quickly when an RXINT is detected, then the status flag may not reflect the correct desync condition. This inconsistency in the desync flag is valid only in compatibility mode of MibSPI. In multi-buffer mode, the desync flag is always assured to be for the current buffer.

11.1.4.2.13 ENA Signal Time-Out (Controller Only)

The SPI in controller mode waits for the hardware handshake signal (ENA) coming from the addressed peripheral before performing a data transfer. To avoid stalling the SPI by a non-responsive peripheral device, a time-out value can be configured using C2EDELAY. If the time-out counter overflows before an active ENA signal is sampled, the TIMEOUT flag in the status register SPIFLG is set and the TIMEOUT flag in the status field of the corresponding buffer is set.

Note

When the chip select signal becomes active, no breaks in transmission are allowed. The next arbitration is performed while waiting for the time-out to occur.

11.1.4.2.14 Data-Length Error

A SPI can generate an error flag by detecting any mismatch in length of received or transmitted data and the programmed character length under certain conditions.

Data-Length Error in Controller Mode: During a data transfer, if the SPI detects a de-assertion of the $\overline{\text{SPIENA}}$ pin (by the peripheral) while the character counter is not overflowed, then an error flag is set to indicate a data-length error. This can be caused by a peripheral receiving extra clocks (for example, due to noise on the SPICLK line).

Note

In a controller mode SPI, the data length error will be generated only if the $\overline{\text{SPIENA}}$ pin is enabled as a functional pin.

Data-Length Error in peripheral Mode: During a transfer, if the SPI detects a de-assertion of the $\overline{\text{SPICS}}$ pin before its character length counter overflows, then an error flag is set to indicate a data-length error. This situation can arise If the peripheral SPI misses one or more SPICLK pulses from the controller. This error in peripheral mode implies that both the transmitted and received data were not complete.

Note

In a peripheral mode SPI, the data-length error flag will be generated only if at least one of the $\overline{\text{SPICS}}$ pins are configured as functional, and are being used for selecting the peripheral.

11.1.4.2.15 Parallel Mode (Multiple PICO/POCI Support, not available on all devices)

In order to increase throughput, the parallel mode of the SPI enables the module to send data over more than one data line (parallel 2, 4, or 8). When parallel mode is used, the data length must be set as 16 bits. Only module MIBSPIP5 supports Parallel Mode.

This feature increases throughput by 2 for 2 pins, by 4 for 4 pins, or by 8 for 8 pins.

Parallel mode supports the following features:

- Scalable data lines (1, 2, 4, 8) per direction. (POCI and PICO lines)
- All clock schemes are supported (clock phase and polarity)
- Parity is supported. The parity bit will be transmitted on bit0 of the PICO/POCI lines. The receive parity is expected on bit0 of the POCI/PICO pins.

Parallel mode can be programmed using the PMODEx bits of SPIPMCTRL register. See Section 11.1.4.8.26 for details about this register.

After reset the parallel mode selection bits are cleared (single PICO/POCI lines).

11.1.4.2.15.1 Parallel Mode Block Diagram

Figure 11-40 and Figure 11-41 show the parallel connections to the SPI shift register.

11.1.4.2.15.4 2-Data Line Mode (MSB First, Phase 0, Polarity 0)

In 2-data line mode (controller mode) the shift register bits 15 and 7 will be connected to the pins PICO[1] and PICO[0], and the shift register bits 8 and 0 will be connected to the pins POCI[1] and POCI[0] or vice versa in peripheral mode. After writing to the SPIDAT0/SPIDAT1 register, the bits 15 and 7 will be output on PICO[1] and PICO[0] on the rising edge if SPICLK. With the falling clock edge of the SPICLK, the received data on POCI[1] and POCI[0] will be latched to the shift register bits 8 and 0. The subsequent rising edge of SPICLK will shift the data in the shift register by 1 bit to the left. (PICO[1] will shift the data out from bit 15 to 8, PICO[0] will shift the data out from bit 7 to 0). After eight SPICLK cycles, when the full data word is transferred, the shift register (16 bits) is copied to the receive buffer, and the RXINT flag will be set. Figure 11-42 shows the clock/data diagram of the 2-data line mode. Figure 11-43 shows the timing of a two-pin parallel transfer.

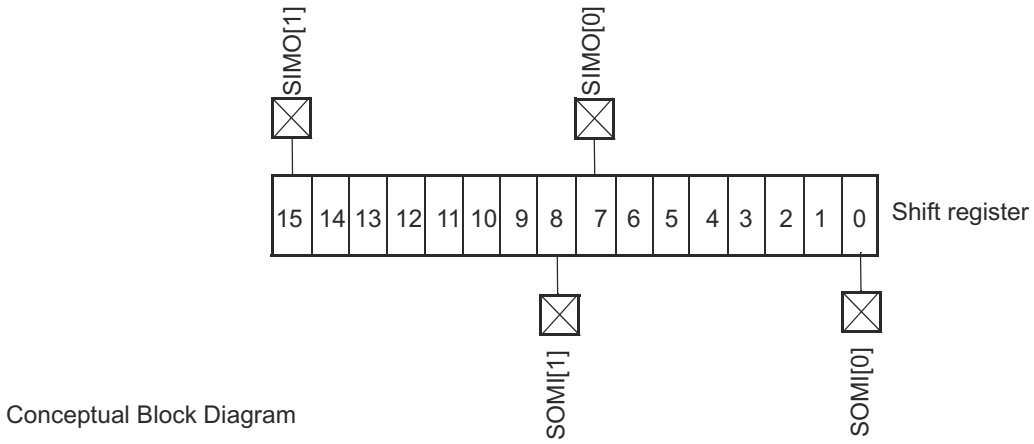

Figure 11-42. 2-data Line Mode (Phase 0, Polarity 0)

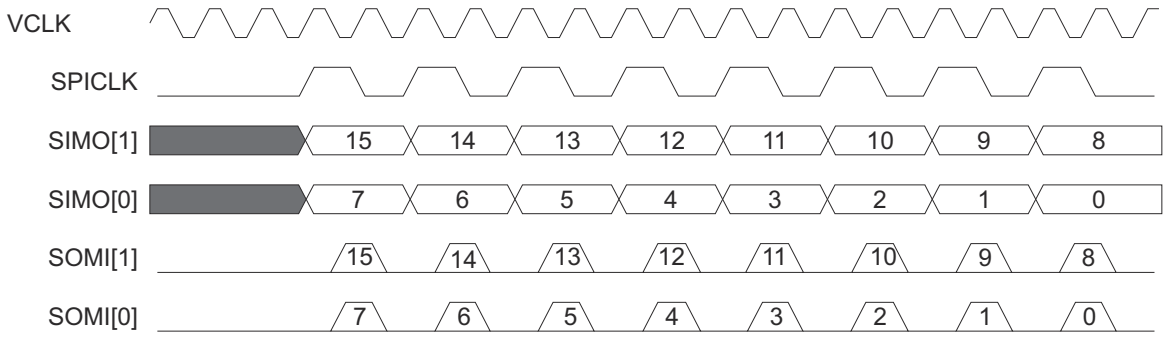

Figure 11-43. Two-Pin Parallel Mode Timing Diagram (Phase 0, Polarity 0)

11.1.4.2.15.5 4-Data Line Mode (MSB First, Phase 0, Polarity 0)

In 4-data line mode (controller mode) the shift register bits 15, 11, 7, and 3 will be connected to the pins SIMO[3], SIMO[2], SIMO[1], and SIMO[0], and the shift register bits 12, 8, 4, and 0 will be connected to the pins SOMI[3], SOMI[2], SOMI[1], and SOMI[0] (or vice versa in peripheral mode). After writing to SPIDAT1/SPIDAT0, the bits 15, 11, 7, and 3 will be output on SIMO[3], SIMO[2], SIMO[1], and SIMO[0] on the rising edge of SPICLK. With the falling clock edge of the SPICLK, the received data on SOMI[3], SOMI[2], SOMI[1] and SOMI[0] will be latched to shift register bits 12, 8, 4, and 0. The subsequent rising edge of SPICLK will shift data in the shift register by 1 bit to the left (SIMO[3] will shift the data out from bit 15 to 12, SIMO[2] will shift the data out from bit 11 to 8, SIMO[1] will shift the data out from bit 7 to 4, SIMO[0] will shift the data out from bit 3 to 0). After four SPICLK cycles, when the full data word is transferred, the shift register (16 bits) is copied to the receive buffer, and the RXINT flag will be set.

Figure 11-44 shows the clock/data diagram of the four-data line mode. Figure 11-45, shows the timing diagram for four-data line mode.

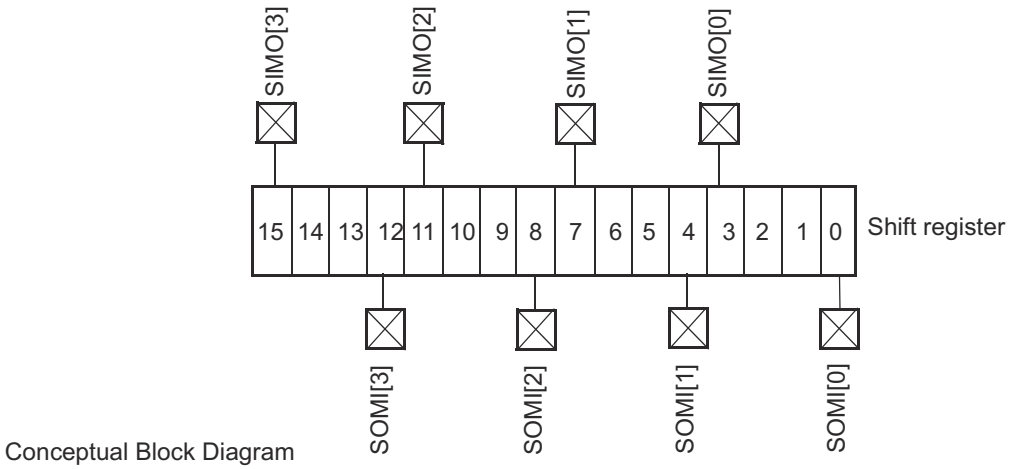

Figure 11-44. 4-Data Line Mode (Phase 0, Polarity 0)

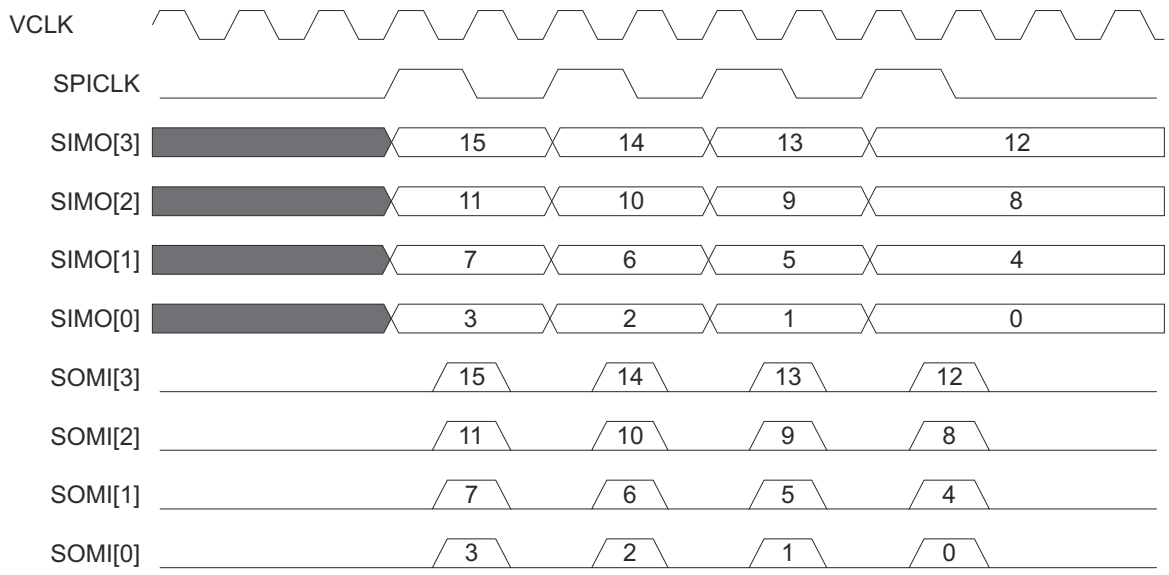

Figure 11-45. 4 Pins Parallel Mode Timing Diagram (Phase 0, Polarity 0)

11.1.4.2.15.6 8-Data Line Mode (MSB First, Phase 0, Polarity 0)

In 8-data line mode (controller mode) the shift register bits 15, 13, 11, 9, 7, 5 and 3 will be connected to the pins PICO[7], PICO[6], PICO[5], PICO[4], PICO[3], PICO[2], PICO[1], and PICO[0], and the shift-register bits 14, 12, 10, 8, 6, 4, and 0 will be connected to the pins POCI[7], POCI[6], POCI[5], POCI[4], POCI[3], POCI[2], POCI[1], and POCI[0] (or vice versa in peripheral mode).

After writing to SPIDAT0/SPIDAT1, the bits 15, 13, 11, 9, 7, 5, 3, and 1 will be output on PICO[7], PICO[6], PICO[5], PICO[4], PICO[3], PICO[2], PICO[1], and PICO[0], on the rising edge of SPICLK. On the falling clock edge of the SPICLK, the received data on POCI[8], POCI[7], POCI[6],POCI[5], POCI[4], POCI[3], POCI[2], POCI[1], and POCI[0] will be latched to the shift register bits 14, 12, 10, 8, 6, 4, 2, and 0.

The subsequent rising edge of SPICLK will shift the data in the shift register by 1 bit to the left. After two SPICLK cycles, when the full data word is transferred the shift register (16 bits) is copied to the receive buffer, and the RXINT flag will be set. Figure 11-46 shows the clock/data diagram of the 8-data line mode. Figure 11-47 shows the pin timings for 8-data line mode.

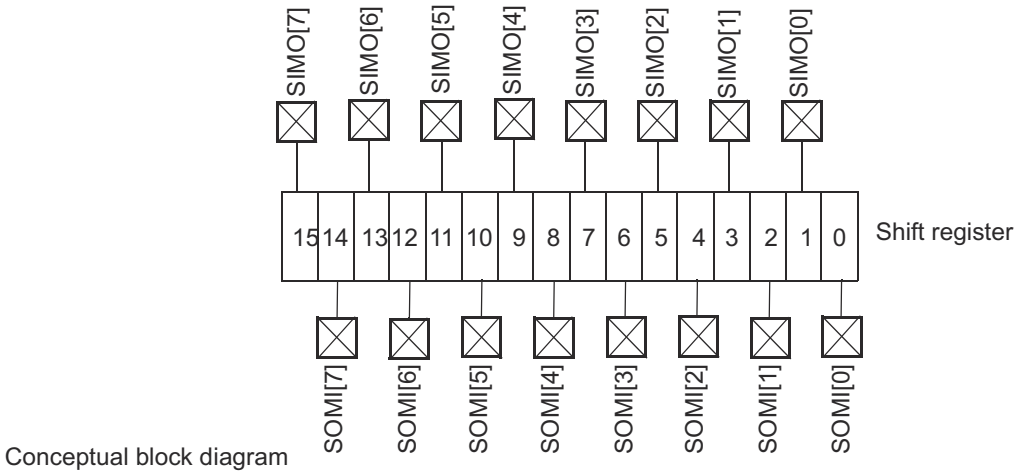

Figure 11-46. 8-data Line Mode (Phase 0, Polarity 0)

Note

Parity Support

Using the parity support in parallel mode may seriously affect throughput. For an eight-line mode to transfer 16 bits of data, only two SPICLK pulses are enough. If parity is enabled, one extra SPICLK pulse will be used to transfer and receive the parity bit. Parity will be transmitted and received on the 0th line regardless of 1/2/4/8-line modes. During the parity bit transfer, other data bits are not valid.

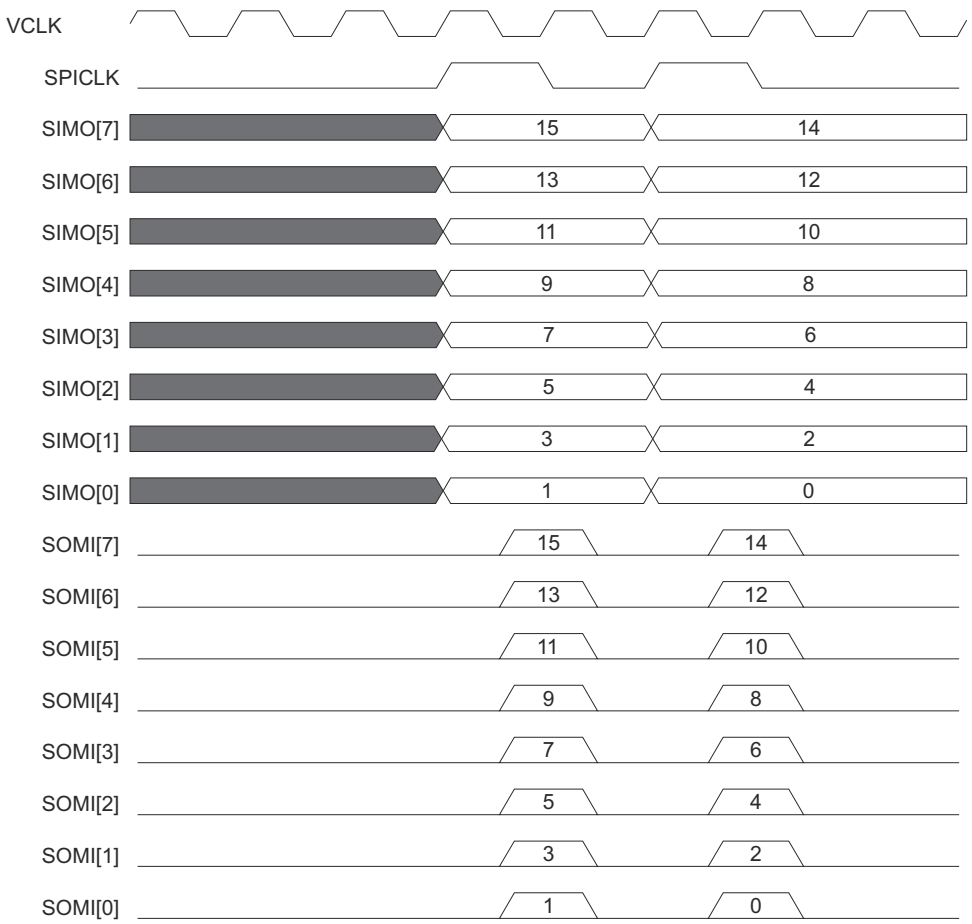

Figure 11-47. 8 Pins Parallel Mode Timing Diagram (Phase 0, Polarity 0)

Note

Modulo Count Parallel Mode is not supported in this device.

11.1.4.2.16 Continuous Self-Test (Controller/Peripheral)

During data transfer, the SPI compares its own internal transmit data with its transmit data on the bus. The sample point for the compare is at one-half SPI clock after transmit point. If the data on the bus does not match the expected value, the bit-error (BITERR) flag is set and an interrupt is asserted if enabled.

Note

The compare is made from the output pin using its input buffer.

11.1.4.2.17 Half Duplex Mode

SPI by protocol is Full Duplex in nature, which means simultaneous TX and RX operations happen on two separate data pins, SIMO and SOMI. However, it is possible to use SPI/MibSPI to do the TX-only operation (ignoring the RX data) and the RX-only operation (using dummy TX data and ignoring the TX pin). But this requires that both SOMI and SIMO lines are bonded out in a chip to be able to support both TX-only or RX-only features.

11.1.4.2.17.1 Half Duplex Mode in Master

The Half Duplex Mode gives an additional flexibility to use the SIMO pin, which is normally used as a TX pin in Controller mode, to work like an RX pin while the HDUPLEX_ENAx bit in SPIFMTx register is set to 1. In Half Duplex Controller mode, the SIMO pin acts as an RX pin. Switching between Full Duplex and Half Duplex can be achieved using the SPIFMTx register being selected using the DFSEL bit of SPIDAT1 register or TXRAM locations.

11.1.4.2.17.2 Half Duplex Mode in Peripheral

In Half Duplex Peripheral mode, the SIMO pin, which is normally an RX pin, acts as a TX pin while the HDUPLEX_ENAx bit in SPIFMTx register is set to 1. In Half Duplex Peripheral mode, the SIMO pin acts as a TX pin. Switching between Full Duplex and Half Duplex can be achieved using the SPIFMTx register being selected using the DFSEL bit of SPIDAT1 register or TXRAM locations.

11.1.4.3 Test Features

11.1.4.3.1 Internal Loop-Back Test Mode (Controller Only)

The internal loop-back self-test mode can be utilized to test the SPI transmit and receive paths, including the shift registers, the SPI buffer registers, and the parity generator. In this mode the transmit signal is internally feedback to the receiver, whereas the SIMO, SOMI, and CLK pin are disconnected; that is, the transmitted data is internally transferred to the corresponding receive buffer while external signals remain unchanged.

This mode allows the CPU to write into the transmit buffer, and check that the receive buffer contains the correct transmit data. If an error occurs the corresponding error is set within the status field.

Note

This mode cannot be changed during transmission.

11.1.4.3.2 Input/Output Loopback Test Mode

Input/Output Loopback Test mode supports the testing of all Input/Output pins without the aid of an external interface. Loopback can be configured as either analog-loopback (loopback through the pin-level input/output buffers) or digital loopback (internal to the SPI module). With Input/Output Loopback, all functional features of the SPI can be tested. Transmit data is fed back through the receive-data line(s). See Figure 11-48 for a diagram of the types of feedback available. The IOLPBKTSTCR register defines all of the available control fields.

In loopback mode, it is also possible to induce various error conditions. See Section 11.1.4.8.44 for details of the register field controlling these features.

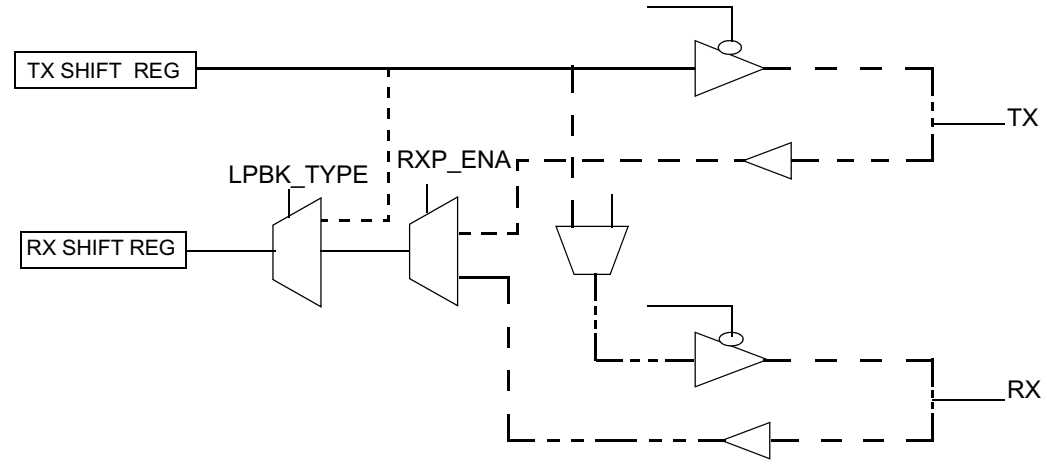
In Input/Output loopback test modes, even when the module is in slave mode, the SPICLK is generated internally. This SPICLK is used for all loopback-mode SPI transactions. Peripheral-mode features can be tested without the help of another controller SPI, using the internally-generated SPICLK. Chip selects are also generated by the slave itself while it is in Input/Output loopback mode.

In Input/Output loopback test modes, if the module is in controller mode, the $\overline{ENA}$ signal is also generated by internal logic so that an external interface is not required.

Note

Usage Guideline for Input/Output Loopback

Input/Output Loopback mode should be used with caution because, in some configurations, even the receive pins will be driven with transmit data. During testing, it should be ensured that none of the SPI pins are driven by any other device connected to them. Otherwise, if analog loopback is selected in I/O Loopback mode, then testing may damage the device.



This diagram is intended to illustrate loopback paths and therefore may omit some normal-mode paths.

Figure 11-48. I/O Paths during I/O Loopback Modes

11.1.4.3.2.1 Input/Output Loopback Mode Operation in Peripheral Mode

In multi-buffer slave mode, there are some additional requirements for using I/O loopback mode (IOLPBK). In multi-buffer peripheral mode, the chip-select pins are the triggers for various TGs. Enabling the IOLPBK mode by writing 0xA to the IOLPBTSTENA bits of the IOLPBKTSTCR register triggers TG0 by driving $\overline{\text{SPICS}}$ to 0. The actual number of chip selects can be programmed to have any or all of the $\overline{\text{SPICS}}$ pins as functional. All other configurations should be completed before enabling the IOLPBK mode in multi-buffer peripheral mode since it triggers TG0.

After the first buffer transfer is completed, the CSNR field of the current buffer is used to trigger the next buffer. So, if multiple TGs are desired to be tested, then the CSNR field of the final buffer in each TG should hold the number of the next TG to be triggered. As long as TG boundaries are well defined and are enabled, the completion of one TG will trigger the next TG.

To stop the transfer in multi-buffer peripheral mode in I/O Loopback configuration, either IOLPBK mode can be disabled by writing 0x5 to the IOLPBTSTENA bits or all of the TGs can be disabled.

11.1.4.4 General-Purpose I/O

All of the SPI pins may be programmed via the SPIPCx control registers to be either functional or general-purpose I/O pins.

If the SPI function is to be used, application software must ensure that at least the SPICLK pin and the SOMI and/or SIMO pins are configured as SPI functional pins, and not as GIO pins, or else the SPI state machine will be held in reset, preventing SPI transactions.

SPI pins support:

- internal pull-up resistors
- internal pull-down resistors
- open-drain or push-pull mode

11.1.4.5 Interrupts

There are two levels of vectorized interrupts supported by the SPI. These interrupts can be caused under the following circumstances:

- Transmission error
- Receive overrun
- Receive complete (receive buffer full)
- Transmit buffer empty

These interrupts may be enabled or disabled via the SPIINT0 register.

During transmission, if one of the following errors occurs: BITERR, DESYNC, DLENERR, PARITYERR, or TIMEOUT, the corresponding bit in the SPIFLG register is set. If the corresponding enable bit is set, then an interrupt is generated. The level of all the above interrupts is set by the bit fields in the SPILVL register.

The error interrupts are enabled and prioritized independently from each other, but the interrupt generated will be the same if multiple errors are enabled on the same level. The SPIFLG register should be used to determine the actual cause of an error.

Note

Since there are two interrupt lines, one each for Level 0 and Level 1, it is possible for a programmer to separate out the interrupts for receive buffer full and transmit buffer empty. By programming one to Level 0 and the other to Level 1, it is possible to avoid a check on whether an interrupt occurred for transmit or for receive. A programmer can also choose to group all of the error interrupts into one interrupt line and both TX-empty and RX-full interrupts into another interrupt line using the LVL control register. In this way, it is possible to separate error-checking from normal data handling.

11.1.4.5.1 Interrupts in Multi-Buffer Mode

In multi-buffer mode, the SPI can generate interrupts on two levels.

In normal multi-buffer operation, the receive and transmit are not used and therefore the enable bits of SPIINT0 are not used.

The interrupts available in multi-buffer mode are:

- Transmission error interrupt
- Receive overrun interrupt
- TG suspended interrupt
- TG completed interrupt

When a TG has finished and the corresponding enable bit in the TGINTENA register is set, a transfer-finished interrupt is generated. The level of priority of the interrupt is determined by the corresponding bit in the TGINTLVL register.

When a TG is suspended by a buffer that has been set as suspend to wait until TXFULL flag or/and RXEMPTY flag are set, and if the corresponding bit in the TGINTENA register is set, an transfer-suspended interrupt is generated. The level of priority of the interrupt is determined by the corresponding bit in the TGINTLVL register.

Figure 11-49 illustrates the TG interrupts.

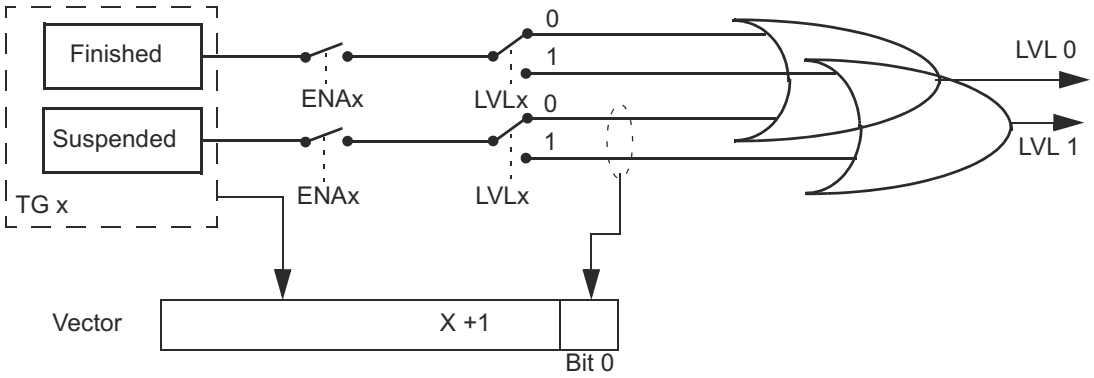


Figure 11-49. TG Interrupt Structure

During transmission, if one of the following errors occurs, BITERR, DESYNC, PARITYERR, TIMEOUT, DLENERR, the corresponding flag in the SPIFLG register is set. If the enable bit is set, then an interrupt is generated. The level of the interrupts could be generated according to the bit field in SPILVL register.

The RXOVRN interrupt is generated when a buffer in the RXRAM is overwritten by a new received word. While writing newly received data to a RXRAM location, if the RXEMPTY bit of the corresponding location is 0, then the RXOVR bit will be set to 1 during the write operation, so that the buffer starts to indicate an overrun. This RXOVR flag is also reflected in SPIFLG register as RXOVRNINTFLG and the corresponding vector number is updated in TGINTVECT0/TGINTVECT1 register. If an overrun interrupt is enabled, then an interrupt will be generated indicating an overrun condition.

The error interrupts are enabled and prioritized independently from each other, but the vector generated by the SPI will be the same if multiple errors are enabled on the same level.

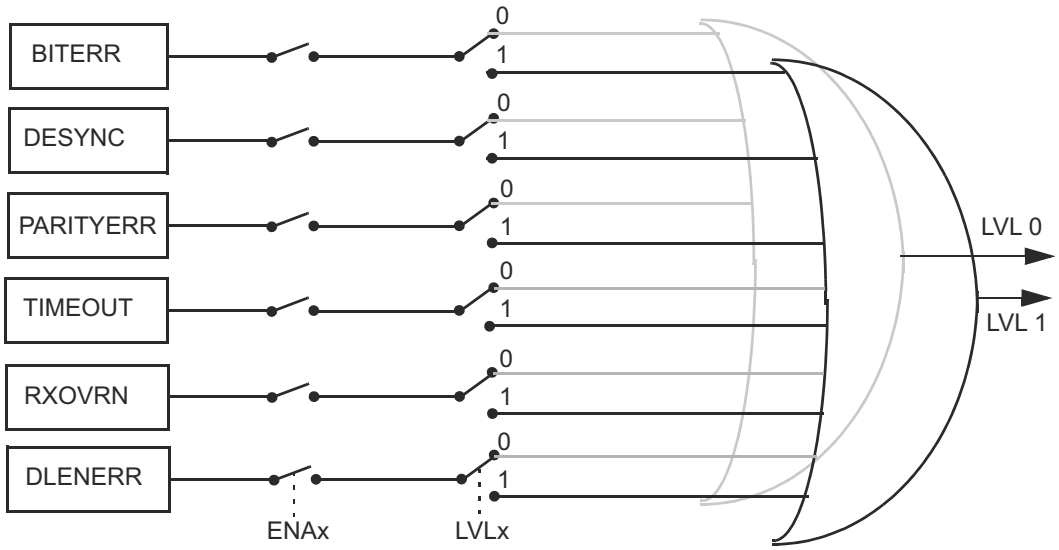

Figure 11-50. SPIFLG Interrupt Structure

Since the priority of an error interrupt is lower than a completion/suspend interrupt for a TG, the interrupts can be split into two levels. By programming all the error interrupts into Level 0 and TG-complete / TG-suspend interrupts into Level 1, it is possible to get a clear indication of the source of error interrupts. However, when a vector register shows an error interrupt, the actual buffer for which the error has occurred is not readily identifiable. Since each buffer in the multi-buffer RAM is stored along with its individual status flags, each buffer should be read until a buffer with any error flag set is found.

A separate interrupt line is provided to indicate the uncorrectable error condition in the MibSPI. This line is available (and valid) only in the multi-buffer mode of the MibSPI module and if the parity error detection feature for multi-buffer RAM is enabled.

11.1.4.6 DMA Interface

In order to reduce CPU overhead in handling SPI message traffic on a character-by-character basis, SPI can use the DMA controller to transfer the data. The DMA request enable bit (DMA REQ EN) controls the assertion of requests to the DMA controller module. When a character is being transmitted or received, the SPI will signal the DMA via the DMA request signals, TX_DMA_REQ and RX_DMA_REQ. The DMA controller will then perform the required data transfer.

For efficient behavior during DMA operations, the transmitter empty and receive-buffer full interrupts can be disabled. For specific DMA features, see the DMA controller specification.

The SPI generates a request on the TX_DMA_REQ line each time the TX data is copied to the TX shift register either from the TXBUF or from peripheral data bus (when TXBUF is empty).

The first TX_DMA_REQ pulse is generated when either of the following is true:

- DMAREQEN (SPIINT0[16]) is set to 1 while SPIEN (SPIGCR1[24]) is already 1.
- SPIEN (SPIGCR1[24]) is set to 1 while DMAREQEN (SPIINT0[16]) is already 1.

The SPI generates a request on the RX_DMA_REQ line each time the received data is copied to the SPIBUF.

11.1.4.6.1 DMA in Multi-Buffer Mode

The MibSPI provides sophisticated programmable DMA control logic that completely eliminates the necessity of CPU intervention for data transfers, once programmed. When the multi-buffer mode is used, the DMA enable bit in the SPIINT0 register is ignored. DMA source or destination should be only the multi-buffer RAM and not SPIDAT0 / SPIDAT1 or SPIBUF register as in case of compatibility mode DMA.

The MibSPI offers up to eight DMA channels (for SEND and RECEIVE). All of the DMA channels are programmable individually and can be hooked to any buffer. The MibSPI provides up to 16 DMA request lines, and DMA requests from any channel can be programmed to be routed through any of these 16 lines. A DMA transfer can trigger both transmit and receive.

Each DMA channel has the capability to transfer a block of up to 32 data words without interruption using only one buffer of the array by configuring the DMAxCTRL register. Using the DMAxCOUNT and DMACTNTLEN register, up to 65535 (64K) words of data can be transferred without any interruption using just one buffer of the array. This enables the transfer of memory blocks from or into an external SPI memory.

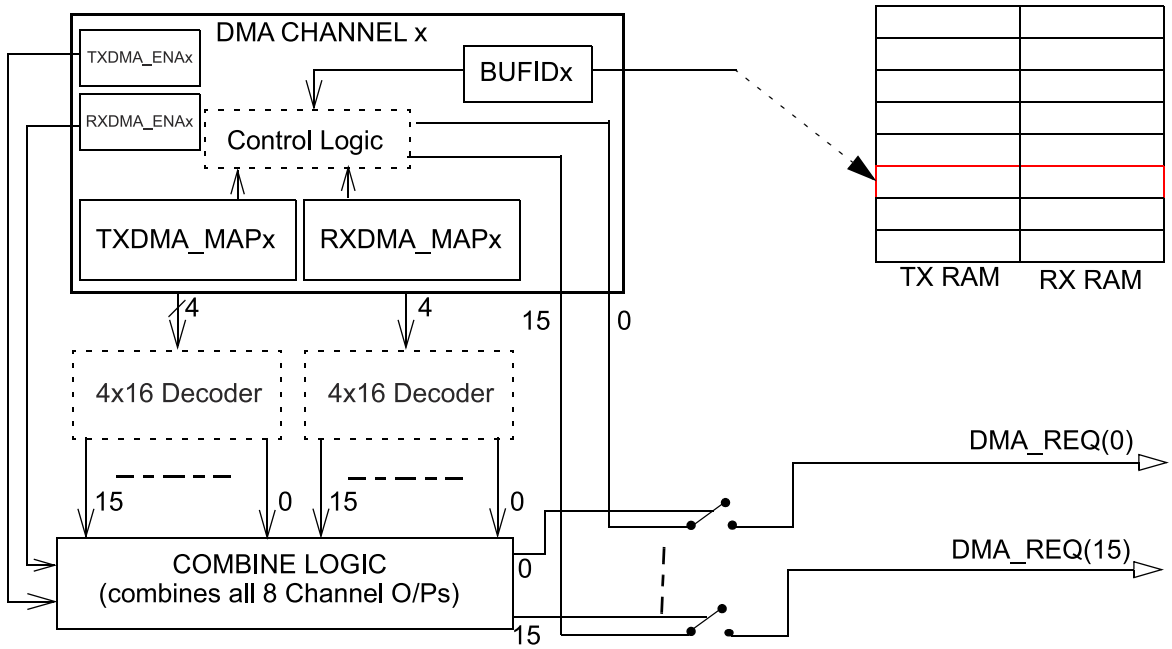

Figure 11-51. DMA Channel and Request Line (Logical) Structure in Multi-buffer Mode

11.1.4.7 Module Configuration

MibSPI/MibSPIP can be configured to function as Normal SPI and Multi-buffered SPI. Upon power-up or a system-level reset, each bit in the module registers is set to a default state. The registers are writable only after the RESET bit is set to 1.

11.1.4.7.1 Compatibility (SPI) Mode Configuration

The following list details the configuration steps that software should perform prior to the transmission or reception of data. As long as the SPIEN bit in the Global Control Register 1 (SPIGCR1) is cleared to 0 the entire time that the SPI is being configured, the order in which the registers are programmed is not important.

- Enable SPI by setting RESET bit.
- Configure the SIMO, SOMI, SPICLK, and optional $\overline{\text{SPICS}}$ and $\overline{\text{SPIENA}}$ pins for SPI functionality by setting the corresponding bit in SPIPC0 register.
- Configure the module to function as Controller or Peripheral using CLKMOD and MASTER bits.
- Configure the required SPI data format using SPIFMTx register.
- If the module is selected to function as Controller, the delay parameters can be configured using SPIDELAY register.
- Enable the Interrupts using SPIINT0 register if required.
- Select the chip select to be used by setting CSNR bits in SPIDAT1 register.
- Configure CSHOLD and WDEL bits in SPIDAT1 register if required.
- Select the Data word format by setting DFSEL bits. Select the Number of the configured SPIFMTx register (0 to 3) to used for the communication.
- Set LOOPBACK bit to connect the transmitter to the receiver internally. (This feature is used to perform a self-test. Do not configure for normal communication to external devices).
- Set SPIEN bit to 1 after the SPI is configured.
- Perform Transmit and receive data, using SPIDAT1 and SPIBUF register.
- You must wait for TXFULL to reset or TXINT before writing next data to SPIDAT1 register.
- You must wait for RXEMPTY to reset or RXINT before reading the data from SPIBUF register.

11.1.4.7.2 MibSPI Mode Configuration

The following list details the configuration steps that software should perform prior to the transmission or reception of data in MIBSPI mode. As long as the SPIEN bit in the Global Control Register 1 (SPIGCR1) is cleared to 0 the entire time that the SPI is being configured, the order in which the registers are programmed is not important.

- Enable SPI by setting RESET bit.
- Set MSPIENA bit to 1 to get access to multi-buffer mode registers.
- Configure the SIMO, SOMI, SPICLK, and optional $\overline{\text{SPICS}}$ and $\overline{\text{SPIENA}}$ pins for SPI functionality by setting the corresponding bit in SPIPC0 register.
- Configure the module to function as Controller or Peripheral using CLKMOD and MASTER bits.
- Configure the required SPI data format using SPIFMTx register.
- If the module is selected to function as Controller, the delay parameters can be configured using SPIDELAY register.
- Check for BUFINITACTIVE bit to be active before configuring MIBSPI RAM. (From Device Power On it take Number of Buffers × Peripheral clock period to initialize complete RAM.)
- Enable the Transfer Group interrupts using TGITENST register if required.
- Enable error interrupts using SPIINT0 register if required.
- Set SPIEN bit to 1 after the SPI is configured.
- The Trigger Source, Trigger Event, Transfer Group start address for the corresponding Transfer groups can be configured using the corresponding TGxCTRL register.
- Configure LPEND to specify the end address of the last TG.
- Similar to SPIDAT1 register, the 16 bit control fields in every TXRAM buffer in the TG have to be configured.
- Configure one of the eight BUFMODE available for each buffer.
- Fill the data to be transmitted in TXDATA field in TXRAM buffers.
- Configure TGENA bit to enable the required Transfer groups. (In case of Trigger event always setting TGENA will trigger the transfer group).
- At the occurrence of the correct trigger event, the Transfer group will be triggered and data gets transmitted and received one after the other with out any CPU intervention.
- You can poll Transfer Group interrupt flag or wait for a transfer-completed interrupt to read and write new data to the buffers.

11.1.4.8 Control Registers

This section describes the SPI control, data, and pin registers. The registers support 8-bit, 16-bit and 32-bit writes. The offset is relative to the associated base address of this module in a system.

Note

TI highly recommends that write values corresponding to the reserved locations of registers be maintained as 0 consistently. This allows future enhancements to use these reserved bits as control bits without affecting the functionality of the module with any older versions of software.

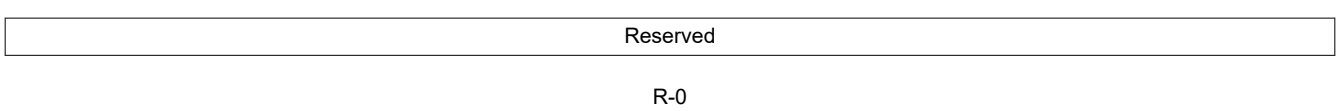
11.1.4.8.1 SPI Global Control Register 0 (SPIGCR0)

Figure 11-52. SPI Global Control Register 0 (SPIGCR0) [offset = 00]



15	1	0
Reserved		nRESET
R-0		R/WP-0

LEGEND: R/W = Read/Write; R = Read only; WP = Write in privilege mode only; -*n* = value after reset

Table 11-188. SPI Global Control Register 0 (SPIGCR0) Field Descriptions

Bit	Field	Value	Description
31-1	Reserved	0	Reads return 0. Writes have no effect.
0	nRESET		This is the local reset control for the module. This bit needs to be set to 1 before any operation on SPI / MibSPI can be done. Only after setting this bit to 1, the Auto Initialization of Multi-buffer RAM starts. Clearing this bit to 0 will result in all of the control and status register values to return to their default values..
		0	SPI is in the reset state.
		1	SPI is out of the reset state.

11.1.4.8.2 SPI Global Control Register 1 (SPIGCR1)

Figure 11-53. SPI Global Control Register 1 (SPIGCR1) [offset = 04h]

Table 11-189. SPI Global Control Register 1 (SPIGCR1) Field Descriptions

Bit	Field	Value	Description
31-25	Reserved	0	Reads return 0. Writes have no effect.
24	SPIEN		SPI enable. This bit enables SPI transfers. This bit must be set to 1 after all other SPI configuration bits have been written. When the SPIEN bit is 0 or cleared to 0, the following SPI registers get forced to their default states: • Both TX and RX shift registers • The TXDATA fields of the SPI Transmit Data Register 0 (SPIDAT0) and the SPI Transmit Data Register 1 (SPIDAT1) • All the fields of the SPI Flag Register (SPIFLG) • Contents of SPIBUF and the internal RXBUF registers
		0	The SPI is not activated for transfers.
		1	Activates SPI.
23-17	Reserved	0	Reads return 0. Writes have no effect.
16	LOOPBACK		Internal loop-back test mode. The internal self-test option can be enabled by setting this bit. If the SPISIMO and SPISOMI pins are configured with SPI functionality, then the SPISIMO[7:0] pins are internally connected to the SPISOMI[7:0] pins (transmit data is looped back as receive data). GIO mode for these pins is not supported in loopback mode. Externally, during loop-back operation, the SPICLK pin outputs an inactive value and SPISOMI[7:0] remains in the high-impedance state. If the SPI is initialized in slave mode or a data transfer is ongoing, errors may result. **Note: This loopback mode can only be used in master mode. Master mode must be selected before setting LOOPBACK. When this mode is selected, the CLKMOD bit should be set to 1, meaning that SPICLK is internally generated.**
		0	Internal loop-back test mode is disabled.
		1	Internal loop-back test mode is enabled.
15-9	Reserved	0	Reads return 0. Writes have no effect.
8	POWERDOWN		When active, the SPI state machine enters a power-down state.
		0	The SPI is in active mode.
		1	The SPI is in power-down mode.
7-2	Reserved	0	Reads return 0. Writes have no effect.

Table 11-189. SPI Global Control Register 1 (SPIGCR1) Field Descriptions (continued)

Bit	Field	Value	Description
1	CLKMOD		Clock mode. This bit selects either an internal or external clock source. This bit also determines the I/O direction of the $\overline{\text{SPIENA}}$ and $\overline{\text{SPICS}}$ pins in functional mode.
		0	Clock is external. • $\overline{\text{SPIENA}}$ is an output. • $\overline{\text{SPICS}}$ are inputs.
		1	Clock is internally-generated. • $\overline{\text{SPIENA}}$ is an input. • $\overline{\text{SPICS}}$ are outputs.
0	MASTER		SPISIMO/SPISOMI pin direction determination. Sets the direction of the SPISIMO and SPISOMI pins. **Note: For master-mode operation of the SPI, MASTER bit should be set to 1 and CLKMOD bit can be set either 1 or 0. The master-mode SPI can run on an external clock on SPICLK.** **For slave mode operation, both the MASTER and CLKMOD bits should be cleared to 0. Any other combinations may result in unpredictable behavior of the SPI. In slave mode. SPICLK will not be generated internally in slave mode.**
		0	SPISIMO[7:0] pins are inputs, SPISOMI[7:0] pins are outputs.
		1	SPISOMI[7:0] pins are inputs, SPISIMO[7:0] pins are outputs.

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Table 11-190. SPI Interrupt Register (SPIINT0) Field Descriptions

Bit	Field	Value	Description
31-25	Reserved	0	Reads return 0. Writes have no effect.
24	ENABLEHIGHZ		$\overline{\text{SPIENA}}$ pin high-impedance enable. When active, the $\overline{\text{SPIENA}}$ pin (when it is configured as a WAIT functional output signal in a slave SPI) is forced to high-impedance when not driving a low signal. If inactive, then the pin will output both a high and a low signal.
		0	$\overline{\text{SPIENA}}$ pin is pulled high when not active.
		1	$\overline{\text{SPIENA}}$ pin remains high-impedance when not active.
23-17	Reserved	0	Reads return 0. Writes have no effect.
16	DMAREQEN		DMA request enable. Enables the DMA request signal to be generated for both receive and transmit channels. Enable DMA REQ only after setting the SPIEN bit to 1.
		0	DMA is not used.
		1	DMA requests will be generated.
			Note: A DMA request will be generated on the TX DMA REQ line each time a word is copied to the shift register either from TXBUF or directly from SPIDAT0/SPIDAT1 writes.
			Note: A DMA request will be generated on the RX DMA REQ line each time a word is copied to the SPIBUF register either from RXBUF or directly from the shift register.
15-10	Reserved	0	Reads return 0. Writes have no effect.
9	TXINTENA		Causes an interrupt to be generated every time data is written to the shift register, so that the next word can be written to TXBUF. Setting this bit will generate an interrupt if the TXINTFLG bit (SPI Flag Register (SPIFLG)[9]) is set to 1.
		0	No interrupt will be generated upon TXINTFLG being set to 1.
		1	An interrupt will be generated upon TXINTFLG being set to 1.
			The transmitter empty interrupt is valid in compatibility mode of SPI only. In multi-buffered mode, this interrupts will not be generated, even if it is enabled.
			Note: An interrupt request will be generated as soon as this bit is set to 1. By default it will be generated on the INT0 line. The SPILVL register can be programmed to change the interrupt line.
8	RXINTENA		Causes an interrupt to be generated when the RXINTFLAG bit (SPI Flag Register (SPIFLG)[8]) is set by hardware.
		0	Interrupt will not be generated.
		1	Interrupt will be generated.
			The receiver full interrupt is valid in compatibility mode of SPI only. In multi-buffered mode, this interrupts will not be generated, even if it is enabled.
7	Reserved	0	Reads return 0. Writes have no effect.
6	RXOVRNINTENA		Overrun interrupt enable.
		0	Overrun interrupt will not be generated.
		1	Overrun interrupt will be generated.
5	Reserved	0	Reads return 0. Writes have no effect.
4	BITERRENA		Enables interrupt on bit error.
		0	No interrupt asserted upon bit error.
		1	Enables interrupt on bit error.
3	DESYNCENA		Enables interrupt on desynchronized slave. DESYNCENA is used in master mode only.
		0	No interrupt asserted upon desynchronization error.
		1	An interrupt is asserted on desynchronization of the slave (DESYNC = 1).
2	PARERRENA		Enables interrupt-on-parity-error.
		0	No interrupt asserted on parity error.
		1	An interrupt is asserted on a parity error.

Table 11-190. SPI Interrupt Register (SPIINT0) Field Descriptions (continued)

Bit	Field	Value	Description
1	TIMEOUTENA		Enables interrupt on ENA signal time-out.
		0	No interrupt asserted upon ENA signal time-out.
		1	An interrupt is asserted on a time-out of the ENA signal.
0	DLENERRENA		Data length error interrupt enable. A data length error occurs under the following conditions. **Master:** When $\overline{\text{SPIENA}}$ is used, if the $\overline{\text{SPIENA}}$ pin from the slave is deasserted before the master has completed its transfer, the data length error is set. That is, if the character length counter has not overflowed while $\overline{\text{SPIENA}}$ deassertion is detected, then it means that the slave has neither received full data from the master nor has it transmitted complete data. **Slave:** When $\overline{\text{SPICS}}$ pins are used, if the incoming valid $\overline{\text{SPICS}}$ pin is deactivated before the character length counter overflows, then the data length error is set.
		0	No interrupt is generated upon data length error.
		1	An interrupt is asserted when a data-length error occurs.

11.1.4.8.4 SPI Interrupt Level Register (SPILVL)

9	TXINTLVL		Transmit interrupt level.
		0	Transmit interrupt is mapped to interrupt line INT0.
		1	Transmit interrupt is mapped to interrupt line INT1.
8	RXINTLVL		Receive interrupt level.
		0	Receive interrupt is mapped to interrupt line INT0.
		1	Receive interrupt is mapped to interrupt line INT1.
7	Reserved	0	Reads return 0. Writes have no effect.
6	RXOVRNINTLVL		Receive overrun interrupt level.
		0	Receive overrun interrupt is mapped to interrupt line INT0.
		1	Receive overrun interrupt is mapped to interrupt line INT1.
5	Reserved	0	Reads return 0. Writes have no effect.
4	BITERRLVL		Bit error interrupt level.
		0	Bit error interrupt is mapped to interrupt line INT0.
		1	Bit error interrupt is mapped to interrupt line INT1.
3	DESYNCLVL		Desynchronized slave interrupt level. (master mode only).
		0	An interrupt caused by desynchronization of the slave is mapped to interrupt line INT0.
		1	An interrupt caused by desynchronization of the slave is mapped to interrupt line INT1.
2	PARERRLVL		Parity error interrupt level.
		0	A parity error interrupt is mapped to interrupt line INT0.
		1	A parity error interrupt is mapped to interrupt line INT1.
1	TIMEOUTLVL		$\overline{\text{SPIENA}}$ pin time-out interrupt level.
		0	An interrupt on a time-out of the ENA signal (TIMEOUT = 1) is mapped to interrupt line INT0.
		1	An interrupt on a time-out of the ENA signal (TIMEOUT = 1) is mapped to interrupt line INT1.

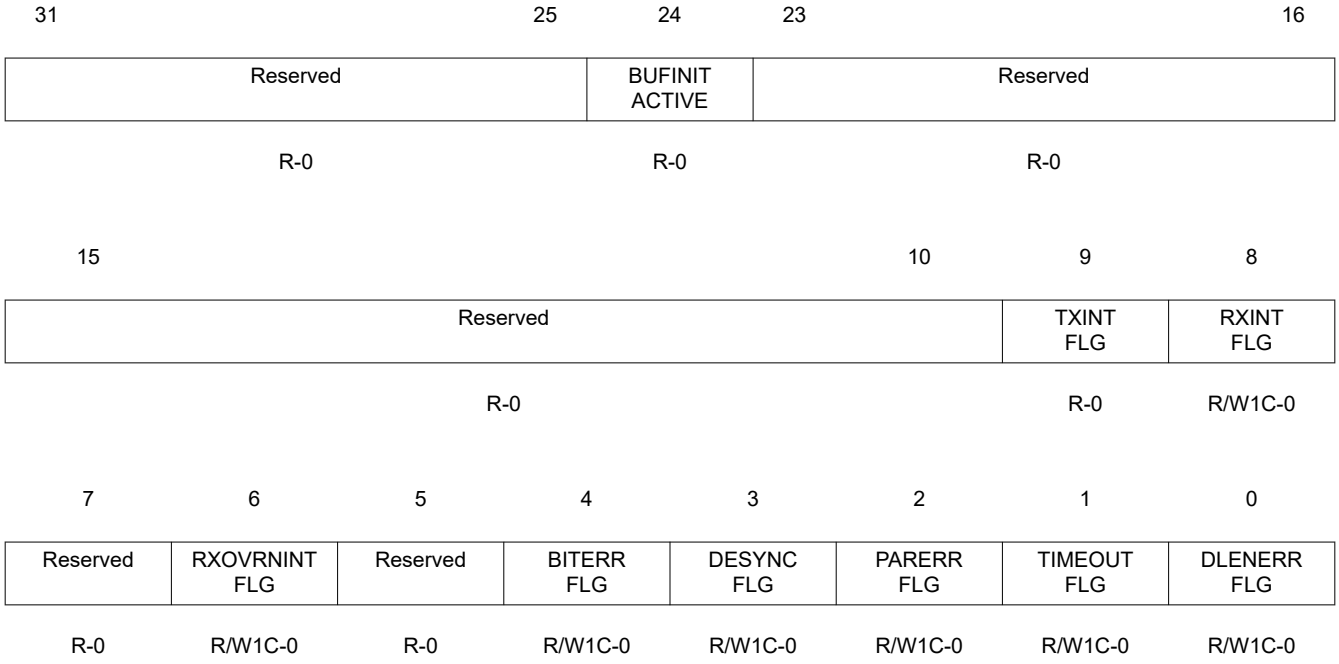
Table 11-191. SPI Interrupt Level Register (SPILVL) Field Descriptions (continued)

Bit	Field	Value	Description
0	DLENERRLVL		Data length error interrupt level (line) select.
		0	An interrupt on data length error is mapped to interrupt line INT0.
		1	An interrupt on data length error is mapped to interrupt line INT1.

11.1.4.8.5 SPI Flag Register (SPIFLG)

Software must check all flag bits when reading this register.

Figure 11-56. SPI Flag Register (SPIFLG) [offset = 10h]



LEGEND: R/W = Read/Write; R = Read only; W1C = Write 1 to clear; -*n* = value after reset

Table 11-192. SPI Flag Register (SPIFLG) Field Descriptions

Bit	Field	Value	Description
31-25	Reserved	0	Reads return 0. Writes have no effect.
24	BUFINITACTIVE		Indicates the status of multi-buffer initialization process. Software can poll for this bit to determine if it can proceed with the register configuration of multi-buffer mode registers or buffer handling. **Note: If the SPIFLG register is read while the multi-buffer RAM is being initialized, the BUFINITACTIVE bit will be read as 1. If SPIFLG is read after the internal automatic buffer initialization is complete, this bit will be read as 0. This bit will show a value of 1 as long as the nRESET bit is 0, but does not really indicate that buffer initialization is underway. Buffer initialization starts only when the nRESET bit is set to 1.**
		0	Multi-buffer RAM initialization is complete.
		1	Multi-buffer RAM is still being initialized. Do not attempt to write to either multi-buffer RAM or any multi-buffer mode registers.
23-10	Reserved	0	Reads return 0. Writes have no effect.
9	TXINTFLG		Transmitter-empty interrupt flag. Serves as an interrupt flag indicating that the transmit buffer (TXBUF) is empty and a new word can be written to it. This flag is set when a word is copied to the shift register either directly from SPIDAT0/SPIDAT1 or from the TXBUF register. This bit is cleared by one of following methods: • Writing a new data to either SPIDAT0 or SPIDAT1 • Writing a 0 to SPIEN (SPIGCR1[24])
		0	Transmit buffer is now full. No interrupt pending for transmitter empty.
		1	Transmit buffer is empty. An interrupt is pending to fill the transmitter.

Table 11-192. SPI Flag Register (SPIFLG) Field Descriptions (continued)

Bit	Field	Value	Description
8	RXINTFLG		Receiver-full interrupt flag. This flag is set when a word is received and copied into the buffer register (SPIBUF). If RXINTEN is enabled, an interrupt is also generated. This bit is cleared under the following methods: • Reading the SPIBUF register • Reading TGINTVECT0 or TGINTVECT1 register when there is a receive buffer full interrupt • Writing a 1 to this bit • Writing a 0 to SPIEN (SPIGCR1[24]) • System reset During emulation mode, however, a read to the emulation register (SPIEMU) does not clear this flag bit.
		0	No new received data pending. Receive buffer is empty.
		1	A newly received data is ready to be read. Receive buffer is full.
			Note: Clearing RXINTFLG bit by writing a 1 before reading the SPIBUF sets the RXEMPTY bit of the SPIBUF register too. In this way, one can ignore a received word. However, if the internal RXBUF is already full, the data from RXBUF will be copied to SPIBUF and the RXEMPTY bit will be cleared again. The SPIBUF contents should be read first if this situation needs to be avoided.
7	Reserved	0	Reads return 0. Writes have no effect.
6	RXOVRNINTFLG		Receiver overrun flag. The SPI hardware sets this bit when a receive operation completes before the previous character has been read from the receive buffer. The bit indicates that the last received character has been overwritten and therefore lost. The SPI will generate an interrupt request if this bit is set and the RXOVRN INTEN bit (SPIINT0.6) is set high. This bit is cleared under the following conditions in compatibility mode of MibSPI: • Reading TGINTVECT0 or TGINTVECT1 register when there is a receive-buffer-overrun interrupt • Writing a 1 to RXOVRNINTFLG in the SPI Flag Register (SPIFLG) itself • Writing a 0 to SPIEN • Reading the data field of the SPIBUF register **Note: Reading the SPIBUF register does not clear this RXOVRNINTFLG bit. If an RXOVRN interrupt is detected, then the SPIBUF may need to be read twice to get to the overrun buffer. This is due to the fact that the overrun will always occur to the internal RXBUF. Each read to the SPIBUF will result in RXBUF contents (if it is full) getting copied to SPIBUF.** **Note: There is a special condition under which the RXOVRNINTFLG flag gets set. If both SPIBUF and RXBUF are already full and while another reception is underway, if any errors (TIMEOUT, BITERR, and DLEN_ERR) occur, then RXOVR in RXBUF and RXOVRNINTFLG in SPIFLG registers will be set to indicate that the status flags are getting overwritten by the new transfer. This overrun should be treated like a receive overrun.** In multi-buffer mode of MibSPI, this bit is cleared under the following conditions: • Reading the RXOVRN_BUF_ADDR register • Writing a 1 to RXOVRNINTFLG in the SPI Flag Register (SPIFLG) itself In multi-buffer mode, if RXOVRNINTFLG is set, then the address of the buffer which experienced the overrun is available in RXOVRN_BUF_ADDR.
		0	Overrun condition did not occur.
		1	Overrun condition has occurred.
5	Reserved	0	Reads return 0. Writes have no effect.

Table 11-192. SPI Flag Register (SPIFLG) Field Descriptions (continued)

Bit	Field	Value	Description
4	BITERRFLG		Mismatch of internal transmit data and transmitted data. This flag can be cleared by one of the following methods. • Write a 1 to this bit • Clear the SPIEN bit to 0
		0	No bit error occurred.
		1	A bit error occurred. The SPI samples the signal of the transmit pin (master: SIMO, slave: SOMI) at the receive point (half clock cycle after transmit point). If the sampled value differs from the transmitted value a bit error is detected and the flag BITERRFLG is set. If BITERRENA is set an interrupt is asserted. Possible reasons for a bit error can be an excessively high bit rate, capacitive load, or another master/slave trying to transmit at the same time.
3	DESYNCFLG		Desynchronization of slave device. Desynchronization monitor is active in master mode only. This flag can be cleared by one of the following methods: • Write a 1 to this bit • Clear the SPIEN bit to 0
		0	No slave desynchronization is detected.
		1	A slave device is desynchronized. The master monitors the ENAble signal coming from the slave device and sets the DESYNC flag after the last bit is transmitted plus $t_{T2EDELAY}$. If DESYNCENA is set an interrupt is asserted. Desynchronization can occur if a slave device misses a clock edge coming from the master.
2	PARERRFLG		Calculated parity differs from received parity bit. If the parity generator is enabled (can be selected individually for each buffer) an even or odd parity bit is added at the end of a data word. During reception of the data word the parity generator calculates the reference parity and compares it to the received parity bit. In the event of a mismatch the PARITYERR flag is set and an interrupt is asserted if PARERRENA is set. This flag can be cleared by one of the following methods: • Write a 1 to this bit • Clear the SPIEN bit to 0
		0	No parity error is detected.
		1	A parity error occurred.
1	TIMEOUTFLG		Time-out caused by nonactivation of ENA signal. This flag can be cleared by one of the following methods: • Write a 1 to this bit • Clear the SPIEN bit to 0
		0	No ENA-signal time-out occurred.
		1	An ENA signal time-out occurred. The SPI generates a time-out because the slave hasn't responded in time by activating the ENA signal after the chip select signal has been activated. If a time-out condition is detected the corresponding chip select is deactivated immediately and the TIMEOUT flag is set. In addition the TIMEOUT flag in the status field of the corresponding buffer is set. The transmit request of the concerned buffer is cleared, that is, the SPI does not re-start a data transfer from this buffer.
0	DLENERRFLG		Data-length error flag. This flag can be cleared by one of the following methods: • Write a 1 to this bit • Clear the SPIEN bit to 0 **Note: Whenever any transmission errors (TIMEOUT, BITERR, DLEN_ERR, PARITY_ERR, DESYNC) are detected and the error flags are cleared by writing to the error bit in the SPIFLG register, the corresponding error flag in SPIBUF does not get cleared. Software needs to read the SPIBUF until it becomes empty before proceeding. This ensures that all of the old status bits in SPIBUF are cleared before starting the next transfer.**
		0	No data length error has occurred.
		1	A data length error has occurred.

11.1.4.8.6 SPI Pin Control Register 0 (SPIPC0)

Note

Register bits vary by device

Register bits 31:24 and 23:16 of SPIPC0 to SPIPC9 reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

Table 11-193. SPI Pin Control (SPIPC0) Field Descriptions

Bit	Field	Value	Description
31-24	SOMIFUN		Slave out, master in function. Determines whether each SPISOMI[x] pin is to be used as a general-purpose I/O pin or as a SPI functional pin. **Note: Duplicate Control Bits for SPISOMI[0]. Bit 24 is not physically implemented. It is a mirror of Bit 11. Any write to bit 24 will be reflected on bit 11. When bit 24 and bit 11 are simultaneously written, the value of bit 11 will control the SPISOMI[0] pin. The read value of bit 24 always reflects the value of bit 11.**
		0	The SPISOMI[x] pin is a GIO pin.
		1	The SPISOMI[x] pin is a SPI functional pin.
23-16	SIMOFUN		Slave in, master out function. Determines whether each SPISIMO[x] pin is to be used as a general-purpose I/O pin or as a SPI functional pin. **Note: Duplicate Control Bits for SPISIMO[0]. Bit 16 is not physically implemented. It is a mirror of Bit 10. Any write to bit 16 will be reflected on bit 10. When bit 16 and bit 10 are simultaneously written, the value of bit 10 will control the SPISIMO[0] pin. The read value of bit 16 always reflects the value of bit 10.**
		0	The SPISIMO[x] pin is a GIO pin.
		1	The SPISIMO[x] pin is a SPI functional pin.
15-12	Reserved	0	Reads return 0. Writes have no effect.

Table 11-193. SPI Pin Control (SPIPC0) Field Descriptions (continued)

Bit	Field	Value	Description
11	SOMIFUN0		Slave out, master in function. This bit determines whether the SPISOMI[0] pin is to be used as a general-purpose I/O pin or as a SPI functional pin.
		0	The SPISOMI[0] pin is a GIO pin.
		1	The SPISOMI[0] pin is a SPI functional pin.
			Note: Regardless of the number of parallel pins used, the SPISOMI[0] pin will always have to be programmed as functional pins for any SPI transfers.
10	SIMOFUN0		Slave in, master out function. This bits determine whether each SPISIMO[0] pin is to be used as a general-purpose I/O pin or as a SPI functional pin.
		0	The SPISIMO[0] pin is a GIO pin.
		1	The SPISIMO[0] pin is a SPI functional pin.
			Note: Regardless of the number of parallel pins used, the SPISIMO[0] pin will always have to be programmed as functional pins for any SPI transfers.
9	CLKFUN		SPI clock function. This bit determines whether the SPICLK pin is to be used as a general-purpose I/O pin, or as a SPI functional pin.
		0	The SPICLK pin is a GIO pin.
		1	The SPICLK pin is a SPI functional pin.
8	ENAFUN		$\overline{\text{SPIENA}}$ function. This bit determines whether the $\overline{\text{SPIENA}}$ pin is to be used as a general-purpose I/O pin or as a SPI functional pin.
		0	The $\overline{\text{SPIENA}}$ pin is a GIO pin.
		1	The $\overline{\text{SPIENA}}$ pin is a SPI functional pin.
7-0	SCSFUN		$\overline{\text{SPICS}}$ function. Determines whether each $\overline{\text{SPICS}}$ pin is to be used as a general-purpose I/O pin or as a SPI functional pin. If the slave $\overline{\text{SPICS}}$ pins are in functional mode and receive an inactive high signal, the slave SPI will place its output in a high-impedance state and disable shifting.
		0	The $\overline{\text{SPICS}}$ pin is a GIO pin.
		1	The $\overline{\text{SPICS}}$ pin is a SPI functional pin.

11.1.4.8.7 SPI Pin Control Register 1 (SPIPC1)

Note

Register bits vary by device

Register bits 31:24 and 23:16 of this register reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

Table 11-194. SPI Pin Control Register (SPIPC1) Field Descriptions

Bit	Field	Value	Description
31-24	SOMIDIR		SPISOMI[x] direction. Controls the direction of each SPISOMI[x] pin when used for general-purpose I/O. If SPISOMI[x] pin is used as a SPI functional pin, the I/O direction is determined by the MASTER bit in the SPIGCR1 register. **Note: Duplicate Control Bits for SPISOMI[0]. Bit 24 is not physically implemented. It is a mirror of Bit 11. Any write to bit 24 will be reflected on bit 11. When bit 24 and bit 11 are simultaneously written, the value of bit 11 will control the SPISOMI[0] pin. The read value of bit 24 always reflects the value of bit 11.**
		0	The SPISOMI[x] pin is an input.
		1	The SPISOMI[x] pin is an output.
23-16	SIMODIR		SPISIMO[x] direction. Controls the direction of each SPISIMO[x] pin when used for general-purpose I/O. If SPISIMO[x] pin is used as a SPI functional pin, the I/O direction is determined by the MASTER bit in the SPIGCR1 register. **Note: Duplicate Control Bits for SPISIMO[0]. Bit 16 is not physically implemented. It is a mirror of Bit 10. Any write to bit 16 will be reflected on bit 10. When bit 16 and bit 10 are simultaneously written, the value of bit 10 will control the SPISIMO[0] pin. The read value of bit 16 always reflects the value of bit 10.**
		0	The SPISIMO[x] pin is an input.
		1	The SPISIMO[x] pin is an output.
15-12	Reserved	0	Reads return 0. Writes have no effect.
11	SOMIDIR0		SPISOMI[0] direction. This bit controls the direction of the SPISOMI[0] pin when it is used as a general-purpose I/O pin. If the SPISOMI[0] pin is used as a SPI functional pin, the I/O direction is determined by the MASTER bit in the SPIGCR1 register.
		0	The SPISOMI[0] pin is an input.
		1	The SPISOMI[0] pin is an output.
10	SIMODIR0		SPISIMO[0] direction. This bit controls the direction of the SPISIMO[0] pin when it is used as a general-purpose I/O pin. If the SPISIMO[0] pin is used as a SPI functional pin, the I/O direction is determined by the MASTER bit in the SPIGCR1 register.
		0	The SPISIMO[0] pin is an input.
		1	The SPISIMO[0] pin is an output.
9	CLKDIR		SPICLK direction. This bit controls the direction of the SPICLK pin when it is used as a general-purpose I/O pin. In functional mode, the I/O direction is determined by the CLKMOD bit.
		0	The SPICLK pin is an input.
		1	The SPICLK pin is an output.
8	ENADIR		$\overline{\text{SPIENA}}$ direction. This bit controls the direction of the $\overline{\text{SPIENA}}$ pin when it is used as a general-purpose I/O. If the $\overline{\text{SPIENA}}$ pin is used as a functional pin, then the I/O direction is determined by the CLKMOD bit (SPIGCR1[1]).
		0	The $\overline{\text{SPIENA}}$ pin is an input.
		1	The $\overline{\text{SPIENA}}$ pin is an output.
7-0	SCSDIR		$\overline{\text{SPICS}}$ direction. These bits control the direction of each $\overline{\text{SPICS}}$ pin when it is used as a general-purpose I/O pin. Each pin could be configured independently from the others if the $\overline{\text{SPICS}}$ is used as a SPI functional pin. The I/O direction is determined by the CLKMOD bit (SPIGCR1[1]).
		0	The $\overline{\text{SPICS}}$ pin is an input.
		1	The $\overline{\text{SPICS}}$ pin is an output.

11.1.4.8.8 SPI Pin Control Register 2 (SPIPC2)

Note

Register bits vary by device

Register bits 31:24 and 23:16 of this register reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

Bit	Field	Value	Description
31-24	SOMISET		SPISOMI[x] data out set. This pin is only active when the SPISOMI[x] pin is configured as a general-purpose output pin. **Bit 11 or bit 24 can be used to set the SPISOMI[0] pin. If a 32-bit write is performed, bit 11 will have priority over bit 24.**
		0	Read: SPISOMI[x] is logic 0. Write: Writing a 0 to this bit has no effect.
		1	Read: SPISOMI[x] is logic 1. Write: Logic 1 is placed on SPISOMI[x] pin, if it is in general-purpose output mode.
23-16	SIMOSET		SPISIMO[x] data out set. This bit is only active when the SPISIMO[x] pin is configured as a general-purpose output pin. **Bit 10 or bit 16 can be used to set the SPISIMO[0] pin. If a 32-bit write is performed, bit 10 will have priority over bit 16.**
		0	Read: SPISIMO[x] is logic 0. Write: Writing a 0 to this bit has no effect.
		1	Read: SPISIMO[x] is logic 1. Write: Logic 1 is placed on SPISIMO[x] pin, if it is in general-purpose output mode.
15-12	Reserved	0	Reads return 0. Writes have no effect.
11	SOMISET0		SPISOMI[0] data out set. This pin is only active when the SPISOMI[0] pin is configured as a general-purpose output pin.
		0	Read: SPISOMI[0] is logic 0. Write: Writing a 0 to this bit has no effect.
		1	Read: SPISOMI[0] is logic 1. Write: Logic 1 is placed on SPISOMI[0] pin, if it is in general-purpose output mode.
10	SIMOSET0		SPISIMO[0] data out set. This pin is only active when the SPISIMO[0] pin is configured as a general-purpose output pin.
		0	Read: SPISIMO[0] is logic 0. Write: Writing a 0 to this bit has no effect.
		1	Read: SPISIMO[0] is logic 1. Write: Logic 1 is placed on SPISIMO[0] pin, if it is in general-purpose output mode.
9	CLKSET		SPICLK data out set. This bit is only active when the SPICLK pin is configured as a general-purpose output pin.
		0	Read: SPICLK is logic 0. Write: Writing a 0 to this bit has no effect.
		1	Read: SPICLK is logic 1. Write: Logic 1 is placed on SPICLK pin, if it is in general-purpose output mode.
8	ENASET		$\overline{\text{SPIENA}}$ data out set. This bit is only active when the $\overline{\text{SPIENA}}$ pin is configured as a general-purpose output pin.
		0	Read: $\overline{\text{SPIENA}}$ is logic 0. Write: Writing a 0 to this bit has no effect.
		1	Read: $\overline{\text{SPIENA}}$ is logic 1. Write: Logic 1 is placed on $\overline{\text{SPIENA}}$ pin, if it is in general-purpose output mode.

Table 11-197. SPI Pin Control Register 4 (SPIPC4) Field Descriptions (continued)

Bit	Field	Value	Description
7-0	SCSSET		$\overline{\text{SPICS}}$ data out set. This bit is only active when the $\overline{\text{SPICS}}$ pin is configured as a general-purpose output pin. A value of 1 written to this bit sets the corresponding SCSDOUT bit to 1.
		0	Read: $\overline{\text{SPICS}}$ is logic 0. Write: Writing a 0 to this bit has no effect.
		1	Read: $\overline{\text{SPICS}}$ is logic 1. Write: Logic 1 is placed on $\overline{\text{SPICS}}$ pin, if it is in general-purpose output mode.

11.1.4.8.11 SPI Pin Control Register 5 (SPIPC5)

Note

Register bits vary by device

Register bits 31:24 and 23:16 of this register reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

Table 11-198. SPI Pin Control Register 5 (SPIPC5) Field Descriptions

Bit	Field	Value	Description
31-24	SOMICLR		SPISOMI[x] data out clear. This pin is only active when the SPISOMI[x] pin is configured as a general-purpose output pin. **Bit 11 or bit 24 can be used to set the SPISOMI[0] pin. If a 32-bit write is performed, bit 11 will have priority over bit 24.**
		0	Read: The current value on SPISOMI[x] is 0. Write: Writing a 0 to this bit has no effect.
		1	Read: The current value on SPISOMI[x] is 1. Write: Logic 0 is placed on SPISOMI[x] pin, if it is in general-purpose output mode.
23-16	SIMOCLR		SPISIMO[x] data out clear. This bit is only active when the SPISIMO[x] pin is configured as a general-purpose output pin. **Bit 10 or bit 16 can be used to set the SPISIMO[0] pin. If a 32-bit write is performed, bit 10 will have priority over bit 16.**
		0	Read: The current value on SPISIMO[x] is 0. Write: Writing a 0 to this bit has no effect.
		1	Read: The current value on SPISIMO[x] is 1. Write: Logic 0 is placed on SPISIMO[x] pin, if it is in general-purpose output mode.
15-12	Reserved	0	Reads return 0. Writes have no effect.

Table 11-198. SPI Pin Control Register 5 (SPIPC5) Field Descriptions (continued)

Bit	Field	Value	Description
11	SOMICLR0		SPISOMI[0] data out clear. This pin is only active when the SPISOMI[0] pin is configured as a general-purpose output pin.
		0	Read: The current value on SPISOMI[0] is 0. Write: Writing a 0 to this bit has no effect.
		1	Read: The current value on SPISOMI[0] is 1. Write: Logic 0 is placed on SPISOMI[0] pin, if it is in general-purpose output mode.
10	SIMOCLR0		SPISIMO[0] data out clear. This pin is only active when the SPISIMO[0] pin is configured as a general-purpose output pin.
		0	Read: The current value on SPISIMO[0] is 0. Write: Writing a 0 to this bit has no effect.
		1	Read: The current value on SPISIMO[0] is 1. Write: Logic 0 is placed on SPISIMO[0] pin, if it is in general-purpose output mode.
9	CLKCLR		SPICLK data out clear. This bit is only active when the SPICLK pin is configured as a general-purpose output pin.
		0	Read: The current value on SPICLK is 0. Write: Writing a 0 to this bit has no effect.
		1	Read: The current value on SPICLK is 1. Write: Logic 0 is placed on SPICLK pin, if it is in general-purpose output mode.
8	ENACLR		$\overline{\text{SPIENA}}$ data out clear. This bit is only active when the $\overline{\text{SPIENA}}$ pin is configured as a general-purpose output pin. A value of 1 written to this bit clears the corresponding ENABLEDOUT bit to 0.
		0	Read: The current value on $\overline{\text{SPIENA}}$ is 0. Write: Writing a 0 to this bit has no effect.
		1	Read: The current value on $\overline{\text{SPIENA}}$ is 1. Write: Logic 0 is placed on $\overline{\text{SPIENA}}$ pin, if it is in general-purpose output mode.
7-0	SCSCLR		$\overline{\text{SPICS}}$ data out clear. This bit is only active when the $\overline{\text{SPICS}}$ pin is configured as a general-purpose output pin.
		0	Read: The current value on SCSDOUT is 0. Write: Writing a 0 to this bit has no effect.
		1	Read: The current value on SCSDOUT is 1. Write: Logic 0 is placed on $\overline{\text{SPICS}}$ pin, if it is in general-purpose output mode.

11.1.4.8.12 SPI Pin Control Register 6 (SPIPC6)

Note

Register bits vary by device

Register bits 31:24 and 23:16 of SPIPC0 to SPIPC9 reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

Bit	Field	Value	Description
31-24	SOMIPDR		SPISOMI[x] open drain enable. This bit enables open drain capability for each SPISOMI[x] pin, if the following conditions are met: • SOMIDIRx = 1 (SPISOMI[x] pin is configured in GIO mode as an output pin) • SOMIDOUTx = 1 **Bit 11 or bit 24 can both be used to enable open-drain for SPISOMI[0]. If a 32-bit write is performed, bit 11 will have priority over bit 24.**
		0	Output value on the SPISOMI[x] pin is logic 1.
		1	Output pin SPISOMI[x] is in a high-impedance state.
23-16	SIMOPDR		SPISIMO[x] open drain enable. This bit enables open drain capability for each SPISIMO[x] pin, if the following conditions are met: • SIMODIRx = 1 (SPISIMO[x] pin is configured in GIO mode as an output pin) • SIMODOUTx = 1 **Bit 10 or bit 16 can both be used to enable open-drain for SPISIMO[0]. If a 32-bit write is performed, bit 10 will have priority over bit 16.**
		0	Output value on the SPISIMO[x] pin is logic 1.
		1	Output pin SPISIMO[x] is in a high-impedance state.
15-12	Reserved	0	Reads return 0. Writes have no effect.
11	SOMIPDR0		SPISOMI[0] open-drain enable. This bit enables open-drain capability for the SPISOMI[0] pin, if the following conditions are met: • SPISOMI[0] pin is configured in GIO mode as output pin • Output value on SPISOMI[0] pin is logic 1
		0	Output value on the SPISOMI[0] pin is logic 1.
		1	Output pin SPISOMI[0] is in a high-impedance state.
10	SIMOPDR0		SPISIMO[0] open-drain enable. This bit enables open drain capability for the SPISIMO[0] pin, if the following conditions are met: • SPISIMO[0] pin is configured in GIO mode as output pin • Output value on SPISIMO[0] pin is logic 1
		0	Output value on the SPISIMO[0] pin is logic 1.
		1	Output pin SPISIMO[0] is in a high-impedance state.

Table 11-199. SPI Pin Control Register 6 (SPIPC6) Field Descriptions (continued)

Bit	Field	Value	Description
9	CLKPDR		SPICLK open drain enable. This bit enables open drain capability for the SPICLK pin, if the following conditions are met: • SPICLK pin is configured in GIO mode as an output pin • SPICLKDOUT = 1
		0	Output value on the SPICLK pin is logic 1.
		1	Output pin SPICLK is in a high-impedance state.
8	ENAPDR		$\overline{\text{SPIENA}}$ open drain enable. This bit enables open drain capability for the $\overline{\text{SPIENA}}$ pin, if the following conditions are met: • $\overline{\text{SPIENA}}$ pin is configured in GIO mode as an output pin • SPIENADOUT = 1
		0	Output value on the $\overline{\text{SPIENA}}$ pin is logic 1.
		1	Output pin $\overline{\text{SPIENA}}$ is in a high-impedance state.
7-0	SCSPDR		$\overline{\text{SPICS}}$ open drain enable. This bit enables open drain capability for each $\overline{\text{SPICS}}$ pin, if the following conditions are met: • $\overline{\text{SPICS}}$ pin is configured in GIO mode as an output pin • SCSDOUT = 1
		0	Output value on the $\overline{\text{SPICS}}$ pin is logic 1.
		1	Output pin $\overline{\text{SPICS}}$ is in a high-impedance state.

11.1.4.8.13 SPI Pin Control Register 7 (SPIPC7)

Note

Register bits vary by device

Register bits 31:24 and 23:16 of this register reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

Note

Default Register Value

The default values of these register bits vary by device. See your device datasheet for information about default pin states, which correspond to the register reset values (see the pin-list table).

		0	Pull down on the SPICLK pin.
		1	Pull up on the SPICLK pin.
8	ENAPSEL		$\overline{\text{SPIENA}}$ pull select. This bit selects the type of pull logic at the $\overline{\text{SPIENA}}$ pin.
		0	Pull down on the $\overline{\text{SPIENA}}$ pin.
		1	Pull up on the $\overline{\text{SPIENA}}$ pin.
7-0	SCSPSEL		$\overline{\text{SPICS}}$ pull select. This bit selects the type of pull logic for each $\overline{\text{SPICS}}$ pin.
		0	Pull down on the $\overline{\text{SPICS}}$ pin.
		1	Pull up on the $\overline{\text{SPICS}}$ pin.

11.1.4.8.15 SPI Transmit Data Register 0 (SPIDAT0)

Figure 11-66. SPI Transmit Data Register 0 (SPIDAT0) [offset = 38h]

31 16

Reserved

R-0

15	0
TXDATA	
R/W-0	

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Table 11-202. SPI Transmit Data Register 0 (SPIDAT0) Field Descriptions

Bit	Field	Value	Description
31-16	Reserved	0	Reads return 0. Writes have no effect.
15-0	TXDATA	0-FFFFh	SPI transmit data. When written, these bits will be copied to the shift register if it is empty. If the shift register is not empty, TXBUF holds the written data. SPIEN (SPICGR1[24]) must be set to 1 before this register can be written to. Writing a 0 to the SPIEN register forces the lower 16 bits of the SPIDAT0 to 0x00. **Note: When this register is read, the contents TXBUF, which holds the latest written data, will be returned.** **Note: Regardless of character length, the transmit word should be right-justified before writing to the SPIDAT1 register.** **Note: The default data format control register for SPIDAT0 is SPIFMT0. However, it is possible to reprogram the DFSEL[1:0] fields of SPIDAT1 before using SPIDAT0, to select a different SPIFMTx register.** **Note: It is highly recommended to use SPIDAT1 register, SPIDAT0 is supported for compatibility reasons.**

11.1.4.8.16 SPI Transmit Data Register 1 (SPIDAT1)

Note

Writing to only the control fields, bits 28 through 16, does not initiate any SPI transfer in master mode. This feature can be used to set up SPICLK phase or polarity before actually starting the transfer by only updating the DFSEL bit field to select the required phase and polarity combination.

Figure 11-67. SPI Transmit Data Register 1 (SPIDAT1) [offset = 3Ch]

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Table 11-203. SPI Transmit Data Register 1 (SPIDAT1) Field Descriptions

Bit	Field	Value	Description
31-29	Reserved	0	Reads return 0. Writes have no effect.
28	CSHOLD		Chip select hold mode. The CSHOLD bit is supported in master mode only in compatibility-mode of SPI, (it is ignored in slave mode). CSHOLD defines the behavior of the chip select line at the end of a data transfer.
		0	The chip select signal is deactivated at the end of a transfer after the T2CDELAY time has passed. If two consecutive transfers are dedicated to the same chip select this chip select signal will be deactivated for at least 2VCLK cycles before it is activated again.
		1	The chip select signal is held active at the end of a transfer until a control field with new data and control information is loaded into SPIDAT1. If the new chip select number equals the previous one, the active chip select signal is extended until the end of transfer with CSHOLD cleared, or until the chip-select number changes.
27	Reserved	0	Reads return 0. Writes have no effect.
26	WDEL		Enable the delay counter at the end of the current transaction. **Note: The WDEL bit is supported in master mode only. In slave mode, this bit will be ignored.**
		0	No delay will be inserted. However, the $\overline{\text{SPICS}}$ pins will still be de-activated for at least for 2VCLK cycles if CSHOLD = 0. **Note: The duration for which the $\overline{\text{SPICS}}$ pin remains deactivated depends upon the time taken to supply a new word after completing the shift operation. If TXBUF is already full, then the $\overline{\text{SPICS}}$ pin will be deasserted for at least two VCLK cycles (if WDEL = 0).**
		1	After a transaction, WDELAY of the corresponding data format will be loaded into the delay counter. No transaction will be performed until the WDELAY counter overflows. The $\overline{\text{SPICS}}$ pins will be de-activated for at least (WDELAY + 2) × VCLK_Period duration.
25-24	DFSEL		Data word format select.
		0	Data word format 0 is selected.
		1h	Data word format 1 is selected.
		2h	Data word format 2 is selected.
		3h	Data word format 3 is selected.

Table 11-203. SPI Transmit Data Register 1 (SPIDAT1) Field Descriptions (continued)

Bit	Field	Value	Description
23-16	CSNR	0-FFh	Chip select (CS) number. CSNR defines the chip select pins that will be activated during the data transfer. CSNR is a bit-mask that controls all chip select pins. See Table 11-204. **Note: If your MibSPI has less than 8 chip select pins, all unused upper bits will be 0. For example, MiBSPI3 has 6 chip select pins, if you write FFh to CSNR, the actual number stored in CSNR is 3Fh.**
15-0	TXDATA	0-FFFFh	Transfer data. When written, these bits are copied to the shift register if it is empty. If the shift register is not empty, then they are held in TXBUF. SPIEN must be set to 1 before this register can be written to. Writing a 0 to SPIEN forces the lower 16 bits of SPIDAT1 to 0x0000. A write to this register (or to the TXDATA field only) drives the contents of the CSNR field on the $\overline{\text{SPICS}}$ pins, if the pins are configured as functional pins (automatic chip select, see Section 11.1.4.2). When this register is read, the contents of TXBUF, which holds the latest data written, will be returned. **Note: Regardless of the character length, the transmit data should be right-justified before writing to the SPIDAT1 register.**

Table 11-204. Chip Select Number Active

CSNR Value	Chip Select Active:							CSNR Value	Chip Select Active:

RXDATA							
R-0							

LEGEND: R = Read only; *-n* = value after reset

Table 11-205. SPI Receive Buffer Register (SPIBUF) Field Descriptions

Bit	Field	Value	Description
31	RXEMPTY		Receive data buffer empty. When the host reads the RXDATA field or the entire SPIBUF register, it automatically sets the RXEMPTY flag. When a data transfer is completed, the received data is copied into RXDATA and the RXEMPTY flag is cleared.
		0	New data has been received and copied into RXDATA.
		1	No data has been received since the last read of RXDATA. This flag gets set to 1 under the following conditions: • Reading the RXDATA field of the SPIBUF register • Writing a 1 to clear the RXINTFLG bit in the SPI Flag Register (SPIFLG) Write-clearing the RXINTFLG bit before reading the SPIBUF indicates the received data is being ignored. Conversely, RXINTFLG can be cleared by reading the RXDATA field of SPIBUF (or the entire register).
30	RXOVR		Receive data buffer overrun. When a data transfer is completed and the received data is copied into RXBUF while it is already full, RXOVR is set. Overruns always occur to RXBUF, not to SPIBUF; the contents of SPIBUF are overwritten only after it is read by the Peripheral (VBUSP) master (CPU, DMA, or other host processor). If enabled, the RXOVRN interrupt is generated when RXBUF is overwritten, and reading either SPI Flag Register (SPIFLG) or SPIVECTx shows the RXOVRN condition. Two read operations from the SPIBUF register are required to reach the overwritten buffer word (one to read SPIBUF, which then transfers RXDATA into SPIBUF for the second read). **Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.** **Note: A special condition under which RXOVR flag gets set. If both SPIBUF and RXBUF are already full and while another buffer receive is underway, if any errors such as TIMEOUT, BITERR, and DLEN_ERR occur, then RXOVR in RXBUF and SPI Flag Register (SPIFLG) registers will be set to indicate that the status flags are getting overwritten by the new transfer. This overrun should be treated like a normal receive overrun.**
		0	No receive data overrun condition occurred since last read of the data field.
		1	A receive data overrun condition occurred since last read of the data field.

Table 11-205. SPI Receive Buffer Register (SPIBUF) Field Descriptions (continued)

Bit	Field	Value	Description
29	TXFULL		Transmit data buffer full. This flag is a read-only flag. Writing into the SPIDAT0 or SPIDAT1 field while the TX shift register is full will automatically set the TXFULL flag. Once the word is copied to the shift register, the TXFULL flag will be cleared. Writing to SPIDAT0 or SPIDAT1 when both TXBUF and the TX shift register are empty does not set the TXFULL flag.
		0	The transmit buffer is empty; SPIDAT0/SPIDAT1 is ready to accept a new data.
		1	The transmit buffer is full; SPIDAT0/SPIDAT1 is not ready to accept new data.
28	BITERR		Bit error. There was a mismatch of internal transmit data and transmitted data.
			Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.
		0	No bit error occurred.
		1	A bit error occurred. The SPI samples the signal of the transmit pins (master: SIMOx, slave: SOMIx) at the receive point (one-half clock cycle after the transmit point). If the sampled value differs from the transmitted value, a bit error is detected and the BITERR flag is set. Possible reasons for a bit error include noise, an excessively high bit rate, capacitive load, or another master/slave trying to transmit at the same time.
27	DESYNC		Desynchronization of slave device. This bit is valid in master mode only.
			The master monitors the ENA signal coming from the slave device and sets the DESYNC flag if ENA is deactivated before the last reception point or after the last bit is transmitted plus $t_{T2EDELAY}$. If DESYNCENA is set, an interrupt is asserted. Desynchronization can occur if a slave device misses a clock edge coming from the master.
			Note: In the Compatibility Mode MibSPI, under some circumstances it is possible for a desync error detected for the previous buffer to be visible in the current buffer. This is because the receive completion flag/interrupt is generated when the buffer transfer is completed. But desynchronization is detected after the buffer transfer is completed. So, if the VBUS master reads the received data quickly when an RXINT is detected, then the status flag may not reflect the correct desync condition. In multi-buffer mode, the desync flag is always assured to be for the current buffer.
			Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.
		0	No slave desynchronization is detected.
		1	A slave device is desynchronized.
26	PARITYERR		Parity error. The calculated parity differs from the received parity bit.
			If the parity generator is enabled (selected individually for each buffer) an even or odd parity bit is added at the end of a data word. During reception of the data word, the parity generator calculates the reference parity and compares it to the received parity bit. If a mismatch is detected, the PARITYERR flag is set.
			Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.
		0	No parity error is detected.
		1	A parity error occurred.
25	TIMEOUT		Time-out because of non-activation of $\overline{\text{SPIENA}}$ pin.
			The SPI generates a time-out when the slave does not respond in time by activating the ENA signal after the chip select signal has been activated. If a time-out condition is detected, the corresponding chip select is deactivated immediately and the TIMEOUT flag is set. In addition, the TIMEOUT flag in the status field of the corresponding buffer and in the SPI Flag Register (SPIFLG) is set.
			Note: This bit is valid only in master mode.
			Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.
		0	No $\overline{\text{SPIENA}}$ pin time-out occurred.
		1	An $\overline{\text{SPIENA}}$ signal time-out occurred.
24	DLENERR		Data length error flag.
			Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.
		0	No data-length error occurred.
		1	A data length error occurred.
23-16	LCSNR	0-FFh	Last chip select number. LCSNR in the status field is a copy of CSNR in the corresponding control field. It contains the chip select number that was activated during the last word transfer.

Table 11-205. SPI Receive Buffer Register (SPIBUF) Field Descriptions (continued)

Bit	Field	Value	Description
15-0	RXDATA	0-FFFFh	SPI receive data. This is the received word, transferred from the receive shift-register at the end of a transfer. Regardless of the programmed character length and the direction of shifting, the received data is stored right-justified in the register.

11.1.4.8.18 SPI Emulation Register (SPIEMU)

Table 11-207. SPI Delay Register (SPIDELAY) Field Descriptions

Bit	Field	Value	Description
31-24	C2TDELAY	0-FFh	Chip-select-active to transmit-start delay. See Figure 11-71 for an example. C2TDELAY is used only in master mode. It defines a setup time (for the slave device) that delays the data transmission from the chip select active edge by a multiple of VCLK cycles. The setup time value is calculated as follows. $t_{C2TDELAY}$ = (C2TDELAY + 2) × VCLK Period Example: VCLK = 25 MHz -> VCLK Period = 40ns; C2TDELAY = 07h; > $t_{C2TDELAY}$ = 360 ns When the chip select signal becomes active, the slave has to prepare data transfer within 360 ns. **Note: If phase = 1, the delay between SPICS falling edge to the first edge of SPICLK will have an additional 0.5 SPICLK period delay. This delay is as per the SPI protocol.**

Table 11-207. SPI Delay Register (SPIDELAY) Field Descriptions (continued)

Bit	Field	Value	Description
23-16	T2CDELAY	0-FFh	Transmit-end-to-chip-select-inactive-delay. See Figure 11-72 for an example. T2CDELAY is used only in master mode. It defines a hold time for the slave device that delays the chip select deactivation by a multiple of VCLK cycles after the last bit is transferred. The hold time value is calculated as follows: $t_{T2CDELAY}$ = (T2CDELAY +1) × VCLK Period Example: VCLK = 25 MHz -> VCLK Period = 40ns; T2CDELAY = 03h; > $t_{T2CDELAY}$ = 160 ns After the last data bit (or parity bit) is being transferred the chip select signal is held active for 160 ns. **Note: If phase = 0, then between the last edge of SPICLK and rise-edge of SPICS there will be an additional delay of 0.5 SPICLK period. This is as per the SPI protocol.** Both C2TDELAY and T2CDELAY counters do not have any dependency on the $\overline{\text{SPIENA}}$ pin value. Even if the $\overline{\text{SPIENA}}$ pin is asserted by the slave, the master will continue to delay the start of SPICLK until the C2TDELAY counter overflows. Similarly, even if the $\overline{\text{SPIENA}}$ pin is deasserted by the slave, the master will continue to hold the $\overline{\text{SPICS}}$ pins active until the T2CDELAY counter overflows. In this way, it is assured that the setup and hold times of the $\overline{\text{SPICS}}$ pins are determined by the delay timers alone. To achieve better throughput, it should be ensured that these two timers are kept at the minimum possible values.
15-8	T2EDELAY	0-FFh	Transmit-data-finished to ENA-pin-inactive time-out. T2EDELAY is used in master mode only. It defines a time-out value as a multiple of SPI clock before $\overline{\text{SPIENA}}$ signal has to become inactive and after $\overline{\text{SPICS}}$ becomes inactive. SPICLK depends on which data format is selected. If the slave device is missing one or more clock edges, it becomes de-synchronized. In this case, although the master has finished the data transfer, the slave is still waiting for the missed clock pulses and the ENA signal is not disabled. The T2EDELAY defines a time-out value that triggers the DESYNC flag, if the $\overline{\text{SPIENA}}$ signal is not deactivated in time. The DESYNC flag is set to indicate that the slave device did not de-assert its $\overline{\text{SPIENA}}$ pin in time to acknowledge that it received all bits of the sent word. See Figure 11-73 for an example of this condition. **Note: DESYNC is also set if the SPI detects a de-assertion of $\overline{\text{SPIENA}}$ before the end of the transmission.** The time-out value is calculated as follows: $t_{T2EDELAY}$ = T2EDELAY/SPIclock Example: SPIclock = 8 Mbit/s; T2EDELAY = 10h; > $t_{T2EDELAY}$ = 2 µs The slave device has to disable the ENA signal within 2 µs, otherwise DESYNC is set and an interrupt is asserted (if enabled).
7-0	C2EDELAY	0-FFh	Chip-select-active to ENA-signal-active time-out. C2EDELAY is used only in master mode and it applies only if the addressed slave generates an ENA signal as a hardware handshake response. C2EDELAY defines the maximum time between when the SPI activates the chip-select signal and the addressed slave has to respond by activating the ENA signal. C2EDELAY defines a time-out value as a multiple of SPI clocks. The SPI clock depends on whether data format 0 or data format 1 is selected. See Figure 11-74 for an example of this condition. **Note: If the slave device does not respond with the ENA signal before the time-out value is reached, the TIMEOUT flag in the SPIFLG register is set and a interrupt is asserted (if enabled).** If a time-out occurs, the SPI clears the transmit request of the timed-out buffer, sets the TIMEOUT flag for the current buffer, and continues with the transfer of the next buffer in the sequence that is enabled. The timeout value is calculated as follows: $t_{C2EDELAY}$ = C2EDELAY/SPIclock Example: SPIclock = 8 Mbit/s; C2EDELAY = 30h; > $t_{C2EDELAY}$ = 6 ms The slave device has to activate the ENA signal within 6 ms after the SPI has activated the chip select signal ($\overline{\text{SPICS}}$), otherwise the TIMEOUT flag is set and an interrupt is asserted (if enabled).

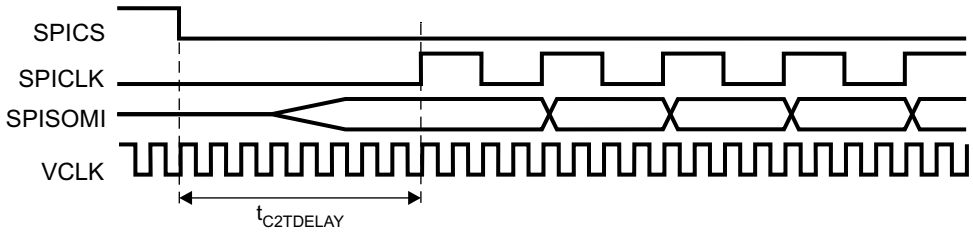

Figure 11-71. Example: $t_{C2TDELAY}$= 8 VCLK Cycles

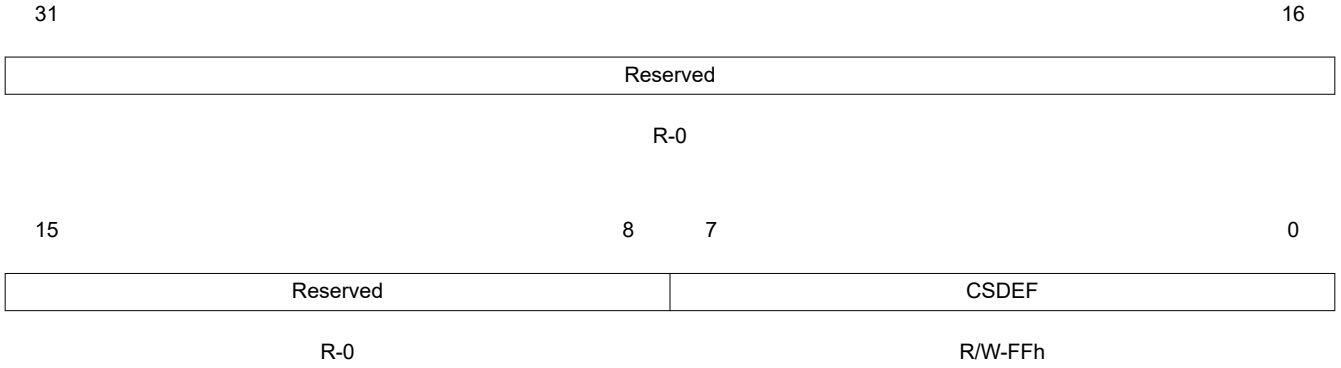
11.1.4.8.20 SPI Default Chip Select Register (SPIDEF)

Figure 11-75. SPI Default Chip Select Register (SPIDEF) [offset = 4Ch]



LEGEND: R/W = Read/Write; R = Read only; *-n* = value after reset

Table 11-208. SPI Default Chip Select Register (SPIDEF) Field Descriptions

Bit	Field	Value	Description
31-8	Reserved	0	Reads return 0. Writes have no effect.
7-0	CDEF	0-FFh	Chip select default pattern. Master-mode only. The CSDEF bits are output to the $\overline{\text{SPICS}}$ pins when no transmission is being performed. It allows the user to set a programmable chip-select pattern that deselects all of the SPI slaves.
		0	$\overline{\text{SPICS}}$ is cleared to 0 when no transfer is active.
		1	$\overline{\text{SPICS}}$ is set to 1 when no transfer is active.

11.1.4.8.21 SPI Data Format Registers (SPIFMT)

Figure 11-76. SPI Data Format Registers (SPIFMT[3:0]) [offset = 5Ch-50h]

PRESCALE					Reserved		CHARLEN
R/WP-0					R-0		R/WP-0

LEGEND: R/W = Read/Write; R = Read only; WP = Write in privilege mode only; -*n* = value after reset

Table 11-209. SPI Data Format Registers (SPIFMT) Field Descriptions

Bit	Field	Value	Description
31-24	WDELAY	0-FFh	Delay in between transmissions for data format x (x= 0,1,2,3).Idle time that will be applied at the end of the current transmission if the bit WDEL is set in the current buffer. The delay to be applied is equal to: WDELAY × P_{VCLK} + 2 × P_{VCLK} P_{VCLK} -> Period of VCLK.
23	PARPOL		Parity polarity: even or odd. PARPOLx can be modified in privilege mode only. It can be used for data format x (x= 0,1,2,3).
		0	An even parity flag is added at the end of the transmit data stream.
		1	An odd parity flag is added at the end of the transmit data stream.
22	PARITYENA		Parity enable for data format x.
			No parity generation/ verification is performed for this data format.
		0	A parity bit is transmitted at the end of each transmitted word. At the end of a transfer the parity generator compares the received parity bit with the locally-calculated parity flag. If the parity bits do not match, the RXERR flag is set in the corresponding control field. The parity type (even or odd) can be selected via the PARPOL bit.
		1	**Note: If an uncorrectable error flag is set in a slave-mode SPI, then the wrong parity bit will be transmitted to indicate to the master that there has been some issue with the data parity. The SPISOMI pins will be forced to transmit all 0s, and the parity bit will be transmitted as 1 if even parity is selected and as 0 if odd parity is selected (using the PARPOLx bit of this register). This behavior occurs regardless of an uncorrectable parity error on either TXRAM or RXRAM.**

Table 11-209. SPI Data Format Registers (SPIFMT) Field Descriptions (continued)

Bit	Field	Value	Description
21	WAITENA		The master waits for the ENA signal from slave for data format x. WAITENA is valid in master mode only. WAITENA enables a flexible SPI network where slaves with ENA signal and slaves without ENA signal can be mixed. WAITENA defines, for each transferred word, whether the addressed slave generates the ENA signal or not.
		0	The SPI does not wait for the ENA signal from the slave and directly starts the transfer.
		1	Before the SPI starts the data transfer it waits for the ENA signal to become low. If the ENA signal is not pulled down by the addressed slave before the internal time-out counter (C2EDELAY) overflows, then the master aborts the transfer and sets the TIMEOUT error flag.
20	SHIFTDIR		Shift direction for data format x. With bit SHIFTDIRx, the shift direction for data format x (x=0,1,2,3) can be selected.
		0	MSB is shifted out first.
		1	LSB is shifted out first.
19	HDUPLEX_ENAx		Half Duplex transfer mode enable for Data Format x. This bit controls the I/O function of SOMI/SIMO lines for a specific requirement where in the case of Master mode, TX pin - SIMO will act as an RX pin, and in the case of Slave mode, RX pin - SIMO will act as a TX pin.
		0	Normal Full Duplex transfer.
		1	If MASTER = 1, SPISIMO pin will act as an RX pin (No TX possible) If MASTER = 0, SPISIMO pin will act as a TX pin (No RX possible). For all normal operations, HDUPLEX_ENAx bits should always remain 0. It is intended for the usage when the SPISIMO pin is used for both TX and RX operations at different times.
18	DIS CS TIMERS		Disable chip-select timers for this format. The C2TDELAY and T2CDELAY timers are by default enabled for all the data format registers. Using this bit, these timers can be disabled for a particular data format, if they are not required. When a master is handling multiple slaves, with varied set-up hold requirement, the application can selectively choose to include or not include the chip-select delay timers for any slaves.
		0	Both C2TDELAY and T2CDELAY counts are inserted for the chip selects.
		1	No C2TDELAY or T2CDELAY is inserted in the chip select timings.
17	POLARITY		SPI data format x clock polarity. POLARITYx defines the clock polarity of data format x. The following restrictions apply when switching clock phase and/or polarity: • In 3-pin/4-pin with $\overline{\text{SPIENA}}$ pin configuration of a slave SPI, the clock phase and polarity cannot be changed on-the-fly between two transfers. The slave should be reset and reconfigured if clock phase/polarity needs to be switched. In summary, SPI format switching is not fully supported in slave mode. • Even while using chip select pins, the polarity of SPICLK can be switched only while the slave is not selected by a valid chip select. The master SPI should ensure that while switching SPICLK polarity, it has deselected all of its slaves. Otherwise, the switching of SPICLK polarity may be incorrectly treated as a clock edge by some slaves.
		0	If POLARITYx is cleared to 0, the SPI clock signal is low-inactive, that is, before and after data transfer the clock signal is low.
		1	If POLARITYx is set to 1, the SPI clock signal is high-inactive, that is, before and after data transfer the clock signal is high.
16	PHASE		SPI data format x clock delay. PHASEx defines the clock delay of data format x.
		0	If PHASEx is cleared to 0, the SPI clock signal is not delayed versus the transmit/receive data stream. The first data bit is transmitted with the first clock edge and the first bit is received with the second (inverse) clock edge.
		1	If PHASEx is set to 1, the SPI clock signal is delayed by a half SPI clock cycle versus the transmit/receive data stream. The first transmit bit has to output prior to the first clock edge. The master and slave receive the first bit with the first edge.

Table 11-209. SPI Data Format Registers (SPIFMT) Field Descriptions (continued)

Bit	Field	Value	Description
15-8	PRESCALE		SPI data format x prescaler. PRESCALEx determines the bit transfer rate of data format x if the SPI is the network master. PRESCALEx is use to derive SPICLK from VCLK. If the SPI is configured as slave, PRESCALEx **does not need** to be configured. The clock rate for data format x can be calculated as: $BR_{Formatx}$ = VCLK / (PRESCALEx + 1) **Note: When PRESCALEx is cleared to 0, the SPI clock rate defaults to VCLK/2.**
7-5	Reserved	0	Reads return 0. Writes have no effect.
4-0	CHARLEN	0-1Fh	SPI data format x data-word length. CHARLENx defines the word length of data format x. Legal values are 0x02 (data word length = 2 bit) to 10h (data word length = 16). Illegal values, such as 00 or 1Fh are not allowed; their effect is indeterminate.

11.1.4.8.22 Interrupt Vector 0 (INTVECT0)

Note

The TG interrupt is not available in MibSPI in compatibility mode. Therefore, there is no possibility to access this register in compatibility mode.

Figure 11-77. Interrupt Vector 0 (NTVECT0) [offset = 60h]

31	16

R-0	

15	6	5	1	0
Reserved		INTVECT0		SUSPEND0
R-0		R-0		R-0

LEGEND: R = Read only; -*n* = value after reset

Table 11-210. Transfer Group Interrupt Vector 0 (INTVECT0)

Bit	Field	Value	Description
31-6	Reserved	0	Reads return 0. Writes have no effect.
5-1	INTVECT0		INTVECT0. Interrupt vector for interrupt line INT0. Returns the vector of the pending interrupt at interrupt line INT0. If more than one interrupt is pending, INTVECT0 always references the highest prior interrupt source first. **Note: This field reflects the status of the SPIFLG register in vector format. Any updates to the SPIFLG register will automatically cause updates to this field.**
		0	There is no pending interrupt.
		1h + x	Transfer group x (x = 0 to 15) has a pending interrupt. SUSPEND0 reflects the type of interrupt (*suspend* or *finished*).
		11h	Error Interrupt pending. The lower half of SPIFLG contains more details about the type of error.
		13h	The pending interrupt is a Receive Buffer Overrun interrupt.
		12h	**SPI mode:** The pending interrupt is a Receive Buffer Full interrupt. **Mib mode:** Reserved. This bit combination should not occur.
		14h	**SPI mode:** The pending interrupt is a Transmit Buffer Empty interrupt. **Mib mode:** Reserved. This bit combination should not occur.
		All Other Combinations	**SPI mode:** Reserved. These bit combinations should not occur.
0	SUSPEND0		Transfer suspended / Transfer finished interrupt flag. Every time INTVECT0 is read by the host, the corresponding interrupt flag of the referenced transfer group is cleared and INTVECT0 is updated with the vector coming next in the priority chain.
		0	The interrupt type is a transfer finished interrupt. In other words, the buffer array referenced by INTVECT0 has asserted an interrupt because all of data from the transfer group has been transferred.
		1	The interrupt type is a transfer suspended interrupt. In other words, the transfer group referenced by INTVECT0 has asserted an interrupt because the buffer to be transferred next is in suspend-to-wait mode.

Note

Reading from the INTVECT0 register when Transmit Empty is indicated does not clear the TXINTFLG flag in the SPI Flag Register (SPIFLG). Writing a new word to the SPIDATx register clears the Transmit Empty interrupt.

Note

In multi-buffer mode, INTVECT0 contains the interrupt for the highest priority transfer group. A read from INTVECT0 automatically causes the next-highest priority transfer group's interrupt status to get loaded into INTVECT0 and its corresponding SUSPEND flag to get loaded into SUSPEND0. The transfer group with the lowest number has the highest priority, and the transfer group with the highest number has the lowest priority.

Reading the INTVECT0 register when the RXOVRN interrupt is indicated in multi-buffer mode does not clear the RXOVRN flag and hence does not clear the vector. The RXOVRN interrupt vector may be cleared in multi-buffer mode either by write-clearing the RXOVRN flag in the SPI Flag Register (SPIFLG) or by reading the RXRAM Overrun Buffer Address Register (RXOVRN_BUF_ADDR).

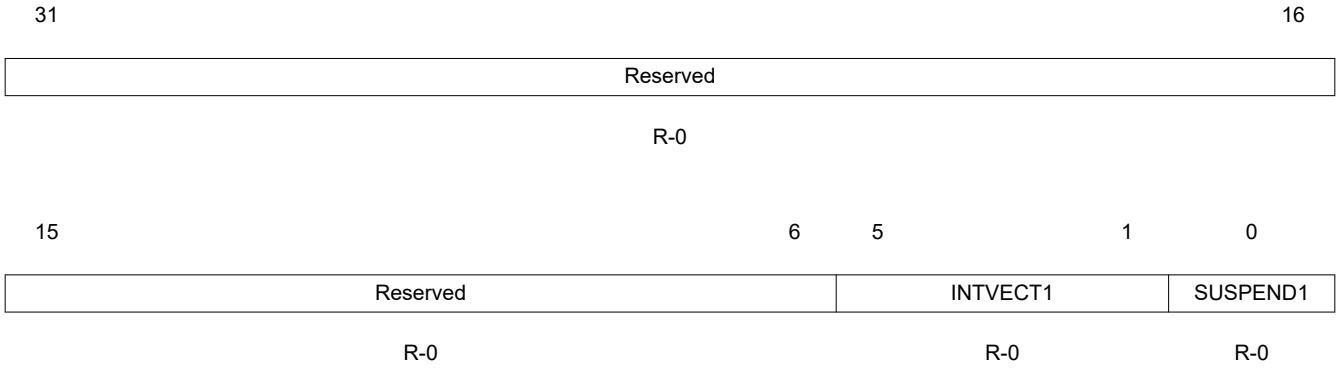
11.1.4.8.23

11.1.4.8.24 Interrupt Vector 1 (INTVECT1)

Note

The TG interrupt is not available in SPI in compatibility mode compatibility mode. Therefore, there is no possibility to access this register in compatibility mode.

Figure 11-78. Interrupt Vector 1 (INTVECT1) [offset = 64h]



LEGEND: R = Read only; *-n* = value after reset

Table 11-211. Transfer Group Interrupt Vector 1 (INTVECT1)

Bit	Field	Value	Description
31-6	Reserved	0	Reads return 0. Writes have no effect.

Table 11-211. Transfer Group Interrupt Vector 1 (INTVECT1) (continued)

Bit	Field	Value	Description
5-1	INTVECT1		INTVECT1. Interrupt vector for interrupt line INT1. Returns the vector of the pending interrupt at interrupt line INT1. If more than one interrupt is pending, INTVECT1 always references the highest prior interrupt source first. **Note: This field reflects the status of the SPIFLG register in vector format. Any updates to the SPIFLG register will automatically cause updates to this field.**
		0	There is no pending interrupt. **SPI mode only.**
		11h	Error Interrupt pending. The lower half of SPIINT1 contains more details about the type of error. **SPI mode only.**
		13h	The pending interrupt is a Receive Buffer Overrun interrupt. **SPI mode only.**
		12h	The pending interrupt is a Receive Buffer Full interrupt. **SPI mode only.**
		14h	The pending interrupt is a Transmit Buffer Empty interrupt. **SPI mode only.**
		All Other Combinations	Reserved. These bit combinations should not occur. **SPI mode only.**
0	SUSPEND1		Transfer suspended / Transfer finished interrupt flag. Every time INTVECT1 is read by the host, the corresponding interrupt flag of the referenced transfer group is cleared and INTVECT1 is updated with the vector coming next in the priority chain.
		0	The interrupt type is a transfer finished interrupt. In other words, the buffer array referenced by INTVECT1 has asserted an interrupt because all of data from the transfer group has been transferred.
		1	The interrupt type is a transfer suspended interrupt. In other words, the transfer group referenced by INTVECT1 has asserted an interrupt because the buffer to be transferred next is in suspend-to-wait mode.

Note

Reading from the INTVECT1 register when Transmit Empty is indicated does not clear the TXINTFLG flag in the SPI Flag Register (SPIFLG). Writing a new word to the SPIDATx register clears the Transmit Empty interrupt.

Note

In multi-buffer mode, INTVECT1 contains the interrupt for the highest priority transfer group. A read from INTVECT1 automatically causes the next-highest priority transfer group's interrupt status to get loaded into INTVECT1 and its corresponding SUSPEND flag to get loaded into SUSPEND1. The transfer group with the lowest number has the highest priority, and the transfer group with the highest number has the lowest priority.

Reading the INTVECT1 register when the RXOVRN interrupt is indicated in multi-buffer mode does not clear the RXOVRN flag and hence does not clear the vector. The RXOVRN interrupt vector may be cleared in multi-buffer mode either by write-clearing the RXOVRN flag in the SPI Flag Register (SPIFLG) or by reading the RXOVERN_BUF_ADDR register.

11.1.4.8.25 SPI Pin Control Register 9 (SPIPC9)

SPIPC9 only applies to SPI2.

Figure 11-79. SPI Pin Control Register 9 (SPIPC9) [offset = 68h]

Table 11-212. SPI Pin Control Register 9 (SPIPC9) Field Descriptions

Bit	Field	Value	Description
31-25	Reserved	0	Reads return the value that was last written. Writes have no effect.
24	SOMISRS0		SPI2 SOMI[0] slew control. This bit controls between the fast or slow slew mode. **Note: Duplicate Control Bits for SPI2 SOMI[0]. Bit 24 is not physically implemented. It is a mirror of bit 11. Any write to bit 24 will be reflected on bit 11. When bit 24 and bit 11 are simultaneously written, the value of bit 11 will control the SPI2 SOMI[0] pin. The read value of bit 24 always reflects the value of bit 11.**
		0	Fast mode is enabled; the normal output buffer is used for this pin.
		1	Slow mode is enabled; slew rate control is used for this pin.
23-17	Reserved	0	Reads return the value that was last written. Writes have no effect.
16	SIMOSRS0		SPI2 SIMO[0] slew control. This bit controls between the fast or slow slew mode. **Note: Duplicate Control Bits for SPI2 SIMO[0]. Bit 16 is not physically implemented. It is a mirror of bit 10. Any write to bit 16 will be reflected on bit 10. When bit 16 and bit 10 are simultaneously written, the value of bit 10 will control the SPI2 SIMO[0] pin. The read value of bit 16 always reflects the value of bit 10.**
		0	Fast mode is enabled; the normal output buffer is used for this pin.
		1	Slow mode is enabled; slew rate control is used for this pin.
15-12	Reserved	0	Reads return 0. Writes have no effect.
11	SOMISRS0		SPI2 SOMI[0] slew control. This bit controls between the fast or slow slew mode.
		0	Fast mode is enabled; the normal output buffer is used for this pin.
		1	Slow mode is enabled; slew rate control is used for this pin.
10	SIMOSRS0		SPI2 SIMO[0] slew control. This bit controls between the fast or slow slew mode.
		0	Fast mode is enabled; the normal output buffer is used for this pin.
		1	Slow mode is enabled; slew rate control is used for this pin.
9	CLKSRS		SPI2 CLK slew control. This bit controls between the fast or slow slew mode.
		0	Fast mode is enabled; the normal output buffer is used for this pin.
		1	Slow mode is enabled; slew rate control is used for this pin.
8-0	Reserved	0	Reads return the value that was last written. Writes have no effect.

11.1.4.8.26 Parallel/Modulo Mode Control Register (SPIPMCTRL)

Note

Do not configure MODCLKPOLx and MMODEx bits since this device does not support modulo mode.

Note

The bits of this register are used in conjunction with the SPIFMTx registers. Each byte of this register corresponds to one of the SPIFMTx registers.

1. Byte0 (Bits 7:0) are used when SPIFMT0 register is selected by DFSEL[1:0] = 00 in the control field of a buffer.

2. Byte1 (Bits 15:8) are used when SPIFMT1 register is selected by DFSEL[1:0] = 01 in the control field of a buffer.

3. Byte2 (Bits 23:16) are used when SPIFMT2 register is selected by DFSEL[1:0] = 10 in the control field of a buffer.

4. Byte3 (Bits 31:24) are used when SPIFMT3 register is selected by DFSEL[1:0] = 11 in the control field of a buffer.

Bit	Field	Value	Description
31-30	Reserved	0	Reads return 0. Writes have no effect.

Table 11-213. SPI Parallel/Modulo Mode Control Register (SPIPMCTRL) Field Descriptions (continued)

Bit	Field	Value	Description
29	MODCLKPOL3		Modulo mode SPICLK polarity. This bit determines the polarity of the SPICLK in modulo mode only. If the MMODE3 bits are 000, this bit will be ignored.
		0	Normal SPICLK in all the modes.
		1	Polarity of the SPICLK will be inverted if Modulo mode is selected.
28-26	MMODE3		These bits determine whether the SPI/MibSPI operates with 1, 2, 4, 5, or 6 data lines (if modulo option is supported by the module).
		0	Normal single data line mode - default (PMODE3 should be set to 00)
		1h	2-data line mode (PMODE3 should be set to 00)
		2h	3-data line mode (PMODE3 should be set to 00)
		3h	4-data line mode (PMODE3 should be set to 00)
		4h	5-data line mode (PMODE3 should be set to 00)
		5h	6-data line mode (PMODE3 should be set to 01)
		6h-7h	Reserved
25-24	PMODE3		Parallel mode bits determine whether the SPI/MibSPI operates with 1, 2, 4, or 8 data lines.
		0	Normal operation/1-data line (MMODE3 should be set to 000)
		1h	2-data line mode (MMODE3 should be set to 000)
		2h	4-data line mode (MMODE3 should be set to 000)
		3h	8-data line mode (MMODE3 should be set to 000)
23-22	Reserved	0	Reads return 0. Writes have no effect.
21	MODCLKPOL2		Modulo mode SPICLK polarity. This bit determines the polarity of the SPICLK in modulo mode only. If the MMODE2 bits are 000, this bit will be ignored.
		0	Normal SPICLK in all the modes.
		1	Polarity of the SPICLK will be inverted if Modulo mode is selected.
20-18	MMODE2		These bits determine whether the SPI/MibSPI operates with 1, 2, 4, 5, or 6 data lines (if modulo option is supported by the module).
		0	1-data line Mode - default (PMODE2 should be set to 00)
		1h	2-data line Mode (PMODE2 should be set to 00)
		2h	3-data line mode (PMODE2 should be set to 00)
		3h	4-data line mode (PMODE2 should be set to 00)
		4h	5-data line mode (PMODE2 should be set to 00)
		5h	6-data line mode (PMODE2 should be set to 01)
		6h-7h	Reserved
17-16	PMODE2		Parallel mode bits determine whether the SPI/MibSPI operates with 1, 2, 4, or 8 data lines.
		0	Normal operation/1-data line (MMODE2 should be set to 000)
		1h	2-data line mode (MMODE2 should be set to 000)
		2h	4-data line mode (MMODE2 should be set to 000)
		3h	8-data line mode (MMODE2 should be set to 000)
15-14	Reserved	0	Reads return 0. Writes have no effect.
13	MODCLKPOL1		Modulo mode SPICLK polarity. This bit determines the polarity of the SPICLK in modulo mode only. If the MMODE1 bits are 000, this bit will be ignored.
		0	Normal SPICLK in all the modes.
		1	Polarity of the SPICLK will be inverted if Modulo mode is selected.

Table 11-213. SPI Parallel/Modulo Mode Control Register (SPIPMCTRL) Field Descriptions (continued)

Bit	Field	Value	Description
12-10	MMODE1		These bits determine whether the SPI/MibSPI operates with 1, 2, 4, 5, or 6 data lines (if modulo option is supported by the module).
		0	1-data line mode - default (PMODE1 should be set to 00)

		1h	2-data line mode (MMODE0 should be set to 000)
		2h	4-data line mode (MMODE0 should be set to 000)
		3h	8-data line mode (MMODE0 should be set to 000)

11.1.4.8.27 Multi-buffer Mode Enable Register (MIBSPIE)

Note

Accessibility of Multi-Buffer RAM

The multi-buffer RAM is not accessible unless the MSPIENA bit set to 1. The only exception to this is in test mode, where, by setting RXRAMACCESS to 1, the multi-buffer RAM can be fully accessed for both read and write.

Figure 11-81. Multi-buffer Mode Enable Register (MIBSPIE) [offset = 70h]

31	17	16
Reserved		RXRAM_ACCESS
R-0		R/WP-0

15	1	0
Reserved		MSPIENA
R-0		R/WP-0

LEGEND: R/W = Read/Write; R = Read only; WP = Write in privilege mode only; -*n* = value after reset

Table 11-214. Multi-buffer Mode Enable Register (MIBSPIE) Field Descriptions

Bit	Field	Value	Description
31-17	Reserved	0	Reads return 0. Writes have no effect.
16	RXRAM ACCESS		Receive-RAM access control. During normal operating mode of SPI, the receive data/status portion of multi-buffer RAM is read-only. To enable testing of receive RAM, direct read/write access is enabled by setting this bit.
		0	The RX portion of multi-buffer RAM is not writable by the CPU.
		1	The whole of multi-buffer RAM is fully accessible for read/write by the CPU.
			Note: The RX RAM ACCESS bit remains 0 after reset and it should remain cleared to 0 at all times, except when testing the RAM. SPI should be given a local reset by using the nRESET (SPIGCR0[0]) bit after RAM testing is performed so that the multi-buffer RAM gets re-initialized.
15-1	Reserved	0	Reads return 0. Writes have no effect.
0	MSPIENA		Multi-buffer mode enable. After power-up or reset, MSPIENA remains cleared, which means that the SPI runs in compatibility mode by default. If multi-buffer mode is desired, this register should be configured first after configuring the SPIGCR0 register. If MSPIENA is not set to 1, the multi-buffer mode registers are not writable.
		0	The SPI runs in compatibility mode, that is, in this mode the MibSPI is fully code-compliant to the standard device SPI. No multi-buffered-mode features are supported.
		1	The SPI is configured to run in multi-buffer mode.

Note

Accessibility of Registers

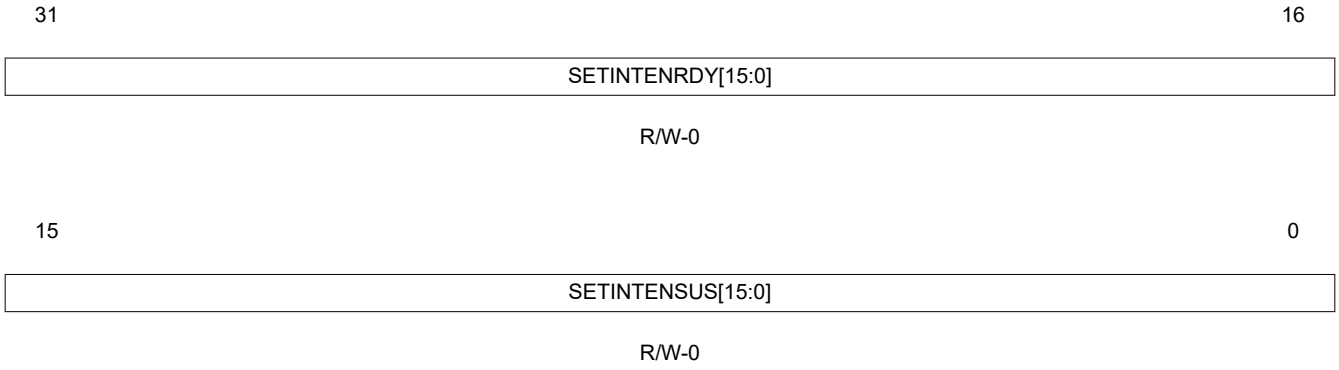
Registers from this offset address onwards are not accessible in SPI compatibility mode. They are accessible only in the multi-buffer mode.

11.1.4.8.28 TG Interrupt Enable Set Register (TGITENST)

The register TGITENST contains the TG interrupt enable flags for transfer-finished and for transfer-suspended events. Each of the enable bits in the higher half-word and the lower half-word of TGITENST belongs to one TG.

The register map shown in Figure 11-82 and Table 11-215 represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

Figure 11-82. TG Interrupt Enable Set Register (TGITENST) [offset = 74h]



LEGEND: R/W = Read/Write; -*n* = value after reset

Table 11-215. TG Interrupt Enable Set Register (TGITENST) Field Descriptions

Bit	Field	Value	Description
31-16	SETINTENRDY[*n*]		TG interrupt set (enable) when transfer finished. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on.
		0	Read: The TGx-completed interrupt is disabled. This interrupt does not get generated when TGx completes. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is enabled. The interrupt gets generated when TGx completes. Write: Enable the TGx-completed interrupt. The interrupt gets generated when TGx completes.
15-0	SETINTENSUS[*n*]		TG interrupt set (enabled) when transfer suspended. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on.
		0	Read: The TGx-completed interrupt is disabled. This interrupt does not get generated when TGx is suspended. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is enabled. The interrupt gets generated when TGx is suspended. Write: Enable the TGx-completed interrupt. The interrupt gets generated when TGx is suspended.

11.1.4.8.29 TG Interrupt Enable Clear Register (TGITENCR)

The register TGITENCR is used to clear the interrupt enables for the TG-completed interrupt and the TG-suspended interrupts.

The register map shown in Figure 11-83 and Table 11-216 represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

Figure 11-83. TG Interrupt Enable Clear Register (TGITENCR) [offset = 78h]

Table 11-216. TG Interrupt Enable Clear Register (TGITENCR) Field Descriptions

Bit	Field	Value	Description
31-16	CLRINTENRDY[*n*]		TG interrupt clear (disabled) when transfer finished. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on.
		0	Read: The TGx-completed interrupt is disabled. This interrupt does not get generated when TGx completes. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is enabled. The interrupt gets generated when TGx completes. Write: Disable the TGx-completed interrupt. The interrupt does not get generated when TGx completes.
15-0	CLRINTENSUS[*n*]		TG interrupt clear (disabled) when transfer suspended. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on.
		0	Read: The TGx-completed interrupt is disabled. This interrupt does not get generated when TGx is suspended. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is enabled. The interrupt gets generated when TGx is suspended. Write: Disable the TGx-completed interrupt. The interrupt does not get generated when TGx is suspended.

11.1.4.8.30 Transfer Group Interrupt Level Set Register (TGITLVST)

The register TGITLVST sets the level of interrupts for transfer completed interrupt and for transfer suspended interrupt to level 1.

The register map shown in Figure 11-84 andTable 11-217 represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

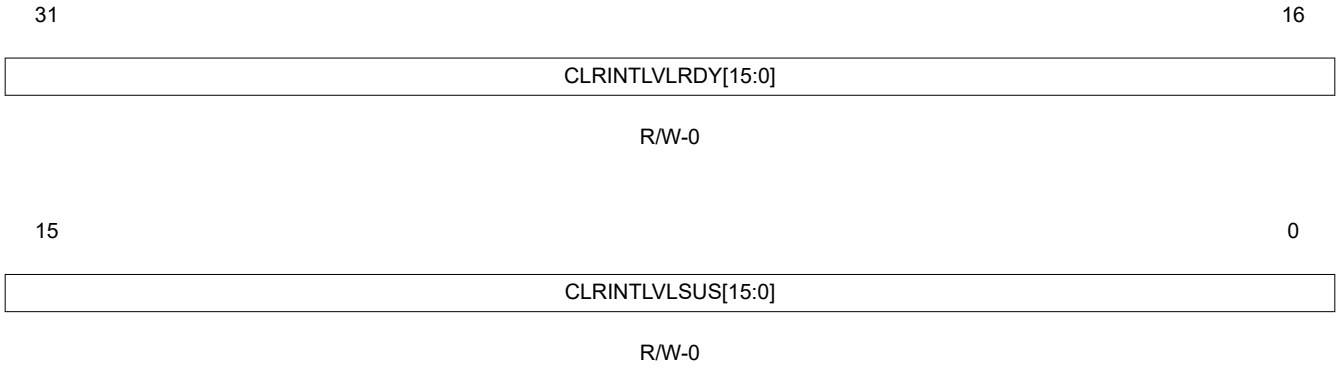
Bit	Field	Value	Description
31-16	SETINTLVLRDY[*n*]		Transfer-group completed interrupt level set. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on.
		0	Read: The TGx-completed interrupt is set to INT0. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is set to INT1. Write: Set the TGx-completed interrupt to INT1.
15-0	SETINTLVLSUS[*n*]		Transfer-group suspended interrupt level set. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on.
		0	Read: The TGx-suspended interrupt is set to INT0. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-suspended interrupt is set to INT1. Write: Set the TGx-suspended interrupt to INT1.

11.1.4.8.31 Transfer Group Interrupt Level Clear Register (TGITLVCR)

The register TGITLVCR clears the level of interrupts for transfer completed interrupt and for transfer suspended interrupt to level 0.

The register map shown in Figure 11-85 and Table 11-218 represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

Figure 11-85. Transfer Group Interrupt Level Clear Register (TGITLVCR) [offset = 80h]



LEGEND: R/W = Read/Write; *-n* = value after reset

Table 11-218. Transfer Group Interrupt Level Clear Register (TGITLVCR) Field Descriptions

Bit	Field	Value	Description
31-16	CLRINTLVLRDY[*n*]		Transfer-group completed interrupt level clear. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on.
		0	Read: The TGx-completed interrupt is set to INT0. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is set to INT1. Write: Clear the TGx-completed interrupt to INT0.
15-0	CLRINTLVLSUS[*n*]		Transfer group suspended interrupt level clear. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on.
		0	Read: The TGx-suspended interrupt is set to INT0. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-suspended interrupt is set to INT1. Write: Clear the TGx-suspended interrupt to INT0.

11.1.4.8.32 Transfer Group Interrupt Flag Register (TGINTFLG)

The TGINTFLG register comprises the transfer group interrupt flags for transfer-completed interrupts (INTFLGRDYx) and for transfer-suspended interrupts (INTFLGSUSx). Each of the interrupt flags in the higher half-word and the lower half-word of TGINTFLG belongs to one TG.

The register map shown in Figure 11-86 and Table 11-219 represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

Figure 11-86. Transfer Group Interrupt Flag Register (TGINTFLG) [offset = 84h]

R/W1C-0	

LEGEND: R/W = Read/Write; W1C = Write 1 to clear; -*n* = value after reset

Table 11-219. Transfer Group Interrupt Flag Register (TGINTFLG) Field Descriptions

Bit	Field	Value	Description
31-16	INTFLGRDY[*n*]		Transfer-group interrupt flag for a transfer-completed interrupt. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on. **Note: Read Clear Behavior. Reading the interrupt vector registers TGINTVECT0 or TGINTVECT1 automatically clears the interrupt flag bit INTFLGRDYx referenced by the vector number given by INTVECT0/INTVECT1 bits, if the SUSPEND[0:1] bit in the vector registers is 0.**
		0	Read: No transfer-completed interrupt occurred since last clearing of the INTFLGRDYx flag. Write: A write of 0 to this bit has no effect.
		1	Read: A transfer finished interrupt from transfer group x occurred. No matter whether the interrupt is enabled or disabled (INTENRDYx = don't care) or whether the interrupt is mapped to INT0 or INT1, INTFLGRDYx is set right after the transfer from TGx is finished. Write: The corresponding bit flag is cleared.
15-0	INTFLGSUS[*n*]		Transfer-group interrupt flag for a transfer-suspend interrupt. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on. **Note: Read Clear Behavior. Reading the interrupt vector registers TGINTVECT0 or TGINTVECT1 automatically clears the interrupt flag bit INTFLGSUSx referenced by the vector number given by INTVECT0/INTVECT1 bits, if the SUSPEND[0:1] bit in the corresponding vector registers is 1.**
		0	Read: No transfer-suspended interrupt occurred since the last clearing of the INTFLGSUSx flag. Write: A write of 0 to this bit has no effect.
		1	Read: A transfer-suspended interrupt from TGx occurred. No matter whether the interrupt is enabled or disabled (INTENSUSx = don't care) or whether the interrupt is mapped to INT0 or INT1, INTFLGSUSx is set right after the transfer from transfer group x is suspended. Write: The corresponding bit flag is cleared.

11.1.4.8.33 Tick Count Register (TICKCNT)

One of the trigger sources for TGs is an internal periodic time trigger. This time trigger is called a tick counter and is basically a down-counter with a preload/reload value. Every time the tick counter detects an underflow it reloads the initial value and toggles the trigger signal provided to the TGs.

The trigger signal, shown in Figure 11-87 as a square wave, illustrates the different trigger event types for the TGs (for example, rising edge, falling edge, and both edges).

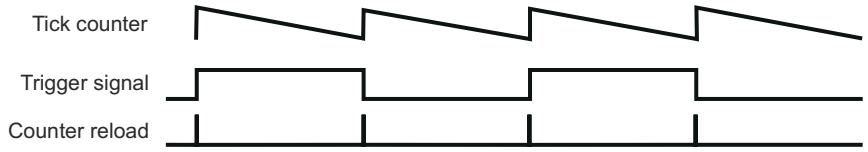

Figure 11-87. Tick Counter Operation

This register is shown in Figure 11-88 and described in Table 11-220.

Figure 11-88. Tick Count Register (TICKCNT) [offset = 90h]

31	30	29	28	27	...	16
TICKENA	RELOAD	CLKCTRL	Reserved			
R/W-0	R/S-0	R/W-0	R-0			

15	...	0
TICKVALUE		
R/W-0		

LEGEND: R/W = Read/Write; R = Read only; S = Set; -*n* = value after reset

Table 11-220. Tick Count Register (TICKCNT) Field Descriptions

Bit	Field	Value	Description
31	TICKENA		Tick counter enable.
		0	The internal tick counter is disabled. The counter value remains unchanged.
			Note: When the tick counter is disabled, the trigger signal is forced low.
		1	The internal tick counter is enabled and is clocked by the clock source selected by CLKCTRL. When TICKENA goes from 0 to 1, the tick counter is automatically loaded with the contents of TICKVALUE.
30	RELOAD		Pre-load the tick counter. RELOAD is a set-only bit; writing a 1 to it reloads the tick counter with the value stored in TICKVALUE. Reading RELOAD always returns a 0.
			Note: When the tick counter is reloaded by the RELOAD bit, the trigger signal is not toggled.
29-28	CLKCTRL		Tick counter clock source control. CLKCTRL defines the clock source that is used to clock the internal tick counter.
		0	SPICLK of data word format 0 is selected as the clock source of the tick counter.
		1h	SPICLK of data word format 1 is selected as the clock source of the tick counter.
		2h	SPICLK of data word format 2 is selected as the clock source of the tick counter.
		3h	SPICLK of data word format 3 is selected as the clock source of the tick counter.
27-16	Reserved	0	Reads return 0. Writes have no effect.

Table 11-220. Tick Count Register (TICKCNT) Field Descriptions (continued)

Bit	Field	Value	Description
15-0	TICKVALUE	0-FFFFh	Initial value for the tick counter. TICKVALUE stores the initial value for the tick counter. The tick counter is loaded with the contents of TICKVALUE every time an underflow condition occurs and every time the RELOAD flag is set by the host.

11.1.4.8.34 Last TG End Pointer (LTGPEND)

Figure 11-89. Last TG End Pointer (LTGPEND) [offset = 94h]

31	29	28	24	23	16
Reserved		TG_IN_SERVICE		Reserved	
R-0		R-0		R-0	

15	14	8	7	0
Rsvd	LPEND		Reserved	
R-0	R/W-0		R-0	

LEGEND: R/W = Read/Write; R = Read only; *-n* = value after reset

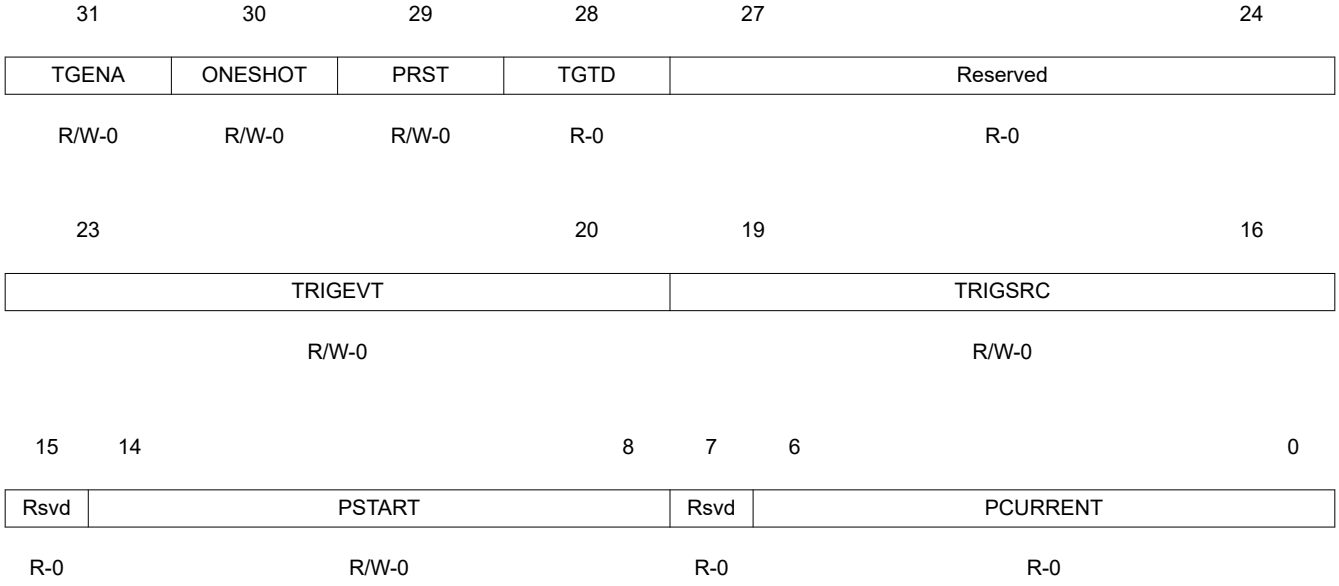
Table 11-221. Last TG End Pointer (LTGPEND) Field Descriptions

Bit	Field	Value	Description
31-29	Reserved	0	Reads return 0. Writes have no effect.
28-24	TG_IN_SERVICE		The TG number currently being serviced by the sequencer. These bits indicate the current TG that is being serviced. This field can generally be used for code debugging.
		0	No TG is being serviced by the sequencer.
		1h	TG0 is being serviced by the sequencer.
		:	:
		10h	TG15 is being serviced by the sequencer. **Note: The number of transfer groups varies by device.**
		11h-1Fh	Invalid values.
23-15	Reserved	0	Reads return 0. Writes have no effect.
14-8	LPEND	0-7Fh	Last TG end pointer. Usually the TG end address (PEND) is inherently defined by the start value of the starting pointer of the subsequent TG (PSTART). The TG ends one word before the next TG starts (PEND[x] = PSTART[x+1] - 1). For a full configuration of MibSPI, the last TG has no subsequent TG, that is, no end address is defined. Therefore, LPEND has to be programmed to specify explicitly the end address of the last TG. **Note: When using all 8 transfer groups, program the LPEND bits to define the end of the last transfer group. When using less than 8 transfer groups, leave the LPEND bits programmed to point to the end of the buffer and create a dummy transfer group that defines the end of your last intentional transfer group and occupies all the remaining buffer space.**
7-0	Reserved	0	Reads return 0. Writes have no effect.

11.1.4.8.35 TGx Control Registers (TGxCTRL)

Each TG can be configured via one dedicated control register. The register description shows one control register (x) that is identical for all TGs. For example, the control register for TG2 is named TG2CTRL and is located at *base address + 98h + 4 × 2*. The actual number of available control registers varies by device.

Figure 11-90. MibSPI TG Control Registers (TGxCTRL) [offsets = 98h-D4h]



LEGEND: R/W = Read/Write; R = Read only; *-n* = value after reset

Table 11-222. TG Control Registers (TGxCTRL) Field Descriptions

Bit	Field	Value	Description
31	TGENA		TGx enable. If the correct event (TRIGEVTx) occurs at the selected source (TRIGSRCx), a group transfer is initiated if no higher-priority TG is in active-transfer mode or if one or more higher-priority TGs are in transfer-suspend mode. Disabling a TG while a transfer is ongoing will finish the ongoing word transfer but not the whole group transfer.
		0	TGx is disabled.
		1	TGx is enabled.
30	ONESHOTx		Single transfer for TGx.
		0	TGx initiates a transfer every time a trigger event occurs and TGENA is set.
		1	A transfer from TGx will be performed only once (one shot) after a valid trigger event at the selected trigger source. After the transfer is finished the TGENAx control bit will be cleared and therefore no additional transfer can be triggered before the host enables the TG again. This one shot mode ensures that after one group transfer the host has enough time to read the received data and to provide new transmit data.

Table 11-222. TG Control Registers (TGxCTRL) Field Descriptions (continued)

Bit	Field	Value	Description
29	PRSTx		TGx pointer reset mode. Configures the way to resolve trigger events during an ongoing transfer. This bit is meaningful only for level-triggered TGs. Edge-triggered TGs cannot be restarted before their completion by another edge. The PRST bit will have no effect on this behavior. **Note: When the PRST bit is set, if the buffer being transferred at the time of a new trigger event is a LOCK, CSHOLD or NOBRK buffer, then only after finishing those transfers, the TG will be restarted. This means that even if the TG is retriggered, the TG will only be restarted after finishing the transfer of the first non-LOCK or non-CSHOLD buffer. In the case of the NOBRK buffer, after completing the ICOUNT number of transfers, the TG will be restarted from its PSTART.** This means that TX control fields such as LOCK and CSHOLD, and DMA control fields such as NOBRK have higher priority over anything else. They have the capability to delay the restart of the TG even if it is retriggered when PRST is 1.
		0	If a trigger event occurs during a transfer from TGx, the event is ignored and is not stored internally. The TGx transfer has priority over additional trigger events.
		1	The TGx pointer (PCURRENTx) will be reset to the start address (PSTARTx) when a valid trigger event occurs at the selected trigger source while a transfer from the same TG is ongoing. Every trigger event resets PCURRENTx no matter whether the concerned TG is in transfer mode or not. The trigger events have priority over the ongoing transfer.
28	TGTDx		TG triggered.
		0	TGx has not been triggered or is no longer waiting for service.
		1	TGx has been triggered and is either currently being serviced or waiting for servicing.
27-24	Reserved	0	Reads return 0. Writes have no effect.

Table 11-222. TG Control Registers (TGxCTRL) Field Descriptions (continued)

Bit	Field	Value		Description
23-20	TRIGEVTx			Type of trigger event. A level-triggered TG can be stopped by de-activating the level trigger. However, the following restrictions apply. • Deactivating the level trigger for a TG during a NOBRK transfer does not stop the transfers until all of the ICOUNT number of buffers are transferred for the NOBRK buffer. Once a NOBRK buffer is prefetched, the trigger event loses control over the TG until the NOBRK buffer transfer is completed. • Once the transfer of a buffer with CSHOLD or LOCK bit set starts, deactivating the trigger level does not stop the transfer until the sequencer completes the transfer of the next non-CSHOLD or non-LOCK buffer in the same TG. • Once the last buffer in a TG is pre-fetched, de-activating the trigger level does not stop the transfer group until the last buffer transfer is completed. This means even if the trigger level is deactivated at the beginning of the penultimate (one-before-last) buffer transfer, the sequencer continues with the same TG until it is completed.
		0	never	Never trigger TGx. This is the default value after reset.
		1h	rising edge	A rising edge (0 to 1) at the selected trigger source (TRIGSRCx) initiates a transfer for TGx
		2h	falling edge	A falling edge (1 to 0) at the selected trigger source (TRIGSRCx) initiates a transfer for TGx
		3h	both edges	Rising and falling edges at the selected trigger source (TRIGSRCx) initiates a transfer for TGx
		4h	Rsvd	Reserved
		5h	high-active	While the selected trigger source (TRIGSRCx) is at a logic-high level (1), the group transfer is continued and at the end of one group, transfer is restarted at the beginning. If the logic level changes to low (0) during an ongoing group transfer, the whole group transfer will be stopped. **Note: If ONESHOTx is set, the transfer is performed only once.**
		6h	low-active	While the selected trigger source (TRIGSRCx) is at a logic-low level (0), the group transfer is continued and at the end of one group, transfer is restarted at the beginning. If the logic level changes to high (1) during an ongoing group transfer, the whole group transfer will be stopped. **Note: If ONESHOTx is set, the transfer is performed only once.**
		7h	always	A repetitive group transfer will be performed. **Note: By setting the TRIGSRC to 0, the TRIGEVT to 7h (ALWAYS), and the ONESHOTx bit to 1, software can trigger this TG. Upon setting the TGENA bit, the TG is immediately triggered.** **Note: If ONESHOTx is set, the transfer is performed only once.**
		8h-Fh	Rsvd	Reserved

Table 11-222. TG Control Registers (TGxCTRL) Field Descriptions (continued)

Bit	Field	Value	Description	
19-16	TRIGSRCx		Trigger source. After reset, the trigger sources of all TGs are disabled.	
		0	Disabled	
		1h	EXT0	External trigger source 0. The actual source varies per device (for example, HET I/O channel, event pin).
		2h	EXT1	External trigger source 1. The actual source varies per device (for example, HET I/O channel, event pin).
		3h	EXT2	External trigger source 2. The actual source varies per device (for example, HET I/O channel, event pin).
		4h	EXT3	External trigger source 3. The actual source varies per device (for example, HET I/O channel, event pin).
		5h	EXT4	External trigger source 4. The actual source varies per device (for example, HET I/O channel, event pin).
		6h	EXT5	External trigger source 5. The actual source varies per device (for example, HET I/O channel, event pin).
		7h	EXT6	External trigger source 6. The actual source varies per device (for example, HET I/O channel, event pin).
		8h	EXT7	External trigger source 7. The actual source varies per device (for example, HET I/O channel, event pin).
		9h	EXT8	External trigger source 8. The actual source varies per device (for example, HET I/O channel, event pin).
		Ah	EXT9	External trigger source 9. The actual source varies per device (for example, HET I/O channel, event pin).
		Bh	EXT10	External trigger source 10. The actual source varies per device (for example, HET I/O channel, event pin).
		Ch	EXT11	External trigger source 11. The actual source varies per device (for example, HET I/O channel, event pin).
		Dh	EXT12	External trigger source 12. The actual source varies per device (for example, HET I/O channel, event pin).
		Eh	EXT13	External trigger source 13. The actual source varies per device (for example, HET I/O channel, event pin).
		Fh	TICK	Internal periodic event trigger. The tick counter can initiate periodic group transfers.
15	Reserved	0	Reads return 0. Writes have no effect.	
14-8	PSTARTx	0-7Fh	TG start address. PSTARTx stores the start address of the corresponding TG. The corresponding end address is inherently defined by the subsequent TG start address minus 1 (PENDx[TGx] = PSTARTx[TGx+1]-1). PSTARTx is copied into PCURRENTx when: • The TG is enabled • The end of the TG is reached during a transfer • A trigger event occurs while PRST is set to 1	
7	Reserved	0	Reads return 0. Writes have no effect.	
6-0	PCURRENTx	0-7Fh	Pointer to current buffer. PCURRENT is read-only. PCURRENTx stores the address (0...127) of the buffer that corresponds to this TG. If the TG switches from active-transfer mode to suspend-to-wait mode, PCURRENTx contains the address of the currently suspended word. After the TG resumes from suspend-to-wait mode, the next buffer will be transferred; that is, no buffer data is transferred because of suspend-to-wait mode.	

Note

Register bits vary by device

TG0 has the highest priority and TG15 has the lowest priority. Under the following conditions, a lower-priority TG cannot be interrupted by a higher-priority TG:

1. When there is a CSHOLD or LOCK buffer, until the completion of the next buffer transfer that is a non-CSHOLD or non-LOCK buffer.
2. An entire sequence of words transferred for a NOBRK DMA buffer.
3. Once the last word in a TG is pre-fetched.

11.1.4.8.36 DMA Channel Control Register (DMAxCTRL)

Each DMA channel can be configured via one dedicated control register. The register description below shows one exemplary control register that is identical for all DMA channels; for example, the control register for DMA channel 0 is named DMA0CTRL. The MibSPI supports up to 8 bidirectional DMA channels.

The number of bidirectional DMA channels varies by device. The number of DMA channels and hence the number of DMA channel control registers may vary.

Figure 11-91. DMA Channel Control Register (DMAxCTRL) [offset = D8h-F4h]

R-0	R-0	R-0	

LEGEND: R/W = Read/Write; R = Read only; *-n* = value after reset

Table 11-223. DMA Channel Control Register (DMAxCTRL) Field Descriptions

Bit	Field	Value	Description
31	ONESHOT		Auto-disable of DMA channel after ICOUNT + 1 transfers. **Note: This ONESHOT applies to the DMA channel identified by x and will autodisable based on ICOUNTx.**
		0	The length of the block transfer is fully controlled by the DMA controller. The enable bits RXDMAENAx and TXDMAENAx are not modified by the MibSPI.
		1	ONESHOT allows a block transfer of defined length (ICOUNTx + 1), mainly controlled by the MibSPI and not by the DMA controller. After ICOUNTx + 1 transfers, the enable bits RXDMAENAx and TXDMAENAx are automatically cleared by the MibSPI, hence no more DMA requests are generated. In conjunction with NOBRKx, a burst transfer can be initiated without any other transfer through another buffer.
30-24	BUFIDx	0-7Fh	Buffer utilized for DMA transfer. BUFIDx defines the buffer that is utilized for the DMA transfer. In order to synchronize the transfer with the DMA controller with the NOBRK condition the "suspend to wait until..." modes must be used.
23-20	RXDMA_MAPx	0-Fh	Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. One request line for receive data and the other for request line for transmit data. RXDMA_MAPx defines the number of the physical DMA Request line that is connected to the receive path of the MibSPI DMA channel. If RXDMAENAx and TXDMAENAx are both set to 1, then RXDMA_MAPx shall differ from TXDMA_MAPx and shall differ from any other used physical DMA Request line. Otherwise, unexpected interference may occur.

Table 11-223. DMA Channel Control Register (DMAxCTRL) Field Descriptions (continued)

Bit	Field	Value	Description
19-16	TXDMA_MAPx	0-Fh	Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. One request line for receive data and the other for request line for transmit data. TXDMA_MAPx defines the number of the physical DMA Request line that is connected to the transmit path of the MibSPI DMA channel. If RXDMAENAx and TXDMAENAx are both set to 1, then TXDMA_MAPx shall differ from RXDMA_MAPx and shall differ from any other used physical DMA Request line. Otherwise, unexpected interference may occur.
15	RXDMAENAx		Receive data DMA channel enable.
		0	No DMA request upon new receive data.
		1	The physical DMA channel for the receive path is enabled. The first DMA request pulse is generated after the first transfer from the referenced buffer (BUFIDx) is finished. The buffer should be configured in as "skip until RXEMPTY is set" or "suspend to wait until RXEMPTY is set" in order to ensure synchronization between the DMA controller and the MibSPI sequencer.
14	TXDMAENAx		Transmit data DMA channel enable.
		0	No DMA request upon new transmit data.
		1	The physical DMA channel for the transmit path is enabled. The first DMA request pulse is generated right after setting TXDMAENAx to load the first transmit data. The buffer should be configured in the as "skip until TXFULL is set" or "suspend to wait until TXFULL is set" in order to ensure synchronization between the DMA controller and the MibSPI sequencer.
13	NOBRKx		Non-interleaved DMA block transfer. This bit is available in master mode only. **Note: Special Conditions during a NOBRK Buffer Transfer. If a NOBRK DMA buffer is currently being serviced by the sequencer, then it is not allowed to be disabled prematurely.** During a NOBRK transfer, the following operations are not allowed: • Clearing the NOBRKx bit to 0 • Clearing the RXDMAENAx to 0 (if it is already 1) • Clearing the TXDMAENAx to 0 (if it is already 1) • Clearing the BUFMODE[2:0] bits in TXRAM to 000 **Note: Any attempts to perform these actions during a NOBRK transfer will produce unpredictable results.**
		0	DMA transfers through the buffer referenced by BUFIDx are interleaved by data transfers from other active buffers or TGs. Every time the sequencer checks the DMA buffer, it performs one transfer and then steps to the next buffer.
		1	NOBRKx ensures that ICOUNTx + 1 data transfers are performed from the buffer referenced by BUFIDx without a data transfer from any other buffer. The sequencer remains at the DMA buffer until ICOUNTx + 1 transfers have been processed. For example, this can be used to generate a burst transfer to one device without disabling the chip select signal in-between (the concerned buffer has to be configured with CSHOLD = 1). Another example would be to have a defined block data transfer in slave mode, synchronous to the master SPI. **Note: Triggering of higher priority TGs or enabling of higher priority DMA channels will not interrupt a NOBRK block transfer.**
12-8	ICOUNTx	0-1Fh	Initial count of DMA transfers. ICOUNTx is used to preset the transfer counter COUNTx. Every time COUNTx hits 0, it is reloaded with ICOUNTx. The real number of transfers equals ICOUNTx plus 1. If ONESHOTx is set, ICOUNTx defines the number of DMA transfers that are performed before the MibSPI automatically disables the DMA channels. If NOBRKx is set, ICOUNTx defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer. If ONESHOTx and NOBRKx are not set, ICOUNTx should be 0. **Note: See Section 11.1.4.8.37 (ICOUNT) and Section 11.1.4.8.38 (DMACNTLEN) about how to increase the ICOUNT to a 16-bit value. With this extended capability, MibSPI can transfer a block of up to 65535 (65K) words without interleaving (if NOBRK is used) or without deasserting the chip select between the buffers (if CSHOLD is used).**
7	Reserved	0	Reads return 0. Writes have no effect.
6	COUNT_BIT17x		The 17th bit of the COUNT field of DMAxCOUNT register.

Table 11-223. DMA Channel Control Register (DMAxCTRL) Field Descriptions (continued)

Bit	Field	Value	Description
5-0	COUNTx	0-3Fh	Actual number of remaining DMA transfers. This field contains the actual number of DMA transfers that remain, until the DMA channel is disabled, if ONESHOTx is set. **Note: If the TX and RX DMA requests are enabled, the COUNT register will be decremented when the RX has been serviced.**

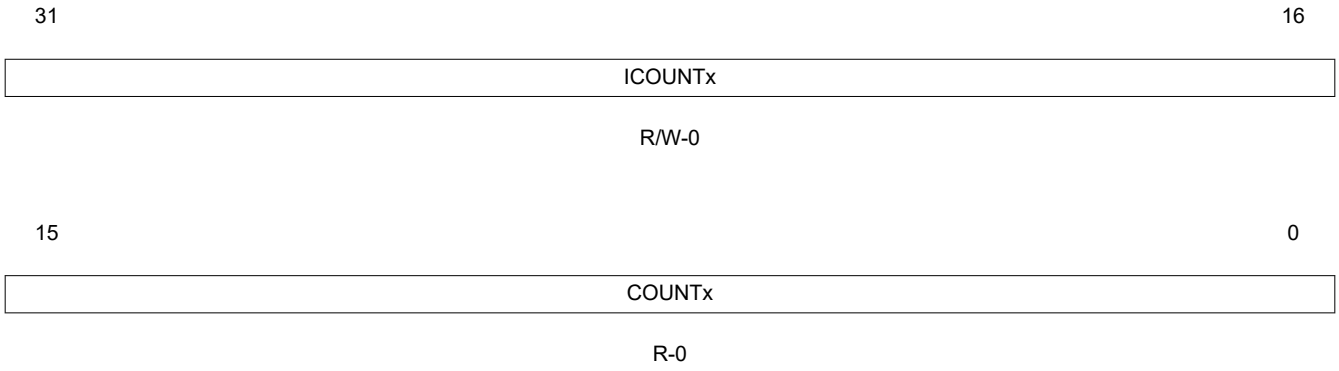
11.1.4.8.37 DMAxCOUNT Register (ICOUNT)

Note

These registers are used only if the LARGE COUNT bit in the DMACNTLEN register is set.

The number of bidirectional DMA channels varies by device. The number of DMA channels and hence the number of DMA registers varies by device.

Figure 11-92. DMAxCOUNT Register (ICOUNT) [offset = F8h-114h]



LEGEND: R/W = Read/Write; R = Read only; *-n* = value after reset

Table 11-224. MibSPI DMAxCOUNT Register (ICOUNT) Field Descriptions

Bit	Field	Value	Description
31-16	ICOUNTx	0-FFFFh	Initial number of DMA transfers. ICOUNTx is used to preset the transfer counter COUNTx. Every time COUNTx hits 0, it is reloaded with ICOUNTx. The real number of transfer equals ICOUNTx plus 1. If ONESHOTx is set, ICOUNTx defines the number of DMA transfers that are performed before the MibSPI automatically disables the corresponding DMA channel. If NOBRKx is set, ICOUNTx defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer.
15-0	COUNTx	0-FFFFh	Actual number of remaining DMA transfers. COUNTx Contains the actual number of DMA transfers that remain, until the DMA channel is disabled, if ONESHOTx is set. Since the real counter value is always ICOUNTx +1, the 17th bit of COUNTx is available on DMACTRLx[6] bit. **Note: Usage Tip for Block Transfer Using a Single DMA Request. It is possible to use the multi-buffer RAM to transfer chunks of data to/from an external SPI. A DMA Controller can be used to handle the data in bursts. Suppose a chunk of 64 bytes of data needs to be transferred and a single DMA request needs to be generated at the end of transferring the 64 bytes. This can be easily achieved by configuring a TG register for the 64 buffer locations and using the DMAxCTRL/DMAxCOUNT registers to configure the last buffer (64th) of the TG as the BUFID and enable RXDMA (NOBRK = 0). At the end of the transfer of the 64th buffer, a DMA request will be generated on the selected DMA request channel. The DMA controller can do a burst read of all 64 bytes from RXRAM and/or then do a burst write to all 64 bytes to the TXRAM for the next chunk.**

Table 11-225. MibSPI DMA Large Count Register (DMACNTLEN) Field Descriptions

Bit	Field	Value	Description
31-1	Reserved	0	Reads return 0. Writes have no effect.
0	LARGE_COUNT		Select either the 16-bit DMAxCOUNT counters or the smaller counters in DMAxCTRL.
		0	Select the DMAxCTRL counters. Writes to the DMAxCTRL register will modify the ICOUNT value. Reading ICOUNT and COUNT can be done from the DMAxCTRL register. The DMAxCOUNT register should not be used since any write to this register will be overwritten by a subsequent write to the DMAxCTRL register to set the TXDMAENA or RXDMAENA bits.
		1	Select the DMAxCOUNT counters. Writes to the DMAxCTRL register will not modify the ICOUNT value. The ICOUNT value must be written to in the DMAxCOUNT register before the RXDMAENA or TXDMAENA bits are set in the DMAxCTRL register. The DMAxCOUNT register should be used for reading COUNT or ICOUNT.

11.1.4.8.39 Multi-buffer RAM Uncorrectable Parity Error Control Register (UERRCTRL)

Bit	Field	Value	Description
31-10	Reserved	0	Reads return 0. Writes have no effect.
9-0	OVERADDR1	200h-3FFh	Uncorrectable parity error address for RXRAM. This register holds the address where a parity error is generated while reading RXRAM. Only the CPU or DMA can read from RXRAM locations. The address captured is byte-aligned. This error address is frozen from being updated until it is read by the CPU. The offset address of RXRAM varies from 200h-3FFh. The register does not clear its contents during or after module-level reset, system-level reset or even power-on reset. A read operation to this register clears its contents to the default value 200h. After a power-on reset the contents will be unpredictable. A read operation can be performed after power-up to keep the register at its default value, if required. However, the contents of this register are meaningful only when EDFLG1 is set to 1. **Note: A read of the UERRADDR1 register will clear EDFLG1 in the UERRSTAT register. However, in emulation mode when the SUSPEND signal is high, a read from the UERRADDR1 register does not clear EDFLG1.**

11.1.4.8.42 TXRAM Uncorrectable Parity Error Address Register (UERRADDR0)

Figure 11-97. TXRAM Uncorrectable Parity Error Address Register (UERRADDR0) [offset = 12Ch]

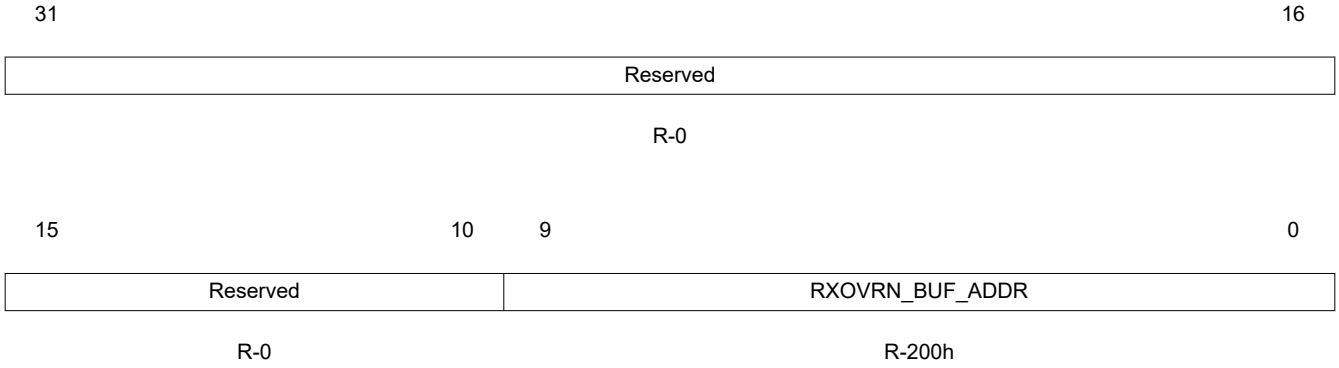
Table 11-229. TXRAM Uncorrectable Parity Error Address Register (UERRADDR0) Field Descriptions

Bit	Field	Value	Description
31-9	Reserved	0	Reads return 0. Writes have no effect.
8-0	UERRADDR0	0-1FFh	Uncorrectable parity error address for TXRAM. This register holds the address where a parity error is generated while reading from TXRAM. The TXRAM can be read either by CPU or by the MibSPI sequencer logic for transmission. The address captured is byte-aligned. This error address is frozen from being updated until it is read by the CPU. The offset address of TXRAM varies from 0-1FFh. The register does not clear its contents during or after module-level reset, system-level reset, or even power-on reset. A read operation to this register clears its contents to all 0s. After a power-on reset, the contents of this register will be unpredictable. A read operation can be performed after power-up to clear the this register's contents, if required. However, the contents of this register are meaningful only when EDFLG0 is set to 1. **Note: A read from the UERRADDR0 register will clear EDFLG0 in the UERRSTAT register. However, in emulation mode when the SUSPEND signal is high, a read from the UERRADDR0 register does not clear EDFLG0.**

11.1.4.8.43 RXRAM Overrun Buffer Address Register (RXOVRN_BUF_ADDR)

In multi-buffer mode, if a particular RXRAM location is written by the MibSPI sequencer logic after the completion of a new transfer when that location already contains valid data, the RX_OVR bit will be set to 1 while the data is being written. The RXOVRN_BUF_ADDR register captures the address of the RXRAM location for which a receiver overrun condition occurred.

Figure 11-98. RXRAM Overrun Buffer Address Register (RXOVRN_BUF_ADDR) [offset = 130h]



LEGEND: R = Read only; -*n* = value after reset

Table 11-230. RXRAM Overrun Buffer Address Register (RXOVRN_BUF_ADDR) Field Descriptions

Bit	Field	Value	Description
31-10	Reserved	0	Reads return 0. Writes have no effect.
9-0	RXOVRN_BUF_ADDR	200h-3FCh	Address in RXRAM at which an overwrite occurred. This address value will show only the offset address of the RAM location in the multi-buffer RAM address space. Refer to the device-specific data sheet for the actual absolute address of RXRAM. This word-aligned address can vary from 200h-3FCh. Contents of this register are valid only when any of the INTVECT0 or INTVECT1 and SPIFLG registers show an RXOVRN error vector while in multi-buffer mode. If there are multiple overrun errors, then this register holds the address of first overrun address until it is read. **Note: Reading this register clears the RXOVRN interrupt flag in the SPIFLG register and the TGINTVECTx.** **Note: Receiver overrun errors in multi-buffer mode can be completely avoided by using the SUSPEND until RXEMPTY feature, which can be programmed into each buffer of any TG. However, using the SUSPEND until RXEMPTY feature will make the sequencer wait until the current RXRAM location is read by the VBUS master before it can start the transfer for the same buffer location again. This may affect the overall throughput of the SPI transfer. By enabling the interrupt on RXOVRN in multi-buffer mode, the user can rely on interrupts to know if a receiver overrun has occurred. The address of the overrun in RXRAM is indicated in this RXOVRN_BUF_ADDR register.**

11.1.4.8.44 I/O-Loopback Test Control Register (IOLPBKTSTCR)

This register controls test mode for I/O pins. It also controls whether loop-back should be digital or analog. In addition, it contains control bits to induce error conditions into the module. These are to be used only for module testing.

All of the control/status bits in this register are valid only when the IOLPBKTSTENA field is set to Ah.

Table 11-231. I/O-Loopback Test Control Register (IOLPBKTSTCR) Field Descriptions

Bit	Field	Value	Description
31-25	Reserved	0	Reads return 0. Writes have no effect.
24	SCS FAIL FLG		Bit indicating a failure on $\overline{\text{SPICS}}$ pin compare during analog loopback.
		0	Read: No miscompares occurred on any of the eight chip select pins (vs. the internal chip select number CSNR during transfers). Write: Writing a 0 to this bit has no effect.
		1	Read: A comparison between the internal CSNR field and the analog looped-back value of one or more of the $\overline{\text{SPICS}}$ pins failed. A stuck-at fault is detected on one of the $\overline{\text{SPICS}}$ pins. Comparison is done only on the pins that are configured as functional and during transfer operation. Write: This flag bit is cleared.
23-21	Reserved	0	Reads return 0. Writes have no effect.
20	CTRL BITERR		Controls inducing of BITERR during I/O loopback test mode.
		0	Do not interfere with looped-back data.
		1	Induces bit errors by inverting the value of the incoming data during loopback.

Table 11-231. I/O-Loopback Test Control Register (IOLPBKTSTCR) Field Descriptions (continued)

Bit	Field	Value	Description
19	CTRL DESYNC		Controls inducing of the desync error during I/O loopback test mode.
		0	Do not cause a desync error.
		1	Induce a desync error by forcing the incoming $\overline{\text{SPIENA}}$ pin (if functional) to remain 0 even after the transfer is complete. This forcing will be retained until the kernel reaches the idle state.
18	CTRL PARERR		Controls inducing of the parity errors during I/O loopback test mode.
		0	Do not cause a parity error.
		1	Induce a parity error by inverting the polarity of the parity bit.
17	CTRL TIMEOUT		Controls inducing of the timeout error during I/O loopback test mode.
		0	Do not cause a timeout error.
		1	Induce a timeout error by forcing the incoming $\overline{\text{SPIENA}}$ pin (if functional) to remain 1 when transmission is initiated. The forcing will be retained until the kernel reaches the idle state.
16	CTRL DLENERR		Controls inducing of the data length error during I/O loopback test mode.
		0	Do not cause a data-length error.
		1	Induce a data-length error.
			Master mode: The $\overline{\text{SPIENA}}$ pin (if functional) is forced to 1 when the module starts shifting data.
			Slave mode: The incoming $\overline{\text{SPICS}}$ pin (if functional) is forced to 1 when the module starts shifting data.
15-12	Reserved	0	Reads return 0. Writes have no effect.
11-8	IOLPBKSTENA		Module I/O loopback test enable key.
		Ah	Enable I/O loopback test mode.
		All Other Values	Disable I/O loopback test mode.
7-6	Reserved	0	Reads return 0. Writes have no effect.
5-3	ERR SCS PIN		Inject error on chip-select pin number x. The value in this field is decoded as the number of the chip select pin on which to inject an error. During analog loopback, if CTRL SCS PIN ERR bit is set to 1, then the chip select pin selected by this field is forced to the opposite of its value in the CSNR.
		0	Select $\overline{\text{SPICS}}$[0] for injecting error.
		1h	Select $\overline{\text{SPICS}}$[1] for injecting error.
		:	:
		7h	Select $\overline{\text{SPICS}}$[7] for injecting error.
2	CTRL SCS PIN ERR		Enable/disable the injection of an error on the $\overline{\text{SPICS}}$ pins. The individual $\overline{\text{SPICS}}$ pins can be chosen using the ERR SCS PIN field.
		0	Disable the $\overline{\text{SPICS}}$ error-inducing logic.
		1	Enable the $\overline{\text{SPICS}}$ error-inducing logic.
1	LPBK TYPE		Module I/O loopback type (analog/digital). See Figure 11-48 for the different types of loopback modes.
		0	Enable Digital loopback when IOLPBKTSTENA = 1010.
		1	Enable Analog loopback when IOLPBKTSTENA = 1010.
0	RXPENA		Enable analog loopback through the receive pin.
			Note: This bit is valid only when LPBK TYPE = 1, which chooses analog loopback mode.
		0	Analog loopback is through the transmit pin.
		1	Analog loopback is through the receive pin.

11.1.4.8.45 SPI Extended Prescale Register 1 (EXTENDED_PRESCALE1 for SPIFMT0 and SPIFMT1)

This register provides an extended Prescale values for SPICLK generation to be able to interface with much slower SPI Slaves. This is an extension of SPIFMT0 and SPIFMT1 registers. For example, EPRESCALE_FMT1[7:0] of EXTENDED_PRESCALE1 and PRESCALE1 of SPIFMT1 register will always reflect the same contents. Similarly, EPRESCALE_FMT0[7:0] and PRESCALE0 of SPIFMT0 reflect the same contents.

Figure 11-100. SPI Extended Prescale Register 1 (EXTENDED_PRESCALE1 for SPIFMT0 and SPIFMT1) [offset = 138h]

R-0		R/WP-0	

LEGEND: R/W = Read/Write; R = Read only; WP = Write in privilege mode only; -*n* = value after reset

Table 11-232. SPI Extended Prescale Register 1 (EXTENDED_PRESCALE1) Field Descriptions

Bit	Field	Value	Description
31-27	Reserved	0	Reads return 0. Writes have no effect.
26-16	EPRESCALE_FMT1	0-7FFh	EPRESCALE_FMT1. Extended Prescale value for SPIFMT1. EPRESCALE_FMT1 determines the bit transfer rate of data format 1 if the SPI/MibSPI is the network master. EPRESCALE_FMT1 is use to derive SPICLK from VCLK. If the SPI is configured as slave, EPRESCALE_FMT1 **does not need** to be configured. These EPRESCALE_FMT1[7:0] bits and PRESCALE1 bits of SPIFMT1 register will point to the same physically implemented register. The clock rate for data format 1 can be calculated as: $BR_{Format1}$ = VCLK / (EPRESCALE_FMT1 + 1) Write: This register field should be written if a SPICLK prescaler of more VCLK/256 is required. This field provides a prescaler of up to VCLK/2048 for SPICLK. Writing to this register field will also get reflected in the PRESCALE1 bits of SPIFMT1 register. Read: Reading this field will reflect the PRESCALE value based on the last written register field, that is, EXTENDED_PRESCALE1[26:16] or SPIFMT1[15:8] register. **Note: If Extended Prescaler is required, it should be ensured that EXTENDED_PRESCALE1 register is programmed after SPIFMT1 register is programmed. This is to ensure that the final SPICLK prescale value is controlled by EXTENDED_PRESCALE1 register when a prescale of more 256 is intended on SPICLK. Writing to PRESCALE1 field of SPIFMT1 will automatically clear EPRESCALE_FMT1[10:8] bits to 000 so that the integrity of PRESCALE value is maintained.**
15-11	Reserved	0	Reads return 0. Writes have no effect.

Table 11-232. SPI Extended Prescale Register 1 (EXTENDED_PRESCALE1) Field Descriptions (continued)

Bit	Field	Value	Description
10-0	EPRESCALE_FMT0	0-7FFh	EPRESCALE_FMT0. Extended Prescale value for SPIFMT0. EPRESCALE_FMT0 determines the bit transfer rate of data format 0 if the SPI/MibSPI is the network master. EPRESCALE_FMT0 is use to derive SPICLK from VCLK. If the SPI is configured as slave, EPRESCALE_FMT0 **does not need** to be configured. These EPRESCALE_FMT0[7:0] bits and PRESCALE0 bits of SPIFMT0 register will point to the same physically implemented register. The clock rate for data format 0 can be calculated as: $BR_{Format0}$ = VCLK / (EPRESCALE_FMT0 + 1) Write: This register field should be written if a SPICLK prescaler of more VCLK/256 is required. This field provides a prescaler of up to VCLK/2048 for SPICLK. Writing to this register field will also get reflected in the PRESCALE0 bits of SPIFMT0 register. Read: Reading this field will reflect the PRESCALE value based on the last written register field, that is, EXTENDED_PRESCALE0[10:0] or SPIFMT0[15:8] register. **Note: If Extended Prescaler is required, it should be ensured that EXTENDED_PRESCALE1 register is programmed after SPIFMT0 register is programmed. This is to ensure that the final SPICLK prescale value is controlled by EXTENDED_PRESCALE1 register when a prescale of more 256 is intended on SPICLK. Writing to PRESCALE0 field of SPIFMT0 will automatically clear EPRESCALE_FMT0[10:8] bits to 000 so that the integrity of PRESCALE value is maintained.**

11.1.4.8.46 SPI Extended Prescale Register 2 (EXTENDED_PRESCALE2 for SPIFMT2 and SPIFMT3)

This register provides an extended Prescale values for SPICLK generation to be able to interface with much slower SPI Slaves. This is an extension of SPIFMT2 and SPIFMT3 registers. For example, EPRESCALE_FMT3[7:0] of EXTENDED_PRESCALE2 and PRESCALE3 of SPIFMT3 register will always reflect the same contents. Similarly, EPRESCALE_FMT2[7:0] and PRESCALE2 of SPIFMT2 reflect the same contents.

Bit	Field	Value	Description
31-27	Reserved	0	Reads return 0. Writes have no effect.
26-16	EPRESCALE_FMT3	0-7FFh	EPRESCALE_FMT3. Extended Prescale value for SPIFMT3. EPRESCALE_FMT3 determines the bit transfer rate of data format 3 if the SPI/MibSPI is the network master. EPRESCALE_FMT3 is use to derive SPICLK from VCLK. If the SPI is configured as slave, EPRESCALE_FMT3 **does not need** to be configured. These EPRESCALE_FMT3[7:0] bits and PRESCALE3 bits of SPIFMT3 register will point to the same physically implemented register. The clock rate for data format 1 can be calculated as: $BR_{Format3}$ = VCLK / (EPRESCALE_FMT3 + 1) Write: This register field should be written if a SPICLK prescaler of more VCLK/256 is required. This field provides a prescaler of up to VCLK/2048 for SPICLK. Writing to this register field will also get reflected in the PRESCALE3 bits of SPIFMT3 register. Read: Reading this field will reflect the PRESCALE value based on the last written register field, that is, EXTENDED_PRESCALE3[26:16] or SPIFMT3[15:8] register. **Note: If Extended Prescaler is required, it should be ensured that EXTENDED_PRESCALE2 register is programmed after SPIFMT3 register is programmed. This is to ensure that the final SPICLK prescale value is controlled by EXTENDED_PRESCALE2 register when a prescale of more 256 is intended on SPICLK. Writing to PRESCALE3 field of SPIFMT3 will automatically clear EPRESCALE_FMT3[10:8] bits to 000 so that the integrity of PRESCALE value is maintained.**
15-11	Reserved	0	Reads return 0. Writes have no effect.

Table 11-233. SPI Extended Prescale Register 2 (EXTENDED_PRESCALE2) Field Descriptions (continued)

Bit	Field	Value	Description
10-0	EPRESCALE_FMT2	0-7FFh	EPRESCALE_FMT2. Extended Prescale value for SPIFMT2. EPRESCALE_FMT2 determines the bit transfer rate of data format 2 if the SPI/MibSPI is the network master. EPRESCALE_FMT2 is use to derive SPICLK from VCLK. If the SPI is configured as slave, EPRESCALE_FMT2 **does not need** to be configured. These EPRESCALE_FMT2[7:0] bits and PRESCALE2 bits of SPIFMT2 register will point to the same physically implemented register. The clock rate for data format 0 can be calculated as: $BR_{Format2}$ = VCLK / (EPRESCALE_FMT2 + 1) Write: This register field should be written if a SPICLK prescaler of more VCLK/256 is required. This field provides a prescaler of up to VCLK/2048 for SPICLK. Writing to this register field will also get reflected in the PRESCALE2 bits of SPIFMT2 register. Read: Reading this field will reflect the PRESCALE value based on the last written register field, that is, EXTENDED_PRESCALE2[10:0] or SPIFMT2[15:8] register. **Note: If Extended Prescaler is required, it should be ensured that EXTENDED_PRESCALE2 register is programmed after SPIFMT2 register is programmed. This is to ensure that the final SPICLK prescale value is controlled by EXTENDED_PRESCALE2 register when a prescale of more 256 is intended on SPICLK. Writing to PRESCALE2 field of SPIFMT2 will automatically clear EPRESCALE_FMT2[10:8] bits to 000 so that the integrity of PRESCALE value is maintained.**

11.1.4.9 Multi-Buffer RAM

The multi-buffer RAM is used for holding transmit and received data, control and status information. The multi-buffer RAM contains two banks of up to 128 32-bit words for a maximum configuration. One bank (TXRAM) contains entries for transmit data (replicating the SPIDAT1 register). The other bank (RXRAM) contains received data (replicating the SPIBUF register). The buffers can be partitioned into multiple TGs, each containing a programmable number of buffers. Each of the buffers can be subdivided into 16-bit transmit field, 16-bit receive field, 16-bit control field, and 16-bit status field, as displayed in Figure 11-102. A 4-bit parity field per word is also included in each bank of RAM.

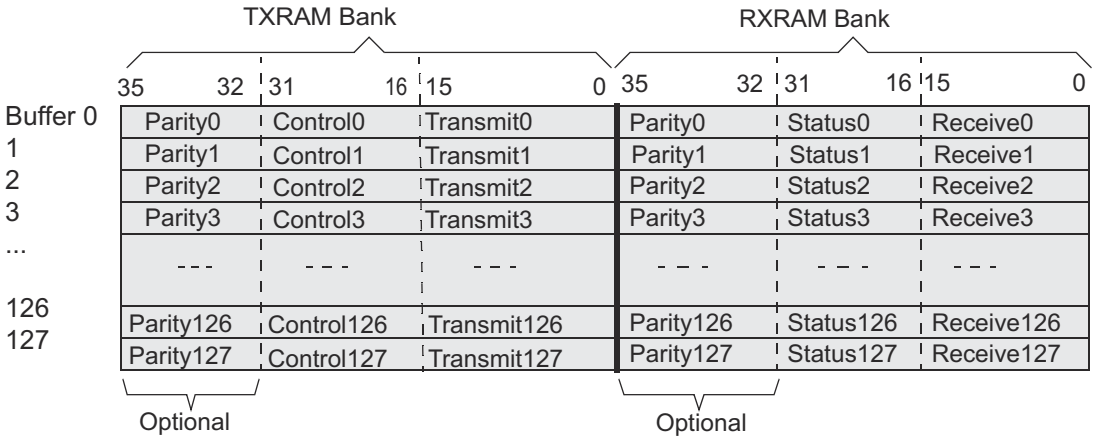

Figure 11-102. Multi-Buffer RAM Configuration

All fields can be read and written with 8-bit, 16-bit, or 32-bit accesses.

The transmit fields can be written and read in the address range 000h to 1FFh. The transmit words contain data and control fields.

The receive RAM fields are read-only and can be accessed through the address range 200h to 3FCh. The receive words contain data and status fields.

The chip select number (CSNR) bit field of the control field for a given word is mirrored into the corresponding receive-buffer status field after transmission.

The Parity is automatically calculated and copied to Parity location

Note

Please refer to the specific device datasheet for the actual number of transmit and receive buffers.

Write to unimplemented buffer is overwriting the corresponding implemented buffer. In MIBSPI, if the RAM SIZE specified is 32 buffers, write to 33rd buffer overwrites 1st buffer, write to 34th buffer overwrites 2st buffer and so on.

11.1.4.9.1 Multi-Buffer RAM Auto Initialization

When the MIBSPI is out of reset mode, auto initialization of multi-buffer RAM starts. The application code must check for BUFINITACTIVE bit to be 0 (Multi-buffer RAM initialization is complete) before configuring multi-buffer RAM.

Besides the default auto initialization after reset, the auto-initialization sequence can also be done by:

1. Enable the global hardware memory initialization key by programming a value of 1010b to the bits [3:0] of the MINITGCR register of the System module.
2. Set the control bit for the multi-buffer RAM in the MSINENA System module register. This bit is device-specific for each memory that support auto-initialization. Please refer to the device datasheet to identify the control bit for the multi-buffer RAM. This starts the initialization process. The BUFINITACTIVE bit will get set to reflect that the initialization is ongoing.
3. When the memory initialization is completed, the corresponding status bit in the MINISTAT register will be set. Also, the BUFINITACTIVE bit will get cleared.
4. Disable the global hardware memory initialization key by programming a value of 0101 to the bits [3:0] of the MINITGCR register of the System module.

Please refer to the *Architecture* chapter for more details on the memory auto-initialization process.

Note

During Auto Initialization process, all the Multi-buffer mode registers (except MIBSPIE) will be reset to their default values. So, it should be ensured that Auto Initialization is completed before configuring the Multi-buffer mode registers.

11.1.4.9.2 Multi-Buffer RAM Register Summary

This section describes the multi-buffer RAM control and transmit-data fields of each word of TXRAM, and the status and receive-data fields of each word of RXRAM. The base address for multi-buffer RAM is FF0E 0000h for MibSPI1 RAM, FF0C 000h for MibSPI3 RAM, and FF0A 0000h for MibSPI5 RAM.

Table 11-234. Multi-Buffer RAM Register Summary

Offset	Acronym	Register Description	Section
Base + 0h-1FFh	TXRAM	Multi-Buffer RAM Transmit Data Register	Section 11.1.4.9.3
Base + 200h-3FFh	RXRAM	Multi-Buffer RAM Receive Buffer Register	Section 11.1.4.9.4

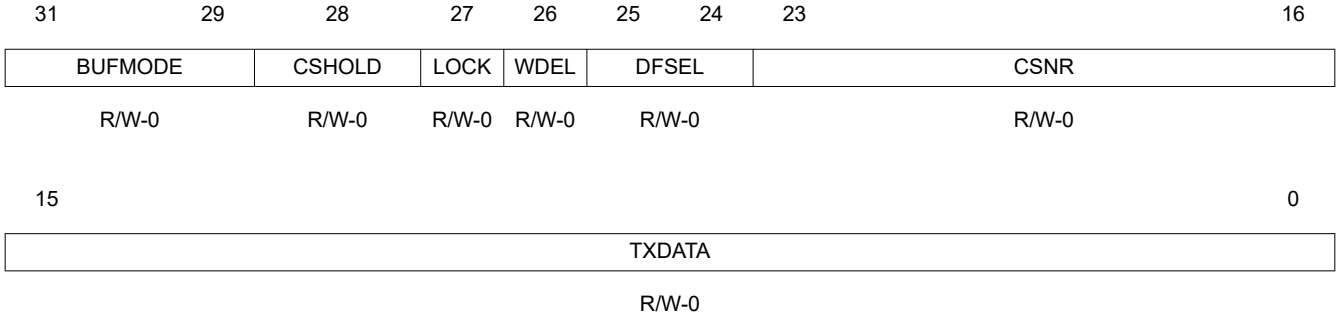
11.1.4.9.3 Multi-Buffer RAM Transmit Data Register (TXRAM)

Each word of TXRAM is a transmit-buffer register.

Note

Writing to only the control fields, bits 28 through 16, does not initiate any SPI transfer in master mode. This feature can be used to set up SPICLK phase or polarity before actually starting the transfer by only updating the DFSEL bit field to select the required phase and polarity combination.

Figure 11-103. Multi-Buffer RAM Transmit Data Register (TXRAM) [offset = RAM Base + 0h-1FFh]



LEGEND: R/W = Read/Write; *-n* = value after reset

Table 11-235. Multi-Buffer RAM Transmit Data Register (TXRAM) Field Descriptions

Bit	Field	Value	Description
31-29	BUFMODE		Specify conditions that are recognized by the sequencer to initiate transfers of each buffer word. When one of the "skip" modes is selected, the sequencer checks the buffer status every time it reads from this buffer. If the current buffer status (TXFULL, RXEMPTY) does not match, the buffer is skipped without a data transfer. When one of the "suspend" modes is selected, the sequencer checks the buffer status when it reads from this buffer. If TXFULL and/or RXEMPTY do not match, the sequencer waits until a match occurs. No data transfer is initiated until the status condition of this buffer changes.
		0	**disabled.** The buffer is disabled.
		1h	**skip single-transfer mode.** Skip this buffer until the corresponding TXFULL flag is set (new transmit data is available).
		2h	**skip overwrite-protect mode.** Skip this buffer until the corresponding RXEMPTY flag is set (new receive data can be stored in RXDATA without data loss).
		3h	**skip single-transfer overwrite-protect mode**. Skip this buffer until both of the corresponding TXFULL and RXEMPTY flags are set. (new transmit data available and previous data received by the host).
		4h	**continuous mode.** Initiate a transfer each time the sequencer checks this buffer. Data words are retransmitted if the buffer has not been updated. Receive data is overwritten, even if it has not been read.
		5h	**suspend single-transfer mode.** Suspend-to-wait until the corresponding TXFULL flag is set (the sequencer stops at the current buffer until new transmit data is written in the TXDATA field).
		6h	**suspend overwrite-protect mode.** Suspend-to-wait until the corresponding RXEMPTY flag is set (the sequencer stops at the current buffer until the previously-received data is read by the host.
		7h	**suspend single-transfer overwrite-protect mode.** Suspend-to-wait until the corresponding TXFULL and RXEMPTY flags are set (the sequencer stops at the current buffer until new transmit data is written into the TXDATA field and the previously-received data is read by the host).

Table 11-235. Multi-Buffer RAM Transmit Data Register (TXRAM) Field Descriptions (continued)

Bit	Field	Value	Description
28	CSHOLD		Chip select hold mode. The CSHOLD bit is supported in master mode only, it is ignored in slave mode. CSHOLD defines the behavior of the chip select line at the end of a data transfer.
		0	The chip select signal is deactivated at the end of a transfer after the T2CDELAY time has passed. If two consecutive transfers are dedicated to the same chip select this chip select signal will be deactivated for at least 2VCLK cycles before it is activated again.
		1	The chip select signal is held active at the end of a transfer until a control field with new data and control information is loaded into SPIDAT1. If the new chip select number equals the previous one, the active chip select signal is extended until the end of transfer with CSHOLD cleared, or until the chip-select number changes.
27	LOCK		Lock two consecutive buffer words. Do not allow interruption by TGs with higher priority.
		0	Any higher-priority TG can begin at the end of the current transaction.
		1	A higher-priority TG cannot occur until after the next unlocked buffer word is transferred.
26	WDEL		Enable the delay counter at the end of the current transaction.
			Note: The WDEL bit is supported in master mode only. In slave mode, this bit is ignored.
		0	No delay will be inserted. However, $\overline{\text{SPICS}}$ pins will still be de-activated for at least for 2VCLK cycles if CSHOLD = 0.
			Note: The duration for which the $\overline{\text{SPICS}}$ pin remains deactivated also depends upon the time taken to supply a new word after completing the shift operation (in compatibility mode). If TXBUF is already full, then the $\overline{\text{SPICS}}$ pin will be deasserted for at least two VCLK cycles (if WDEL = 0).
		1	After a transaction, WDELAY of the corresponding data format will be loaded into the delay counter. No transaction will be performed until the WDELAY counter overflows. The $\overline{\text{SPICS}}$ pins will be de-activated for at least (WDELAY + 2) × VCLK_Period duration.
25-24	DFSEL		Data word format select.
		0	Data word format 0 is selected.
		1h	Data word format 1 is selected.
		2h	Data word format 2 is selected.
		3h	Data word format 3 is selected.
23-16	CSNR	0-FFh	Chip select (CS) number. CSNR defines the chip select pins that will be activated during the data transfer. CSNR is a bit-mask that controls all chip select pins. See Table 11-236.
			Note: If your MibSPI has less than 8 chip select pins, all unused upper bits will be 0. For example, MiBSPI3 has 6 chip select pins, if you write FFh to CSNR, the actual number stored in CSNR is 3Fh.
15-0	TXDATA	0-7FFFh	Transfer data. When written, these bits are copied to the shift register if it is empty. If the shift register is not empty, then they are held in TXBUF.
			SPIEN must be set to 1 before this register can be written to. Writing a 0 to SPIEN forces the lower 16 bits of TXDATA to 0.
			A write to this register (or to the TXDATA field only) drives the contents of the CSNR field on the $\overline{\text{SPICS}}$ pins, if the pins are configured as functional pins (automatic chip select, see Section 11.1.4.2).
			When this register is read, the contents of TXBUF, which holds the latest data written, will be returned.
			Note: Regardless of the character length, the transmit data should be right-justified before writing to the SPIDAT1 register.

Table 11-236. Chip Select Number Active

CSNR Value	Chip Select Active:							CSNR Value	Chip Select Active:					
	CS[5](1)	CS[4](1)	CS[3](1)	CS[2](1)	CS[1](1)	CS[0]			CS[5](1)	CS[4](1)	CS[3](1)	CS[2](1)	CS[1](1)	CS[0]

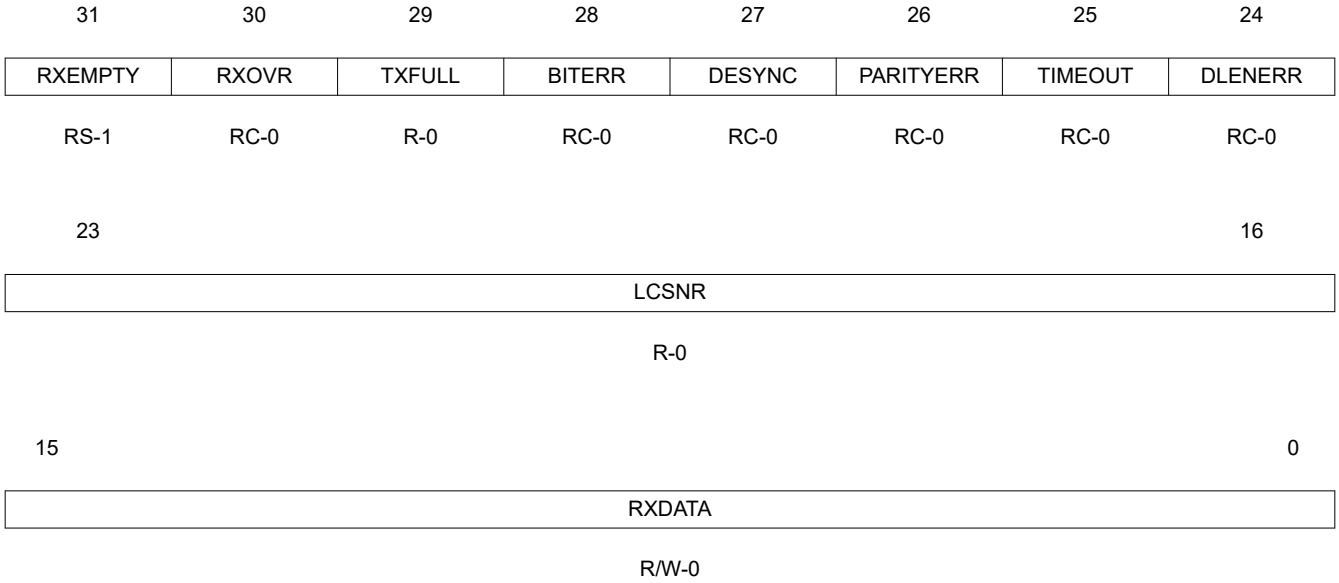
(1) If your MibSPI does not have this chip select pin, this bit is 0.

11.1.4.9.4 Multi-Buffer RAM Receive Buffer Register (RXRAM)

Each word of RXRAM is a receive-buffer register.

Figure 11-104. Multi-Buffer RAM Receive Buffer Register (RXRAM) [offset = RAM Base + 200h-3FFh]



LEGEND: R/W = Read/Write; R = Read only; C = Clear; S = Set; -*n* = value after reset

Table 11-237. Multi-Buffer Receive Buffer Register (RXRAM) Field Descriptions

Bit	Field	Value	Description
31	RXEMPTY		Receive data buffer empty. When the host reads the RXDATA field or the entire RXRAM register, it automatically sets the RXEMPTY flag. When a data transfer is completed, the received data is copied into RXDATA, and the RXEMPTY flag is cleared.
		0	New data has been received and copied into RXDATA.
		1	No data has been received since the last read of RXDATA.
			This flag gets set to 1 under the following conditions: • Reading the RXDATA field of the RXRAM register • Writing a 1 to clear the RXINTFLG bit in the SPI Flag Register (SPIFLG) Write-clearing the RXINTFLG bit before reading RXDATA indicates the received data is being ignored. Conversely, RXINTFLG can be cleared by reading the RXDATA field of RXRAM (or the entire register).
30	RXOVR		Receive data buffer overrun. When a data transfer is completed and the received data is copied into RXBUF while it is already full, RXOVR is set. Overruns always occur to RXBUF, not to RXRAM; the contents of RXRAM are overwritten only after it is read by the Peripheral (VBUSP) master (CPU, DMA, or other host processor). If enabled, the RXOVRN interrupt is generated when RXBUF is overwritten, and reading either SPI Flag Register (SPIFLG) or SPIVECTx shows the RXOVRN condition. Two read operations from the RXRAM register are required to reach the overwritten buffer word (one to read RXRAM, which then transfers RXDATA into RXRAM for the second read). **Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.** **Note: A special condition under which RXOVR flag gets set. If both RXRAM and RXBUF are already full and while another buffer receive is underway, if any errors such as TIMEOUT, BITERR, and DLEN_ERR occur, then RXOVR in RXBUF and SPI Flag Register (SPIFLG) registers will be set to indicate that the status flags are getting overwritten by the new transfer. This overrun should be treated like a normal receive overrun.**
		0	No receive data overrun condition occurred since last read of the data field.
		1	A receive data overrun condition occurred since last read of the data field.

Table 11-237. Multi-Buffer Receive Buffer Register (RXRAM) Field Descriptions (continued)

Bit	Field	Value	Description
29	TXFULL		Transmit data buffer full. This flag is a read-only flag. Writing into the SPIDAT0 or SPIDAT1 field while the TX shift register is full will automatically set the TXFULL flag. Once the word is copied to the shift register, the TXFULL flag will be cleared. Writing to SPIDAT0 or SPIDAT1 when both TXBUF and the TX shift register are empty does not set the TXFULL flag.
		0	The transmit buffer is empty; SPIDAT0/SPIDAT1 is ready to accept a new data.
		1	The transmit buffer is full; SPIDAT0/SPIDAT1 is not ready to accept new data.
28	BITERR		Bit error. There was a mismatch of internal transmit data and transmitted data.
			Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.
		0	No bit error occurred.
		1	A bit error occurred. The SPI samples the signal of the transmit pins (master: SIMOx, slave: SOMIx) at the receive point (one-half clock cycle after the transmit point). If the sampled value differs from the transmitted value, a bit error is detected and the BITERR flag is set. Possible reasons for a bit error include noise, an excessively high bit rate, capacitive load, or another master/slave trying to transmit at the same time.
27	DESYNC		Desynchronization of slave device. This bit is valid in master mode only.
			The master monitors the ENA signal coming from the slave device and sets the DESYNC flag if ENA is deactivated before the last reception point or after the last bit is transmitted plus $t_{T2EDELAY}$. If DESYNCENA is set, an interrupt is asserted. Desynchronization can occur if a slave device misses a clock edge coming from the master.
			Note: In the Compatibility Mode MibSPI, under some circumstances it is possible for a desync error detected for the previous buffer to be visible in the current buffer. This is because the receive completion flag/interrupt is generated when the buffer transfer is completed. But desynchronization is detected after the buffer transfer is completed. So, if the VBUS master reads the received data quickly when an RXINT is detected, then the status flag may not reflect the correct desync condition. In multi-buffer mode, the desync flag is always guaranteed to be for the current buffer.
			Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.
		0	No slave desynchronization is detected.
		1	A slave device is desynchronized.
26	PARITYERR		Parity error. The calculated parity differs from the received parity bit.
			If the parity generator is enabled (selected individually for each buffer) an even or odd parity bit is added at the end of a data word. During reception of the data word, the parity generator calculates the reference parity and compares it to the received parity bit. If a mismatch is detected, the PARITYERR flag is set.
			Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.
		0	No parity error is detected.
		1	A parity error occurred.
25	TIMEOUT		Time-out because of non-activation of $\overline{\text{SPIENA}}$ pin.
			The SPI generates a time-out when the slave does not respond in time by activating the ENA signal after the chip select signal has been activated. If a time-out condition is detected, the corresponding chip select is deactivated immediately and the TIMEOUT flag is set. In addition, the TIMEOUT flag in the status field of the corresponding buffer and in the SPI Flag Register (SPIFLG) is set.
			Note: This bit is valid only in master mode.
			Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.
		0	No $\overline{\text{SPIENA}}$ pin time-out occurred.
		1	An $\overline{\text{SPIENA}}$ signal time-out occurred.
24	DLENERR		Data length error flag.
			Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.
		0	No data-length error occurred.
		1	A data length error occurred.
23-16	LCSNR	0-FFh	Last chip select number. LCSNR in the status field is a copy of CSNR in the corresponding control field. It contains the chip select number that was activated during the last word transfer.

Table 11-237. Multi-Buffer Receive Buffer Register (RXRAM) Field Descriptions (continued)

Bit	Field	Value	Description
15-0	RXDATA	0-FFFFh	SPI receive data. This is the received word, transferred from the receive shift-register at the end of a transfer. Regardless of the programmed character length and the direction of shifting, the received data is stored right-justified in the register.

11.1.4.10 Parity Memory

The parity portion of multi-buffer RAM is not accessible by the CPU during normal operating modes. However, each read or write operation to the control/data/status portion of the multi-buffer RAM causes reads/writes to the parity portion as well.

- Each write to the multi-buffer RAM (either from the Peripheral interface or by the MibSPI itself) causes a write operation to the parity portion of RAM simultaneously to update the equivalent parity bits.
- Each read operation from the multi-buffer RAM (either from the Peripheral interface or by the MibSPI itself) causes a read operation from the parity portion of the RAM for parity comparison purpose.
- Reads/Writes to multi-buffer RAM can either be caused by any CPU/DMA accesses or by the sequencer logic of MibSPI itself.
- Incase of Parity error ESM module is notified to generate MIBSPI Parity ESM interrupt. User can check the error status and address location captured in the UERRSTAT and UERRADDRx registers respectively.

For testing the parity portion of the multi-buffer RAM, which is a 4-bit field per word address (1 bit per byte), a separate parity memory test mode is available. Parity memory test mode can be enabled and disabled by the PTESTEN bit in the UERRCTRL register.

During the parity test mode, the parity locations are addressable at the address between RAM_BASE_ADDR + 0x400h and RAM_BASE_ADDR + 0x7FFh. Each location corresponds, sequentially, to each TXRAM word, then to each RXRAM word. See Figure 11-105 for a diagram of the memory map of parity memory during normal operating mode and during parity test mode.

During parity test mode, after writing the data/control portion of the RAM, the parity locations can be written with incorrect parity bits to intentionally cause parity errors.

See the device-specific data sheet to get the actual base address of the multi-buffer RAM.

Note

The RX_RAM_ACCESS bit can also be set to 1 during the parity test mode to be enable writes to RXRAM locations. Both parity RAM testing and RXRAM testing can be done together.

There are 4 bits of parity corresponding to each of the 32-bit multi-buffer locations. Individual bits in the parity memory are byte-addressable in parity test mode. See the example in Figure 11-106 for further details.

Note

Polarity of the parity (odd/even) varies by device. In some devices, a control register in the system module can be used to select odd or even parity.

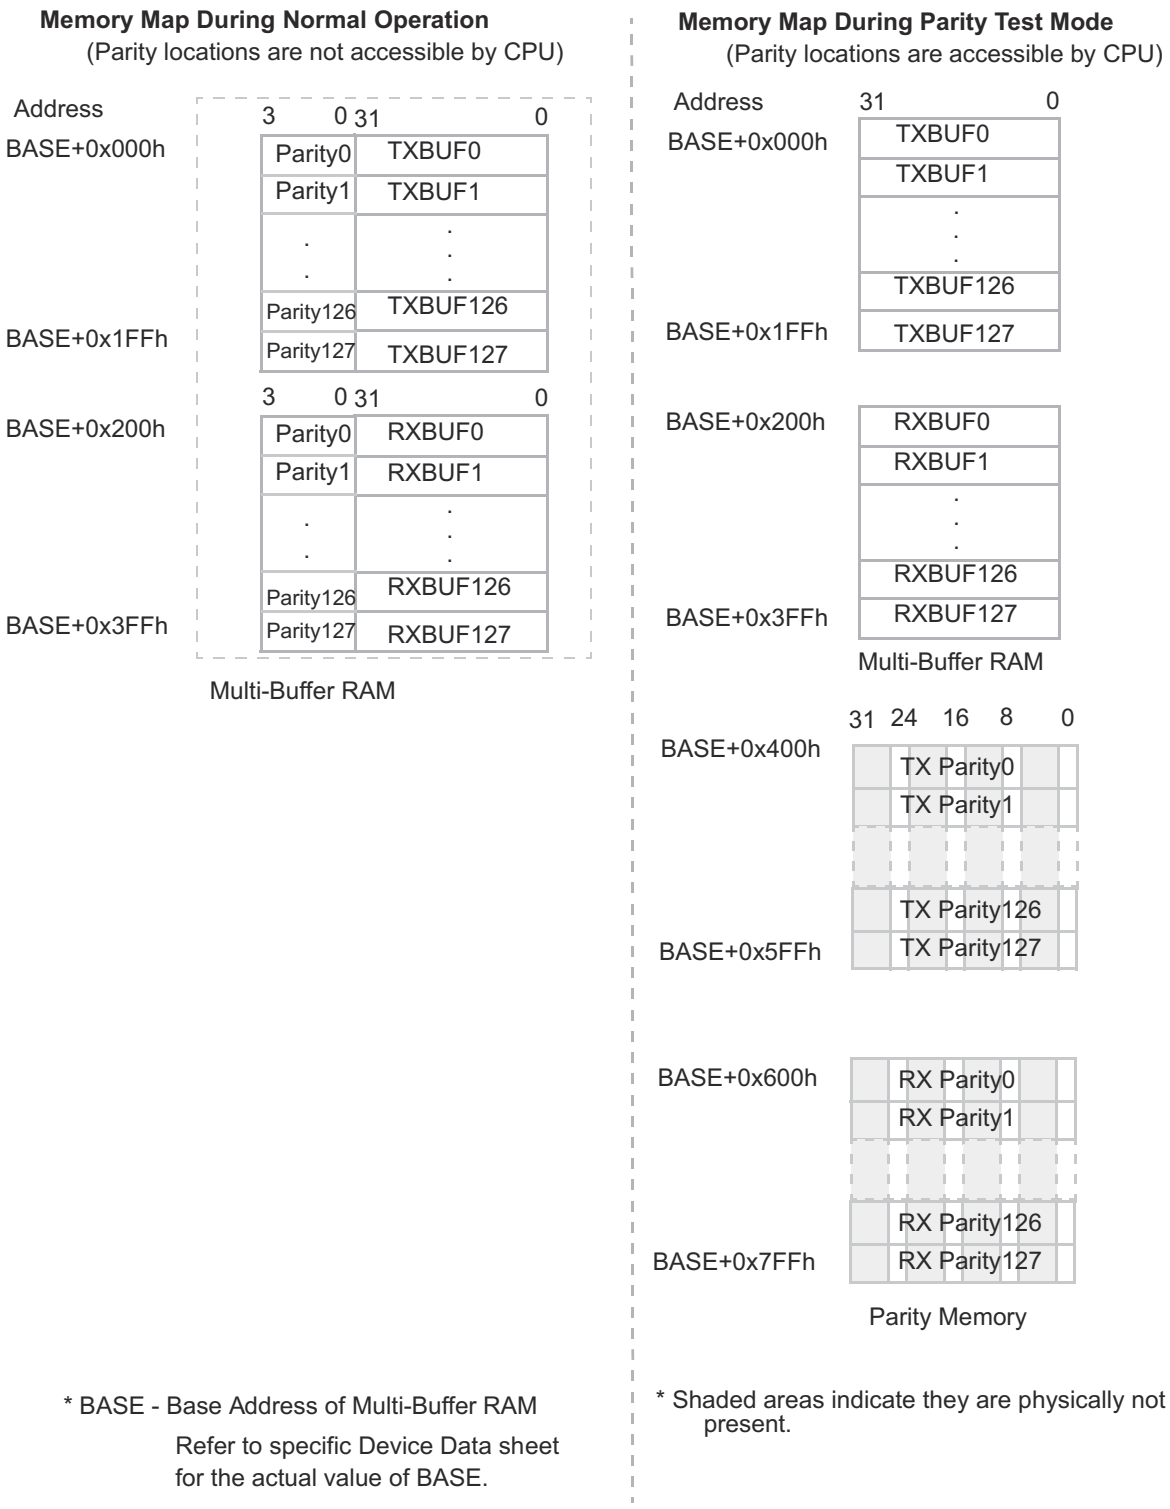


Figure 11-105. Memory Map for Parity Locations During Normal and Test Mode

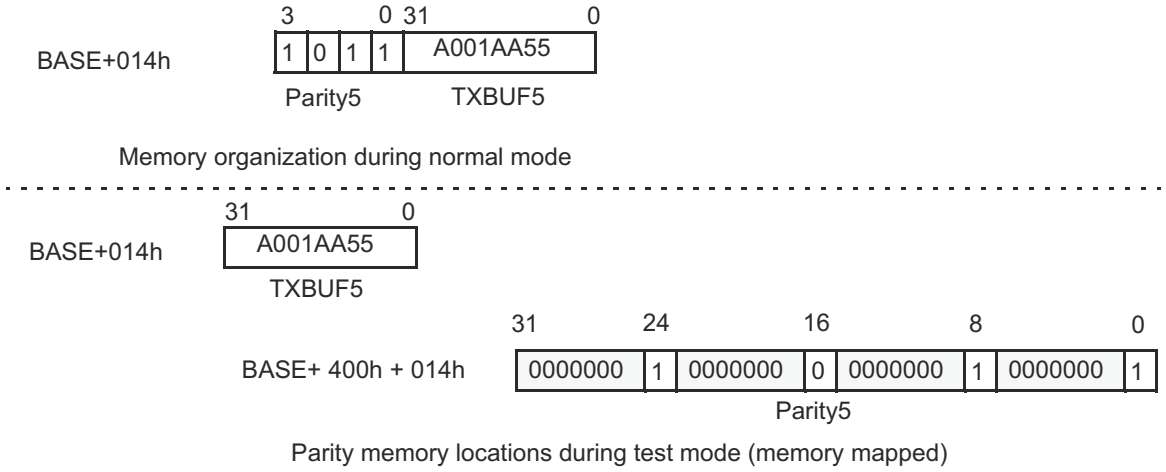
11.1.4.10.1 Example of Parity Memory Organization

Suppose TXBUF5 (6th location in TXRAM) in the multi-buffer RAM is written with a value of A001_AA55. If the polarity of the parity is set to odd, the corresponding parity location parity5 will get updated with equivalent parity of 1011 in its field.

During parity-memory test mode, these bits can be individually byte addressed. The return data will be a byte adjusted with actual parity bit in the LSB of the byte. If a word is read from the word-boundary address of parity locations, then each bit of the 4-bit parity is byte-adjusted and a 32-bit word is returned. 0s will be padded into the parity bits to get each byte. See Figure 11-106 for a diagram.



Parity memory locations during test mode (memory mapped)

1 Shaded areas indicate reads return 0, writes have no effect. These registers are not physically present.

Figure 11-106. Example of Memory-Mapped Parity Locations During Test Mode

Note

Read Access to Parity Memory Locations

Parity memory locations can be read even without entering into parity memory test mode. Their address remains as in memory test mode. It is only to enter parity-memory test mode to enable write access to the parity memory locations.

11.1.4.11 MibSPI Pin Timing Parameters

The pin timings of SPI can be classified based on its mode of operation. In each mode, different configurations like Phase and Polarity affect the pin timings.

The pin directions are based on the mode of operation.

Controller mode SPI:

- SPICLK (SPI Clock) - Output
- SPISIMO (SPI Peripheral In Controller Out) - Output
- $\overline{\text{SPICS}}$ (SPI Peripheral Chip Selects) - Output
- SPISOMI (SPI Peripheral Out Controller In) - Input
- $\overline{\text{SPIENA}}$ (SPI Peripheral ready Enable) - Input

Peripheral mode SPI:

- SPICLK - Input
- SPISIMO - Input
- $\overline{\text{SPICS}}$ - Input
- SPISOMI - Output
- $\overline{\text{SPIENA}}$ - Output

Note

All the timing diagrams given below are with Phase = 0 and Polarity = 0. unless explicitly stated otherwise.

Figure 11-114. SPI/MibSPI Pins During Peripheral Mode in 5-pin Configuration - (Single/Multi Peripheral)

11.1.4.11.3 Controller Timing Parameter Details

In case of Controller the module drives out SPICLK. It also drives out the Transmit data on SPISIMO with respect to its internal SPICLK. In case of Controller mode, the RX data on the SPISOMI pin is registered with respect to SPICLK received through the input buffer from the I/O pad.

If the chip select pin is functional, then the Controller will drive out the $\overline{\text{SPICS}}$ pins before starting the SPICLK. If the $\overline{\text{SPIENA}}$ pin is functional, then Controller will wait for an active low from the Peripheral on the input pin to start the SPICLK.

11.1.4.11.4 Peripheral Mode Timing Parameter Details

In case of Peripheral mode, the module will drive only the SPISOMI and $\overline{\text{SPIENA}}$ pins. All other pins are inputs to it. The RX data on the SPISIMO pin will be registered with respect to the SPICLK pin. The Peripheral will use the $\overline{\text{SPICS}}$ pin to drive out the $\overline{\text{SPIENA}}$ pin if both are functional. If 4-pin with $\overline{\text{SPIENA}}$ is configured, then the Peripheral will drive out an active-low signal on the $\overline{\text{SPIENA}}$ pin when new data is written to the TX Shift Register. Irrespective of 4-pin with $\overline{\text{SPIENA}}$ or 5-pin configuration, the Peripheral will deassert the $\overline{\text{SPIENA}}$ pin after the last bit is received. If ENABLE_HIGHZ (SPIINT0.24) bit is 0, the deasserted value of the $\overline{\text{SPIENA}}$ pin will be 1. Otherwise, it will depend upon the internal pull up or pull down resistor (if implemented) depending upon the Specification of the Chip.

11.1.5 GPADC

11.1.5.1 GPADC Overview

The AM273x device implements a GPADC module on MainSS for safety monitoring the inputs, such as the temp sensor, voltage regulators, and so forth; both external and internal to the device. Features supported by the ADC module include:

- 10-bit ENOB 625Ksps ADC
- Full-scale range of GPADC input between 0 V and 1.8 V
- 9 external I/Os and internal components -temperature sensors (3), supplies, bias reference, LDO output mapped to GPADC input
  - For details on accessing the internal components (also known as channels) and temperature sensors, please refer to the GPADC SDK documentation
- Total capacitance, including parasitic and sampling cap, for each of GPADC pins be less than 14pf
- Event pin and software command mechanism to trigger the conversion
  - Event signal from either of the GPIO (provides options with pinmuxing) as well as from RTI timer module
- Data RAM to store the conversion results (1K results)
- Storage of min, max, and sum of the samples captured per channel
- Mechanism to skip initial M samples and program the number of samples N to be collected every channel
- Instruction PARAMs RAM to program the channels is monitored
- Mechanism to execute the instruction PARAMs in a circular manner without any CPU intervention
- DMA trigger when conversion is completed or data RAM threshold is achieved
- Self-test logic support for input channel failure detection (open / short to power / short to ground)
- Calibration logic using BGAP, for offset error correction
- Separate operating supply and ground pins on package
- Capability to have an external reference voltage for GPADC

11.1.5.2 Functional Description Modes of Operation

11.1.5.2.1 IFM Mode (Inter Frame Monitoring Mode)

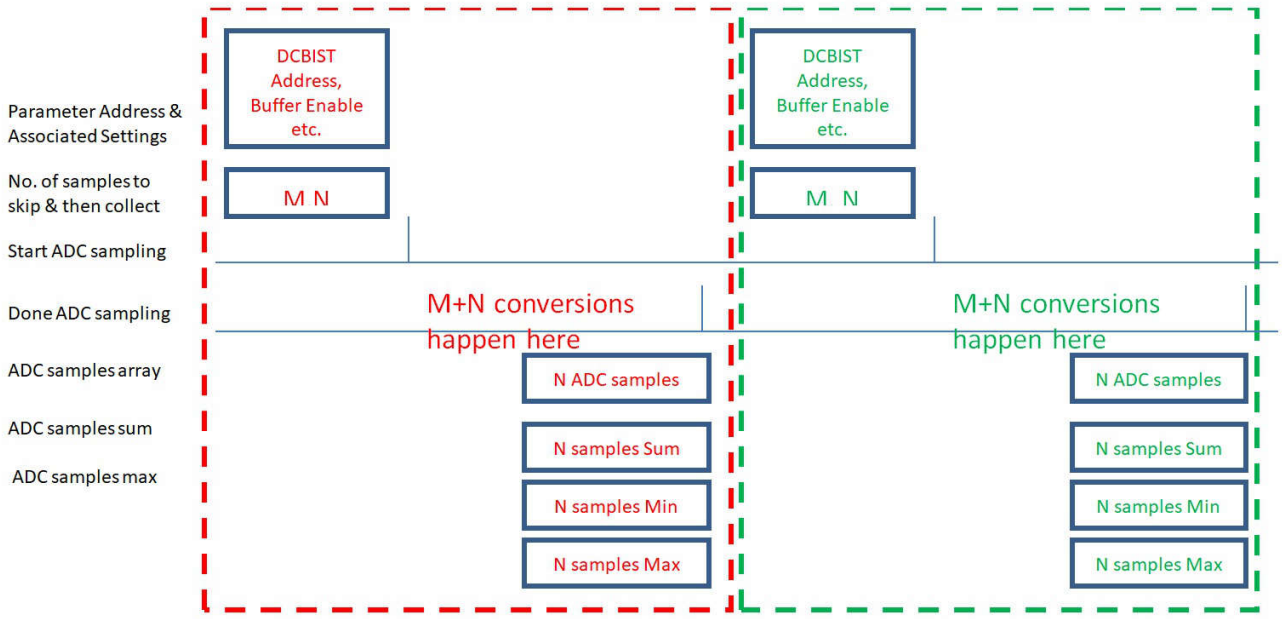

Figure 11-115. IFM Mode

Firmware writes the following register bit fields:

- Param_val_ifm
- Config_value_ifm
- Skip_samples_ifm(M)
- Collect_samples_ifm(N)
- Config settings in Analog
- ADC Reset =0
- ADC Enable =1
- ADC Start =1
- Firmware issues GPADC Trigger (self clearing bit)

Hardware skips M samples, collects N samples. Hardware outputs the sum, min, max of those samples in a register. Hardware outputs the actual array of samples in Data RAM (debug, if enabled). Each entry in the data RAM (256 deep) contains 4 ADC data samples, i.e. 1K ADC samples can be stored in the data RAM. Hardware issues a done interrupt.

11.1.5.2.2 CTM Mode (Continuous Time Monitoring Mode)

Before frame, the firmware programs parameters to be measured for all data-profiles in the instruction packet RAM. Firmware writes “Gpadc_init_mem” =1 (self-clearing) to initialize the data RAM to all ‘0’s.

Configure settings in Analog

ADC Reset =0

ADC Enable =1

ADC Start =1

Program the instructions to be performed in instruction packet RAM.

GPADC_CTM_Trigger starts the CTM mode operation and finishes after completing the programmed instructions. At end of the operation, the firmware can read or process min-max-average.

11.1.5.3 Interrupts

The following interrupt is generated by GPADC:

- MSS_GPADC_IFM_DONE

11.1.5.4 GPADC Trigger Sources

11.1.5.4.1 IFM Mode

Writing 1'b1 to MSS_GPADC_REG::REG1:: GPADC_TRIGGER generates a trigger for IFM Mode to start.

11.1.5.4.2 CTM Mode

Table 11-238 shows the 16 trigger sources for CTM Mode.

Table 11-238. CTM Mode Trigger Sources

No.	Trigger Source
0	GPIO_0
1	GPIO_1
2	GPIO_2
3	GPIO_3
4	RSS_CSI2A_EOL_INT
5	RSS_CSI2A_SOF_INT0
6	RSS_CSI2A_SOF_INT1
7	RSS_CSI2A_SOF_INT
8	RSS_CSI2B_SOF_INT
9	HW_Sync_FE1
10	HW_Sync_FE2
11	DSS_RTIA_1
12	DSS_RTIB_1
13	MSS_RTIA_INT1
14	MSS_RTIB_INT1
15	MMR based SW trigger

MSS_CTRL::GPADC_CTRL::GPADC_CTRL_GPADC_TRIGIN_SEL is used for selecting the trigger source for CTM mode.

Writing 1'b1 to MSS_CTRL::GPADC_CTRL::GPADC_CTRL_GPADC_SW_TRIG triggers the 15th trigger in Table 11-238.

11.1.5.5 MSS GPADC Register Specification

11.1.5.5.1 MSS_GPADC_PKT_RAM Registers

lists the MSS_GPADC_PKT_RAM registers. All register offset addresses not listed in should be considered as reserved locations and the register contents should not be modified.

Table 11-239. MSS_GPADC_PKT_RAM Registers

Offset	Acronym	Register Notes	Section
0+4*Nh	INSTN_0	Where N goes from 0-255	Section 12.1.5.5.1.1
4+4*Nh	INSTN_1	Where N goes from 0-255	Section 12.1.5.5.1.2

11.1.5.5.1.1 INSTN_0 Register (Offset = 0h) [reset = 0h]

INST**N**_0 is shown in and described in .

11.2 High-speed Serial Interfaces

11.2.1 Ethernet SubSystem (MCU_CPSW0)

This chapter describes the Gigabit Ethernet MAC (Media Access Controller). For conceptual purposes the below documentation refers to this MAC as being a two port CPSW with port 0 being the CPPI DMA host port and port 1 being the Ethernet port.

11.2.1.1 MCU_CPSW0 Overview

The two-port Ethernet MAC (MCU_CPSW0) subsystem provides Ethernet packet communication for the device and is configured in a similar manner as a two-port Ethernet switch. MCU_CPSW0 features the Reduced Gigabit Media Independent Interface (RGMII), Reduced Media Independent Interface (RMII), and the Management Data Input/Output (MDIO) interface for physical layer device (PHY) management.

The device has integrated two-port Ethernet Switch subsystem into device MCU domain named MCU_CPSW0.

Figure 11-141 shows the MCU_CPSW0 module overview.

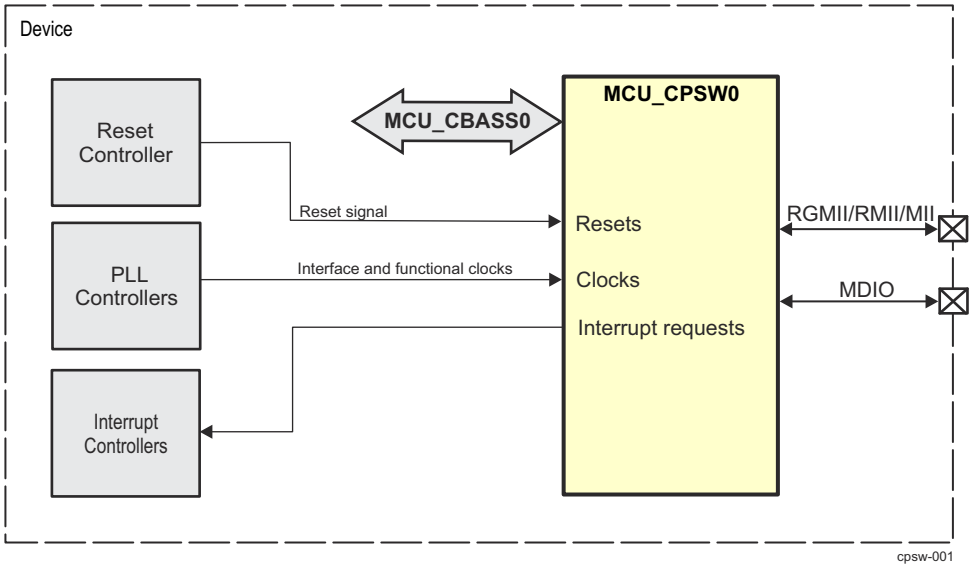

Figure 11-141. MCU_CPSW0 Overview

11.2.1.1.1 MCU_CPSW0 Features

The MCU_CPSW0 subsystem provides the following features:

- One Ethernet port with selectable MII, RMII and RGMII interfaces (port 1).
- One CPDMA CPPI DMA Host Interface (Port 0)
- Synchronous 10/100 Mbit operation
- Flexible logical FIFO-based packet buffer structure
- Eight priority level Quality Of Service (QOS) support (802.1p)
- Support for Audio/Video Bridging (P802.1Qav/D6.0) (**C**redit **B**ased **S**haper)
- Support for IEEE 1588 Clock Synchronization (2008 Annex D, Annex E and Annex F)
  - Timestamp module capable of time stamping external timesync events like Pulse-Per-Second and also generating Pulse-Per-Second outputs
  - CPTS module that supports time stamping for IEEE1588 with support for 4 hardware push events and generation of compare output pulses
- DSCP Priority Mapping (IPv4 and IPv6)
- Energy Efficient Ethernet (EEE) support (802.3az)
- Flow Control (802.3x) Support
- Non Blocking switch fabric
- Time Sensitive Network Support
  - IEEE 802.1Qbv/D2.2 Enhancements for Scheduled Traffic
- Address Lookup Engine (ALE)
  - Configurable number of addresses plus VLANs
  - Wire rate lookup
  - Host controlled time-based aging and/or auto-aging
  - Spanning tree support

  - L2 address lock and L2 filtering support
  - MAC authentication (802.1x)
  - Receive-based or destination-based Multicast and Broadcast rate limits
  - MAC address blocking
  - Source port locking
  - OUI (Vendor ID) host accept/deny feature
  - Configurable number of classifier/policers
  - VLAN support
    - 802.1Q compliant
      - Auto add port VLAN for untagged frames on ingress
      - Auto VLAN removal on egress and with pad to minimum frame size
- EtherStats and 802.3Stats Remote network Monitoring (RMON) statistics gathering (per port)
- Ethernet or Castignoli CRC selectable on Ethernet egress
- Digital Loopback supported (Ethernet egress to Ethernet ingress)
- OAM Loopback supported (FIFO Loopback - port ingress to egress including host port)
- CPSGMII Loopback Modes (Ethernet egress to Ethernet ingress)
- Maximum frame size of 2024 bytes (including VLAN)
- Management Data Input/Output (MDIO) module for PHY Management with Clause 45 support
- Programmable interrupt control with selected interrupt pacing
- Emulation support
- Full duplex mode supported in 10/100 Mbps. Half-duplex mode supported only in 10/100 Mbps modes only.
- RAM Error Detection and Correction (SECDED)
- InterVLAN Routing is supported - 4 routes per egress port.
- Support for Audio/Video Bridging (P802.1Qav/D6.0) (Credit Based Shaper - CBS)
- Automotive Security Features
  - VLANs can be configured to not allow fragmented IPv4 frames (that is, fragmented IPv4 traffic)
  - VLANs can be configured to only allow up to four different IPv4 Protocols or IPv6 Next Header values
  - Drop invalid source addresses, that is drop Source Addresses with bit 40 set (Multicast/Broadcast indicator on Destination Addresses)
  - Drop frames that the IEEE802.3 length is not contained within the frame. (Ether Types 0-1500)
  - Any source address can be secured to a port dropping any attempts from other ports to masquerade as a service
  - Any source or destination address can be blocked
  - Per port or per VLAN ingress checking, dropping traffic from non-member ports
  - Classification, policing on L2 and L3 information

11.2.1.1.2 MCU_CPSW0 Not Supported Features

The following MCU_CPSW0 features are not supported:

- GMII Mode
- SGMII Mode
- MACSEC
- Synchronous Ethernet
- Software reset
- Rate-limiting is not supported in half-duplex mode
- Dual VLAN switch operations are not supported
- RGMII Internal Delay Mode disabled.
- Priority based flow control is not supported.
- InterVLAN routed packets will be dropped if the FIFO room is insufficient regardless of receive 803.3x flow control.

11.2.1.1.3 Terminology

Terminology:

AVB	Audio Video Bridging
AVBTP	Audio Video Bridging Trasport Protocol
BMCA	Best Master Clock Algorithm
CFI	Canonical Format Indicator
CPPI	Communications Port Programming Interface
DLR	Device Level Ring
DSCP	Differentiated Services Code Point
EEE	Energy Efficient Ethernet
EMAC	Ethernet Media Access Control
EOP	End of Packet
EOQ	End of Queue
IPG	Inter-Packet Gap
LPI	Low Power Indicator
MDIO	Management Data Input/Output
MOF	Middle of Frame
OUI	Organizationally Unique Identifier
PTP	Precision Time Protocol
RMON	Remote Monitoring
RTCP	RTP Control Protocol
RTP	Real-time Transport Protocol
SCR	Switched Central Resource
SRP	Stream Reservation Protocol
TOS	Type of Service
VLAN	Virtual Local Area Network
CPSW_2G	CPSW two port

11.2.1.2 MCU_CPSW0 Environment

11.2.1.2.1 MCU_CPSW0 RMII Interface

Figure 11-142 shows a device with integrated RMII and MDIO interface connection in a typical system. The individual MCU_CPSW0 and MDIO signals for the RMII interface are summarized in Table 11-268.

For more information, refer to either the IEEE 802.3 standard or ISO/IEC 8802-3:2000(E).

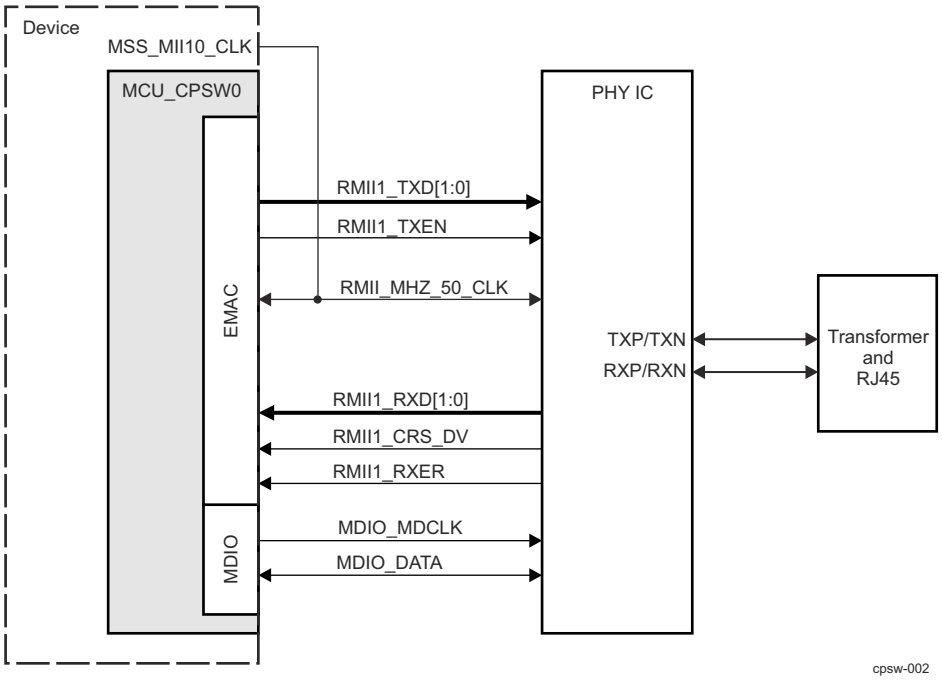

Figure 11-142. RMII Interface Typical Application

Table 11-268. RMII I/O Description

Signal	Device Pin	I/O[1]	Description
RMII_TXD[1:0]	MCU_RMII_TXD[1:0]	O	Transmit data. The transmit data pins are a collection of 2 bits of data. TXD0 is the least-significant bit (LSB). The signals are synchronized by RMII_MHZ_50_CLK and valid only when RMII_TXEN is asserted.
RMII_TXEN	MCU_RMII_TX_EN	O	RMII transmit enable. The transmit enable signal indicates that the MCU_RMII_TXD pins are generating data for use by the PHY. RMII_TXEN is synchronous to RMII_MHZ_50_CLK.
RMII_MHZ_50_CLK	MCU_RMII_REF_CLK	I	RMII 50MHz reference clock. The reference clock is used to synchronize all RMII signals. RMII_MHZ_50_CLK must be continuous and fixed at 50 MHz. This bit controls the clock source MSS_CTRL::CPSW_CONTROL:: CPSW_CONTROL_RMII_REF_CLK_OE_N
RMII_RXD[1:0]	MCU_RMII_RXD[1:0]	I	Receive data. The receive data pins are a collection of 2 bits of data. RXD0 is the least-significant bit (LSB). The signals are synchronized by RMII_MHZ_50_CLK and valid only when RMII_CRS_DV is asserted and RMII_RXER is de-asserted.
RMII_CRS_DV	MCU_RMII_CRS_DV	I	Carrier sense/receive data valid. Multiplexed signal between carrier sense and receive data valid.
RMII_RXER	MCU_RMII_RX_ER	I	Receive error. The receive error signal is asserted to indicate that an error was detected in the received frame.
MDIO_MDCLK	MCU_MDIO_CLK	O	Management data clock (MDIO_MDCLK). The MDIO data clock is sourced by the MDIO module on the system. It is used to synchronize MDIO data access operations done on the MCU_MDIO0_DATA pin.

Table 11-268. RMII I/O Description (continued)

Signal	Device Pin	I/O(1)	Description
MDIO_DATA	MCU_MDIO_DATA	I/O	MDIO data pin drives PHY management data into and out of the PHY by way of an access frame consisting of start of frame, read/write indication, PHY address, register address, and data bit cycles. The MCU_MDIO0_DATA pin acts as an output for all but the data bit cycles at which time it is an input for read operations.

(1) I = Input; O = Output

11.2.1.2.2 MCU_CPSW0 RGMII Interface

Figure 11-143 shows a device with integrated RGMII and MDIO interface connection in a typical system. The individual MCU_CPSW0 and MDIO signals for the RGMII interface are summarized in Table 11-269.

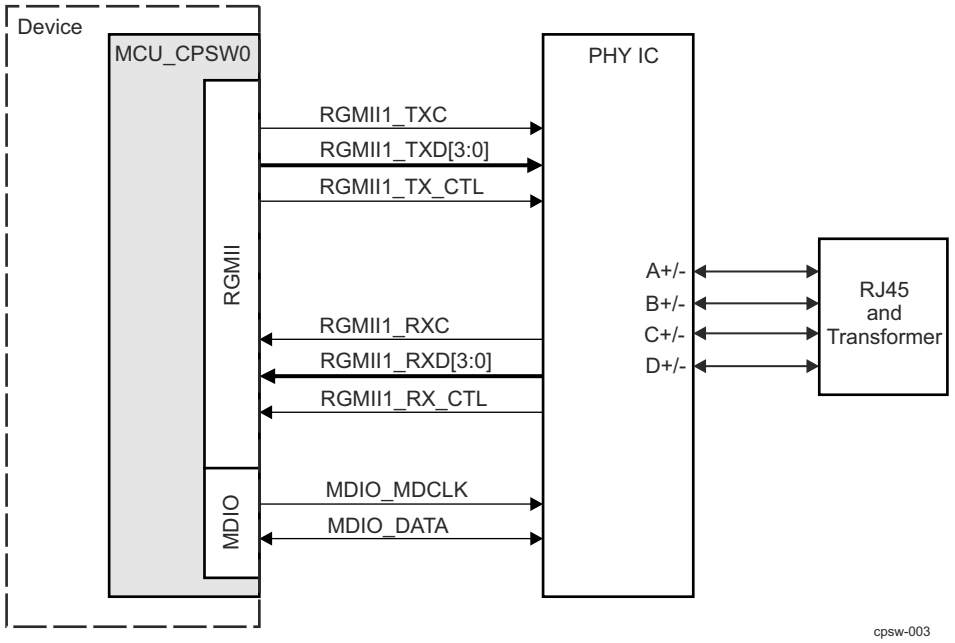

Figure 11-143. RGMII Interface Typical Application

Table 11-269. RGMII I/O Description

Signal	Device Pin(s)	I/O(1)	Description
RGMII_TXD[3:0]	MCU_RGMII_TD[3:0]	O	The transmit data pins are a collection of 4 bits of data. TD0 is the least-significant bit (LSB). The signals are valid only when RGMII_TX_CTL is asserted.
RGMII_TX_CTL	MCU_RGMII_TX_CTL	O	Transmit Control/enable. The transmit enable signal indicates that the TD pins are generating data for use by the PHY.
RGMII_TXC	MCU_RGMII_TXC	O	The transmit reference clock. The clock is 2.5 MHz at 10 Mbps operation, 25 MHz at 100 Mbps operation, and 125 MHz at 1000 Mbps* of operation.
RGMII_RXD[3:0]	MCU_RGMII_RD[3:0]	I	The receive data pins are a collection of 4 bits of data. RD0 is the least-significant bit (LSB). The signals are valid only when RGMII_RX_CTL is asserted
RGMII_RX_CTL	MCU_RGMII_RX_CTL	I	The receive data valid/control signal indicates that the RD pins are nibble data for use by the EMAC.
RGMII_RXC	MCU_RGMII_RXC	I	The receive clock is a continuous clock that provides the timing reference for receive operations. The clock is generated by the PHY and is 2.5 MHz at 10 Mbps operation, 25 MHz at 100 Mbps operation, 125 MHz at 1000 Mbps* of operation.

Table 11-269. RGMII I/O Description (continued)

Signal	Device Pin(s)	I/O(1)	Description
MDIO_MDCLK	MCU_MDIO_CLK	O	Management data clock (MDIO_MDCLK). The MDIO data clock is sourced by the MDIO module on the system. It is used to synchronize MDIO data access operations done on the MCU_MDIO0_DATA pin.
MDIO_DATA	MCU_MDIO_DATA	I/O	The MCU_MDIO0_DATA pin drives PHY management data into and out of the PHY by way of an access frame consisting of start of frame, read/write indication, PHY address, register address, and data bit cycles. The MCU_MDIO0_DATA pin acts as an output for all but the data bit cycles at which time it is an input for read operations.

(1) I = Input; O = Output

Note

The Control Module registers assign the specific function to the device pads. For more information on Control Module settings, see , Pad Configuration Registers in *Control Module (CTRL_MMR)* and the device-specific Datasheet.

11.2.1.3 MCU_CPSW0 Integration

Figure 11-144 shows the integration of the MCU_CPSW0 module in the device.

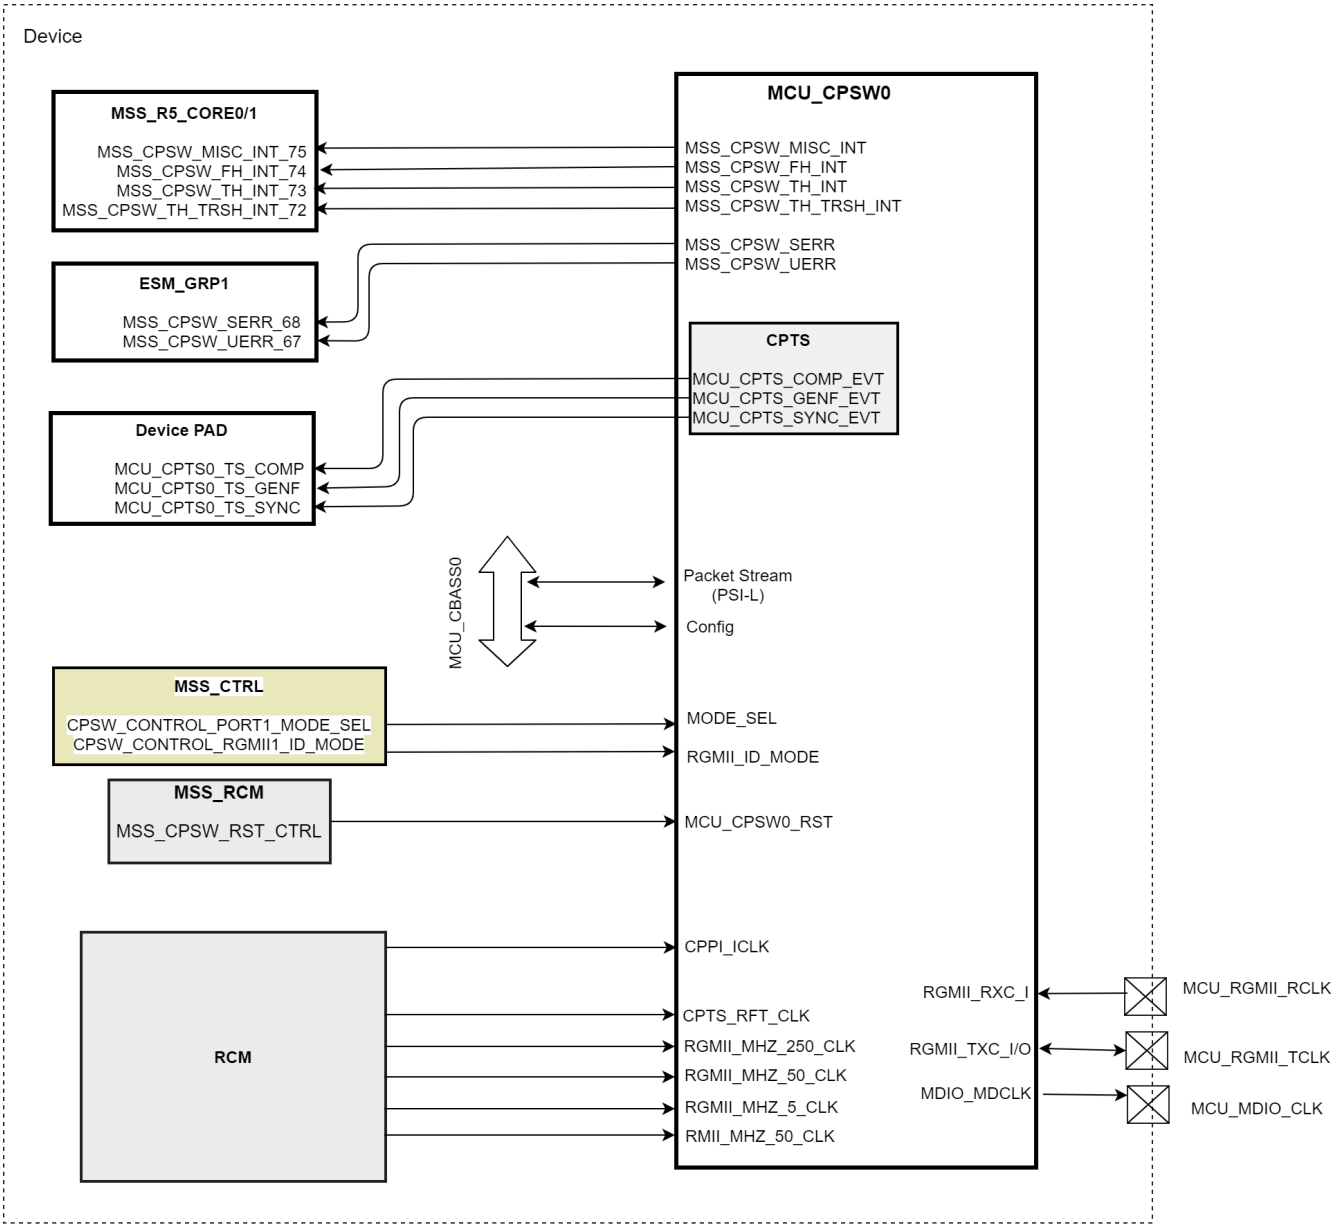

Figure 11-144. MCU_CPSW0 Integration

Below Tables summarize the integration of the MCU_CPSW0 module in the device.

Table 11-270. MCU_CPSW0 Clocks and Resets

Clocks			
Module Instance	**Module Clock Input**	**Reference/Source**	**Description**
MCU_CPSW0	CPPI_CLK	MSS_RCM::CPSW_CLK	CPPI packet streaming interface clock. Main clock for MCU_CPSW0.
	CPTS_RFT_CLK	MSS_RCM::MSS_CPTS_CLK	Time sync Reference Clock 400/250/divided
	RGMII_MHZ_5_CLK	MSS_RCM::MSS_MII10_CLK	5-MHz RGMII reference clock.
	RGMII_MHZ_50_CLK	MSS_RCM::MSS_MII100_CLK	50-MHz RGMII reference clock.

Table 11-270. MCU_CPSW0 Clocks and Resets (continued)

RGMII_MHZ_250_CLK	MSS_RCM::MSS_RGMII_CLK	250-MHz RGMII reference clock.
RMII_MHZ_50_CLK	MSS_RCM::MSS_MII100_CLK	50-MHz RMII reference clock.

	MCU_CPSW_GENF_EVT	MCU_CPTS0_TS_GENF	MCU_CPSW0 CPTS generator function event interrupt	Edge
	MCU_CPSW_SYNC_EVT	MCU_CPTS0_TS_SYNC	MCU_CPSW0 CPTS sync event interrupt	Edge

Note

For more information about interrupts, see *Local Interrupt Controller*.

For more information on the interconnects, see Chapter 4.

For more information on the power, reset and clock management, see the corresponding sections within Chapter 6.

For more information on the device interrupt controllers, see *Interrupt Controllers*.

11.2.1.4 MCU_CPSW0 Functional Description

The two-port switch Ethernet subsystem modules (CPSW) are compliant to the IEEE Std 802.3 Specification. CPSW top level functional block diagram is shown in Figure 11-145.

11.2.1.4.1 Functional Block Diagram

The two-port Ethernet subsystem consists of:

- CPSW_2G
- One RGMII interface module
- One RMII interface module
- One Host Port 0 CPPI Packet Streaming Interface
- CPSW subsystem control registers (REG)
- One MDIO interface module
- One Interrupt Controller module

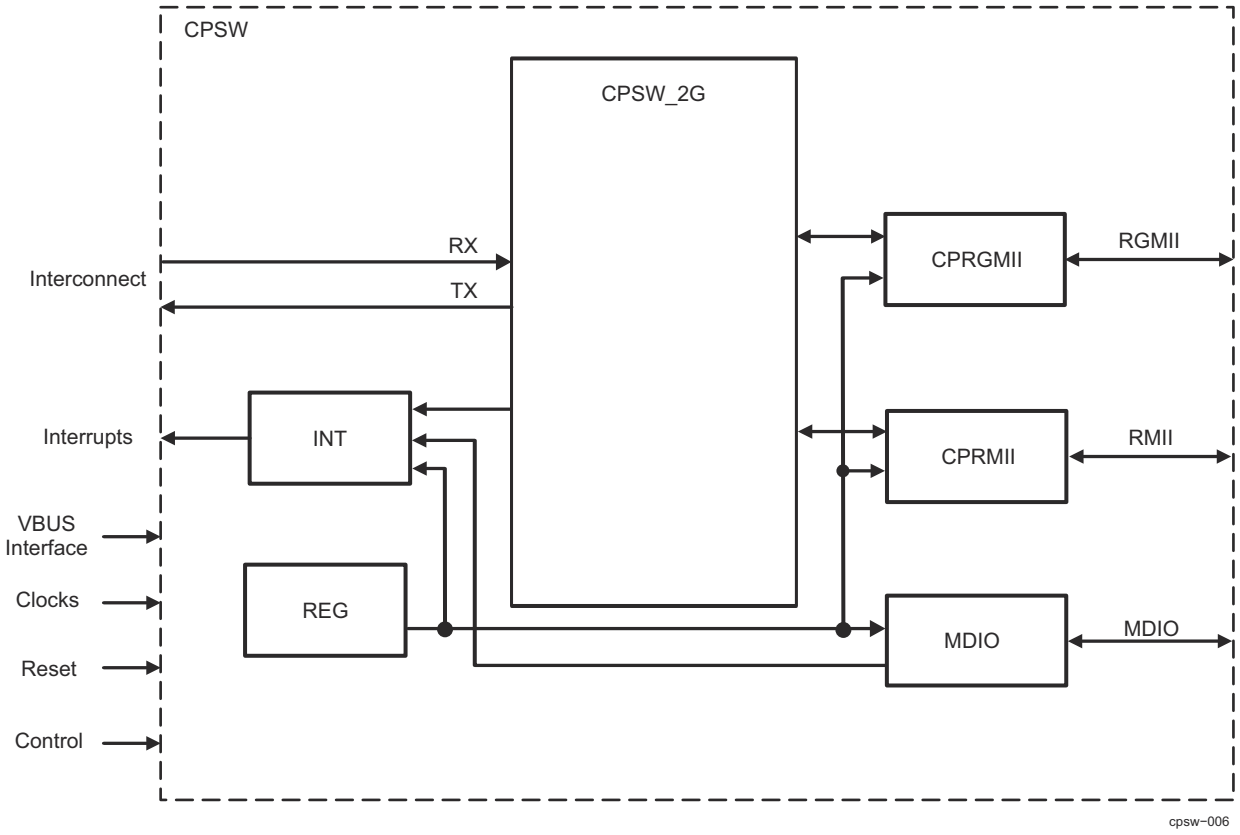

Figure 11-145. CPSW Top Level Block Diagram

11.2.1.4.2 CPSW Ports

The Ethernet Subsystem has two ports. Port 0 is the Host port (internal to the Subsystem). Port 1 is the external port connected to RGMII, or RMII interfaces as per the interface selected.

Naming conventions followed in this chapter:

- Port0 is referred to the CPPI CPDMA Host Port
- Port1 is referred to the interfaces RGMII/RMII

11.2.1.4.2.1 Ethernet Port Operation

11.2.1.4.2.1.1 Interface Mode Selection

The two-port switch (CPSW) Ethernet Subsystem has one 10/100/1000 Ethernet port with selectable MII, RMII, and RGMII interfaces. These interfaces can be enabled by **MSS_CTRL:CPSW_CONTROL:CPSW_CONTROL_PORT1_MODE_SEL**

For specific interface mode further features is selected by configuring the Ethernet bits (EXT_EN, GIG, FULLDUPLEX, IFCTL_A) in the **PN_MAC_CONTROL** register.

See the device-specific Datasheet for configuring the pin mux mode as per the interface selected.

CPSW_CONTROL_PORT1_MODE_SEL	Link Type
00	GMII/MII
01	RMII
10	RGMII

11.2.1.4.2.1.2 RMII Operation

The **IFCTL_A** bit determines the RMII link speed (0=10mbps, 1=100mbps). The **FULLDUPLEX** bit controls RMII duplexity. The **IFCTL_B** is not used.

11.2.1.4.2.1.3 RGMII Operation

Each port RGMII interface can operate in a forced mode or an in-band mode as determined by the **EXT_EN** bit. Forced mode is with **EXT_EN** cleared. In-band mode is with **EXT_EN** set.

11.2.1.4.2.1.3.1 RGMII In-Band Operation

A port CPRGMII is operating in the in-band mode of operation when the **EXT_EN** is set. The link status, duplexity, and speed are determined from the RGMII input data stream as defined in the RGMII specification and can be read in the **SS_RGMII1_STATUS** register. The link speed is indicated as shown in Table 11-272.

Table 11-272. RGMII Link Speed

SPEED(1:0)	Link Speed
00	10 Mbs mode
01	100 Mbs mode
10	1000 Mbs mode
11	reserved

11.2.1.4.2.1.3.2 RGMII Forced Mode Operation

A RGMII is operating in the forced mode of operation when **EXT_EN** is cleared. In the forced mode of operation, the in-band data is ignored if present. The link status is forced set, the duplexity is set by the **FULLDUPLEX** bit, and the speed is set by the **GIG** bit. If the **GIG** bit is set, then operation is gigabit mode (**SS_RGMII1_STATUS: SPEED(1:0)** = 10). If the **GIG** bit is cleared, then operation is 100mbps mode (**SPEED(1:0)** = 01). 10mbps is not supported when operating in the forced mode.

11.2.1.4.3 Clocking

11.2.1.4.3.1 Subsystem Clocking

CPSW clocking summary is shown in Section 11.2.1.3, *CPSW Integration*.

11.2.1.4.3.2 Interface Clocking

Data is transmitted and received with respect to the reference clocks of the interface pins.

11.2.1.4.3.2.1 RGMII Interface Clocking

RGMII_RXC, RGMII_TXC frequencies are:

- 2.5 MHz at 10 Mbps

- 25 MHz at 100 Mbps
- 125 MHz at 1000 Mbps

11.2.1.4.3.2.2 RMII Interface Clocking

RMII interface clock RMII_50MHZ_CLK frequency is:

- 50 MHz at 10 Mbps
- 50 MHz at 100 Mbps

MCU_RMII1_REFCLK pin or internal RGMII_MHZ_50_CLK clock (default clock) can be selected through rmii_ref_clk_oe_n in CSPW_CONTROL, and one of these clocks can be used as the clock source for RMII interface. For more details on RMII clocking, please see Section 11.2.1.3, *CPSW Integration*.

CTRLMMR_MCU_CLKOUT0_CTRL[4]CLK_EN and CTRLMMR_MCU_CLKOUT0_CTRL[0]CLK_SEL bits are used to enable and select the clock source for MCU_CLKOUT pin.

11.2.1.4.3.2.3 MDIO Clocking

The MDIO clock is based on a divide-down of the interface (CPPI_ICLK) clock. The application software or driver must control the divide-down value.

See the CPSW_MDIO_CONTROL_REG register for configuring the Clock Divider ([15-0]CLKDIV) value.

11.2.1.4.4 Interrupt Functionality

Table 11-273. Interrupt Functionality

Interrupt	Description
MSS_CPSW_FH_INT	FHost (from host to Ethernet) interrupt
MSS_CPSW_TH_INT	THost (from Ethernet to host) interrupt
MSS_CPSW_TH_TRSH_INT	THost (from Ethernet to host) Threshold interrupt
MSS_CPSW_MISC_INT	Miscellaneous interrupt
MSS_CPSW_SERR	ECC SEC interrupt – output from CPSW ECC module. This interrupt is also included in the **MSS_CPSW_MISC_INT** if enabled or this interrupt can be used separately.
MSS_CPSW_UERR	ECC DED interrupt – output from CPSW ECC module. This interrupt is also included in the **MSS_CPSW_MISC_INT** if enabled or this interrupt can be used separately.

11.2.1.4.4.1 MSS_CPSW_TH_TRSH_INT Interrupt Description

The **MSS_CPSW_TH_TRSH_INT** interrupts are each an immediate (non-paced) pulse interrupt selected from the CPSW_2G **TH_THRESH_PEND[7:0]** interrupts. The THost threshold pending interrupt(s) is selected by setting one or more bits in the **SS_TH_THRESH_PULSE_EN_REG[7:0]** register. The masked interrupt status can be read in the **SS_TH_THRESH_PULSE_STATUS_REG[7:0]** register. Upon reception of an interrupt, software should perform the following:

- Read the SS_TH_THRESH_PULSE_STATUS_REG[7:0] register to determine which channel(s) caused the interrupt.
- Process THost packets in order to add more buffers to any channel that is below the threshold value.
- Write the CPSW_2G completion pointer(s) to acknowledge the CPDMA interrupt.
- Write 0x0 to the CPDMA_EOI_VECTOR register in the CPSW_2G slave address space to acknowledge the subsystem interrupt.

11.2.1.4.4.2 MSS_CPSW_TH_INT Interrupt Description

The **MSS_CPSW_TH_INT**interrupts are each a paced pulse interrupt selected from the CPSW_2G **TH_PEND[7:0]** interrupts. The THost pending interrupt(s) is selected by setting one or more bits in the **SS_TH_PULSE_EN_REG[7:0]** register. The masked interrupt status can be read in the **SS_TH_PULSE_STATUS_REG[7:0]** register. Upon reception of an interrupt, software should perform the following:

- Read the SS_TH_PULSE_STATUS_REG[7:0] register to determine which channel(s) caused the interrupt.
- Process THost packets for the interrupting channel(s) to acknowledge the CPDMA interrupt.
- Write the CPSW_2G completion pointer(s).
- Write 0x1 to the CPDMA_EOI_VECTOR_REG register in the CPSW_2G slave address space to acknowledge the subsystem interrupt.

11.2.1.4.4.3 MSS_CPSW_FH_INT Interrupt Description

The **MSS_CPSW_FH_INT** interrupts are each a pulse interrupt selected from the CPSW_2G **FH_PEND[7:0]** interrupts. The transmit pending interrupt(s) is selected by setting one or more bits in the **SS_FH_PULSE_EN_REG[7:0]** register. The masked interrupt status can be read in the **SS_FH_PULSE_STATUS_REG[7:0]** register. Upon reception of an interrupt, software should perform the following:

- Read the SS_FH_PULSE_STATUS_REG[7:0] register to determine which channel(s) caused the interrupt.
- Process THost packets for the interrupting channel(s).
- Write the CPSW_2G completion pointer(s) to acknowledge the CPDMA interrupt.
- Write 0x2 to the CPDMA_EOI_VECTOR_REG register in the CPSW_2G slave address space to acknowledge the subsystem interrupt.

11.2.1.4.4.4 MSS_CPSW_MISC_INT Interrupt Description

The **MSS_CPSW_MISC_INT** interrupts are each an immediate (non-paced) pulse interrupt selected from the miscellaneous interrupts (**DED_PEND, SEC_PEND, EVNT_PEND, STAT_PEND,HOST_PEND, MDIO_LINKINT,MDIO_USERINT**). The miscellaneous interrupt bits are enabled by setting one or more bits in the **SS_MISC_EN_REG** register. The masked interrupt status can be read in the **SS_MISC_STATUS_REG** register. Upon reception of an interrupt, software should perform the following:

- Read the **SS_MISC_STATUS_REG** register to determine the cause of the interrupt.
  - MDIO_USERINT is the logical “OR” of the CPSW_2G MDIO MDIO_USERINT[1:0].
  - MDIO_LINKINT is the logical “OR” of the CPSW_2G MDIO MDIO_LINKINT[1:0]
  - HOST_PEND is the CPSW_2G CPDMA host error interrupt.
  - STAT_PEND is the logical “OR” of the CPSW_2G statistics interrupt STAT_PEND[2:0].
  - EVNT_PEND is the CPSW_2G CPTS event interrupt.
  - SEC_PEND is the ECC Single bit error interrupt.
  - DED_PEND is the ECC double bit error interrupt.
- Process the interrupt.
- Write 0x3 to the CPDMA_EOI_VECTOR register in the CPSW_2G slave address space to acknowledge the subsystem interrupt.

11.2.1.4.4.5 ECC SEC ESM Interrupt (MSS_CPSW_SERR)

ESM interrupt indicating a CPSW_2G ECC single error has been detected and corrected. Although the **MSS_CPSW_SERR** value can be read in the **CPDMA_IN_VECTOR** register, there is no EOI associated with this interrupt. It is a direct output of the CPSW_2G ECC aggregator module. MSS can enable this interrupt from **SS_MISC_EN_REG[5]** and read status from **SS_TH_PULSE_STATUS_REG[5]**

11.2.1.4.4.6 ECC DED ESM Interrupt (MSS_CPSW_UERR)

ESM interrupt indicating a CPSW_2G ECC double error has been detected. Although the **MSS_CPSW_UERR** value can be read in the **CPDMA_IN_VECTOR** register, there is no EOI associated with this interrupt. It is a direct output of the CPSW_2G ECC aggregator module. MSS can enable this interrupt from **SS_MISC_EN_REG[6]** and read status from **SS_MISC_STATUS_REG[6]**.

11.2.1.4.4.7 THost Threshold Interrupts for CPDMA

Each of the eight THost channels has a corresponding THost threshold interrupt (**TH_THRESH_PEND[7:0]**). The THost threshold interrupts are level interrupts that remain asserted until the triggering condition is cleared by the host. Each of the eight threshold interrupts may be individually enabled by setting to one the appropriate bit in the **CPDMA_TH_INTSTAT_SET** register. Each of the eight channel interrupts may be individually disabled by clearing to zero the appropriate bit in the **CPDMA_TH_INTSTAT_CLR** register. The raw

and masked interrupt receive interrupt status may be read by reading the **CPDMA_TH_INTSTAT_RAW** and **CPDMA_TH_INTSTAT_MASKED** registers respectively. A **TH_THRESH_PEND[7:0]** interrupt bit is asserted when enabled and when the channel's associated freebuffer count (**CPDMA_TH(0/7)_FREEBUFFER**) is less than or equal to the channel's associated flow control threshold register (**CPDMA_TH(0/7)_PENDTHRESH**. The threshold interrupts are intended to give the host an indication that resources are running low for a particular channel(s).

11.2.1.4.4.8 Thost Packet Completion Interrupts for CPDMA

The THost DMA controller has eight channels with each channel having a corresponding interrupt (**TH_PEND[7:0]**). The THost interrupts are level interrupts that remain asserted until cleared by the host. Each of the eight channel interrupts may be individually enabled by setting to one the appropriate bit in the **CPDMA_TH_INTSTAT_SET** register. Each of the eight channel interrupts may be individually disabled by clearing to zero the appropriate bit in the **CPDMA_TH_INTSTAT_CLR** register. The raw and masked interrupt interrupt status may be read by reading the **CPDMA_TH_INTSTAT_RAW** and **CPDMA_TH_INTSTAT_MASKED** registers respectively. When a packet transfer is complete, the CPDMA issues an interrupt to the host by writing the packet's last buffer descriptor address to the appropriate channel queue's **CPDMA_TH(0..7)_CP** completion pointer. The interrupt is generated by the write, regardless of the value written. Upon interrupt reception, the host processes one or more packets from the queue and then acknowledges one or more interrupt(s) by writing the address of the last buffer descriptor processed to the queue's associated **CPDMA_TH(0..7)_CP** Completion Pointer. If the host written buffer address value is different from the buffer address written by the port, then the level interrupt remains asserted which means that the CPDMA has transferred more packets than the host has processed interrupts for. If the host written buffer address value is equal to the port written value then the host has processed all packets that the CPDMA has transferred and the level interrupt is deasserted. The CPDMA write to the completion pointer actually stores the value. The host written value is actually not written to the register location. The host written value is compared to the register contents which was written by the CPDMA. If the two values are equal then the interrupt is removed, otherwise the interrupt remains asserted. The host may process multiple packets previous to acknowledging an interrupt, or the host may acknowledge interrupts for every packet.

11.2.1.4.4.9 Fhost Packet Completion Interrupts for CPDMA

The FHost DMA controller has eight channels with each channel having a corresponding interrupt (**FH_PEND[7:0]**). The FHost interrupts are level interrupts that remain asserted until cleared by the host. Each of the eight channel interrupts may be individually enabled by setting to one the appropriate bit in the **CPDMA_FH_INTSTAT_MASKED_SET** register. Each of the eight channel interrupts may be individually disabled by clearing to zero the appropriate bit in the **CPDMA_FH_INTSTAT_MASKED_CLR** register. The raw and masked interrupt status may be read by reading the **CPDMA_FH_INTSTAT_RAW** and **CPDMA_FH_INTSTAT_MASKED** registers respectively. When each packet transfer is complete, the CPDMA issues an interrupt to the host by writing the packet's last buffer descriptor address to the appropriate channel **CPDMA_FH(0..7)_CP** completion pointer register. The interrupt is generated by the write, regardless of the value written. Upon interrupt reception, the host processes one or more packets from the queue and then acknowledges an interrupt by writing the address of the last buffer descriptor processed to the queue's associated Fhost Completion Pointer. If the host written buffer address value is different from the buffer address written by the port, then the level interrupt remains asserted which means that the CPDMA has transferred more packets than the host has processed interrupts for. If the host written buffer address value is equal to the port written value then the host has processed all packets that the CPDMA has transferred and the level interrupt is deasserted. The CPDMA write to the completion pointer actually stores the value. The host written value is actually not written to the register location. The host written value is compared to the register contents which was written by the CPDMA and if the two values are equal then the interrupt is removed, otherwise the interrupt remains asserted. The host may process multiple packets previous to acknowledging an interrupt, or the host may acknowledge interrupts for every packet.

11.2.1.4.5 Media Independent Interfaces (XGMII/GMII)

For the purposes of this document, Ethernet transmit is egress and Ethernet receive is ingress.

11.2.1.4.5.1 Receive Control

Data received from the PHY is interpreted and forwarded by the MAC into the switch. Interpretation involves detection and removal of the preamble and start of frame delimiter, extraction of the address and frame length, data handling, error checking and reporting, cyclic redundancy checking (CRC), and statistics control signal generation.

11.2.1.4.5.1.1 Receive Inter-Frame Interval

The 802.3 required inter-packet gap (IPG) is 24 GMII clocks (96 bit times) for 10/100 Mbit modes, and 12 GMII clocks (96 bit times) for 1000 Mbit mode. However, the MAC can tolerate a reduced IPG (2 GMII clocks in 10/100 mode and 5 GMII clocks in 1000 mode) with a correct preamble and start frame delimiter.

This interval between frames must comprise (in the following order):

1. An Inter-Packet Gap (IPG).
2. A seven octet preamble (all octets 0x55).
3. A one octet start frame delimiter (0x5d).

11.2.1.4.5.1.2 Received Frame Classification

Received frames are proper (good) frames if they are between 64 and **PN_RX_MAXLEN** in length (inclusive) and contain no errors (code/align/CRC).

Received frames are long frames if their frame count exceeds the value in the **PN_RX_MAXLEN** register. The **PN_RX_MAXLEN** register reset (default) value is 1518 (dec). Long received frames are either oversized or jabber frames. Long frames with no errors are oversized frames. Long frames with CRC, code, or alignment errors are jabber frames.

Received frames are short frames if their frame count is less than 64 bytes. Short frames that contain no errors are runt frames. Short frames with CRC, code, or alignment errors are fragment frames. If **RX_CSF_EN** in **PN_MAC_CONTROL** is set, undersized frames from 33 to 63 bytes will be forwarded only to the host on a best effort basis (meaning that the ALE may or may not be able to keep up with the packet rate and the short packet may be dropped due to bandwidth limitations). If **RX_CSF_EN** and **RX_CEF_EN** in **PN_MAC_CONTROL** are set, fragment frames from 33 to 63 bytes will also be forwarded only to the host on a best effort basis. Ethernet port received frames shorter than 33 bytes are dropped in all cases.

A received long packet will always contain **PN_RX_MAXLEN** number of bytes transferred to memory (if **RX_CEF_EN** = 1). Examples with **PN_RX_MAXLEN** = 1518 is below:

- If the frame length is 1518, then the packet is not a long packet and there will be 1518 bytes transferred to memory.
- If the frame length is 1519, there will be 1518 bytes transferred to memory. The last three bytes will be the first three CRC bytes.
- If the frame length is 1520, there will be 1518 bytes transferred to memory. The last two bytes will be the first two CRC bytes.
- If the frame length is 1521, there will be 1518 bytes transferred to memory. The last byte will be the first CRC byte.
- If the frame length is 1522, there will be 1518 bytes transferred to memory. The last byte will be the last data byte.

11.2.1.4.5.2 Transmit Control

A jam sequence is output if a collision is detected on a transmit packet in half-duplex mode. If the collision was late (after the first 64 bytes have been transmitted) then the collision is ignored. If the collision is not late, then the controller will back off before retrying the frame transmission. When operating in full duplex mode the carrier sense (CRS) and collision sensing modes are disabled.

11.2.1.4.5.2.1 Adaptive Performance Optimization (APO)

The Ethernet MAC port incorporates Adaptive Performance Optimization (APO) logic that may be enabled by setting the **TX_PACE** bit in the **PN_MAC_CONTROL** register. Transmission pacing to enhance performance

is enabled when set. Adaptive performance pacing introduces delays into the normal transmission of frames, delaying transmission attempts between stations, reducing the probability of collisions occurring during heavy traffic (as indicated by frame deferrals and collisions) thereby increasing the chance of successful transmission.

When a frame is deferred, suffers a single collision, multiple collisions or excessive collisions, the pacing counter is loaded with an initial value of 31. When a frame is transmitted successfully (without experiencing a deferral, single collision, multiple collision or excessive collision) the pacing counter is decremented by one, down to zero.

With pacing enabled, a new frame is permitted to immediately (after one IPG) attempt transmission only if the pacing counter is zero. If the pacing counter is non-zero, the frame is delayed by the pacing delay, a delay of approximately four inter-packet gap delays. APO only affects the IPG preceding the first attempt at transmitting a frame. It does not affect the back-off algorithm for retransmitted frames.

11.2.1.4.5.2.2 Inter-Packet-Gap Enforcement

The measurement reference for the IPG of 96 bit times is changed depending on frame traffic conditions. If a frame is successfully transmitted without collision, and **MCRS** is de-asserted within approximately 48 bit times of **MTXEN** being de-asserted, then 96 bit times is measured from **MTXEN**. If the frame suffered a collision, or if **MCRS** is not de-asserted until more than approximately 48 bit times after **MTXEN** is de-asserted, then 96 bit times (approximately, but not less) is measured from **MCRS**.

The Ethernet port transmit inter-packet gap (IPG) may be shortened by eight bit times when short gap is enabled and triggered. Setting the **TX_SHORT_GAP_ENABLE** bit each **PN_MAC_CONTROL** register enables the gap to be shortened when triggered. The condition is triggered when the ports associated transmit packet FIFO has a user defined number of FIFO blocks used. The associated transmit FIFO blocks used value determines if the gap is shortened, and so on. The **GAP_THRESH** register value determines the short gap threshold. If the FIFO blocks used is greater than or equal to the **GAP_THRESH** value then short gap is triggered.

11.2.1.4.5.2.3 Programmable Transmit Inter-Packet Gap

The transmit inter-packet gap (IPG) is programmable through the **PN_MAC_TX_GAP** register. The default value is decimal 12. The transmit IPG may be increased to the maximum value of 0x1ff. Increasing the IPG is not compatible with transmit pacing. The short gap feature will override the increased gap value, so the short gap feature may not be compatible with an increased IPG.

11.2.1.4.5.2.4 Back Off

The Ethernet Mac implements the 802.3 binary exponential back-off algorithm for half-duplex based collisions.

11.2.1.4.5.3 Emulation Control

The emulation control input (**TBEMUSUP**) and register bits (**SOFT** and **FREE** in the **PN_MAC_EMCONTROL** register)allow Mac operation to be suspended. When the emulation suspend state is entered, the MAC will stop processing receive and transmit frames at the next frame boundary. Any frame currently in reception or transmission will be completed normally without suspension. For receive, frames that are detected by the MAC after the suspend state is entered are ignored. Emulation control is implemented for compatibility with other peripherals. Table 11-274 shows the operations of emulation control input and register bits.

Table 11-274. Emulation Control Input and Register Bits

TBEMUSUSP	SOFT	FREE	Description
0	X	X	Normal Operation
1	0	0	Normal Operation
1	1	0	Emulation Suspend
1	X	1	Normal Operation

11.2.1.4.5.4 Command IDLE

The **CMD_IDLE** bit in the **PN_MAC_CONTROL** register allows MAC operation to be suspended by software. When the idle state is commanded, the MAC will stop processing receive and transmit frames at the next frame boundary. Any frame currently in reception or transmission will be completed normally without suspension.

Received frames that are detected after the suspend state is entered are ignored (dropped without any processing or statistics). Commanded idle is similar in operation to emulation control and hardware clock stop.

11.2.1.4.6 Software IDLE

The submodule software idle register bits enable CPSW operation to be completely or partially suspended by software control. There are two CPSW submodules that contain software idle register bits. Each of the two submodules may be individually commanded to enter the idle state. The idle state is entered at packet boundaries, and no further packet operations will occur on an idled submodule until the idle command is removed. The CPSW module enters the idle state when all two submodules are commanded to enter and have entered the idle state. Idle status is determined by reading or polling the two submodule idle bits. The CPSW_2G is in the idle state when all two submodules are in the idle state. The CPSW_SOFT_IDLE_REG[0] SOFT_IDLE bit may be set if desired after the submodules are in the idle state. The SOFT_IDLE bit causes packets to not be transferred from one FIFO to another FIFO internal to the switch.

11.2.1.4.7 CPSW_2G

The CPSW_2G RMII/ RGMII interface is compliant to the IEEE Std 802.3 Specification.

The CPSW_2G contains one Ethernet port interface (Ethernet port 1), one CPPI packet streaming interface host port (port 0), Common Platform Time Sync (CPTS), ALE Engine and Statistics (STATS). A top-level block diagram of the CPSW_2G is shown in Figure 11-146.

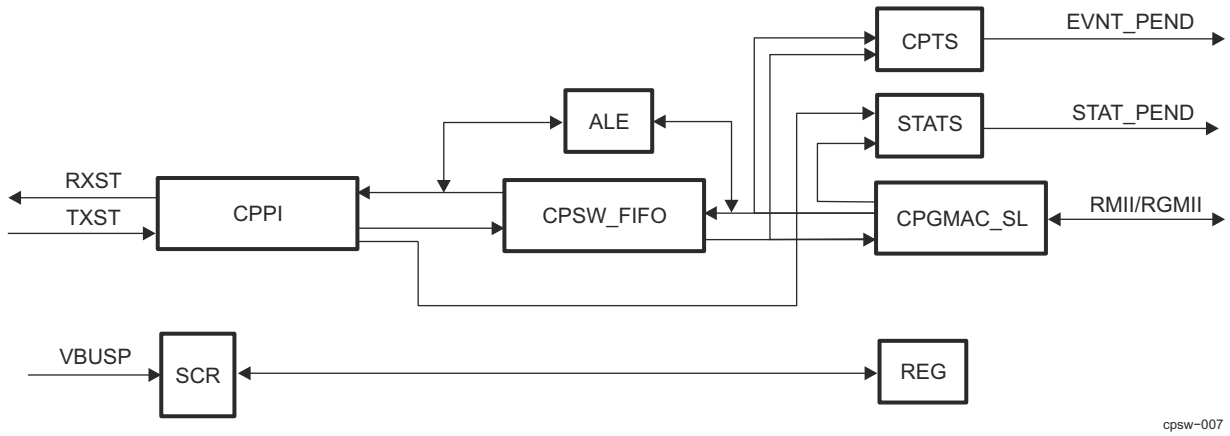

Figure 11-146. CPSW_2G Block Diagram

11.2.1.4.7.1 Address Lookup Engine (ALE)

The Address Lookup Engine (ALE) is a sub-block of the CPSW Switch and it processes all received packets and determines to which port(s) the packet should be forwarded. The ALE uses the incoming packet received port number, destination address, source address, length/type, and VLAN information to determine how the packet should be forwarded. The ALE outputs the port mask to the switch fabric that indicates the port(s) the packet should be forwarded to. The ALE is enabled when the ENABLE bit in the ALE_CONTROL_REG register is set. All packets are dropped when the ENABLE bit is cleared to 0.

11.2.1.4.7.1.1 Error Handling

In normal operation, the Ethernet port is configured to issue an abort, instead of an end of packet, at the end of a packet that contains an error (runt, frag, oversize, jabber, crc, alignment, code etc.) or at the end of a MAC control packet. However, when the PN_MAC_CONTROL_REG configuration bit(s) RX_CEF_EN, RX_CSF_EN, or RX_CMF_EN are set, error frames, short frames or MAC control frames have a normal end of packet instead of an abort at the end of the packet. When the ALE receives a packet that contains errors (due to a set header error bit), or a MAC control frame and does not receive an abort, the packet will be forwarded only to the host port (port 0). Packets with errors that are forwarded to the host have no VLAN untagging or drop due to rate limiting. No ALE learning occurs on packets with errors or mac control frames. Learning is based on source

address and lookup is based on destination address. Directed packets from the host are not learned, updated, or touched.

11.2.1.4.7.1.2 Bypass Operations

The ALE may be configured to operate in bypass mode by setting the BYPASS bit in the ALE_CONTROL_REG register. When in bypass mode, all Ethernet port received packets are forwarded only to the host port (port 0). In bypass mode, the ALE processes host port transmit packets the same as in normal mode. In general, packets would be directed by the host in bypass mode.

11.2.1.4.7.1.3 OUI Deny or Accept

The ALE may be configured to operate in OUI deny mode by setting the enable_oui_deny bit in the ALE_CONTROL register. When in OUI deny mode, any packet with a non-matching OUI source address will be dropped to the host unless the packet destination address matches with a supervisory table entry. (Non-matching OUI source address broadcast/multicast packets will be dropped to the host unless the packet destination address is entered into the table with the super bit set. Non-matching OUI source address unicast packets will be dropped to the host unless the unicast destination address is in the table with block and Secure both set). When enable_oui_deny is cleared, any packet source address matching an OUI address table entry will be dropped to the host unless the destination address matches with a supervisory address table entry. (Broadcast packets matching the OUI source address will be dropped to the host unless the broadcast destination address is entered into the table with the super bit set. Unicast packets matching the OUI source address will be dropped to the host unless the unicast destination address is in the table with block and Secure both set)

11.2.1.4.7.1.4 Statistics Counting

ALE sends many statistics along with the frame routing so the CPSW can count them on a per port basis. The events specified through the CPSW_ALE_STAT_DIAG[3-0] STAT_DIAG field are individually counted in CPSW per port statistics counters.

11.2.1.4.7.1.5 Supervisory packets

Multicast supervisory packets are designated by the SUPER bit in the table entry. Unicast supervisory packets are indicated when BLOCK and SECURE are both set. Supervisory packets are not dropped due to rate limiting, OUI, or VLAN processing. The purpose of supervisory packets is to allow packets that would be otherwise blocked to be forwaded for special purposes.

11.2.1.4.7.1.6 ALE Lookup Table Entry Definitions

The ALE table contains multiple table entry types. Each table entry represents a free entry, an address, a VLAN, an address/VLAN pair, or an OUI address. Software should ensure that there are not double address entries in the table. The double entry used would be indeterminate. Reserved table bits must be written with zeroes.

Source Address learning occurs for packets with a unicast, multicast or broadcast destination address and a unicast or multicast (including broadcast) source address. Multicast source addresses have the group bit (bit 40) cleared before ALE processing begins, changing the multicast source address to a unicast source address. A multicast address of all ones is the broadcast address which may be added to the table. A learned unicast source address is added to the table with the following control bits:

Table 11-275. Learned Address Control Bits

Bit(s)	Value
Ageable	1
Touch	1
BLOCK	0
SECURE	0

If a received packet has a source address that is equal to the destination address then the following occurs:

- The address is learned if the address is not found in the table.

- The address is updated if the address is found.
- The packet is dropped.

Table Entry Type

00 - Free Entry

01 - Address Entry : unicast or multicast determined by destination **address bit 40.** (1:Multicast, 0:Unicast)

10 - VLAN entry

11 - VLAN Address Entry : unicast or multicast determined by **address bit 40.**(1:Multicast, 0:Unicast)

11.2.1.4.7.1.6.1 Free Table Entry

Table 11-276. Free (Unused) Address Table Entry Bit Values

70:62	61:60	59:0
Reserved	ENTRY_TYPE (00)	Reserved

11.2.1.4.7.1.6.2 Multicast Address Table Entry (Bit 40==1)

Table 11-277. Multicast Address Table Entry Bit Values

70:68	67:66	65	64	63:62	61:60	59:48	47:0
Reserved	PORT_MASK	SUPER	IgnoreMbits	MCAST_FWD_STATE	ENTRY_TYPE (01)	Reserved	MULTICAST_ADDRESS

IgnoreMbits

Ignore Multicast Bits - Indication that the Multicast Address has ignored bits.

Supervisory Packet (SUPER)

When set, this field indicates that the packet with a matching multicast destination address is a supervisory packet.

0: Non-supervisory packet

1: Supervisory packet

Port Mask(1:0) (PORT_MASK)

This 2-bit field is the port bit mask that is returned with a found multicast destination address. There may be multiple bits set indicating that the multicast packet may be forwarded to multiple ports (but not the receiving port).

Multicast Forward State (MCAST_FWD_STATE)

Indicates the port state(s) required for the received port on a destination address lookup in order for the multicast packet to be forwarded to the transmit port(s). A transmit port must be in the Forwarding state in order to forward the packet. If the transmit PORT_MASK has multiple set bits then each forward decision is independent of the other transmit port(s) forward decision.

00 - Forwarding

01 - Blocking/Forwarding/Learning

10 - Forwarding/Learning

11 - Forwarding

The forward state test returns a true value if both the RX and TX ports are in the required state.

Table Entry Type (ENTRY_TYPE)

Address entry type. Unicast or multicast determined by address bit 40.

01: Address entry. Unicast or multicast determined by address bit 40.

Packet Address (MULTICAST_ADDRESS)

This is the 48-bit packet MAC address. For an OUI address, only the upper 24-bits of the address are used in the source or destination address lookup. Otherwise, all 48-bits are used in the lookup.

11.2.1.4.7.1.6.3 VLAN/Multicast Address Table Entry (Bit 40==1)

Table 11-278. VLAN/Multicast Address Table Entry Bit Values

70:68	67:66	65	64	63:62	61:60	59:48	47:0
Reseved	PORT_MASK	SUPER	Reserved	MCAST_FWD_STATE	ENTRY_TYPE (11)	VLAN_ID	MULTICAST_ADDRESS

Supervisory Packet (SUPER)

When set, this field indicates that the packet with a matching multicast destination address is a supervisory packet.

0: Non-supervisory packet

1: Supervisory packet

Port Mask(1:0) (PORT_MASK)

This 2-bit field is the port bit mask that is returned with a found multicast destination address. There may be multiple bits set indicating that the multicast packet may be forwarded to multiple ports (but not the receiving port).

Multicast Forward State (MCAST_FWD_STATE)

Indicates the port state(s) required for the received port on a destination address lookup in order for the multicast packet to be forwarded to the transmit port(s). A transmit port must be in the Forwarding state in order to forward the packet. If the transmit PORT_MASK has multiple set bits then each forward decision is independent of the other transmit port(s) forward decision.

00 - Forwarding

01 - Blocking/Forwarding/Learning

10 - Forwarding/Learning

11 - Forwarding

The forward state test returns a true value if both the RX and TX ports are in the required state.

Table Entry Type (ENTRY_TYPE)

Address entry type. Unicast or multicast determined by address bit 40.

11: VLAN address entry. Unicast or multicast determined by address bit 40.

VLAN ID (VLAN_ID)

The unique identifier for VLAN identification. This is the 12-bit VLAN ID.

Packet Address (MULTICAST_ADDRESS)

This is the 48-bit packet MAC address. For an OUI address, only the upper 24-bits of the address are used in the source or destination address lookup. Otherwise, all 48-bits are used in the lookup.

11.2.1.4.7.1.6.4 Unicast Address Table Entry (Bit 40==0)

Table 11-279. Unicast Address Table Entry Bit Values

70:68	67	66	65	64	63:62	61:60	59:48	47:0

Table 11-279. Unicast Address Table Entry Bit Values (continued)

Reseved	TRUNK	PORT_NUMBER	BLOCK	SECURE	UNICAST_TYPE (00) or (X1)	ENTRY_TYPE (01)	Reserved	UNICAST_ADDRESS

Trunk

Trunk Indicator -

0 - the port bits in the entry are the port number

1 - the port bits in the entry are the trunk number

Port Number (PORT_NUMBER)

This field indicates the port number (not port mask) that the packet with a unicast destination address may be forwarded to. Packets with unicast destination addresses are forwarded only to a single port (but not the receiving port).

Block (BLOCK)

The block bit indicates that a packet with a matching source or destination address should be dropped (block the address).

0 - Address is not blocked.

1 - Drop a packet with a matching source or destination address (secure must be zero)

If block and secure are both set, then they no longer mean block and secure. When both are set, the block and secure bits indicate that the packet is a unicast supervisory (super) packet and they determine the unicast forward state test criteria. If both bits are set then the packet is forwarded if the receive port is in the Forwarding/Blocking/Learning state. If both bits are not set then the packet is forwarded if the receive port is in the Forwarding state.

Secure (SECURE)

This bit indicates that a packet with a matching source address should be dropped if the received port number is not equal to the table entry port_number.

0 - Received port number is a don't care.

1 - Drop the packet if the received port is not the secure port for the source

address and do not update the address (block must be zero)

Unicast Type (UNICAST_TYPE)

This field indicates the type of unicast address the table entry contains.

00 - Unicast address that is not ageable.

01 - Ageable unicast address that has not been touched.

10 - OUI address - lower 24-bits are don't cares (not ageable).

11 - Ageable unicast address that has been touched.

Table Entry Type (ENTRY_TYPE)

Address entry. Unicast or multicast determined by address bit 40.

01: Address entry. Unicast or multicast determined by address bit 40.

Packet Address (UNICAST_ADDRESS)

This is the 48-bit packet MAC address. All 48-bits are used in the lookup.

11.2.1.4.7.1.6.5 OUI Unicast Address Table Entry

Table 11-280. OUI Unicast Address Table Entry Bit Values

70:64	63:62	61:60	59:48	47:24	23:0
Reserved	UNICAST_TYPE (10)	ENTRY_TYPE (01)	Reserved	UNICAST_OUI	Reserved

Unicast Type (UNICAST_TYPE)

This field indicates the type of unicast address the table entry contains.

00 - Unicast address that is not ageable.

01 - Ageable unicast address that has not been touched.

10 - OUI address - lower 24-bits are don't cares (not ageable).

11 - Ageable unicast address that has been touched.

Table Entry Type (ENTRY_TYPE)

Address entry. Unicast or multicast determined by address bit 40.

01: Address entry. Unicast or multicast determined by address bit 40.

Packet Address (UNICAST_OUI)

For an OUI address, only the upper 24-bits of the address are used in the source or destination address lookup.

11.2.1.4.7.1.6.6 VLAN/Unicast Address Table Entry (Bit 40==0)

Table 11-281. Unicast Address Table Entry Bit Values

70:68	67	66	65	64	63:62	61:60	59:48	47:0
Reseved	TRUNK	PORT_NUMBER	BLOCK	SECURE	UNICAST_TYPE (00) or (X1)	ENTRY_TYPE (11)	VLAN_ID	UNICAST_ADDRESS

Trunk

Trunk Indicator -

0 - the port bits in the entry are the port number

1 - the port bits in the entry are the trunk number

Port Number (PORT_NUMBER)

This field indicates the port number (not port mask) that the packet with a unicast destination address may be forwarded to. Packets with unicast destination addresses are forwarded only to a single port (but not the receiving port).]

Block (BLOCK)

The block bit indicates that a packet with a matching source or destination address should be dropped (block the address).

0 - Address is not blocked.

1 - Drop a packet with a matching source or destination address (secure must be zero)

If block and secure are both set, then they no longer mean block and secure. When both are set, the block and secure bits indicate that the packet is a unicast supervisory (super) packet and they determine the unicast forward state test criteria. If both bits are set then the packet is forwarded if the receive port is in the Forwarding/ Blocking/Learning state. If both bits are not set then the packet is forwarded if the receive port is in the Forwarding state.

Secure (SECURE)

This bit indicates that a packet with a matching source address should be dropped if the received port number is not equal to the table entry PORT_NUMBER.

0 - Received port number is a don't care.

1 - Drop the packet if the received port is not the secure port for the source address and do not update the address (block must be zero)

Unicast Type (UNICAST_TYPE)

This field indicates the type of unicast address the table entry contains.

00 - Unicast address that is not ageable.

01 - Ageable unicast address that has not been touched.

10 - OUI address - lower 24-bits are don't cares (not ageable).

11 - Ageable unicast address that has been touched.

Table Entry Type (ENTRY_TYPE)

Address entry. Unicast or multicast determined by address bit 40.

11: VLAN address entry. Unicast or multicast determined by address bit 40.

VLAN ID (VLAN_ID)

The unique identifier for VLAN identification. This is the 12-bit VLAN ID.

Packet Address (UNICAST_ADDRESS)

This is the 48-bit packet MAC address. All 48-bits are used in the lookup.

11.2.1.4.7.1.6.7 VLAN Table Entry

Table 11-282. Inner VLAN Table Entry

70:68	67:66	65	64:62	61:60	59:48	47	46:44	43	42:26	25:24	23	22:20	19	18:2	1:0

Table 11-283. Outer VLAN Table Entry

70:68	67:66	65	64:62	61:60	59:48	47	46:44	43	42:26	25:24	23	22:20	19	18:2	1:0
Resvd	NoLrn Msk	Ingress Chk	010	10	oVLAN ID	Resvd	RegIdx	NoFrag	Reserved	fwdutag	Reserved	UregIdx	LmtNxtHdr	Reserved	Member

Member

VLAN Member list - This field indicates which port(s) are a member of the associated VLAN.

LmtNxtHdr

VLAN Limit Next Header Control - Causes frames to be dropped if the Protocol/Nxt Header does not match the ALE_NXT_HDR register values

UregIdx

VLAN Unregister Multicast Index - Index into VLAN_Mask_Mux register array that is used to create the unregistered multicast flood mask.

fwdutag

VLAN Forward Untagged Egress - Causes the packet VLAN tag to be removed on egress for the specified port(s).

NoFrag

LAN No IPv4 Fragmented frames Control - Causes IPv4 fragmented IP frames to be dropped.

RegIdx

VLAN Registered Multicast Index - Index into VLAN_Mask_Mux register array that is used to create the registered multicast flood mask.

iVLANID

Inner VLAN ID - This is the 12-bit Inner VLAN ID, normally referred to as C-VLANID

oVLANID

Outer VLAN ID - This is the 12-bit Outer VLAN ID, normally referred to as S-VLANID

IngressChk

VLAN Ingress Check - When set, if the receive port is not a member of this VLAN then the packet is dropped. This is similar to the vid_ingress_check bit in the ale_port_control register except this check is for this VLAN only (not all VLANs).

NoLrnMsk

VLAN No Learn Mask - When a bit is set in this mask, a packet with an unknown source address received on the associated port will not be learned (i.e. When a VLAN packet is received and the source address is not in the table, the source address will not be added to the table).

Table 11-284. IPv4 Table Entry

70	69:65	64:62	61:60	59:32	31:0
Resvd	IgnBits	110	10	Reserved	IPv4Adr

Table 11-285. IPv6 Table Entry High

70:64	63	62	61:60	59:0
IgnBits	Resvd	1	10	IPv6Adr[127:68]

Table 11-286. IPv6 Table Entry Low

70:63	62	61:60	59:0
IPv6Adr[67:60]	1	10	IPv6Adr[59:0]

IgnBits

Inore Bits - Indicates the number of lower address bits (IPv4 or IPv6) to be ignored starting at bit zero. Ignored bits must be zero value in the table entry

11.2.1.4.7.1.7 ALE Policing and Classification

The ALE has a number of configurable policer engines. Each policer engine can be used for classification and or policing. Policing is an extension of the classifier function that allows for color marking and rate limiting due to classifier bandwidth measurement thresholds. Any policer engine can be used for classification alone by not using the bandwidth limiting thresholds. The policers_div_8 field in the ALE_Status register indicates the number of policers available to be used for classification or policing.

Each policer can be enabled to match on one or more of any of the below packet fields for classification. All but Port and Priority are index references to the ALE table entries.

ALE Policing

The policing function on each policer engine is implemented as dual-counter three-color marking engine as described in the IETF RFC2698. The first counter is the committed information rate (CIR) counter and the

second counter is the peak information rate (PIR) counter. The policing function can use either or both counters. Based on the counter values the packet color is determined. The color is used to determine whether the packet is dropped or forwarded. The ALE has a local feature that can drop packets regardless of queue state.

The policing rates are determined by the below equations:

CIR policing rate in Mbit/s = ((ALE frequency in Mhz) * cir_idle_inc_val) / 32768

PIR policing rate in Mbit/s = ((ALE frequency in Mhz) * pir_idle_inc_val) / 32768

Each policer has 10 different match operations (see below Classification). Since multiple policing entries can be hit on a single packet this provides the ability to create precise traffic stream control.

11.2.1.4.7.1.7.1 ALE Classification

Each policer can be enabled to classify on one or more of any of the below packet fields for classification or policing. All but Port and Priority are index references to the ALE table entries.

- Port or Trunk Group Number
- Priority extracted from VLAN, mapped from DSCP if enabled or Default Port Priority
- Organization Network Unique identifier - ONU
- Destination Address - DA
- Source Address - SA
- Outer VLANID - S-VLANID
- Inner VLANID - C-VLANID
- Ether Type
- IP Source Address - IPSA with full CIDR masking for IPv4 and IPv6
- IP Destination Address - IPSA with full CIDR masking for IPv4 and IPv6

Multiple classifiers can match on a single packet. For example a classifier can be enabled to match on priority while another classifier could match on IP address. The ALE will return to the switch the highest classifier entries thread ID that matched with an enabled thread ID number. This could be used to further host routing of the packet.

11.2.1.4.7.1.7.1.1 Classifier to CPPI Transmit Flow ID Mapping

The ALE can generate a 6-bit transmit CPPI Flow ID based on classifier matches that can be used instead of the switch default transmit Flow ID mapping. The switch default flow ID is the remapped received packet priority (0 to 7). Thread and flow ID are used interchangeably for this since there is a single hardware thread (TXST_THREAD_MREADY) but there are 6-bits of FLOW_ID in the transmit CPPI INFO word 0. When enabled, the highest classifier match can map to a particular 6-bit flow ID value that is associated with the classifier. The ALE also supports an optional ALE default thread/flow ID value in the event that no classifiers match. Each thread/flow ID, including the ALE default thread/flow ID, has an enable such that the ALE default thread/Flow ID is used if enabled and if no matches occur (instead of the remapped received packet priority). If the ALE default is not enabled and no matches occur then the switch default value will be used. If multiple classifier matches occur, the highest match with a thread enable bit set will be used. The resultant flow ID has the CPSW_P0_FLOW_ID_OFFSET_REG register value added to it to determine the actual value in the INFO 0 Flow ID field.

Three registers are used for ALE classification thread/flow ID mapping configuration (CPSW_ALE_THREAD_DEF_REG, CPSW_ALE_THREAD_CTL_REG and CPSW_ALE_THREAD_VAL_REG). The three thread mapping registers are used independently and are separate from the other ALE policing registers. The CPSW_ALE_THREAD_CTL_REG register allows the CPSW_ALE_THREAD_VAL_REG register contents to be written to the selected classifier. There is a single CPSW_ALE_THREAD_DEF_REG that is used for all classifiers. The thread mapping registers can be written or changed at any time but any packets that are already processed will not have their thread altered.

11.2.1.4.7.1.8 Mirroring

The ALE supports three mirroring modes: destination port, source port and or table entry.

Destination port mirroring allows packets from any ingress port or trunk which ends up switching to a particular egress destination port or trunk to be mirrored to yet another egress destination port or trunk. For example any traffic from any port that is switched to port 'A' can be also mirrored to port 'B'. (MIRROR_DP=A, MIRROR_DEN=1h, MIRROR_TOP=B in the ALE_CONTROL register).

Source port mirroring allows packets received on any enabled ingress source port or trunk to be switched to the mirror egress port as well as the actual egress destination ports. For example traffic received on ingress port 'A' can be switched to egress port 'B' as well as the intended egress destination port.(MIRROR_SP=1h in the ALE_PORTn_CONTROL register, MIRROR_SEN=1h, MIRROR_TOP=B in the ALE_CONTROL register).

Table entry mirroring allows for any MAC Address, MAC Address with VLAN, ONU Address or VLAN entry that matches on ingress to be switched to the egress destination as well as the actual egress destination. For example all traffic for VLAN ID of 35 can be mirrored to port 'B'. That is any traffic switched on VLAN ID of 35 will be mirrored. ({VLAN ID of 35 in ALE Table entry index=C}, MIRROR_MIDX=C, MIRROR_MEN=1h, MIRROR_TOP=B)

In the event that mirrored packets are mirrored to or from a port that is also the mirror port the packet will not be duplicated or marked as a mirror packet since the packet has already been on the port as ingress or egress. The packet sent to the mirror port may have modified VLAN info based on the port and VLAN lookup table entries. The mirror port need not be a member of the VLAN ID it is mirroring, the ALE will forward traffic to the mirror port after ingress and egress filters are applied.

The switch may decide to drop any mirror traffic based on switch buffer thresholds as to prevent required traffic from becoming congested.

Port mirroring is controlled by register fields in ALE_CONTROL, ALE_CONTROL2 and the port control registers.

- MIRROR_DP - The destination port that will have its traffic mirrored (ALE_CONTROL_REG register).
- MIRROR_TOP - The port to which mirrored traffic is sent (ALE_CONTROL_REG register).
- MIRROR_MEN - The enable for mirroring traffic that matches a supported lookup table entry (ALE_CONTROL_REG register).
- MIRROR_DEN - The Enable for destination port mirroring (ALE_CONTROL_REG register).
- MIRROR_SEN - The Enable for source port mirroring (ALE_CONTROL_REG register).
- MIRROR_MIDX - The index of a lookup table entry that will be mirrored ALE_CONTROL2_REG register).
- Px_MIRROR_SP - The enable for the Source port to be mirrored. Although multiple source ports can be mirrored concurrently, a mirror traffic bandwidth issue may occur on the mirror egress port (ALE_PORTn_CONTROL register).

11.2.1.4.7.1.9 Trunking

The ALE supports port trunking of any port in any of four trunk groups. That is, four trunk groups can be supported with up to eight ports in each trunk group. There are no port adjacency rules for trunk groups. When ports are a member of a trunk group, addresses added and used in the lookup table will refer to the trunk group rather than port as indicated in the lookup table entries. If ports are removed from a trunk group, the ALE will redistribute the traffic based on the crc polynomial of enabled fields and the remaining ports within the trunk group. A trunk group may contain only one port. Packet priority, DA, SA, C-VLAN ID, IPv4SA, IPv4DA, IPv6SA, and/or IPv6DA can be used in the hash to generate destination port within the trunk group. If all hash enables are disabled, the packet can be directed to a particular port within the trunk group which allows for testing paths etc. A host directed frame is directed to the directed port regardless of trunk group settings.

Trunking is controlled through fields in the ALE_CONTROL2_REG register and in each ALE ALE_PORTn_CONTROL_REG register:

- TRK_EN_DST - Enable destination address hashing for trunk port calculation.
- TRK_EN_SRC - Enable source address hashing for trunk port calculation.
- TRK_EN_PRI - Enable priority hashing for trunk port calculation.
- TRK_EN_VLAN - Enable inner C-VLAN ID hashing for trunk port calculation.
- TRK_EN_SIP - Enable source IP address hashing for trunk port calculation.
- TRK_EN_DIP - Enable destination IP address hashing for trunk port calculation.

- TRK_BASE - Hashing formula starting value and test port offset.
- TRUNK_EN - Enable this port as a trunk group
- TRUNK_NUMBER - Trunk group number defines this port as a member of a particular trunk group.

11.2.1.4.7.1.10 DSCP

The ALE can map DSCP field to priority prior to classification matching. When enabled the DSCP is mapped via 64 priority entries such that any DSCP value can be mapped to any of the eight priorities. When a packet is received without a VLAN priority this remapped priority can be used instead of the default Port VLAN priority field. See P0_RX_DSCP_MAP_REG and PN_RX_DSCP_MAP_REG registers in the Register Manual section for DSCP mapping.

11.2.1.4.7.1.11 Packet Forwarding Processes

There are four processes that an incoming received packet may go through to determine packet forwarding. The processes are *Ingress Filtering*, *VLAN_Aware Lookup*, *VLAN_Unaware Lookup*, and *Egress.*

Packet processing begins in the Ingress Filtering process. Each port has an associated packet forwarding state that can be one of four values (Disabled, Blocked, Learning, or Forwarding). The default state for all ports is Disabled. The host sets the packet forwarding state for each port.

In the packet ingress process (receive packet process), there is a forward state test for unicast destination addresses and a forward state test for multicast addresses. The multicast forward state test indicates the port states required for the receiving port in order for the multicast packet to be forwarded to the transmit port(s). A transmit port must be in the Forwarding state for the packet to be forwarded for transmission. The MCAST_FWD_STATE indicates the required port state for the receiving port as indicated in the preceding table. The unicast forward state test indicates the port state required for the receiving port in order to forward the unicast packet. The transmit port must be in the Forwarding state in order to forward the packet. The BLOCK and SECURE bits determine the unicast forward state test criteria. If both bits are set then the packet is forwarded if the receive port is in the Forwarding/Blocking/Learning state. If both bits are not set then the packet is forwarded if the receive port is in the Forwarding state. The transmit port must be in the Forwarding state regardless. The forward state test used in the ingress process is determined by the destination address packet type (multicast/unicast).

In general, packets received with errors are dropped by the address lookup engine without learning, updating, or touching the address. The error condition and the abort are indicated by the Ethernet port to the ALE. Packets with errors may be passed to the host (not aborted) by a Ethernet port, if the port has the RX_CMF_EN, RX_CEF_EN, or RX_CSF_EN bit(s) set in the CPSW_PN_MAC_CONTROL_REG register. Error packets that are passed to the host by the Ethernet port are considered to be bypass packets by the ALE and are sent only to the host. Error packets do not learn, update, or touch addresses regardless of whether they are aborted or sent to the host. Packets with long or short errors received by the host are dropped. Packets with errors received by the host are forwarded as normal.

The following control bits are in the CPSW PN_MAC_CONTROL_REG register:

- [22] RX_CEF_EN - enables frames that are fragments, long, jabber, CRC, code, and alignment errors to be forwarded
- [23] RX_CSF_EN - enables short frames to be forwarded
- [24] RX_CMF_EN - enables MAC control frames to be forwarded.

11.2.1.4.7.1.11.1 Ingress Filtering Process

Condition and action
If ((ALE BYPASS) and (host port is not the receive port)) then use host portmask and go to Egress process
if (directed packet) then use directed port number and go to Egress process
If (Rx PORT_STATE is Disabled) then discard the packet

if ((ALE BYPASS or error packet) and (host port is not the receive port)) then use host portmask and go to Egress process
if (((BLOCK) and (unicast source address found)) or ((BLOCK) and (unicast destination address found))) then discard the packet
if ((ENABLE_RATE_LIMIT) and (rate limit exceeded) and (not RATE_LIMIT_TX) then if (((Multicast/Broadcast destination address found) and (not SUPER)) or (Multicast/Broadcast destination address not found)) then discard the packet
if ((not forward state test valid) and (destination address found)) then discard the packet to any port not meeting the requirements • Unicast destination addresses use the unicast forward state test and multicast destination addresses use the multicast forward state test.
if ((destination address not found) and ((not transmit port forwarding) or (not receive port forwarding))) then discard the packet to any ports not meeting the above requirements
if (source address found) and (secure) and (not block) and (receive port number != port_number)) then discard the packet
if ((not super) and (drop_untagged) and ((non-tagged packet) or ((priority tagged) and not(en_vid0_mode)) then discard the packet

If (VLAN_Unaware)
CPSW_ALE_FORCE_UNTAGGED_EGRESS_REG = “000000”

if ((Multicast packet) and (destination address found with or without VLAN) and (SUPER)) then portmask is the PORT_MASK and goto Egress process

if (Multicast packet) # destination address not found then portmask is the logical “AND” of CPSW_ALE_UNKNOWN_MCAST_FLOOD_REG and VLAN_MEMMBER_LIST then goto Egress process
if (Broadcast packet) then use found VLAN_MEMMBER_LIST and goto Egress process

11.2.1.4.7.1.11.4 Egress Process

Condition and action
Clear Rx port from portmask (don’t send packet to Rx port).
Clear disabled ports from portmask.
if ((ENABLE_OUI_DENY) and (OUI source address not found) and (not ALE BYPASS) and (not error packet) and not ((mcast destination address) and (SUPER))) then Clear host port from portmask
if ((not ENABLE_OUI_DENY) and (OUI source address found) and (not ALE BYPASS) and (not error packet) and not ((mcast destination address) and (SUPER))) then Clear host port from portmask
if ((ENABLE_RATE_LIMIT) and (RATE_LIMIT_TX)) then if (not SUPER) and (rate limit exceeded on any tx port) then clear rate limited tx port from portmask If address not found then SUPER cannot be set.
If portmask is zero then discard packet
Send packet to portmask ports.

11.2.1.4.7.1.11.5 Learning/Updating/Touching Processes

The learning, updating, and touching processes are applied to each receive packet that is not aborted. The processes are concurrent with the packet forwarding process. In addition to the following, a packet must be received without error in order to learn/update/touch an address.

11.2.1.4.7.1.11.5.1 Learning Process

The learning process is applied to each receive packet that is not aborted. The learning process is a concurrent process with the packet forwarding process.

Condition and action
If (directed) then do not learn, update, or set touched else continue
If (not (Learning or Forwarding) or (ENABLE_AUTH_MODE) or (packet error) or (NO_LEARN)) then do not learn address
if ((Non-tagged packet) and (DROP_UNTAGGED)) then do not learn address
if ((VLAN_AWARE) and (VLAN not found) and (unknown VLAN_MEMMBER_LIST = “000”)) then do not learn address
if ((VID_INGRESS_CHECK) and (Rx port is not VLAN member) and (VLAN found)) then do not learn address
if ((source address found) and (receive port_number != PORT_NUMBER) and (SECURE or BLOCK)) then do not update address else continue

if ((source address found) and (receive port number != PORT_NUMBER)) then update address else continue
if ((source address not found) and (VLAN_AWARE) and not (LEARN_NO_VID)) then learn address with VLAN
if ((source address not found) and ((not VLAN_AWARE) or (VLAN_AWARE and LEARN_NO_VID))) then learn address without VLAN

11.2.1.4.7.1.11.5.2 Updating Process

Condition and action
if (dlr_unicast) then do not update address
If (not(Learning or Forwarding) or (ENABLE_AUTH_MODE) or (packet error) or (NO_SA_UPDATE)) then do not update address
if ((Non-tagged packet) and (DROP_UNTAGGED)) then do not update address
if ((VLAN_AWARE) and (VLAN not found) and (unknown VLAN_MEMMBER_LIST = “000”)) then do not update address
if ((VID_INGRESS_CHECK) and (Rx port is not VLAN member) and (VLAN found)) then do not update address
if ((source address found) and (receive port number != PORT_NUMBER) and (SECURE or BLOCK)) then do not update address
if ((source address found) and (receive port number != PORT_NUMBER)) then update address

11.2.1.4.7.1.11.5.3 Touching Process

if ((source address found) and (ageable) and (not touched)) then set touched

11.2.1.4.7.2 CPPI CPDMA Host Interface

11.2.1.4.7.2.1 Functional Operation

For legacy reasons this document uses FHost (“cpsw ingress **F**rom **Host**”) interchangeably with host receive and THost (“cpsw egress **T**o **Host**”) interchangeably with host transmit.

Host Software sends and receives network frames via the CPDMA CPPI 3.0 compliant host interface. The host interface includes module registers and host memory data structures. The host memory data structures are buffer descriptors and data buffers. Buffer descriptors are data structures that contain information about a single data buffer. Buffer descriptors may be linked together to describe frames or queues of frames for transmission of data from the host to Ethernet and free buffer queues available for packet data from Ethernet to the host.

After reset, initialization, and configuration the host may initiate CPDMA host interface operations. FHost DMA operations (from host to Ethernet) are initiated by host writes to the appropriate FHost channel head descriptor pointer. The FHost DMA controller then fetches the first packet in the packet chain from memory in accordance with CPPI 3.0 protocol and proceeds with packet operations. The DMA controller fetches the packet data in 64-byte (maximum) bursts.

Host CPDMA THost operations are initiated by host writes to the appropriate THost channel head descriptor pointer after host initialization and configuration. The THost DMA controller writes Ethernet received packet data to external host memory in accordance with CPPI 3.0 protocol.

11.2.1.4.7.2.2 THost CPDMA Interface

The THost DMA (Ethernet to host) is an eight channel CPPI 3.0 compliant interface. Each priority/channel (priority and channel are used interchangeably) has a single queue for frame reception.

11.2.1.4.7.2.2.1 THost CPDMA Host Configuration

To configure the CPDMA for THost operations the host must perform the following:

- Initialize the CPDMA_TH(0..7)_HDP Registers to zero.
- Enable the desired THost interrupts in the CPDMA_TH_INTSTAT_SET register.
- Write the CPDMA_TH_BUFFER_OFFSET register value.
- Setup the channel(s) buffer descriptors in host memory as required by CPPI.
- Enable the CPDMA controller by setting the TH_EN bit in the CPDMA_TH_CONTROL register.

11.2.1.4.7.2.2.2 THost CPDMA Buffer Descriptors

A THost buffer descriptor is a contiguous block of four 32-bit data words aligned on a 32-bit word boundary.

Table 11-287. THost Buffer Descriptor format

Word Offset	Bit fields																													
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	next descriptor pointer																															
	buffer pointer																															
	reserved					buffer offset											reserved					buffer length									
	sop	eop	ownership	eoq	teardown_complete	passed_crc	long	short	mac_ctl	overrun	pkt_err	vlan_encap	from_port				ts_encap	memory_protect_err	crc_type	checksum_encap	reserved	packet length									

Field	Description
next_descriptor_pointer	Next Descriptor Pointer - The 32-bit word aligned memory address of the next buffer descriptor in the RX queue. This is the mechanism used to reference the next buffer descriptor from the current buffer descriptor. If the value of this pointer is zero then the current buffer is the last buffer in the queue. The host sets the **next_descriptor_pointer**.
buffer_pointer	Buffer Pointer - The byte aligned memory address of the buffer associated with the buffer descriptor. The host sets the **buffer_pointer**.

Field	Description
buffer_offset	Buffer Offset – Indicates how many unused bytes are at the start of the buffer. The buffer offset is reduced to 12-bits. A value of 0x0000 indicates that there are no unused bytes at the start of the buffer and that valid data begins on the first byte of the buffer. A value of 0x000F (decimal 15) indicates that the first 15 bytes of the buffer are to be ignored by the port and that valid buffer data starts on byte 16 of the buffer. The port writes the **buffer_offset** with the value from the **CPDMA_TH_BUFFER_OFFSET** register value. The host initializes the **buffer_offset** to zero for free buffers. The **buffer_length** must be greater than the **CPDMA_TH_BUFFER_OFFSET** register value. The buffer offset is valid only on **sop**.
buffer_length	Buffer Length – Indicates how many valid data bytes are in the buffer. The buffer length is reduced to 12-bits. Unused or protocol specific bytes at the beginning of the buffer are not counted in the Buffer Length field. The host initializes the **buffer_length**, but the port may overwrite the host initiated value with the actual buffer length value on SOP and/or EOP buffer descriptors. SOP buffer length values will be overwritten if the packet size is less than the size of the buffer or if the offset is nonzero. EOP buffer length values will be overwritten if the entire buffer is not filled up with data. The **buffer_length** must be greater than zero.
sop	Start of Packet - Indicates that the descriptor buffer is the first buffer in the packet. The port sets the **sop** bit. 0 - Not start of packet buffer 1 - Start of packet buffer
eop	End of Packet - Indicates that the descriptor buffer is the last buffer in the packet. The port sets the **eop** bit. 0 - Not end of packet buffer. 1 - End of packet buffer.
ownership	Ownership - Indicates ownership of the packet and is valid only on **sop**. This bit is set by the host and cleared by the port when the packet has been transferred. The host uses this bit to reclaim buffers. 0 - The packet is owned by the host 1 - The packet is owned by the port
eoq	End Of Queue - Set by the port to indicate that the RX queue empty condition exists. This bit is valid only on **eop**. The port determines the end of queue condition by a zero **next_descriptor_pointer**. 0 – The RX queue has more buffers available for reception. 1 - The Descriptor buffer is the last buffer in the last packet in the queue.
teardown_complete	Teardown Complete – Set by the port to indicate that the host commanded teardown process is complete, and the channel buffers may be reclaimed by the host. This bit is valid only on **sop**. 0 - The port has not completed the teardown process. 1 - The port has completed the commanded teardown process.
passed_crc	Passed CRC – Set by the port to indicate that the CRC was passed with the data. The **Packet_Length** includes the CRC bytes. The **passed_crc** bit is valid only on SOP. The **p0_tx_crc_remove** bit in the **CPDMA_Control** register determines if CPPI THost packets have a CRC included or not.
long	Jabber Frame – Indicates that the frame is a jabber frame and was not discarded because **rx_cef_en** was set in the ingress port **Pn_MAC_Control** register. Valid only on SOP.
short	Fragment Frame – Indicates that the frame is a fragment and was not discarded because **rx_cef_en** was set in the ingress port **Pn_MAC_Control** register. Valid only on SOP.
mac_ctl	Control Frame – Indicates that the frame is a MAC control frame and was not discarded because the **rx_cmf_en** bit was set inthe ingress port **Pn_Mac_Control** register. Valid only on SOP.
overrun	Overrun – Set by the port to indicate that the frame reception was aborted due to THost buffer overrun. This bit is valid only on SOP. 0 – no overrun occurred on the packet 1 – The packet was aborted due to overrun

Field	Description
pkt_error	Packet Contained Error on Ethernet Ingress. This field is valid on SOP. – 00 – no error 01 – CRC error on ingress 10 – Code error on ingress 11 – align error on ingress
vlan_encap	VLAN Encapsulated Packet – Indicates when set that the packet data contains a 32-bit VLAN header word that is included in the packet byte count. This field is set by the port to be the value of the **CPDMA_Control** register **th_vlan_encap** bit. If both **th_vlan_encap** and **th_ts_encap** are set then the VLAN is first. This encapsulated word also contains the ALE classification FLOW (threadval). This bit is valid on SOP.
ts_encap	Timestamp Encapsulated Packet – Indicates when set that the packet data contains a 64-bit timestamp (two 32-bit words with the lower 32-bit word first) that is included in the packet byte count. This field is set by the port to be the value of the **CPDMA_Control** register **th_ts_encap** bit. If both **th_vlan_encap** and **thost_ts_encap** are set then the VLAN is first. This bit is valid on SOP.
chksum_encap	Checksum Encapsulated Packet – Indicates when set that the packet data contains 4-bytes of THost checksum information at the end of the packet (last 4 bytes). The packet length includes the checksum bytes.
memory_protect_error	Memory Protect Error – An error was detected in the packet Castignoli protect CRC. The Packet should be dropped by the host.
from_port	From Port – Indicates the Ethernet ingress port number. This field is valid only on SOP.
packet_length	Packet Length – Specifies the number of bytes in the entire packet. Offset bytes are not included. The sum of the buffer_length fields should equal the packet_length. Valid only on SOP.

11.2.1.4.7.2.2.3 THost CPDMA Channel Teardown

The host commands a THost channel teardown by writing the channel number to the **CPDMA_TH_TEARDOWN** register. When a teardown command is issued to an enabled THost channel the following will occur:

- Any current frame in reception will complete normally.
- The teardown_complete bit will be set in the next THost buffer descriptor in the chain if there is one.
- The channel head descriptor pointer will be cleared to zero
- A THost interrupt for the channel will be issued to the host.
- The host should acknowledge a teardown interrupt with a 0xfffffffc acknowledge value

Channel teardown may be commanded on any channel at any time. The host is informed of the teardown completion by the set teardown complete buffer descriptor bit. The port does not clear any channel enables due to a teardown command. A teardown command to an inactive channel issues an interrupt that software should acknowledge with a 0xfffffffc acknowledge value (note that there is no buffer descriptor in this case). Software may read the interrupt acknowledge location to determine if the interrupt was due to a commanded teardown. The read value will be 0xfffffffc if the interrupt was due to a teardown command.

11.2.1.4.7.2.3 FHost CPDMA Interface

The FHost DMA is an eight channel CPPI 3.0 compliant interface. Priority between the eight queues may be either fixed or round robin as selected by **FH_PTYPE** in the **CPDMA_Control** register. If the priority type is fixed, then channel 7 has the highest priority and channel 0 has the lowest priority. Round robin priority proceeds from channel 0 to channel 7. Packet Data transfers occur on the TX_VBUSP interface in 64-byte maximum burst transfers. Any packet can be designated by the host to generate a host timesync event on Ethernet egress by setting the **host_event** bit in the packet buffer descriptor.

11.2.1.4.7.2.3.1 FHost CPDMA Host Configuration

To configure the CPDMA for FHost operations the host must do the following:

- Initialize the CPDMA_FH(0..7)_HDP registers to a zero value.
- Enable the desired ingress interrupts in the CPDMA_FH_INTSTAT_MASKED_SET register.
- Setup the transmit channel(s) buffer descriptors in host memory as defined in CPPI 3.0.

- Configure and enable the ingress operation as desired in the CPDMA_FH_Control register.
- Write the appropriate CPDMA_FH(0..7)_HDP registers with the appropriate values to start packet operations.

11.2.1.4.7.2.3.2 FHost CPDMA Buffer Descriptors

An FHost buffer descriptor is a contiguous block of four 32-bit data words aligned on a 32-bit word boundary.

Table 11-288. FHost Buffer Descriptor format

Word Offset	Bit fields																														
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	next descriptor pointer																															
1	buffer pointer																															
2	buffer offset																buffer length															
3	sop	eop	ownership	eoq	teardown_complete	pass_crc	crc_type	reserved				to_port_en	to_port				host_event	chksum_encap	reserved			packet_length										

Name	Description
next_descriptor_pointer	Next Descriptor Pointer - The 32-bit word aligned memory address of the next buffer descriptor in the FHost queue. This is the mechanism used to reference the next buffer descriptor from the current buffer descriptor. If the value of this pointer is zero then the current buffer is the last buffer in the queue. The host sets the **next_descriptor_pointer**.
buffer_pointer	Buffer Pointer - The byte aligned memory address of the buffer associated with the buffer descriptor. The host sets the **buffer_pointer**.
buffer_offset	Buffer Offset – Indicates how many unused bytes are at the start of the buffer. A value of 0x0000 indicates that no unused bytes are at the start of the buffer and that valid data begins on the first byte of the buffer. A value of 0x000F (decimal 15) indicates that the first 15 bytes of the buffer are to be ignored by the port and that valid buffer data starts on byte 16 of the buffer. The host sets the **buffer_offset** value (which may be zero to the buffer length minus 1). Valid only on **sop**.
buffer_length	Buffer Length – Indicates how many valid data bytes are in the buffer. Unused or protocol specific bytes at the beginning of the buffer are not counted in the Buffer Length field. The host sets the **buffer_length.** The **buffer_length** must be greater than zero.
sop	Start of Packet - Indicates that the descriptor buffer is the first buffer in the packet. 0 - Not start of packet buffer 1 - Start of packet buffer

Name	Description
eop	End of Packet - Indicates that the descriptor buffer is the last buffer in the packet. 0 - Not end of packet buffer. 1 - End of packet buffer.
ownership	Ownership - Indicates ownership of the packet and is valid only on **sop**. This bit is set by the host and cleared by the port when the packet has been transferred. The host uses this bit to reclaim buffers. 0 - The packet is owned by the host 1 - The packet is owned by the port
eoq	End Of Queue - Set by the port to indicate that all packets in the queue have been transferred and the FHost queue is empty. End of queue is determined by the port when the **next_descriptor_pointer** is zero on an **eop** buffer. This bit is valid only on **eop**. 0 - The FHost queue has more packets to transfer. 1 - The Descriptor buffer is the last buffer in the last packet in the queue.
teardown_complete	Teardown Complete – Set by the port to indicate that the host commanded teardown process is complete, and the channel buffers may be reclaimed by the host. This bit is valid only on **sop**. 0 - The port has not completed the teardown process. 1 - The port has completed the commanded teardown process.
crc_type	CRC Type – 0 – Ethernet CRC 1 – Castignoli CRC (if **$CPPI_Cast** = 1)
pass_crc	Pass CRC – Valid only on SOP 0 – A CRC is not included with the packet data. The Ethernet port(s) will generate the CRC on Ethernet egress. A CRC (or placeholder) at the end of the data is allowed, but not required, and the **buffer_count** and **packet_length** fields should not include the CRC bytes if they are present. 1 – A CRC is included with the host packet data. The **packet_length** and **buffer_count** fields should include the four CRC bytes. The host supplied CRC should be in the last four bytes of the data.
to_port	To Port – Port number to send the directed packet to. This field is set by the host. This field is valid on SOP. Directed packets go to the directed port, but an ALE lookup is performed to determine untagged egress in VLAN_AWARE mode. 1 – Send the packet to port 1 if **to_port_en** is asserted. 2 – Send the packet to port 2 if **to_port_en** is asserted.
to_port_en	To Port Enable – Indicates when set that the packet is a directed packet to be sent to the **to_port** field port number. This field is set by the host. The packet is sent to one port only (index not mask). This bit is valid on SOP. 0 – not a directed packet 1 – directed packet
host_event	Host Timesync Event – Generate a host timesync event on Ethernet egress. The upper 28-bits of the packet SOP buffer descriptor address are the domain[7:0], message_type[3:0], and sequence_id[15:0] in that order. 0 – The packet will not generate a host event on Ethernet egress 1 – The packet will generate a host event on Ethernet egress
chksum_encap	Checksum Encapsulated Packet – Indicates when set that the packet data contains 4-bytes of FHost checksum information at the start of the packet (first 4 bytes). The packet length includes the checksum bytes.

Name	Description
packet_length	Packet Length – Specifies the number of bytes in the entire packet. Offset bytes are not included. The sum of the buffer_length fields should equal the packet_length. Valid only on SOP. The packet length must be greater than zero. The packet data will be truncated to the packet length if the packet length is shorter than the sum of the packet buffer descriptor buffer lengths. A host error occurs if the packet length is greater than the sum of the packet buffer descriptor buffer lengths.

11.2.1.4.7.2.3.3 FHost CPDMA Channel Teardown

The host commands a FHost channel teardown by writing the channel number to the **CPDMA_FH_Teardown** register. When a teardown command is issued to an enabled FHost channel the following will occur:

- Any frame currently in transmission will complete normally
- The teardown complete bit will be set in the next sop buffer descriptor (if there is one).
- The channel head descriptor pointer will be set to zero.
- An interrupt will be issued to inform the host of the channel teardown.
- The host should acknowledge a teardown interrupt with a 0xfffffffc acknowledge value

Channel teardown may be commanded on any channel at any time. The host is informed of the teardown completion by the set teardown complete buffer descriptor bit. The port does not clear any channel enables due to a teardown command. A teardown command to an inactive channel issues an interrupt that software should acknowledge with a 0xfffffffc acknowledge value (note that there is no buffer descriptor in this case). Software may read the interrupt acknowledge location to determine if the interrupt was due to a commanded teardown. The read value will be 0xfffffffc if the interrupt was due to a teardown command.

11.2.1.4.7.2.4 VLAN Aware Mode

The CPSW is in VLAN aware mode when the CPSW Control register **vlan_aware** bit is set. In VLAN aware mode port 0 THost packets may or may not be VLAN encapsulated depending on the CPDMA_Control register **th_vlan_encap** bit. The header packet VLAN is generated as described in later sections of this specification. VLAN encapsulated receive packets have a 32-bit VLAN header encapsulation word added to the packet data. VLAN encapsulated packets are specified by a set **vlan_encap** bit in the packet buffer descriptor. The VLAN encapsulation header is included in the packet length and has the below format:

32-bit VLAN Header Encapsulation Word																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
hdr_pkt_priority			hdr_pkt_cfi	hdr_pkt_vid												flow						pkt_type		reserved							

Field	Description
hdr_pkt_priority	Header Packet VLAN priority (7 is highest priority)
hrd_pkt_cfi	Header Packet VLAN CFI bit. The
hdr_pkt_vid	Header Packet VLAN ID.

Field	Description
flow	FLOW – A nonzero value indicates that the ALE matched a classifier with the **flow** (threadval).
pkt_type	Packet Type – Indicates whether the packet is a VLAN tagged, priority tagged or non-tagged packet. 00 – VLAN tagged packet 01 – reserved 10 – priority tagged packet 11 – non-tagged packet

11.2.1.4.7.2.5 VLAN Unaware Mode

The CPSW is in VLAN unaware mode when the CPSW Control register **vlan_aware** bit is cleared. Port 0 THost packets (egress) may or may not be VLAN encapsulated depending on the CPSW Control register **th_vlan_encap** bit.

11.2.1.4.7.2.6 CPDMA Command IDLE

The **cmd_idle** bit in the **CPDMA_Control** register allows CPDMA operation to be suspended. When the idle state is commanded, the CPDMA will stop processing THost and FHost frames at the next frame boundary. Any frame currently in reception or transmission will be completed normally without suspension. For FHost, any frame in process will be completed. For THost, frames that are detected by the CPDMA after the suspend state is entered are ignored. No statistics will be kept for ignored frames. Commanded idle is similar in operation to emulation control and clock stop.

11.2.1.4.7.2.7 CPDMA CPPI 3.0 Interface Bandwidth

The HOST CPPI 3.0 FHost and THost interfaces are capable of supporting linerate on the Ethernet ports provided that the clock frequency is sufficient, and provided that the Host master VBUSP read/write latency is low.

11.2.1.4.8 CPPI Checksum Offload

The CPPI host port can be enabled to perform checksum offload on host port packet ingress and egress. UDP and TCP over IPV4 and IPV6 are supported. For the purposes of checksum description, the first packet byte (the first byte of the destination address) is byte 1 (not byte 0). That is, a 64 byte packet goes from byte 1 to byte 64. For all packet types, the **s_cn_switch** bit must be set for the **vlan_ltype_outer** to be supported. Because it's not now a dual vlan switch, A C-switch cannot have an outer VLAN. An S-switch can have an inner, an outer, or both (outer then inner).

11.2.1.4.8.1 CPPI THost Checksum Offload

When **p0_tx_chksum_en** is set in **P0_Control**, IPV4 and IPV6 UDP and TCP packets received on any Ethernet port and destined for port 0 egress are checked for correct checksum as described below. The EOP Thost buffer descriptor bit **chksum_encap** indicates whether or not the THost checksum information is included with the THost egress packet or not. If the checksum information is included in the packet the **packet_length** includes the four checksum information bytes. The byte counts below are shown for packets with no VLAN's. The byte counts vary with one or two packet VLANs. Packets received on an Ethernet port with errors are not checked for a correct checksum if they are passed to the host (no checksum information with the error packet).

11.2.1.4.8.1.1 IPV4 UDP

- Byte 15 Upper Nibble = 4 for IPV4
- Byte 15 Lower Nibble = IHL - Nibble with number of 32-bit words in IPV4 header (5 to 15 supported).
- Bytes 20:21 = fragment[15:0] – Bit 13 is the MF bit and bits 12:0 are the Fragment offset. A packet is a fragment if the MF bit is set or if the fragment offset is non-zero. The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets have MF=0 and a zero offset. A count is output for packet fragments but no errors are reported. First fragments have the UDP header included in the count. Middle and last fragments have only data included in the count (there is no UDP header).

- Byte 24 = 0x11 for UDP protocol.
- Received packet UDP checksum of zero means that there is no IPV4 checksum sent with the packet so no error will be issued.
- Received packet UDP checksum of 0xffff means that the checksum was calculated to be 0xffff or 0x0000 but was sent in the transmitted packet as 0xffff by the sending originating entity.

11.2.1.4.8.1.2 IPV4 TCP

- Byte 15 Upper Nibble = 4 for IPV4
- Byte 15 Lower Nibble = IHL - Nibble with number of 32-bit words in IPV4 header (5 to 15 supported).
- Bytes 20:21 = fragment[15:0] – Bit 13 is the MF bit and bits 12:0 are the Fragment offset. A packet is a fragment if the MF bit is set or if the fragment offset is non-zero. The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets have MF=0 and a zero offset. A count is output for packet fragments but no errors are reported. First fragments have the UDP header included in the count. Middle and last fragments have only data included in the count (there is no TCP header).
- Byte 24 = 0x06 for TCP protocol.

11.2.1.4.8.1.3 IPV6 UDP

- Byte 15 upper nibble = 6 for IPV6.
- Byte 21 = 0x11 for UDP protocol as next header.
- Fragment extension headers are supported. First fragments have a fragment extension header (byte 21 = 0x2c) followed by a UDP header (byte 55 = 0x11). Middle and last fragments have a fragment extension header followed by data only (no UDP header). The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets do not have a fragment extension header. A count is output for packet fragments but no errors are reported.
- Received packet UDP checksum of zero means that there is no IPV6 checksum sent with the packet so no error will be issued.
- Received packet UDP checksum of 0xffff means that the checksum was calculated to be 0xffff or 0x0000 but was sent in the transmitted packet as 0xffff by the sending originating entity.

11.2.1.4.8.1.4 IPV6 TCP

- Byte 15 upper nibble = 6 for IPV6.
- Byte 21 = 0x06 for TCP protocol as next header.
- Fragment extension headers are supported. First fragments have a fragment extension header (byte 21 = 0x2c) followed by a UDP header (byte 55 = 0x06). Middle and last fragments have a fragment extension header followed by data only (no TCP header). The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets do not have a fragment extension header. A count is output for packet fragments but no errors are reported.

11.2.1.4.8.1.5 THost Checksum Encapsulation Word

The 4-byte checksum encapsulation word is included as the last 4-bytes of the THost packet data when EOP buffer descriptor **chksum_encap** is set. The **packet_length** includes the four encapsulation bytes.

THost Checksum Encapsulation Word																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
reserved											ipv4_valid	ipv6_valid	tcp_udp_n	fragment	checksum_error	checksum_add																

Field	Name	Description
31:21	reserved	
20	ipv4_valid	IPV4 Valid – An IPV4 TCP or UDP packet was detected
19	**ipv6_valid**	IPV6 Valid – An IPV6 TCP or UDP Packet was detected
18	tcp_udp_n	TCP or UDP packet – Valid only when either the **ipv4_valid** or **ipv6_valid** bits are set. 0 – Indicates UDP packet was detected. 1 – Indicates TCP packet was detected.
17	fragment	Fragment – Indicates that an IP fragment was detected. Valid only when when either the **ipv4_valid** or **ipv6_valid** bits are set.
16	checksum_error	Checksum Error detected. Valid only when either the **ipv4_valid** or **ipv6_valid** bits are set.
15:0	checksum_add	Checksum Add Value – This is the value that was summed during the checksum computation. This value is 0xffff for IPV4/6 UDP/TCP packets with no checksum error.

11.2.1.4.8.2 CPPI FHost Checksum Offload

Packets sent from host port 0 (switch ingress) to any Ethernet port can have a checksum calculated and inserted into the Ethernet egress packet. The **rx_chksum_en** bit in the **P0_CONTROL** register must be set for receive checksum operation to be enabled. When enabled and when the **chksum_encap** SOP FHost buffer descriptor is set, the first four packet bytes contain the checksum information which determines how the checksum is calculated. The **checksum_result** field determines where the checksum is inserted in the egress packet. The checksum result location is adjusted by the egress port if a VLAN is to be inserted or removed on Ethernet port egress.

11.2.1.4.8.2.1 FHost Checksum Encapsulation Word

The 4-byte FHost checksum encapsulation word is included as the first four bytes of the packet data when **chksum_encap** is set in the FHost SOP buffer descriptor. The **packet_length** includes the four checksum encapsulation bytes.

FHost Checksum Encapsulation Word																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
checksum_result								checksum_start_byte								chksum_inv	reserved	checksum_bytecount													

Field	Name	Description
31:24	**checksum_result**	Checksum Result Byte Location – This is the packet byte number where the checksum result will be placed in the egress packet. The first packet byte which is the first byte of the destination address is byte 1 (not byte zero).
23:16	**checksum_start_byte**	Checksum Start Byte – This is the packet byte number to start the checksum calculation on. The first packet byte is byte 1.
15	**chksum_inv**	Checksum Invert Zero – When set, a zero checksum value will be inverted and sent as 0xffff.
14	reserved	
13:0	checksum_bytecount	Checksum Byte Count – This is the number of bytes to calculate the checksum on. The outgoing Ethernet packet will have a checksum inserted when this value is non-zero.

11.2.1.4.9 Egress Packet Operations

Each CPSW egress port (Ethernet and Host) is capable of performing egress packet processing operations. **Intra**VLAN processing either adds, removes, or replaces VLAN information or does nothing. **Inter**VLAN routing allows hardware routing between a limited number of VLANs - thereby allowing high-bandwidth or other routing operations to be offloaded from software to the CPSW (hardware). IntraVLAN processing and InterVLAN routing operations are mutually exclusive. In addition, OAM loopback allows the loopback packet source and destination addresses can be swapped on egress to facilitate OAM or generic testing operations.

11.2.1.4.9.1 IntraVLAN Processing

All ports (Ethernet and CPPI) process packet VLAN's identically on cpsw egress. CPSW ingress packet VLAN's are not modified on ingress regardless of the port type or VLAN mode.

11.2.1.4.9.1.1 VLAN Unaware Mode

An egress port is operating in the VLAN unaware mode when the **VLAN_AWARE** bit in the **CPSW_Control** register is cleared to zero. In VLAN unaware mode, transmit (egress) packets are not modified on egress (no IntraVLAN processing).

11.2.1.4.9.1.2 VLAN Aware Mode

An egress port is operating in the VLAN aware mode when the **VLAN_AWARE** bit in the **CPSW_Control** register is set. In VLAN aware mode, transmitted packet data is changed depending on the packet type, the packet priority (**pkt_pri**), and the VLAN information as shown in the below tables. The **vlan_ltype_sel** value is selected by the **s_cn_switch** bit in the **CPSW_Control** register and is either the **vlan_ltype_inner** (0x8100 default)or **vlan_ltype_outer** (0x88a8 default) value. The **force_untagged_egress** bit comes from the Address Lookup Engine (ALE) lookup:

VLAN Aware Mode Non Tagged Transmit Packet Processing	
Insert VLAN Case	Non-tagged input packets have the header packet VLAN inserted when the **force_untagged_egress** bit in the transmit packet header (from the ALE) is de-asserted. **The vlan_ltype_sel** length/type is inserted after the source address followed by the two byte header packet VLAN. The header packet VLAN is composed of the **hdr_pkt_pri**, the **hdr_pkt_cfi**,and the **hdr_pkt_vid**. The packet length/type field is output four bytes later than it is input and is not removed or replaced.
No Change Case	Non tagged input packets are output unchanged when the **force_untagged_egress** transmit packet header bit is asserted.

VLAN Aware Mode Priority Tagged Transmit Packet Processing	
Replace PRI/VID Case	Priority tagged input packets have the packet VLAN ID (VID) and the packet priority replaced with the **hdr_pkt_vid** and the **hdr_pkt_pri** when the transmit packet header **force_untagged_egress** bit (from the ALE) is de-asserted.
Remove VLAN Case	Priority tagged input packets have the 4-byte packet VLAN information removed when the transmit packet header **force_untagged_egress** bit (from the ALE) is asserted. **The vlan_ltype_sel** length/type is removed as is the two byte packet VLAN. Input 64-67 byte priority tagged packets go out with the VLAN removed and padded to 64-bytes. The input CRC bytes are used as the pad data. Input 64-byte priority tagged packets use all four input CRC bytes as pad, input 65-byte priority tagged packets use three of the input CRC bytes as pad, and so on.

VLAN Aware Mode VLAN Tagged Transmit Packet Processing	
Replace PRI Case	VLAN tagged input packets are output with the packet priority replaced with the **hdr_pkt_pri** when the transmit packet header **force_untagged_egress** bit is de-asserted.
Remove VLAN Case	VLAN tagged input packets have the 4-byte packet VLAN information removed when the transmit packet header **force_untagged_egress** bit is asserted. **The vlan_ltype_sel** length/type is removed as is the two byte packet VLAN. Input 64-67 byte VLAN tagged packets go out with the VLAN removed and padded to 64-bytes. The input CRC bytes are used as the pad data. Input 64-byte VLAN tagged packets use all four input CRC bytes as pad, input 65-byte VLAN tagged packets use three of the input CRC bytes as pad, and so on. The output CRC is generated when the VLAN is removed.

VLAN tagged ingress packets of 64 to 67-bytes will be padded to 64-bytes on egress (Ethernet and CPPI port egress) if the VLAN is to be removed on egress.

11.2.1.4.9.2 ALE Egress Opcode Operations

The Address Lookup Engine (ALE) can be setup to pass an 8-bit opcode to the destination port(s) egress packet processing logic. InterVLAN routing and OAM Source/Destination address swap are supported operation codes as shown in the below table.

ALE Egress OP Code	Egress Operation
0x00	No egress opcode (NOP)
0x01	InterVLAN (route) opcode 1
0x02	InterVLAN (route) opcode 2
0x03	InterVLAN (route) opcode 3
0x04	InterVLAN (route) opcode 4
0x05-0xFE	reserved
0xFF	DA/SA Swap opcode

11.2.1.4.9.2.1 InterVLAN Routing

The CPSW is capable of InterVLAN routing with a limited number of routes (InterVLAN opcode 1 to 4). The Address Lookup Engine (ALE) determines an InterVLAN egress opcode for each packet to be VLAN routed via a classifier/policer configured for the route. Non VLAN routed packets do not have an InterVLAN (egress) opcode. The ALE classifier/policer can use the ingress packet destination address, source address, VLAN, IPDA, and/or

IPSA to determine if a packet is to be VLAN routed or not. If a packet is to be routed, then the InterVLAN opcode is used on Ethernet packet egress with a total of 4 available VLAN routes (opcodes) per egress port. Each InterVLAN routing opcode contains the below fields in the opcode's associated **Pn_InterVLAN_OPX_x** registers (where **x** = A to D):

Field	Description
da[47:0]	Destination Address
sa[47:0]	Source Address
vid[11:0]	VLAN ID
replace_da_sa	When set, the routed packet Destination Address is replaced with **da[47:0]** and the packet Source Address is replaced with **sa[47:0]** from InterVLAN opcode x (the selected egress opcode).
replace_vid	When set, Replace the packet VLAN ID with **vid[11:0]** from InterVLAN opcode x (the selected egress opcode).
dest_force_untagged_egress	Remove the VLAN on the egress routed packet when set (associated with the destination VLAN). **Note** The ALE **force_untagged_egress** bit from the ALE is for the source VLAN and is ignored for an InterVLAN routed packet. On InterVLAN routed packets this bit is used because it is associated with the destination vlan. This **dest_force_untagged_egress** bit would not be set by software if the destination VLAN is different from the port VLAN since that might cause leaky VLANs.
decrement_ttl	When set, the Time To Live (TTL) field in the header is decremented: • IPV4 – Decrement the TTL byte and update the Header Checksum • IPV6 – Decrement the Hop Limit. note: The ALE will send any IPv4/6 packet with a zero or one TTL field to the host. When this bit is cleared the TTL/Hop Limit fields are not checked or modified.

11.2.1.4.9.2.2 OAM Source and Destination Address Swap

To facilitate OAM or generic testing, the ALE can be configured to loopback packets from Ethernet receive to Ethernet Transmit. Packets destined for OAM loopback have only the source address and destination addresses swapped. No other egress processing is performed. The ALE does not perform lookups for a port in OAM loopback mode, but directed packets are transferred as normal.

11.2.1.4.10 IEEE 1588 Clock Synchronization Support

The CPSW supports 1588 clock synchronization (annex D, annex E, and annex F). Ethernet GMII Transmit and receive time sync operation are supported. Time sync is double-step on egress but may be single-step on ingress.

11.2.1.4.10.1 1588 Receive (Ingress) Packet Operation

There are two CPSW egress time sync interfaces for each Ethernet port. The first is the TS_RX_MII interface and the second is the TS_RX_DEC interface. Both interfaces are generated in the switch and are input to the CPTS module. There are register bits in the CPSW that control time sync operations in addition to the registers in the CPTS module. The TS_RX_MII interface issues a record signal along with a handle to the CPTS controller for each packet that is received. The record signal is a single clock pulse indicating that a receive packet has been detected at the associated port MII interface. The handle value is incremented with each packet and rolls over to zero after 15. There are 16 possible handle values so there can be a maximum of 16 packets "in flight" from the TS_RX_MII to the TS_RX_DEC block at any given time. A handle value is reused (not incremented) for any received packet that is shorter than about 31 octets (including preamble). Handle reuse on short packets prevents any possible overrun condition if multiple fragments are consecutively received. The TS_RX_MII logic

is in the receive wireside clock domain. There is no decode logic in the TS_RX_MII to determine if the packet is a time sync event packet or not. Each received packet generates a record signal and new handle. The handle is sent to the CPTS controller with the record pulse and the handle is also sent to the TS_RX_DEC block along with the packet. The packet decode is performed in the TS_RX_DEC block. The decode function is separated from the record function because in some systems the incoming packet can be encrypted. The decode function would be after packet decryption in those systems.

The TS_RX_DEC function decodes each received packet and determines if the packet meets the time sync event packet criteria. If the packet is determined to be a time sync event packet, then the time sync event is signaled to the CPTS controller via the TS_RX_DEC interface. If the packet is determined to be a time sync event packet and if the ALE did not drop the packet (the packet was to be sent to at least one port), then the ALE lookup is overridden and the packet is forced only to the host. The event signal is a single clock pulse indicating that the packet matched the time sync event packet criteria and that the associated packet handle, message type, and sequence ID are valid. No indication is given for received packets that do not meet the time sync event criteria. The 16-bit sequence ID is found in the time sync event packet at the sequence ID offset into the PTP message header (**pn_ts_seq_id_offset**). The 8-bit domain number is found in the time sync event packet at the domain offset into the PTP message header (**pn_ts_domain_offset**). A packet is determined to be a receive event packet under the following conditions.

Note

TS_RX_DEC and TS_RX_MII are internal interfaces that have no registers. They are included here for description purposes only.

11.2.1.4.10.1.1 Annex D (IPv4)

1. Receive annex D time sync is enabled (pn_ts_rx_annex_d_en is set in the Pn_TS_Ctl register).
2. One of the sequences below is true.
   - The first packet LTYPE matches 0x0800
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_rx_vlan_ltype1_en is set and the second packet LTYPE matches 0x0800
   - The first packet LTYPE matches ts_vlan_ltype2 and ts_rx_vlan_ltype2_en is set and the second packet LTYPE matches 0x0800
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_rx_vlan_ltype1_en is set and the second packet LTYPE matches ts_vlan_ltype2 and ts_rx_vlan_ltype2_en is set and the third packet LTYPE matches 0x0800
3. Byte 14 (the byte after the LTYPE) contains 0x45 (IP_VERSION). Note that the byte numbering assumes that there are no VLANs. The byte number is intended to show the relative order of the bytes.
4. Byte 20 contains 0bXXX00000 (5 lower bits zero) and Byte 21 contains 0x00 (fragment offset zero)
5. Byte 22 contains 0x01 (HOP Limit = 1) if the ts_ttl_nonzero bit in the switch Pn_TS_CTL_LTYPE2 register is zero, or byte 22 contains any value if ts_ttl_nonzero is set. Byte 22 is the TTL/HOP field.
6. Byte 23 contains 0x11 (Next Header UDP Fixed).
7. The ts_uni_en bit in the Pn_TS_Ctl_Ltype2 register is zero and Bytes 30 through 33 contain:
   - Decimal 224.0.1.129 and the ts_129 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - Decimal 224.0.1.130 and the ts_130 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - Decimal 224.0.1.131 and the ts_131 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - Decimal 224.0.1.132 and the ts_132 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - Decimal 224.0.0.107 and the ts_107 bit in the Pn_TS_Ctl_Ltype2 register is set

   Or:

   The ts_uni_en bit in the Pn_TS_Ctl_Ltype2 register is set and Bytes 30 through 33 contain any values.
8. Bytes 36 and 37 contain:
   - Decimal 0x01 and 0x3f respectively and the ts_319 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - Decimal 0x01 and 0x40 respectively and the ts_320 bit in the Pn_TS_Ctl_Ltype2 register is set.
9. The PTP message begins in byte 42.
10. The packet message type is enabled in the ts_msg_type_en field in Pn_TS_Ctl.

11. The packet was received without error (not long/short/mac_ctl/crc/code/align).

11.2.1.4.10.1.2 Annex E (IPv6)

1. Receive annex E time sync is enabled (pn_ts_rx_annex_e_en is set in the switch Pn_TS_Ctl register).
2. One of the sequences below is true.
   - The first packet LTYPE matches 0x86dd.
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_rx_vlan_ltype1_en is set and the second packet LTYPE matches 0x86dd.
   - The first packet LTYPE matches ts_vlan_ltype2 andts_rx_vlan_ltype2_en is set and the second packet LTYPE matches 0x86dd.
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_rx_vlan_ltype1_en is set and the second packet LTYPE matches ts_vlan_ltype2 and ts_rx_vlan_ltype2_en is set and the third packet LTYPE matches 0x86dd.
3. Byte 14 (the byte after the LTYPE) contains 0x6X (IP_VERSION in most significant nibble).
4. Byte 20 contains 0x11 (UDP Fixed Next Header).
5. Byte 21 contains 0x01 (HOP Limit = 1) if the ts_ttl_nonzero bit in the switch Pn_TS_Ctl_LType2 register is zero, or byte 21 contains any value if ts_ttl_nonzero is set. Byte 21 is the TTL/HOP field.
6. The ts_uni_en bit in the Pn_TS_Ctl_Ltype2 register is zero and Bytes 38 through 53 contain:
   - FF0M:0:0:0:0:0:0:0181 and the ts_129 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - FF0M:0:0:0:0:0:0:0182 and the ts_130 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - FF0M:0:0:0:0:0:0:0183 and the ts_131 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - FF0M:0:0:0:0:0:0:0184 and the ts_132 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - FF0M:0:0:0:0:0:0:006B and the ts_107 bit in the Pn_TS_Ctl_Ltype2 register is set (all values above are 16-bit hex numbers with M is enabled in the ts_mcast_type_en field in the Pn_TS_Ctl2 register.

   Or:

   The ts_uni_en bit in the Pn_TS_Ctl_Ltype2 register is set and Bytes 38 through 53 contain any value.
7. Bytes 56 and 57 contain (UDP Header in bytes 54 through 61):
   - Decimal 0x01 and 0x3f respectively and the ts_319 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - Decimal 0x01 and 0x40 respectively and the ts_320 bit in the Pn_TS_Ctl_Ltype2 register is set.
8. The PTP message begins in byte 62.
9. The packet message type is enabled in the ts_msg_type_en field in Pn_TS_Ctl.
10. The packet was received without error (not long/short/mac_ctl/crc/code/align).

11.2.1.4.10.1.3 Annex F (IEEE 802.3)

1. Receive Annex F time sync is enabled (ts_rx_annex_f_en is set in the switch Pn_TS_Ctl register).
2. One of the sequences below is true.
   - The first packet LTYPE matches ts_ltype1. LTYPE 1 should be used when only one time sync LTYPE is to be enabled.
   - The first packet LTYPE matches ts_ltype2 and ts_ltype2_en is set
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_rx_vlan_ltype1_en is set and the second packet LTYPE matches pn_ts_ltype1
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_rx_vlan_ltype1_en is set and the second packet LTYPE matches ts_ltype2 and ts_ltype2_en is set
   - The first packet LTYPE matches ts_vlan_ltype2 and ts_rx_vlan_ltype2_en is set and the second packet LTYPE matches pn_ts_ltype1
   - The first packet LTYPE matches ts_vlan_ltype2 and ts_rx_vlan_ltype2_en is set and the second packet LTYPE matches ts_ltype2 and ts_ltype2_en is set
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_rx_vlan_ltype1_en is set and the second packet LTYPE matches ts_vlan_ltype2 and ts_tx_vlan_ltype2_en is set and the third packet LTYPE matches pn_ts_ltype1
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_rx_vlan_ltype1_en is set and the second packet LTYPE matches ts_vlan_ltype2 and ts_rx_vlan_ltype2_en is set and the third packet LTYPE matches ts_ltype2 and ts_ltype2_en is set

3. The PTP message begins in the byte after the LTYPE.
4. The packet message type is enabled in the ts_msg_type_en field in the Pn_TS_Ctl register.
5. The packet was received without error (not long/short/mac_ctl/crc/code/align).

11.2.1.4.10.2 1588 Transmit Packet Operation

There are two CPSW transmit time sync interfaces for each Ethernet port. The first is the TS_TX_DEC interface and the second is the TS_TX_MII interface. Both interfaces are internal to the cpsw and are input to the CPTS module.

The TS_TX_DEC function decodes each packet to be transmitted and determines if the packet meets the time sync event packet criteria. If the packet is determined to be a time sync event packet, then the time sync event is signaled to the CPTS controller via the TS_TX_DEC interface (**pn_ts_tx_dec_evnt**, **pn_ts_tx_dec_hndl[3:0]**, **pn_ts_tx_dec_msg_type[3:0], pn_ts_tx_dec_seq_id[15:0]** and **pn_ts_rx_dec_domain[7:0]**). The event signal is a single clock pulse indicating that the packet matched the time sync event packet criteria and that the associated packet handle, message type, and sequence ID are valid. The 16-bit sequence ID is found in the time sync event packet at the sequence ID offset into the message header (**pn_ts_seq_id_offset**). The 8-bit domain number is found in the time sync event packet at the domain offset into the PTP message header (**pn_ts_domain_offset**). No indication is given for transmit packets that do not meet the time sync event criteria. The time sync event packet handle is also passed along with the packet to the TS_TX_MII with an indication that the packet is a time sync event packet. Unlike receive; only transmit event packets increment the handle value. The decode function is separated from the record function because some systems may encrypt the packet. The encryption is after the decode function on transmit (egress). A packet is determined to be a transmit event packet under the following conditions.

11.2.1.4.10.2.1 Annex D (IPv4)

1. Transmit time sync is enabled (ts_tx_annex_d_en is set in the switch Pn_TS_Ctl register).
2. One of the sequences below is true.
   - The first packet LTYPE matches 0x0800
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_tx_vlan_ltype1_en is set (PN_TS_VLAN_LTYPE register) and the second packet LTYPE matches 0x0800
   - The first packet LTYPE matches ts_vlan_ltype2 and ts_tx_vlan_ltype2_en is set and the second packet LTYPE matches 0x0800
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_tx_vlan_ltype1_en (PN_TS_CTL_REG) is set and the second packet LTYPE matches ts_vlan_ltype2 and ts_tx_vlan_ltype2_en is set and the third packet LTYPE matches 0x0800
3. Byte 14 (the byte after the LTYPE) contains 0x45 (IP_VERSION). Note that the byte numbering assumes that there are no VLANs. The byte number is intended to show the relative order of the bytes. If VLAN(s) are present then the byte numbers push down.
4. Byte 20 contains 0bXXX00000 (5 lower bits zero) and Byte 21 contains 0x00 (fragment offset zero)
5. Byte 22 contains 0x01 (HOP Limit = 1) if the ts_ttl_nonzero bit in the switch Pn_TS_Ctl_LType2 register is zero, or byte 22 contains any value if ts_ttl_nonzero bit is set. Byte 22 is the TTL/HOP field.
6. Byte 23 contains 0x11 (Next Header UDP Fixed).
7. The pn_ts_uni_en bit in the Pn_TS_Ctl_Ltype2 register is zero and bytes 30 through 33 contain:
   - Decimal 224.0.1.129 and the ts_129 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - Decimal 224.0.1.130 and the ts_130 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - Decimal 224.0.1.131 and the ts_131 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - Decimal 224.0.1.132 and the ts_132 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - Decimal 224.0.0.107 and the ts_107 bit in the Pn_TS_Ctl_Ltype2 register is set

   Or:

   The ts_uni_en bit in the Pn_TS_Ctl_Ltype2 register is set and Bytes 30 through 33 contain any values.
8. Bytes 36 and 37 contain:
   - Decimal 0x01 and 0x3f respectively and the ts_319 bit in the Pn_TS_CTL_Ltype2 register is set, or
   - Decimal 0x01 and 0x40 respectively and the ts_320 bit in the Pn_TS_CTL_Ltype2 register is set.
9. The PTP message begins in byte 42 (this is offset 0).

10. The packet message type is enabled in ts_msg_type_en field in the Pn_TS_Ctl register.
11. The packet was sent by the host (port 0).

11.2.1.4.10.2.2 Annex E (IPv6)

1. Transmit annex E time sync is enabled (ts_tx_annex_e_en is set in the Pn_TS_Ctl register).
2. One of the sequences below is true.
   - The first packet LTYPE matches 0x86dd.
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_tx_vlan_ltype1_en is set and the second packet LTYPE matches 0x86dd.
   - The first packet LTYPE matches ts_vlan_ltype2 and ts_tx_vlan_ltype2_en is set and the second packet LTYPE matches 0x86dd.
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_tx_vlan_ltype1_en is set and the second packet LTYPE matches ts_vlan_ltype2 and ts_tx_vlan_ltype2_en is set and the third packet LTYPE matches 0x86dd.
3. Byte 14 (the byte after the LTYPE) contains 0x6X (IP_VERSION in most significant nibble).
4. Byte 20 contains 0x11 (UDP Fixed Next Header).
5. Byte 21 contains 0x01 (HOP Limit = 1) if the ts_ttl_nonzero bit in the switch Pn_TS_Ctl_LType2 register is zero, or byte 21 contains any value if ts_ttl_nonzero is set. Byte 21 is the TTL/HOP field.
6. The ts_uni_en bit in the Pn_TS_Ctl_Ltype2 register is zero and Bytes 38 through 53 contain:
   - FF0M:0:0:0:0:0:0:0181 and the ts_129 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - FF0M:0:0:0:0:0:0:0182 and the ts_130 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - FF0M:0:0:0:0:0:0:0183 and the ts_131 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - FF0M:0:0:0:0:0:0:0184 and the ts_132 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - FF0M:0:0:0:0:0:0:006B and the ts_107 bit in the Pn_TS_Ctl_Ltype2 register is set (all values above are 16-bit hex numbers with M is enabled in the ts_mcast_type_en field in the Pn_TS_Ctl2 register.

     Or:

     The pn_ts_uni_en bit in the Pn_TS_Ctl_Ltype2 register is set and Bytes 38 through 53 contain any value.
7. Bytes 56 and 57 contain (UDP Header in bytes 54 through 61):
   - Decimal 0x01 and 0x3f respectively and the ts_319 bit in the Pn_TS_Ctl_Ltype2 register is set, or
   - Decimal 0x01 and 0x40 respectively and the ts_320 bit in the Pn_TS_Ctl_Ltype2 register is set.
8. The PTP message begins in byte 62.
9. The packet message type is enabled in the ts_msg_type_en field in Pn_TS_Ctl.
10. The packet was sent by the host (port 0).

11.2.1.4.10.2.3 Annex F (IEEE 802.3)

1. Transmit time sync is enabled (ts_tx_annex_f_en is set in the switch Pn_TS_Ctl register).
2. One of the sequences below is true.
   - The first packet LTYPE matches ts_ltype1. LTYPE 1 should be used when only one time sync LTYPE is to be enabled.
   - The first packet LTYPE matches ts_ltype2 and ts_ltype2_en is set
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_tx_vlan_ltype1_en is set and the second packet LTYPE matches pn_ts_ltype1
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_tx_vlan_ltype1_en is set and the second packet LTYPE matches ts_ltype2 and ts_ltype2_en is set
   - The first packet LTYPE matches ts_vlan_ltype2 and ts_tx_vlan_ltype2_en is set and the second packet LTYPE matches pn_ts_ltype1
   - The first packet LTYPE matches ts_vlan_ltype2 and ts_tx_vlan_ltype2_en is set and the second packet LTYPE matches ts_ltype2 and ts_ltype2_en is set
   - The first packet LTYPE matches ts_vlan_ltype1 and ts_tx_vlan_ltype1_en is set and the second packet LTYPE matches ts_vlan_ltype2 and ts_tx_vlan_ltype2_en is set and the third packet LTYPE matches pn_ts_ltype1

- The first packet LTYPE matches ts_vlan_ltype1 and ts_tx_vlan_ltype1_en is set and the second packet LTYPE matches ts_vlan_ltype2 and ts_tx_vlan_ltype2_en is set and the third packet LTYPE matches ts_ltype2 and ts_ltype2_en is set

3. The packet message type is enabled in the ts_msg_type_en field in the Pn_TS_Ctl register.
4. The packet was sent by the host (port 0).

The TS_TX_MII interface issues a single clock record signal at the beginning of each transmitted packet. If the packet is a time sync event packet then a single clock event signal along with a handle will be issued before the next record signal for the next packet. The event signal will not be issued for packets that did not meet the time sync event criteria in the TS_TX_DEC function. If consecutive record indications occur without an interleaving event indication, then the packet associated with the first record was not a time sync event packet. The record signal is a single clock pulse indicating that a transmit packet egress has been detected at the associated port MII interface. The handle value is incremented with each time sync event packet and rolls over to zero after 7. There are 8 possible handle values so there can be a maximum of 8 time sync event packets “in flight” from the TS_TX_DEC to the TS_TX_MII block at any given time. The handle value increments only on time sync event packets. The TS_TX_MII logic is in the transmit wireside clock domain.

Note

TS_TX_DEC and TS_TX_MII are internal interfaces that have no registers. They are included for description purposes only.

11.2.1.4.11 Rate Limiting (Traffic Shaping) (P802.1Qav/D6.0)

Rate-limit mode is intended to allow some CPPI ingress channels and some Ethernet transmit (switch egress) priorities to be rate-limited. Non rate-limited traffic (bulk traffic) is allowed on lower priority non rate-limited channels and FIFO priorities. Rate-limited traffic must be configured to be sent to rate-limited queues (via packet priority handling). The allocated rates for rate-limited traffic must not be oversubscribed. For example, if port 1 is sending 15% rate limited traffic to port 2 priority 3, and port 0 is also sending 10% rate-limited traffic to port 2 priority 3, then the port 2 priority 3 egress rate must be configured to be 25% plus a percent or two for margin. The switch must be configured to allow some percentage of non rate-limited traffic. Non rate-limited traffic must be configured to be sent to non rate-limited queues. No packets from the host should be dropped, but non rate-limited Ethernet ingress traffic can be dropped. For rate limited priorities, the configured transfer rate includes the committed information rate and the excess information rate. The excess information rate will only be attempted to be sent when there is no packet backlog on every priority that does not have the excess information rate enabled. The committed information rate will be sent regardless of network traffic as long as the configuration is not oversubscribed. The excess information rate will be sent only when network conditions allow.

Credit Based Shaper (CBS)

CBS based traffic shaping is supported in the CPSW IP and can be enabled by either configuring it in the ***committed information rate*** register either in the CPPI port ingress or in the Ethernet port transmit. If the rate limiting is applied at the CPPI port ingress, then the CPDMA makes sure to transmit the data at the limited rate. If it is configured at the Ethernet port end the burst data may be buffered in the Ethernet FIFO before transmitting, care must be taken such that Ethernet FIFO does not overflow when rate limiting is set in Ethernet port.

The relation between CBS parameters and hardware register configuration is as follows:

- idleSlope is essentially the rate limit, i.e. idleSlope = CIR (committed information rate) in Mbps
- portTransmitRate is link speed or port speed which is 100Mbps in
- sendSlope is calculated as, sendSlope = idleSlope - portTransmitRate (this is described in the spec)
- hicredit and locredit : credit is calculated based on the idleSlope and sendSlope, it is maintained internally in the hardware, this is not a configurable parameter to the user.

11.2.1.4.11.1 CPPI Port Ingress Rate Limiting

Port 0 FHost operations can be configured to rate limit the packet data for each channel (priority). FHost has 8 priorities for QOS. There is a committed information rate (**P0_Pri_CIR**) and an excess information rate for each priority (**P0_Pri_EIR**). Rate limiting is enabled for a priority when the committed information rate for the

priority is non-zero. The excess information rate for a priority is enabled when the excess information rate for the priority is non-zero. The committed information rate must be non-zero if the excess information rate is configured to be non-zero. That is, there must be a configured non-zero committed information rate for there to be a configured non-zero excess information rate. Bulk traffic on other non-rate limited priorities does not impact the committed information traffic on a priority. However, bulk traffic on other non-rate limited priorities does impact the excess information rates. No bulk priority will be enabled to send unless there are **tx_host_blks_rem** number of unused blocks remaining in each of the Ethernet port transmit FIFOs. The “blocks remaining check” ensures that bulk traffic from the host will not block rate-limited traffic from the host. Rate limited channels must be the highest priority channels. For example, if two rate limited channels are required then priorities 7 and 6 should be configured for committed information (and excess information if desired). When any channels are configured to be rate-limited, the ingress priority type must be fixed. Round-robin priority type is not allowed when rate-limiting is configured for any priority. The configured transfer rate includes the inter-packet gap (12 bytes) and the preamble (8 bytes). The rate in Mbits/second for each priority is controlled by the below equation. If the configured excess information rate is zero, then only the committed information rate is transferred:

Priority Transfer rate in Mbit/s = ((((Frequency in MHZ) * **P0_Pri_CIR**) / 32768) +

(((Frequency in MHZ) * **P0_PriX_EIR**) / 32768))

Where the frequency is the **VBUSP_GCLK** frequency (350 for 350Mhz) and priX = pri0 to pri7. For example, 10Mbps on priority 7 would give the below:

10Mbps = ~ ((350 * 936) / 32768), at 350Mhz and **p0_pri7_cir** value = 936 (no excess information rate)

11.2.1.4.11.2 Ethernet Port Transmit Rate Limiting

Ethernet port transmit operations can be configured to rate limit egress data for each egress priority. There is a committed information rate (**Pn_PriX_CIR**) and an excess information rate for each priority (**Pn_PriX_EIR**). Rate limiting is enabled for a priority when the committed information rate for the priority is non-zero. The excess information rate for a priority is enabled when the excess information rate for the priority is non-zero. The committed information rate must be non-zero if the excess information rate is configured to be non-zero. That is, there must be a configured non-zero committed information rate for there to be a configured non-zero excess information rate. Bulk traffic on other non-rate limited priorities does not impact the committed information traffic on a priority. However, bulk traffic on other non-rate limited priorities does impact the excess information rates. Rate limited channels must be the highest priority channels. For example, if two rate limited channels are required then priorities 7 and 6 should be configured for committed information (and excess information if desired). The configured transfer rate includes the inter-packet gap (12 bytes) and the preamble (8 bytes). The rate in Mbits/second that each priority is configured to send is controlled by the below equation. If the excess information rate is disabled then the committed information rate only is transferred:

Priority Transfer rate in Mbit/s = ((((Frequency in MHZ) * **Pn_PriX_CIR**) / 32768) +

(((Frequency in MHZ) * **Pn_PriX_EIR**) / 32768))

Where the frequency is the **VBUSP_GCLK** frequency (350 for 350Mhz) and priX = pri0 to pri7. For example, 100Mbps on priority 7 would give the below:

100Mbps = ~ ((350 * 9360) / 32768), at 350Mhz and **pn_pri7_cir** value = 9360, with no excess information rate.

11.2.1.4.12 Transmit Priority Escalation

Bulk (non rate limited) traffic can be escalated in order to preclude starvation of lower bulk traffic priorities from higher bulk traffic priorities. Escalation is configured and enabled in the **PTYPE** register with the **pn_ptype_esc** and **esc_pri_ld_val** fields. Escalation can be enabled with rate limited priorities. The rate limited priorities are on the upper priorities starting with priority 7 and going down(consecutively), and therefore, the escalated priorities are on the lower bulk priorities.

11.2.1.4.13 Enhanced Scheduled Traffic (EST – P802.1Qbv/D2.2)

11.2.1.4.13.1 EST Overview

- When enabled and configured, EST allows express queue traffic to be scheduled (placed) on the wire at specific repeatable time intervals.
- EST operates on a repeating time interval generated by the CPTS EST function generator. For example, a 125us repeating time interval can be configured.
- Each Ethernet port has 128 EST fetch commands maximum in the global EST fetch RAM.
- Each 22-bit fetch command consists of a 14-bit fetch count (14 msb's) and an 8-bit priority fetch allow (8 lsb's) that will be applied for the fetch count time in wireside clocks.
- The configured port fetch commands are executed in sequence, beginning at port address zero each time through the time interval beginning at cycle start.
- EST allows non-scheduled express and prempt queue traffic to be cleared from the wire to ensure that the scheduled traffic is transmitted at the proper time (wire clear is performed with zero allow).
- EST can be used with or without premption. The pn_mac_prempt[7:0] value determines whether the priority is enabled on the express or prempt queue. Whether a priority is on the express or prempt queue only effects the wire clear time from an EST operation perspective.
- Software should not move priorities to the prempt queue unless preemption is configured, enabled, and verified - allowing preemption to occur.
- Express packet time stamp events can be enabled to assist software in configuring and timing EST operations.

11.2.1.4.13.2 EST Fetch RAM

- The EST fetch RAM is read/write in the CPSW configuration address space.
- Each Ethernet transmit port has 128 locations in the global EST fetch RAM.
  - Ethernet port 1 has EST fetch RAM addresses 0x000-0x1ff.
  - Ethernet port 2 has EST fetch RAM addresses 0x200-0x3ff, and so on.
- One buffer operation – When est_onebuf is set, the 128 port locations operate as one buffer. The est_bufact bit in Pn_FIFO_Status is the upper address bit of the port's fetch RAM address indicating whether operation is currently in the upper or lower 64 locations of the port's fetch RAM.
- Two buffer operation - When est_onebuf of PN_EST_CONTROL register is cleared there are two 64-location buffers with est_bufsel selecting the buffer to be used. When the buffer is switched by changing the est_bufsel value, the actual switch occurs on cycle start. The actual buffer being used is indicated by the est_bufact bit in Pn_FIFO_Status. Software should avoid writing the switched out buffer fetch RAM locations until it detects that the actual switch has occurred.
- The first address location in the port's fetch RAM space (location zero) is read at the beginning of each EST time interval (cycle start). Addresses are then read in ascending order for the duration of the interval. The port's address zero location is then read again at the beginning of the next cycle repeating the time interval packet operations.

11.2.1.4.13.3 EST Time Interval

- Each Ethernet port has an EST function (ESTF) generator in the CPTS submodule.
- The EST function generator generates the EST time interval as a configured number of CPTS reference clocks (CPTS_RCLK).
- The EST function generator rising edge is the cycle start time and the cycle repeats (cycle start occurs) after every time interval.
- The first fetch allow (8 lsb's of the fetch command from the EST fetch RAM) value is at the port's base address zero in the EST fetch RAM and is actually applied 16 wireside clocks after cycle start. The 16 clock delay allows the first fetch value to be fetched from the EST fetch RAM (prefetch time at cycle start).
- Each successive fetch allow is applied for the associated fetch count thereafter. The minimum non-zero fetch count is 16. The minimum value of 16 guarantees that the next fetch value has time to be fetched before the current fetch count is over. There are 64 maximum fetch values when est_onebuf=0, and 128 maximum fetch values when est_onebuf=1.
- The next cycle start then causes the fetch to once again start at the port's address zero location.

11.2.1.4.13.4 EST Fetch Values

- The 22-bit fetch value is made up of the 14-bit fetch count and the 8-bit fetch allow.
- The fetch time indicates the number of wireside clocks that the fetch allow will be active.
- The fetch count is in Ethernet wireside clocks which is bytes in gigabit mode (pn_gig=1) and nibbles in 10/100Mbps mode.
- When a fetch allow bit is set, the corresponding priority is enabled to begin packet transmission on an allowed priority subject to rate limiting. There is no requirement that the packet end in the time interval. The actual packet transmission on the wire may carry over into the next fetch count - which is the reason for the wire clear time in a fetch zero allow.
- When a fetch allow bit is cleared, the corresponding priority is not enabled to transmit for the fetch count time. However, if a packet were enabled in a previous fetch allow there the packet could finish in the current time interval.
- A non-zero fetch allow value with a non-zero fetch count causes the fetch allow value to be applied for the fetch count number of wireside clocks (minimum of 16 fetch count).
- A zero fetch count causes the associated fetch allow to be held for the duration of the cycle (until the next cycle start).
- A zero fetch allow with a non-zero fetch count is intended to clear the wire for a scheduled (timed) express packet in the next fetch. A zero fetch allow indicates that no packet can be started for transmission for the associated fetch count. However, packets that were started in the previous interval could still be on the wire. The associated fetch count must be sufficient to guarantee that the wire is cleared given that a packet on an allowed priority in the previous fetch could have been started on the previous clock and that there is hardware latency in the clear time. The timed packet should be sent on a priority that is enabled in the next fetch but disabled in the current zero allow fetch.
- EST Ram Configuration – The simplest EST configuration is for a single express packet on a single priority in the EST time interval. Ram Address 0 will be read at the start of each interval, the timed packet goes out in Ram Address 1 interval, and Ram Address 2 priorities are held for the duration of the cycle in this simple configuration.
  - Ram Address 0 – 0xD0000 (10/100 with 1518 max pkt length in previous allow)
    - This is a zero allow at the beginning of each cycle which clears the wire for the timed express packet in the next fetch. The zero allow time (0xD00 in this case) allows the wire to be cleared for the express packet. Setting this value lower might push out the timed express packet into the next interval. For a 2020 max packet size in the previous allow, this value should be 0x10F400. The number of clocks required for the zero allow is determined by the below equation.
      - Clocks in zero allow = Maximum ***Express*** packet length in previous allow (times 2 for 10/100) + decimal 292. (If preemption is configured and enabled then this minimum time is 0x100 if only prempt priorites are in the previous allow – which is not a normal case).
  - Ram Address 1 – 0x01080
    - This is a decimal 16 clock allow for the timed express packet on priority 7. The 16 clock allow value permits only a single packet to start in the time interval.
  - Ram Address 2 – 0x0007F
    - This is a zero fetch count that allows priorities 6 downto 0 for the duration of the EST time interval. This is the previous allow for the zero allow in Address 0 above.

11.2.1.4.13.5 EST Packet Fill

- Packet fill can (should) be configured and enabled to occur in the fetch count time associated with a fetched zero allow that preceeds a timed express packet. The intention with fill is that a smaller packet on a non-timed priority might be able to be inserted on the wire during the wire clear time which would increase wire utilization. Fill must be configured to ensure that any fill packet does not conflict with the timed express packet allowed in the next fetch. Incorrect configuration might push out in time any express timed packet which indicates that the fill margin needs to be increased.
- Fill Configuration
  - The est_fill_margin value in Pn_EST_Control should be written with a 0x100 value.

- The est_prempt_comp value in Pn_EST_Control should be written with a 0x12 value (if IET is to be configured and enabled). This value times eight is the number of wireside clocks required to clear prempt packets off the wire at the end of a zero allow.
- The est_fill_en bit in Pn_EST_Control should be set.

11.2.1.4.13.6 EST Time Stamp

- EST can be configured to generate CPTS timestamp events for selected express traffic.
- EST timestamp events use the CPTS host event type (event_type=7). EST timestamps will not override host sent timestamps for packets that were sent from the host with an enabled host timestamp.
- EST Events (host events EVENT_n_REG) contain the below information:
  - Time Stamp of the selected express packet.
  - The event port_number indicates the transmit port number.
  - The event event_type is decimal 7 (host event).
  - The event message_type indicates the packet transmit hardware switch priority.
  - The event sequence_id upper nibble indicates the packet receive port number.
  - The event sequence_id lower byte indicates the sequence number of the express packet in numerical order. The first event is event one, the second is event two and so on. The sequence id rolls over to zero after 0xff (8-bits).
  - The event domain is the value from the est_ts_domain[8:0] register.
- When est_ts_en is set, timestamp events will be generated on selected express traffic.
- When est_ts_first is also set, events will be generated only on the first express packet in each time interval. If est_ts_onepri is also set then the event will only be on the first est_ts_pri express packet in the time interval. If est_ts_onepri is clear then the event will be generated on the first express packet in the time interval on any priority.
- When est_ts_first is clear, events will be generated on every express packet. If est_ts_onepri is set then the event will be generated on every est_ts_pri express packet. If est_ts_onepri is clear then event will be generated on every express packet on any priority.

11.2.1.4.13.7 EST Packets Per Priority – (N = 2 only)

With a MAC configuration (**N** = 2), the number of packets allowed in a transmit FIFO priority can be selected by writing a non-zero value to **p0_rx_pkts_pri[7-0]**. The port 0 receive gap should then be enabled by setting the corresponding priority **rx_gap_en[7:0]**. The receive gap allows a packet to land in the transmit FIFO before another packet is allowed in which guarantees that only the selected number (max) of packets is allowed in on the specified priority. If the receive gap is not enabled, then there might be one or two more packets allowed in on the priority than the **p0_rx_pkt_pri[7:0]** value has selected.

11.2.1.4.14 DSCP

The ALE can map DSCP field to priority prior to port trunking hashing and policing/classification matching. When enabled the DSCP is mapped via 64 priority entries such that any DSCP value can be mapped to any of the eight priorities. When a packet is received without a VLAN priority this remapped priority can be used instead of the default Port VLAN priority field. See the Switch Port configuration for the registers describing DSCP mapping.

11.2.1.4.15 Packet Priority Handling

There are three priorities used inside the CPSW - the packet priority, the header packet priority, and the switch priority. The packet priority is the determined priority of the ingress packet. The header packet priorityis used as the outgoing VLAN priority if the packet is egressing from the switch with a VLAN tag. The switch prioritydetermines which of the eight FIFO priority queues the packet uses during egress.

The **vlan_ltype_sel** value below is selected by the **s_cn_switch** bit in the **CPSW_Control** register and is either the **vlan_ltype_inner** (0x8100 default) or **vlan_ltype_outer** (0x88a8 default) value.

11.2.1.4.15.1 Ethernet Port Ingress

Ethernet ingress packets have an ingress packet priority of 0 to 7 (with 7 being the highest priority). The packet priority is determined as follows:

1. If the first packet LTYPE = vlan_ltype_sel then the ingress packet priority is the packet priority (VLAN tagged and priority tagged packets).
2. Else if the first packet LTYPE = 0x0800 and byte 14 (following the LTYPE) is equal to 0x4X, and dscp_ipv4_en is set in Pn_Control, then the ingress packet priority is the 6-bit TOS field in byte 15 (upper 6-bits) mapped through the port's DSCP priority mapping registers (IPV4 packet).
3. Else if the first packet LTYPE = 0x86dd and the most significant nibble of byte 14 (following the LTYPE) is equal to 0x6, and dscp_ipv6_en is set in Pn_Control, then the ingress packet priority is the 6-bit priority (in the 6-bits following the upper nibble 0x6) mapped through the port's DSCP priority mapping registers (IPV6 packet).
4. Else the ingress packet priority is the source (ingress) port priority taken from the port's Pn_Port_VLAN register.

The packet priority is mapped through the ingress port's associated "packet priority to header packet priority mapping register" (**pn_rx_pri_map**) to obtain the header packet priority (**hdr_pkt_pri**). The header packet priority is then used as the actual transmit packet priority if the VLAN information is to be sent on egress. The header packet priority is mapped at each destination FIFO through the **pn_tx_pri_map** register (header priority to switch priority mapping register) to obtain the hardware switch priority (hardware queue 0 through 7).

11.2.1.4.15.2 CPPI Port FHost (Ingress)

FHost packets have a packet priority (0 to 7 with 7 being the highest priority). The FHost packet priority is determined as follows:

1. If the first packet LTYPE = vlan_ltype_sel then the FHost packet priority is the packet priority (VLAN tagged and priority tagged packets).
2. Else if the first packet LTYPE = 0x0800 and byte 14 (following the LTYPE) is equal to 0x4X, and p0_dscp_ipv4_en is set in P0_Control, then the FHost packet priority is the 6-bit TOS field in byte 15 (upper 6-bits) mapped through the port's DSCP priority mapping registers (IPV4 packet).
3. Else if the first packet LTYPE = 0x86dd and the most significant nibble of byte 14 (following the LTYPE) is equal to 0x6, and dscp_ipv6_en is set in P0_Control, then the FHost packet priority is the 6-bit priority (in the 6-bits following the upper nibble 0x6) mapped through the port's DSCP priority mapping registers (IPV6 packet).
4. Else the FHost packet priority is the source port priority taken from P0_Port_VLAN.

The ingress packet priority is mapped through the port's associated "packet priority to header packet priority mapping register" (**p0_rx_pri_map**) to obtain the header packet priority. The header packet priority is then used as the actual transmit packet priority if the VLAN information is to be sent on egress.

For CPPI FHost packets, the destination port hardware switch priority is the below selected value remapped through **p0_rx_pri_map**:

1. If the FHost packet is priority tagged or vlan tagged:
   - If rx_remap_vlan is clear then the the destination hardware switch priority is the CPPI FHost channel number.
   - If rx_remap_vlan is set then the the destination hardware switch priority is the packet priority value. Port transmit remapping (Pn_Tx_Pri_Map should remain the default value) is not compatible with this bit being set, but remapping can be configured on port 0 FHost. If N=2 (two port MAC) remapping should be done only on ingress for Ethernet and CPPI.
2. Else if the ingress packet has the first packet LTYPE = 0x0800 and byte 14 (following the LTYPE) is equal to 0x4X, and **dscp_ipv4_en** is set in **P0_Control**:
   - If rx_remap_dscp_v4 is clear then the destination hardware switch priority is the CPPI ingress priority.
   - If rx_remap_dscp_v4 is set then the destination hardware switch priority is the 6-bit TOS field in byte 15 (upper 6-bits) mapped through the port's DSCP priority mapping registers (IPV4 packet). Port 1 transmit remapping (Pn_Tx_Pri_Map should remain the default value) is not compatible with this bit being set, but remapping can be configured on port 0 ingress. If N=2 (two port MAC) remapping should be done only on ingress for Ethernet and CPPI.
3. Else if the ingress packet has the first packet LTYPE = 0x86dd and the most significant nibble of byte 14 (following the LTYPE) is equal to 0x6, and **dscp_ipv6_en** is set in **CPPI_P0_Control**:

- If rx_remap_dscp_v6 is clear then the destination hardware switch priority is the CPPI ingress priority.
- If rx_remap_dscp_v6 is set then the destination hardware switch priority is the 6-bit priority (in the 6-bits following the upper nibble 0x6) mapped through the port's DSCP priority mapping registers (IPV6 packet). Port 1 transmit remapping (Pn_Tx_Pri_Map should remain the default value) is not compatible with this bit being set, but remapping can be configured on port 0 ingress. If N=2 (two port MAC) remapping should be done only on ingress for Ethernet and CPPI.

4. Else the ingress packet is non-tagged and the destination hardware switch priority is the CPPI ingress channel number.

11.2.1.4.15.3 CPPI Port THost (Egress)

If the **thost_ch_override** bit in **CPDMA_Control** is clear then the CPDMA packet THost channel number is the port 0 hardware switch priority. If **thost_ch_overide** is set, then for packets with a classification match the THost channel number is the lower three bits of the 6-bit address lookup engine classification match value (**threadval[2:0]** in ALE register **THREADMAPVAL**). The **flow** value in the VLAN encapsulation word is all 6 bits of the **threadval** for classifier matches regardless of the setting of **thost_ch_override** if the encapsulation word is transferred.

11.2.1.4.16 Packet CRC Handling

Every cpsw ingress packet on all ports is checked for CRC correctness. Each packet is then given an internally generated Castignoli CRC for transport through the cpsw to egress port(s). The internally generated Castignoli CRC protects the packet from end to end through the cpsw. Ingress Packets with CRC errors are handled as indicated below.

11.2.1.4.16.1 Ethernet Port Ingress

Ethernet ports check each ingress packet CRC for correctness in all modes/speeds. The port can check for either Ethernet CRC for correctness as determined by the **crc_type** bit in the **Mac_Control** register. Ethernet packets received with a CRC error are dropped at the receive port unless the receive port **rx_cef_en** bit is set. Error packets are sent only to the host port. For packets with Ethernet ingress errors sent to the host, the error is indicated in the host egress buffer descriptor and the original packet CRC bytes are kept for CPDMA THost.

11.2.1.4.16.2 Ethernet Port Egress

Ethernet ports transmit egress packets with the CRC type selected by the **crc_type** bit in the **Pn_Mac_Control** register regardless of the packet's ingress CRC type. On Ethernet egress, after passing through the switch, the internally generated Castignoli CRC is checked for correctness and if correct the packet is output with the generated selected output CRC type. If the internally generated CRC is incorrect, due either to a bit flip in a memory (or logic) or an error CRC passed in on host ingress, then the generated egress CRC type is used with at least a single byte of the internally generated Castignoli CRC inverted to indicate the error. If the packet length including CRC is divisible by 4 then all 4 CRC bytes will be inverted on error. If there are three bytes remainder after dividing the packet length by 4 then three bytes will be inverted (and so on down to one byte remainder).

11.2.1.4.16.3 CPPI Port FHost

CPPI host port FHost packets can be passed in with or without a CRC. The FHost packet CRC type is indicated in the buffer descriptor word **crc_type** bit and can be Ethernet. The **p0_rx_pass_crc_err** bit in the **CPSW_Control** register determines if FHost packets with CRC errors are passed or dropped. Passed packets with CRC errors will be transmitted on Ethernet egress with a CRC error.

11.2.1.4.16.4 CPPI Port Egress (THost)

The **p0_tx_crc_remove** bit in the **CPSW_Control** register determines if all CPPI THost packets have a CRC included or not. THost packets not filtered on Ethernet ingress due to **pn_rx_cef_en** have the packet error CRC included (not replaced by the egress CRC type) if the CRC is not removed on egress. The error is indicated in the buffer descriptor. CPPI THost packets that detected a CRC error on the internally generated Castignoli CRC, due to a bit flip in logic or memory, will indicate the error with the **drop** bit set in the buffer descriptor.

11.2.1.4.17 Ethernet FIFO

Each transmit packet FIFO contains eight logical transmit queues (priority 0 through 7 with 7 the highest priority) regardless of the memory configuration. The receive logical FIFO is combined with the transmit logical FIFO into the same RAM instance. The receive FIFO is used for single packet reception and error detection and flow control runout. Packets are queued on transmit. Ethernet FIFO size is 20 KBytes.

11.2.1.4.18 Ethernet Receive Flow Control

When enabled and triggered, receive flow control is initiated to limit the Mac from further frame reception. Half-duplex mode receive flow control is collision based while full duplex mode issues 802.3X or Priority Based Flow Control (PFC) pause frames. In all cases, receive flow control prevents frame reception by issuing the flow control appropriate for the current mode of operation. Receive flow control is enabled by the **rx_flow_en** bit in the **Pn_Mac_Control** register, and **rx_flow_pri[7:0]** in **Pn_Pri_Ctl**. For 10/100 modes of operation, collision or IEEE 802.3X flow control is determined via the **fullduplex** bit in the **Pn_Mac_Control** register. The **fullduplex** bit must be set for Priority Based Flow Control.

11.2.1.4.18.1 MII (10/100) Collision Based Receive Buffer Flow Control

Collision-based receive buffer flow control provides a means of preventing frame reception when the port is operating in half-duplex mode (**fullduplex**is cleared in **Pn_Mac_Control)**. When receive flow control is enabled and triggered, the port will generate collisions for received frames. The jam sequence transmitted will be the twelve byte sequence C3.C3.C3.C3.C3.C3.C3.C3.C3.C3.C3.C3 (hex). The jam sequence will begin no later than approximately as the source address starts to be received. Note that these forced collisions will not be limited to a maximum of 16 consecutive collisions, and are independent of the normal back-off algorithm. Receive flow control does not depend on the value of the incoming frame destination address. A collision will be generated for any incoming packet, regardless of the destination address.

11.2.1.4.18.2 IEEE 802.3X (10/100/1G/10G) Receive Flow Control

IEEE 802.3x based receive flow control provides a means of preventing frame reception when the port is operating in full-duplex mode (**fullduplex**is set in **Pn_Mac_Control)**. When receive flow control is enabled and triggered, the port will transmit a pause frame to request that the sending station stop transmitting for the period indicated within the transmitted pause frame.

The Mac will transmit a pause frame to the reserved multicast address at the first available opportunity (immediately if currently idle, or following the completion of the frame currently being transmitted). The pause frame will contain the maximum possible value for the pause time (0xFFFF). The MAC will count the receive pause frame time (decrements 0xFF00 down to zero) and retransmit an outgoing pause frame if the count reaches zero. When the flow control request is removed, the MAC will transmit a pause frame with a zero pause time to cancel the pause request.

Note that transmitted pause frames are only a request to the other end station to stop transmitting. Frames that are received during the pause interval will be received normally (provided the Rx FIFO is not full at which time the receive FIFO will overrun and **Rx_Top_Of_FIFO_Drop** will increment).

Pause frames will be transmitted if enabled and triggered regardless of whether or not the port is observing the pause time period from an incoming pause frame.

The Mac will transmit pause frames as described below:

- The 48-bit reserved multicast destination address 01.80.C2.00.00.01.
- The 48-bit source address – Pn_SA(47:0) (PN_SA_L, PN_SA_H registers).
- The 16-bit length/type field containing the value 88.08
- The 16-bit pause opcode equal to 00.01
- The 16-bit pause time value FF.FF. A pause-quantum is 512 bit-times. Pause frames sent to cancel a pause request will have a pause time value of 00.00.
- Zero padding to 64-byte packet length (The MAC will transmit only 64 byte pause frames).
- The 32-bit frame-check sequence (CRC word).

All quantities above are hexadecimal and are transmitted most-significant byte first. The least-significant bit is transferred first in each byte.

If **rx_flow_en** is cleared to zero while the pause time is nonzero, then the pause time will be cleared to zero and a zero count pause frame will be sent.

11.2.1.4.18.2.1 Flow Control Trigger

Receive flow control is triggered (when enabled), when the number of words in the receive FIFO is greater than or equal to **rx_flow_thresh**. The flow control packet runout is then contained in the remainder of the receive FIFO.

11.2.1.4.18.3 Ethernet Transmit Flow Control

11.2.1.4.18.3.1 IEEE 802.3X (10/100/1G/10G) Based Transmit Flow Control

Incoming pause frames are acted upon, when enabled, to prevent the Mac from transmitting any further frames. Incoming pause frames are only acted upon when the **fullduplex** and **tx_flow_en** bits in the **Pn_Mac_Control** register are set. Pause frames are not acted upon in half-duplex mode. Pause frame action will be taken if enabled, but normally the frame will be filtered and not transferred to memory. MAC control frames will be transferred to memory if the **rx_cmf_en** (Copy MAC Frames) bit in the **Pn_Mac_Control** register is set. The **tx_flow_en** and **fullduplex** bits effect whether or not MAC control frames are acted upon, but they have no effect upon whether or not MAC control frames are transferred to memory or filtered.

Pause frames are a subset of MAC Control Frames with an opcode field=0x0001. Incoming pause frames will only be acted upon by the port if:

- tx_flow_en is set in Pn_Mac_Control, and
- the frame's length is 64 to rx_maxlen bytes inclusive, and
- the frame contains no crc error or align/code errors.

The pause time value from valid frames will be extracted from the two bytes following the opcode. The pause time will be loaded into the port's transmit pause timer and the transmit pause time period will begin.

If a valid pause frame is received during the transmit pause time period of a previous transmit pause frame then:

- if the destination address is not equal to the reserved multicast address or any enabled or disabled unicast address, then the transmit pause timer will immediately expire, or
- if the new pause time value is zero then the transmit pause timer will immediately expire, else
- the port transmit pause timer will immediately be set to the new pause frame pause time value. (Any remaining pause time from the previous pause frame will be discarded).

If **tx_flow_en** in **Pn_Mac_Control** is cleared, then the pause-timer will immediately expire.

The port will not start the transmission of a new data frame any sooner than 512-bit times after a pause frame with a non-zero pause time has finished being received (**MRXDV** going inactive). No transmission will begin until the pause timer has expired (the port may transmit pause frames in order to initiate outgoing flow control). Any frame already in transmission when a pause frame is received will be completed and unaffected.

Incoming pause frames consist of the below:

- A 48-bit destination address equal to:
  - The reserved multicast destination address 01.80.C2.00.00.01, or
  - The Enet_Pn_SA[47:0] input mac source address.
- The 48-bit source address of the transmitting device.
- The 16-bit length/type field containing the value 88.08
- The 16-bit pause opcode equal to 00.01
- The 16-bit pause_time. A pause-quantum is 512 bit-times.
- Padding to 64-byte packet length.
- The 32-bit frame-check sequence (CRC word).

All quantities above are hexadecimal and are transmitted most-significant byte first. The least-significant bit is transferred first in each byte.

The padding is required to make up the frame to a minimum of 64 bytes. The standard allows pause frames longer than 64 bytes to be discarded or interpreted as valid pause frames. The MAC will recognize any pause frame between 64 bytes and **rx_maxlen** bytes in length.

11.2.1.4.19 Energy Efficient Ethernet Support (802.3az)

Energy Efficient Ethernet (EEE) allows the external clock controller to turn off (in a glitch-less manner) the module input clock (**CLK**) during inactive periods as determined by network and host traffic. The module can then be awakened by host queued transmit packet(s) or by a port's external Ethernet PHY. The module EEE clock stop interface is used by the external controller to control module EEE operations. EEE is supported in MII/GMII/RGMII but not RMII, The chosen PHY must also support EEE. EEE operations are configured as shown below:

1. The 12-bit EEE clock pre-scale value is written to the switch EEE_Prescale register. The pre-scaler is used to clock all EEE related counters.
2. The port Idle to LPI count values (Pn_Idle2LPI) are written with the desired values.
3. The port LPI to Wake count values (Pn_LPI2Wake) are written with the desired values.
4. The eee_en bit is set in the switch CPSW_Control register.

Energy Efficient Ethernet operation can begin after configuration. The host allows the module to enter a low power state by asserting the **CLKSTOP_REQ** signal. There are no requirements on host queues or traffic in order for the host to assert or de-assert **CLKSTOP_REQ**.

Each Ethernet port has a transmit and a receive LPI (low power indicate) state. The receive LPI state is entered when the port's corresponding PHY indicates the LPI state via the MII/RGMII interface. The PHY indicates LPI by asserting **GMII_MRXER_SEL** with a **GMII_MRXD[7:0]** value of 0x01 while **GMII_MRXDV** is deasserted (inter-packet gap). The Ethernet transmit port indicates LPI after the **PX_Idle2LPI** value has been counted (the transmit port has gone idle for the configured amount of time). If another packet is received for transmit during the count then the count is restarted. When the transmit port has been idle for the Idle to LPI time, the transmit port enters the LPI state and indicates LPI to the associated PHY. The LPI is indicated to the external PHY by an asserted **GMII_MTXER** with a **GMII_MTXD[7:0]** value of 0x01. while **GMII_MTXEN** is deasserted (inter-packet gap). The CPPI LPI state includes transmit and receive. The CPPI LPI state is entered when the CPPI transmit and receive interfaces have both been idle for the Idle to LPI time (**P0_Idle2LPI**). The Idle to LPI time value for all ports must be large relative to the switch latency to ensure that the count is not able to complete between successive packets.

When all transmit and receive ports are in the LPI state (CPSW LPI state), the **CLKSTOP_ACK** signal is asserted, and the external clock controller is allowed to stop the input module clock (**CLK**). The clock must be stopped (and re-started) in a glitch-less manner. When **CLKSTOP_ACK** is asserted, the clockmay be turned on and off as desired by the host. The host is allowed to restart the clock, perform slave read/write operations to the module memory address space, and then turn off the clock again while **CLKSTOP_ACK** is asserted. The clock must be restarted for two clock periods before the assertion of **SLV_VBUSP_REQ** and must remain asserted for five clock periods after the de-assertion of **SLV_VBUSP_REQ**.

The host can remove and disable from re-entering the CPSW LPI state by restarting the module clock (in a glitch-less manner) and then de-asserting **CLKSTOP_REQ**. There must be at least one rising edge of the clockbefore **CLKSTOP_REQ** is de-asserted. The module **CLKSTOP_ACK** output signal will be deasserted on the clock after the de-assertion of **CLKSTOP_REQ**. The host may queue CPPI receive packets at any time without regard to the module LPI state. The Host must deassert **CLKSTOP_REQ** on wakeup for a minimum of two clock periods. If **CLKSTOP_REQ** is deasserted for less than 5 clock periods for a wakeup event from the host to a particular Ethernet port (or visa versa), then the wakeup event will not cause the other Ethernet ports to awaken.

The external Ethernet PHY's can also wakeup the external clock controller by removing the Ethernet receive LPI indication. If the module is in the CPSW Idle state with **CLKSTOP_ACK** asserted and the receive LPI indication is removed, the **CLKSTOP_WAKEUP** signal will be asynchronously asserted. On wakeup, the external clock

controller must restart the clock and de-assert the **CLKSTOP_REQ** signal. The **CLKSTOP_WAKEUP** signal will be synchronously deasserted with **CLKSTOP_ACK**. There must be at least one positive edge of the clock before the **CLKSTOP_REQ** signal is deasserted. Upon the de-assertion of **CLKSTOP_REQ**, the Ethernet ports will count the **Pn_LPI2Wake** time for each port at which time the port is available for transmit.

11.2.1.4.20 Switch Latency

When the CPSW is configured as a store and forward switch, the switch latency is defined as the amount of time between the end of packet reception of the received packet to the start of the output packet transmit. The store and forward latency is shown in the below table:

Mode	Latency
Gig (1000)	880ns
100	1.3us
10	6.5us

11.2.1.4.21 Emulation Control

The emulation control input (**EMUSUSP**), emulation control register, and the submodule emulation control registers allow CPSW operation to be completely or partially suspended. The CPDMA Host port and each Ethernet port has associated emulation control registers. The submodule emulation control registers must be accessed to facilitate CPSW emulation control. The CPSW module enters the emulation suspend state if the switch level emulation control register and all submodules are configured for emulation suspend and the emulation suspend input is asserted. A partial emulation suspend state is entered if one or more submodules is configured for emulation suspend and the emulation suspend input is asserted. Emulation suspend occurs at packet boundaries. The emulation control feature is implemented for compatibility with other peripherals. The following table shows the operation of the emulation control input and register bits:

EMUSUSP	soft	free	Description
0	X	X	Normal Operation
1	0	0	Normal Operation
1	1	0	Emulation Suspend
1	X	1	Normal Operation

Note

Enable Suspend control (EMUSUSP) by MSS_CTRL: MSS_DBG_ACK_CTL0[26:24]

11.2.1.4.22 Software IDLE

The software idle register bits enable switch operation to be completely or partially suspended by software control. Each Ethernet port may be individually commanded to enter the idle state. The idle state is entered at packet boundaries, and no further packet operations will occur on an idled port until the idle command is removed. The CPSW software idle inhibits packets from starting to be unloaded from each port switch FIFO, but packets already in process are unaffected.

11.2.1.4.23 Common Platform Time Sync (CPTS)

The Common Platform Time Sync (CPTS) module is used to facilitate host control of time sync operations. It enables compliance with the IEEE 1588 standard for a precision clock synchronization protocol.

Main features of CPTS module are:

- Supports the selection of up to 32 external clock sources.
- Software control of time sync events via interrupt or polling.
- Supports 8 hardware timestamp push inputs.
- Supports timestamp counter compare output (TS_COMP).
- Supports timestamp counter bit output (TS_SYNC).

- Supports a configurable number of timestamp Generator bit outputs (TS_GENFn).
- Supports Ethernet Enhanced Scheduled Traffic Operations (TS_ESTFn).
- 64-bit timestamp mode with PPM and nudge adjustment.

11.2.1.4.23.1 CPTS Integration

This section describes CPTS module integration in the device, including information about clocks, resets, and hardware requests.

Figure 11-147 shows CPTS integration in the device.

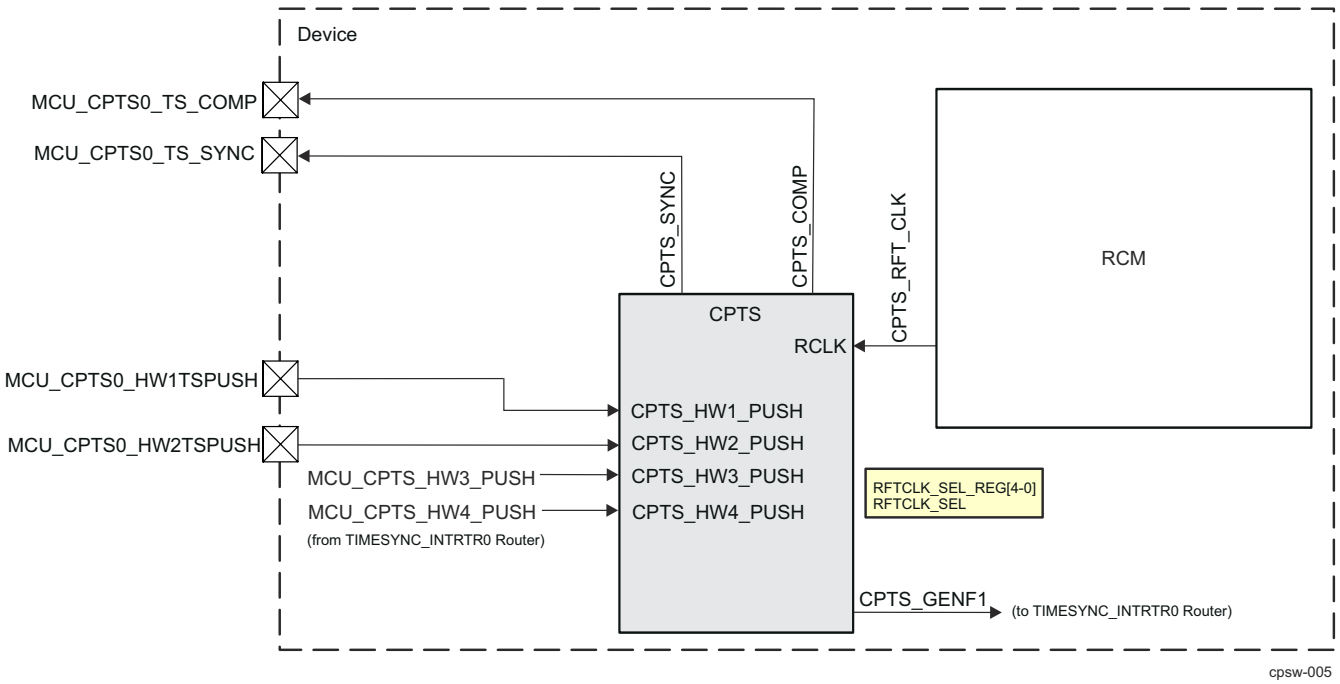

Figure 11-147. CPTS Integration

CPTS IEEE 1588 clock (RCLK) is selected through the CPSW_CPTS_RFTCLK_SEL_REG register.

Note

For more information about CPTS clocks and resets, see Table 11-270 in Section 11.2.1.3 *CPSW Integration*.

11.2.1.4.23.2 CPTS Architecture

Figure 11-148 shows the architecture of the CPTS module inside the CPSW Ethernet Subsystem. Time stamp values for every packet transmitted or received on either port of the CPSW are recorded. At the same time, each packet is decoded to determine if it is a valid time sync event. If so, an event is loaded into the Event FIFO for processing containing the recorded time stamp value when the packet was transmitted or received.

In addition, both hardware (HWx_TS_PUSH) and software (TS_PUSH) can be used to read the current time stamp value though the Event FIFO. The reference clock used for the time stamp (CPTS_RFT_CLK) can be derived from several sources.

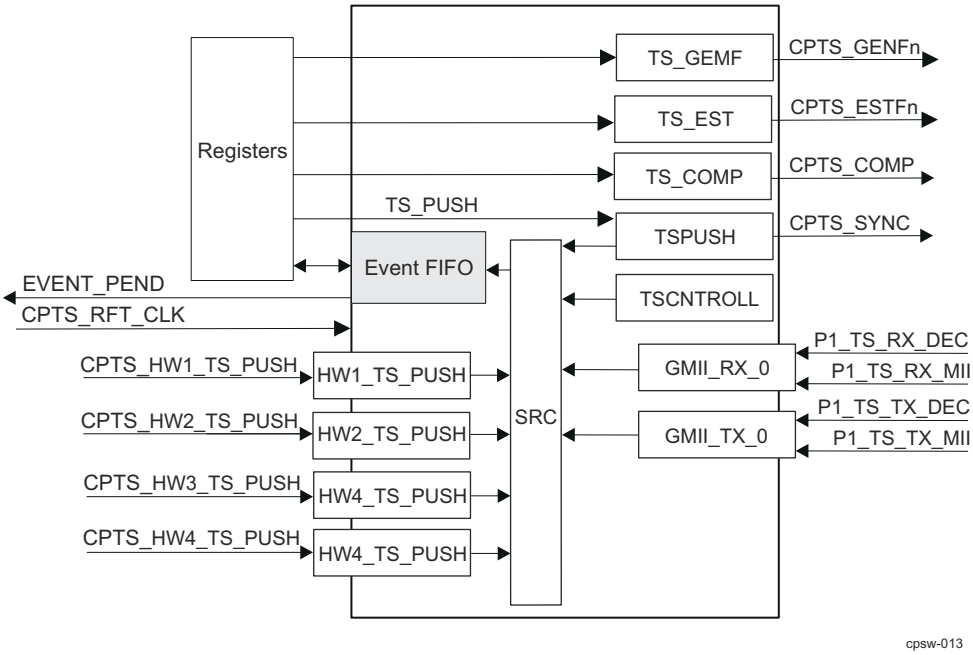

Figure 11-148. CPTS Block Diagram

Note

See Section 11.2.1.4.23.1, *CPTS Integration* for CPTS integration in the device.

11.2.1.4.23.3 CPTS Initialization

The CPTS module should be configured as follows:

1. Reset the CPTS module.
2. Write the **rftclk_sel[4:0]** value in the **RFTCLK_Sel** register with the desired reference clock multiplexor value. This value is allowed to be written only when the **cpts_en** bit in CPTS control register is cleared to zero.
3. Write a one to the **cpts_en** bit in the **TS_Control** register. The **RCLK** domain is in reset while this bit is low.
4. Enable the interrupt by writing a one to the **ts_pend** bit in the **Int_Enable** register (if using interrupts and not polling)..

11.2.1.4.23.4 32-bit Time Stamp Value

The **time_stamp** value is a 32-bit value that is cleared to zero when **cpts_en** is cleared to zero and increments on each **RCLK** rising edge when **cpts_en** is set to one. The time stamp value can be written via the time stamp load function (**TS_Load_En** and **TS_Load_Low_val** registers). Host software maintains the required number of upper bits of the time stamp value. The upper time stamp value is incremented by the host when the rollover event is detected. The **add_val[2:0]** of **TS_ADD_VAL** value must be zero in 32-bit mode. Nudge and PPM adjustments are not supported in 32-bit mode.

11.2.1.4.23.5 64-bit Time Stamp Value

The **time_stamp** value is a 64-bit value that is cleared to zero when **cpts_en** is cleared to zero and increments by the increment value (1 to 8) on each **RCLK** rising edge when **cpts_en** is set to one. The increment value is from 1 to 8 (1 + **ts_add_val[2:0]**). The default increment value is one. The time stamp value can be written via the time stamp load function (**TS_Load_En**, **TS_Load_Low_val**, and **TS_Load_High_val** registers). The **add_val** feature (TS_ADD_VAL_Reg) is included to allow 1ns timestamp operations with an **RCLK** rate less than 1Ghz.The below table shows the **RCLK** and **add_val** values for 1ns operations. The highest **RCLK**

frequency possible should be used as allowed by the technology. Table 11-289 shows the RFTCLK_SEL and TS_ADD_VAL_REG values for 1ns operations.

Table 11-289. ADD_VAL feature

RFTCLK_SEL (MHz)	TS_ADD_VAL_REG[2-0]
1 GHz	0
500 MHz	1
333.33 MHz	2
250 MHz	3
200 MHz	4
166.66 MHz	5
142.85714 MHz	6
125 MHz	7

11.2.1.4.23.6 64-Bit Timestamp Nudge

The 64-bit **time_stamp** value can be adjusted by writing the **ts_nudge_val[7:0]** register value which is a 2's complement value. A value of 0xff will subtract 1 **RCLK** from the next incremented **time_stamp[63:0]** value. A nudge value of 0x01 will add 1 **RCLK** to the next incremented **time_stamp[63:0]** value. For example, if the current **time_stamp** value is 0x0f06, and **add_val[2:0]**=3, the next incremented timestamp value would be 0x0f0a without a nudge and 0x0f0a +/- **tx_nudge_val[7:0]** with a nudge. The **ts_nudge** value is cleared to zero when the nudge has occurred.

11.2.1.4.23.7 64-bit Timestamp PPM

The 64-bit **time_stamp** can be adjusted by parts per million or by parts per hour. Writing a non-zero value to the **ts_ppm[41:0]** (PPM_High & PPM_High)value enables PPM operations. The adjustment is up or down depending on the **ppm_dir** bit (TS_control_Reg). The **time_stamp** value is increased by the PPM value when **ppm_dir** is cleared and decreased by the PPM value when **ppm_dir** is set.

Parts Per Million example:
To adjust for 100 parts per million the configured value for **ts_ppm[41:0]** is:

1,000,000/100 = decimal 10,000

Parts Per Hour example:
To adjust for 1 part per hour at 1 Ghz **RCLK** the configured value for **ts_ppm[41:0]** is: (1,000,0000,000hz/1pph) * (3600 seconds/hour) = hex 34630B8A000

11.2.1.4.23.8 Event FIFO

The event FIFO contains at least as many locations as two times the number of ports plus 6 locations. Software must service the event FIFO in a timely manner which prevents event FIFO overrun. No overrun indication will be given.

11.2.1.4.23.9 Timestamp Compare Output

The **TS_COMP** function is a software oriented feature that is intended to be replaced going forward by the hardware oriented GENF function. **TS_COMP** is not compatible with timestamp PPM or a non-zero **TS_ADD_VAL** value.

11.2.1.4.23.9.1 Non-Toggle Mode: 32-bit

The **TS_COMP** output is asserted for **ts_comp_length[31:0] RCLK** periods when the **time_stamp[31:0]** (EVENT_0_REG) value compares with the **ts_comp_val[31:0]** and the length value is non-zero. The **TS_COMP** rising edge occurs three **RCLK** periods after the values compare. A timestamp compare event is pushed into the event FIFO when **TS_COMP** is asserted. The polarity of the **TS_COMP** output is determined by the **ts_comp_polarity** bit. The output is asserted low when the polarity bit is low.

11.2.1.4.23.9.2 Non-Toggle Mode: 64-bit

64-bit mode operation is identical to 32-bit mode except that all 64-bits of the **timestamp[63:0]** are used (Event_0_reg and Event_3_reg) instead of only the lower 32-bits. The 64-bit timestamp cannot be allowed to rollover.

11.2.1.4.23.9.3 Toggle Mode: 32-bit

The **TS_COMP** output is asserted for **ts_comp_len[31:0] RCLK** periods when the **time_stamp[31:0]** value compares with the **ts_comp_low_val[31:0]** and the length value is non-zero. The **TS_COMP** toggles thereafter on **ts_comp_low_len[31:0] RCLK** periods. The length high or low can be adjusted by writing the **TS_COMP_NUDGE[7:0]** register value which is a 2's complement value. A value of 0xff will subtract 1 **RCLK** from the **ts_comp_length[31:0]** value. A value of 0x01 will add 1 **RCLK** to the **ts_comp_length[31:0]** value. Only a single high or low time is adjusted (nudged) and the **ts_comp_nudge** value is cleared to zero when the nudge has occurred. The **TS_COMP** output is asserted low when the **TS_Comp_Polarity** bit is low. No compare events and no **CPTS_EVNT** interrupts are generated in toggle mode. The **ts_comp_tog** bit must be set for toggle mode, and must be set before writing a non-zero value to **ts_comp_length[31:0]**.

11.2.1.4.23.9.4 Toggle Mode: 64-bit

64-bit mode operation is identical to 32-bit mode except that all 64-bits of the TIMESTAMP are used (EVENT_0_REG and EVENT_3_REG). In 32-bit mode only the lower 32-bits (EVENT_0_REG) are used.

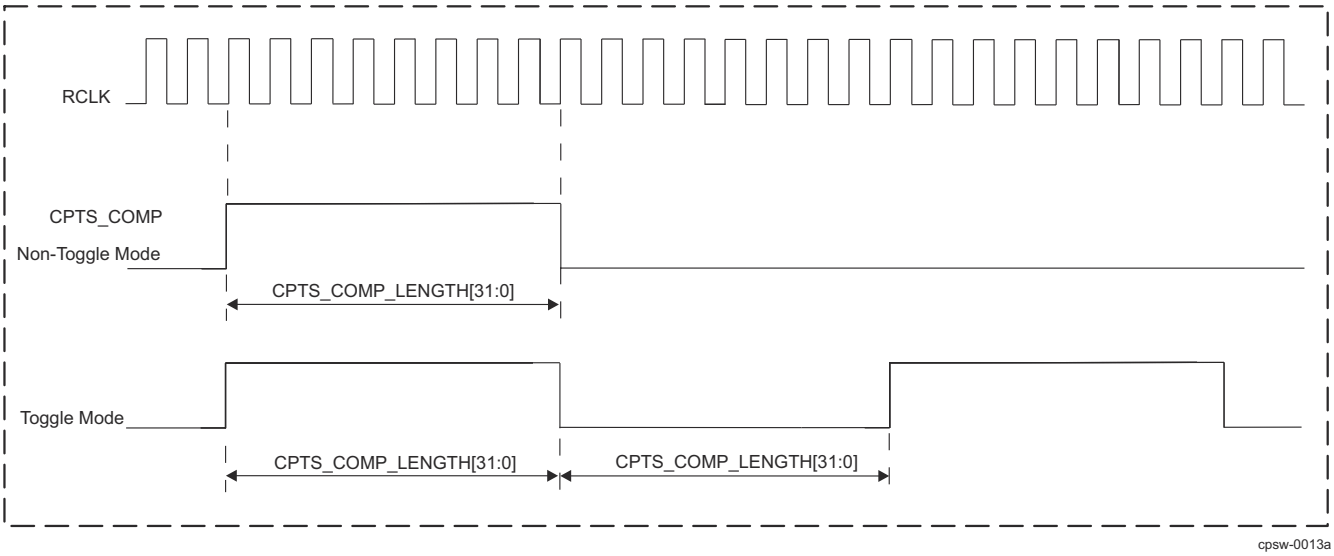

Figure 11-149. CPTS_COMP Output in Toggle and Non-Toggle Mode

11.2.1.4.23.10 Timestamp Sync Output

The CPTS_SYNC output is a selected bit of the [31-0]TIME_STAMP counter value. One of bits 17-31 can be selected in CPTS_CONTROL_REG[31-28] TS_SYNC_SEL. The CPTS_SYNC output is disabled when CPTS_CONTROL_REG[31-28] TS_SYNC_SEL is zero.

If the selected counter bit is 1 at the time when TS_SYNC_SEL value is written then a rising edge will not occur on the CPTS_SYNC output. A rising edge will occur on the CPTS_SYNC output upon the next transition to 1 of the selected counter bit. The TS_SYNC_SEL value must be written to zero before changing to a different non-zero value. No events are generated due to the CPTS_SYNC operation. The CPTS_SYNC output is two CPTS_RFT_CLK periods after the actual count value.

11.2.1.4.23.11 Timestamp GENFn Output

The CPTS_GENFn outputs have a programmable cycle (frequency) with a PPM feature and software nudge feature. The CPTS_GENFn output cycle is CPSW_GENF0_LENGTH_REG_I[31-0] CPTS_RFT_CLK periods (which is different than CPTS_COMP operation). Figure 11-150 represents the CPTS_GENFn output signal.

The CPTS_GENFn output cycle is CPSW_GENF0_LENGTH_REG_I[31-0] CPTS_RFT_CLK periods beginning when the 64-bit TIME_STAMP value compares with the 64-bit GENFn_COMP value (CPSW_GENF0_COMP_LOW_REG_I and CPSW_GENF0_COMP_HIGH_REG_I registers) and the length value is non-zero. The CPTS_GENFn output cycle repeats thereafter every CPSW_GENF0_LENGTH_REG_I[31-0] CPTS_RFT_CLK periods. The upper 32-bit word should be written first for 64-bit values. The length should be zero while the comparison value and other configuration parameters are being configured. The length should be written non-zero to enable operations last. The first cycle after comparison is active high when the CPSW_CPTS_CONTROL_REG[2] TS_COMP_POLARITY bit is low. No compare events and no CPTS_EVNT interrupts are generated.

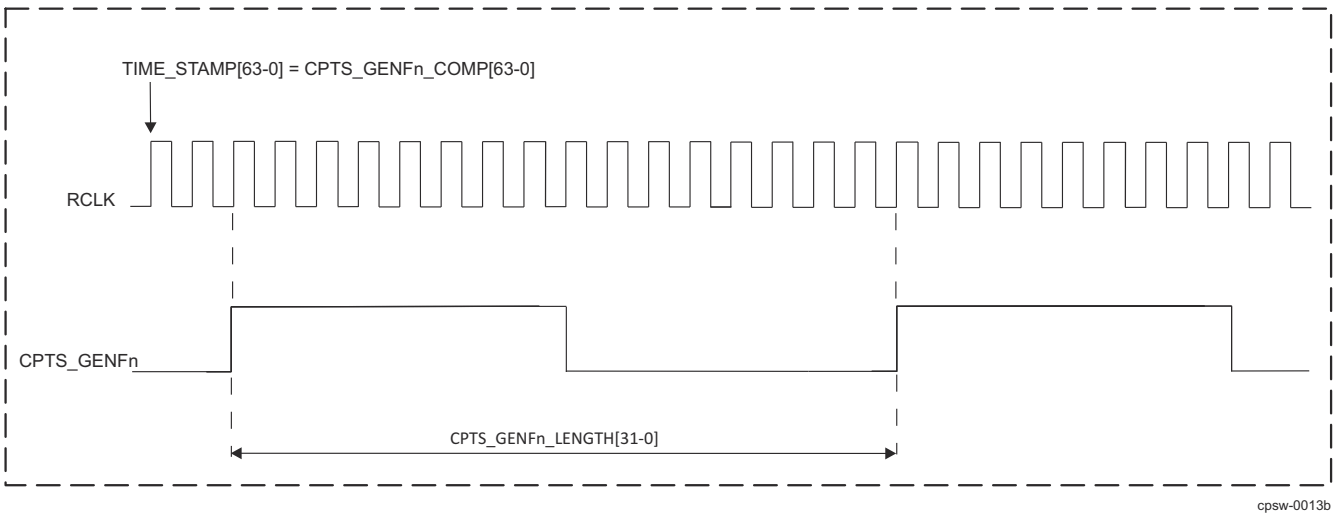

Figure 11-150. CPTS_GENFn Output Signal Diagram

11.2.1.4.23.11.1 GENFn Nudge

The cycle length can be adjusted by writing the CPSW_CPTS_TS_COMP_NUDGE_REG[7-0] NUDGE register value which is a two's complement value. A value of FFh will subtract 1 CPTS_RFT_CLK from the CPSW_GENF0_LENGTH_REG_I[31-0] value. A value of 1h will add 1 CPTS_RFT_CLK to the CPSW0_ESTF1_LENGTH_REG_I[23-0] value. The CPSW_CPTS_TS_COMP_NUDGE_REG[7-0] NUDGE value is cleared to zero when the nudge has occurred.

11.2.1.4.23.11.2 GENFn PPM

The CPTS_GENFn output cycle can be adjusted by parts per million or by parts per hour. Writing a non-zero value to CPSW_GENF0_PPM_LOW_REG_I/ CPSW_GENF0_PPM_HIGH_REG_I enables PPM operations. The PPM counter continually loads and decrements to zero and then loads again. A single CPTS_RFT_CLK adjustment is made when the PPM counter decrements to zero. The adjustment is up or down depending on the CPSW_ESTF1_CONTROL_REG[0] PPM_DIR bit. When PPM_DIR bit is set a single CPTS_RFT_CLK time is subtracted from the generate function counter which has the effect of increasing the generate function frequency by the PPM amount. When PPM_DIR bit is cleared a single CPTS_RFT_CLK time is added to the generate function counter which has the effect of decreasing the generate function frequency by the PPM amount.

Parts Per Million example:
To adjust for 100 parts per million the configured value for GENF_PPM[41-0] (through CPSW_GENF0_PPM_LOW_REG_I and CPSW_GENF0_PPM_HIGH_REG_I) is:
1,000,000/100 = 10,000(decimal)

Parts Per Hour example:
To adjust for 1 part per hour at 1 GHz CPTS_RFT_CLK the configured value for GENF_PPM[41-0] (through CPSW_GENF0_PPM_LOW_REG_I and CPSW_GENF0_PPM_HIGH_REG_I) is:
(1,000,0000,000Hz/1pph) * (3600 seconds/hour) = 34630B8A000 (hex)

11.2.1.4.23.12 Timestamp ESTFn

Each Ethernet port has a dedicated ESTFn generator which operates identically to the GENFn function.

11.2.1.4.23.13 Time Sync Events

Time Sync events are 96-bit values that are pushed onto the event FIFO and read by software in 32-bit reads. Four 32-bit registers, CPSW_CPTS_EVENT_0_REG through CPSW_CPTS_EVENT_3_REG hold the data of a time sync event. There are eight types of sync events:

- Time Stamp Push Event
- Time Stamp Counter Rollover Event (32-bit mode only)
- Time Stamp Counter Half-rollover Event (32-bit mode only)
- Hardware Time Stamp Push Event
- Ethernet Receive Event
- Ethernet Transmit Event
- Time Stamp Compare Event
- Host Transmit Event

Name	Description
time_stamp	Time Stamp – The timestamp is valid for transmit, receive, and time stamp push event types. The timestamp value is not valid for counter roll event types.

Name	Description
port_number	Port Number – indicates the port number of an Ethernet event (1 to 4 encoded) or the hardware push number (1 to 8 encoded).
event_type	Time Sync Event Type 0000 – Time Stamp Push Event 0001 – Time Stamp Rollover Event (32-bit mode only) 0010 – Time Stamp Half Rollover Event (32-bit mode only) 0011 – Hardware Time Stamp Push Event 0100 – Ethernet Receive Event 0101 – Ethernet Transmit Event 0110 – Time Stamp Compare Event 0111 – Host Event 1000 --- - reserved 1111
message_type	Message type – The message type value that was contained in an Ethernet transmit or receive time sync packet. This field is valid only for Ethernet transmit or receive events.
sequence_id	Sequence ID – The 16-bit sequence id is the value that was contained in an Ethernet transmit or receive time sync packet. This field is valid only for Ethernet transmit or receive events.
domain	Domain – The 8-bit domain is the value that was contained in an Ethernet transmit or receive time sync packet. This field is valid only for Ethernet transmit or receive events.
prempt_queue	Prempt Queue – 0 – The packet was received/transmitted on the express queue. 1 – The packet was received/transmitted on the prempt queue.

11.2.1.4.23.13.1 Time Stamp Push Event

Software can obtain the current time stamp value (at the time of the write) by initiating a time stamp push event. The push event is initiated by setting the TS_PUSH bit of the CPSW_CPTS_TS_PUSH_REG register. The time stamp value is returned in the event, along with a time stamp push event code. The upper 32-bits (CPSW_CPTS_EVENT_3_REG register) of the timestamp are zero in 32-bit mode.

11.2.1.4.23.13.2 Time Stamp Counter Rollover Event (32-bit mode only)

The CPTS module contains a 32-bit time stamp value (CPSW_CPTS_EVENT_0_REG). The counter upper bits are maintained by host software. The rollover event indicates to software that the time stamp counter has rolled over from 0xFFFF FFFF to 0x0000 0000 and the software-maintained upper count value should be incremented. This event occurs only in 32-bit mode.

11.2.1.4.23.13.3 Time Stamp Counter Half-rollover Event (32-bit mode only)

The CPTS includes a time stamp counter half-rollover event. The half-rollover event indicates to software that the time stamp value (CPSW_CPTS_EVENT_0_REG[31-0] TIME_STAMP) has incremented from 0x7FFF FFFF to 0x8000 0000. The half-rollover event is included to enable software to correct a misaligned event condition. This event occurs only in 32-bit mode.

The half-rollover event is included to enable software to determine the correct time for each event that contains a valid time stamp value, such as an Ethernet event. If an Ethernet event occurs around a counter rollover (full rollover), the rollover event could possibly be loaded into the event FIFO before the Ethernet event, even though the Ethernet event time was actually taken before the rollover. Figure 11-151 shows a misalignment condition. This misaligned event condition arises because an Ethernet event time stamp occurs at the beginning of a packet and time passes before the packet is determined to be a valid synchronization packet. The misaligned event condition occurs if the rollover occurs in the middle, after the packet time stamp has been taken, but before the packet has been determined to be a valid time sync packet.

Host software must detect and correct for misaligned event conditions. For every event time stamp after a rollover and before a half-rollover, software must examine the time stamp most significant bit. If bit 31 of the time stamp value is low (0x0000 0000 through 0x7FFF FFFF), then the event time stamp was taken after the rollover and no correction is required. If the value is high (0x8000 0000 through 0xFFFF FFFF), the time stamp value was taken before the rollover and a misalignment is detected. The misaligned case indicates to software that it must subtract one from the upper count value stored in software to calculate the correct time for the misaligned event. The misaligned event occurs only on the rollover boundary and not on the half-rollover boundary. Software only needs to check for misalignment from a rollover event to a half-rollover event.

When a rollover occurs, software increments the software time stamp upper value. The misaligned case indicates to software that the misaligned event time stamp has a valid upper value that is pre-increment, so one must be subtracted from the upper value to allow software to calculate the correct time for the misaligned event.

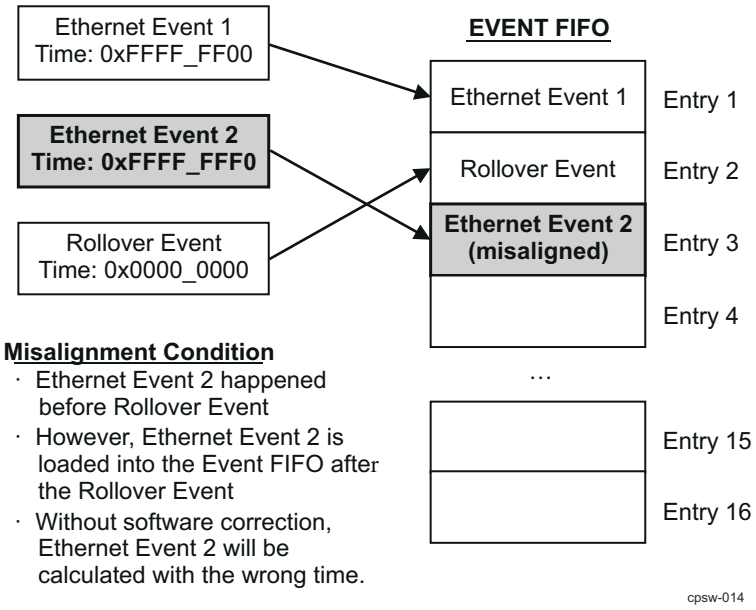

Figure 11-151. Event FIFO Misalignment Condition

11.2.1.4.23.13.4 Hardware Time Stamp Push Event

There are four hardware time stamp inputs (CPTS_HW[1:4]_TS_PUSH events) that can cause hardware time stamp push events to be loaded into the Event FIFO. Each time stamp input is mapped in the device as shown in Figure 11-147. The event is loaded into the event FIFO on the rising edge of the timer, and the PORT_NUMBER field in the CPSW_CPTS_EVENT_1_REG register indicates the hardware push input that caused the event (encoded).

The hardware time stamp inputs are asynchronous and are low frequency signals. The CPTS logic synchronizes and performs a rising edge detect on the incoming asynchronous input.

Each hardware time stamp input must be asserted for at least 10 periods of the selected CPTS_RFT_CLK clock. Each input can be enabled or disabled by setting the respective bits in the CPSW_CPTS_CONTROL_REG register.

Hardware time stamps are intended to be an extremely low frequency signals, such that the event FIFO does not overrun. Software must keep up with the event FIFO and ensure that there is no overrun, or events will be lost.

11.2.1.4.23.13.5 Ethernet Port Events

Packets transmitted or received on each Ethernet port can generate Ethernet Transmit Events or Ethernet Receive Events, respectively. The CPTS hardware will decode each packet to determine if it is a valid CPTS time sync event.

According to the IEEE 802.3 Ethernet standard, each Ethernet frame contains a 2-octet EtherType field to indicate which protocol is encapsulated in the PayLoad field, as shown in Figure 11-152. For standard time sync packets, this will contain the EtherType for the Precision Time Protocol (IEEE 1588), which is defined as 0x88F7. The CPTS hardware will compare this field to the TS_LTYPE1 field in the CPSW_PN_TS_SEQ_LTYPE_REG register or the TS_LTYPE2 field in CPSW_PN_TS_CTL_LTYPE2_REG register (depending on which enable bit was set) , which should also be programmed to 88F7h.

When a virtual LAN is used, an additional 4-octet 802.1Q tag is inserted in the Ethernet frame before the EtherType field, as shown in Figure 11-152. To indicate to the CPTS hardware that a virtual LAN is in use, the TS_TX_VLAN_LTYPE1_EN (or TS_TX_VLAN_LTYPE2_EN) enable bit must be set in the CPSW_PN_TS_CTL_REG register. The EtherType for the 802.1Q tag is defined as 0x8100, and the CPTS hardware will compare this value to the TS_VLAN_LTYPE1 (or TS_VLAN_LTYPE2 depending on which enable bit was set) field in the CPSW_PN_TS_VLAN_LTYPE_REG register, which should also be programmed to 0x8100.

When two stacked VLANs are used, two additional 4-octet 801.Q tags are inserted in the Ethernet frame before the EtherType field, as shown in Figure 11-152. In this case, both TS_VLAN_LTYPE1 and TS_VLAN_LTYPE2 must be enabled. The outer tag must match the value of the TS_VLAN_LTYPE1 field, and the inner tag must match the value of the TS_VLAN_LTYPE2 field.

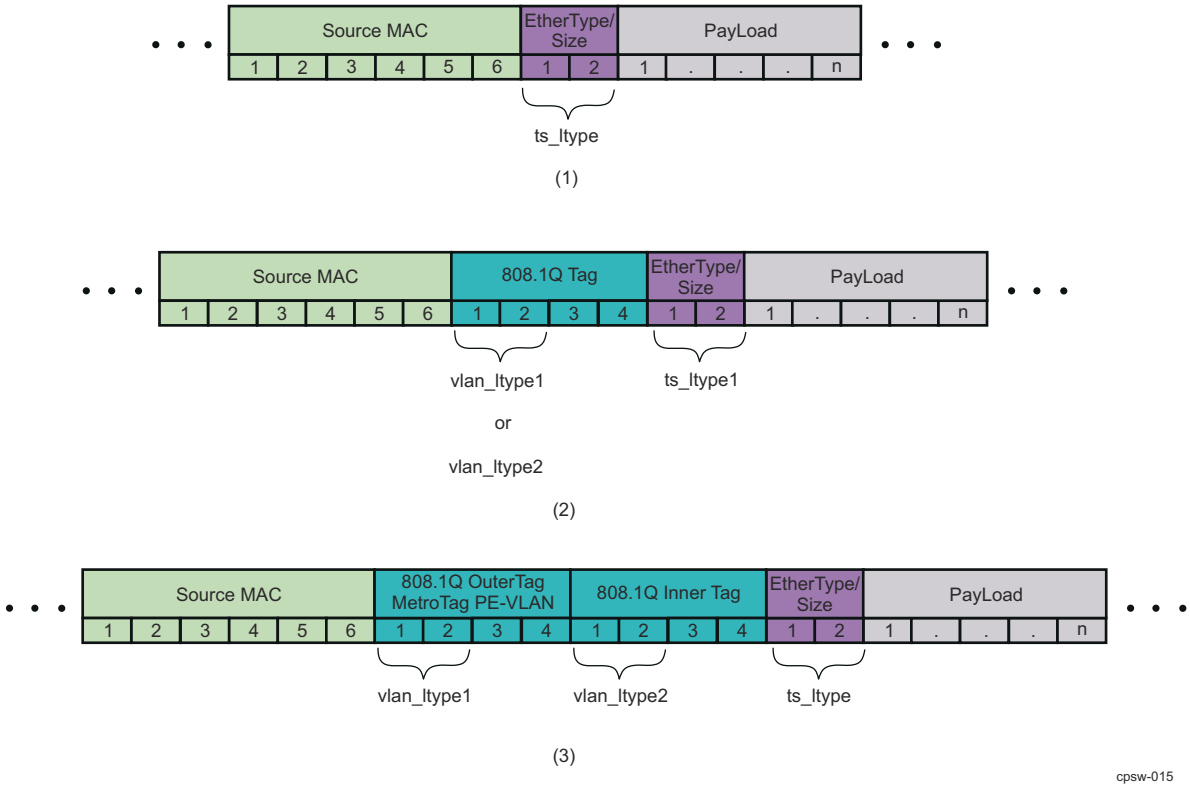

Figure 11-152. Partial Ethernet-II Frames Showing Register Mapping of EtherTypes for a Simple Frame (1), a Single 1Q Tag Added (2), and Two 1Q Tags Added (3)

11.2.1.4.23.13.5.1 Ethernet Port Receive Event

This section describes Ethernet port receive events. Ethernet port generates time synchronization events for valid received time sync packets. For every packet received on the Ethernet port, a timestamp will be captured by the receive module inside the CPTS for the corresponding port. The time stamp will be captured by the receive module regardless of whether or not the packet is a time synchronization packet to make sure that the time stamp is captured as soon as possible. The packet is sampled on both the rising and falling edges of the CPTS_RFT_CLK, and the time stamp will be captured once the start of frame delimiter for the receive packet is detected.

After the time stamp has been captured, the receive interface will begin parsing the packet to determine if it is a valid Ethernet time synchronization packet. The CPSW decoder determines if the packet is a valid Ethernet receive time synchronization event. The receive interface for the port will use the following criteria to determine if the packet is a valid Annex D, Annex E, or Annex F time synchronization Ethernet receive event:

Annex D (IPv4)

1. Receive annex D time sync is enabled (TS_RX_ANNEX_D_EN is set in the CPSW_PN_TS_CTL_REG register).
2. One of the sequences below is true.
   a. The first packet LTYPE matches 0x0800
   b. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches 0x0800
   c. The first packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches 0x0800
   d. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the third packet LTYPE matches 0x0800
3. Byte 14 (the byte after the LTYPE) contains 0x45 (IPv4).

Note

The byte numbering assumes that there are no VLANs. The byte number is intended to show the relative order of the bytes.

4. Byte 20 contains 0bXXX00000 (5 lower bits zero) and Byte 21 contains 0x00 (fragment offset zero)
5. Byte 22 contains 0x01 (HOP Limit = 1) if the TS_TTL_NONZERO bit in the switch CPSW_PN_TS_CTL_LTYPE2_REG register is cleared to 0h, or byte 22 contains any value if CPSW_PN_TS_CTL_LTYPE2_REG is set to 1h. Byte 22 is the TTL/HOP field.
6. Byte 23 contains 0x11 (Next Header UDP Fixed).
7. The TS_UNI_EN bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is cleared to 0h and Bytes 30 through 33 contain:
   a. Decimal 224.0.1.129 and the TS_129 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   b. Decimal 224.0.1.130 and the TS_130 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   c. Decimal 224.0.1.131 and the TS_131 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   d. Decimal 224.0.1.132 and the TS_132 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   e. Decimal 224.0.0.107 and the TS_107 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set

   -OR-

   The TS_UNI_EN bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set and Bytes 30 through 33 contain any values.
8. Bytes 36 and 37 contain:

a. Decimal 0x01 and 0x3F respectively and the TS_319 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set -OR-
b. Decimal 0x01 and 0x40 respectively and the TS_320 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set.

9. The PTP message begins in byte 42.
10. The packet message type is enabled in the TS_MSG_TYPE_EN field in the CPSW_PN_TS_CTL_REG register.
11. The packet was received without error (not long/short/mac_ctl/CRC/code/align).

Annex E (IPv6)

1. Receive annex E time sync is enabled (TS_RX_ANNEX_E_EN bit is set in the switch CPSW_PN_TS_CTL_REG register).
2. One of the sequences below is true.
   a. The first packet LTYPE matches 0x86dd.
   b. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches 0x86dd
   c. The first packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches 0x86dd
   d. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the third packet LTYPE matches 0x86dd
3. Byte 14 (the byte after the LTYPE) contains 0x6X (IPv6).
4. Byte 20 contains 0x11 (UDP Fixed Next Header).
5. Byte 21 contains 0x01 (Hop Limit = 1) if the TS_TTL_NONZERO bit in the switch CPSW_PN_TS_CTL_LTYPE2_REG register is cleared to 0h, or byte 21 contains any value if TS_TTL_NONZERO is set to 1h. Byte 21 is the TTL/HOP field.
6. The TS_UNI_EN bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is cleared to 0 and Bytes 38 through 53 contain:
   a. FF0M:0:0:0:0:0:0:0181 and the TS_129 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   b. FF0M:0:0:0:0:0:0:0182 and the TS_130 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   c. FF0M:0:0:0:0:0:0:0183 and the TS_131 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   d. FF0M:0:0:0:0:0:0:0184 and the TS_132 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   e. FF0M:0:0:0:0:0:0:006B and the TS_107 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set

   Note

   All values above are 16-bit hex numbers where M is enabled in the TS_MCAST_TYPE_EN field in the CPSW_PN_TS_CTL2_REG register.

   -OR-

   The TS_UNI_EN bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set to 1 and Bytes 38 through 53 contain any value.
7. Bytes 56 and 57 contain (UDP Header in bytes 54 through 61):
   a. Decimal 0x01 and 0x3F respectively and the TS_319 bit in the CPSW_PN_TS_CTL2_REG register is set, or
   b. Decimal 0x01 and 0x40 respectively and the TS_320 bit in the CPSW_PN_TS_CTL2_REG register is set.
8. The PTP message begins in byte 62.
9. The packet message type is enabled in the MSG_TYPE_EN field in the CPSW_PN_TS_CTL2_REG register.

10. The packet was received without error (not long/short/mac_ctl/CRC/code/align).

Annex F (IEEE 802.3)

1. Receive Annex F time sync is enabled (TS_RX_ANNEX_F_EN is set in the switch CPSW_PN_TS_CTL_REG register).
2. One of the sequences below is true:
   a. The first packet LTYPE matches TS_LTYPE1 in the CPSW_PN_TS_SEQ_LTYPE_REG register. LTYPE 1 should be used when only one time sync LTYPE is to be enabled.
   b. The first packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register and LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register.
   c. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_LTYPE1 in the CPSW_PN_TS_SEQ_LTYPE_REG register
   d. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register and TS_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register.
   e. The first packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_LTYPE1 in the CPSW_PN_TS_SEQ_LTYPE_REG register.
   f. The first packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register and TS_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register.
   g. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the third packet LTYPE matches TS_LTYPE1 in the CPSW_PN_TS_SEQ_LTYPE_REG register.
   h. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the third packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register and TS_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register
3. The PTP message begins in the byte after the LTYPE.
4. The packet message type is enabled in the TS_MSG_TYPE_EN field in the CPSW_PN_TS_CTL_REG register.
5. The packet was received without error (not long/short/mac_ctl/CRC/code/align).

If all of the criteria described above are met for either Annex D, Annex E, or Annex F, and the packet is determined to be a valid time synchronization packet, then the RX interface will push an Ethernet receive event into the event FIFO.

11.2.1.4.23.13.5.2 Ethernet Port Transmit Event

This section describes Ethernet port transmit events. For every packet transmitted on the Ethernet ports, the port transmit interface will begin parsing the packet to determine if it is a valid Ethernet time synchronization packet. The CPTS transmit interface for the port will use to the following criteria to determine if the packet is a valid time synchronization Ethernet transmit event. The CPSW decoder determines if the packet is a valid ethernet receive time synchronization event. To be a valid Ethernet transmit time synchronization event, the conditions listed below must be true for either Annex D, Annex E, or Annex F:

Annex D (IPv4)

1. Transmit time sync is enabled (TS_TX_ANNEX_D_EN is set in the CPSW_PN_TS_CTL_REG register).
2. One of the sequences below is true.

   a. The first packet LTYPE matches 0x0800
   b. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches 0x0800
   c. The first packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches 0x0800
   d. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the third packet LTYPE matches 0x0800
3. Byte 14 (the byte after the LTYPE) contains 0x45 (IPv4).

Note

The byte numbering assumes that there are no VLANs. The byte number is intended to show the relative order of the bytes.

4. Byte 20 contains 0bXXX00000 (5 lower bits zero) and Byte 21 contains 0x00 (fragment offset zero)
5. Byte 22 contains 0x01 (HOP Limit = 1) if the TS_TTL_NONZERO bit in the switch CPSW_PN_TS_CTL_LTYPE2_REG register is cleared to 0h, or byte 22 contains any value if TS_TTL_NONZERO is set to 1h. Byte 22 is the TTL/HOP field.
6. Byte 23 contains 0x11 (Next Header UDP Fixed).
7. The TS_UNI_EN bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is cleared to 0h and Bytes 30 through 33 contain:
   a. Decimal 224.0.1.129 and the TS_129 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   b. Decimal 224.0.1.130 and the TS_130 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   c. Decimal 224.0.1.131 and the TS_131 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   d. Decimal 224.0.1.132 and the TS_132 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   e. Decimal 224.0.0.107 and the TS_107 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   f. The TS_UNI_EN bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set and Bytes 30 through 33 contain any values.
8. Bytes 36 and 37 contain:
   a. Decimal 0x01 and 0x3F respectively and the TS_319 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   b. Decimal 0x01 and 0x40 respectively and the TS_320 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set.
9. The PTP message begins in byte 42.
10. The packet message type is enabled in the TS_MSG_TYPE_EN field in the CPSW_PN_TS_CTL_REG register.
11. The packet was sent by host port 0.

Annex E (IPv6)

1. Transmit annex E time sync is enabled (TS_TX_ANNEX_E_EN bit is set in the switch CPSW_PN_TS_CTL_REG register).
2. One of the sequences below is true.
   a. The first packet LTYPE matches 0x86dd.
   b. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches 0x86dd
   c. The first packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches 0x86dd
   d. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second

packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the third packet LTYPE matches 0x86dd

3. Byte 14 (the byte after the LTYPE) contains 0x6X (IPv6).
4. Byte 20 contains 0x11 (UDP Fixed Next Header).
5. Byte 21 contains 0x01 (Hop Limit = 1) if the TS_TTL_NONZERO bit in the switch CPSW_PN_TS_CTL_LTYPE2_REG register is cleared to 0h, or byte 21 contains any value if TS_TTL_NONZERO is set to 1h. Byte 21 is the TTL/HOP field..
6. The TS_UNI_EN bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is cleared to 0 and Bytes 38 through 53 contain:
   a. FF0M:0:0:0:0:0:0:0181 and the TS_129 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   b. FF0M:0:0:0:0:0:0:0182 and the TS_130 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   c. FF0M:0:0:0:0:0:0:0183 and the TS_131 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   d. FF0M:0:0:0:0:0:0:0184 and the TS_132 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   e. FF0M:0:0:0:0:0:0:006B and the TS_107 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set

Note

All values above are 16-bit hex numbers where M is enabled in the TS_MCAST_TYPE_EN field in the CPSW_PN_TS_CTL2_REG register.

-OR-

The TS_UNI_EN bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set to 1h and Bytes 38 through 53 contain any value.

7. Bytes 56 and 57 contain (UDP Header in bytes 54 through 61):
   a. Decimal 0x01 and 0x3F respectively and the TS_319 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
   b. Decimal 0x01 and 0x40 respectively and the TS_320 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set.
8. The PTP message begins in byte 62.
9. The packet message type is enabled in the TS_MSG_TYPE_EN field in the CPSW_PN_TS_CTL_REG register.
10. The packet was sent by host port 0.

Annex F (IEEE 802.3)

1. Transmit time sync is enabled (TS_TX_ANNEX_F_EN is set in the switch CPSW_PN_TS_CTL_REG register).
2. One of the sequences below is true:
   a. The first packet LTYPE matches TS_LTYPE1 in the CPSW_PN_TS_SEQ_LTYPE_REG register. LTYPE 1 should be used when only one time sync LTYPE is to be enabled.
   b. The first packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register and TS_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register.
   c. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register.
   d. The first packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_LTYPE1 in the CPSW_PN_TS_SEQ_LTYPE_REG register.
   e. The first packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register.
   f. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet

LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register and TS_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register.

g. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the third packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register.

h. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the third packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register and TS_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register

3. The packet message type is enabled in the TS_MSG_TYPE_EN field in the CPSW_PN_TS_CTL_REG register.
4. The packet was sent by host port 0.

If all of the criteria described above are met, and the packet is determined to be a valid time synchronization packet, then the time stamp for the transmit event will not be generated until the start of frame delimiter of the packet is actually transmitted. The start of frame delimiter will be sampled on every rising and falling edge of the CPTS_RFT_CLK. Once the packet is transmitted, then the TX interface will push an Ethernet transmit event into the event FIFO.

11.2.1.4.23.13.5.3

Table 11-290. Values of Message Type Field

Message Type	Value (hex)
Sync	0
Delay_Req	1
Pdelay_Req	2
Pdelay_Resp	3
Reserved	4:7
Follow_Up	8
Delay_Resp	9
Pdelay_Resp_Follow_Up	A
Announce	B
Signaling	C
Management	D
Reserved	E:F

Once a transmitted or received packet is determined to be a valid time sync packet, the Ethernet Transmit Event or Ethernet Receive Event is loaded onto the Event FIFO.

The CPTS_EVENT_1 register contains the Message Type and Sequence ID values from the original time sync packet. The CPTS_EVENT_0 (and CPTS_EVENT_3) register contains the time stamp value when the packet arrived at the corresponding port.

11.2.1.4.23.14 Timestamp Compare Event

Note

Timestamp compare events are generated for non-toggle mode only.

The CPTS can generate an event for a time stamp comparison in 32-bit or 64-bit mode.

11.2.1.4.23.14.1 32-Bit Mode

The CPTS_COMP output is also asserted when the event is generated. The event is generated when the 32-bit time stamp value (EVENT_0_REG) compares with the CPSW_CPTS_TS_COMP_VAL_REG register and the CPSW_CPTS_TS_COMP_LEN_REG value is non-zero. The CPSW_CPTS_TS_COMP_LEN_REG value should be written by software after the CPSW_CPTS_TS_COMP_VAL_REG register is written and should be zero when the comparison value is written.

11.2.1.4.23.14.2 64-Bit Mode

The CPTS_COMP output is also asserted when the event is generated. The event is generated when the 64-bit time stamp value (CPSW_CPTS_EVENT_0_REG and CPSW_CPTS_EVENT_3_REG) compares with the CPWS0_TS_COMP_VAL_REG and CPWS0_TS_COMP_HIGH_VAL_REG registers and the CPWS0_TS_COMP_LEN_REG value is non-zero. The CPWS0_TS_COMP_LEN_REG value should be written by software after the CPWS0_TS_COMP_VAL_REG register is written and should be zero when the comparison value is written.

11.2.1.4.23.15 Host Transmit Event

The host can send a packet to be transmitted on an Ethernet port that will generate a time synchronization event. The host sets the TSTAMP_EN bit and sends the DOMAIN, MESSAGE_TYPE, and SEQUENCE_ID in the additional control information that resides in the protocol specific section of the descriptor that is transmitted to the CPSW_2G. An event is then generated and placed on the event FIFO once the packet is transmitted. Host events allow the user to timestamp exactly when a software generated packet exits the device.

11.2.1.4.23.16 CPTS Interrupt Handling

The **TS_PEND** interrupt is enabled by writing a logic high to the **ts_int_enable** bit in the interrupt enable register. The raw interrupt value (before the enable) can be read by reading the **TS_Instat_raw** register. The enabled interrupt value can be read by reading the **TS_Instat_masked** register.

Software can process time sync events via interrupts in the following way:

1. Enable the **TS_PEND** interrupt by writing a logic high to bit zero of the **TS_Int_enable** register.
2. Upon interrupt, read the **Event_0-4** register values.
3. Write logic high to bit-0 of the **Event_Pop** register to pop the previously read value off of the event FIFO.
4. Process the end of interrupt as required by the upper level modules (outside the scope of CPTS).

Software has the option of processing more than a single event from the event FIFO in the interrupt service routine in the following way:

1. Enable the **TS_PEND** interrupt by writing a logic high to bit zero of the **TS_Int_enable** register.
2. Upon interrupt enter the CPTS service routine.
3. Read the **Event_0-4** register values.
4. Write a logic high to bit-0 of the **Event_Pop** register to pop the previously read value off of the event FIFO.
5. Wait for an amount of time greater than four **RCLK** periods plus four **VBUSP_CLK** periods.
6. Read bit 0 (**ts_pend_raw**) in the **TS_Intstat_raw** register to determine if another valid event is in the event FIFO. If bit zero is asserted then go to step 3. If bit 0 is not asserted then go to step 7.
7. Process the end of interrupt as required by the upper level modules (outside the scope of CPTS).

Software also has the option of disabling the interrupt and polling the **ts_intstat_raw** bit to determine if a valid event is on the event FIFO.

11.2.1.4.24 MII Management Interface (MDIO)

The MII Management interface module implements the 802.3 serial management interface to interrogate and control external Ethernet PHY using a two-wire bus.

Features Supported

- Clause 22 and CLuse 45 support
- Supports up to 32 PHY addresses.
- Two user access registers to control and monitor up to two PHYs simultaneously.

- VBUS 3.0 compliant slave interface for configuration and control.
- Each PHY can be individually enabled to be polled.
- The inter-poll gap between PHY polls can be changed.
- State Change Mode of operation to monitor up to 32 PHYs simultaneously.
- The MDIO interface can be manually controlled by software for GPIO operations.

11.2.1.4.24.1 MDIO Frame Formats

Clause 22

Table 11-291. MDIO Clause 22 Read Frame Format

Pre-amble	Start Delimiter	Operation Code	PHY Address	MMD Number	Turnaround	Data
FFFF FFFFh	01	10	AAAAA	RRRRR	Z0	DDDD.DDDD.DDDD.DDDD

Table 11-292. MDIO Clause 22 Write Frame Format

Pre-amble	Start Delimiter	Operation Code	PHY Address	MMD Number	Turnaround	Data
FFFF FFFFh	01	01	AAAAA	RRRRR	10	DDDD.DDDD.DDDD.DDDD

The default or idle state of the two wire serial interface is a logic one. All tri-state drivers should be disabled and the PHY's pull-up resistor should pull the **MDIO** line to a logic one. Prior to initiating any other transaction, the station management entity shall send a preamble sequence of 32 contiguous logic one bits on the **MDIO** line with 32 corresponding cycles on **MDCLK** to provide the PHY with a pattern that it can use to establish synchronization. A PHY shall observe a sequence of 32 contiguous logic one bits on **MDIO** with 32 corresponding **MDCLK** cycles before it responds to any other transaction.

Preamble

The start of a frame is indicated by a preamble, which consists of a sequence of 32 contiguous bits all of which are a "1". This sequence provides the PHY a pattern to use to establish synchronization.

Start Delimiter

The preamble is followed by the start delimiter which is indicated by a "01" pattern. The pattern assures transitions from the default logic one state to zero and back to one.

Operation Code

The operation code for a read is "10", while the operation code for a write is a "01".

PHY Address

The PHY address is 5 bits allowing 32 unique values. The first bit transmitted is the MSbit of the PHY address.

Register Address

The Register address is 5 bits allowing 32 registers to be addressed within each PHY. Refer to the 10/100 PHY address map for addresses of individual registers.

Turnaround

An idle bit time during which no device actively drives the MDIO signal shall be inserted between the register address field and the data field of a read frame in order to avoid contention. During a read frame, the PHY shall drive a zero bit onto MDIO for the first bit time following the idle bit and preceding the Data field. During a write frame, this field shall consist of a one bit followed by a zero bit.

Data

The Data field is 16-bits. The first bit transmitted and received is the MSbit of the data word.

Clause 45

Table 11-293 shows the address, Table 11-294 shows the read format and Table 11-295 shows the write format of the supported Clause 45 MII Management interface frames. Post-increment accesses are not supported.

Table 11-293. MDIO Clause 45 Address Frame Format

Pre-amble	Start Delimiter	Operation Code	PHY Address	MMD Number	Turnaround	Data
FFFF FFFFh	00	00	AAAAA	RRRRR	10	AAAA.AAAA.AAAA.AAAA

Table 11-294. MDIO Clause 45 Read Frame Format

Pre-amble	Start Delimiter	Operation Code	PHY Address	MMD Number	Turnaround	Data
FFFF FFFFh	00	11	AAAAA	RRRRR	Z0	DDDD.DDDD.DDDD.DDDD

Table 11-295. MDIO Clause 45 Write Frame Format

Pre-amble	Start Delimiter	Operation Code	PHY Address	MMD Number	Turnaround	Data
FFFF FFFFh	00	01	AAAAA	RRRRR	10	DDDD.DDDD.DDDD.DDDD

The default or idle state of the two wire serial interface is a logic one. All tri-state drivers should be disabled and the PHY's pull-up resistor should pull the **MDIO** line to a logic one. Prior to initiating any other transaction, the station management entity shall send a preamble sequence of 32 contiguous logic one bits on the **MDIO** line with 32 corresponding cycles on **MDCLK** to provide the PHY with a pattern that it can use to establish synchronization. A PHY shall observe a sequence of 32 contiguous logic one bits on **MDIO** with 32 corresponding **MDCLK** cycles before it responds to any other transaction. The **MDIO User_Addr** registers must be written before a read or write operation is performed to set the address used in the operation. Each read or write operation has a preceeding address frame.

Preamble

The start of a frame is indicated by a preamble, which consists of a sequence of 32 contiguous bits all of which are a "1". This sequence provides the PHY a pattern to use to establish synchronization. The preamble is required in clause 45 operation.

Start Delimiter

The preamble is followed by the start delimiter which is indicated by a "00" pattern.

Operation Code

The operation code for an address transaction is "00", The operation code for a read is "11", while the operation code for a write is a "01".

PHY Address

The PHY address is 5 bits allowing 32 unique values. The first bit transmitted is the MSbit of the PHY address.

MMD Number

The MMD number is the 5-bits allowing 32 unique values. The first bit transmitted is the MSbit.

Turnaround

An idle bit time during which no device actively drives the MDIO signal shall be inserted between the register address field and the data field of a read frame in order to avoid contention. During a read frame, the PHY shall drive a zero bit onto MDIO for the first bit time following the idle bit and preceding the Data field. During a write frame, this field shall consist of a one bit followed by a zero bit.

Address

The address field is 16-bits on address operations. The first bit transmitted is the MSbit of the address word. Each read/write operation initiated has an automatic address operation initiated first that uses the **MDIO User_Addr0/1** register values as the 16-bit address.

Data

The Data field is 16-bits on read and write operations. The first bit transmitted and received is the MSbit of the data word.

11.2.1.4.24.2 MDIO Functional Description

The MDIO Management I/F will remain idle until enabled by setting the **enable** bit in the **MDIO Control** register. The module will then continuously poll the linkstatus bits from within the GenericStatusRegister of all enabled 32 PHY addresses. Individual PHY's can be enabled or disabled for polling thru the associated bit in the **Poll_En** register. The **MDIO Link** and **MDIO alive** register bit values are updated on the poll of each PHY. In Normal Mode, The link status of two of the 32 possible PHY addresses can also be determined using the **MLINK** pin inputs. The **linksel** bit in the **MDIO USER_PHY_SEL** register determines the status input that is used. A change in the link status of the two PHYs being monitored will set the appropriate bit in the **MDIO LinkIntRaw** register and the **MDIO LinkIntMasked** register, if enabled by the **linkint_enable** bit in the **MDIO User_Phy_Sel** register. In State Change Mode, a change in any PHY status will be indicated on the **MDIO LINKINT[0]** interrupt if enabled.

The **MDIO Alive** register is updated if the PHY acknowledged the read of the generic status register. In addition, any PHY register read transactions initiated by the host also update the **MDIO Alive** register bit associated with the PHY.

At any time, the host can initiate a transaction for the MDO module to undertake using the **data, phyadr, regadd/MMD,** and **write** fields in an **MDIO User_Access** register. When the host sets the **go** bit in this register, the MDIO module will begin the transaction without any further intervention from the host. Upon completion, the MDIO will clear the **go** bit and set the **userintraw** bit in the **MDIO User_Int_Raw** register corresponding to the **MDIO User_Access** register being used. The corresponding bit in the **MDIO User_Int_Masked** register may also be set depending on the mask setting in the **MDIO User_Int_Mask_Set** and **MDIO User_Int_Mask_Clear** registers. A round-robin arbitration scheme is used to schedule transactions which may queued by the host in different **MDIO User_Access** registers. The host should check the status of the **go** bit in the **MDIO User_Access** register before initiating a new transaction to ensure that the previous transaction has completed. The host can use the **ack** bit in the **MDIO User_Access** register to determine the status of a read transaction.

Software may use the MDIO module to setup the auto-negotiation parameters of each PHY attached to a MAC port, retrieve the negotiation results, and setup the **MAC Control** register in the corresponding MAC.

11.2.1.4.25 Reset Isolation

The CPSW supports reset isolation of the Ethernet switch ports. When the **ISOLATE** input is asserted the below occur simultaneously:

- The Host Port 0 is removed from ALE processing (packets received on ports 1 through N-1 will be dropped to port 0).
- FHost packets are dropped. Any packet currently in progress when ISOLATE is asserted is dropped due to a FHost packet code error (and possible a CRC or FRAG error).
- THost packets in queue are dropped.

The intent of reset isolation is to allow packets to switch between the Ethernet ports while the remainder of the system is undergoing a reset. Isolation assumes that the external host and logic connected to the port 0 host interface is reset and will not be in the middle of a packet when **ISOLATE** is de-asserted.

11.2.1.4.26 CPSW Initialization and Configuration

To configure the CPSW for operation the host must perform the following:

- Ensure that at least 2000 VBUSP_CLK periods are run after reset is de-asserted.
- Configure the CPSW Control register.

- Configure the Ethernet Port Source Address registers
- Configure the Statistics Port Enable registers
- Configure the ALE.
- Configure the Ethernet Ports.

11.2.1.4.27 Enet Mac Reset or XGMII/GMII Mode Change Configuration

- Set pn_cmd_idle in the Ethernet port Pn_Mac_Control registers.
- Wait for pn_Idle to be indicated in the Ethernet port Pn_Mac_Status registers.
- Set pn_soft_reset in the Ethernet port Pn_Soft_Reset registers.
- Wait for pn_soft_reset in the Pn_Soft_Reset registers to be cleared to confirm reset completion.
- Configure the Ethernet ports.

11.2.1.4.28 Memory Error Detection and Correction

The cpsw error detection and correction logic uses the IP ECC Aggregator Module. The ECC Aggregator allows the control of the cpsw RAMs as shown in the below table. ECC is always enabled. The cpsw FIFO RAMS implement ECC only on packet headers. The packet data is protected by Castignoli CRC (regardless of the input packet CRC type or output CRC type). The ALE and EST RAMs have complete ECC as normal.

11.2.1.4.28.1 Packet Header ECC

Only packet headers bits are protected by ECC in the cpsw RAMs. The **ECC_Error_Control1** register **ecc_row** is not implemented – **ecc_bit1** is implemented to determine which bit of the header is flipped for an SEC error when the **ecc_crc_mode** bit is cleared in the **CPSW_Control** register. The ECC status registers return the RAM address that was flipped (**ecc_row**) along with the **ecc_bit1** value. Forcing double bit errors in testing can cause indeterminate switch operation if multiple used packet header bits are flipped given that only single bit errors are fixed by the ECC logic. Header bits 207 downto 200 are not currently used in the switch and may be used to test double bit errors without the possibility of requiring a reset for the switch to recover from the double bit error. No header bits are flipped when **ecc_crc_mode** is set to one. Either the **pn_rx_ecc_err_en** or the **pn_tx_ecc_err_en** bit must be set in the **PN_Control** register to test ecc header errors.

The header ECC code is stored in bits 255 downto 208. If any bit is flipped in the ECC code, the flipped bit will be corrected, but the index of the flipped bit will be reported as bit zero. This implies that when the aggregator reports that there is a SEC on 'bit 0', it can mean two things: either SEC on data bit 0 or SEC somewhere inside the ECC code. Any packet header with ECC error issues a pulse on **ECC_PULSE_INTR** as does an ale ram ECC error.

11.2.1.4.28.2 Packet Protect CRC

Each ingress packet without error is passed through the cpsw with an internally generated Castignoli protect CRC. The protect CRC is checked on port egress for correctness and is replaced. If the CRC is correct (no RAM bit errors), then the packet is output with the selected port CRC type. If a protect CRC error is detected on THost then the **memory_protect_error** buffer descriptor bit will be asserted so that the packet is dropped to the host. If a protect CRC error is detected on Ethernet egress then the egress CRC will be generated on the packet and at least one byte of the CRC will be inverted on output. CRC memory protect errors do not assert the **ECC_PULSE_INTR** signal. CRC memory protect errors are counted in the associated port statistics registers and issue an interrupt on **STAT_PEND_INTR** if any CRC memory protect error occurs (and the statistics for that port are enabled). When the **ecc_crc_mode** bit in the **CPSW_Control** register is set, the **ecc_bit1** aggregator register will flip the associated column bit in any FIFO memory read operation, inducing a CRC protect error when the protect CRC is checked. No header bits are flipped when **ecc_crc_mode** is set. Either the **pn_rx_ecc_err_en** or the **pn_tx_ecc_err_en** bit must be set in the **PN_Control** register to test packet CRC errors.

RAM 0	ALE Ram
RAM 1	Port 0 FIFO Rx Ram
RAM 2	Port 0 FIFO Tx Ram
RAM 3	Port 1 FIFO Rx Ram
RAM 4	Port 1 FIFO Tx Ram

RAM 5	Port 2 FIFO Rx Ram
RAM 6	Port 2 FIFO Tx Ram
…	…
RAM (N*2) - 1	Port N FIFO Rx Ram
RAM (N*2)	Port N FIFO Tx Ram
RAM 19	EST Ram

11.2.1.4.28.3 Aggregator Ram Control

The ECC logic for each FIFO ram (receive and transmit) is divided into eight separate ECC encoders/decoders that encode/decode 26-bits of data each. Each of the 8 encoders (0 to 7) generates 6-bits of ECC code (48 code bits total), and each of the eight decoders (0 to 7) checks 6-bits of ECC code across the 26-bits of data (208 data bits total). The 48-bits of ECC code are passed through the ram in the upper 48 unused bits in the header word. The header data bits and ECC code bits are shown in the below table. The **ecc_bit1[15:0]** value returned on error is a 16-bit value that is the concatenation of 5-bits of zero, 3-bits of the encoder/decoder number (0 to 7), 3-bits of zero, and 5-bits of index into the indicated 26-bit encoder/decoder. For example, an **ecc_bit1** value of 0x0308 is bit-8 of encoder/decoder 3, which is header bit 86 (((26*3) + 8).

Header Data Bits	Encoder/Decoder
25:0	Encoder/Decoder 0 Data
51:26	Encoder/Decoder 1 Data
77:52	Encoder/Decoder 2 Data
103:78	Encoder/Decoder 3 Data
129:104	Encoder/Decoder 4 Data
155:130	Encoder/Decoder 5 Data
181:156	Encoder/Decoder 6 Data
207:182	Encoder/Decoder 7 Data
213:208	Encoder/Decoder 0 Code
219:214	Encoder/Decoder 1 Code
225:220	Encoder/Decoder 2 Code
231:226	Encoder/Decoder 3 Code
237:232	Encoder/Decoder 4 Code
243:238	Encoder/Decoder 5 Code
249:244	Encoder/Decoder 6 Code
255:250	Encoder/Decoder 7 Code

11.2.1.4.29 CPSW Network Statistics

The CPSW has statistics that record events associated with frame traffic on each port. STAT0 keeps statistics for PORT0, STAT1 for PORT1 and so on. All statistics are 32-bit registers. By convention the statistics registers are receive for ingress and transmit for egress for all ports.

If any bit in **stat_port_en** is set for a specific STAT module, the value written to a statistics register will be subtracted from the register value with the result being stored in the register. If a value greater than the statistics value is written, then zero will be written to the register (writing 0xffffffff will clear a statistics location). When all port enable bits are cleared to zero, all statistics registers are read/write (normal write direct, so writing 0x00000000 will clear a statistics location). All write accesses must be 32-bit accesses. In the below statistics descriptions, “the port” refers to any enabled port (with a corresponding set **stat_port_en** bit).

11.2.1.4.29.1 Rx (only) Statistics Descriptions

11.2.1.4.29.1.1 Good Rx Frames

The total number of good frames received on the port. A good frame is defined to be:

- any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

11.2.1.4.29.1.2 Broadcast Rx Frames

The total number of good broadcast frames received on the port. A good broadcast frame is defined to be:

- any data or MAC control frame which was destined for address 0xFFFFFFFFFFFF only, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

11.2.1.4.29.1.3 Multicast Rx Frames

The total number of good multicast frames received on the port. A good multicast frame is defined to be:

- any data or MAC control frame which was destined for any multicast address other than 0xFFFFFFFFFFFF, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

11.2.1.4.29.1.4 Pause Rx Frames

The total number of IEEE 802.3X pause frames received by the port (whether acted upon or not). Such a frame:

- contained any unicast, broadcast, or multicast address, and
- contained the length/type field value 88.08 (hex) and the opcode 0x0001, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error, and
- pause frames are enabled on the port (pn_tx_flow_en = 1).

The port could have been in either half or full-duplex mode.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic

or

The total number of priority based flow control (802.1Qbb) pause frames received by the port (whether acted upon or not). Such a frame:

- contained any unicast, broadcast, or multicast address, and
- contained the length/type field value 88.08 (hex) and the opcode 0x0001, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, and
- priority based flow control pause frames are enabled on the port.

See the **Rx CRC errors** statistic descriptions for definitions of CRC errors. Overruns have no effect upon this statistic

11.2.1.4.29.1.5 Rx CRC Errors

The total number of frames received on the port that experienced a CRC error. Such a frame:

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and

- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no code/align error, and
- had a CRC error.

Overruns have no effect upon this statistic.

A CRC error is defined to be:
- a frame containing an even number of nibbles, and
- fails the Frame Check Sequence test.

11.2.1.4.29.1.6 Rx Align/Code Errors

The total number of frames received (ingress) on the port that experienced an alignment error or code error. Such a frame:
- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had either an alignment error or a code error.

Over-runs have no effect upon this statistic.

An alignment error is defined to be:
- a frame containing an odd number of nibbles, and
- also fails the Frame Check Sequence test if the final nibble is ignored.

A code error is defined to be:
- A frame which has been discarded because the port's **MRXER** pindriven with a one for at least one bit-time's duration at any point during the frame's reception.

Note

RFC 1757 etherStatsCRCAlignErrors Ref. 1.5 can be calculated by summing **Rx Align/Code Errors** and **Rx CRC errors** (see below).

10G: For XGMII, packets are ended at the code error and only that number of bytes are kept when rx_cef is set (includes the code error bytes).

11.2.1.4.29.1.7 Oversize Rx Frames

The total number of oversized frames received on the port. An oversized frame is defined to be:
- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was greater than pn_rx_maxlen in bytes, and
- had no CRC error, alignment error or code error.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

11.2.1.4.29.1.8 Rx Jabbers

The total number of jabber frames received on the port. A jabber frame is:
- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was greater than pn_rx_maxlen bytes long, and
- had a CRC error, an alignment error, or a code error.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

11.2.1.4.29.1.9 Undersize (Short) Rx Frames

The total number of undersized frames received on the port. An undersized frame is defined to be:

- any data frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was less than 64 bytes long, and
- had no CRC error, alignment error or code error.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

11.2.1.4.29.1.10 Rx Fragments

The total number of frame fragments received on the port. A frame fragment is defined to be:

- any data frame (address matching does not matter), and
- was less than 64 bytes long, and
- had a CRC error, an alignment error, or a code error, and
- was not the result of a collision caused by half duplex, collision based flow control.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

11.2.1.4.29.1.11 Rx IPG Error

The total number of 10G frames received on a port that had a correct preamble but did not have at least five bytes of IDLE preceding the frame. This does not indicate if the frame with the IPG error was kept or ignored.

11.2.1.4.29.1.12 Rx Bottom Of FIFO Drop

Ethernet Ports

The total number of ingress frames on a port that overran the port's receive FIFO and were dropped (bottom of receive FIFO). Port 0 (CPPI transmit port) should not drop packets on ingress because port 0 ingress flow control should be enabled. The Ethernet ports will only drop packets in the receive FIFO when receive flow control is enabled and the sending port ignores sent pause frame and then overruns the receive FIFO. The overrun frame is defined to be:

- any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- Was dropped on port 0 due to a lack of memory space in the receive FIFO

Note

This stat should be zero

Host Port 0

This statistic also counts frames dropped on port 0 that were 17 to 33 bytes (only for port 0). For Ethernet ports, the drop count for frames shorter than 33 bytes is included in the undersized or fragment count. Port 0 simply gives an indication that a packet with 33 bytes was dropped. No other statistics are counted for frames shorter than 33 bytes.

11.2.1.4.29.1.13 Portmask Drop

All Ports

The total number of ingress frames on a port that were dropped by the ALE (the ALE did not forward the packet to any port). The frame was defined to be:

- any data or MAC control frame
- Was any length greater than 32 bytes
- Was dropped by the ALE - ale_portmask = 0 (was not sent to any destination port)

- The frame could have been dropped due to error or other counted reason, so it could be counted elsewhere also.

Note

This stat does not count in the overall total as it includes every packet received greater than 32 bytes that had a zero **port_mask**.

11.2.1.4.29.1.14 Rx Top Of FIFO Drop

All Ports

The total number of frames received on a port that had a **START** of frame (SOF) overrun on any destination port egress (when attempting to load the packet from the top of the ingress port receive FIFO into any other port's transmit FIFO). If a multicast/broadcast packet is dropped by multiple destination ports then this statistic will increment by the number of ports that dropped the packet. Rx Top Of FIFO Drop is defined to be:

- any data or MAC control frame
- Was any length greater than 32 bytes
- Was dropped by the ALE - ale_portmask = 0 (was not sent to any destination port)
- The frame could have been dropped due to error or other counted reason, so it could be counted elsewhere also.

11.2.1.4.29.1.15 ALE Drop

All Ports

The total number of frames received on a port such that the destination address was not equal to the source address and the packet was not destined to the port it was received on, but the frame was not forwarded to any port (the **port_mask** was zero).

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- had no CRC error, alignment error or code error, and
- the destination address was not equal to the source address, and
- The packet was not destined for the port it was receive on, and
- had a zero port_mask

11.2.1.4.29.1.16 ALE Overrun Drop

All Ports

The total number of frames received on a port that were dropped (zero **port_mask**) due to exceeding the maximum ALE lookup rate (Port 0 should not have ALE Overrun Drops because the ingress rate is controlled to prevent it). This statistic should be zero and when non-zero indicates a system clock issue or indicates that short packets were sent with **pn_rx_csf_en** at a rate that exceeded the maximum lookup rate.

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- the maximum ALE lookup rate was exceeded so the lookup was aborted and the packet was dropped.

11.2.1.4.29.1.17 ALE Rate Limit Drop

All Ports

The total number of frames received on a port that were dropped (zero **port_mask**) due to receive rate limiting on this port or due to transmit rate limiting on any destination port (not sent to all expected destination ports if transmit rate limiting).

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and

- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- had no CRC error, alignment error or code error, and
- the receive rate was exceeded and the packet was dropped, or the transmit rate was exceeded to any destination port and the packet was dropped to one or more expected destination ports (indicates that the destinations were pruned due to rate limiting).

11.2.1.4.29.1.18 ALE VLAN Ingress Check Drop

The total number of frames received on a port that were dropped (zero **port_mask**) due to VLAN ingress check failure.

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- had no CRC error, alignment error or code error, and
- the VLAN ID ingress check failed (the receive port was not in the group), and
- The address lookup did not return a match with the super bit set

11.2.1.4.29.1.19 ALE DA=SA Drop

The total number of frames received on a port that were dropped (zero **port_mask**) due to destination address equal to source address.

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- had no CRC error, alignment error or code error, and
- The destination address was equal to the source address
- The source address was not an entry in the table.

11.2.1.4.29.1.20 Block Address Drop

The total number of frames received on a port that were dropped (zero **port_mask**) due to the destination or source address being blocked.

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- had no CRC error, alignment error or code error, and
- the source or destination address matched a table entry with the block bit set.

11.2.1.4.29.1.21 ALE Secure Drop

The total number of frames received on a port that were dropped (zero **port_mask**) due to a secure violation (the source address is owned by a different receive port).

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- had no CRC error, alignment error or code error, and
- the source address is an entry in the table with the secure bit set and a port number for a different receive port.

11.2.1.4.29.1.22 ALE Authentication Drop

The total number of frames received on a port that were dropped (zero **port_mask**) due to authentication failure.

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- had no CRC error, alignment error or code error, and
- enable_auth_mode is set, and
- the source address is not equal to the destination address, and

- the source address is not a table entry, and
- the destination address is not a table entry with the super bit set.

11.2.1.4.29.1.23 ALE Unknown Unicast

The total number of frames received on a port that had a unicast destination address with an unknown source address. The frame is defined to be:

- was any data frame with a unicast destination address, and
- the source address was not a table entry, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

Note

The ALE Unknown Unicast Bytecount statistic is the number of bytes contained in the ALE Unknown Unicast frames.

11.2.1.4.29.1.24 ALE Unknown Multicast

The total number of frames received on a port that had a multicast destination address with an unknown source address. The frame is defined to be:

- was any data frame with a multicast destination address, and
- the source address was not a table entry, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

Note

The ALE Unknown Multicast Bytecount statistic is the number of bytes contained in the ALE Unknown Multicast frames.

11.2.1.4.29.1.25 ALE Unknown Broadcast

The total number of frames received on a port that had a Broadcast destination address with an unknown source address. The frame is defined to be:

- was any data frame with a broadcast destination address, and
- the source address was not a table entry, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

Note

The ALE Unknown Broadcast Bytecount statistic is the number of bytes contained in the ALE Unknown Broadcast frames.

11.2.1.4.29.1.26 ALE Policer Match

The total number of frames received on a port that had a matched a policer. The frame is defined to be:

- any data frame, and
- matched a condition on a policer, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

11.2.1.4.29.1.27 ALE Policer Match Red

The total number of frames received on a port that had matched a policer and the condition was red. The frame is defined to be:

- any data frame, and
- matched a policer with the condition red, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and

- had no CRC error, alignment error or code error.

11.2.1.4.29.1.28 ALE Policer Match Yellow

The total number of frames received on a port that had matched a policer and the condition was yellow. The frame is defined to be:

- any data frame, and
- matched a policer with the condition yellow, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

11.2.1.4.29.1.29 IET Receive Assembly OK

The total number of correctly received and re-assembled premptable frames.

- any premptable frame received
- was any size, and
- was correctly received and re-assembled without error.

11.2.1.4.29.1.30 IET Receive Assembly Error

The total number of premptable received frames with IET assembly errors.

- any frame received
- was any size, and
- was a non-initial fragment that mismatched the frame count or fragment count (went to the assembly error state in the IET receive state machine).

11.2.1.4.29.1.31 IET Receive SMD Error

The total number of received frames rejected due to an unknown SMD value or received frames rejected with an SMD-C when no frame is in progress.

- any frame received
- was any size, and
- was rejected because of an unknown SMD value or SMD-C with no frame in progress.

Note

If **iet_en** is not set, this statistic counts any received frame with any non express SMD.

11.2.1.4.29.1.32 IET Receive Merge Fragment Count

The total number of received non-initial fragments that did not have an assembly error. The IET stat aMACMergeFragCountRx is derived by adding the Receive Assembly Error count to this value.

- any frame received
- was any size, and
- was a non-initial fragment that did not contain an assembly error.

11.2.1.4.29.1.33 Rx Octets

The total number of bytes in all good frames received on the port. A good frame is defined to be:

- any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

11.2.1.4.29.2 Tx (only) Statistics Descriptions

The maximum and minimum transmit frame size is software controllable.

Thost overruns (**P0_Tx_SOF_OVERRUN** and **P0_Tx_MOF_OVERRUN**) have no effect on Tx statistics. They are counted separately.

11.2.1.4.29.2.1 Good Tx Frames

The total number of good frames transmitted on the port. A good frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and
- was any length, and
- had no late or excessive collisions, no carrier loss and no underrun.

11.2.1.4.29.2.2 Broadcast Tx Frames

The total number of good broadcast frames transmitted on the port. A good broadcast frame is defined to be:

- any data or MAC control frame destined for address 0xFFFFFFFFFFFF only, and
- was of any length, and
- had no late or excessive collisions, no carrier loss and no underrun

11.2.1.4.29.2.3 Multicast Tx Frames

The total number of good multicast frames transmitted on the port. A good multicast frame is defined to be:

- any data or MAC control frame destined for any multicast address other than 0xFFFFFFFFFFFF, and
- was of any length, and
- had no late or excessive collisions, no carrier loss and no underrun.

11.2.1.4.29.2.4 Pause Tx Frames

This statistic indicates the number of IEEE 802.3X pause frames transmitted by the port.

Pause frames cannot contain a CRC error because they are created in the transmitting MAC, so these error conditions have no effect upon the statistic. Pause frames sent by software will not be included in this count.

Since pause frames are only transmitted in full duplex carrier loss and collisions have no effect upon this statistic.

Transmitted pause frames are always 64 byte multicast frames so will appear in the **Tx Multicast Frames** and **64octect Frames** statistics.

11.2.1.4.29.2.5 Collisions

This statistic records the total number of times that the port experienced a collision. Collisions occur under two circumstances.

1. When a transmit data or MAC control frame:
   - was destined for any unicast, broadcast or multicast address, and
   - was any size, and
   - had no carrier loss and no underrun, and
   - experienced a collision. A jam sequence is sent for every non-late collision, so this statistic will increment on each occasion if a frame experiences multiple collisions (and increments on late collisions).

   CRC errors have no effect upon this statistic.
2. When the port is in half-duplex mode, flow control is active, and a frame reception begins.

11.2.1.4.29.2.6 Single Collision Tx Frames

The total number of frames transmitted on the port that experienced exactly one collision. Such a frame:

- was any data or MAC control frame destined for any unicast, broadcast or multicast address, and
- was any size, and
- had no carrier loss and no underrun, and
- experienced one collision before successful transmission. The collision was not late.

CRC errors have no effect upon this statistic.

11.2.1.4.29.2.7 Multiple Collision Tx Frames

The total number of frames transmitted on the port that experienced multiple collisions. Such a frame:
- was any data or MAC control frame destined for any unicast, broadcast or multicast address, and
- was any size, and
- had no carrier loss and no underrun, and
- experienced 2 to 15 collisions before being successfully transmitted. None of the collisions were late.

CRC errors have no effect upon this statistic.

11.2.1.4.29.2.8 Excessive Collisions

The total number of frames for which transmission was abandoned due to excessive collisions. Such a frame:
- was any data or MAC control frame destined for any unicast, broadcast or multicast address, and
- was any size, and
- had no carrier loss and no underrun, and
- experienced 16 collisions before abandoning all attempts at transmitting the frame. None of the collisions were late.

CRC errors have no effect upon this statistic.

11.2.1.4.29.2.9 Late Collisions

The total number of frames on the port for which transmission was abandoned because they experienced a late collision. Such a frame:
- was any data or MAC control frame destined for any unicast, broadcast or multicast address, and
- was any size, and
- experienced a collision later than 512 bit-times into the transmission. There may have been up to 15 previous (non-late) collisions which had previously required the transmission to be re-attempted. The Late Collisions statistic dominates over the single, multiple and excessive Collisions statistics - if a late collision occurs the frame will not be counted in any of these other three statistics.

CRC errors, carrier loss, and underrun have no effect upon this statistic.

11.2.1.4.29.2.10 Deferred Tx Frames

The total number of frames transmitted on the port that first experienced deferment. Such a frame:
- was any data or MAC control frame destined for any unicast, broadcast or multicast address, and
- was any size, and
- had no carrier loss and no underrun, and
- experienced no collisions before being successfully transmitted, and
- found the medium busy when transmission was first attempted, so had to wait.

CRC errors have no effect upon this statistic

See RFC1623 Ref. 2.6 dot3StatsDefferredTransmissions.

11.2.1.4.29.2.11 Carrier Sense Errors

The total number of frames on the port that experienced carrier loss. Such a frame:
- was any data or MAC control frame destined for any unicast, broadcast or multicast address, and
- was any size, and
- the carrier sense condition was lost or never asserted when transmitting the frame (the frame is not retransmitted). This is a transmit only statistic. Carrier Sense is a don’t care for received frames. Transmit frames with carrier sense errors are sent until completion and are not aborted.
- CRC errors and underrun have no effect upon this statistic.

11.2.1.4.29.2.12 Tx Octets

The total number of bytes in all good frames transmitted on the port. A good frame is defined to be:
- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and

- was any size, and
- had no late or excessive collisions and no carrier loss.

11.2.1.4.29.2.13 Transmit Priority 0-7

The total number of frames transmitted on the port from transmit FIFO priority 0-7. Collision retries do not affect this statistic. Pause frames do not affect this statistic.

- any frame transmitted from priority 0-7, and
- was less than or equal to cpsw_tx_pri(0-7)_maxlen.
- Collision retries are not counted in this statistic
- Pause frames are not counted in this statistic.
- Carrier sense errors do not affect this statistic.

Note

The Transmit Priority 0-7 Bytecount statististic is the number of bytes contained in the frames of the Transmit Priority 0-7 statistic.

11.2.1.4.29.2.14 Transmit Priority 0-7 Drop

The total number of transmit frames on the port that overran the transmit FIFO priority 0-7 and were dropped. This count includes frames dropped due to **cpsw_tx_pri(0-7)_maxlen**.

- any frame destined to be transmitted from priority 0-7, and
- was any size, and
- was dropped due to priority 0-7 FIFO overrun (Start of packet overrun).
- Was dropped due to frame size larger than cpsw_tx_pri(0-7)_maxlen.

Note

The Transmit Priority 0-7 Drop Bytecount statististic is the number of bytes contained in the frames of the Transmit Priority 0-7 Drop statistic.

11.2.1.4.29.2.15 Transmit Memory Protect Errors

The total number of transmit frames on the port that had a memory protect CRC error on egress.

- any frame destined to be transmitted, and
- was any size, and
- Had a memory protect CRC error on egress.

Frames to the host with memory protect errors are indicated to be dropped with a set receive buffer descriptor **drop** bit. Ethernet frames will have at least one byte of the generated port type CRC inverted on egress.

This statistic is 8-bits wide only and will not rollover but will limit at 0xff.

A non-zero value in this statistic will issue a **STAT_PEND_INTR** interrupt for the associated port.

11.2.1.4.29.2.16 IET Transmit Merge Fragment Count

The total number of non-initial premptable transmit fragments on premptable transmit.

- any frame destined to be transmitted on the premptable port, and
- was any size, and
- was a non-initial fragment.

11.2.1.4.29.2.17 IET Transmit Merge Hold Count

The total number of premptable frames that were prempted and reassembled by the assertion of **pn_mac_hold** in the **Enet_Pn_IET_Control** register or were prempted by EST. The IET statistic aMACMergeHoldCount can be derived and maintained by software.

- any frame destined to be transmitted on the premptable port, and
- was any size, and
- was prempted by the assertion of pn_mac_hold, or
- was prempted by Enhanced Scheduled Traffic (EST).

11.2.1.4.29.3 Rx and Tx (shared) Statistics Descriptions

11.2.1.4.29.3.1 Net Octets

The total number of bytes of frame data received and transmitted on the port. Each frame counted:

- was any data or MAC control frame destined for any unicast, broadcast or multicast address (address match does not matter), and
- was of any size (including <64 byte and > pn_rx_maxlen byte frames).

Also counted in this statistic are:

- every byte transmitted before a carrier-loss was experienced,
- every byte transmitted before each collision was experienced, (i.e. multiple retries are counted each time),
- every byte received if the port is in half-duplex mode until a jam sequence was transmitted to initiate flow control. (The jam sequence was not counted to prevent double-counting).

Error conditions such as alignment errors, CRC errors, code errors, overruns and underruns do not affect the recording of bytes by this statistic.

The objective of this statistic is to give a reasonable indication of Ethernet utilization.

11.2.1.4.29.3.2 Rx + Tx 64 Octet Frames

The total number of 64-byte frames received and transmitted on the port. Such a frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and
- did not experience late collisions, excessive collisions, or carrier sense error, and
- was exactly 64 bytes long. (If the frame was being transmitted and experienced carrier loss that resulted in a frame of this size being transmitted, then the frame will be recorded in this statistic).

CRC errors, code/align errors and overruns do not affect the recording of frames in this statistic.

11.2.1.4.29.3.3 Rx + Tx 65-127 Octet Frames

The total number of frames of size 65 to 127 bytes received and transmitted on the port. Such a frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and
- did not experience late collisions, excessive collisions, or carrier sense error, and
- was 65 to 127 bytes long.

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

11.2.1.4.29.3.4 Rx + Tx 128-255 Octet Frames

The total number of frames of size 128 to 255 bytes received and transmitted on the port. Such a frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and
- did not experience late collisions, excessive collisions, or carrier sense error, and
- was 128 to 255 bytes long.

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

For Rx reference only, see RFC1757 Ref. 1.13 etherStatsPkts128to255Octets.

11.2.1.4.29.3.5 Rx + Tx 256-511 Octet Frames

The total number of frames of size 256 to 511 bytes received and transmitted on the port. Such a frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and
- did not experience late collisions, excessive collisions, or carrier sense error, and
- was 256 to 511 bytes long.

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.Rx + Tx 512-1023 Octet Frames

The total number of frames of size 512 to 1023 bytes received and transmitted on the port. Such a frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and
- did not experience late collisions, excessive collisions, or carrier sense error, and
- was 512 to 1023 bytes long.

CRC errors, code/align errors and overruns do not affect the recording of frames in this statistic.

11.2.1.4.29.3.6 Rx + Tx 1024_Up Octet Frames

The total number of frames of size 1024 to **pn_rx_maxlen** bytes for receive or 1024 up for transmit on the port. Such a frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and
- did not experience late collisions, excessive collisions, or carrier sense error, and
- was 1024 to pn_rx_maxlen bytes long on receive, or any size on transmit.

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

Table 11-296. Rx Statistics Summary

Rx Statistic	Frame/ Oct	Rx/ Rx+ Tx	Frame Type					Frame Size (bytes)								Event				
			MAC control		Data			< 64	64	65-127	128-255	256-511	512-1023	1024-rx_maxlen	> rx_maxlen	flow coll.	CRC error	align / code	over-run	addr disc.

Table 11-296. Rx Statistics Summary (continued)

Rx Octets	O	Rx	(y|	y|	y|	y|	y)	n	(y|	y|	y|	y|	y|	y)	n	-	n	n	-	n
Net Octets	O	Rx+Tx	(y|	y|	y|	y|	y)	(y|	y|	y|	y|	y|	y|	y|	y|	y)	-	-	-	-

1. “AND” is assumed horizontally across the table between all conditions which form the statistic (marked y or n) except where (y|y), meaning “OR” is indicated. Parentheses are significant.
2. “-“ indicates conditions which are ignored in the formations of the statistic.
3. Statistics marked “Rx+Tx” are formed by summing the Rx and Tx statistics, each of which is formed independently.
4. The non-pause column refers to all MAC control frames (i.e. frames with length/type=88.08) with opcodes other than 0x0001. The pauseframe column refers to MAC frames with the opcode=0x0001.
5. The multicast, broadcast and unicast columns in the table refer to non-MAC Control/non-pause frames (i.e. data frames)
6. “%” If either a MAC control frame or pause frame has a multicast or broadcast destination address then the appropriate statistics will be updated.
7. “%” If either a MAC control frame or pause frame has a multicast or broadcast destination address then the appropriate statistics will be updated.
8. “y^” Frame fragments are not counted if less than 8 bytes.
9. flow coll. are half-duplex collisions forced by the MAC to achieve flow-control. A collision will be forced during the first 8 bytes so should not show in frame fragments. Some of the ‘-‘s in this column might in reality be ‘n’s.
10. The rx_overruns stat show above is for rx_mof_overruns and rx_sof_overruns added together.

Table 11-297. Tx Statistics Summary

Tx Statistic	Frame/Oct	Tx/Rx+Tx	Frame Type					Frame Size (bytes)							Event									
			MAC control		Data			64	65-127	128-255	256-511	512-1023	1024-1535	>1535	CRC error	Collision type					No carrier	Queued	Deferred	Underrun

1024-UP octect Frames	F	Rx+Tx	(y|	y|	y|	y|	y)	n	n	n	n	n	y	y	-	-	-	-	n	n	n	-	-	-
Tx Octects	O	Tx	(y|	y|	y|	y|	y)	(y|	y|	y|	y|	y|	y|	y)	-	-	-	-	n	n	n	-	-	n
Net Octects	O	Rx+Tx	(y|	y|	y|	y|	y)	(y|	y|	y|	y|	y|	y|	y)	-	-	$	$	$	$	$	-	-	-

1. “AND” is assumed horizontally across the table between all conditions which form the statistic (marked y or n) except where (y|y), meaning “OR” is indicated. Parentheses are significant.
2. “-“ indicates conditions which are ignored in the formations of the statistic.
3. Statistics marked “Rx+Tx” are formed by summing the Rx and Tx statistics, each of which is formed independently.
4. Pause(MAC) frames are issued in the MAC as perfect (no CRC error) 64 byte frames in full duplex only, so cannot collide
5. “%” If a CPU sourced MAC control frame has a multicast or broadcast destination address then the appropriate statistics will be updated.
6. “+” indicates collisions which are “summed” (i.e. every collision is counted in the Collisions statistic). Jam sequences used for half-duplex flow control are also counted.
7. “$” Every byte written on the wire during each retry attempt is also counted in addition to frames which experience no collisions or carrier loss.

8. The flow collision type is for half-duplex collisions forced by the MAC to achieve flow control. Some of the '-'s in this column might in reality be 'n's. To prevent double-counting, Net Octects are unaffected by the jam sequence – the 'received' bytes, however, are counted. (see Rx Statistics table).
9. When the transmit Tx FIFO is drained due to the MAC being disabled or link being lost, then the frames being purged will not appear in the Tx statistics.

11.2.1.4.30 CPPI Streaming Packet Interface

The receive streaming interface on port 0 of the CPSW is responsible for receiving packet for Ethernet egress data from the packet streaming switch in the NAVSS. The CPPI receive port is equivalent to an Ethernet port with the difference being that the data is provided to the CPSW in the 128-bit streaming interface data format instead RGMII data format.

In addition to the packet data, the receive streaming interface also can provide additional control information that resides in the information words of the descriptor that was transmitted to the CPSW.

The tables below show the information that may be passed along with which descriptor information word to put it in.

11.2.1.4.30.1 Port 0 CPPI Transmit Packet Streaming Interface (CPSW_2G Egress)

INFO Word 0–3 and Status Data Word 0–3 (on EOP) are the only non-payload data word types that are transferred. Long packets are truncated at the CPWS0_PN_RX_MAXLEN_REG[13-0] RX_MAXLEN byte value of the ingress port (only the CPWS0_PN_RX_MAXLEN_REG number of bytes are kept if long packets are transferred due to CPWS0_PN_MAC_CONTROL_REG register copy error frames set - RX_CEF_EN). MAC control frames are only transferred if the receiving Ethernet port has the CPWS0_PN_MAC_CONTROL_REG[24] RX_CMF_EN bit set.

INFO Words are a contiguous block of four 32-bit data words aligned on a 32-bit word boundary.

Figure 11-153. TX INFO Word 0 Format

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED								FLOW_ID							

Bit	Field	Description
31-27	PKT_TYPE	Always set to 0b00111. Host PD (Packet Descriptor) Word 2. Packet Type: bits[31-27].
26-24	RESERVED	Reserved.
23	PASS_CRC	This bit is cleared to zero (no CRC passed) when the P0_TX_CRC_REMOVE bit in the CPSW_CONTROL_REG register is set (and the egress packet has no errors). When the remove bit is cleared to zero then this bit is cleared and no CRC is passed with the output packet. The packet length includes the CRC if it is present.
22	CRC_TYPE	The packet CRC type. The type of CRC passed is determined by CRC_TYPE field in the CPSW_PN_MAC_CONTROL_REG register (not by the type of CRC the packet had on Ethernet port ingress). Host PD Word 1. Protocol Specific Flags: bits[27-24]. 0h: Ethernet CRC 1h: Castagnoli CRC
21-8	RESERVED	Reserved.

Bit	Field	Description
7-0	FLOW_ID	This is the packet output transmit streaming interface flow. The default flow ID can be overridden by ALE classification (Thread mapping). The switch default flow is the 3-bit “From Port” value concatenated with the 3-bit “Switch Priority” {From_Port[2:0], Switch_Priority[2:0]} as shown below: Host PD (Packet Descriptor) Word 1. Flow ID: bits[13-0]. 0h: The packet was received on Ethernet port 1 1h: The packet was received on Ethernet port 2 Switch Priority – The actual hardware switch priority that the packet was stored in on the CPPI transmit FIFO.

0		PKT_LENGTH													

Bit	Field	Description
31-20	FIXED_PS_SIZE	Fixed ps size: 0x4
19-14	RESERVED	Reserved.
13-0 (Host PD (Packet Descriptor) Word 1. Packet Length: bits[21-0])	PKT_LENGTH	Specifies the number of bytes in the entire packet. Offset bytes are not included. Valid only on SOP. The packet length must be greater than zero. The packet data will be truncated to the packet length if the packet length is shorter than the sum of the packet buffer descriptor buffer lengths. A host error occurs if the packet length is greater than the sum of the packet buffer descriptor buffer lengths.

0

Bit	Field	Description
31-0	RESERVED	Reserved.

11.2.1.4.30.2 CPPI Receive Packet Streaming Interface (CPSW Ingress)

Info Word 0/1/2/3 (INFO1 and INFO3 are ignored) are transferred on SOP. If a timestamp word (Extended Packet Info Word 0/1/2/3) is to be transferred it must be after SOP and before any packet data is transferred. Any following non-data type words will be dropped. The EOP word must be payload data.

Input receive packets cannot be aborted by the host. The INFO Word bit descriptions and Extended Packet INFO Word bit descriptions are shown below. The PASS_CRC bit indicates that the CRC is passed with the packet data. Packets that have a passed CRC that is an error CRC will be output on the Ethernet port with at least one CRC byte inverted to indicate the error if P0_RX_PASS_CRC_ERR bit is set, otherwise they are dropped. The packet is a directed packet when any of the TO_PORT bits are nonzero. A packet may be directed only to a single port. The packet will be sent to the port number indicated. For directed packets the lookup process is skipped to determine the destination. However, in vlan aware mode (when VLAN_AWARE bit in the CPSW_CONTROL_REG register is set to 1h) the lookup is performed to determine untagged egress. Packets longer then the value in CPSW_P0_RX_MAXLEN_REG[13-0] RX_MAXLEN bit field are dropped. Packets shorter than 60-Bytes are padded to 64-Bytes (after adding pad and CRC) if P0_RX_PAD bit in the CPSW_CONTROL_REG register is set and if PASS_CRC is clear, otherwise they are dropped. This means that packets shorter than 64-Bytes are dropped if the PASS_CRC info bit is set regardless of P0_RX_PAD bit (packets are padded only if they are short and do not have CRC).

A RX INFO word is a contiguous block of four 32-bit data words aligned on a 32-bit word boundary.

Note

RX Control Data Words [0..2] are mapped to Host Packet Descriptor Protocol Specific Words if (TCHAN[a]_TCFG.tx_filt_pswords = 0) and (Host PD Word 1.Protocol Specific Region Location.bit[28] = 0h) and (Host PD Word 1.Protocol Specific Valid Word Count.bits[22-27] = 4h)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CHECKSUM_INV	RESERVED	CHECKSUM_BYTECOUNT													

Bit	Field	Description
31-24	CHECKSUM_RESULT	This is the packet byte number where the checksum result will be placed in the egress packet. The first packet byte which is the first byte of the destination address is Byte 1 (not byte zero).

Bit	Field	Description
23-16	CHECKSUM_START_BYTE	This is the packet byte number to start the checksum calculation on. The first packet byte is Byte 1.
15	CHECKSUM_INV	When set, a zero checksum value will be inverted and sent as FFFFh.
14	RESERVED	Reserved.
13-0	CHECKSUM_BYTECOUNT	This is the number of bytes to calculate the checksum on. The outgoing Ethernet packet will have a checksum inserted when this value is non-zero.

Other INFO words are not taken into account.

11.2.1.4.30.3 CPPI Checksum Offload

The CPPI host port can be enabled to perform checksum offload on host port packet ingress and egress. UDP (User Datagram Protocol) and TCP (Transmission Control Protocol) over IPV4 and IPV6 are supported. For the purposes of checksum description, the first packet byte (the first byte of the destination address) is byte 1 (not byte 0). That is, a 64 byte packet goes from byte 1 to byte 64. For all packet types, the S_CN_SWITCH bit in the CPSW_CONTROL_REG register must be set for the Outer VLAN L type to be supported.

11.2.1.4.30.3.1 CPPI Transmit Checksum Offload

IPV4 and IPV6 UDP and TCP packets that are received on any Ethernet port and destined for port 0 egress are checked for correct checksum as described below. The byte counts below are shown for packets with no VLAN's. The byte counts vary with one or two packet VLAN's. Packets received on an Ethernet port with errors are not checked for a correct checksum if they are passed to the host.

11.2.1.4.30.3.1.1 IPV4 UDP

- Byte 15 Upper Nibble = 4 for IPV4
- Byte 15 Lower Nibble = IHL - Nibble with number of 32-bit words in IPV4 header (5 to 15 supported).
- Bytes 20-21 = fragment[15-0] – Bit 13 is the MF bit and bits [12-0] are the Fragment offset. A packet is a fragment if the MF bit is set or if the fragment offset is non-zero. The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets have MF=0 and a zero offset. A count is output for packet fragments but no errors are reported. First fragments have the UDP header included in the count. Middle and last fragments have only data included in the count (there is no UDP header).
- Byte 24 = 0x11 for UDP protocol.
- Received packet UDP checksum of zero means that there is no IPV4 checksum sent with the packet so no error will be issued.
- Received packet UDP checksum of 0xFFFF means that the checksum was calculated to be 0xFFFF or 0x0000 but was sent in the transmitted packet as 0xFFFF by the sending originating entity.

11.2.1.4.30.3.1.2 IPV4 TCP

- Byte 15 Upper Nibble = 4 for IPV4
- Byte 15 Lower Nibble = IHL - Nibble with number of 32-bit words in IPV4 header (5 to 15 supported).
- Bytes 20-21 = fragment[15-0] – Bit 13 is the MF bit and bits [12-0] are the Fragment offset. A packet is a fragment if the MF bit is set or if the fragment offset is non-zero. The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets have MF=0 and a zero offset. A count is output for packet fragments but no errors are reported. First fragments have the UDP header included in the count. Middle and last fragments have only data included in the count (there is no TCP header).
- Byte 24 = 0x06 for TCP protocol.

11.2.1.4.30.3.1.3 IPV6 UDP

- Byte 15 upper nibble = 6 for IPV6.
- Byte 21 = 0x11 for UDP protocol as next header.

- Fragment extension headers are supported. First fragments have a fragment extension header (byte 21 = 0x2C) followed by a UDP header (byte 55 = 0x11). Middle and last fragments have a fragment extension header followed by data only (no UDP header). The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets do not have a fragment extension header. A count is output for packet fragments but no errors are reported.
- Received packet UDP checksum of zero means that there is no IPV6 checksum sent with the packet so no error will be issued.
- Received packet UDP checksum of 0xFFFF means that the checksum was calculated to be 0xFFFF or 0x0000 but was sent in the transmitted packet as 0xFFFF by the sending originating entity.

11.2.1.4.30.3.1.4 IPV6 TCP

- Byte 15 upper nibble = 6 for IPV6.
- Byte 21 = 0x06 for TCP protocol as next header.
- Fragment extension headers are supported. First fragments have a fragment extension header (byte 21 = 0x2C) followed by a UDP header (byte 55 = 0x06). Middle and last fragments have a fragment extension header followed by data only (no TCP header). The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets do not have a fragment extension header. A count is output for packet fragments but no errors are reported.

11.2.1.4.30.4 CPPI Receive Checksum Offload

Packets sent from host port 0 (switch ingress) to any Ethernet port can have a checksum calculated and inserted into the Ethernet egress packet. The RX_CHECKSUM_EN bit in the CPSW_P0_CONTROL_REG register must be set for receive checksum operation to be enabled. When bit RX_CHECKSUM_EN is enabled, Control Data Word 2 input on CPPI receive PSI interface determines how the checksum is calculated. The CHECKSUM_RESULT field in Control Data Word 2 determines where the checksum is inserted. The checksum result location is adjusted by the egress port if a VLAN is to be inserted or removed on Ethernet port egress.

11.2.1.4.31 Egress Packet Operations

Note

InterVLAN routing is supported on SR2.0 only.

Each CPSW egress port (Ethernet and Host) is capable of performing egress packet processing operations. IntraVLAN processing either adds, removes, or replaces VLAN information or does nothing. InterVLAN routing allows hardware routing between a limited number of VLANs - thereby allowing high-bandwidth or other routing operations to be offloaded from software to the CPSW (hardware). IntraVLAN processing and InterVLAN routing operations are mutually exclusive. In addition, the packet source and destination addresses can be swapped on egress to facilitate OAM or generic testing operations.

11.2.1.5 MCU_CPSW0 Programming Guide

11.2.1.5.1 Initialization and Configuration of CPSW Subsystem

To configure the CPSW Ethernet Subsystem for operation, the host must perform the following:

1. Select the Interface (RMII, or RGMII) Mode. See the CTRLMMR_MCU_ENET_CTRL[1-0] MODE_SEL register.
2. Configure pads (pin muxing), as per the interface selected. Refer to *Pad Configuration Registers* and the device-specific Datasheet.
3. Enable the CPSW Ethernet Subsystem clocks. See Section 11.2.1.3, *CPSW Integration*
4. Ensure that at least 2000 CPPI_ICLK periods are run after reset is de-asserted.
5. Configure the CPSW_CONTROL_REG register
6. Configure the Ethernet Port Source Address registers (CPSW0_PN_SA_L_REG and CPSW_PN_SA_H_REG)
7. Configure the CPSW statistic port enable register CPSW_STAT_PORT_EN_REG

8. Configure the ALE (Section 11.2.1.4.7.1, *Address Lookup Engine*)
9. Configure the MDIO (Section 11.2.1.5.3.1, *Initializing the MDIO Module*)
10. Configure Ethernet port, as per the desired mode of operations

11.2.1.5.2 CPSW Reset

To reset the CPMAC_SL, the host must perform the following:

1. Set CMD_IDLE in the Ethernet port CPSW_PN_MAC_CONTROL_REG register
2. Wait for IDLE to be indicated in the Ethernet port CPSW_PN_MAC_STATUS_REG register
3. Configure the Ethernet ports.

11.2.1.5.3 MDIO Software Interface

11.2.1.5.3.1 Initializing the MDIO Module

The following steps are performed by the application software or device driver to initialize the MDIO device:

1. Configure the PREAMBLE and CLKDIV bits in the MDIO Control register (CPSW_MDIO_CONTROL_REG).
2. Enable the MDIO module by setting the ENABLE bit in CPSW_MDIO_CONTROL_REG.
3. The MDIO PHY alive status register (MDIO CPSW_MDIO_ALIVE_REG) can be read in polling fashion until a PHY connected to the system responded, and the MDIO PHY link status register (MDIO CPSW_MDIO_LINK_REG) can determine whether this PHY already has a link.
4. Set the appropriate PHY addresses in the MDIO user PHY select register (CPSW_MDIO_USER_PHY_SEL_REG_k, where k = 0 or 1), and set the LINKINT_ENABLE bit to enable a link change event interrupt if desirable.
5. Set the appropriate LINKSEL bit in the CPSW_MDIO_USER_PHY_SEL_REG_k register (where k = 0 or 1).
6. Set the appropriate USERINTMASKSET bit field in the CPSW_MDIO_USER_INT_MASK_SET_REG register.
7. If an interrupt on general MDIO register access is desired, set the corresponding bit in the MDIO user command complete interrupt mask set register (MDIO CPSW_MDIO_USER_INT_MASK_SET_REG) to use the MDIO user access register (MDIO CPSW_MDIO_USER_ACCESS_REG_k, where k = 0 or 1).

11.2.1.5.3.2 Writing Data To a PHY Register

The MDIO module includes a user access register (MDIO CPSW_MDIO_USER_ACCESS_REG_k, where k = 0 or 1) to directly access a specified PHY device.To write a PHY register, perform the following:

1. Check to ensure that the GO bit in the MDIO user access register (MDIO CPSW_MDIO_USER_ACCESS_REG_k) is cleared.
2. Write to the GO, WRITE, REGADR, PHYADR, and DATA bits in MDIO CPSW_MDIO_USER_ACCESS_REG_k corresponding to the PHY and PHY register SW wants to write.
3. The write operation to the PHY is scheduled and completed by the MDIO module. Completion of the write operation can be determined by polling the GO bit in MDIO CPSW_MDIO_USER_ACCESS_REG_k for a 0.
4. Completion of the operation sets the corresponding USERINTRAW bit (0 or 1) in the MDIO user command complete interrupt register (CPSW_MDIO_USER_INT_RAW_REG) corresponding to MDIO CPSW_MDIO_USER_ACCESS_REG_k used. If interrupts have been enabled on this bit using the MDIO user command complete interrupt mask set register (CPSW_MDIO_USER_INT_MASK_SET_REG), then the bit is also set in the MDIO user command complete interrupt register (CPSW_MDIO_USER_INT_MASKED_REG) and an interrupt is triggered on the host processor.

11.2.1.5.3.3 Reading Data From a PHY Register

The MDIO module includes a user access register (MDIO CPSW_MDIO_USER_ACCESS_REG_k, where k = 0 or 1) to directly access a specified PHY device. To read a PHY register, perform the following:

1. Check to ensure that the GO bit in the MDIO user access register (CPSW_MDIO_USER_ACCESS_REG_k, where k = 0 or 1) is cleared.
2. Write to the GO, REGADR, and PHYADR bits in the CPSW_MDIO_USER_ACCESS_REG_k register corresponding to the PHY and PHY register SW wants to read.
3. The read data value is available in the DATA bit field in MDIO CPSW_MDIO_USER_ACCESS_REG_k register after the module completes the read operation on the serial bus. Completion of the read operation

can be determined by polling the GO and ACK bits in CPSW_MDIO_USER_ACCESS_REG_k register. After the GO bit has cleared, the ACK bit is set on a successful read.

4. Completion of the operation sets the corresponding USERINTRAW bit (0 or 1) in the MDIO user command complete interrupt register (CPSW_MDIO_USER_INT_RAW_REG) corresponding to MDIO CPSW_MDIO_USER_ACCESS_REG_k used. If interrupts have been enabled on this bit using the MDIO user command complete interrupt mask set register (CPSW_MDIO_USER_INT_MASK_SET_REG), then the bit is also set in the MDIO user command complete interrupt register (CPSW_MDIO_USER_INT_MASKED_REG) and an interrupt is triggered on the host processor.

11.2.1.6 MSS_CPSW Registers

Table 11-298 lists the memory-mapped registers for the MSS_CPSW registers. All register offset addresses not listed in Table 11-298 should be considered as reserved locations and the register contents should not be modified.

Table 11-298. MSS_CPSW Registers

Complex bit access types are encoded to fit into small table cells. Table 11-299 shows the codes that are used for access types in this section.

Table 11-299. MSS_CPSW Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Wdecr	W decr	Write
Wincr	W incr	Write
Reset or Default Value		
-n		Value after reset or the default value

11.2.1.6.1 CPSW_NUSS_IDVER_REG Register (Offset = 0h) [Reset = 6BA01903h]

CPSW_NUSS_IDVER_REG is shown in Table 11-300.

Return to the Summary Table.

ID Version Register

Table 11-300. CPSW_NUSS_IDVER_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	IDENT	R	6BA0h	Identification value
15-11	RTL_VER	R	3h	RTL version value
10-8	MAJOR_VER	R	1h	Major version value
7-0	MINOR_VER	R	3h	Minor version value

11.2.1.6.2 SS_SYNCE_COUNT_REG Register (Offset = 4h) [Reset = 00000000h]

SS_SYNCE_COUNT_REG is shown in Table 11-301.

Return to the Summary Table.

SS SYNCE Count Register

Table 11-301. SS_SYNCE_COUNT_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SYNCE_CNT	R/W	0h	Sync E Count Value

11.2.1.6.3 SS_SYNCE_MUX_REG Register (Offset = 8h) [Reset = 00000000h]

SS_SYNCE_MUX_REG is shown in Table 11-302.

Return to the Summary Table.

SS Synce Mux Register

Table 11-302. SS_SYNCE_MUX_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R	0h	
5-0	SYNCE_SEL	R/W	0h	Sync E Select Value

11.2.1.6.4 SS_CONTROL_REG Register (Offset = Ch) [Reset = 00000000h]

SS_CONTROL_REG is shown in Table 11-303.

Return to the Summary Table.

SS Control Register

Table 11-303. SS_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1	EEE_PHY_ONLY	R/W	0h	Energy Efficient Enable Phy Only Mode: 0=The low power indicate state includes gating off the CPPI_GCLK to the CPSW, 1=The low power indicate state does not gate the clock to the CPSW
0	EEE_EN	R/W	0h	Energy Efficient Ethernet Enable: 0=EEE is disabled, 1=EEE is enabled

11.2.1.6.5 SS_INT_CONTROL_REG Register (Offset = 18h) [Reset = XXX0X000h]

SS_INT_CONTROL_REG is shown in Table 11-304.

Return to the Summary Table.

SS Interrupt Control Register

Table 11-304. SS_INT_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	INT_TEST	R/W	0h	Interrupt Test
30	INT_SEL_VEC_EN	R/W	0h	Interrupt Sel Vector Enable
29-22	RESERVED	R	0h	
21-16	INT_BYPASS	R/W	0h	Interrupt Bypass Value
15-12	RESERVED	R	0h	
11-0	INT_PRESCALE	R/W	0h	Interrupt Prescale Value

11.2.1.6.6 SS_STATUS_REG Register (Offset = 1Ch) [Reset = 00000000h]

SS_STATUS_REG is shown in Table 11-305.

Return to the Summary Table.

SS Status Register

Table 11-305. SS_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	EEE_CLKSTOP_ACK	R	0h	Energy Efficient Ethernet clockstop acknowledge from CPSW

11.2.1.6.7 SUBSYSTEM_CONFIG_REG Register (Offset = 20h) [Reset = 0003X302h]

SUBSYSTEM_CONFIG_REG is shown in Table 11-306.

Return to the Summary Table.

Subsystem Configuration Register

Table 11-306. SUBSYSTEM_CONFIG_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	RESERVED	R	0h	
27-20	XGMII	R	0h	The Number of XGMII Ports included in the CPSW_NUSS
19	QSGMII	R	0h	QSGMII is included in the CPSW_NUSS
18	SGMII	R	0h	SGMII is included in the CPSW_NUSS
17	RGMII	R	1h	RGMII is included in the CPSW_NUSS
16	RMII	R	1h	RMII is included in the CPSW_NUSS
15-13	RESERVED	R	0h	
12-8	NUM_GENF	R	3h	The number of CPTS GENF outputs
7-0	NUM_PORTS	R	2h	The total number of ports including the host port 0

11.2.1.6.8 RGMII1_STATUS_REG Register (Offset = 30h) [Reset = 00000000h]

RGMII1_STATUS_REG is shown in Table 11-307.

Return to the Summary Table.

RGMII1 Status Register

Table 11-307. RGMII1_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	FULLDUPLEX	R	0h	Rgmii 1 full dulex: 0=Half-duplex, 1=Full-duplex
2-1	SPEED	R	0h	Rgmii 1 speed: 00= 10Mbps, 01= 100Mbps, 10= 1000Mbps, 11=reserved
0	LINK	R	0h	Rgmii 1 link indicator: 0=Link is down, 1=Link is up

11.2.1.6.9 MDIO_MDIO_VERSION_REG Register (Offset = F00h) [Reset = 00071107h]

MDIO_MDIO_VERSION_REG is shown in Table 11-308.

Return to the Summary Table.

MDIO Version Register

Table 11-308. MDIO_MDIO_VERSION_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	scheme	R	0h	Scheme
29-28	bu	R	0h	bu
27-16	module_id	R	7h	Module ID
15-11	revrtl	R	2h	RTL version
10-8	revmaj	R	1h	Major version
7-6	custom	R	0h	Custom version
5-0	revmin	R	7h	Minor version

11.2.1.6.10 MDIO_CONTROL_REG Register (Offset = F04h) [Reset = X1XX00FFh]

MDIO_CONTROL_REG is shown in Table 11-309.

Return to the Summary Table.

MDIO Control Register

Table 11-309. MDIO_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IDLE	R	1h	MDIO state machine idle
30	ENABLE	R/W	0h	Enable control
29	RESERVED	R	0h	
28-24	HIGHEST_USER_CHANNEL	R	1h	Highest user channel
23-21	RESERVED	R	0h	
20	PREAMBLE	R/W	0h	Preamble disable
19	FAULT	R/W	0h	Fault indicator
18	FAULT_DETECT_ENABLE	R/W	0h	Fault detect enable
17	INT_TEST_ENABLE	R/W	0h	Interrupt test enable
16	RESERVED	R	0h	
15-0	CLKDIV	R/W	FFh	Clock divider

11.2.1.6.11 MDIO_ALIVE_REG Register (Offset = F08h) [Reset = 00000000h]

MDIO_ALIVE_REG is shown in Table 11-310.

Return to the Summary Table.

MDIO Alive Register

Table 11-310. MDIO_ALIVE_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ALIVE	R/W	0h	MDIO alive

11.2.1.6.12 MDIO_LINK_REG Register (Offset = F0Ch) [Reset = 00000000h]

MDIO_LINK_REG is shown in Table 11-311.

Return to the Summary Table.

MDIO Link Register

Table 11-311. MDIO_LINK_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LINK	R	0h	MDIO link state

11.2.1.6.13 MDIO_LINK_INT_RAW_REG Register (Offset = F10h) [Reset = 00000000h]

MDIO_LINK_INT_RAW_REG is shown in Table 11-312.

Return to the Summary Table.

MDIO Link Interrupt Raw Register

Table 11-312. MDIO_LINK_INT_RAW_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	LINKINTRAW	R/W	0h	MDIO link change event raw value

11.2.1.6.14 MDIO_LINK_INT_MASKED_REG Register (Offset = F14h) [Reset = 00000000h]

MDIO_LINK_INT_MASKED_REG is shown in Table 11-313.

Return to the Summary Table.

MDIO Link Interrupt Masked Register

Table 11-313. MDIO_LINK_INT_MASKED_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	LINKINTMASKED	R/W	0h	MDIO link change interrupt masked value

11.2.1.6.15 MDIO_LINK_INT_MASK_SET_REG Register (Offset = F18h) [Reset = 00000000h]

MDIO_LINK_INT_MASK_SET_REG is shown in Table 11-314.

Return to the Summary Table.

MDIO Link Interrupt Mask Set Register

Table 11-314. MDIO_LINK_INT_MASK_SET_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	LINKINTMASKSET	R/W	0h	MDIO link interrupt mask set

11.2.1.6.16 MDIO_LINK_INT_MASK_CLEAR_REG Register (Offset = F1Ch) [Reset = 00000000h]

MDIO_LINK_INT_MASK_CLEAR_REG is shown in Table 11-315.

Return to the Summary Table.

MDIO Link Interrupt Mask Clear Register

Table 11-315. MDIO_LINK_INT_MASK_CLEAR_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	LINKINTMASKCLR	R/W	0h	MDIO link interrupt mask clear

11.2.1.6.17 MDIO_USER_INT_RAW_REG Register (Offset = F20h) [Reset = 00000000h]

MDIO_USER_INT_RAW_REG is shown in Table 11-316.

Return to the Summary Table.

MDIO User Interrupt Raw Register

Table 11-316. MDIO_USER_INT_RAW_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	USERINTRAW	R/W	0h	User interrupt raw

11.2.1.6.18 MDIO_USER_INT_MASKED_REG Register (Offset = F24h) [Reset = 00000000h]

MDIO_USER_INT_MASKED_REG is shown in Table 11-317.

Return to the Summary Table.

MDIO User Interrupt Masked Register

Table 11-317. MDIO_USER_INT_MASKED_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	USERINTMASKED	R/W	0h	User interrupt masked

11.2.1.6.19 MDIO_USER_INT_MASK_SET_REG Register (Offset = F28h) [Reset = 00000000h]

MDIO_USER_INT_MASK_SET_REG is shown in Table 11-318.

Return to the Summary Table.

MDIO User Interrupt Mask Set Register

Table 11-318. MDIO_USER_INT_MASK_SET_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	USERINTMASKSET	R/W	0h	MDIO user interrupt mask set

11.2.1.6.20 MDIO_USER_INT_MASK_CLEAR_REG Register (Offset = F2Ch) [Reset = 00000000h]

MDIO_USER_INT_MASK_CLEAR_REG is shown in Table 11-319.

Return to the Summary Table.

MDIO User Interrupt Mask Clear Register

Table 11-319. MDIO_USER_INT_MASK_CLEAR_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	USERINTMASKCLR	R/W	0h	MDIO user interrupt mask clear

11.2.1.6.21 MDIO_MANUAL_IF_REG Register (Offset = F30h) [Reset = 00000000h]

MDIO_MANUAL_IF_REG is shown in Table 11-320.

Return to the Summary Table.

MDIO Manual Interface Register

Table 11-320. MDIO_MANUAL_IF_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h

Return to the Summary Table.

CPSW PFC Tx Global Out Flow Threshold Clear

Table 11-350. CPSW_NC_TX_G_OFLOW_THRESH_CLR_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	PRI7	R/W	0h	Priority Based Flow Control Global Outflow Usage Threshold for Pri 7
27-24	PRI6	R/W	0h	Priority Based Flow Control Global Outflow Usage Threshold for Pri 6
23-20	PRI5	R/W	0h	Priority Based Flow Control Global Outflow Usage Threshold for Pri 5
19-16	PRI4	R/W	0h	Priority Based Flow Control Global Outflow Usage Threshold for Pri 4
15-12	PRI3	R/W	0h	Priority Based Flow Control Global Outflow Usage Threshold for Pri 3
11-8	PRI2	R/W	0h	Priority Based Flow Control Global Outflow Usage Threshold for Pri 2
7-4	PRI1	R/W	0h	Priority Based Flow Control Global Outflow Usage Threshold for Pri 1
3-0	PRI0	R/W	0h	Priority Based Flow Control Global Outflow Usage Threshold for Pri 0

11.2.1.6.52 CPSW_NC_TX_G_BUF_THRESH_SET_L_REG Register (Offset = 00020038h) [Reset = FFFFFFFFh]

CPSW_NC_TX_G_BUF_THRESH_SET_L_REG is shown in Table 11-351.

Return to the Summary Table.

CPSW PFC Global Tx Buffer Threshold Set Low

Table 11-351. CPSW_NC_TX_G_BUF_THRESH_SET_L_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	PRI3	R/W	FFh	Priority Based Flow Control Global Buffer Usage Threshold for Priority 3
23-16	PRI2	R/W	FFh	Priority Based Flow Control Global Buffer Usage Threshold for Priority 2
15-8	PRI1	R/W	FFh	Priority Based Flow Control Global Buffer Usage Threshold for Priority 1
7-0	PRI0	R/W	FFh	Priority Based Flow Control Global Buffer Usage Threshold for Priority 0

11.2.1.6.53 CPSW_NC_TX_G_BUF_THRESH_SET_H_REG Register (Offset = 0002003Ch) [Reset = FFFFFFFFh]

CPSW_NC_TX_G_BUF_THRESH_SET_H_REG is shown in Table 11-352.

Return to the Summary Table.

CPSW PFC Global Tx Buffer Threshold Set High

Table 11-352. CPSW_NC_TX_G_BUF_THRESH_SET_H_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	PRI7	R/W	FFh	Priority Based Flow Control Global Buffer Usage Threshold for Priority 7
23-16	PRI6	R/W	FFh	Priority Based Flow Control Global Buffer Usage Threshold for Priority 6
15-8	PRI5	R/W	FFh	Priority Based Flow Control Global Buffer Usage Threshold for Priority 5
7-0	PRI4	R/W	FFh	Priority Based Flow Control Global Buffer Usage Threshold for Priority 4

11.2.1.6.54 CPSW_NC_TX_G_BUF_THRESH_CLR_L_REG Register (Offset = 00020040h) [Reset = 00000000h]

CPSW_NC_TX_G_BUF_THRESH_CLR_L_REG is shown in Table 11-353.

Return to the Summary Table.

CPSW PFC Global Tx Buffer Threshold Clear Low

Table 11-353. CPSW_NC_TX_G_BUF_THRESH_CLR_L_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	PRI3	R/W	0h	Priority Based Flow Control Global Buffer Usage Threshold for Priority 3
23-16	PRI2	R/W	0h	Priority Based Flow Control Global Buffer Usage Threshold for Priority 2
15-8	PRI1	R/W	0h	Priority Based Flow Control Global Buffer Usage Threshold for Priority 1
7-0	PRI0	R/W	0h	Priority Based Flow Control Global Buffer Usage Threshold for Priority 0

11.2.1.6.55 CPSW_NC_TX_G_BUF_THRESH_CLR_H_REG Register (Offset = 00020044h) [Reset = 00000000h]

CPSW_NC_TX_G_BUF_THRESH_CLR_H_REG is shown in Table 11-354.

Return to the Summary Table.

CPSW PFC Global Tx Buffer Threshold Clear High

Table 11-354. CPSW_NC_TX_G_BUF_THRESH_CLR_H_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	PRI7	R/W	0h	Priority Based Flow Control Global Buffer Usage Threshold for Priority 7
23-16	PRI6	R/W	0h	Priority Based Flow Control Global Buffer Usage Threshold for Priority 6
15-8	PRI5	R/W	0h	Priority Based Flow Control Global Buffer Usage Threshold for Priority 5
7-0	PRI4	R/W	0h	Priority Based Flow Control Global Buffer Usage Threshold for Priority 4

11.2.1.6.56 CPSW_NC_VLAN_LTYPE_REG Register (Offset = 00020050h) [Reset = 88A88100h]

CPSW_NC_VLAN_LTYPE_REG is shown in Table 11-355.

Return to the Summary Table.

VLAN Length/type

Table 11-355. CPSW_NC_VLAN_LTYPE_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	VLAN_LTYPE_OUTER	R/W	88A8h	Outer VLAN LType
15-0	VLAN_LTYPE_INNER	R/W	8100h	Inner VLAN LType

11.2.1.6.57 CPSW_NC_EST_TS_DOMAIN_REG Register (Offset = 00020054h) [Reset = 00000000h]

CPSW_NC_EST_TS_DOMAIN_REG is shown in Table 11-356.

Return to the Summary Table.

Enhanced Scheduled Traffic Host Event Domain

Table 11-356. CPSW_NC_EST_TS_DOMAIN_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	EST_TS_DOMAIN	R/W	0h	Enhanced Scheduled Traffic Host Event Domain

11.2.1.6.58 CPSW_NC_TX_PRI0_MAXLEN_REG Register (Offset = 00020100h) [Reset = 000007E8h]

CPSW_NC_TX_PRI0_MAXLEN_REG is shown in Table 11-357.

Return to the Summary Table.

Transmit Priority 0 Maximum Length

Table 11-357. CPSW_NC_TX_PRI0_MAXLEN_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-14	RESERVED	R	0h	
13-0	TX_PRI0_MAXLEN	R/W	7E8h	Transmit Priority 0 Maximum Length

31-0	TEST_FH1_CP	R/W	0h	Test CPDMA FHost Channel 1 Completion Pointer

11.2.1.6.424 CPSW_CPDMA_SRAM_TEST_CPDMA_FH2_CP_REG Register (Offset = 00034348h) [Reset = 00000000h]

CPSW_CPDMA_SRAM_TEST_CPDMA_FH2_CP_REG is shown in Table 11-723.

Return to the Summary Table.

Test CPDMA FHost Channel 2 Completion Pointer

Table 11-723. CPSW_CPDMA_SRAM_TEST_CPDMA_FH2_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_FH2_CP	R/W	0h	Test CPDMA FHost Channel 2 Completion Pointer

11.2.1.6.425 CPSW_CPDMA_SRAM_TEST_CPDMA_FH3_CP_REG Register (Offset = 0003434Ch) [Reset = 00000000h]

CPSW_CPDMA_SRAM_TEST_CPDMA_FH3_CP_REG is shown in Table 11-724.

Return to the Summary Table.

Test CPDMA FHost Channel 3 Completion Pointer

Table 11-724. CPSW_CPDMA_SRAM_TEST_CPDMA_FH3_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_FH3_CP	R/W	0h	Test CPDMA FHost Channel 3 Completion Pointer

11.2.1.6.426 CPSW_CPDMA_SRAM_TEST_CPDMA_FH4_CP_REG Register (Offset = 00034350h) [Reset = 00000000h]

CPSW_CPDMA_SRAM_TEST_CPDMA_FH4_CP_REG is shown in Table 11-725.

Return to the Summary Table.

Test CPDMA FHost Channel 4 Completion Pointer

Table 11-725. CPSW_CPDMA_SRAM_TEST_CPDMA_FH4_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_FH4_CP	R/W	0h	Test CPDMA FHost Channel 4 Completion Pointer

11.2.1.6.427 CPSW_CPDMA_SRAM_TEST_CPDMA_FH5_CP_REG Register (Offset = 00034354h) [Reset = 00000000h]

CPSW_CPDMA_SRAM_TEST_CPDMA_FH5_CP_REG is shown in Table 11-726.

Return to the Summary Table.

Test CPDMA FHost Channel 5 Completion Pointer

Table 11-726. CPSW_CPDMA_SRAM_TEST_CPDMA_FH5_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_FH5_CP	R/W	0h	Test CPDMA FHost Channel 5 Completion Pointer

11.2.1.6.428 CPSW_CPDMA_SRAM_TEST_CPDMA_FH6_CP_REG Register (Offset = 00034358h) [Reset = 00000000h]

CPSW_CPDMA_SRAM_TEST_CPDMA_FH6_CP_REG is shown in Table 11-727.

Return to the Summary Table.

Test CPDMA FHost Channel 6 Completion Pointer

Table 11-727. CPSW_CPDMA_SRAM_TEST_CPDMA_FH6_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_FH6_CP	R/W	0h	Test CPDMA FHost Channel 6 Completion Pointer

11.2.1.6.429 CPSW_CPDMA_SRAM_TEST_CPDMA_FH7_CP_REG Register (Offset = 0003435Ch) [Reset = 00000000h]

CPSW_CPDMA_SRAM_TEST_CPDMA_FH7_CP_REG is shown in Table 11-728.

Return to the Summary Table.

Test CPDMA FHost Channel 7 Completion Pointer

Table 11-728. CPSW_CPDMA_SRAM_TEST_CPDMA_FH7_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_FH7_CP	R/W	0h	Test CPDMA FHost Channel 7 Completion Pointer

11.2.1.6.430 CPSW_CPDMA_SRAM_TEST_CPDMA_TH0_CP_REG Register (Offset = 00034360h) [Reset = 00000000h]

CPSW_CPDMA_SRAM_TEST_CPDMA_TH0_CP_REG is shown in Table 11-729.

Return to the Summary Table.

Test CPDMA THost Channel 0 Completion Pointer

Table 11-729. CPSW_CPDMA_SRAM_TEST_CPDMA_TH0_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_TH0_CP	R/W	0h	Test CPDMA THost Channel 0 Completion Pointer

11.2.1.6.431 CPSW_CPDMA_SRAM_TEST_CPDMA_TH1_CP_REG Register (Offset = 00034364h) [Reset = 00000000h]

CPSW_CPDMA_SRAM_TEST_CPDMA_TH1_CP_REG is shown in Table 11-730.

Return to the Summary Table.

Test CPDMA THost Channel 1 Completion Pointer

Table 11-730. CPSW_CPDMA_SRAM_TEST_CPDMA_TH1_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_TH1_CP	R/W	0h	Test CPDMA THost Channel 1 Completion Pointer

11.2.1.6.432 CPSW_CPDMA_SRAM_TEST_CPDMA_TH2_CP_REG Register (Offset = 00034368h) [Reset = 00000000h]

CPSW_CPDMA_SRAM_TEST_CPDMA_TH2_CP_REG is shown in Table 11-731.

Return to the Summary Table.

Test CPDMA THost Channel 2 Completion Pointer

Table 11-731. CPSW_CPDMA_SRAM_TEST_CPDMA_TH2_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_TH2_CP	R/W	0h	Test CPDMA THost Channel 2 Completion Pointer

11.2.1.6.433 CPSW_CPDMA_SRAM_TEST_CPDMA_TH3_CP_REG Register (Offset = 0003436Ch) [Reset = 00000000h]

CPSW_CPDMA_SRAM_TEST_CPDMA_TH3_CP_REG is shown in Table 11-732.

Return to the Summary Table.

Test CPDMA THost Channel 3 Completion Pointer

Table 11-732. CPSW_CPDMA_SRAM_TEST_CPDMA_TH3_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_TH3_CP	R/W	0h	Test CPDMA THost Channel 3 Completion Pointer

11.2.1.6.434 CPSW_CPDMA_SRAM_TEST_CPDMA_TH4_CP_REG Register (Offset = 00034370h) [Reset = 00000000h]

CPSW_CPDMA_SRAM_TEST_CPDMA_TH4_CP_REG is shown in Table 11-733.

Return to the Summary Table.

Test CPDMA THost Channel 4 Completion Pointer

Table 11-733. CPSW_CPDMA_SRAM_TEST_CPDMA_TH4_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_TH4_CP	R/W	0h	Test CPDMA THost Channel 4 Completion Pointer

11.2.1.6.435 CPSW_CPDMA_SRAM_TEST_CPDMA_TH5_CP_REG Register (Offset = 00034374h) [Reset = 00000000h]

CPSW_CPDMA_SRAM_TEST_CPDMA_TH5_CP_REG is shown in Table 11-734.

Return to the Summary Table.

Test CPDMA THost Channel 5 Completion Pointer

Table 11-734. CPSW_CPDMA_SRAM_TEST_CPDMA_TH5_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_TH5_CP	R/W	0h	Test CPDMA THost Channel 5 Completion Pointer

11.2.1.6.436 CPSW_CPDMA_SRAM_TEST_CPDMA_TH6_CP_REG Register (Offset = 00034378h) [Reset = 00000000h]

CPSW_CPDMA_SRAM_TEST_CPDMA_TH6_CP_REG is shown in Table 11-735.

Return to the Summary Table.

Test CPDMA THost Channel 6 Completion Pointer

Table 11-735. CPSW_CPDMA_SRAM_TEST_CPDMA_TH6_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_TH6_CP	R/W	0h	Test CPDMA THost Channel 6 Completion Pointer

11.2.1.6.437 CPSW_CPDMA_SRAM_TEST_CPDMA_TH7_CP_REG Register (Offset = 0003437Ch) [Reset = 00000000h]

CPSW_CPDMA_SRAM_TEST_CPDMA_TH7_CP_REG is shown in Table 11-736.

Return to the Summary Table.

Test CPDMA THost Channel 7 Completion Pointer

Table 11-736. CPSW_CPDMA_SRAM_TEST_CPDMA_TH7_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_TH7_CP	R/W	0h	Test CPDMA THost Channel 7 Completion Pointer

11.2.1.6.438 CPSW_NC_STAT_0_RXGOODFRAMES Register (Offset = 0003A000h) [Reset = 00000000h]

CPSW_NC_STAT_0_RXGOODFRAMES is shown in Table 11-737.

Return to the Summary Table.

Total number of good frames received

Table 11-737. CPSW_NC_STAT_0_RXGOODFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good frames received

11.2.1.6.439 CPSW_NC_STAT_0_RXBROADCASTFRAMES Register (Offset = 0003A004h) [Reset = 00000000h]

CPSW_NC_STAT_0_RXBROADCASTFRAMES is shown in Table 11-738.

Return to the Summary Table.

Total number of good broadcast frames received

Table 11-738. CPSW_NC_STAT_0_RXBROADCASTFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good broadcast frames received

11.2.1.6.440 CPSW_NC_STAT_0_RXMULTICASTFRAMES Register (Offset = 0003A008h) [Reset = 00000000h]

CPSW_NC_STAT_0_RXMULTICASTFRAMES is shown in Table 11-739.

Return to the Summary Table.

Total number of good multicast frames received

Table 11-739. CPSW_NC_STAT_0_RXMULTICASTFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good multicast frames received

11.2.1.6.441 CPSW_NC_STAT_0_RXCRCERRORS Register (Offset = 0003A010h) [Reset = 00000000h]

CPSW_NC_STAT_0_RXCRCERRORS is shown in Table 11-740.

Return to the Summary Table.

Total number of CRC errors frames received

Table 11-740. CPSW_NC_STAT_0_RXCRCERRORS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of CRC errors frames received

11.2.1.6.442 CPSW_NC_STAT_0_RXOVERSIZEDFRAMES Register (Offset = 0003A018h) [Reset = 00000000h]

CPSW_NC_STAT_0_RXOVERSIZEDFRAMES is shown in Table 11-741.

Return to the Summary Table.

Total number of oversized frames received

Table 11-741. CPSW_NC_STAT_0_RXOVERSIZEDFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of oversized frames received

11.2.1.6.443 CPSW_NC_STAT_0_RXUNDERSIZEDFRAMES Register (Offset = 0003A020h) [Reset = 00000000h]

CPSW_NC_STAT_0_RXUNDERSIZEDFRAMES is shown in Table 11-742.

Return to the Summary Table.

Total number of undersized frames received

Table 11-742. CPSW_NC_STAT_0_RXUNDERSIZEDFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of undersized frames received

11.2.1.6.444 CPSW_NC_STAT_0_RXFRAGMENTS Register (Offset = 0003A024h) [Reset = 00000000h]

CPSW_NC_STAT_0_RXFRAGMENTS is shown in Table 11-743.

Return to the Summary Table.

Total number of fragmented frames received

Table 11-743. CPSW_NC_STAT_0_RXFRAGMENTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of fragmented frames received

11.2.1.6.445 CPSW_NC_STAT_0_ALE_DROP Register (Offset = 0003A028h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_DROP is shown in Table 11-744.

Return to the Summary Table.

Total number of frames dropped by the ALE

Table 11-744. CPSW_NC_STAT_0_ALE_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames dropped by the ALE

11.2.1.6.446 CPSW_NC_STAT_0_ALE_OVERRUN_DROP Register (Offset = 0003A02Ch) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_OVERRUN_DROP is shown in Table 11-745.

Return to the Summary Table.

Total number of overrun frames dropped by the ALE

Table 11-745. CPSW_NC_STAT_0_ALE_OVERRUN_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of overrun frames dropped by the ALE

11.2.1.6.447 CPSW_NC_STAT_0_RXOCTETS Register (Offset = 0003A030h) [Reset = 00000000h]

CPSW_NC_STAT_0_RXOCTETS is shown in Table 11-746.

Return to the Summary Table.

Total number of received bytes in good frames

Table 11-746. CPSW_NC_STAT_0_RXOCTETS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of received bytes in good frames

11.2.1.6.448 CPSW_NC_STAT_0_TXGOODFRAMES Register (Offset = 0003A034h) [Reset = 00000000h]

CPSW_NC_STAT_0_TXGOODFRAMES is shown in Table 11-747.

Return to the Summary Table.

Total number of good frames transmitted

Table 11-747. CPSW_NC_STAT_0_TXGOODFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good frames transmitted

11.2.1.6.449 CPSW_NC_STAT_0_TXBROADCASTFRAMES Register (Offset = 0003A038h) [Reset = 00000000h]

CPSW_NC_STAT_0_TXBROADCASTFRAMES is shown in Table 11-748.

Return to the Summary Table.

Total number of good broadcast frames transmitted

Table 11-748. CPSW_NC_STAT_0_TXBROADCASTFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good broadcast frames transmitted

11.2.1.6.450 CPSW_NC_STAT_0_TXMULTICASTFRAMES Register (Offset = 0003A03Ch) [Reset = 00000000h]

CPSW_NC_STAT_0_TXMULTICASTFRAMES is shown in Table 11-749.

Return to the Summary Table.

Total number of good multicast frames transmitted

Table 11-749. CPSW_NC_STAT_0_TXMULTICASTFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good multicast frames transmitted

11.2.1.6.451 CPSW_NC_STAT_0_TXSINGLECOLLFRAMES Register (Offset = 0003A04Ch) [Reset = 00000000h]

CPSW_NC_STAT_0_TXSINGLECOLLFRAMES is shown in Table 11-750.

Return to the Summary Table.

Total number of transmitted frames experiencing a single collision

Table 11-750. CPSW_NC_STAT_0_TXSINGLECOLLFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames experiencing a single collision

11.2.1.6.452 CPSW_NC_STAT_0_TXMULTCOLLFRAMES Register (Offset = 0003A050h) [Reset = 00000000h]

CPSW_NC_STAT_0_TXMULTCOLLFRAMES is shown in Table 11-751.

Return to the Summary Table.

Total number of transmitted frames experiencing multiple collisions

Table 11-751. CPSW_NC_STAT_0_TXMULTCOLLFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames experiencing multiple collisions

11.2.1.6.453 CPSW_NC_STAT_0_TXOCTETS Register (Offset = 0003A064h) [Reset = 00000000h]

CPSW_NC_STAT_0_TXOCTETS is shown in Table 11-752.

Return to the Summary Table.

Total number of bytes in all good frames transmitted

Table 11-752. CPSW_NC_STAT_0_TXOCTETS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of bytes in all good frames transmitted

11.2.1.6.454 CPSW_NC_STAT_0_OCTETFRAMES64 Register (Offset = 0003A068h) [Reset = 00000000h]

CPSW_NC_STAT_0_OCTETFRAMES64 is shown in Table 11-753.

Return to the Summary Table.

Total number of 64-byte frames received and transmitted

Table 11-753. CPSW_NC_STAT_0_OCTETFRAMES64 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of 64-byte frames received and transmitted

11.2.1.6.455 CPSW_NC_STAT_0_OCTETFRAMES65T127 Register (Offset = 0003A06Ch) [Reset = 00000000h]

CPSW_NC_STAT_0_OCTETFRAMES65T127 is shown in Table 11-754.

Return to the Summary Table.

Total number of frames of size 65 to 127 bytes received and transmitted

Table 11-754. CPSW_NC_STAT_0_OCTETFRAMES65T127 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 65 to 127 bytes received and transmitted

11.2.1.6.456 CPSW_NC_STAT_0_OCTETFRAMES128T255 Register (Offset = 0003A070h) [Reset = 00000000h]

CPSW_NC_STAT_0_OCTETFRAMES128T255 is shown in Table 11-755.

Return to the Summary Table.

Total number of frames of size 128 to 255 bytes received and transmitted

Table 11-755. CPSW_NC_STAT_0_OCTETFRAMES128T255 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 128 to 255 bytes received and transmitted

11.2.1.6.457 CPSW_NC_STAT_0_OCTETFRAMES256T511 Register (Offset = 0003A074h) [Reset = 00000000h]

CPSW_NC_STAT_0_OCTETFRAMES256T511 is shown in Table 11-756.

Return to the Summary Table.

Total number of frames of size 256 to 511 bytes received and transmitted

Table 11-756. CPSW_NC_STAT_0_OCTETFRAMES256T511 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 256 to 511 bytes received and transmitted

11.2.1.6.458 CPSW_NC_STAT_0_OCTETFRAMES512T1023 Register (Offset = 0003A078h) [Reset = 00000000h]

CPSW_NC_STAT_0_OCTETFRAMES512T1023 is shown in Table 11-757.

Return to the Summary Table.

Total number of frames of size 512 to 1023 bytes received and transmitted

Table 11-757. CPSW_NC_STAT_0_OCTETFRAMES512T1023 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 512 to 1023 bytes received and transmitted

11.2.1.6.459 CPSW_NC_STAT_0_OCTETFRAMES1024TUP Register (Offset = 0003A07Ch) [Reset = 00000000h]

CPSW_NC_STAT_0_OCTETFRAMES1024TUP is shown in Table 11-758.

Return to the Summary Table.

Total number of frames of size 1024 to rx_maxlen bytes received and 1024 bytes or greater transmitted

Table 11-758. CPSW_NC_STAT_0_OCTETFRAMES1024TUP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 1024 to rx_maxlen bytes received and 1024 bytes or greater transmitted

11.2.1.6.460 CPSW_NC_STAT_0_NETOCTETS Register (Offset = 0003A080h) [Reset = 00000000h]

CPSW_NC_STAT_0_NETOCTETS is shown in Table 11-759.

Return to the Summary Table.

Total number of bytes received and transmitted

Table 11-759. CPSW_NC_STAT_0_NETOCTETS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of bytes received and transmitted

11.2.1.6.461 CPSW_NC_STAT_0_RX_BOTTOM_OF_FIFO_DROP Register (Offset = 0003A084h) [Reset = 00000000h]

CPSW_NC_STAT_0_RX_BOTTOM_OF_FIFO_DROP is shown in Table 11-760.

Return to the Summary Table.

Receive Bottom of FIFO Drop

Table 11-760. CPSW_NC_STAT_0_RX_BOTTOM_OF_FIFO_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Receive Bottom of FIFO Drop

11.2.1.6.462 CPSW_NC_STAT_0_PORTMASK_DROP Register (Offset = 0003A088h) [Reset = 00000000h]

CPSW_NC_STAT_0_PORTMASK_DROP is shown in Table 11-761.

Return to the Summary Table.

Total number of dropped frames received due to portmask

Table 11-761. CPSW_NC_STAT_0_PORTMASK_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames received due to portmask

11.2.1.6.463 CPSW_NC_STAT_0_RX_TOP_OF_FIFO_DROP Register (Offset = 0003A08Ch) [Reset = 00000000h]

CPSW_NC_STAT_0_RX_TOP_OF_FIFO_DROP is shown in Table 11-762.

Return to the Summary Table.

Receive Top of FIFO Drop

Table 11-762. CPSW_NC_STAT_0_RX_TOP_OF_FIFO_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Receive Top of FIFO Drop

11.2.1.6.464 CPSW_NC_STAT_0_ALE_RATE_LIMIT_DROP Register (Offset = 0003A090h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_RATE_LIMIT_DROP is shown in Table 11-763.

Return to the Summary Table.

Total number of dropped frames due to ALE Rate Limiting

Table 11-763. CPSW_NC_STAT_0_ALE_RATE_LIMIT_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Rate Limiting

11.2.1.6.465 CPSW_NC_STAT_0_ALE_VID_INGRESS_DROP Register (Offset = 0003A094h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_VID_INGRESS_DROP is shown in Table 11-764.

Return to the Summary Table.

Total number of dropped frames due to ALE VID Ingress

Table 11-764. CPSW_NC_STAT_0_ALE_VID_INGRESS_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE VID Ingress

11.2.1.6.466 CPSW_NC_STAT_0_ALE_DA_EQ_SA_DROP Register (Offset = 0003A098h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_DA_EQ_SA_DROP is shown in Table 11-765.

Return to the Summary Table.

Total number of dropped frames due to DA=SA

Table 11-765. CPSW_NC_STAT_0_ALE_DA_EQ_SA_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to DA=SA

11.2.1.6.467 CPSW_NC_STAT_0_ALE_BLOCK_DROP Register (Offset = 0003A09Ch) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_BLOCK_DROP is shown in Table 11-766.

Return to the Summary Table.

Total number of dropped frames due to ALE Block Mode

Table 11-766. CPSW_NC_STAT_0_ALE_BLOCK_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Block Mode

11.2.1.6.468 CPSW_NC_STAT_0_ALE_SECURE_DROP Register (Offset = 0003A0A0h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_SECURE_DROP is shown in Table 11-767.

Return to the Summary Table.

Total number of dropped frames due to ALE Secure Mode

Table 11-767. CPSW_NC_STAT_0_ALE_SECURE_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Secure Mode

11.2.1.6.469 CPSW_NC_STAT_0_ALE_AUTH_DROP Register (Offset = 0003A0A4h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_AUTH_DROP is shown in Table 11-768.

Return to the Summary Table.

Total number of dropped frames due to ALE Authentication

Table 11-768. CPSW_NC_STAT_0_ALE_AUTH_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Authentication

11.2.1.6.470 CPSW_NC_STAT_0_ALE_UNKN_UNI Register (Offset = 0003A0A8h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_UNKN_UNI is shown in Table 11-769.

Return to the Summary Table.

ALE Receive Unknown Unicast

Table 11-769. CPSW_NC_STAT_0_ALE_UNKN_UNI Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Unicast

11.2.1.6.471 CPSW_NC_STAT_0_ALE_UNKN_UNI_BCNT Register (Offset = 0003A0ACh) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_UNKN_UNI_BCNT is shown in Table 11-770.

Return to the Summary Table.

ALE Receive Unknown Unicast Bytecount

Table 11-770. CPSW_NC_STAT_0_ALE_UNKN_UNI_BCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Unicast Bytecount

11.2.1.6.472 CPSW_NC_STAT_0_ALE_UNKN_MLT Register (Offset = 0003A0B0h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_UNKN_MLT is shown in Table 11-771.

Return to the Summary Table.

ALE Receive Unknown Multicast

Table 11-771. CPSW_NC_STAT_0_ALE_UNKN_MLT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Multicast

11.2.1.6.473 CPSW_NC_STAT_0_ALE_UNKN_MLT_BCNT Register (Offset = 0003A0B4h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_UNKN_MLT_BCNT is shown in Table 11-772.

Return to the Summary Table.

ALE Receive Unknown Multicast Bytecount

Table 11-772. CPSW_NC_STAT_0_ALE_UNKN_MLT_BCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Multicast Bytecount

11.2.1.6.474 CPSW_NC_STAT_0_ALE_UNKN_BRD Register (Offset = 0003A0B8h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_UNKN_BRD is shown in Table 11-773.

Return to the Summary Table.

ALE Receive Unknown Broadcast

Table 11-773. CPSW_NC_STAT_0_ALE_UNKN_BRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Broadcast

11.2.1.6.475 CPSW_NC_STAT_0_ALE_UNKN_BRD_BCNT Register (Offset = 0003A0BCh) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_UNKN_BRD_BCNT is shown in Table 11-774.

Return to the Summary Table.

ALE Receive Unknown Broadcast Bytecount

Table 11-774. CPSW_NC_STAT_0_ALE_UNKN_BRD_BCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Broadcast Bytecount

11.2.1.6.476 CPSW_NC_STAT_0_ALE_POL_MATCH Register (Offset = 0003A0C0h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_POL_MATCH is shown in Table 11-775.

Return to the Summary Table.

ALE Policer Matched

Table 11-775. CPSW_NC_STAT_0_ALE_POL_MATCH Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Policer Matched

11.2.1.6.477 CPSW_NC_STAT_0_ALE_POL_MATCH_RED Register (Offset = 0003A0C4h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_POL_MATCH_RED is shown in Table 11-776.

Return to the Summary Table.

ALE Policer Matched and Condition Red

Table 11-776. CPSW_NC_STAT_0_ALE_POL_MATCH_RED Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Policer Matched and Condition Red

11.2.1.6.478 CPSW_NC_STAT_0_ALE_POL_MATCH_YELLOW Register (Offset = 0003A0C8h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_POL_MATCH_YELLOW is shown in Table 11-777.

Return to the Summary Table.

ALE Policer Matched and Condition Yellow

Table 11-777. CPSW_NC_STAT_0_ALE_POL_MATCH_YELLOW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Policer Matched and Condition Yellow

11.2.1.6.479 CPSW_NC_STAT_0_ALE_MULT_SA_DROP Register (Offset = 0003A0CCh) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_MULT_SA_DROP is shown in Table 11-778.

Return to the Summary Table.

ALE Multicast Source Address Drop

Table 11-778. CPSW_NC_STAT_0_ALE_MULT_SA_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Multicast Source Address drop

11.2.1.6.480 CPSW_NC_STAT_0_ALE_DUAL_VLAN_DROP Register (Offset = 0003A0D0h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_DUAL_VLAN_DROP is shown in Table 11-779.

Return to the Summary Table.

ALE Dual VLAN Drop

Table 11-779. CPSW_NC_STAT_0_ALE_DUAL_VLAN_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Dual VLAN drop

11.2.1.6.481 CPSW_NC_STAT_0_ALE_LEN_ERROR_DROP Register (Offset = 0003A0D4h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_LEN_ERROR_DROP is shown in Table 11-780.

Return to the Summary Table.

ALE Length Error Drop

Table 11-780. CPSW_NC_STAT_0_ALE_LEN_ERROR_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Length Error drop

11.2.1.6.482 CPSW_NC_STAT_0_ALE_IP_NEXT_HDR_DROP Register (Offset = 0003A0D8h) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_IP_NEXT_HDR_DROP is shown in Table 11-781.

Return to the Summary Table.

ALE IP Next Header Drop

Table 11-781. CPSW_NC_STAT_0_ALE_IP_NEXT_HDR_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Next Header drop

11.2.1.6.483 CPSW_NC_STAT_0_ALE_IPV4_FRAG_DROP Register (Offset = 0003A0DCh) [Reset = 00000000h]

CPSW_NC_STAT_0_ALE_IPV4_FRAG_DROP is shown in Table 11-782.

Return to the Summary Table.

ALE IPV4 Frag Drop

Table 11-782. CPSW_NC_STAT_0_ALE_IPV4_FRAG_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE IPV4 Fragment drop

11.2.1.6.484 CPSW_NC_STAT_0_TX_MEMORY_PROTECT_ERROR Register (Offset = 0003A17Ch) [Reset = 00000000h]

CPSW_NC_STAT_0_TX_MEMORY_PROTECT_ERROR is shown in Table 11-783.

Return to the Summary Table.

Transmit Memory Protect CRC Error

Table 11-783. CPSW_NC_STAT_0_TX_MEMORY_PROTECT_ERROR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	COUNT	R/W	0h	Transmit Memory Protect CRC Error

11.2.1.6.485 CPSW_NC_STAT_1_RXGOODFRAMES Register (Offset = 0003A200h) [Reset = 00000000h]

CPSW_NC_STAT_1_RXGOODFRAMES is shown in Table 11-784.

Return to the Summary Table.

Total number of good frames received

Table 11-784. CPSW_NC_STAT_1_RXGOODFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good frames received

11.2.1.6.486 CPSW_NC_STAT_1_RXBROADCASTFRAMES Register (Offset = 0003A204h) [Reset = 00000000h]

CPSW_NC_STAT_1_RXBROADCASTFRAMES is shown in Table 11-785.

Return to the Summary Table.

Total number of good broadcast frames received

Table 11-785. CPSW_NC_STAT_1_RXBROADCASTFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good broadcast frames received

11.2.1.6.487 CPSW_NC_STAT_1_RXMULTICASTFRAMES Register (Offset = 0003A208h) [Reset = 00000000h]

CPSW_NC_STAT_1_RXMULTICASTFRAMES is shown in Table 11-786.

Return to the Summary Table.

Total number of good multicast frames received

Table 11-786. CPSW_NC_STAT_1_RXMULTICASTFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good multicast frames received

11.2.1.6.488 CPSW_NC_STAT_1_RXPAUSEFRAMES Register (Offset = 0003A20Ch) [Reset = 00000000h]

CPSW_NC_STAT_1_RXPAUSEFRAMES is shown in Table 11-787.

Return to the Summary Table.

Total number of pause frames received

Table 11-787. CPSW_NC_STAT_1_RXPAUSEFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of pause frames received

11.2.1.6.489 CPSW_NC_STAT_1_RXCRCERRORS Register (Offset = 0003A210h) [Reset = 00000000h]

CPSW_NC_STAT_1_RXCRCERRORS is shown in Table 11-788.

Return to the Summary Table.

Total number of CRC errors frames received

Table 11-788. CPSW_NC_STAT_1_RXCRCERRORS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of CRC errors frames received

11.2.1.6.490 CPSW_NC_STAT_1_RXALIGNCODEERRORS Register (Offset = 0003A214h) [Reset = 00000000h]

CPSW_NC_STAT_1_RXALIGNCODEERRORS is shown in Table 11-789.

Return to the Summary Table.

Total number of alignment/code errors received

Table 11-789. CPSW_NC_STAT_1_RXALIGNCODEERRORS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of alignment/code errors received

11.2.1.6.491 CPSW_NC_STAT_1_RXOVERSIZEDFRAMES Register (Offset = 0003A218h) [Reset = 00000000h]

CPSW_NC_STAT_1_RXOVERSIZEDFRAMES is shown in Table 11-790.

Return to the Summary Table.

Total number of oversized frames received

Table 11-790. CPSW_NC_STAT_1_RXOVERSIZEDFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of oversized frames received

11.2.1.6.492 CPSW_NC_STAT_1_RXJABBERFRAMES Register (Offset = 0003A21Ch) [Reset = 00000000h]

CPSW_NC_STAT_1_RXJABBERFRAMES is shown in Table 11-791.

Return to the Summary Table.

Total number of jabber frames received

Table 11-791. CPSW_NC_STAT_1_RXJABBERFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of jabber frames received

11.2.1.6.493 CPSW_NC_STAT_1_RXUNDERSIZEDFRAMES Register (Offset = 0003A220h) [Reset = 00000000h]

CPSW_NC_STAT_1_RXUNDERSIZEDFRAMES is shown in Table 11-792.

Return to the Summary Table.

Total number of undersized frames received

Table 11-792. CPSW_NC_STAT_1_RXUNDERSIZEDFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of undersized frames received

11.2.1.6.494 CPSW_NC_STAT_1_RXFRAGMENTS Register (Offset = 0003A224h) [Reset = 00000000h]

CPSW_NC_STAT_1_RXFRAGMENTS is shown in Table 11-793.

Return to the Summary Table.

Total number of fragmented frames received

Table 11-793. CPSW_NC_STAT_1_RXFRAGMENTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of fragmented frames received

11.2.1.6.495 CPSW_NC_STAT_1_ALE_DROP Register (Offset = 0003A228h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_DROP is shown in Table 11-794.

Return to the Summary Table.

Total number of frames dropped by the ALE

Table 11-794. CPSW_NC_STAT_1_ALE_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames dropped by the ALE

11.2.1.6.496 CPSW_NC_STAT_1_ALE_OVERRUN_DROP Register (Offset = 0003A22Ch) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_OVERRUN_DROP is shown in Table 11-795.

Return to the Summary Table.

Total number of overrun frames dropped by the ALE

Table 11-795. CPSW_NC_STAT_1_ALE_OVERRUN_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of overrun frames dropped by the ALE

11.2.1.6.497 CPSW_NC_STAT_1_RXOCTETS Register (Offset = 0003A230h) [Reset = 00000000h]

CPSW_NC_STAT_1_RXOCTETS is shown in Table 11-796.

Return to the Summary Table.

Total number of received bytes in good frames

Table 11-796. CPSW_NC_STAT_1_RXOCTETS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of received bytes in good frames

11.2.1.6.498 CPSW_NC_STAT_1_TXGOODFRAMES Register (Offset = 0003A234h) [Reset = 00000000h]

CPSW_NC_STAT_1_TXGOODFRAMES is shown in Table 11-797.

Return to the Summary Table.

Total number of good frames transmitted

Table 11-797. CPSW_NC_STAT_1_TXGOODFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good frames transmitted

11.2.1.6.499 CPSW_NC_STAT_1_TXBROADCASTFRAMES Register (Offset = 0003A238h) [Reset = 00000000h]

CPSW_NC_STAT_1_TXBROADCASTFRAMES is shown in Table 11-798.

Return to the Summary Table.

Total number of good broadcast frames transmitted

Table 11-798. CPSW_NC_STAT_1_TXBROADCASTFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good broadcast frames transmitted

11.2.1.6.500 CPSW_NC_STAT_1_TXMULTICASTFRAMES Register (Offset = 0003A23Ch) [Reset = 00000000h]

CPSW_NC_STAT_1_TXMULTICASTFRAMES is shown in Table 11-799.

Return to the Summary Table.

Total number of good multicast frames transmitted

Table 11-799. CPSW_NC_STAT_1_TXMULTICASTFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good multicast frames transmitted

11.2.1.6.501 CPSW_NC_STAT_1_TXPAUSEFRAMES Register (Offset = 0003A240h) [Reset = 00000000h]

CPSW_NC_STAT_1_TXPAUSEFRAMES is shown in Table 11-800.

Return to the Summary Table.

Total number of pause frames transmitted

Table 11-800. CPSW_NC_STAT_1_TXPAUSEFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of pause frames transmitted

11.2.1.6.502 CPSW_NC_STAT_1_TXDEFERREDFRAMES Register (Offset = 0003A244h) [Reset = 00000000h]

CPSW_NC_STAT_1_TXDEFERREDFRAMES is shown in Table 11-801.

Return to the Summary Table.

Total number of deferred frames transmitted

Table 11-801. CPSW_NC_STAT_1_TXDEFERREDFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of deferred frames transmitted

11.2.1.6.503 CPSW_NC_STAT_1_TXCOLLISIONFRAMES Register (Offset = 0003A248h) [Reset = 00000000h]

CPSW_NC_STAT_1_TXCOLLISIONFRAMES is shown in Table 11-802.

Return to the Summary Table.

Total number of transmitted frames experiencing a collision

Table 11-802. CPSW_NC_STAT_1_TXCOLLISIONFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames experiencing a collision

11.2.1.6.504 CPSW_NC_STAT_1_TXSINGLECOLLFRAMES Register (Offset = 0003A24Ch) [Reset = 00000000h]

CPSW_NC_STAT_1_TXSINGLECOLLFRAMES is shown in Table 11-803.

Return to the Summary Table.

Total number of transmitted frames experiencing a single collision

Table 11-803. CPSW_NC_STAT_1_TXSINGLECOLLFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames experiencing a single collision

11.2.1.6.505 CPSW_NC_STAT_1_TXMULTCOLLFRAMES Register (Offset = 0003A250h) [Reset = 00000000h]

CPSW_NC_STAT_1_TXMULTCOLLFRAMES is shown in Table 11-804.

Return to the Summary Table.

Total number of transmitted frames experiencing multiple collisions

Table 11-804. CPSW_NC_STAT_1_TXMULTCOLLFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames experiencing multiple collisions

11.2.1.6.506 CPSW_NC_STAT_1_TXEXCESSIVECOLLISIONS Register (Offset = 0003A254h) [Reset = 00000000h]

CPSW_NC_STAT_1_TXEXCESSIVECOLLISIONS is shown in Table 11-805.

Return to the Summary Table.

Total number of transmitted frames abandoned due to excessive collisions

Table 11-805. CPSW_NC_STAT_1_TXEXCESSIVECOLLISIONS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames abandoned due to excessive collisions

11.2.1.6.507 CPSW_NC_STAT_1_TXLATECOLLISIONS Register (Offset = 0003A258h) [Reset = 00000000h]

CPSW_NC_STAT_1_TXLATECOLLISIONS is shown in Table 11-806.

Return to the Summary Table.

Total number of transmitted frames abandoned due to a late collision

Table 11-806. CPSW_NC_STAT_1_TXLATECOLLISIONS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames abandoned due to a late collision

11.2.1.6.508 CPSW_NC_STAT_1_RXIPGERROR Register (Offset = 0003A25Ch) [Reset = 00000000h]

CPSW_NC_STAT_1_RXIPGERROR is shown in Table 11-807.

Return to the Summary Table.

Total number of receive inter-packet gap errors (10G only)

Table 11-807. CPSW_NC_STAT_1_RXIPGERROR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of receive inter-packet gap errors (10G only)

11.2.1.6.509 CPSW_NC_STAT_1_TXCARRIERSENSEERRORS Register (Offset = 0003A260h) [Reset = 00000000h]

CPSW_NC_STAT_1_TXCARRIERSENSEERRORS is shown in Table 11-808.

Return to the Summary Table.

Total number of transmitted frames that experienced a carrier loss

Table 11-808. CPSW_NC_STAT_1_TXCARRIERSENSEERRORS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames that experienced a carrier loss

11.2.1.6.510 CPSW_NC_STAT_1_TXOCTETS Register (Offset = 0003A264h) [Reset = 00000000h]

CPSW_NC_STAT_1_TXOCTETS is shown in Table 11-809.

Return to the Summary Table.

Total number of bytes in all good frames transmitted

Table 11-809. CPSW_NC_STAT_1_TXOCTETS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of bytes in all good frames transmitted

11.2.1.6.511 CPSW_NC_STAT_1_OCTETFRAMES64 Register (Offset = 0003A268h) [Reset = 00000000h]

CPSW_NC_STAT_1_OCTETFRAMES64 is shown in Table 11-810.

Return to the Summary Table.

Total number of 64-byte frames received and transmitted

Table 11-810. CPSW_NC_STAT_1_OCTETFRAMES64 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of 64-byte frames received and transmitted

11.2.1.6.512 CPSW_NC_STAT_1_OCTETFRAMES65T127 Register (Offset = 0003A26Ch) [Reset = 00000000h]

CPSW_NC_STAT_1_OCTETFRAMES65T127 is shown in Table 11-811.

Return to the Summary Table.

Total number of frames of size 65 to 127 bytes received and transmitted

Table 11-811. CPSW_NC_STAT_1_OCTETFRAMES65T127 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 65 to 127 bytes received and transmitted

11.2.1.6.513 CPSW_NC_STAT_1_OCTETFRAMES128T255 Register (Offset = 0003A270h) [Reset = 00000000h]

CPSW_NC_STAT_1_OCTETFRAMES128T255 is shown in Table 11-812.

Return to the Summary Table.

Total number of frames of size 128 to 255 bytes received and transmitted

Table 11-812. CPSW_NC_STAT_1_OCTETFRAMES128T255 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 128 to 255 bytes received and transmitted

11.2.1.6.514 CPSW_NC_STAT_1_OCTETFRAMES256T511 Register (Offset = 0003A274h) [Reset = 00000000h]

CPSW_NC_STAT_1_OCTETFRAMES256T511 is shown in Table 11-813.

Return to the Summary Table.

Total number of frames of size 256 to 511 bytes received and transmitted

Table 11-813. CPSW_NC_STAT_1_OCTETFRAMES256T511 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 256 to 511 bytes received and transmitted

11.2.1.6.515 CPSW_NC_STAT_1_OCTETFRAMES512T1023 Register (Offset = 0003A278h) [Reset = 00000000h]

CPSW_NC_STAT_1_OCTETFRAMES512T1023 is shown in Table 11-814.

Return to the Summary Table.

Total number of frames of size 512 to 1023 bytes received and transmitted

Table 11-814. CPSW_NC_STAT_1_OCTETFRAMES512T1023 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 512 to 1023 bytes received and transmitted

11.2.1.6.516 CPSW_NC_STAT_1_OCTETFRAMES1024TUP Register (Offset = 0003A27Ch) [Reset = 00000000h]

CPSW_NC_STAT_1_OCTETFRAMES1024TUP is shown in Table 11-815.

Return to the Summary Table.

Total number of frames of size 1024 to rx_maxlen bytes received and 1024 bytes or greater transmitted

Table 11-815. CPSW_NC_STAT_1_OCTETFRAMES1024TUP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 1024 to rx_maxlen bytes received and 1024 bytes or greater transmitted

11.2.1.6.517 CPSW_NC_STAT_1_NETOCTETS Register (Offset = 0003A280h) [Reset = 00000000h]

CPSW_NC_STAT_1_NETOCTETS is shown in Table 11-816.

Return to the Summary Table.

Total number of bytes received and transmitted

Table 11-816. CPSW_NC_STAT_1_NETOCTETS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of bytes received and transmitted

11.2.1.6.518 CPSW_NC_STAT_1_RX_BOTTOM_OF_FIFO_DROP Register (Offset = 0003A284h) [Reset = 00000000h]

CPSW_NC_STAT_1_RX_BOTTOM_OF_FIFO_DROP is shown in Table 11-817.

Return to the Summary Table.

Receive Bottom of FIFO Drop

Table 11-817. CPSW_NC_STAT_1_RX_BOTTOM_OF_FIFO_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Receive Bottom of FIFO Drop

11.2.1.6.519 CPSW_NC_STAT_1_PORTMASK_DROP Register (Offset = 0003A288h) [Reset = 00000000h]

CPSW_NC_STAT_1_PORTMASK_DROP is shown in Table 11-818.

Return to the Summary Table.

Total number of dropped frames received due to portmask

Table 11-818. CPSW_NC_STAT_1_PORTMASK_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames received due to portmask

11.2.1.6.520 CPSW_NC_STAT_1_RX_TOP_OF_FIFO_DROP Register (Offset = 0003A28Ch) [Reset = 00000000h]

CPSW_NC_STAT_1_RX_TOP_OF_FIFO_DROP is shown in Table 11-819.

Return to the Summary Table.

Receive Top of FIFO Drop

Table 11-819. CPSW_NC_STAT_1_RX_TOP_OF_FIFO_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Receive Top of FIFO Drop

11.2.1.6.521 CPSW_NC_STAT_1_ALE_RATE_LIMIT_DROP Register (Offset = 0003A290h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_RATE_LIMIT_DROP is shown in Table 11-820.

Return to the Summary Table.

Total number of dropped frames due to ALE Rate Limiting

Table 11-820. CPSW_NC_STAT_1_ALE_RATE_LIMIT_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Rate Limiting

11.2.1.6.522 CPSW_NC_STAT_1_ALE_VID_INGRESS_DROP Register (Offset = 0003A294h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_VID_INGRESS_DROP is shown in Table 11-821.

Return to the Summary Table.

Total number of dropped frames due to ALE VID Ingress

Table 11-821. CPSW_NC_STAT_1_ALE_VID_INGRESS_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE VID Ingress

11.2.1.6.523 CPSW_NC_STAT_1_ALE_DA_EQ_SA_DROP Register (Offset = 0003A298h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_DA_EQ_SA_DROP is shown in Table 11-822.

Return to the Summary Table.

Total number of dropped frames due to DA=SA

Table 11-822. CPSW_NC_STAT_1_ALE_DA_EQ_SA_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to DA=SA

11.2.1.6.524 CPSW_NC_STAT_1_ALE_BLOCK_DROP Register (Offset = 0003A29Ch) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_BLOCK_DROP is shown in Table 11-823.

Return to the Summary Table.

Total number of dropped frames due to ALE Block Mode

Table 11-823. CPSW_NC_STAT_1_ALE_BLOCK_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Block Mode

11.2.1.6.525 CPSW_NC_STAT_1_ALE_SECURE_DROP Register (Offset = 0003A2A0h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_SECURE_DROP is shown in Table 11-824.

Return to the Summary Table.

Total number of dropped frames due to ALE Secure Mode

Table 11-824. CPSW_NC_STAT_1_ALE_SECURE_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Secure Mode

11.2.1.6.526 CPSW_NC_STAT_1_ALE_AUTH_DROP Register (Offset = 0003A2A4h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_AUTH_DROP is shown in Table 11-825.

Return to the Summary Table.

Total number of dropped frames due to ALE Authentication

Table 11-825. CPSW_NC_STAT_1_ALE_AUTH_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Authentication

11.2.1.6.527 CPSW_NC_STAT_1_ALE_UNKN_UNI Register (Offset = 0003A2A8h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_UNKN_UNI is shown in Table 11-826.

Return to the Summary Table.

ALE Receive Unknown Unicast

Table 11-826. CPSW_NC_STAT_1_ALE_UNKN_UNI Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Unicast

11.2.1.6.528 CPSW_NC_STAT_1_ALE_UNKN_UNI_BCNT Register (Offset = 0003A2ACh) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_UNKN_UNI_BCNT is shown in Table 11-827.

Return to the Summary Table.

ALE Receive Unknown Unicast Bytecount

Table 11-827. CPSW_NC_STAT_1_ALE_UNKN_UNI_BCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Unicast Bytecount

11.2.1.6.529 CPSW_NC_STAT_1_ALE_UNKN_MLT Register (Offset = 0003A2B0h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_UNKN_MLT is shown in Table 11-828.

Return to the Summary Table.

ALE Receive Unknown Multicast

Table 11-828. CPSW_NC_STAT_1_ALE_UNKN_MLT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Multicast

11.2.1.6.530 CPSW_NC_STAT_1_ALE_UNKN_MLT_BCNT Register (Offset = 0003A2B4h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_UNKN_MLT_BCNT is shown in Table 11-829.

Return to the Summary Table.

ALE Receive Unknown Multicast Bytecount

Table 11-829. CPSW_NC_STAT_1_ALE_UNKN_MLT_BCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Multicast Bytecount

11.2.1.6.531 CPSW_NC_STAT_1_ALE_UNKN_BRD Register (Offset = 0003A2B8h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_UNKN_BRD is shown in Table 11-830.

Return to the Summary Table.

ALE Receive Unknown Broadcast

Table 11-830. CPSW_NC_STAT_1_ALE_UNKN_BRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Broadcast

11.2.1.6.532 CPSW_NC_STAT_1_ALE_UNKN_BRD_BCNT Register (Offset = 0003A2BCh) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_UNKN_BRD_BCNT is shown in Table 11-831.

Return to the Summary Table.

ALE Receive Unknown Broadcast Bytecount

Table 11-831. CPSW_NC_STAT_1_ALE_UNKN_BRD_BCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Broadcast Bytecount

11.2.1.6.533 CPSW_NC_STAT_1_ALE_POL_MATCH Register (Offset = 0003A2C0h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_POL_MATCH is shown in Table 11-832.

Return to the Summary Table.

ALE Policer Matched

Table 11-832. CPSW_NC_STAT_1_ALE_POL_MATCH Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Policer Matched

11.2.1.6.534 CPSW_NC_STAT_1_ALE_POL_MATCH_RED Register (Offset = 0003A2C4h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_POL_MATCH_RED is shown in Table 11-833.

Return to the Summary Table.

ALE Policer Matched and Condition Red

Table 11-833. CPSW_NC_STAT_1_ALE_POL_MATCH_RED Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Policer Matched and Condition Red

11.2.1.6.535 CPSW_NC_STAT_1_ALE_POL_MATCH_YELLOW Register (Offset = 0003A2C8h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_POL_MATCH_YELLOW is shown in Table 11-834.

Return to the Summary Table.

ALE Policer Matched and Condition Yellow

Table 11-834. CPSW_NC_STAT_1_ALE_POL_MATCH_YELLOW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Policer Matched and Condition Yellow

11.2.1.6.536 CPSW_NC_STAT_1_ALE_MULT_SA_DROP Register (Offset = 0003A2CCh) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_MULT_SA_DROP is shown in Table 11-835.

Return to the Summary Table.

ALE Multicast Source Address Drop

Table 11-835. CPSW_NC_STAT_1_ALE_MULT_SA_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Multicast Source Address drop

11.2.1.6.537 CPSW_NC_STAT_1_ALE_DUAL_VLAN_DROP Register (Offset = 0003A2D0h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_DUAL_VLAN_DROP is shown in Table 11-836.

Return to the Summary Table.

ALE Dual VLAN Drop

Table 11-836. CPSW_NC_STAT_1_ALE_DUAL_VLAN_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Dual VLAN drop

11.2.1.6.538 CPSW_NC_STAT_1_ALE_LEN_ERROR_DROP Register (Offset = 0003A2D4h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_LEN_ERROR_DROP is shown in Table 11-837.

Return to the Summary Table.

ALE Length Error Drop

Table 11-837. CPSW_NC_STAT_1_ALE_LEN_ERROR_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Length Error drop

11.2.1.6.539 CPSW_NC_STAT_1_ALE_IP_NEXT_HDR_DROP Register (Offset = 0003A2D8h) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_IP_NEXT_HDR_DROP is shown in Table 11-838.

Return to the Summary Table.

ALE IP Next Header Drop

Table 11-838. CPSW_NC_STAT_1_ALE_IP_NEXT_HDR_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Next Header drop

11.2.1.6.540 CPSW_NC_STAT_1_ALE_IPV4_FRAG_DROP Register (Offset = 0003A2DCh) [Reset = 00000000h]

CPSW_NC_STAT_1_ALE_IPV4_FRAG_DROP is shown in Table 11-839.

Return to the Summary Table.

ALE IPV4 Frag Drop

Table 11-839. CPSW_NC_STAT_1_ALE_IPV4_FRAG_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE IPV4 Fragment drop

11.2.1.6.541 CPSW_NC_STAT_1_TX_MEMORY_PROTECT_ERROR Register (Offset = 0003A37Ch) [Reset = 00000000h]

CPSW_NC_STAT_1_TX_MEMORY_PROTECT_ERROR is shown in Table 11-840.

Return to the Summary Table.

Transmit Memory Protect CRC Error

Table 11-840. CPSW_NC_STAT_1_TX_MEMORY_PROTECT_ERROR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	COUNT	R/W	0h	Transmit Memory Protect CRC Error

11.2.1.6.542 CPSW_NC_STAT_1_ENET_PN_TX_PRI_REG_0 Register (Offset = 0003A380h) [Reset = 00000000h]

CPSW_NC_STAT_1_ENET_PN_TX_PRI_REG_0 is shown in Table 11-841.

Return to the Summary Table.

ENET Port n PRIORITY N Packet Count

Table 11-841. CPSW_NC_STAT_1_ENET_PN_TX_PRI_REG_0 Register Field Descriptions

Bit	Field	Type	Reset	Description

31-0	PN_TX_PRIN_DROP_BCNT	R/W	0h	ENET Port n PRIORITY N Packet Drop Byte Count

11.2.1.6.574 IDVER_REG Register (Offset = 0003D000h) [Reset = 4E8A010Dh]

IDVER_REG is shown in Table 11-873.

Return to the Summary Table.

Identification and Version Register

Table 11-873. IDVER_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TX_IDENT	R	4E8Ah	Identification value
15-11	RTL_VER	R	0h	RTL version value
10-8	MAJOR_VER	R	1h	Major version value
7-0	MINOR_VER	R	Dh	Minor version value

11.2.1.6.575 CPTS_CONTROL_REG Register (Offset = 0003D004h) [Reset = 0XXX0004h]

CPTS_CONTROL_REG is shown in Table 11-874.

Return to the Summary Table.

Time Sync Control Register

Table 11-874. CPTS_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	TS_SYNC_SEL	R/W	0h	TS_SYNC output timestamp counter bit select
27-18	RESERVED	R	0h	
17	TS_GENF_CLR_EN	R/W	0h	Enable for GENF clear when length is zero
16	TS_RX_NO_EVENT	R/W	0h	Receive Produces no Events
15	HW8_TS_PUSH_EN	R/W	0h	Hardware push 8 enable
14	HW7_TS_PUSH_EN	R/W	0h	Hardware push 7 enable
13	HW6_TS_PUSH_EN	R/W	0h	Hardware push 6 enable
12	HW5_TS_PUSH_EN	R/W	0h	Hardware push 5 enable
11	HW4_TS_PUSH_EN	R/W	0h	Hardware push 4 enable
10	HW3_TS_PUSH_EN	R/W	0h	Hardware push 3 enable
9	HW2_TS_PUSH_EN	R/W	0h	Hardware push 2 enable
8	HW1_TS_PUSH_EN	R/W	0h	Hardware push 1 enable
7	TS_PPM_DIR	R/W	0h	Timestamp PPM Direction
6	TS_COMP_TOG	R/W	0h	Timestamp Compare Toggle mode: 0=TS_COMP is in non-toggle mode, 1=TS_COMP is in toggle mode
5	MODE	R/W	0h	Timestamp mode
4	SEQUENCE_EN	R/W	0h	Sequence Enable
3	TSTAMP_EN	R/W	0h	Host Receive Timestamp Enable
2	TS_COMP_POLARITY	R/W	1h	TS_COMP polarity
1	INT_TEST	R/W	0h	Interrupt test
0	CPTS_EN	R/W	0h	Time sync enable

11.2.1.6.576 CPTS_RFTCLK_SEL_REG Register (Offset = 0003D008h) [Reset = 00000000h]

CPTS_RFTCLK_SEL_REG is shown in Table 11-875.

Return to the Summary Table.

RFTCLK Select Register

Table 11-875. CPTS_RFTCLK_SEL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R	0h	
4-0	RFTCLK_SEL	R/W	0h	Reference clock select

11.2.1.6.577 CPTS_TS_PUSH_REG Register (Offset = 0003D00Ch) [Reset = 00000000h]

CPTS_TS_PUSH_REG is shown in Table 11-876.

Return to the Summary Table.

Time Stamp Event Push Register

Table 11-876. CPTS_TS_PUSH_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	TS_PUSH	W	0h	Time stamp event push

11.2.1.6.578 TS_LOAD_VAL_REG Register (Offset = 0003D010h) [Reset = 00000000h]

TS_LOAD_VAL_REG is shown in Table 11-877.

Return to the Summary Table.

Time Stamp Load Low Value Register

Table 11-877. TS_LOAD_VAL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TS_LOAD_VAL	R/W	0h	Time stamp load low value

11.2.1.6.579 CPTS_TS_LOAD_EN_REG Register (Offset = 0003D014h) [Reset = 00000000h]

CPTS_TS_LOAD_EN_REG is shown in Table 11-878.

Return to the Summary Table.

Time Stamp Load Enable Register

Table 11-878. CPTS_TS_LOAD_EN_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	TS_LOAD_EN	W	0h	Time stamp load enable

11.2.1.6.580 TS_COMP_VAL_REG Register (Offset = 0003D018h) [Reset = 00000000h]

TS_COMP_VAL_REG is shown in Table 11-879.

Return to the Summary Table.

Time Stamp Comparison Low Value Register

Table 11-879. TS_COMP_VAL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TS_COMP_VAL	R/W	0h	Time stamp comparison low value

11.2.1.6.581 CPTS_TS_COMP_LEN_REG Register (Offset = 0003D01Ch) [Reset = 00000000h]

CPTS_TS_COMP_LEN_REG is shown in Table 11-880.

Return to the Summary Table.

Time Stamp Comparison Length Register

Table 11-880. CPTS_TS_COMP_LEN_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TS_COMP_LENGTH	R/W	0h	Time stamp comparison length

11.2.1.6.582 CPTS_INTSTAT_RAW_REG Register (Offset = 0003D020h) [Reset = 00000000h]

CPTS_INTSTAT_RAW_REG is shown in Table 11-881.

Return to the Summary Table.

Interrupt Status Register Raw

Table 11-881. CPTS_INTSTAT_RAW_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	TS_PEND_RAW	R/W	0h	TS_PEND_RAW int read (before enable)

11.2.1.6.583 CPTS_INTSTAT_MASKED_REG Register (Offset = 0003D024h) [Reset = 00000000h]

CPTS_INTSTAT_MASKED_REG is shown in Table 11-882.

Return to the Summary Table.

Interrupt Status Register Masked

Table 11-882. CPTS_INTSTAT_MASKED_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	TS_PEND	R	0h	TS_PEND masked interrupt read (after enable)

11.2.1.6.584 CPTS_INT_ENABLE_REG Register (Offset = 0003D028h) [Reset = 00000000h]

CPTS_INT_ENABLE_REG is shown in Table 11-883.

Return to the Summary Table.

Interrupt Enable Register

Table 11-883. CPTS_INT_ENABLE_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	TS_PEND_EN	R/W	0h	TS_PEND masked interrupt enable

11.2.1.6.585 CPTS_TS_COMP_NUDGE_REG Register (Offset = 0003D02Ch) [Reset = 00000000h]

CPTS_TS_COMP_NUDGE_REG is shown in Table 11-884.

Return to the Summary Table.

Time Stamp Comparison Nudge Register

Table 11-884. CPTS_TS_COMP_NUDGE_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	NUDGE	R/W	0h	This 2s complement number is added to the ts_comp_length value to increase or decrease the TS_COMP length by the nudge amount

11.2.1.6.586 CPTS_EVENT_POP_REG Register (Offset = 0003D030h) [Reset = 00000000h]

CPTS_EVENT_POP_REG is shown in Table 11-885.

Return to the Summary Table.

Event Pop Register

ALE_MOD_VER is shown in Table 11-925.

Return to the Summary Table.

The Module and Version Register identifies the module identifier and revision of the ALE_2g32 module.

Table 11-925. ALE_MOD_VER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	MODULE_ID	R	29h	ALE_2g32 module ID.
15-11	RTL_VERSION	R	0h	RTL Version.
10-8	MAJOR_REVISION	R	1h	Major Revision.
7-6	CUSTOM_REVISION	R	0h	Custom Revision.
5-0	MINOR_REVISION	R	5h	Minor Revision.

11.2.1.6.627 ALE_ALE_STATUS Register (Offset = 0003E004h) [Reset = XXXX00X0h]

ALE_ALE_STATUS is shown in Table 11-926.

Return to the Summary Table.

The ALE status provides information on the ALE configuration and state. The ~iramdepth is used to determine how IPv6 entries are stored in the table. IPv6 entries are stored in two entries where IPv6 Entry hi is designated by the odd slice index and lo is designated by the even slice index. The slice index is above the ram depth like {SlixeIndex,RamIndex}. So for a 64 deep RAM index of 0x005, the Hi portion of the IPv6 entry is located at 0x005|0x040 and the Lo portion is located at 0x005&(~0x040).

Table 11-926. ALE_ALE_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	UREGANDREGMSK12	R	0h	When set, the unregistered multicast field is a mask versus an index on 12 bit boundary in the ALE table.
30	UREGANDREGMSK08	R	0h	When set, the unregistered multicast field is a mask versus an index on 8 bit boundary in the ALE table.
29-16	RESERVED	R	0h	
15-8	POLCNTDIV8	R	0h	This is the number of Classifiers the ALE implements divided by 8. A value of 4 indicates 32 policer engines total.
7	RAMDEPTH128	R	0h	The number of ALE entries per slice of the table when this is set it indicates the depth is 128 if both ramdepth128 and ramdepth32 are zero the depth is 64.
6	RAMDEPTH32	R	0h	The number of ALE entries per slice of the table when this is set it indicates the depth is 32 if both ramdepth128 and ramdepth32 are zero the depth is 64.
5	RESERVED	R	0h	
4-0	KLUENTRIES	R	0h	This is the number of table entries total divided by 1024. A value of 1 indicates 1024 table entries. A value of 8 indicates 8192 table entries.

11.2.1.6.628 ALE_ALE_CONTROL Register (Offset = 0003E008h) [Reset = XXXXXX00h]

ALE_ALE_CONTROL is shown in Table 11-927.

Return to the Summary Table.

The ALE Control Register is used to set the ALE modes used for all ports.

Table 11-927. ALE_ALE_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ENABLE_ALE	R/W	0h	Enable ALE 0 - Drop all packets 1 - Enable ALE packet processing
30	CLEAR_TABLE	R/W	0h	Clear ALE address table - Setting this bit causes the ALE hardware to write all table bit values to zero. Software must perform a clear table operation as part of the ALE setup/configuration process. Setting this bit causes all ALE accesses to be held up for 64 clocks while the clear is performed. Access to all ALE registers will be blocked (wait states) until the 64 clocks have completed. This bit cannot be read as one because the read is blocked until the clear table is completed at which time this bit is cleared to zero.
29	AGE_OUT_NOW	R/W	0h	Age Out Address Table Now - Setting this bit causes the ALE hardware to remove (free up) any ageable table entry that does not have a set touch bit. This bit is cleared when the age out process has completed. This bit may be read. The age out process takes four times the number of table entries clock cycles (4096 cycles for 1K addresses) best case (no ale packet processing during ageout) and sixty five times the number of table entries clock cycles (66560 cycles for 1K addresses) absolute worst case.
28-25	RESERVED	R	0h	
24	MIRROR_DP	R/W	0h	Mirror Destination Port - This field defines the port to which destination traffic destined will be duplicated. That is all traffic that is forwarded to this port will also be mirrored to the ~imirror_top port.
23-21	UPD_BW_CTRL	R/W	0h	The ~iupd_bw_ctrl field allows for up to 8 times the rate in which adds, updates, touches, writes, and aging updates can occur. At frequencies of 350Mhz, the table update rate should be at it lowest or 5 Million updates per second. When operating the switch core at frequencies or above, the ~iupd_bw_ctrl can be programmed more aggressive. If the ~iupd_bw_ctrl is set but the frequency of the switch subsystem is below the associated value, ALE will drop packets due to insufficient time to complete lookup under high traffic loads. 0 - 350Mhz, 5M 1 - 359Mhz, 11M 2 - 367Mhz, 16M 3 - 375Mhz, 22M 4 - 384Mhz, 28M 5 - 392Mhz, 34M 6 - 400Mhz, 39M 7 - 409Mhz, 45M
20-17	RESERVED	R	0h	
16	MIRROR_TOP	R/W	0h	Mirror To Port - This field defines the destination port for the mirror traffic. If the traffic is received or transmitted on the mirror destination port it will not be duplicated. Traffic defined as mirror traffic only may be dropped by the switch due to congestion.

Table 11-927. ALE_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15	UPD_STATIC	R/W	0h	Update Static Entries - A static Entry is an entry that is not agable. When clear this bit will prevent any static entry (agable bit clear) from being updated due to port change. When set it allows static entries (agable bit clear) to update the source port if required. This bit should normally be '0' for most switch configurations.
14	RESERVED	R	0h	
13	UVLAN_NO_LEARN	R/W	0h	Unknown VLAN No Learn - This field when set will prevent source addresses of unknown VLAN IDs from being automatically added into the look up table if learning is enabled.
12	MIRROR_MEN	R/W	0h	Mirror Match Entry Enable - This field enables the match mirror option. When this bit is set any traffic whose destination, source, VLAN or OUI matches the ~imirror_midx entry index will have that traffic also sent to the ~imirror_top port.
11	MIRROR_DEN	R/W	0h	Mirror Destination Port Enable - This field enables the destination port mirror option. When this bit is set any traffic destined for the ~imirror_dp port will have its transmit traffic also sent to the ~imirror_top port.
10	MIRROR_SEN	R/W	0h	Mirror Source Port Enable - This field enables the source port mirror option. When this bit is set any port with the ~ipX_mirror_sp set in the ALE Port Control registers set will have its received traffic also sent to the ~imirror_top port.
9	RESERVED	R	0h	
8	EN_HOST_UNI_FLOOD	R/W	0h	Unknown unicast packets flood to host 0 - unknown unicast packets are not sent to the host 1 - unknown unicast packets flood to host port as well as other ports
7	LEARN_NO_VLANID	R/W	0h	Learn No VID - 0 - VID is learned with the source address 1 - VID is not learned with the source address (source address is not tied to VID). Determines the entry type.
6	ENABLE_VID0_MODE	R/W	0h	Enable VLAN ID = 0 Mode 0 - Process the priority tagged packet with VID = PORT_VLAN[11:0]. 1 - Process the priority tagged packet with VID = 0.
5	ENABLE_OUI_DENY	R/W	0h	Enable OUI Deny Mode - When set, any packet with a non-matching OUI source address will be dropped to the host unless the packet destination address matches a supervisory destination address table entry. When cleared, any packet source address matching an OUI address table entry will be dropped to the host unless the destination address matches with a supervisory destination address table entry.
4	ENABLE_BYPASS	R/W	0h	ALE Bypass - When set, packets received on non-host ports are sent to the host. It is expected that packets from the host are directed to the particular port. 0 - no bypass 1 - bypass the ALE
3	BCAST_MCAST_CTL	R/W	0h	Rate Limit Transmit mode 0 - Broadcast and multicast rate limit counters are received port based 1 - Broadcast and multicast rate limit counters are transmit port based
2	ALE_VLAN_AWARE	R/W	0h	ALE VLAN Aware - Determines how traffic is forwarded using VLAN rules. 0 - Simple switch rules, packets forwarded to all ports for unknown destinations. 1 - VLAN Aware rules, packets forwarded based on VLAN members

Table 11-927. ALE_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	ENABLE_AUTH_MODE	R/W	0h	Enable MAC Authorization Mode - Mac authorization mode requires that all table entries be made by the host software. There is no auto learning of addresses in authorization mode and the packet will be dropped if the source address is not found (and the destination address is not a multicast address with the super table entry bit set). 0 - The ALE is not in MAC authorization mode 1 - The ALE is in MAC authorization mode
0	ENABLE_RATE_LIMIT	R/W	0h	Enable Broadcast and Multicast Rate Limit 0 - Broadcast/Multicast rates not limited 1 - Broadcast/Multicast packet reception limited to the port control register rate limit fields.

11.2.1.6.629 ALE_ALE_CTRL2 Register (Offset = 0003E00Ch) [Reset = XX0XXXX0h]

ALE_ALE_CTRL2 is shown in Table 11-928.

Return to the Summary Table.

The ALE Control 2 Register is used to set the extended features used for all ports.

Table 11-928. ALE_ALE_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TRK_EN_DST	R/W	0h	Trunk Enable Destination Address - This field enables the destination MAC address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
30	TRK_EN_SRC	R/W	0h	Trunk Enable Source Address - This field enables the source MAC address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
29	TRK_EN_PRI	R/W	0h	Trunk Enable Priority - This field enables the VLAN Priority bits to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. In the event that DSCP mapping is enabled and there is no VLAN the DSCP priority will be used. For all other non IP frames without VLAN the port default priority is used.
28	RESERVED	R	0h	
27	TRK_EN_IVLAN	R/W	0h	Trunk Enable Inner VLAN - This field enables the inner VLAN ID value (C-VLANID) to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
26	RESERVED	R	0h	
25	TRK_EN_SIP	R/W	0h	Trunk Enable Source IP Address - This field enables the source IP address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
24	TRK_EN_DIP	R/W	0h	Trunk Enable Destination IP Address - This field enables the destination IP address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
23	DROP_BADLEN	R/W	0h	Drop Bad Length will drop any packet that the 802.3 length field is larger than the packet. Ethertypes 0-1500 are 802.3 lengths, all others are Ether types.
22	NODROP_SRCMCST	R/W	0h	No Drop Source Multicast will disable the dropping of any source address with the multicast bit set.
21	DEFNOFRAG	R/W	0h	Default No Frag field will cause an IPv4 fragmented packet to be dropped if a VLAN entry is not found.
20	DEFLMTNXTHDR	R/W	0h	Default limit next header field will cause an IPv4 protocol or IPv6 next header packet to be dropped if a VLAN entry is not found and the protocol or next header does not match the ~iALE_NXT_HDR register values.
19	RESERVED	R	0h	

Table 11-928. ALE_ALE_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18-16	TRK_BASE	R/W	0h	Trunk Base - This field is the hash formula starting value. Changing this value will cause the packet distribution on trunk ports to be changed. If all the ~itrk_en_dst, ~itrk_en_src, ~itrk_en_pri and ~itrk_en_vlan are '0', this value is used as the distribution index. That is a '0' will select the 1st bit of an 'N' link trunk, a '1' will select the second, etc. Below is the distribution across the trunk links. The first number in the ~iitalic sequence indicates the traffic is sent to the lowest numbered port of a trunk group. For example if you have a 3 port trunk, the hash result 0 will go to the base port (0), hash result 1 will go to the highest port of the trunk group (2), hash result 2 will go to the middle port (1), etc. 1 - ~i00000000 2 - ~i01010101 3 - ~i02102102 4 - ~i03210321
15	MULTIHOST	R/W	0h	The ~multihost allows host traffic to be sent bact to the host if the DA is market for the host port.
14-5	RESERVED	R	0h	
4-0	MIRROR_MIDX	R/W	0h	Mirror Index - This field is the ALE lookup table entry index that when a match occurs will cause this traffic to be mirrored to the ~imirror_top port. That is any VLAN, ONU or address with or withou VLAN can be selected for traffic mirroring.

11.2.1.6.630 ALE_ALE_PRESCALE Register (Offset = 0003E010h) [Reset = 00000000h]

ALE_ALE_PRESCALE is shown in Table 11-929.

Return to the Summary Table.

The ALE Prescale Register is used to set the Broadcast and Multicast rate limiting prescaler value.

Table 11-929. ALE_ALE_PRESCALE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	RESERVED	R	0h	
19-0	ALE_PRESCALE	R/W	0h	ALE Prescale - The input clock is divided by this value for use in the multicast/broadcast rate limiters. The minimum operating value is 0x10. The prescaler is off when the value is zero.

11.2.1.6.631 ALE_ALE_AGING_CTRL Register (Offset = 0003E014h) [Reset = XX000000h]

ALE_ALE_AGING_CTRL is shown in Table 11-930.

Return to the Summary Table.

The ALE Aging Control sets the aging interval which will cause periodic aging to occur. This value specifies the minimum time between aging starts.

Table 11-930. ALE_ALE_AGING_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PRESCALE_2_DISABLE	R/W	0h	ALE Prescaler 2 Disable - When set will divide the aging interval by 1000. This bit is designed for device verification and should not be used in production software. Combination of PreScale1Disable and PreScale2Disable will divide the aging interval by 1,000,000 for test purposes.
30	PRESCALE_1_DISABLE	R/W	0h	ALE Prescaler 1 Disable - When set will divide the aging interval by 1000. This bit is designed for device verification and should not be used in production software. Combination of PreScale1Disable and PreScale2Disable will divide the aging interval by 1,000,000 for test purposes.
29-24	RESERVED	R	0h	
23-0	ALE_AGING_TIMER	R/W	0h	ALE Aging Timer - This field specifies the number of clock cycles times 1,000,000 between aging operations.

11.2.1.6.632 ALE_ALE_NXT_HDR Register (Offset = 0003E01Ch) [Reset = 00000000h]

ALE_ALE_NXT_HDR is shown in Table 11-931.

Return to the Summary Table.

The ALE Next Header is used to limit the IPv6 Next header or IPv4 Protocol values found in the IP header. It is enabled via the ~iLmtNxtHdr bit in the VLAN entry. All four ~iip_nxt_hdr0-3 are compared when enabled, so if only one is required, set them all to the one value to be tested.

Table 11-931. ALE_ALE_NXT_HDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	IP_NXT_HDR3	R/W	0h	The ~iip_nxt_hdr3 is the forth protocol or next header compared when enabled.
23-16	IP_NXT_HDR2	R/W	0h	The ~iip_nxt_hdr2 is the third protocol or next header compared when enabled.
15-8	IP_NXT_HDR1	R/W	0h	The ~iip_nxt_hdr1 is the second protocol or next header compared when enabled.
7-0	IP_NXT_HDR0	R/W	0h	The ~iip_nxt_hdr0 is the first protocol or next header compared when enabled.

11.2.1.6.633 ALE_ALE_TBLCTL Register (Offset = 0003E020h) [Reset = XXXXXXX0h]

ALE_ALE_TBLCTL is shown in Table 11-932.

Return to the Summary Table.

The ALE table control register is used to read or write that ALE table entries. After writing to this register any read or write to any ALE register will be stalled until the read or write operation completes.

Table 11-932. ALE_ALE_TBLCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TABLEWR	R/W	0h	Table Write - This bit is used to write the table words to the lookup table. 0 - Table Read Operation is performed. The contents of the ~b TABLEIDX entry will be read into the ~b ALE_TBLWx registers 1 - Table write operation is performed. This will take the current contents from the ~b ALE_TBLWx registers and write them to the table at the specified ~b TABLEIDX.
30-5	RESERVED	R	0h	
4-0	TABLEIDX	R/W	0h	The table index is used to determine which lookup table entry is read or written.

11.2.1.6.634 ALE_ALE_TBLW2 Register (Offset = 0003E034h) [Reset = 00000000h]

ALE_ALE_TBLW2 is shown in Table 11-933.

Return to the Summary Table.

The ALE Table Word 2 is the most significant word of an ALE table entry.

Table 11-933. ALE_ALE_TBLW2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	0h	
6-0	TABLEWRD2	R/W	0h	Table Entry bits [71:64]

11.2.1.6.635 ALE_ALE_TBLW1 Register (Offset = 0003E038h) [Reset = 00000000h]

ALE_ALE_TBLW1 is shown in Table 11-934.

Return to the Summary Table.

The ALE Table Word 1 is the middle word of an ALE table entry.

Table 11-934. ALE_ALE_TBLW1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TABLEWRD1	R/W	0h	Table Entry bits [63:32]

11.2.1.6.636 ALE_ALE_TBLW0 Register (Offset = 0003E03Ch) [Reset = 00000000h]

ALE_ALE_TBLW0 is shown in Table 11-935.

Return to the Summary Table.

The ALE Table Word 0 is the least significant word of an ALE table entry.

Table 11-935. ALE_ALE_TBLW0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TABLEWRD0	R/W	0h	Table Entry bits [31:0]

11.2.1.6.637 ALE_I0_ALE_PORTCTL0_0 Register (Offset = 0003E040h) [Reset = 000000X0h]

ALE_I0_ALE_PORTCTL0_0 is shown in Table 11-936.

Return to the Summary Table.

The ALE Port Control Register sets the port specific modes of operation.

Table 11-936. ALE_I0_ALE_PORTCTL0_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	I0_REG_P0_BCAST_LIMIT	R/W	0h	Broadcast Packet Rate Limit - Each prescale pulse loads this field into the port broadcast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Broadcast rate limiting is enabled by a non-zero value in this field.
23-16	I0_REG_P0_MCAST_LIMIT	R/W	0h	Multicast Packet Rate Limit - Each prescale pulse loads this field into the port multicast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Multicast rate limiting is enabled by a non-zero value in this field.The ~imcast_limit is the number of Multicast packets that will be forwaded per ~iale_prescale time.
15	I0_REG_P0_DROP_DOUBLE_VLAN	R/W	0h	Drop Double VLAN - When set cause any received packet with double VLANs to be dropped. That is if there are two ctag or two stag fields in the packet it will be dropped.
14	I0_REG_P0_DROP_DUAL_VLAN	R/W	0h	Drop Dual VLAN - When set will cause any received packet with dual VLAN stag followed by ctag to be dropped.
13	I0_REG_P0_MACONLY_CAF	R/W	0h	Mac Only Copy All Frames - When set a Mac Only port will transfer all received good frames to the host. When clear a Mac Only port will transfer packets to the host based on ALE destination address lookup operation (which operates more like an Ethernet Mac). A Mac Only port is a port with ~imaconly set.
12	I0_REG_P0_DIS_PAUTHMOD	R/W	0h	Disable Port authorization - When set will allow unknown addresses to arrive on a switch in authorization mode. It is intended for device to device network connection on ports which do not require MACSEC encryption.
11	I0_REG_P0_MACONLY	R/W	0h	MAC Only - When set enables this port be treated like a MAC port for the host. All traffic received is only sent to the host. The host must direct traffic to this port as the lookup engine will not send traffic to the ports with the ~ip0_maconly bit set and the ~ip0_no_learn also set. If ~ip0_maconly bit is set and the ~ip0_no_learn is not set, the host can send non-directed packets that can be sent to the destination of a MacOnly port. It is also possible that The host can broadcast to all ports including MacOnly ports in this mode.
10	I0_REG_P0_TRUNKEN	R/W	0h	Trunk Enable - This field is used to enable a port into a trunk. Any port can be used as a trunk port, any two or more ports with the ~ip0_trunken its set and having the same ~ip0_trunknum will be placed in the same trunk. There is no requirement for trunk ports to be adjacent. If all ports are enabled in the same trunk, no traffic can flow as traffic received within a trunk is never trasnmitted out the same trunk. If only a single port is a member of a trunk, it looks like a normal port with exception of entries in the look up table will be noted as a trunk entry.

Table 11-936. ALE_I0_ALE_PORTCTL0_0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-8	I0_REG_P0_TRUNKNUM	R/W	0h	Trunk Number - This field is used as the trunk number when the ~ip0_trunken is also set. Ports with the same trunk number that have the ~ip0_trunken also set will have traffic distributed within the trunk based on the result of the hash function descrived above.
7	I0_REG_P0_MIRROR_SP	R/W	0h	Mirror Source Port - This field enables the source port mirror option. When this bit is set any traffic received on the port with the reg_p0_mirror_sp bit set will have its received traffic also sent to the ~imirror_top port.
6	RESERVED	R	0h	
5	I0_REG_P0_NO_SA_UPDATE	R/W	0h	No Source Address Update - When set will not update the source addresses for this port.
4	I0_REG_P0_NO_LEARN	R/W	0h	No Learn - When set will not learn the source addresses for this port.
3	I0_REG_P0_VID_INGRESS_CHECK	R/W	0h	VLAN Ingress Check - When set if a packet received is not a member of the VLAN, the packet will be dropped.
2	I0_REG_P0_DROP_UN_TAGGED	R/W	0h	If Drop Untagged - When set will drop packets without a VLAN tag.
1-0	I0_REG_P0_PORTSTATE	R/W	0h	Port State - Defins the current port state used for lookup operations. 0 - Disabled 1 - Blocked 2 - Learning 3 - Forwarding

11.2.1.6.638 ALE_I0_ALE_PORTCTL0_1 Register (Offset = 0003E044h) [Reset = 000000X0h]

ALE_I0_ALE_PORTCTL0_1 is shown in Table 11-937.

Return to the Summary Table.

The ALE Port Control Register sets the port specific modes of operation.

Table 11-937. ALE_I0_ALE_PORTCTL0_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	I0_REG_P0_BCAST_LIMIT	R/W	0h	Broadcast Packet Rate Limit - Each prescale pulse loads this field into the port broadcast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Broadcast rate limiting is enabled by a non-zero value in this field.
23-16	I0_REG_P0_MCAST_LIMIT	R/W	0h	Multicast Packet Rate Limit - Each prescale pulse loads this field into the port multicast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Multicast rate limiting is enabled by a non-zero value in this field.The ~imcast_limit is the number of Multicast packets that will be forwaded per ~iale_prescale time.
15	I0_REG_P0_DROP_DOUBLE_VLAN	R/W	0h	Drop Double VLAN - When set cause any received packet with double VLANs to be dropped. That is if there are two ctag or two stag fields in the packet it will be dropped.
14	I0_REG_P0_DROP_DUAL_VLAN	R/W	0h	Drop Dual VLAN - When set will cause any received packet with dual VLAN stag followed by ctag to be dropped.
13	I0_REG_P0_MACONLY_CAF	R/W	0h	Mac Only Copy All Frames - When set a Mac Only port will transfer all received good frames to the host. When clear a Mac Only port will transfer packets to the host based on ALE destination address lookup operation (which operates more like an Ethernet Mac). A Mac Only port is a port with ~imaconly set.
12	I0_REG_P0_DIS_PAUTHMOD	R/W	0h	Disable Port authorization - When set will allow unknown addresses to arrive on a switch in authorization mode. It is intended for device to device network connection on ports which do not require MACSEC encryption.
11	I0_REG_P0_MACONLY	R/W	0h	MAC Only - When set enables this port be treated like a MAC port for the host. All traffic received is only sent to the host. The host must direct traffic to this port as the lookup engine will not send traffic to the ports with the ~ip0_maconly bit set and the ~ip0_no_learn also set. If ~ip0_maconly bit is set and the ~ip0_no_learn is not set, the host can send non-directed packets that can be sent to the destination of a MacOnly port. It is also possible that The host can broadcast to all ports including MacOnly ports in this mode.
10	I0_REG_P0_TRUNKEN	R/W	0h	Trunk Enable - This field is used to enable a port into a trunk. Any port can be used as a trunk port, any two or more ports with the ~ip0_trunken its set and having the same ~ip0_trunknum will be placed in the same trunk. There is no requirement for trunk ports to be adjacent. If all ports are enabled in the same trunk, no traffic can flow as traffic received within a trunk is never trasnmitted out the same trunk. If only a single port is a member of a trunk, it looks like a normal port with exception of entries in the look up table will be noted as a trunk entry.

Table 11-937. ALE_I0_ALE_PORTCTL0_1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-8	I0_REG_P0_TRUNKNUM	R/W	0h	Trunk Number - This field is used as the trunk number when the ~ip0_trunken is also set. Ports with the same trunk number that have the ~ip0_trunken also set will have traffic distributed within the trunk based on the result of the hash function descrived above.
7	I0_REG_P0_MIRROR_SP	R/W	0h	Mirror Source Port - This field enables the source port mirror option. When this bit is set any traffic received on the port with the reg_p0_mirror_sp bit set will have its received traffic also sent to the ~imirror_top port.
6	RESERVED	R	0h	
5	I0_REG_P0_NO_SA_UPDATE	R/W	0h	No Source Address Update - When set will not update the source addresses for this port.
4	I0_REG_P0_NO_LEARN	R/W	0h	No Learn - When set will not learn the source addresses for this port.
3	I0_REG_P0_VID_INGRESS_CHECK	R/W	0h	VLAN Ingress Check - When set if a packet received is not a member of the VLAN, the packet will be dropped.
2	I0_REG_P0_DROP_UN_TAGGED	R/W	0h	If Drop Untagged - When set will drop packets without a VLAN tag.
1-0	I0_REG_P0_PORTSTATE	R/W	0h	Port State - Defins the current port state used for lookup operations. 0 - Disabled 1 - Blocked 2 - Learning 3 - Forwarding

11.2.1.6.639 ALE_ALE_UVLAN_MEMBER Register (Offset = 0003E090h) [Reset = 00000000h]

ALE_ALE_UVLAN_MEMBER is shown in Table 11-938.

Return to the Summary Table.

The ALE Unknown VLAN Member Mask Register is used to specify the member list for unknown VLAN ID.

Table 11-938. ALE_ALE_UVLAN_MEMBER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	UVLAN_MEMBER_LIST	R/W	0h	Unknown VLAN Member List - Each bit represents the port member status for unknown VLANs.

11.2.1.6.640 ALE_ALE_UVLAN_URCAST Register (Offset = 0003E094h) [Reset = 00000000h]

ALE_ALE_UVLAN_URCAST is shown in Table 11-939.

Return to the Summary Table.

The ALE Unknown VLAN Unregistered Multicast Flood Mask Register is used to specify which egress ports unregistered multicast addresses egress for the unregistered VLAN ID.

Table 11-939. ALE_ALE_UVLAN_URCAST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	UVLAN_UNREG_MCAST_FLOOD_MASK	R/W	0h	Unknown VLAN Unregister Multicast Flood Mask - Each bit represents the port to which unregistered multicast are sent for unregistered VLANs.

11.2.1.6.641 ALE_ALE_UVLAN_RMCAST Register (Offset = 0003E098h) [Reset = 00000000h]

ALE_ALE_UVLAN_RMCAST is shown in Table 11-940.

Return to the Summary Table.

The ALE Unknown VLAN Registered Multicast Flood Mask Register is used to specify which egress ports registered multicast addresses egress for the unregistered VLAN ID.

Table 11-940. ALE_ALE_UVLAN_RMCAST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	UVLAN_REG_MCAST_FLOOD_MASK	R/W	0h	Unknown VLAN Register Multicast Flood Mask - Each bit represents the port to which registered multicast are sent for unregistered VLANs. This field is ANDed with the registered multicast mask to determine the destinations for unregistered VLANs.

11.2.1.6.642 ALE_ALE_UVLAN_UNTAG Register (Offset = 0003E09Ch) [Reset = 00000000h]

ALE_ALE_UVLAN_UNTAG is shown in Table 11-941.

Return to the Summary Table.

The ALE Unknown VLAN force Untagged Egress Mask Register is used to specify which egress ports the VLAN ID will be removed.

Table 11-941. ALE_ALE_UVLAN_UNTAG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	UVLAN_FORCE_UNTAGGED_EGRESS	R/W	0h	Unknown VLAN Force Untagged Egress Mask - Each bit represents the port where the VLAN will be removed for unregistered VLANs.

11.2.1.6.643 ALE_ALE_FAST_LUT Register (Offset = 0003E0B4h) [Reset = 00000000h]

ALE_ALE_FAST_LUT is shown in Table 11-942.

Return to the Summary Table.

The Fast LUT registers allows the ports to be placed in Fast LUT mode.

Table 11-942. ALE_ALE_FAST_LUT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	FAST_LUT	R/W	0h	The ~Fast_LUT field alows any port to be Fast_LUT mode, which will cause all lookup operations to start based on DA/SA and VLAN only. That is any data beyong the first 32 are not used in the lookup process.

11.2.1.6.644 ALE_ALE_STAT_DIAG Register (Offset = 0003E0B8h) [Reset = 0000XXX0h]

ALE_ALE_STAT_DIAG is shown in Table 11-943.

Return to the Summary Table.

The ALE Statistic Output Diagnostic Register allows the output statistics to diagnose the SW counters. This register is for diagnostice only.

Table 11-943. ALE_ALE_STAT_DIAG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15	PBCAST_DIAG	R/W	0h	When set and the ~iport_diag is set to zero, will allow all ports to see the same stat diagnostic increment.
14-9	RESERVED	R	0h	
8	PORT_DIAG	R/W	0h	The port selected that a received packet will cause the selected error to increment
7-4	RESERVED	R	0h	
3-0	STAT_DIAG	R/W	0h	When non-zero will cause the selected statistic to increment on the next frame received. For the selected Port. 0: Disabled 1: Destination Equal Source Drop Stat will count 2: VLAN Ingress Check Drop Stat will count 3: Source Multicast Drop Stat will count 4: Dual VLAN Drop Stat will count 5: Ether Type length error Drop Stat will count 6: Next Hop Limit Drop Stat will count 7: IPv4 Fragment Drop Stat will count 8: Classifier Hit Stat will count 9: Classifier Red Drop Stat will count 10: Classifier Yellow Drop Stat will count 11: ALE Overflow Drop Stat will count 12: Rate Limit Drop Stat will count 13: Blocked Address Drop Stat will count 14: Secure Address Drop Stat will count 15: Authorization Drop Stat will count.

11.2.1.6.645 ALE_ALE_OAM_LB_CTRL Register (Offset = 0003E0BCh) [Reset = 00000000h]

ALE_ALE_OAM_LB_CTRL is shown in Table 11-944.

Return to the Summary Table.

The ALE OAM Control allows ports to be put into OAM Loopback, only non-supervisor packet are looped back to the source port.

Table 11-944. ALE_ALE_OAM_LB_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	OAM_LB_CTRL	R/W	0h	The ~ioam_lb_ctrl allows any port to be put into OAM loopback, that is any packet received will be returned to the same port with an egressop of 0xFF which swaps the source and destination address. BPDUs will still flow through as normal so that OAM can be remotly requested and disabled.

11.2.1.6.646 ALE_ALE_MSK_MUX0 Register (Offset = 0003E0C0h) [Reset = 00000003h]

ALE_ALE_MSK_MUX0 is shown in Table 11-945.

Return to the Summary Table.

VLAN Mask Mux x - The ALE Mask Mux registers are used along with the VLAN registered/unregistered index selectors from the Lookup Table to determine the value for vlan registered and unregister mask respectively.

Table 11-945. ALE_ALE_MSK_MUX0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	VLAN_MASK_MUX_0	R	3h	VLAN Mask Mux x - When selected by the VLAN lookup table entry FwdUnRegIdx or FwdAllRegIdx is used as the FwdUnRegMask or FwdUnRegMask values anded with the member list to determine the forwarding of packets. The Value of vlan_mask_mux_0 is read only and set to all ones for all ports.

11.2.1.6.647 ALE_I1_ALE_MSK_MUX1_0 Register (Offset = 0003E0C4h) [Reset = 00000000h]

ALE_I1_ALE_MSK_MUX1_0 is shown in Table 11-946.

Return to the Summary Table.

VLAN Mask Mux x - The ALE Mask Mux registers are used along with the VLAN registered/unregistered index selectors from the Lookup Table to determine the value for vlan registered and unregister mask respectively.

Table 11-946. ALE_I1_ALE_MSK_MUX1_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	I1_REG_VLAN_MASK_MUX_1	R/W	0h	VLAN Mask Mux x - When selected by the VLAN lookup table entry FwdUnRegIdx or FwdAllRegIdx is used as the FwdUnRegMask or FwdUnRegMask values anded with the member list to determine the forwarding of packets. The Value of vlan_mask_mux_0 is read only and set to all ones for all ports.

11.2.1.6.648 ALE_I1_ALE_MSK_MUX1_1 Register (Offset = 0003E0C8h) [Reset = 00000000h]

ALE_I1_ALE_MSK_MUX1_1 is shown in Table 11-947.

Return to the Summary Table.

VLAN Mask Mux x - The ALE Mask Mux registers are used along with the VLAN registered/unregistered index selectors from the Lookup Table to determine the value for vlan registered and unregister mask respectively.

Table 11-947. ALE_I1_ALE_MSK_MUX1_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	I1_REG_VLAN_MASK_MUX_1	R/W	0h	VLAN Mask Mux x - When selected by the VLAN lookup table entry FwdUnRegIdx or FwdAllRegIdx is used as the FwdUnRegMask or FwdUnRegMask values anded with the member list to determine the forwarding of packets. The Value of vlan_mask_mux_0 is read only and set to all ones for all ports.

11.2.1.6.649 ALE_I1_ALE_MSK_MUX1_2 Register (Offset = 0003E0CCh) [Reset = 00000000h]

ALE_I1_ALE_MSK_MUX1_2 is shown in Table 11-948.

Return to the Summary Table.

VLAN Mask Mux x - The ALE Mask Mux registers are used along with the VLAN registered/unregistered index selectors from the Lookup Table to determine the value for vlan registered and unregister mask respectively.

Table 11-948. ALE_I1_ALE_MSK_MUX1_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	I1_REG_VLAN_MASK_MUX_1	R/W	0h	VLAN Mask Mux x - When selected by the VLAN lookup table entry FwdUnRegIdx or FwdAllRegIdx is used as the FwdUnRegMask or FwdUnRegMask values anded with the member list to determine the forwarding of packets. The Value of vlan_mask_mux_0 is read only and set to all ones for all ports.

11.2.1.6.650 ALE_EGRESSOP Register (Offset = 0003E0FCh) [Reset = 000XXXXXh]

ALE_EGRESSOP is shown in Table 11-949.

Return to the Summary Table.

The Egress Operation register allows enabled classifiers with any match like IPSA or IPDA match to use the CPSW Egress Packet Operations Inter VLAN Routing sub functions. If the packet was destined for the host or is destined to any port without any errors, but matches a clasifier that has a programmed egress opcode, it will be forwarded to the destination ports where the destination ports will use the thier egress opcode entry to modify the packet. InterVLAN Routing and mirroring need to be understood, they are orthogonal functions. Care must be taken not to violate VLAN rules as this can redirect packets based on classifier matches.

Table 11-949. ALE_EGRESSOP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	EGRESS_OP	R/W	0h	The Egress Operation defines the operation performed by the CPSW Egress Packet Operations 0: NOP : 1-n: Defines which egress Operation will be performed. This allows Inter VLAN routing to be configured for high bandwidth traffic, reducing CPU load. 0xff: Swap SA and DA of packet, this is intended to allow OAM diagnostics for a link.
23-21	EGRESS_TRK	R/W	0h	The Egress Trunk Index is the calculated trunk index from the SA, DA or VLAN if modified to that InterVLAN routing will work on trunks as well. The DA, SA and VLAN are ignored for trunk generation on InterVLAN Routing so that this field is the index generated from the Egress Op replacements elclusive or'd together into a three bit index.
20	TTL_CHECK	R/W	0h	The TTL Check will cause any packet that fails TTL checks to not be routed to the Inter VLAN Routing sub functions. The packet will be routed to the host it was destined to.
19-2	RESERVED	R	0h	
1-0	DEST_PORTS	R/W	0h	The Destination Ports is a list of the ports the classified packet will be set to. If a destination is a Trunk, all the port bits for that trunck must be set.

11.2.1.6.651 ALE_POLICECFG0 Register (Offset = 0003E100h) [Reset = XXX0XXX0h]

ALE_POLICECFG0 is shown in Table 11-950.

Return to the Summary Table.

The Policing Config 0 holds the port, frame priority and ONU address index as well as match enables for port, frame priority and ONU address matching.

Table 11-950. ALE_POLICECFG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PORT_MEN	R/W	0h	Port Match Enable - Enabled port match for the selected policing/ classifier entry
30	TRUNKID	R/W	0h	Trunk ID - When set indicates the port number is a trunk group.
29-26	RESERVED	R	0h	
25	PORT_NUM	R/W	0h	Port Number - Specifies the port address to match for the selected policing/classifier entry
24-20	RESERVED	R	0h	
19	PRI_MEN	R/W	0h	Priority Match Enable - Enables frame priority match for the selected policing/classifier entry
18-16	PRI_VAL	R/W	0h	Priority Value - Specifies the frame priority to match for the selected policing/classifier entry
15	ONU_MEN	R/W	0h	OUI Match Enable - Enables frame ONU address match for the selected policing/classifier entry
14-5	RESERVED	R	0h	
4-0	ONU_INDEX	R/W	0h	OUI Table Entry Index - Specifies the ALE ONU address lookup table index to match for the selected policing/classifier entry

11.2.1.6.652 ALE_POLICECFG1 Register (Offset = 0003E104h) [Reset = XXX0XXX0h]

ALE_POLICECFG1 is shown in Table 11-951.

Return to the Summary Table.

The Policing Config 1 holds the match enable/match index for the L2 Destination and L2 source addresses

Table 11-951. ALE_POLICECFG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DST_MEN	R/W	0h	Destination Address Match Enable - Enables frame L2 destination address match for the selected policing/classifier entry
30-21	RESERVED	R	0h	
20-16	DST_INDEX	R/W	0h	Destination Address Table Entry Index - Specifies the ALE L2 destination address lookup table index to match for the selected policing/classifier entry
15	SRC_MEN	R/W	0h	Source Address Match Enable - Enables frame L2 source address match for the selected policing/classifier entry
14-5	RESERVED	R	0h	
4-0	SRC_INDEX	R/W	0h	Source Address Table Entry Index - Specifies the ALE L2 source address lookup table index to match for the selected policing/ classifier entry

11.2.1.6.653 ALE_POLICECFG2 Register (Offset = 0003E108h) [Reset = XXX0XXX0h]

ALE_POLICECFG2 is shown in Table 11-952.

Return to the Summary Table.

The Policing Config 2 holds the match enable/match index for the Outer VLAN and Inner VLAN addresses

Table 11-952. ALE_POLICECFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	OVLAN_MEN	R/W	0h	Outer VLAN Match Enable - Enables frame Outer VLAN address match for the selected policing/classifier entry
30-21	RESERVED	R	0h	
20-16	OVLAN_INDEX	R/W	0h	Outer VLAN Table Entry Index - Specifies the ALE Outer VLAN address lookup table index to match for the selected policing/ classifier entry Note this index assumes the VLANID is in the packet, it does not use the port VLAN if the packet in untagged or priority tagged.
15	IVLAN_MEN	R/W	0h	Inner VLAN Match Enable - Enables frame Inner VLAN address match for the selected policing/classifier entry
14-5	RESERVED	R	0h	
4-0	IVLAN_INDEX	R/W	0h	Inner VLAN Table Entry Index - Specifies the ALE Inner VLAN address lookup table index to match for the selected policing/ classifier entry Note this index assumes the VLANID is in the packet, it does not use the port VLAN if the packet in untagged or priority tagged.

11.2.1.6.654 ALE_POLICECFG3 Register (Offset = 0003E10Ch) [Reset = XXX0XXX0h]

ALE_POLICECFG3 is shown in Table 11-953.

Return to the Summary Table.

The Policing Config 3 holds the match enable/match index for the Ether Type and IP Source address

Table 11-953. ALE_POLICECFG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ETHERTYPE_MEN	R/W	0h	EtherType Match Enable - Enables frame Ether Type match for the selected policing/classifier entry
30-21	RESERVED	R	0h	
20-16	ETHERTYPE_INDEX	R/W	0h	EtherType Table Entry Index - Specifies the ALE Ether Type lookup table index to match for the selected policing/classifier entry
15	IPSRC_MEN	R/W	0h	IP Source Address Match Enable - Enables frame IP Source address match for the selected policing/classifier entry
14-5	RESERVED	R	0h	
4-0	IPSRC_INDEX	R/W	0h	IP Source Address Table Entry Index - Specifies the ALE IP Source address lookup table index to match for the selected policing/classifier entry

11.2.1.6.655 ALE_POLICECFG4 Register (Offset = 0003E110h) [Reset = XXX0XXXXh]

ALE_POLICECFG4 is shown in Table 11-954.

Return to the Summary Table.

The Policing Config 4 holds the match enable/match index for the IP Destination address

Table 11-954. ALE_POLICECFG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPDST_MEN	R/W	0h	IP Destination Address Match Enable - Enables frame IP Destination address match for the selected policing/classifier entry
30-21	RESERVED	R	0h	
20-16	IPDST_INDEX	R/W	0h	IP Destination Address Table Entry Index - Specifies the ALE IP Destination address lookup table index to match for the selected policing/classifier entry
15-0	RESERVED	R	0h	

11.2.1.6.656 ALE_POLICECFG6 Register (Offset = 0003E118h) [Reset = 00000000h]

ALE_POLICECFG6 is shown in Table 11-955.

Return to the Summary Table.

The PIR counter is a 37 bit internal counter where ~ipir_idle_inc_val is added every clock and the frame size << 18 is subtracted at EOF if not RED at LUT time. If the counter is negative the packet will be marked RED, else it can be YELLOW or GREEN based on the CIR counter. If only this counter is used (aka cir_idle_inc_val==0) Packet are marked RED or GREEN based on PIR counter only.

Table 11-955. ALE_POLICECFG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	PIR_IDLE_INC_VAL	R/W	0h	Peak Information Rate Idle Increment Value - The number added to the PIR counter every clock cycle. If zero the PIR counter is disabled and packets will never be marked or processed as RED.

11.2.1.6.657 ALE_POLICECFG7 Register (Offset = 0003E11Ch) [Reset = 00000000h]

ALE_POLICECFG7 is shown in Table 11-956.

Return to the Summary Table.

The CIR counter is a 37 bit internal counter where ~icir_idle_inc_val is added every clock and the frame size << 18 is subtracted at EOF if not RED or YELLOW at LUT time. If the counter is positive the packet will be marked GREEN, else it can be YELLOW or RED based on the PIR counter. If only this counter is used (aka pir_idle_inc_val==0) Packet are marked YELLOW or GREEN based on CIR counter only.

Table 11-956. ALE_POLICECFG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CIR_IDLE_INC_VAL	R/W	0h	Committed Information Idle Increment Value - The number added to the CIR counter every clock cycle. If zero the CIR counter is disabled and packets will never be marked or processed as YELLOW.

11.2.1.6.658 ALE_POLICETBLCTL Register (Offset = 0003E120h) [Reset = XXXXXXXXh]

ALE_POLICETBLCTL is shown in Table 11-957.

Return to the Summary Table.

The Policing Table Control is used to read or write the selected policing/classifier entry. The selected policing/classifier entry is only read or written after this register is written based on the value of the ~iwrite_enable bit.

Table 11-957. ALE_POLICETBLCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	WRITE_ENABLE	R/W	0h	Write Enable - Setting this bit will write the POLICECFG0-7 to the ~ipol_tbl_idx selected policing/classifier entry. Clearing this bit will read the ~ipol_tbl_idx selected policing/classifier entry into the POLICECFG0-7 registers.
30-2	RESERVED	R	0h	
1-0	POL_TBL_IDX	R/W	0h	Policer Entry Index - This field specifies the policing/classifier entry to be read or written. When writing to this field without setting the ~iwrite_enable=1 will cause the selected policing/classifier entry to be loaded into the POLICECFG0-7 registers. When writing to this field with setting the ~iwrite_enable=1 will cause the selected policing/classifier entry to be updated from the POLICECFG0-7 registers.

11.2.1.6.659 ALE_POLICECONTROL Register (Offset = 0003E124h) [Reset = XX0XXXXXh]

ALE_POLICECONTROL is shown in Table 11-958.

Return to the Summary Table.

The Control Enables color marking as well as internal ALE packet dropping rules.

Table 11-958. ALE_POLICECONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	POLICING_EN	R/W	0h	Policing Enable - Enables the policing to color the packets, this also enables red or yellow drop capabilities.
30	RESERVED	R	0h	
29	RED_DROP_EN	R/W	0h	RED Drop Enable - Enables the ALE to drop the red colored packets.
28	YELLOW_DROP_EN	R/W	0h	WELLOW Drop Enable - Enables the ALE to drop yellow packets based on the ~iyellowthresh value. This field would normally not be used as to let the switch drop packets at a buffer threshold instead. In the event that the switch does not enable buffer threshold dropping, YELLOW packets can be dropped based on this feature.
27	RESERVED	R	0h	
26-24	YELLOWTHRESH	R/W	0h	Yellow Threshold - When set enables a portion of the yellow packets to be dropped based on the ~iyellow_drop_en enable. 0- 100% 1= 50% 2- 33% 3- 25% 4= 20% 5- 17% 6- 14% 7- 13%
23-22	POLMCHMODE	R/W	0h	Policing Match Mode - This field determines what happens to packets that fail to hit any policing/classifier entry. 0 - No Hit packets are marked GREEN 1 - No Hit packets are marked YELLOW 2 - No Hit packets are marked RED 3 - No Hit packets are marked based on policing/classifier entry=0 state.
21	PRIORITY_THREAD_EN	R/W	0h	Priority Thread Enable - This field determines if priority is OR'd to the default thread when no classifiers hit and the default thread is enabled.
20	MAC_ONLY_DEF_DIS	R/W	0h	MAC Only Default Disable - This field when set disables the default thread on MAC Only Ports. That is the default thread will be {port,priority}. If the traffic matches a classifier with a thread mapping, the classifier thread mapping still occurs.
19-0	RESERVED	R	0h	

11.2.1.6.660 ALE_POLICETESTCTL Register (Offset = 0003E128h) [Reset = 0XXXXXXXh]

ALE_POLICETESTCTL is shown in Table 11-959.

Return to the Summary Table.

The Policing Test Control enables the ability to determine which policing entry has been hit and whether they reported a red or yellow rate condition.

Table 11-959. ALE_POLICETESTCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	POL_CLRALL_HIT	R/W	0h	Policer Clear - This bit clears all the policing/classifier hit bits. This bit is self clearing. This can be used to test the fact that a policing/classifier entry has been hit.
30	POL_CLRALL_REDHIT	R/W	0h	Policer Clear RED - This bit clears all the policing/classifier RED hit bits. This bit is self clearing. This can be used to test the fact that a policing/classifier entry has been hit during a RED condition.
29	POL_CLRALL_YELLOWHIT	R/W	0h	Policer Clear YELLOW - This bit clears all the policing/classifier YELLOW hit bits. This bit is self clearing. This can be used to test the fact that a policing/classifier entry has been hit during a YELLOW condition.
28	POL_CLRSEL_ALL	R/W	0h	Police Clear Selected - This bit clears the selected policing/classifier hit, redhit and yellowhit bits. This bit is self clearing.
27-2	RESERVED	R	0h	
1-0	POL_TEST_IDX	R/W	0h	Policer Test Index - This field selects which policing/classifier hit bits will be read or written.

11.2.1.6.661 ALE_POLICEHSTAT Register (Offset = 0003E12Ch) [Reset = XXXXXXXXh]

ALE_POLICEHSTAT is shown in Table 11-960.

Return to the Summary Table.

The policing hit status is a read only register that reads the hit bits of the selected policing/classifier.

Table 11-960. ALE_POLICEHSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	POL_HIT	R	0h	Policer Hit - This indicates that the selected policing/classifier via the ~ipol_test_idx field has been hit by a packet seen on any port that matches the policing/classifier entry match.
30	POL_REDHIT	R	0h	Policer Hit RED - This indicates that the selected policing/classifier via the ~ipol_test_idx field has been hit during a RED condition by a packet seen on any port that matches the policing/classifier entry match.
29	POL_YELLOWHIT	R	0h	Policer Hit YELLOW - This indicates that the selected policing/classifier via the ~ipol_test_idx field has been hit during a YELLOW condition by a packet seen on any port that matches the policing/classifier entry match.
28-0	RESERVED	R	0h	

11.2.1.6.662 ALE_THREADMAPDEF Register (Offset = 0003E134h) [Reset = 0000XXX0h]

ALE_THREADMAPDEF is shown in Table 11-961.

Return to the Summary Table.

The THREAD Mapping Default Value register is used to set the default thread ID when no classifier is matched,

Table 11-961. ALE_THREADMAPDEF Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15	DEFTHREAD_EN	R/W	0h	Default Tread Enable - When set the switch will use the ~idefthreadval for the host interface thread ID if no classifier is matched. If clear the switch will generate its own thread ID based on port and priority if there is no classifier match.
14-6	RESERVED	R	0h	
5-0	DEFTHREADVAL	R/W	0h	Default Thread Value - This field specifies the default thread ID value.

11.2.1.6.663 ALE_THREADMAPCTL Register (Offset = 0003E138h) [Reset = 00000000h]

ALE_THREADMAPCTL is shown in Table 11-962.

Return to the Summary Table.

The THREAD Mapping Control register allows the highest matched classifier to return a particular thread ID for traffic sent to the host. This allows particular classifier matched traffic to be placed an a particular hosts queue.

Table 11-962. ALE_THREADMAPCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	CLASSINDEX	R/W	0h	Classifier Index - This is the classifier index entry that the thread enable and thread value will be read or written by the ~bTHREADMAPVAL register.

11.2.1.6.664 ALE_THREADMAPVAL Register (Offset = 0003E13Ch) [Reset = 0000XXX0h]

ALE_THREADMAPVAL is shown in Table 11-963.

Return to the Summary Table.

The THREAD Mapping Value register is used to set the thread ID for a particular classifier entry.

Table 11-963. ALE_THREADMAPVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15	THREAD_EN	R/W	0h	Thread Enable - When set the switch will use the ~ithreadval for the selected classifier match. If clear the the thread ID will be determined by the ~bTHREADMAPDEF register settings.
14-6	RESERVED	R	0h	
5-0	THREADVAL	R/W	0h	Thread Value - This field is the thread ID value that is used to map a classifier hit to thread ID for host traffic.

11.2.1.6.665 rev Register (Offset = 0003F000h) [Reset = 66A03A01h]

rev is shown in Table 11-964.

Return to the Summary Table.

Revision parameters

Table 11-964. rev Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	scheme	R	1h	Scheme
29-28	bu	R	2h	bu
27-16	module_id	R	6A0h	Module ID
15-11	revrtl	R	7h	RTL version
10-8	revmaj	R	2h	Major version
7-6	custom	R	0h	Custom version
5-0	revmin	R	1h	Minor version

11.2.1.6.666 vector Register (Offset = 0003F008h) [Reset = 0000XX00h]

vector is shown in Table 11-965.

Return to the Summary Table.

ECC Vector Register

Table 11-965. vector Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	RESERVED	R	0h	
24	rd_svbus_done	R/W1C	0h	Status to indicate if read on serial VBUS is complete, write of any value will clear this bit.
23-16	rd_svbus_address	R/W	0h	Read address
15	rd_svbus	R/W1S	0h	Write 1 to trigger a read on the serial VBUS
14-11	RESERVED	R	0h	
10-0	ecc_vector	R/W	0h	Value written to select the corresponding ECC RAM for control or status

11.2.1.6.667 stat Register (Offset = 0003F00Ch) [Reset = 00000005h]

stat is shown in Table 11-966.

Return to the Summary Table.

Misc Status

Table 11-966. stat Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R	0h	
10-0	num_rams	R	5h	Indicates the number of RAMS serviced by the ECC aggregator

11.2.1.6.668 ECC_reserved_svbus_0 Register (Offset = 0003F010h) [Reset = 00000000h]

ECC_reserved_svbus_0 is shown in Table 11-967.

Return to the Summary Table.

Reference other documents that contain the ECC RAM wrapper and EDC controller serial vbus register sets.

Table 11-967. ECC_reserved_svbus_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	data	R/W	0h	Serial VBUS register data

11.2.1.6.669 ECC_reserved_svbus_1 Register (Offset = 0003F014h) [Reset = 00000000h]

ECC_reserved_svbus_1 is shown in Table 11-968.

Return to the Summary Table.

Reference other documents that contain the ECC RAM wrapper and EDC controller serial vbus register sets.

Table 11-968. ECC_reserved_svbus_1 Register Field Descriptions

11.2.2 LVDS

11.2.2.1 LVDS Overview

The LVDS interface includes the following signals:

- LVDS bit clock
- LVDS data lanes (the HSI integration chapter specific to the device lists the number of available lanes specific to the device)
- LVDS frame clock
- LVDS data_valid signal

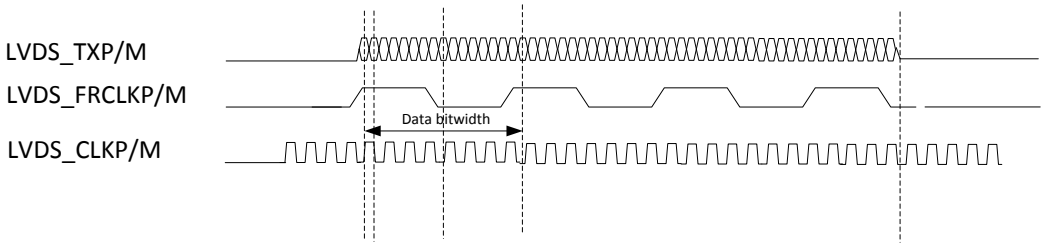

Figure 11-165. LVDS Interface Timings

The LVDS interface supports the following data rates(only DDR mode is supported):

- 900 Mbps (450-MHz DDR Clock)
- 600 Mbps (300-MHz DDR Clock)
- 450 Mbps (225-MHz DDR Clock)
- 400 Mbps (200-MHz DDR Clock)
- 300 Mbps (150-MHz DDR Clock)
- 225 Mbps (112.5-MHz DDR Clock)
- 150 Mbps (75-MHz DDR Clock)

Refer to the device data sheet for more details.

11.2.2.2 LVDS Programming Sequence

The following sections show the programming sequence needed before the hardware triggers are generated to initiate the high-speed LVDS data transmission.

11.2.2.2.1 LVDS Global Initialization

Table 11-987. Main Sequence – TOP_CTRL and Global Configuration

Steps	Register/Bit Field/Programming	Value
Power on the LVDS I/Os	MSS_TOP_CTRL. LVDS_PAD_CTRL0 MSS_TOP_CTRL. LVDS_PAD_CTRL1	0x0 0x0
Power off the LVDS I/Os	MSS_TOP_CTRL. LVDS_PAD_CTRL0 MSS_TOP_CTRL. LVDS_PAD_CTRL1	0x39393939 0x01003939
Power on the LVDS I/Os	MSS_TOP_CTRL. LVDS_PAD_CTRL0 MSS_TOP_CTRL. LVDS_PAD_CTRL1	0x0 0x0

11.2.2.2.2 CBUFF Configuration

Table 11-988. Main Sequence – CBUFF LVDS Static Configuration

Steps	Register/Bit Field/Programming	Value
Assert the CBUFF soft reset	CONFIG_REG_0.CSWCRST	0x1
Configure CBUFF for LVDS data transfer	CONFIG_REG_0.CFG_1LVDS_0CSI	0x1

Table 11-988. Main Sequence – CBUFF LVDS Static Configuration (continued)

Steps	Register/Bit Field/Programming	Value
Configure static values for LVDS	CONFIG_REG_0.CVC0EN	
	CFG_SPHDR_ADDRESS	0x55555555
	CFG_CMD_VSVAL	0x55555555
	CFG_CMD_VEVAL	0xAAAAAAAA
	CFG_LPHDR_ADDRESS	0xAAAAAAAA
	CFG_LVDS_GEN_0.CCSMEN	0x1
Configure the number of chirps in a frame	CFG_CHIRPS_PER_FRAME	X
Configure static values for LVDS based on LVDS CRC enabled or disabled	CFG_LVDS_GEN_0.CBCRCEN CFG_CMD_HEVAL CFG_CMD_HSVAL	X
Enable the LVDS lanes	CFG_LVDS_GEN_0.CFG_LVDS_LANE[X]_EN	0x1
Configure the alignment for start of samples	CFG_LVDS_GEN_0.CPOSSEL	0x-
Configure the LVDS FIFO initial threshold	CFG_LVDS_GEN_0.CFDLY	0x8
Set the 3C3L mode if the system configuration is interleaved 3 channel – 3 lane	CFG_LVDS_GEN_1.C3C3L	0x-
Configure the lane-mapping format registers	CFG_LVDS_MAPPING_LANE[X]_FMT_0 CFG_LVDS_MAPPING_LANE[X]_FMT_1	X
Release the CBUFF from soft reset	CONFIG_REG_0.CSWCRST	0x0

The configuration in Table 11-989 should be performed for each linklist entry required to transmit the LVDS packet.

Table 11-989. Main Sequence – CBUFF Linklist

Steps	Register/Bit Field/Programming	Value
Set the valid for the linklist	CFG_DATA_LL[X].LL[X]_VALID	0x1
If the linklist is the start of a new LVDS packet	CFG_DATA_LL[X].LL[X]_LPHDR_EN CFG_DATA_LL[X].LL[X]_HS	0x-
Configure the long packet header to static value for LVDS	CFG_DATA_LL[X]_LPHDR_VAL	0xBBBBBBBB
If the linklist is the end of a LVDS packet	CFG_DATA_LL[X].LL[X]_HE	0x-
Configure the size in CBUFF units	CFG_DATA_LL[X].LL[X]_SIZE	X
Configure the format of the CSI2 packet to which the linklist belongs	CFG_DATA_LL[X].LL[X]_FMT	X
Select the LVDS format-mapping register for the LVDS packet	CFG_DATA_LL[X].LL[X]_FMT_MAP	0x-
Set the input format	CFG_DATA_LL[X].LL[X]_FMT_IN	X
Set the Linklist write threshold	CFG_DATA_LL[X]_THRESHOLD.LL[X]_WR_THRESHOLD	X
Set the Linklist read threshold	CFG_DATA_LL[X]_THRESHOLD.LL[X]_WR_THRESHOLD	X

11.2.2.3 CBUFF and LVDS Registers

11.2.2.3.1 DSS_CBUFF Registers

Table 11-990 lists the memory-mapped registers for the DSS_CBUFF registers. All register offset addresses not listed in Table 11-990 should be considered as reserved locations and the register contents should not be modified.

Table 11-990. DSS_CBUFF Registers

Complex bit access types are encoded to fit into small table cells. Table 11-991 shows the codes that are used for access types in this section.

Table 11-991. DSS_CBUFF Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

11.2.2.3.1.1 CONFIG_REG_0 Register (Offset = 0h) [Reset = 00000000h]

CONFIG_REG_0 is shown in Table 11-992.

Return to the Summary Table.

Basic Config register

Table 11-992. CONFIG_REG_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	dbussel	R/W	0h	TI Internal feature. 1 : This selects the debug bus mode transmission on LVDS
27	cswcrst	R/W	0h	CBUFF controller SW Reset 1 => RESET the CBUFF Controller 0 => RELEASE RESET for CBUFF Controller
26	cswlrst	R/W	0h	TI Internal Feature. LVDS logic SW Reset. Debug feature. 1 => RESET the FSM 0 => RELEASE RESET
25	CFG_FRAME_START_TRIG	SW Trigger generation : Write 1 to this bit to generate a Frame Start SW Trigger		
24	CFG_CHIRP_AVAIL_TRIG	SW Trigger generation : Write 1 to this bit to generate a Chirp Available SW Trigger		
23-20	CFG_VBUSP_BURST_EN	R/W	0h	TI Internal Feature. Only required for 900 Mbps 4 lane trasnmission CSI2 only Programming : 0xA : Burst Enable. Set this only for transmission at 900 Mbps Others : Burst disable.
19	dbusen	R/W	0h	TC2 Mode selection. TI Internal feature. 0 : Normal 1 : When in TC2 mode, setting this bit will enable debug bus to sent via LVDS
18	ccfwpen	R/W	0h	TI Internal Feature. Debug only. CSI2 only Programming : CFG_CSI2_FIFO_WORDS_PROCESSING_EN 0 : Use the fifo_free_words directly from CSI2 by vbusp_mstr to decide how many more words to send. 1 : Process the fifo_free_words and use it by vbusp_mstr to decide how many more words to send.
17-16	cvc3en	R/W	0h	CSI2 only Programming : 0 : No Vsync packet is sent at Frame boundary 1 : A VSYNC Start packet on Virtual Channel 3 is generated at beginning of Frame 2 : A VSYNC End packet on Virtual Channel 3 is generated at end of Frame 3 : A VSYNC Start packet on Virtual Channel 3 is generated at beginning of Frame and a VSYNC End packet on Virtual Channel 3 is generated at end of Frame

Table 11-992. CONFIG_REG_0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-14	cvc2en	R/W	0h	CSI2 only Programming : 0 : No Vsync packet is sent at Frame boundary 1 : A VSYNC Start packet on Virtual Channel 2 is generated at beginning of Frame 2 : A VSYNC End packet on Virtual Channel 2 is generated at end of Frame 3 : A VSYNC Start packet on Virtual Channel 2 is generated at beginning of Frame and a VSYNC End packet on Virtual Channel 2 is generated at end of Frame
13-12	cvc1en	R/W	0h	CSI2 only Programming : 0 : No Vsync packet is sent at Frame boundary 1 : A VSYNC Start packet on Virtual Channel 1 is generated at beginning of Frame 2 : A VSYNC End packet on Virtual Channel 1 is generated at end of Frame 3 : A VSYNC Start packet on Virtual Channel 1 is generated at beginning of Frame and a VSYNC End packet on Virtual Channel 1 is generated at end of Frame
11-10	cvc0en	R/W	0h	CSI2 only Programming : 0 : No Vsync packet is sent at Frame boundary 1 : A VSYNC Start packet on Virtual Channel 0 is generated at beginning of Frame 2 : A VSYNC End packet on Virtual Channel 0 is generated at end of Frame 3 : A VSYNC Start packet on Virtual Channel 0 is generated at beginning of Frame and a VSYNC End packet on Virtual Channel 0 is generated at end of Frame
9	crdthsel	R/W	0h	TI Internal Feature. Debug only. CSI2 only Programming : CFG_RDTHRESHOLD_SEL . This is a Debug feature. Not requred in Programming model 0 : The read threshold is selected based on the Write Side parsing engine 1 : The read threshold is selected based on the Read Side parsing engine.
8	ccfwlen	R/W	0h	TI Internal Feature. Debug only. CSI2 only Programming : CFG_CSI2_FIFO_WORDS_LOAD_SW_EN. This is a Debug feature. Not requred in Programming model When CFG_CSI2_FIFO_WORDS_PROCESSING_EN==1 and CFG_CSI2_FIFO_WORDS_LOAD_SW_EN==1, then a fixed fifo_free_words from CSI2 is not used. Program the CFG_FIFO_FREE_THRESHOLD0 to 0x4
7-4	NU1	R	0h	
3	CFG_SW_TRIG_EN	R/W	0h	Select Chirp Available Trigger Source 0 : Chirp Available trigger will be generated by HW 1 : Chirp Available trigger will be generated by SW
2	cftrigen	R/W	0h	Select Frame Start Trigger Source 0 : Frame trigger will be generated by HW 1 : Frame trigger will be generated by SW
1	CFG_ECC_EN	R/W	0h	0 : Disable ECC on the CBUF FIFO 1 : Enable ECC on the CBUF FIFO
0	CFG_1LVDS_0CSI	R/W	0h	0 : Send data over CSI-2 1 : Send data over LVDS

11.2.2.3.1.2 CFG_SPHDR_ADDRESS Register (Offset = 4h) [Reset = 00000000h]

CFG_SPHDR_ADDRESS is shown in Table 11-993.

Return to the Summary Table.

Short Packet Header Address

Table 11-993. CFG_SPHDR_ADDRESS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_SPHDR_ADDRESS	R/W	0h	CSI2 Programming : Configure the CSI_PROTOCOL_ENGINE__CSI_VC_SHORT_PACKET_HEADER Address in the CSI Protocol Engine LVDS Programming : Configure with the static value : 0x55555555

11.2.2.3.1.3 CFG_CMD_HSVAL Register (Offset = 8h) [Reset = 00000000h]

CFG_CMD_HSVAL is shown in Table 11-994.

Return to the Summary Table.

HSYNC Value

Table 11-994. CFG_CMD_HSVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_CMD_HSVAL	R/W	0h	CSI2 Programming : Configure the HSync Start Short Packet Value LVDS Programming : If LVDS CRC is enabled : Configure with the static value : 0x55555555 If LVDS CRC is disbaled : Configure with the static value : 0xAAAAAAAA

11.2.2.3.1.4 CFG_CMD_HEVAL Register (Offset = Ch) [Reset = 00000000h]

CFG_CMD_HEVAL is shown in Table 11-995.

Return to the Summary Table.

HEND Value

Table 11-995. CFG_CMD_HEVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_CMD_HEVAL	R/W	0h	CSI2 Programming : Configure the HSync End Short Packet Value LVDS Programming : If LVDS CRC is enabled : Configure with the static value : 0x33333333 If LVDS CRC is disbaled : Configure with the static value : 0xAAAAAAAA

11.2.2.3.1.5 CFG_CMD_VSVAL Register (Offset = 10h) [Reset = 00000000h]

CFG_CMD_VSVAL is shown in Table 11-996.

Return to the Summary Table.

VSYNC Value

Table 11-996. CFG_CMD_VSVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_CMD_VSVAL	R/W	0h	CSI2 Programming : Configure the VSync Start Short Packet Value LVDS Programming : Configure with the static value : 0xAAAAAAAA

11.2.2.3.1.6 CFG_CMD_VEVAL Register (Offset = 14h) [Reset = 00000000h]

CFG_CMD_VEVAL is shown in Table 11-997.

Return to the Summary Table.

VEND Value

Table 11-997. CFG_CMD_VEVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_CMD_VEVAL	R/W	0h	CSI2 Programming : Configure the VSync End Short Packet Value LVDS Programming : Configure with the static value : 0xAAAAAAAA

11.2.2.3.1.7 CFG_LPHDR_ADDRESS Register (Offset = 18h) [Reset = 00000000h]

CFG_LPHDR_ADDRESS is shown in Table 11-998.

Return to the Summary Table.

Long Packet Address

Table 11-998. CFG_LPHDR_ADDRESS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_LPHDR_ADDRESS	R/W	0h	CSI2 Programming : Configure the CSI_PROTOCOL_ENGINE__CSI_VC_LONG_PACKET_HEADER Address in the CSI Protocol Engine LVDS Programming : Configure with the static value : 0x55555555

11.2.2.3.1.8 CFG_CHIRPS_PER_FRAME Register (Offset = 20h) [Reset = 00000000h]

CFG_CHIRPS_PER_FRAME is shown in Table 11-999.

Return to the Summary Table.

Number of Chirps per Frame

Table 11-999. CFG_CHIRPS_PER_FRAME Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_CHIRPS_PER_FRAME	R/W	0h	Configure the number of Chirps in a Frame

11.2.2.3.1.9 CFG_FIFO_FREE_THRESHOLD Register (Offset = 24h) [Reset = 00000000h]

CFG_FIFO_FREE_THRESHOLD is shown in Table 11-1000.

Return to the Summary Table.

CSI2 FIFO threshold for transferring data from CBUFF to CSI2

Table 11-1000. CFG_FIFO_FREE_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	CFG_FIFO_FREE_THRESHOLD3	R/W	0h	TI Internal Feature CSI2 only Programming : Configure the threshold used to fill the FIFO3 in the CSI Protocol engine. CBUFF will send data to the Protocol Engine only if there is a larger number of Free slots that that configured in this register. By default, only 1 FIFO will be used so register programming is not Required in Programming model
23-16	CFG_FIFO_FREE_THRESHOLD2	R/W	0h	TI Internal Feature CSI2 only Programming : Configure the threshold used to fill the FIFO2 in the CSI Protocol engine. CBUFF will send data to the Protocol Engine only if there is a larger number of Free slots that that configured in this register. By default, only 1 FIFO will be used so register programming is not Required in Programming model
15-8	CFG_FIFO_FREE_THRESHOLD1	R/W	0h	TI Internal Feature CSI2 only Programming : Configure the threshold used to fill the FIFO1 in the CSI Protocol engine. CBUFF will send data to the Protocol Engine only if there is a larger number of Free slots that that configured in this register. By default, only 1 FIFO will be used so register programming is not Required in Programming model
7-0	CFG_FIFO_FREE_THRESHOLD0	R/W	0h	CSI2 only Programming : Configure the threshold used to fill the FIFO0 in the CSI Protocol engine. CBUFF will send data to the Protocol Engine only if there is a larger number of Free slots that that configured in this register

11.2.2.3.1.10 CFG_LPPYLD_ADDRESS Register (Offset = 28h) [Reset = 00000000h]

CFG_LPPYLD_ADDRESS is shown in Table 11-1001.

Return to the Summary Table.

Long payload Address

Table 11-1001. CFG_LPPYLD_ADDRESS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_LPPYLD_ADDRESS	R/W	0h	CSI2 only Programming : Configure the CSI_PROTOCOL_ENGINE__CSI_VC_LONG_PACKET_PAYLOAD Address in the CSI Protocol Engine

11.2.2.3.1.11 CFG_DELAY_CONFIG Register (Offset = 2Ch) [Reset = 00000000h]

CFG_DELAY_CONFIG is shown in Table 11-1002.

Return to the Summary Table.

Delay Config Registers

Table 11-1002. CFG_DELAY_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	NU	R	0h	
23-16	CFG_DATA_WR_DELAY	R/W	0h	TI Internal Feature CSI2 only Programming : Configure an additional delay after sending a Long packet Payload. This is a Debug feature. Not requred in Programming model
15-8	CFG_LPHDR_DELAY	R/W	0h	TI Internal Feature CSI2 only Programming : Configure an additional delay after sending a Long packet Header. This is a Debug feature. Not requred in Programming model
7-0	CFG_SPHDR_DELAY	R/W	0h	TI Internal Feature CSI2 only Programming : Configure an additional delay after sending a Short packet. This is a Debug feature. Not requred in Programming model

11.2.2.3.1.12 CFG_DATA_LL0 Register (Offset = 30h) [Reset = 00000000h]

CFG_DATA_LL0 is shown in Table 11-1003.

Return to the Summary Table.

Payload Description : Linked list entry 0

Table 11-1003. CFG_DATA_LL0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL0_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL0_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL0_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL0_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL0_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL0_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL0_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL0_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL0_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL0_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL0_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL0_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL0_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL0_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL0_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.13 CFG_DATA_LL0_LPHDR_VAL Register (Offset = 34h) [Reset = 00000000h]

CFG_DATA_LL0_LPHDR_VAL is shown in Table 11-1004.

Return to the Summary Table.

Payload Description : Linked list entry 0

Table 11-1004. CFG_DATA_LL0_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL0_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.14 CFG_DATA_LL0_THRESHOLD Register (Offset = 38h) [Reset = 0000X0X0h]

CFG_DATA_LL0_THRESHOLD is shown in Table 11-1005.

Return to the Summary Table.

Table 11-1005. CFG_DATA_LL0_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll0dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL0_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL0_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.15 CFG_DATA_LL1 Register (Offset = 3Ch) [Reset = 00000000h]

CFG_DATA_LL1 is shown in Table 11-1006.

Return to the Summary Table.

Table 11-1006. CFG_DATA_LL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL1_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL1_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL1_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL1_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL1_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL1_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL1_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL1_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL1_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL1_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL1_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL1_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL1_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL1_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL1_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.16 CFG_DATA_LL1_LPHDR_VAL Register (Offset = 40h) [Reset = 00000000h]

CFG_DATA_LL1_LPHDR_VAL is shown in Table 11-1007.

Return to the Summary Table.

Table 11-1007. CFG_DATA_LL1_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL1_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.17 CFG_DATA_LL1_THRESHOLD Register (Offset = 44h) [Reset = 0000X0X0h]

CFG_DATA_LL1_THRESHOLD is shown in Table 11-1008.

Return to the Summary Table.

Table 11-1008. CFG_DATA_LL1_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll1dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL1_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL1_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.18 CFG_DATA_LL2 Register (Offset = 48h) [Reset = 00000000h]

CFG_DATA_LL2 is shown in Table 11-1009.

Return to the Summary Table.

Table 11-1009. CFG_DATA_LL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL2_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL2_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL2_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL2_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL2_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL2_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL2_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL2_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL2_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL2_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL2_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL2_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL2_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL2_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL2_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.19 CFG_DATA_LL2_LPHDR_VAL Register (Offset = 4Ch) [Reset = 00000000h]

CFG_DATA_LL2_LPHDR_VAL is shown in Table 11-1010.

Return to the Summary Table.

Table 11-1010. CFG_DATA_LL2_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL2_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.20 CFG_DATA_LL2_THRESHOLD Register (Offset = 50h) [Reset = 0000X0X0h]

CFG_DATA_LL2_THRESHOLD is shown in Table 11-1011.

Return to the Summary Table.

Table 11-1011. CFG_DATA_LL2_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll2dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL2_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL2_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.21 CFG_DATA_LL3 Register (Offset = 54h) [Reset = 00000000h]

CFG_DATA_LL3 is shown in Table 11-1012.

Return to the Summary Table.

Table 11-1012. CFG_DATA_LL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL3_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL3_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL3_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL3_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL3_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL3_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL3_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL3_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL3_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL3_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL3_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL3_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL3_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL3_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL3_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.22 CFG_DATA_LL3_LPHDR_VAL Register (Offset = 58h) [Reset = 00000000h]

CFG_DATA_LL3_LPHDR_VAL is shown in Table 11-1013.

Return to the Summary Table.

Table 11-1013. CFG_DATA_LL3_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL3_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.23 CFG_DATA_LL3_THRESHOLD Register (Offset = 5Ch) [Reset = 0000X0X0h]

CFG_DATA_LL3_THRESHOLD is shown in Table 11-1014.

Return to the Summary Table.

Table 11-1014. CFG_DATA_LL3_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll3dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL3_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL3_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.24 CFG_DATA_LL4 Register (Offset = 60h) [Reset = 00000000h]

CFG_DATA_LL4 is shown in Table 11-1015.

Return to the Summary Table.

Table 11-1015. CFG_DATA_LL4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL4_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL4_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL4_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL4_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL4_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL4_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL4_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL4_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL4_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL4_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL4_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL4_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL4_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL4_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL4_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.25 CFG_DATA_LL4_LPHDR_VAL Register (Offset = 64h) [Reset = 00000000h]

CFG_DATA_LL4_LPHDR_VAL is shown in Table 11-1016.

Return to the Summary Table.

Table 11-1016. CFG_DATA_LL4_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL4_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.26 CFG_DATA_LL4_THRESHOLD Register (Offset = 68h) [Reset = 0000X0X0h]

CFG_DATA_LL4_THRESHOLD is shown in Table 11-1017.

Return to the Summary Table.

Table 11-1017. CFG_DATA_LL4_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll4dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL4_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL4_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.27 CFG_DATA_LL5 Register (Offset = 6Ch) [Reset = 00000000h]

CFG_DATA_LL5 is shown in Table 11-1018.

Return to the Summary Table.

Table 11-1018. CFG_DATA_LL5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL5_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL5_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL5_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL5_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL5_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL5_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL5_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL5_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL5_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL5_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL5_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL5_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL5_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL5_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL5_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.28 CFG_DATA_LL5_LPHDR_VAL Register (Offset = 70h) [Reset = 00000000h]

CFG_DATA_LL5_LPHDR_VAL is shown in Table 11-1019.

Return to the Summary Table.

Table 11-1019. CFG_DATA_LL5_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL5_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.29 CFG_DATA_LL5_THRESHOLD Register (Offset = 74h) [Reset = 0000X0X0h]

CFG_DATA_LL5_THRESHOLD is shown in Table 11-1020.

Return to the Summary Table.

Table 11-1020. CFG_DATA_LL5_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll5dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL5_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL5_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.30 CFG_DATA_LL6 Register (Offset = 78h) [Reset = 00000000h]

CFG_DATA_LL6 is shown in Table 11-1021.

Return to the Summary Table.

Table 11-1021. CFG_DATA_LL6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL6_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL6_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL6_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL6_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL6_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL6_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL6_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL6_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL6_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL6_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL6_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL6_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL6_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL6_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL6_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.31 CFG_DATA_LL6_LPHDR_VAL Register (Offset = 7Ch) [Reset = 00000000h]

CFG_DATA_LL6_LPHDR_VAL is shown in Table 11-1022.

Return to the Summary Table.

Table 11-1022. CFG_DATA_LL6_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL6_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.32 CFG_DATA_LL6_THRESHOLD Register (Offset = 80h) [Reset = 0000X0X0h]

CFG_DATA_LL6_THRESHOLD is shown in Table 11-1023.

Return to the Summary Table.

Table 11-1023. CFG_DATA_LL6_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll6dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL6_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL6_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.33 CFG_DATA_LL7 Register (Offset = 84h) [Reset = 00000000h]

CFG_DATA_LL7 is shown in Table 11-1024.

Return to the Summary Table.

Table 11-1024. CFG_DATA_LL7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL7_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL7_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL7_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL7_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL7_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL7_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL7_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL7_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL7_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL7_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL7_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL7_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL7_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL7_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL7_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.34 CFG_DATA_LL7_LPHDR_VAL Register (Offset = 88h) [Reset = 00000000h]

CFG_DATA_LL7_LPHDR_VAL is shown in Table 11-1025.

Return to the Summary Table.

Table 11-1025. CFG_DATA_LL7_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL7_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.35 CFG_DATA_LL7_THRESHOLD Register (Offset = 8Ch) [Reset = 0000X0X0h]

CFG_DATA_LL7_THRESHOLD is shown in Table 11-1026.

Return to the Summary Table.

Table 11-1026. CFG_DATA_LL7_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll7dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL7_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL7_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.36 CFG_DATA_LL8 Register (Offset = 90h) [Reset = 00000000h]

CFG_DATA_LL8 is shown in Table 11-1027.

Return to the Summary Table.

Table 11-1027. CFG_DATA_LL8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL8_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL8_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL8_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL8_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL8_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL8_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL8_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL8_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL8_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL8_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL8_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL8_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL8_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL8_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL8_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.37 CFG_DATA_LL8_LPHDR_VAL Register (Offset = 94h) [Reset = 00000000h]
