CFG_DATA_LL8_LPHDR_VAL is shown in Table 11-1028.

Return to the Summary Table.

Table 11-1028. CFG_DATA_LL8_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL8_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.38 CFG_DATA_LL8_THRESHOLD Register (Offset = 98h) [Reset = 0000X0X0h]

CFG_DATA_LL8_THRESHOLD is shown in Table 11-1029.

Return to the Summary Table.

Table 11-1029. CFG_DATA_LL8_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll8dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL8_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL8_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.39 CFG_DATA_LL9 Register (Offset = 9Ch) [Reset = 00000000h]

CFG_DATA_LL9 is shown in Table 11-1030.

Return to the Summary Table.

Table 11-1030. CFG_DATA_LL9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL9_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL9_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL9_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL9_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL9_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL9_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL9_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL9_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL9_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL9_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL9_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL9_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL9_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL9_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL9_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.40 CFG_DATA_LL9_LPHDR_VAL Register (Offset = A0h) [Reset = 00000000h]

CFG_DATA_LL9_LPHDR_VAL is shown in Table 11-1031.

Return to the Summary Table.

Table 11-1031. CFG_DATA_LL9_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL9_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.41 CFG_DATA_LL9_THRESHOLD Register (Offset = A4h) [Reset = 0000X0X0h]

CFG_DATA_LL9_THRESHOLD is shown in Table 11-1032.

Return to the Summary Table.

Table 11-1032. CFG_DATA_LL9_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll9dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL9_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL9_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.42 CFG_DATA_LL10 Register (Offset = A8h) [Reset = 00000000h]

CFG_DATA_LL10 is shown in Table 11-1033.

Return to the Summary Table.

Table 11-1033. CFG_DATA_LL10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL10_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL10_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL10_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL10_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL10_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL10_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL10_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL10_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL10_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL10_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL10_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL10_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL10_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL10_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL10_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.43 CFG_DATA_LL10_LPHDR_VAL Register (Offset = ACh) [Reset = 00000000h]

CFG_DATA_LL10_LPHDR_VAL is shown in Table 11-1034.

Return to the Summary Table.

Table 11-1034. CFG_DATA_LL10_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL10_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.44 CFG_DATA_LL10_THRESHOLD Register (Offset = B0h) [Reset = 0000X0X0h]

CFG_DATA_LL10_THRESHOLD is shown in Table 11-1035.

Return to the Summary Table.

Table 11-1035. CFG_DATA_LL10_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll10dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL10_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL10_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.45 CFG_DATA_LL11 Register (Offset = B4h) [Reset = 00000000h]

CFG_DATA_LL11 is shown in Table 11-1036.

Return to the Summary Table.

Table 11-1036. CFG_DATA_LL11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL11_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL11_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL11_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL11_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL11_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL11_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL11_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL11_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL11_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL11_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL11_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL11_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL11_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL11_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL11_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.46 CFG_DATA_LL11_LPHDR_VAL Register (Offset = B8h) [Reset = 00000000h]

CFG_DATA_LL11_LPHDR_VAL is shown in Table 11-1037.

Return to the Summary Table.

Table 11-1037. CFG_DATA_LL11_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL11_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.47 CFG_DATA_LL11_THRESHOLD Register (Offset = BCh) [Reset = 0000X0X0h]

CFG_DATA_LL11_THRESHOLD is shown in Table 11-1038.

Return to the Summary Table.

Table 11-1038. CFG_DATA_LL11_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll11dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL11_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL11_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.48 CFG_DATA_LL12 Register (Offset = C0h) [Reset = 00000000h]

CFG_DATA_LL12 is shown in Table 11-1039.

Return to the Summary Table.

Table 11-1039. CFG_DATA_LL12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL12_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL12_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL12_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL12_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL12_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL12_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL12_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL12_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL12_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL12_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL12_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL12_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL12_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL12_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL12_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.49 CFG_DATA_LL12_LPHDR_VAL Register (Offset = C4h) [Reset = 00000000h]

CFG_DATA_LL12_LPHDR_VAL is shown in Table 11-1040.

Return to the Summary Table.

Table 11-1040. CFG_DATA_LL12_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL12_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.50 CFG_DATA_LL12_THRESHOLD Register (Offset = C8h) [Reset = 0000X0X0h]

CFG_DATA_LL12_THRESHOLD is shown in Table 11-1041.

Return to the Summary Table.

Table 11-1041. CFG_DATA_LL12_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll12dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL12_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL12_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.51 CFG_DATA_LL13 Register (Offset = CCh) [Reset = 00000000h]

CFG_DATA_LL13 is shown in Table 11-1042.

Return to the Summary Table.

Table 11-1042. CFG_DATA_LL13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL13_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL13_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL13_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL13_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL13_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL13_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL13_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL13_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL13_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL13_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL13_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL13_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL13_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL13_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL13_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.52 CFG_DATA_LL13_LPHDR_VAL Register (Offset = D0h) [Reset = 00000000h]

CFG_DATA_LL13_LPHDR_VAL is shown in Table 11-1043.

Return to the Summary Table.

Table 11-1043. CFG_DATA_LL13_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL13_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.53 CFG_DATA_LL13_THRESHOLD Register (Offset = D4h) [Reset = 0000X0X0h]

CFG_DATA_LL13_THRESHOLD is shown in Table 11-1044.

Return to the Summary Table.

Table 11-1044. CFG_DATA_LL13_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll13dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL13_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL13_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.54 CFG_DATA_LL14 Register (Offset = D8h) [Reset = 00000000h]

CFG_DATA_LL14 is shown in Table 11-1045.

Return to the Summary Table.

Table 11-1045. CFG_DATA_LL14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL14_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL14_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL14_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL14_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL14_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL14_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL14_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL14_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL14_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL14_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL14_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL14_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL14_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL14_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL14_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.55 CFG_DATA_LL14_LPHDR_VAL Register (Offset = DCh) [Reset = 00000000h]

CFG_DATA_LL14_LPHDR_VAL is shown in Table 11-1046.

Return to the Summary Table.

Table 11-1046. CFG_DATA_LL14_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL14_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.56 CFG_DATA_LL14_THRESHOLD Register (Offset = E0h) [Reset = 0000X0X0h]

CFG_DATA_LL14_THRESHOLD is shown in Table 11-1047.

Return to the Summary Table.

Table 11-1047. CFG_DATA_LL14_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll14dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL14_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL14_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.57 CFG_DATA_LL15 Register (Offset = E4h) [Reset = 00000000h]

CFG_DATA_LL15 is shown in Table 11-1048.

Return to the Summary Table.

Table 11-1048. CFG_DATA_LL15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL15_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL15_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL15_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL15_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL15_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL15_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL15_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL15_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL15_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL15_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL15_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL15_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL15_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL15_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL15_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.58 CFG_DATA_LL15_LPHDR_VAL Register (Offset = E8h) [Reset = 00000000h]

CFG_DATA_LL15_LPHDR_VAL is shown in Table 11-1049.

Return to the Summary Table.

Table 11-1049. CFG_DATA_LL15_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL15_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.59 CFG_DATA_LL15_THRESHOLD Register (Offset = ECh) [Reset = 0000X0X0h]

CFG_DATA_LL15_THRESHOLD is shown in Table 11-1050.

Return to the Summary Table.

Table 11-1050. CFG_DATA_LL15_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll15dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL15_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL15_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.60 CFG_DATA_LL16 Register (Offset = F0h) [Reset = 00000000h]

CFG_DATA_LL16 is shown in Table 11-1051.

Return to the Summary Table.

Table 11-1051. CFG_DATA_LL16 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL16_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL16_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL16_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL16_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL16_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL16_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL16_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL16_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL16_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL16_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL16_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL16_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL16_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL16_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL16_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.61 CFG_DATA_LL16_LPHDR_VAL Register (Offset = F4h) [Reset = 00000000h]

CFG_DATA_LL16_LPHDR_VAL is shown in Table 11-1052.

Return to the Summary Table.

Table 11-1052. CFG_DATA_LL16_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL16_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.62 CFG_DATA_LL16_THRESHOLD Register (Offset = F8h) [Reset = 0000X0X0h]

CFG_DATA_LL16_THRESHOLD is shown in Table 11-1053.

Return to the Summary Table.

Table 11-1053. CFG_DATA_LL16_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll16dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL16_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL16_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.63 CFG_DATA_LL17 Register (Offset = FCh) [Reset = 00000000h]

CFG_DATA_LL17 is shown in Table 11-1054.

Return to the Summary Table.

Table 11-1054. CFG_DATA_LL17 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL17_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL17_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL17_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL17_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL17_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL17_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL17_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL17_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL17_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL17_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL17_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL17_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL17_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL17_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL17_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.64 CFG_DATA_LL17_LPHDR_VAL Register (Offset = 100h) [Reset = 00000000h]

CFG_DATA_LL17_LPHDR_VAL is shown in Table 11-1055.

Return to the Summary Table.

Table 11-1055. CFG_DATA_LL17_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL17_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.65 CFG_DATA_LL17_THRESHOLD Register (Offset = 104h) [Reset = 0000X0X0h]

CFG_DATA_LL17_THRESHOLD is shown in Table 11-1056.

Return to the Summary Table.

Table 11-1056. CFG_DATA_LL17_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll17dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL17_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL17_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.66 CFG_DATA_LL18 Register (Offset = 108h) [Reset = 00000000h]

CFG_DATA_LL18 is shown in Table 11-1057.

Return to the Summary Table.

Table 11-1057. CFG_DATA_LL18 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL18_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL18_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL18_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL18_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL18_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL18_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL18_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL18_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL18_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL18_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL18_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL18_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL18_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL18_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL18_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.67 CFG_DATA_LL18_LPHDR_VAL Register (Offset = 10Ch) [Reset = 00000000h]

CFG_DATA_LL18_LPHDR_VAL is shown in Table 11-1058.

Return to the Summary Table.

Table 11-1058. CFG_DATA_LL18_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL18_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.68 CFG_DATA_LL18_THRESHOLD Register (Offset = 110h) [Reset = 0000X0X0h]

CFG_DATA_LL18_THRESHOLD is shown in Table 11-1059.

Return to the Summary Table.

Table 11-1059. CFG_DATA_LL18_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll18dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL18_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL18_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.69 CFG_DATA_LL19 Register (Offset = 114h) [Reset = 00000000h]

CFG_DATA_LL19 is shown in Table 11-1060.

Return to the Summary Table.

Table 11-1060. CFG_DATA_LL19 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL19_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL19_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL19_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL19_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL19_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL19_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL19_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL19_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL19_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL19_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL19_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL19_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL19_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL19_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL19_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.70 CFG_DATA_LL19_LPHDR_VAL Register (Offset = 118h) [Reset = 00000000h]

CFG_DATA_LL19_LPHDR_VAL is shown in Table 11-1061.

Return to the Summary Table.

Table 11-1061. CFG_DATA_LL19_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL19_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.71 CFG_DATA_LL19_THRESHOLD Register (Offset = 11Ch) [Reset = 0000X0X0h]

CFG_DATA_LL19_THRESHOLD is shown in Table 11-1062.

Return to the Summary Table.

Table 11-1062. CFG_DATA_LL19_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll19dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL19_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL19_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.72 CFG_DATA_LL20 Register (Offset = 120h) [Reset = 00000000h]

CFG_DATA_LL20 is shown in Table 11-1063.

Return to the Summary Table.

Table 11-1063. CFG_DATA_LL20 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL20_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL20_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL20_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL20_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL20_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL20_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL20_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL20_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL20_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL20_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL20_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL20_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL20_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL20_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL20_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.73 CFG_DATA_LL20_LPHDR_VAL Register (Offset = 124h) [Reset = 00000000h]

CFG_DATA_LL20_LPHDR_VAL is shown in Table 11-1064.

Return to the Summary Table.

Table 11-1064. CFG_DATA_LL20_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL20_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.74 CFG_DATA_LL20_THRESHOLD Register (Offset = 128h) [Reset = 0000X0X0h]

CFG_DATA_LL20_THRESHOLD is shown in Table 11-1065.

Return to the Summary Table.

Table 11-1065. CFG_DATA_LL20_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll20dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL20_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL20_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.75 CFG_DATA_LL21 Register (Offset = 12Ch) [Reset = 00000000h]

CFG_DATA_LL21 is shown in Table 11-1066.

Return to the Summary Table.

Table 11-1066. CFG_DATA_LL21 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL21_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL21_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL21_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL21_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL21_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL21_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL21_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL21_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL21_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL21_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL21_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL21_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL21_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL21_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL21_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.76 CFG_DATA_LL21_LPHDR_VAL Register (Offset = 130h) [Reset = 00000000h]

CFG_DATA_LL21_LPHDR_VAL is shown in Table 11-1067.

Return to the Summary Table.

Table 11-1067. CFG_DATA_LL21_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL21_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.77 CFG_DATA_LL21_THRESHOLD Register (Offset = 134h) [Reset = 0000X0X0h]

CFG_DATA_LL21_THRESHOLD is shown in Table 11-1068.

Return to the Summary Table.

Table 11-1068. CFG_DATA_LL21_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll21dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL21_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL21_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.78 CFG_DATA_LL22 Register (Offset = 138h) [Reset = 00000000h]

CFG_DATA_LL22 is shown in Table 11-1069.

Return to the Summary Table.

Table 11-1069. CFG_DATA_LL22 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL22_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL22_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL22_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL22_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL22_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL22_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL22_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL22_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL22_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL22_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL22_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL22_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL22_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL22_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL22_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.79 CFG_DATA_LL22_LPHDR_VAL Register (Offset = 13Ch) [Reset = 00000000h]

CFG_DATA_LL22_LPHDR_VAL is shown in Table 11-1070.

Return to the Summary Table.

Table 11-1070. CFG_DATA_LL22_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL22_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.80 CFG_DATA_LL22_THRESHOLD Register (Offset = 140h) [Reset = 0000X0X0h]

CFG_DATA_LL22_THRESHOLD is shown in Table 11-1071.

Return to the Summary Table.

Table 11-1071. CFG_DATA_LL22_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll22dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL22_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL22_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.81 CFG_DATA_LL23 Register (Offset = 144h) [Reset = 00000000h]

CFG_DATA_LL23 is shown in Table 11-1072.

Return to the Summary Table.

Table 11-1072. CFG_DATA_LL23 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL23_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model

29	LL23_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL23_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL23_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL23_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL23_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL23_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL23_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL23_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL23_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL23_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL23_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL23_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL23_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.82 CFG_DATA_LL23_LPHDR_VAL Register (Offset = 148h) [Reset = 00000000h]

CFG_DATA_LL23_LPHDR_VAL is shown in Table 11-1073.

Return to the Summary Table.

Table 11-1073. CFG_DATA_LL23_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL23_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.83 CFG_DATA_LL23_THRESHOLD Register (Offset = 14Ch) [Reset = 0000X0X0h]

CFG_DATA_LL23_THRESHOLD is shown in Table 11-1074.

Return to the Summary Table.

Table 11-1074. CFG_DATA_LL23_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll23dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL23_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL23_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.84 CFG_DATA_LL24 Register (Offset = 150h) [Reset = 00000000h]

CFG_DATA_LL24 is shown in Table 11-1075.

Return to the Summary Table.

Table 11-1075. CFG_DATA_LL24 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL24_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL24_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL24_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL24_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL24_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL24_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL24_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL24_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL24_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL24_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL24_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL24_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL24_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL24_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL24_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.85 CFG_DATA_LL24_LPHDR_VAL Register (Offset = 154h) [Reset = 00000000h]

CFG_DATA_LL24_LPHDR_VAL is shown in Table 11-1076.

Return to the Summary Table.

Table 11-1076. CFG_DATA_LL24_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL24_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.86 CFG_DATA_LL24_THRESHOLD Register (Offset = 158h) [Reset = 0000X0X0h]

CFG_DATA_LL24_THRESHOLD is shown in Table 11-1077.

Return to the Summary Table.

Table 11-1077. CFG_DATA_LL24_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll24dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL24_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL24_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.87 CFG_DATA_LL25 Register (Offset = 15Ch) [Reset = 00000000h]

CFG_DATA_LL25 is shown in Table 11-1078.

Return to the Summary Table.

Table 11-1078. CFG_DATA_LL25 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL25_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL25_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL25_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL25_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL25_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL25_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL25_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL25_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL25_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL25_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL25_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL25_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL25_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL25_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL25_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.88 CFG_DATA_LL25_LPHDR_VAL Register (Offset = 160h) [Reset = 00000000h]

CFG_DATA_LL25_LPHDR_VAL is shown in Table 11-1079.

Return to the Summary Table.

Table 11-1079. CFG_DATA_LL25_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL25_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.89 CFG_DATA_LL25_THRESHOLD Register (Offset = 164h) [Reset = 0000X0X0h]

CFG_DATA_LL25_THRESHOLD is shown in Table 11-1080.

Return to the Summary Table.

Table 11-1080. CFG_DATA_LL25_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll25dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL25_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL25_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.90 CFG_DATA_LL26 Register (Offset = 168h) [Reset = 00000000h]

CFG_DATA_LL26 is shown in Table 11-1081.

Return to the Summary Table.

Table 11-1081. CFG_DATA_LL26 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL26_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL26_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL26_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL26_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL26_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL26_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL26_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL26_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL26_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit

6-5	LL26_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL26_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL26_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL26_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL26_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.91 CFG_DATA_LL26_LPHDR_VAL Register (Offset = 16Ch) [Reset = 00000000h]

CFG_DATA_LL26_LPHDR_VAL is shown in Table 11-1082.

Return to the Summary Table.

Table 11-1082. CFG_DATA_LL26_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL26_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.92 CFG_DATA_LL26_THRESHOLD Register (Offset = 170h) [Reset = 0000X0X0h]

CFG_DATA_LL26_THRESHOLD is shown in Table 11-1083.

Return to the Summary Table.

Table 11-1083. CFG_DATA_LL26_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll26dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL26_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL26_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.93 CFG_DATA_LL27 Register (Offset = 174h) [Reset = 00000000h]

CFG_DATA_LL27 is shown in Table 11-1084.

Return to the Summary Table.

Table 11-1084. CFG_DATA_LL27 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL27_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL27_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL27_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL27_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL27_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL27_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL27_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL27_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL27_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL27_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL27_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL27_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL27_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL27_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL27_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.94 CFG_DATA_LL27_LPHDR_VAL Register (Offset = 178h) [Reset = 00000000h]

CFG_DATA_LL27_LPHDR_VAL is shown in Table 11-1085.

Return to the Summary Table.

Table 11-1085. CFG_DATA_LL27_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL27_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.95 CFG_DATA_LL27_THRESHOLD Register (Offset = 17Ch) [Reset = 0000X0X0h]

CFG_DATA_LL27_THRESHOLD is shown in Table 11-1086.

Return to the Summary Table.

Table 11-1086. CFG_DATA_LL27_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll27dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL27_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL27_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.96 CFG_DATA_LL28 Register (Offset = 180h) [Reset = 00000000h]

CFG_DATA_LL28 is shown in Table 11-1087.

Return to the Summary Table.

Table 11-1087. CFG_DATA_LL28 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL28_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model

29	LL28_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL28_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL28_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL28_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL28_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL28_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL28_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL28_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL28_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL28_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL28_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL28_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL28_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.97 CFG_DATA_LL28_LPHDR_VAL Register (Offset = 184h) [Reset = 00000000h]

CFG_DATA_LL28_LPHDR_VAL is shown in Table 11-1088.

Return to the Summary Table.

Table 11-1088. CFG_DATA_LL28_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL28_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.98 CFG_DATA_LL28_THRESHOLD Register (Offset = 188h) [Reset = 0000X0X0h]

CFG_DATA_LL28_THRESHOLD is shown in Table 11-1089.

Return to the Summary Table.

Table 11-1089. CFG_DATA_LL28_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll28dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL28_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL28_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.99 CFG_DATA_LL29 Register (Offset = 18Ch) [Reset = 00000000h]

CFG_DATA_LL29 is shown in Table 11-1090.

Return to the Summary Table.

Table 11-1090. CFG_DATA_LL29 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL29_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL29_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL29_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL29_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL29_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL29_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL29_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL29_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL29_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL29_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL29_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL29_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL29_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL29_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL29_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.100 CFG_DATA_LL29_LPHDR_VAL Register (Offset = 190h) [Reset = 00000000h]

CFG_DATA_LL29_LPHDR_VAL is shown in Table 11-1091.

Return to the Summary Table.

Table 11-1091. CFG_DATA_LL29_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL29_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.101 CFG_DATA_LL29_THRESHOLD Register (Offset = 194h) [Reset = 0000X0X0h]

CFG_DATA_LL29_THRESHOLD is shown in Table 11-1092.

Return to the Summary Table.

Table 11-1092. CFG_DATA_LL29_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll29dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL29_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL29_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.102 CFG_DATA_LL30 Register (Offset = 198h) [Reset = 00000000h]

CFG_DATA_LL30 is shown in Table 11-1093.

Return to the Summary Table.

Table 11-1093. CFG_DATA_LL30 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL30_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL30_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL30_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL30_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL30_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL30_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL30_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL30_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL30_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL30_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL30_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL30_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL30_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL30_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL30_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.103 CFG_DATA_LL30_LPHDR_VAL Register (Offset = 19Ch) [Reset = 00000000h]

CFG_DATA_LL30_LPHDR_VAL is shown in Table 11-1094.

Return to the Summary Table.

Table 11-1094. CFG_DATA_LL30_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL30_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.104 CFG_DATA_LL30_THRESHOLD Register (Offset = 1A0h) [Reset = 0000X0X0h]

CFG_DATA_LL30_THRESHOLD is shown in Table 11-1095.

Return to the Summary Table.

Table 11-1095. CFG_DATA_LL30_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll30dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL30_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL30_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.105 CFG_DATA_LL31 Register (Offset = 1A4h) [Reset = 00000000h]

CFG_DATA_LL31 is shown in Table 11-1096.

Return to the Summary Table.

Table 11-1096. CFG_DATA_LL31 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	LL31_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
30	LL31_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
29	LL31_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not requred in Programming model
28	LL31_CRC_EN	R/W	0h	0 : CRC is disbaled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL31_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data corresponind to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL31_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for furture debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL31_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL31_SIZE	R/W	0h	Configure the Size of the data in terms of the numer of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL31_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL31_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANEx_FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANEx_FMT_1_y
6-5	LL31_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL31_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL31_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL31_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL31_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

11.2.2.3.1.106 CFG_DATA_LL31_LPHDR_VAL Register (Offset = 1A8h) [Reset = 00000000h]

CFG_DATA_LL31_LPHDR_VAL is shown in Table 11-1097.

Return to the Summary Table.

Table 11-1097. CFG_DATA_LL31_LPHDR_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LL31_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0xBBBBBBBB

11.2.2.3.1.107 CFG_DATA_LL31_THRESHOLD Register (Offset = 1ACh) [Reset = 0000X0X0h]

CFG_DATA_LL31_THRESHOLD is shown in Table 11-1098.

Return to the Summary Table.

Table 11-1098. CFG_DATA_LL31_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll31dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA trasnfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL31_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL31_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

11.2.2.3.1.108 CFG_LVDS_MAPPING_LANE0_FMT_0 Register (Offset = 1B0h) [Reset = 00000000h]

CFG_LVDS_MAPPING_LANE0_FMT_0 is shown in Table 11-1099.

Return to the Summary Table.

Table 11-1099. CFG_LVDS_MAPPING_LANE0_FMT_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	CFG_LVDS_MAPPING_LANE0_FMT_0_H	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
27-24	CFG_LVDS_MAPPING_LANE0_FMT_0_G	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
23-20	CFG_LVDS_MAPPING_LANE0_FMT_0_F	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
19-16	CFG_LVDS_MAPPING_LANE0_FMT_0_E	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
15-12	CFG_LVDS_MAPPING_LANE0_FMT_0_D	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
11-8	CFG_LVDS_MAPPING_LANE0_FMT_0_C	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
7-4	CFG_LVDS_MAPPING_LANE0_FMT_0_B	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
3-0	CFG_LVDS_MAPPING_LANE0_FMT_0_A	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details

11.2.2.3.1.109 CFG_LVDS_MAPPING_LANE1_FMT_0 Register (Offset = 1B4h) [Reset = 00000000h]

CFG_LVDS_MAPPING_LANE1_FMT_0 is shown in Table 11-1100.

Return to the Summary Table.

Table 11-1100. CFG_LVDS_MAPPING_LANE1_FMT_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	CFG_LVDS_MAPPING_LANE1_FMT_0_H	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details

11.2.2.3.1.116 CFG_LVDS_GEN_0 Register (Offset = 1D0h) [Reset = 00000000h]

CFG_LVDS_GEN_0 is shown in Table 11-1107.

Return to the Summary Table.

Table 11-1107. CFG_LVDS_GEN_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	cpz	R/W	0h	LVDS Clock config. 1 : Clock alignment enabled Others : Internal clock alignment not enabled This needs to be set to 0x1 for correct functionality
29	cblpen	R/W	0h	TI Internal CFG_LASTPULSE_EN
28	cbcrcen	R/W	0h	LVDS Frame CRC 0 : CRC is not sent at the end of LVDS Frame 1 : CRC is sent at the end of the LVDS Frame
27-24	cfdly	R/W	0h	LVDS FIFO Initial Threshold. This is a Static configuration and sould be set to a fixed value as mention in the Programming model
23	cmsbf	R/W	0h	1 : Data is sent out on the LVDS lane MSB first 0 : Data is sent out on the LVDS lane LSB first
22	cpossel	R/W	0h	0 : When a new chirp is starting, align first sample start to negedge of DDR clock. 1 : When a new chirp is starting, align first sample start to posedge of DDR clock (recommended)
21-16	cckdiv	R/W	0h	TI Internal feature. CFG_LVDS_CLK_DIV
15	cclksel1	R/W	0h	TRM Description : 0 : DDR mode clock mux 1 : SDR mode clock mux TI Restricted Description : CFG_LVDS_CLK_SEL1 0-> Use div-by-2 (Q2 path) 1 -> Used for direct (Q1 path)
14	cclksel	R/W	0h	TI Internal feature. CFG_LVDS_CLK_SEL (between div-by-N and CLK_HSI_DIG) 1 -> CLK_HSI_DIG 0 - through div-by-N (N is programmed in CFG_LVDS_CLK_DIV)
13-12	ckchar	R/W	0h	TI Internal feature. CFG_K_CHAR_SEL
11	ccsmen	R/W	0h	TRM Description : As per alignment TI Restricted Description : 0 : Regular operation 1 : Continuous Streaming Mode Enabled (Not supported internally also in AR16xx)
10	CFG_BIT_CLK_MODE	R/W	0h	Bit Clock Mode 0 : SDR clocking mode 1 : DDR clocking mode
9-8	CFG_LINE_MODE	R/W	0h	TI Internal feature. Reserved.
7	cpkfmt	R/W	0h	TI Internal feature. CFG_PACK_FORMAT: While packing in 12/14 bit whether to use CSI like packing or general packing.
6	cacdsel	R/W	0h	TI Internal feature. CFG_ALL_CHL_READY_DELAY_SEL This bit is added to take of the fast to slow transition in the ADC Buffer. 0 => If the LVDS clock frequency (SDR) is >= 200MHz 1 => If the LVDS clock frequency (SDR) is < 200MHz
5	ctc2en	R/W	0h	TI Internal feature. 0 : Regular operation 1: TC2MODE Enable (Not supported internally also in AR16xx)
4	CFG_8B10B_EN	R/W	0h	TI Internal Feature. Reserved. For Furture enhancement. Not supported in this version 0 : No encoding 1: 8B10B encoding
3	CFG_LVDS_LANE3_EN	R/W	0h	LVDS only programming : 0 : LVDS Lane 3 is disbaled 1 : LVDS Lane 3 is enabled

Table 11-1107. CFG_LVDS_GEN_0 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	CFG_LVDS_LANE2_EN	R/W	0h	LVDS only programming : 0 : LVDS Lane 2 is disbaled 1 : LVDS Lane 2 is enabled
1	CFG_LVDS_LANE1_EN	R/W	0h	LVDS only programming : 0 : LVDS Lane 1 is disbaled 1 : LVDS Lane 1 is enabled
0	CFG_LVDS_LANE0_EN	R/W	0h	LVDS only programming : 0 : LVDS Lane 0 is disbaled 1 : LVDS Lane 0 is enabled

11.2.2.3.1.117 CFG_LVDS_GEN_1 Register (Offset = 1D4h) [Reset = 000000XXh]

CFG_LVDS_GEN_1 is shown in Table 11-1108.

Return to the Summary Table.

Table 11-1108. CFG_LVDS_GEN_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	NU2	R	0h	RESERVED
18	cgbcen	R/W	0h	TI Internal Feature. 0 : Bit clk is free running 1 : Bit clk is valid only during the valid frame.
17	cfcpol	R/W	0h	TI Internal Feature. 0 : During IDLE, Frame clock will be 0. Start of the valid sample is indicated by the rise edge 1 : During IDLE. Frame clock will be 1. Start of the valid sample is indicated by the fall edge.
16	clfven	R/W	0h	TI Internal feature. Extend the Single Ended Frame Valid When the frame_valid is used as a single ended signal, then make this 1. 0 : Regular Operation. Frame Valid will exactly match with the valid data. 1 : The frame_valid would start early by about 10 lvds_clk (internal) and would extend beyond by 10 lvds_clk (internal) after the end of the frame
15-14	ctpsel3	R/W	0h	TI Internal feature. This is used when Test Pattern Generation Enabled is enabled. 0 :Incremental pattern - For Lane 3
13-12	ctpsel2	R/W	0h	TI Internal feature. This is used when Test Pattern Generation Enabled is enabled. 0 :Incremental pattern - For Lane 2
11-10	ctpsel1	R/W	0h	TI Internal feature. This is used when Test Pattern Generation Enabled is enabled. 0 :Incremental pattern - For Lane 1
9-8	ctpsel0	R/W	0h	TI Internal feature. This is used when Test Pattern Generation Enabled is enabled. 0 :Incremental pattern - For Lane 0
7	NU1	R	Bh	RESERVED
6-4	ctiddly	R/W	0h	TI Internal feature. Configure the skew delay in terms on number of cycles
3	NU3	R	Bh	
2	c3c3l	R/W	0h	LVDS Only Programming: 0 : Regular Operation 1 : Enable 3Ch-3Lane mode in LVDS. Refer to Programming model for more details
1	csdrinv	R/W	0h	TI Internal feature. Configure the clock inversion during SDR mode. 0 : No inversion 1 : Inversion
0	ctpen	R/W	0h	TI Internal feature. 0 : Regular Operation 1 : LVDS Testpattern Enable

11.2.2.3.1.118 CFG_LVDS_GEN_2 Register (Offset = 1D8h) [Reset = 00000000h]

CFG_LVDS_GEN_2 is shown in Table 11-1109.

Return to the Summary Table.

Table 11-1109. CFG_LVDS_GEN_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_LVDS_GEN_2	R/W	0h	CFG_LVDS_GEN_2[0]: Configure LSB/MSB first for CRC. This feature is supported only when the field CFG_LVDS_GEN_0[28] is set to 1 0 -> The calculated value of 32-bit Ethernet polynomial CRC is swapped and sent out, clear this bit if data is set to LSB first (CFG_LVDS_GEN_0[23]=0) but CRC should be MSB first or vice-versa 1 -> The calculated value of 32-bit Ethernet polynomial CRC is sent out without swapping, set this bit if both data and CRC should have same format (LSB/MSB first) CFG_LVDS_GEN_2[1]: Configure value of frame clock during inter frame period 0 -> Frame clock is held low 1 -> Frame clock is held high CFG_LVDS_GEN_2[2]: Configure frame clock period. This feature is supported only when the field CFG_LVDS_GEN_0[28] is set to 1 0 -> 32-bit CRC is transmitted as single packet with frame clock set to 16h16l (16 high 16 low) configuration 1 -> 32-bit CRC is transmitted as two packets with frame clock set to 8h8l (8 high 8 low) configuration for each packet CFG_LVDS_GEN_2[3]: Configure bit clock during inter frame period 0 -> Bit clock toggles during inter frame period 1 -> Bit clock does not toggle during inter frame period, the value of bit clock is held low This feature is supported when DDR clock is selected (CFG_LVDS_GEN_0[10]=1) and first data sample is driven on posedge of DDR clock (CFG_LVDS_GEN_0[22]=1) CFG_LVDS_GEN_2[4]: Configure CRC inversion. This feature is supported only when the field CFG_LVDS_GEN_0[28] is set to 1 0 -> The calculated value of 32-bit Ethernet polynomial CRC is inverted and sent out 1 -> The calculated value of 32-bit Ethernet polynomial CRC is sent out without inversion CFG_LVDS_GEN_2[5]: Enable/disable the calibration mode, in this mode frame clock will follow data lane[0] 0 -> Calibration mode is disabled 1 -> Calibration mode is enabled

11.2.2.3.1.119 CFG_MASK_REG0 Register (Offset = 1DCh) [Reset = 00000000h]

CFG_MASK_REG0 is shown in Table 11-1110.

Return to the Summary Table.

Table 11-1110. CFG_MASK_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_MASK_REG0	R/W	0h	Mask Register field corresponding to STAT_CBUFF_REG0. Refer STAT_CBUFF_REG0 for bitwise mapping. 0 : Event is unmasked and will cause an interrupt on occuruence 1 : Event is masked. No interrupt will be generated on occurrence

11.2.2.3.1.120 CFG_MASK_REG1 Register (Offset = 1E0h) [Reset = 00000000h]

CFG_MASK_REG1 is shown in Table 11-1111.

Return to the Summary Table.

Table 11-1111. CFG_MASK_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_MASK_REG1	R/W	0h	Mask Register field corresponding to STAT_CBUFF_REG1. Refer STAT_CBUFF_REG1 for bitwise mapping. 0 : Event is unmasked and will cause an interrupt on occuruence 1 : Event is masked. No interrupt will be generated on occurrence

11.2.2.3.1.121 CFG_MASK_REG2 Register (Offset = 1E4h) [Reset = 00000000h]

CFG_MASK_REG2 is shown in Table 11-1112.

Return to the Summary Table.

Table 11-1112. CFG_MASK_REG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_MASK_REG2	R/W	0h	Mask Register field corresponding to STAT_LVDS_REG0. Refer STAT_LVDS_REG0 for bitwise mapping. 0 : Event is unmasked and will cause an interrupt on occuruence 1 : Event is masked. No interrupt will be generated on occurrence

11.2.2.3.1.122 CFG_MASK_REG3 Register (Offset = 1E8h) [Reset = 00000000h]

CFG_MASK_REG3 is shown in Table 11-1113.

Return to the Summary Table.

Table 11-1113. CFG_MASK_REG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CFG_MASK_REG3	R/W	0h	RESERVED

11.2.2.3.1.123 STAT_CBUFF_REG0 Register (Offset = 1ECh) [Reset = 00000000h]

STAT_CBUFF_REG0 is shown in Table 11-1114.

Return to the Summary Table.

Table 11-1114. STAT_CBUFF_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-13	STAT_CBUFF_REG0_OTHERS	R	0h	Reseved for future enhancement
12	S_FRAME_DONE	R	0h	Indicates that CBUFF has completed sending out data for the current Frame
11	S_CHIRP_DONE	R	0h	Indicates that CBUFF has completed sending out data for the current Chirp
10-6	S_LL_INDEX	R	0h	TI Internal Feature. Debug only. Current Linked list index.
5	S_CSI_PKT_LP_RCVD_STATE	R	0h	TI Internal Feature Indicates that the CSI-2 Packet Received is sent to the CBUFF from the Protocol Engine after Long Data Packet
4	S_CSI_PKT_HE_RCVD_STATE	R	0h	TI Internal Feature Indicates that the CSI-2 Packet Received is sent to the CBUFF from the Protocol Engine after Hsync End Packet
3	S_CSI_PKT_HS_RCVD_STATE	R	0h	TI Internal Feature Indicates that the CSI-2 Packet Received is sent to the CBUFF from the Protocol Engine after Hsync Start Packet
2	S_CSI_PKT_VE_RCVD_STATE	R	0h	TI Internal Feature Indicates that the CSI-2 Packet Received is sent to the CBUFF from the Protocol Engine after Vsync End Packet
1	S_CSI_PKT_VS_RCVD_STATE	R	0h	TI Internal Feature Indicates that the CSI-2 Packet Received is sent to the CBUFF from the Protocol Engine after Vsync Start Packet
0	S_CSI_PKT_RCVD	R	0h	TI Internal Feature Indicates that the CSI-2 Packet Received is sent to the CBUFF from the Protocol Engine

11.2.2.3.1.124 STAT_CBUFF_REG1 Register (Offset = 1F0h) [Reset = 00000000h]

STAT_CBUFF_REG1 is shown in Table 11-1115.

Return to the Summary Table.

Table 11-1115. STAT_CBUFF_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	S1_UNUSED3	R	0h	
20	S_CBFIFO_READY_IN_FSM	R	0h	TI Internal Feature. Debug only. cbuff-fifo_ready - Keep this masked. Not relevant.
19	S_CBFIFO_EMPTY_IN_FSM	R	0h	TI Internal Feature. Debug only. cbuff-fifo_empty - Keep this masked. Not relevant.
18	S_PKTRCV_ERR	R	0h	TI Internal Feature. Debug only. If the packetReceived arrives at a wrong time. It should NOT be coming while in IDLE state (as no packet was sent before) and in HIBER state (where the next LL group is being evaluated).
17	S_FRAME_ERR	R	0h	Indicates the FrameStart arrived before CBUFF has completed sending out data for all the Chirps programmed
16	S_CHIRP_ERR	R	0h	Indicates tha the chirpAvailable from ADCBuffer arrived before CBUFF has completed sending out the previous Chirp data.
15-12	S1_UNUSED2	R	0h	RESERVED
11	S_CBFIFO_EMPTY	R	0h	TI Internal Feature. Debug only. CBUFF_FIFO Empty Status – Keep this masked, since full and empty will be normal conditions.
10	S_CBFIFO_FULL	R	0h	TI Internal Feature. Debug only. CBUFF_FIFO Full Status – Keep this masked, since full and empty will be normal conditions.
9	S_CBPUSH_ERR	R	0h	TI Internal Feature. Debug only. CBUFF_FIFO_PUSH_ERROR
8	S_CBPOP_ERR	R	0h	TI Internal Feature. Debug only. CBUFF_FIFO_POP_ERROR
7-3	S1_UNUSED1	R	0h	RESERVED
2	S_LCLPUSH_ERR	R	0h	TI Internal Feature. Debug only. LCL_FIFO_PUSH_ERROR
1	S_LCLPOP_ERR	R	0h	TI Internal Feature. Debug only. LCL_FIFO_POP_ERROR
0	S_LCLFSM_ERR	R	0h	TI Internal Feature. Debug only. LCL_FIFO_FSM_ERROR

11.2.2.3.1.125 STAT_CBUFF_REG2 Register (Offset = 1F4h) [Reset = 00000000h]

STAT_CBUFF_REG2 is shown in Table 11-1116.

Return to the Summary Table.

Table 11-1116. STAT_CBUFF_REG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STAT_CBUFF_REG2	R	0h	RESERVED. This does not have coresponding clear or mask

11.2.2.3.1.126 STAT_CBUFF_REG3 Register (Offset = 1F8h) [Reset = 00000000h]

STAT_CBUFF_REG3 is shown in Table 11-1117.

Return to the Summary Table.

Table 11-1117. STAT_CBUFF_REG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STAT_CBUFF_REG3	R	0h	RESERVED. This does not have coresponding clear or mask

11.2.2.3.1.127 STAT_LVDS_REG0 Register (Offset = 1FCh) [Reset = 00000000h]

STAT_LVDS_REG0 is shown in Table 11-1118.

Return to the Summary Table.

Table 11-1118. STAT_LVDS_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STAT_LVDS_REG0	R	0h	TI Internal Feature. Debug only. Clr is CLR_LVDS_REG0 and MASK is CFG_MASK_REG2 FSM_STAT_CODE: [3:0] is for Ch0, [7:4] is for Ch1, [11:8] is for Ch2, [15:12] is for ch3 ASYNC_FIFO_STATUS: [19:16] is for Ch0, [23:20] is for Ch1, [27:24] is for Ch2, [32:28] is for ch3 FSM_STATE_CODE : Using this the states can be decoded. ASYNC_FIFO_STATUS: 0 - POP_ERROR 1 - PUSH_ERROR 2- POP_EMPTY 3 - PUSH_FULL. Set the mask for POP_EMPTY and PUSH_FULL. These are normal conditions and will keep happening and need not generate any interrupt

11.2.2.3.1.128 STAT_LVDS_REG1 Register (Offset = 200h) [Reset = 00000000h]

STAT_LVDS_REG1 is shown in Table 11-1119.

Return to the Summary Table.

Table 11-1119. STAT_LVDS_REG1 Register Field Descriptions

11.2.2.3.1.135 STAT_CBUFF_ECC_REG Register (Offset = 21Ch) [Reset = 00000000h]

STAT_CBUFF_ECC_REG is shown in Table 11-1126.

Return to the Summary Table.

Table 11-1126. STAT_CBUFF_ECC_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	NU2	R	Bh	
9	seccdbe	R	0h	0 : No Double bit error 1 : Indicates a double bit error has occurred
8	seccsbe	R	0h	0 : No Single bit error 1 : Indicates a single bit error has occurred
7-6	NU1	R	0h	
5-0	seccadd	R	0h	6-bit address where the ECC error occurred. It is valid when either seccsbe or seccdbe is set. If none of them is set, then the addr does not mean anything.

11.2.2.3.1.136 MASK_CBUFF_ECC_REG Register (Offset = 220h) [Reset = 00000000h]

MASK_CBUFF_ECC_REG is shown in Table 11-1127.

Return to the Summary Table.

Table 11-1127. MASK_CBUFF_ECC_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	NU2	R	Bh	
9	meccdbe	R/W	0h	0 : Double bit error indications are unmasked 1 : Double bit error indications are Masked
8	meccsbe	R/W	0h	0 : Single bit error indications are unmasked 1 : Single bit error indications are Masked
7-0	NU1	R	0h	

11.2.2.3.1.137 CLR_CBUFF_ECC_REG Register (Offset = 224h) [Reset = 00000000h]

CLR_CBUFF_ECC_REG is shown in Table 11-1128.

Return to the Summary Table.

Table 11-1128. CLR_CBUFF_ECC_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	NU2	R	Bh	
9	ceccdbe	Clear Register field corresponding to STAT_CBUFF_ECC. Write 0x1 to Clear the field		
8	ceccsbe	Clear Register field corresponding to STAT_CBUFF_ECC. Write 0x1 to Clear the field		
7-1	NU1	R	0h	
0	ceccadd	Clear Register field corresponding to STAT_CBUFF_ECC. Write 0x1 to Clear the field		

11.2.2.3.1.138 STAT_SAFETY Register (Offset = 228h) [Reset = 00000000h]

STAT_SAFETY is shown in Table 11-1129.

Return to the Summary Table.

Table 11-1129. STAT_SAFETY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	SAF_UNUSED1	R	0h	RESERVED
8	SAF_CHIRP_ERR	R	0h	Safety Error. Indicates tha the chirpAvailable from ADCBuffer arrived before CBUFF has completed sending out the previous Chirp data.
7-0	SAF_CRC	R	0h	TRM Desccription : Indicates a CRC error between ADCBuffer and CBUFF. 0 : No Error Non Zero : Error TI Restricted Description : 0 - CRC for col-0 - [15:0], 1 - CRC for col-1 [31:16] 2 - CRC for col-2 [47:32] 3 - CRC for col-3 [63:48] 4 - CRC for col-4 - [79:64] 5 - CRC for col-5 [95:80] 6 - CRC for col-6 [111 :96 7 - for col-7 [127:112]

11.2.2.3.1.139 MASK_SAFETY Register (Offset = 22Ch) [Reset = 00000000h]

MASK_SAFETY is shown in Table 11-1130.

Return to the Summary Table.

Table 11-1130. MASK_SAFETY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	MASK_SAFETY	R/W	0h	Mask Register field corresponding to STAT_SAFETY. Refer STAT_SAFETY for bitwise mapping. 0 : Event is unmasked and will cause an interrupt on occuruence 1 : Event is masked. No interrupt will be generated on occurrence

11.2.2.3.1.140 CLR_SAFETY Register (Offset = 230h) [Reset = 00000000h]

CLR_SAFETY is shown in Table 11-1131.

Return to the Summary Table.

Table 11-1131. CLR_SAFETY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CLR_SAFETY	Clear Register field corresponding to STAT_SAFETY. Write 0x1 to Clear the field		

11.2.3 MDO/Aurora

11.2.3.1 Measurement Data Output Infrastructure

11.2.3.1.1 MDO Infra Design Overview

MDO is used to capture the transactions on the bus connected from different interfaces of the AM273x device and transmitted outside over LVDS (4-data lanes). MDO is comprised of a sniffer, FIFO, and aggregator, which are explained in following sections.

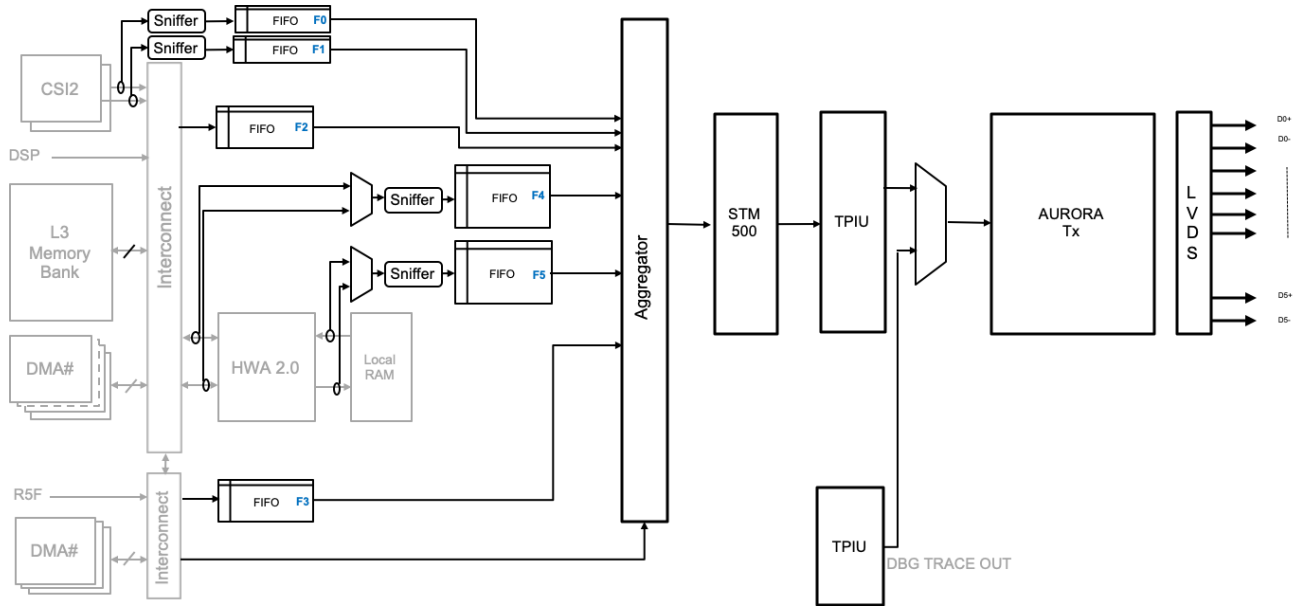

Figure 11-166. MDO Diagram

As depicted in above figure, the sniffer can access the data from the the CSI2 receiver, L3 memory, DMA, HWA, and from local RAM, which are then sent to the aggregator.

11.2.3.1.2 MDO Sniffer

11.2.3.1.2.1 Overview

The MDO sniffer module is responsible for monitoring the hardware interfaces in the SoC and capturing the transactions on the bus which are within the configured addressing region of interest, and writing the transaction details into a FIFO.

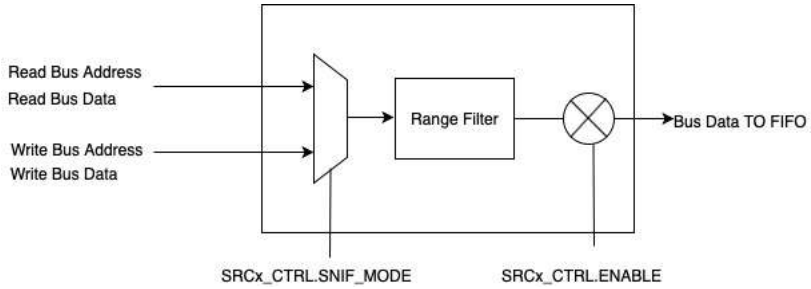

Figure 11-167. MDO Sniffer

The sniffer module can sniff a bus interface and filter transfers to be sent to the MDO FIFO.

Table 11-1132. MDO Source Address Range Selection

Start Address	End Address	Range Enable
TOP_MDO_INFRA:SRCx_RANGE_START0	TOP_MDO_INFRA:SRCx_RANGE_END0	TOP_MDO_INFRA:SRCx_CTRL.RANGE_EN[0]
TOP_MDO_INFRA:SRCx_RANGE_START1	TOP_MDO_INFRA:SRCx_RANGE_END1	TOP_MDO_INFRA:SRCx_CTRL.RANGE_EN[1]
TOP_MDO_INFRA:SRCx_RANGE_START2	TOP_MDO_INFRA:SRCx_RANGE_END2	TOP_MDO_INFRA:SRCx_CTRL.RANGE_EN[2]
TOP_MDO_INFRA:SRCx_RANGE_START3	TOP_MDO_INFRA:SRCx_RANGE_END3	TOP_MDO_INFRA:SRCx_CTRL.RANGE_EN[3]

- Read OR Write interface can be selected based on the configuration TOP_MDO_INFRA.SRCx_CTRL.SNIF_MODE
- The address/paramset is used to filter transactions.
- Only the data bus is captured. Range is not sent to the FIFO.
- On completion of configuration, the sniffer can be enabled by writing 0x1 to TOP_MDO_INFRA:SRCx_CTRL.ENABLE.
- If TOP_MDO_INFRA:SRCx_CTRL.CROP_EN is set to 0x1, then for every 32 bits of DATA[31:0], DATA[27:16], and DATA[11:0] is written to the FIFO (24 bits).

11.2.3.1.3 MDO FIFO Master

11.2.3.1.3.1 Overview

The data from MDO sniffer accumulates in the FIFO. When a threshold is reached, the data is sent out to the aggregator as a burst transfer.

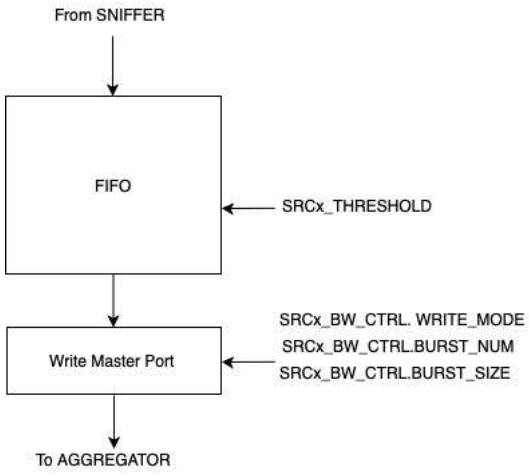

Figure 11-168. MDO FIFO Master

- When SRC0_BW_CTRL Register (Offset = 40h) [Reset = X] .WRITE_MODE is 0x0, then the data is sent out as a burst where the burst size is the THRESHOLD.
- When SRC0_BW_CTRL Register (Offset = 40h) [Reset = X] .WRITE_MODE is 0x1, then the data is sent out as a series of bursts of count BURST_NUM each of size BURST_SIZE.

11.2.3.1.3.2 Sniffer Marker Generation

An MDO source can inject a marker indicator along with its data. A marker indicator is sent to the STM module to generate a FLAG or FLAG_TS.

A marker indicator can be injected into the source stream by:

- A hardware event when register field SRC0_CTRL Register (Offset = 14h) [Reset = X] :HW_MARKER_EN is 0x1
- Software writing to the register field SRC0_SW_TRIGGER Register (Offset = 38h) [Reset = X] :MARKER

If SRCx_CHANNEL_CFG_NONDATA_TIMESTAMPED is set, then the STM is written to generate a FLAG_TS packet; else, a FLAG packet is generated.

An MDO source can inject a flush indicator in its data stream. A flush causes all the previous data in the FIFO to be sent to the STM irrespective of the threshold.

A flush indicator can be injected into the source stream by:

- A hardware event when register field SRC0_CTRL Register (Offset = 14h) [Reset = X] :HW_FLUSH_EN is 0x1
- Software writing to the register fieldSRC0_SW_TRIGGER Register (Offset = 38h) [Reset = X] :FLUSH

11.2.3.1.3.3 Sniffer Flush Operation

On a flush request, the MDO FIFO Master empties the FIFO, irrespective of the threshold. Any new data in the FIFO is not drained and is sent out only when the threshold is reached or a new flush request is received.

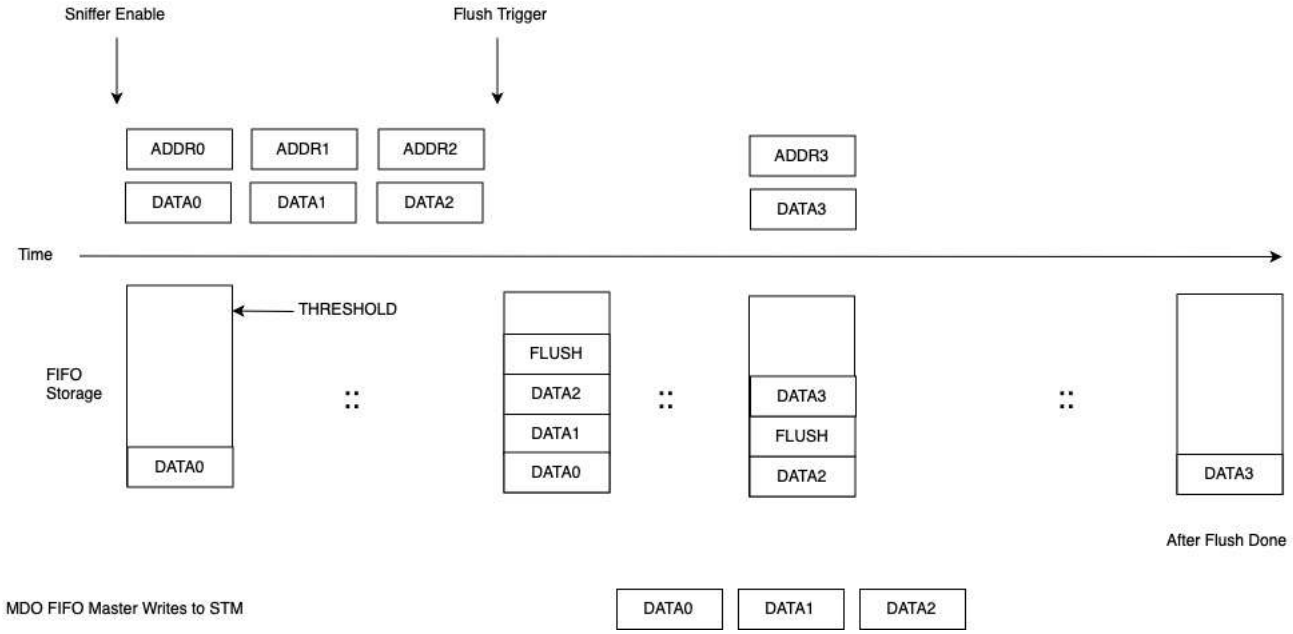

Figure 11-169. Sniffer Flush Operation

11.2.3.1.4 MDO Aggregator

11.2.3.1.4.1 Overview

The aggregator module merges the streams of data from the various MDO sources (SRCx) and sends it to the CS-STM Block.

- If there are multiple active SRC streams, it uses round robin arbitration to arbitrate which SRC should be sent.
- When an SRC wins arbitration, it has access for the entire duration of its burst transfer.
- The aggregator module also provides the correct address for the STM channel.

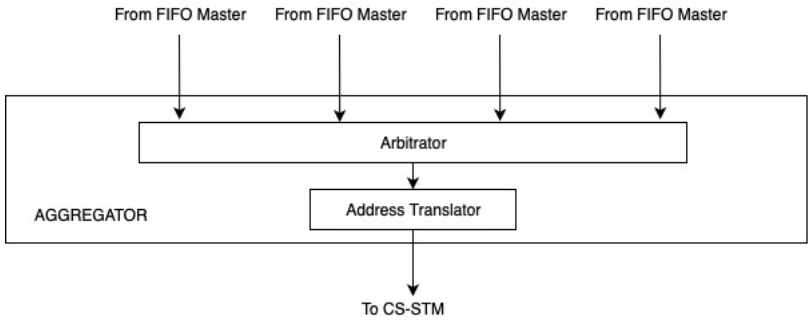

Figure 11-170. MDO Aggregator

11.2.3.1.4.2 Address Translator - CS_STM Mapping

The address provided to the CS-STM for each of the sources is derived as shown in Table 11-1133 and Table 11-1134.

Table 11-1133. Address Mapping for Data Access

CS-STM Address	Mapping
[31:8]	SRCx_CHANNEL_ADDR[31:8]
[7]	!SRCx_CHANNEL_CFG_DATA_GUARANTEED
[6:5]	Tie Low
[4]	!SRCx_CHANNEL_CFG_DATA_MARKED
[3]	!SRCx_CHANNEL_CFG_DATA_TIMESTAMPED
[2:0]	Tie Low

Table 11-1134. Address Mapping for Non Data Access

CS-STM Address	Mapping
[31:8]	SRCx_CHANNEL_ADDR[31:8]
[7]	!SRCx_CHANNEL_CFG_NONDATA_GUARANTEED
[6:5]	Tie High
[4]	Tie Low
[3]	!SRCx_CHANNEL_CFG_NONDATA_TIMESTAMPED
[2:0]	Tie Low

11.2.3.1.5 MDO Transmission Example

Table 11-1135. MDO Transmission Example

SRC	Data	Size	Threshold
SRC2	DSP Processor Variables	2 KB	256 Bytes
SRC3	MSS SPI Data	2 KB	256 Bytes
SRC4	HWA 1D FFT Output 256 16 bit complex samples for 4 channels	4 KB	512 Bytes

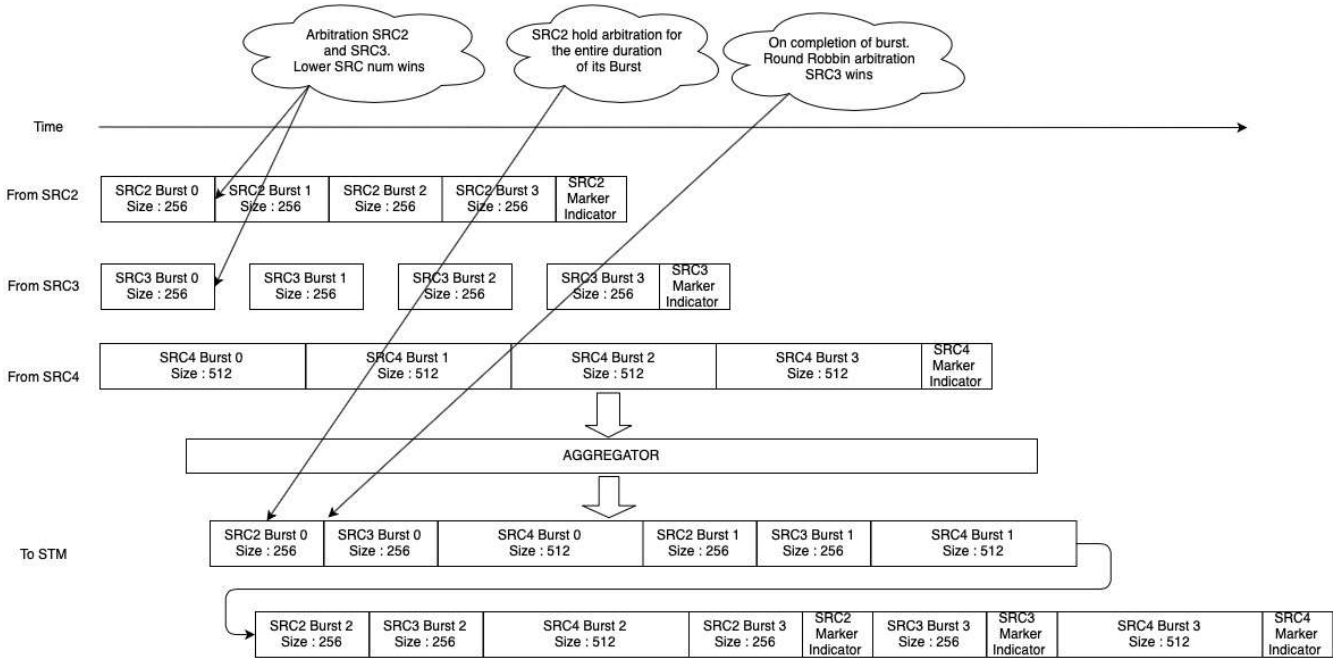

Figure 11-171. MDO Transmission

11.2.3.1.6 MDO Source Attributes

Table 11-1136. MDO Source Attributes

SRC Num	SRC Name	Read/Write	Bus Matrix Stall Capability	HW Marker Event	Range Selection Parameter
0	RCSS_CSI2A_MDMA	Write	No	0 : RCSS_CSI2A_SOF_INT0 1 : RCSS_CSI2A_SOF_INT1 2 : RCSS_CSI2A_EOF_INT0 3 : RCSS_CSI2A_EOF_INT1	Address
1	RCSS_CSI2B_MDMA	Write	No	0 : RCSS_CSI2B_SOF_INT0 1 : RCSS_CSI2B_SOF_INT1 2 : RCSS_CSI2B_EOF_INT0 3 : RCSS_CSI2B_EOF_INT1	Address
2	DSS_MDO_FIFO	Write	Yes		Address
3	MSS_MDO_FIFO	Write	Yes		Address
4	DSS_HWA_DMA0 OR DSS_HWA_DMA1	Read OR Write	No	No	HWA Param Set Num
5	DSS_HWA_ENGINE	Read OR Write	No		HWA Param Set Num

Note

Because the DSS_MDO_FIFO (Address 0x83400000:0x83403FFC) and MSS_MDO_FIFO (Address 0xCA000000:0xCA00FFFC) have stall capability as they are hooked up to the bus matrix, these sources do not overflow.

11.2.3.1.7 References

Table 11-1137 shows the ARM Coresight components that are part of the MDO Datapath.

Table 11-1137. ARM Coresight Components

Component	TRM Refernce
Trace Port Interface Unit (TPIU)	ARM CoreSight™ Components TRM
System Trace Macrocell (STM)	ARM® CoreSight™ STM-500 System Trace Macrocell TRM

11.2.3.1.8 TOP_MDO_INFRA Registers

Table 11-1138 lists the memory-mapped registers for the TOP_MDO_INFRA registers. All register offset addresses not listed in Table 11-1138 should be considered as reserved locations and the register contents should not be modified.

11-8	hw_marker_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Marker
7-3	RESERVED	R/W	X	
2	crop_en	R/W	0h	Chop of the sign extension bits [15:12] for every 16 bits of data. 0 : Send all 16 bits 1 : Send lower 12 of 16 bits
1	snif_mode	R/W	0h	Select which bus to capture. 0 : Write Bus 1 : Read Bus
0	enable	R/W	0h	Indicates is the sniffer block is active or inactive. 0 : Captuere is Disabled 1 : Sniffer Enabled

11.2.3.1.8.7 SRC0_RANGE_START0 Register (Offset = 18h) [Reset = 00000000h]

SRC0_RANGE_START0 is shown in Table 11-1146.

Return to the Summary Table.

Table 11-1146. SRC0_RANGE_START0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 0 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.8 SRC0_RANGE_END0 Register (Offset = 1Ch) [Reset = 00000000h]

SRC0_RANGE_END0 is shown in Table 11-1147.

Return to the Summary Table.

Table 11-1147. SRC0_RANGE_END0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 0 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.9 SRC0_RANGE_START1 Register (Offset = 20h) [Reset = 00000000h]

SRC0_RANGE_START1 is shown in Table 11-1148.

Return to the Summary Table.

Table 11-1148. SRC0_RANGE_START1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 1 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.10 SRC0_RANGE_END1 Register (Offset = 24h) [Reset = 00000000h]

SRC0_RANGE_END1 is shown in Table 11-1149.

Return to the Summary Table.

Table 11-1149. SRC0_RANGE_END1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 1 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.11 SRC0_RANGE_START2 Register (Offset = 28h) [Reset = 00000000h]

SRC0_RANGE_START2 is shown in Table 11-1150.

Return to the Summary Table.

Table 11-1150. SRC0_RANGE_START2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 2 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.12 SRC0_RANGE_END2 Register (Offset = 2Ch) [Reset = 00000000h]

SRC0_RANGE_END2 is shown in Table 11-1151.

Return to the Summary Table.

Table 11-1151. SRC0_RANGE_END2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 2 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.13 SRC0_RANGE_START3 Register (Offset = 30h) [Reset = 00000000h]

SRC0_RANGE_START3 is shown in Table 11-1152.

Return to the Summary Table.

Table 11-1152. SRC0_RANGE_START3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 3 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.14 SRC0_RANGE_END3 Register (Offset = 34h) [Reset = 00000000h]

SRC0_RANGE_END3 is shown in Table 11-1153.

Return to the Summary Table.

Table 11-1153. SRC0_RANGE_END3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 3 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.15 SRC0_SW_TRIGGER Register (Offset = 38h) [Reset = X]

SRC0_SW_TRIGGER is shown in Table 11-1154.

Return to the Summary Table.

Table 11-1154. SRC0_SW_TRIGGER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	flush	R/W	0h	Write 0x1 to trigger a Flush. A marker packet will also be inserted
3-1	RESERVED	R/W	X	
0	marker	R/W	0h	Write 0x1 to insert a Marker

11.2.3.1.8.16 SRC0_THRESHOLD Register (Offset = 3Ch) [Reset = X]

SRC0_THRESHOLD is shown in Table 11-1155.

Return to the Summary Table.

Table 11-1155. SRC0_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9-0	threshold	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. This value is in multiples of 32 bytes. If SRCx_BW_CTRL_WRITE_MODE is 0x0, then the bits [9:5] of this field need to be programmed to 0x0

11.2.3.1.8.17 SRC0_BW_CTRL Register (Offset = 40h) [Reset = X]

SRC0_BW_CTRL is shown in Table 11-1156.

Return to the Summary Table.

Table 11-1156. SRC0_BW_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-28	priority	R/W	0h	0 : Highest Dynamic Priority 7 : Lowest Dynamic Priority
27-21	RESERVED	R/W	X	
20-16	burst_size	R/W	0h	The burst_size is the minimum size for which the SRC will keep arbitration once it wins . The value in multiples of 32 bytes
15-12	RESERVED	R/W	X	
11-4	burst_num	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. Value to be aligned to 32 bytes [4:0] should be 0x0
3-1	RESERVED	R/W	X	
0	write_mode	R/W	0h	0 : Send data equivalent to threshold size. This can be set only if threshold is less than 1024 bytes 1 : Send data equivalent to burst_count * burst_size

11.2.3.1.8.18 SRC0_CHANNEL Register (Offset = 44h) [Reset = 00000000h]

SRC0_CHANNEL is shown in Table 11-1157.

Return to the Summary Table.

Table 11-1157. SRC0_CHANNEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	addr	R/W	0h	Configure the STM channel number on bits [31:8] . If channel number is 3 , configure bits [31:8] =3

11.2.3.1.8.19 SRC0_CHANNEL_CFG Register (Offset = 48h) [Reset = X]

SRC0_CHANNEL_CFG is shown in Table 11-1158.

Return to the Summary Table.

Table 11-1158. SRC0_CHANNEL_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	NONDATA_TIMESTAMPED	R/W	0h	Selects whether the Non Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
3	NONDATA_GUARANTEED	R/W	0h	Selects whether the Non Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed
2	DATA_TIMESTAMPED	R/W	0h	Selects whether the Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
1	DATA_MARKED	R/W	0h	Selects whether the Data access for the Source is marked 0 : Un-Marked 1 : Marked
0	DATA_GUARANTEED	R/W	0h	Selects whether the Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed

11.2.3.1.8.20 SRC1_CTRL Register (Offset = 4Ch) [Reset = X]

SRC1_CTRL is shown in Table 11-1159.

Return to the Summary Table.

Table 11-1159. SRC1_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20	gen_marker_on_flush	R/W	0h	Write 0x1 to generate a marker on Flush trigger
19-16	range_en	R/W	0h	Enable the corresponding range for data capture. Bit 0 : 0: Range 0 is disabled 1 : Range 0 is enableld
15-12	hw_flush_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Flush
11-8	hw_marker_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Marker
7-3	RESERVED	R/W	X	
2	crop_en	R/W	0h	Chop of the sign extension bits [15:12] for every 16 bits of data. 0 : Send all 16 bits 1 : Send lower 12 of 16 bits
1	snif_mode	R/W	0h	Select which bus to capture. 0 : Write Bus 1 : Read Bus
0	enable	R/W	0h	Indicates is the sniffer block is active or inactive. 0 : Captuere is Disabled 1 : Sniffer Enabled

11.2.3.1.8.21 SRC1_RANGE_START0 Register (Offset = 50h) [Reset = 00000000h]

SRC1_RANGE_START0 is shown in Table 11-1160.

Return to the Summary Table.

Table 11-1160. SRC1_RANGE_START0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 0 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.22 SRC1_RANGE_END0 Register (Offset = 54h) [Reset = 00000000h]

SRC1_RANGE_END0 is shown in Table 11-1161.

Return to the Summary Table.

Table 11-1161. SRC1_RANGE_END0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 0 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.23 SRC1_RANGE_START1 Register (Offset = 58h) [Reset = 00000000h]

SRC1_RANGE_START1 is shown in Table 11-1162.

Return to the Summary Table.

Table 11-1162. SRC1_RANGE_START1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 1 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.24 SRC1_RANGE_END1 Register (Offset = 5Ch) [Reset = 00000000h]

SRC1_RANGE_END1 is shown in Table 11-1163.

Return to the Summary Table.

Table 11-1163. SRC1_RANGE_END1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 1 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.25 SRC1_RANGE_START2 Register (Offset = 60h) [Reset = 00000000h]

SRC1_RANGE_START2 is shown in Table 11-1164.

Return to the Summary Table.

Table 11-1164. SRC1_RANGE_START2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 2 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.26 SRC1_RANGE_END2 Register (Offset = 64h) [Reset = 00000000h]

SRC1_RANGE_END2 is shown in Table 11-1165.

Return to the Summary Table.

Table 11-1165. SRC1_RANGE_END2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 2 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.27 SRC1_RANGE_START3 Register (Offset = 68h) [Reset = 00000000h]

SRC1_RANGE_START3 is shown in Table 11-1166.

Return to the Summary Table.

Table 11-1166. SRC1_RANGE_START3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 3 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.28 SRC1_RANGE_END3 Register (Offset = 6Ch) [Reset = 00000000h]

SRC1_RANGE_END3 is shown in Table 11-1167.

Return to the Summary Table.

Table 11-1167. SRC1_RANGE_END3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 3 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.29 SRC1_SW_TRIGGER Register (Offset = 70h) [Reset = X]

SRC1_SW_TRIGGER is shown in Table 11-1168.

Return to the Summary Table.

Table 11-1168. SRC1_SW_TRIGGER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	flush	R/W	0h	Write 0x1 to trigger a Flush. A marker packet will also be inserted
3-1	RESERVED	R/W	X	
0	marker	R/W	0h	Write 0x1 to insert a Marker

11.2.3.1.8.30 SRC1_THRESHOLD Register (Offset = 74h) [Reset = X]

SRC1_THRESHOLD is shown in Table 11-1169.

Return to the Summary Table.

Table 11-1169. SRC1_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9-0	threshold	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. This value is in multiples of 32 bytes. If SRCx_BW_CTRL_WRITE_MODE is 0x0, then the bits [9:5] of this field need to be programmed to 0x0

11.2.3.1.8.31 SRC1_BW_CTRL Register (Offset = 78h) [Reset = X]

SRC1_BW_CTRL is shown in Table 11-1170.

Return to the Summary Table.

Table 11-1170. SRC1_BW_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-28	priority	R/W	0h	0 : Highest Dynamic Priority 7 : Lowest Dynamic Priority
27-21	RESERVED	R/W	X	
20-16	burst_size	R/W	0h	The burst_size is the minimum size for which the SRC will keep arbitration once it wins . The value in multiples of 32 bytes
15-12	RESERVED	R/W	X	
11-4	burst_num	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. Value to be aligned to 32 bytes [4:0] should be 0x0
3-1	RESERVED	R/W	X	
0	write_mode	R/W	0h	0 : Send data equivalent to threshold size. This can be set only if threshold is less than 1024 bytes 1 : Send data equivalent to burst_count * burst_size

11.2.3.1.8.32 SRC1_CHANNEL Register (Offset = 7Ch) [Reset = 00000000h]

SRC1_CHANNEL is shown in Table 11-1171.

Return to the Summary Table.

Table 11-1171. SRC1_CHANNEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	addr	R/W	0h	Configure the STM channel number on bits [31:8] . If channel number is 3 , configure bits [31:8] =3

11.2.3.1.8.33 SRC1_CHANNEL_CFG Register (Offset = 80h) [Reset = X]

SRC1_CHANNEL_CFG is shown in Table 11-1172.

Return to the Summary Table.

Table 11-1172. SRC1_CHANNEL_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	NONDATA_TIMESTAMPED	R/W	0h	Selects whether the Non Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
3	NONDATA_GUARANTEED	R/W	0h	Selects whether the Non Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed
2	DATA_TIMESTAMPED	R/W	0h	Selects whether the Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped

1	snif_mode	R/W	0h	Select which bus to capture. 0 : Write Bus 1 : Read Bus
0	enable	R/W	0h	Indicates is the sniffer block is active or inactive. 0 : Captuere is Disabled 1 : Sniffer Enabled

11.2.3.1.8.35 SRC2_RANGE_START0 Register (Offset = 88h) [Reset = 00000000h]

SRC2_RANGE_START0 is shown in Table 11-1174.

Return to the Summary Table.

Table 11-1174. SRC2_RANGE_START0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 0 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.36 SRC2_RANGE_END0 Register (Offset = 8Ch) [Reset = 00000000h]

SRC2_RANGE_END0 is shown in Table 11-1175.

Return to the Summary Table.

Table 11-1175. SRC2_RANGE_END0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 0 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.37 SRC2_RANGE_START1 Register (Offset = 90h) [Reset = 00000000h]

SRC2_RANGE_START1 is shown in Table 11-1176.

Return to the Summary Table.

Table 11-1176. SRC2_RANGE_START1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 1 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.38 SRC2_RANGE_END1 Register (Offset = 94h) [Reset = 00000000h]

SRC2_RANGE_END1 is shown in Table 11-1177.

Return to the Summary Table.

Table 11-1177. SRC2_RANGE_END1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 1 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.39 SRC2_RANGE_START2 Register (Offset = 98h) [Reset = 00000000h]

SRC2_RANGE_START2 is shown in Table 11-1178.

Return to the Summary Table.

Table 11-1178. SRC2_RANGE_START2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 2 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.40 SRC2_RANGE_END2 Register (Offset = 9Ch) [Reset = 00000000h]

SRC2_RANGE_END2 is shown in Table 11-1179.

Return to the Summary Table.

Table 11-1179. SRC2_RANGE_END2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 2 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.41 SRC2_RANGE_START3 Register (Offset = A0h) [Reset = 00000000h]

SRC2_RANGE_START3 is shown in Table 11-1180.

Return to the Summary Table.

Table 11-1180. SRC2_RANGE_START3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 3 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.42 SRC2_RANGE_END3 Register (Offset = A4h) [Reset = 00000000h]

SRC2_RANGE_END3 is shown in Table 11-1181.

Return to the Summary Table.

Table 11-1181. SRC2_RANGE_END3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 3 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.43 SRC2_SW_TRIGGER Register (Offset = A8h) [Reset = X]

SRC2_SW_TRIGGER is shown in Table 11-1182.

Return to the Summary Table.

Table 11-1182. SRC2_SW_TRIGGER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	flush	R/W	0h	Write 0x1 to trigger a Flush.
3-1	RESERVED	R/W	X	
0	marker	R/W	0h	Write 0x1 to insert a Marker

11.2.3.1.8.44 SRC2_THRESHOLD Register (Offset = ACh) [Reset = X]

SRC2_THRESHOLD is shown in Table 11-1183.

Return to the Summary Table.

Table 11-1183. SRC2_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9-0	threshold	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. This value is in multiples of 32 bytes. If SRCx_BW_CTRL_WRITE_MODE is 0x0, then the bits [9:5] of this field need to be programmed to 0x0

11.2.3.1.8.45 SRC2_BW_CTRL Register (Offset = B0h) [Reset = X]

SRC2_BW_CTRL is shown in Table 11-1184.

Return to the Summary Table.

Table 11-1184. SRC2_BW_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-28	priority	R/W	0h	0 : Highest Dynamic Priority 7 : Lowest Dynamic Priority
27-21	RESERVED	R/W	X	
20-16	burst_size	R/W	0h	The burst_size is the minimum size for which the SRC will keep arbitration once it wins . The value in multiples of 32 bytes
15-12	RESERVED	R/W	X

11.2.3.1.8.48 SRC3_CTRL Register (Offset = BCh) [Reset = X]

SRC3_CTRL is shown in Table 11-1187.

Return to the Summary Table.

Table 11-1187. SRC3_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20	gen_marker_on_flush	R/W	0h	Write 0x1 to generate a marker on Flush trigger
19-16	range_en	R/W	0h	Enable the corresponding range for data capture. Bit 0 : 0: Range 0 is disabled 1 : Range 0 is enableld
15-12	hw_flush_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Flush
11-8	hw_marker_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Marker
7-3	RESERVED	R/W	X	
2	crop_en	R/W	0h	Chop of the sign extension bits [15:12] for every 16 bits of data. 0 : Send all 16 bits 1 : Send lower 12 of 16 bits
1	snif_mode	R/W	0h	Select which bus to capture. 0 : Write Bus 1 : Read Bus
0	enable	R/W	0h	Indicates is the sniffer block is active or inactive. 0 : Captuere is Disabled 1 : Sniffer Enabled

11.2.3.1.8.49 SRC3_RANGE_START0 Register (Offset = C0h) [Reset = 00000000h]

SRC3_RANGE_START0 is shown in Table 11-1188.

Return to the Summary Table.

Table 11-1188. SRC3_RANGE_START0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 0 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.50 SRC3_RANGE_END0 Register (Offset = C4h) [Reset = 00000000h]

SRC3_RANGE_END0 is shown in Table 11-1189.

Return to the Summary Table.

Table 11-1189. SRC3_RANGE_END0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 0 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.51 SRC3_RANGE_START1 Register (Offset = C8h) [Reset = 00000000h]

SRC3_RANGE_START1 is shown in Table 11-1190.

Return to the Summary Table.

Table 11-1190. SRC3_RANGE_START1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 1 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.52 SRC3_RANGE_END1 Register (Offset = CCh) [Reset = 00000000h]

SRC3_RANGE_END1 is shown in Table 11-1191.

Return to the Summary Table.

Table 11-1191. SRC3_RANGE_END1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 1 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.53 SRC3_RANGE_START2 Register (Offset = D0h) [Reset = 00000000h]

SRC3_RANGE_START2 is shown in Table 11-1192.

Return to the Summary Table.

Table 11-1192. SRC3_RANGE_START2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 2 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.54 SRC3_RANGE_END2 Register (Offset = D4h) [Reset = 00000000h]

SRC3_RANGE_END2 is shown in Table 11-1193.

Return to the Summary Table.

Table 11-1193. SRC3_RANGE_END2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 2 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.55 SRC3_RANGE_START3 Register (Offset = D8h) [Reset = 00000000h]

SRC3_RANGE_START3 is shown in Table 11-1194.

Return to the Summary Table.

Table 11-1194. SRC3_RANGE_START3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 3 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.56 SRC3_RANGE_END3 Register (Offset = DCh) [Reset = 00000000h]

SRC3_RANGE_END3 is shown in Table 11-1195.

Return to the Summary Table.

Table 11-1195. SRC3_RANGE_END3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 3 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.57 SRC3_SW_TRIGGER Register (Offset = E0h) [Reset = X]

SRC3_SW_TRIGGER is shown in Table 11-1196.

Return to the Summary Table.

Table 11-1196. SRC3_SW_TRIGGER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	flush	R/W	0h	Write 0x1 to trigger a Flush. A marker packet will also be inserted
3-1	RESERVED	R/W	X	
0	marker	R/W	0h	Write 0x1 to insert a Marker

11.2.3.1.8.58 SRC3_THRESHOLD Register (Offset = E4h) [Reset = X]

SRC3_THRESHOLD is shown in Table 11-1197.

Return to the Summary Table.

Table 11-1197. SRC3_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9-0	threshold	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. This value is in multiples of 32 bytes. If SRCx_BW_CTRL_WRITE_MODE is 0x0, then the bits [9:5] of this field need to be programmed to 0x0

11.2.3.1.8.59 SRC3_BW_CTRL Register (Offset = E8h) [Reset = X]

SRC3_BW_CTRL is shown in Table 11-1198.

Return to the Summary Table.

Table 11-1198. SRC3_BW_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-28	priority	R/W	0h	0 : Highest Dynamic Priority 7 : Lowest Dynamic Priority
27-21	RESERVED	R/W	X	
20-16	burst_size	R/W	0h	The burst_size is the minimum size for which the SRC will keep arbitration once it wins . The value in multiples of 32 bytes
15-12	RESERVED	R/W	X	
11-4	burst_num	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. Value to be aligned to 32 bytes [4:0] should be 0x0
3-1	RESERVED	R/W	X	
0	write_mode	R/W	0h	0 : Send data equivalent to threshold size. This can be set only if threshold is less than 1024 bytes 1 : Send data equivalent to burst_count * burst_size

11.2.3.1.8.60 SRC3_CHANNEL Register (Offset = ECh) [Reset = 00000000h]

SRC3_CHANNEL is shown in Table 11-1199.

Return to the Summary Table.

Table 11-1199. SRC3_CHANNEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	addr	R/W	0h	Configure the STM channel number on bits [31:8] . If channel number is 3 , configure bits [31:8] =3

11.2.3.1.8.61 SRC3_CHANNEL_CFG Register (Offset = F0h) [Reset = X]

SRC3_CHANNEL_CFG is shown in Table 11-1200.

Return to the Summary Table.

Table 11-1200. SRC3_CHANNEL_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	NONDATA_TIMESTAMPED	R/W	0h	Selects whether the Non Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
3	NONDATA_GUARANTEED	R/W	0h	Selects whether the Non Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed
2	DATA_TIMESTAMPED	R/W	0h	Selects whether the Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
1	DATA_MARKED	R/W	0h	Selects whether the Data access for the Source is marked 0 : Un-Marked 1 : Marked
0	DATA_GUARANTEED	R/W	0h	Selects whether the Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed

11.2.3.1.8.62 SRC4_CTRL Register (Offset = F4h) [Reset = X]

SRC4_CTRL is shown in Table 11-1201.

Return to the Summary Table.

Table 11-1201. SRC4_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20	gen_marker_on_flush	R/W	0h	Write 0x1 to generate a marker on Flush trigger
19-16	range_en	R/W	0h	Enable the corresponding range for data capture. Bit 0 : 0: Range 0 is disabled 1 : Range 0 is enableld
15-12	hw_flush_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Flush
11-8	hw_marker_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Marker
7-5	RESERVED	R/W	X	
4	port_sel	R/W	0h	Select which bus to capture. 0 : DSS_HWA_DMA0 1 : DSS_HWA_DMA1
3	RESERVED	R/W	X	
2	crop_en	R/W	0h	Chop of the sign extension bits [15:12] for every 16 bits of data. 0 : Send all 16 bits 1 : Send lower 12 of 16 bits
1	snif_mode	R/W	0h	Select which bus to capture. 0 : Write Bus 1 : Read Bus
0	enable	R/W	0h	Indicates is the sniffer block is active or inactive. 0 : Captuere is Disabled 1 : Sniffer Enabled

11.2.3.1.8.63 SRC4_RANGE_START0 Register (Offset = F8h) [Reset = 00000000h]

SRC4_RANGE_START0 is shown in Table 11-1202.

Return to the Summary Table.

Table 11-1202. SRC4_RANGE_START0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 0 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.64 SRC4_RANGE_END0 Register (Offset = FCh) [Reset = 00000000h]

SRC4_RANGE_END0 is shown in Table 11-1203.

Return to the Summary Table.

Table 11-1203. SRC4_RANGE_END0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 0 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.65 SRC4_RANGE_START1 Register (Offset = 100h) [Reset = 00000000h]

SRC4_RANGE_START1 is shown in Table 11-1204.

Return to the Summary Table.

Table 11-1204. SRC4_RANGE_START1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 1 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.66 SRC4_RANGE_END1 Register (Offset = 104h) [Reset = 00000000h]

SRC4_RANGE_END1 is shown in Table 11-1205.

Return to the Summary Table.

Table 11-1205. SRC4_RANGE_END1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 1 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.67 SRC4_RANGE_START2 Register (Offset = 108h) [Reset = 00000000h]

SRC4_RANGE_START2 is shown in Table 11-1206.

Return to the Summary Table.

Table 11-1206. SRC4_RANGE_START2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 2 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.68 SRC4_RANGE_END2 Register (Offset = 10Ch) [Reset = 00000000h]

SRC4_RANGE_END2 is shown in Table 11-1207.

Return to the Summary Table.

Table 11-1207. SRC4_RANGE_END2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 2 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.69 SRC4_RANGE_START3 Register (Offset = 110h) [Reset = 00000000h]

SRC4_RANGE_START3 is shown in Table 11-1208.

Return to the Summary Table.

Table 11-1208. SRC4_RANGE_START3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 3 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.70 SRC4_RANGE_END3 Register (Offset = 114h) [Reset = 00000000h]

SRC4_RANGE_END3 is shown in Table 11-1209.

Return to the Summary Table.

Table 11-1209. SRC4_RANGE_END3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 3 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.71 SRC4_SW_TRIGGER Register (Offset = 118h) [Reset = X]

SRC4_SW_TRIGGER is shown in Table 11-1210.

Return to the Summary Table.

Table 11-1210. SRC4_SW_TRIGGER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	flush	R/W	0h	Write 0x1 to trigger a Flush. A marker packet will also be inserted
3-1	RESERVED	R/W	X	
0	marker	R/W	0h	Write 0x1 to insert a Marker

11.2.3.1.8.72 SRC4_THRESHOLD Register (Offset = 11Ch) [Reset = X]

SRC4_THRESHOLD is shown in Table 11-1211.

Return to the Summary Table.

Table 11-1211. SRC4_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9-0	threshold	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. This value is in multiples of 32 bytes. If SRCx_BW_CTRL_WRITE_MODE is 0x0, then the bits [9:5] of this field need to be programmed to 0x0

11.2.3.1.8.73 SRC4_BW_CTRL Register (Offset = 120h) [Reset = X]

SRC4_BW_CTRL is shown in Table 11-1212.

Return to the Summary Table.

Table 11-1212. SRC4_BW_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-28	priority	R/W	0h	0 : Highest Dynamic Priority 7 : Lowest Dynamic Priority
27-21	RESERVED	R/W	X	
20-16	burst_size	R/W	0h	The burst_size is the minimum size for which the SRC will keep arbitration once it wins . The value in multiples of 32 bytes
15-12	RESERVED	R/W	X	
11-4	burst_num	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. Value to be aligned to 32 bytes [4:0] should be 0x0
3-1	RESERVED	R/W	X	
0	write_mode	R/W	0h	0 : Send data equivalent to threshold size. This can be set only if threshold is less than 1024 bytes 1 : Send data equivalent to burst_count * burst_size

11.2.3.1.8.74 SRC4_CHANNEL Register (Offset = 124h) [Reset = 00000000h]

SRC4_CHANNEL is shown in Table 11-1213.

Return to the Summary Table.

Table 11-1213. SRC4_CHANNEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	addr	R/W	0h	Configure the STM channel number on bits [31:8] . If channel number is 3 , configure bits [31:8] =3

11.2.3.1.8.75 SRC4_CHANNEL_CFG Register (Offset = 128h) [Reset = X]

SRC4_CHANNEL_CFG is shown in Table 11-1214.

Return to the Summary Table.

Table 11-1214. SRC4_CHANNEL_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	NONDATA_TIMESTAMPED	R/W	0h	Selects whether the Non Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
3	NONDATA_GUARANTEED	R/W	0h	Selects whether the Non Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed
2	DATA_TIMESTAMPED	R/W	0h	Selects whether the Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped

0	DATA_GUARANTEED	R/W	0h	Selects whether the Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed

11.2.3.1.8.76 SRC5_CTRL Register (Offset = 12Ch) [Reset = X]

SRC5_CTRL is shown in Table 11-1215.

Return to the Summary Table.

Table 11-1215. SRC5_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-21	RESERVED	R/W	X	
20	gen_marker_on_flush	R/W	0h	Write 0x1 to generate a marker on Flush trigger
19-16	range_en	R/W	0h	Enable the corresponding range for data capture. Bit 0 : 0: Range 0 is disabled 1 : Range 0 is enableld
15-12	hw_flush_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Flush
11-8	hw_marker_en	R/W	0h	Write 0x1 to enable HW Marker trigger to generate a Marker
7-3	RESERVED	R/W	X	
2	crop_en	R/W	0h	Chop of the sign extension bits [15:12] for every 16 bits of data. 0 : Send all 16 bits 1 : Send lower 12 of 16 bits
1	snif_mode	R/W	0h	Select which bus to capture. 0 : Write Bus 1 : Read Bus
0	enable	R/W	0h	Indicates is the sniffer block is active or inactive. 0 : Captuere is Disabled 1 : Sniffer Enabled

11.2.3.1.8.77 SRC5_RANGE_START0 Register (Offset = 130h) [Reset = 00000000h]

SRC5_RANGE_START0 is shown in Table 11-1216.

Return to the Summary Table.

Table 11-1216. SRC5_RANGE_START0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 0 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.78 SRC5_RANGE_END0 Register (Offset = 134h) [Reset = 00000000h]

SRC5_RANGE_END0 is shown in Table 11-1217.

Return to the Summary Table.

Table 11-1217. SRC5_RANGE_END0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 0 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.79 SRC5_RANGE_START1 Register (Offset = 138h) [Reset = 00000000h]

SRC5_RANGE_START1 is shown in Table 11-1218.

Return to the Summary Table.

Table 11-1218. SRC5_RANGE_START1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 1 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.80 SRC5_RANGE_END1 Register (Offset = 13Ch) [Reset = 00000000h]

SRC5_RANGE_END1 is shown in Table 11-1219.

Return to the Summary Table.

Table 11-1219. SRC5_RANGE_END1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 1 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.81 SRC5_RANGE_START2 Register (Offset = 140h) [Reset = 00000000h]

SRC5_RANGE_START2 is shown in Table 11-1220.

Return to the Summary Table.

Table 11-1220. SRC5_RANGE_START2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 2 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.82 SRC5_RANGE_END2 Register (Offset = 144h) [Reset = 00000000h]

SRC5_RANGE_END2 is shown in Table 11-1221.

Return to the Summary Table.

Table 11-1221. SRC5_RANGE_END2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 2 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.83 SRC5_RANGE_START3 Register (Offset = 148h) [Reset = 00000000h]

SRC5_RANGE_START3 is shown in Table 11-1222.

Return to the Summary Table.

Table 11-1222. SRC5_RANGE_START3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	start	R/W	0h	Range 3 Start address OR Start param number for HWA , which needs to be captured

11.2.3.1.8.84 SRC5_RANGE_END3 Register (Offset = 14Ch) [Reset = 00000000h]

SRC5_RANGE_END3 is shown in Table 11-1223.

Return to the Summary Table.

Table 11-1223. SRC5_RANGE_END3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	end	R/W	0h	Range 3 End address OR End param number for HWA , which needs to be captured

11.2.3.1.8.85 SRC5_SW_TRIGGER Register (Offset = 150h) [Reset = X]

SRC5_SW_TRIGGER is shown in Table 11-1224.

Return to the Summary Table.

Table 11-1224. SRC5_SW_TRIGGER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	flush	R/W	0h	Write 0x1 to trigger a Flush. A marker packet will also be inserted
3-1	RESERVED	R/W	X	
0	marker	R/W	0h	Write 0x1 to insert a Marker

11.2.3.1.8.86 SRC5_THRESHOLD Register (Offset = 154h) [Reset = X]

SRC5_THRESHOLD is shown in Table 11-1225.

Return to the Summary Table.

Table 11-1225. SRC5_THRESHOLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9-0	threshold	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. This value is in multiples of 32 bytes. If SRCx_BW_CTRL_WRITE_MODE is 0x0, then the bits [9:5] of this field need to be programmed to 0x0

11.2.3.1.8.87 SRC5_BW_CTRL Register (Offset = 158h) [Reset = X]

SRC5_BW_CTRL is shown in Table 11-1226.

Return to the Summary Table.

Table 11-1226. SRC5_BW_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	X	
30-28	priority	R/W	0h	0 : Highest Dynamic Priority 7 : Lowest Dynamic Priority
27-21	RESERVED	R/W	X	
20-16	burst_size	R/W	0h	The burst_size is the minimum size for which the SRC will keep arbitration once it wins . The value in multiples of 32 bytes
15-12	RESERVED	R/W	X	
11-4	burst_num	R/W	0h	The FIFO threshold to trigger writes from the Source FIFO. Value to be aligned to 32 bytes [4:0] should be 0x0
3-1	RESERVED	R/W	X	
0	write_mode	R/W	0h	0 : Send data equivalent to threshold size. This can be set only if threshold is less than 1024 bytes 1 : Send data equivalent to burst_count * burst_size

11.2.3.1.8.88 SRC5_CHANNEL Register (Offset = 15Ch) [Reset = 00000000h]

SRC5_CHANNEL is shown in Table 11-1227.

Return to the Summary Table.

Table 11-1227. SRC5_CHANNEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	addr	R/W	0h	Configure the STM channel number on bits [31:8] . If channel number is 3 , configure bits [31:8] =3

11.2.3.1.8.89 SRC5_CHANNEL_CFG Register (Offset = 160h) [Reset = X]

SRC5_CHANNEL_CFG is shown in Table 11-1228.

Return to the Summary Table.

Table 11-1228. SRC5_CHANNEL_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	X	
4	NONDATA_TIMESTAMPED	R/W	0h	Selects whether the Non Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
3	NONDATA_GUARANTEED	R/W	0h	Selects whether the Non Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed
2	DATA_TIMESTAMPED	R/W	0h	Selects whether the Data access for the Source is timestamped 0 : No Timestamp 1 : Timestamped
1	DATA_MARKED	R/W	0h	Selects whether the Data access for the Source is marked 0 : Un-Marked 1 : Marked
0	DATA_GUARANTEED	R/W	0h	Selects whether the Data access for the Source is Guaranteed or Invariant Timing 0 : Time Invariant 1 : Guaranteed

11.2.3.1.8.90 SRC0_STATUS Register (Offset = 1D4h) [Reset = X]

SRC0_STATUS is shown in Table 11-1229.

Return to the Summary Table.

Table 11-1229. SRC0_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	status	R	2h	Status of the Sniffer for Source 0
15-4	RESERVED	R/W	X	
3	overflow_err	R/W	0h	Source Overflow Error is generated with the Source FIFO is full and there is no space to write the sniffed data
2	flush_err	R/W	0h	Flush Err is generated on Multiple Flush requests
1	data_miss	R/W	0h	Data Miss Erro is generated when a Flush or Marker Requested causes Miss in the Sniffer data
0	flush_done	R/W	0h	Flush Done is generated on completion of a flush request

11.2.3.1.8.91 SRC1_STATUS Register (Offset = 1D8h) [Reset = X]

SRC1_STATUS is shown in Table 11-1230.

Return to the Summary Table.

Table 11-1230. SRC1_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	status	R	2h	Status of the Sniffer for Source 1
15-4	RESERVED	R/W	X	
3	overflow_err	R/W	0h	Source Overflow Error is generated with the Source FIFO is full and there is no space to write the sniffed data
2	flush_err	R/W	0h	Flush Err is generated on Multiple Flush requests
1	data_miss	R/W	0h	Data Miss Erro is generated when a Flush or Marker Requested causes Miss in the Sniffer data
0	flush_done	R/W	0h	Flush Done is generated on completion of a flush request

11.2.3.1.8.92 SRC2_STATUS Register (Offset = 1DCh) [Reset = X]

SRC2_STATUS is shown in Table 11-1231.

Return to the Summary Table.

Table 11-1231. SRC2_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	status	R	2h	Status of the Sniffer for Source 2
15-4	RESERVED	R/W	X	
3	overflow_err	R/W	0h	Source Overflow Error is generated with the Source FIFO is full and there is no space to write the sniffed data
2	flush_err	R/W	0h	Flush Err is generated on Multiple Flush requests
1	data_miss	R/W	0h	Data Miss Erro is generated when a Flush or Marker Requested causes Miss in the Sniffer data
0	flush_done	R/W	0h	Flush Done is generated on completion of a flush request

11.2.3.1.8.93 SRC3_STATUS Register (Offset = 1E0h) [Reset = X]

SRC3_STATUS is shown in Table 11-1232.

Return to the Summary Table.

Table 11-1232. SRC3_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	status	R	2h	Status of the Sniffer for Source 3
15-4	RESERVED	R/W	X	
3	overflow_err	R/W	0h	Source Overflow Error is generated with the Source FIFO is full and there is no space to write the sniffed data
2	flush_err	R/W	0h	Flush Err is generated on Multiple Flush requests
1	data_miss	R/W	0h	Data Miss Erro is generated when a Flush or Marker Requested causes Miss in the Sniffer data
0	flush_done	R/W	0h	Flush Done is generated on completion of a flush request

11.2.3.1.8.94 SRC4_STATUS Register (Offset = 1E4h) [Reset = X]

SRC4_STATUS is shown in Table 11-1233.

Return to the Summary Table.

Table 11-1233. SRC4_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	status	R	2h	Status of the Sniffer for Source 4
15-4	RESERVED	R/W	X	
3	overflow_err	R/W	0h	Source Overflow Error is generated with the Source FIFO is full and there is no space to write the sniffed data
2	flush_err	R/W	0h	Flush Err is generated on Multiple Flush requests
1	data_miss	R/W	0h	Data Miss Erro is generated when a Flush or Marker Requested causes Miss in the Sniffer data
0	flush_done	R/W	0h	Flush Done is generated on completion of a flush request

11.2.3.1.8.95 SRC5_STATUS Register (Offset = 1E8h) [Reset = X]

SRC5_STATUS is shown in Table 11-1234.

Return to the Summary Table.

Table 11-1234. SRC5_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	status	R	2h	Status of the Sniffer for Source 5
15-4	RESERVED	R/W	X	
3	overflow_err	R/W	0h	Source Overflow Error is generated with the Source FIFO is full and there is no space to write the sniffed data
2	flush_err	R/W	0h	Flush Err is generated on Multiple Flush requests
1	data_miss	R/W	0h	Data Miss Erro is generated when a Flush or Marker Requested causes Miss in the Sniffer data
0	flush_done	R/W	0h	Flush Done is generated on completion of a flush request

11.2.3.1.8.96 INTERRUPT_MASK Register (Offset = 1ECh) [Reset = FFFFFFFFh]

INTERRUPT_MASK is shown in Table 11-1235.

Return to the Summary Table.

Table 11-1235. INTERRUPT_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	mask	R/W	FFFFFFFFh	MDO Infra Interrupt Mask

11.2.3.1.8.97 HW_SPARE_RW0 Register (Offset = FD0h) [Reset = 00000000h]

HW_SPARE_RW0 is shown in Table 11-1236.

Return to the Summary Table.

Table 11-1236. HW_SPARE_RW0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw0	R/W	0h	Reserved for HW R&D

11.2.3.1.8.98 HW_SPARE_RW1 Register (Offset = FD4h) [Reset = 00000000h]

HW_SPARE_RW1 is shown in Table 11-1237.

Return to the Summary Table.

Table 11-1237. HW_SPARE_RW1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw1	R/W	0h	Reserved for HW R&D

11.2.3.1.8.99 HW_SPARE_RW2 Register (Offset = FD8h) [Reset = 00000000h]

HW_SPARE_RW2 is shown in Table 11-1238.

Return to the Summary Table.

Table 11-1238. HW_SPARE_RW2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw2	R/W	0h	Reserved for HW R&D

11.2.3.1.8.100 HW_SPARE_RW3 Register (Offset = FDCh) [Reset = 00000000h]

HW_SPARE_RW3 is shown in Table 11-1239.

Return to the Summary Table.

31-0	LOCK0_kick1	R/W	0h	RESERVED, write has no impact

11.2.3.1.8.109 intr_raw_status Register (Offset = 1010h) [Reset = X]

intr_raw_status is shown in Table 11-1248.

Return to the Summary Table.

Interrupt Raw Status/Set Register

Table 11-1248. intr_raw_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	proxy_err	R/W1S	0h	Proxy0 access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
2	kick_err	R/W1S	0h	Kick access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
1	addr_err	R/W1S	0h	Addressing violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
0	prot_err	R/W1S	0h	Protection violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.

11.2.3.1.8.110 intr_enabled_status_clear Register (Offset = 1014h) [Reset = X]

intr_enabled_status_clear is shown in Table 11-1249.

Return to the Summary Table.

Interrupt Enabled Status/Clear register

Table 11-1249. intr_enabled_status_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	enabled_proxy_err	R/W1C	0h	Proxy0 access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
2	enabled_kick_err	R/W1C	0h	Kick access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
1	enabled_addr_err	R/W1C	0h	Addressing violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
0	enabled_prot_err	R/W1C	0h	Protection violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.

11.2.3.1.8.111 intr_enable Register (Offset = 1018h) [Reset = X]

intr_enable is shown in Table 11-1250.

Return to the Summary Table.

Interrupt Enable register

Table 11-1250. intr_enable Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	proxy_err_en	R/W1S	0h	Proxy0 access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
2	kick_err_en	R/W1S	0h	Kick access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
1	addr_err_en	R/W1S	0h	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	R/W1S	0h	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

11.2.3.1.8.112 intr_enable_clear Register (Offset = 101Ch) [Reset = X]

intr_enable_clear is shown in Table 11-1251.

Return to the Summary Table.

Interrupt Enable Clear register

Table 11-1251. intr_enable_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3	proxy_err_en_clr	R/W1C	0h	Proxy0 access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
2	kick_err_en_clr	R/W1C	0h	Kick access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
1	addr_err_en_clr	R/W1C	0h	Addressing violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_en_clr	R/W1C	0h	Protection violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.

11.2.3.1.8.113 eoi Register (Offset = 1020h) [Reset = X]

eoi is shown in Table 11-1252.

Return to the Summary Table.

EOI register

Table 11-1252. eoi Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	X	
7-0	eoi_vector	R/W	0h	EOI vector value. Write this with interrupt distribution value in the chip.

11.2.3.1.8.114 fault_address Register (Offset = 1024h) [Reset = 00000000h]

fault_address is shown in Table 11-1253.

Return to the Summary Table.

Fault Address register

Table 11-1253. fault_address Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	fault_addr	R	0h	Fault Address.

11.2.3.1.8.115 fault_type_status Register (Offset = 1028h) [Reset = X]

fault_type_status is shown in Table 11-1254.

Return to the Summary Table.

Fault Type Status register

Table 11-1254. fault_type_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	X	
6	fault_ns	R	0h	Non-secure access.
5-0	fault_type	R	0h	Fault Type 10_0000 = Supervisor read fault - priv = 1 dir = 1 dtype ! = 1 01_0000 = Supervisor write fault - priv = 1 dir = 0 00_1000 = Supervisor execute fault - priv = 1 dir = 1 dtype = 1 00_0100 = User read fault - priv = 0 dir = 1 dtype = 1 00_0010 = User write fault - priv = 0 dir = 0 00_0001 = User execute fault - priv = 0 dir = 1 dtype = 1 00_0000 = No fault

11.2.3.1.8.116 fault_attr_status Register (Offset = 102Ch) [Reset = 00000000h]

fault_attr_status is shown in Table 11-1255.

Return to the Summary Table.

Fault Attribute Status register

Table 11-1255. fault_attr_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	fault_xid	R	0h	XID.
19-8	fault_routeid	R	0h	Route ID.
7-0	fault_privid	R	0h	Privilege ID.

11.2.3.1.8.117 fault_clear Register (Offset = 1030h) [Reset = X]

fault_clear is shown in Table 11-1256.

Return to the Summary Table.

Fault Clear register

Table 11-1256. fault_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	W	X	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

11.2.3.2 Aurora TX IP

11.2.3.2.1 Features Supported

The Aurora Tx IP has the following features:

- Configurable 4/2/1 lane of operation
- Transmit data compliant to Aurora 8B/10B Serial Simplex Operation
- Transmit data compliant to Aurora 64B/66B Serial Simplex Operation
- Only Tx support. No Rx support
- Supports input format for Trace Wrapper Protocol (TWP) from ARM Coresight CS-TPIU IP
- Support for packing TWP packets as an Aurora User PDU
- Configurable option to append CRC for TWP data
- Configurable option to drop TWP padding packets
- Support for transmission of user-defined flow control packet for overflow condition

Note

11.2.3.2.2 Block Diagram

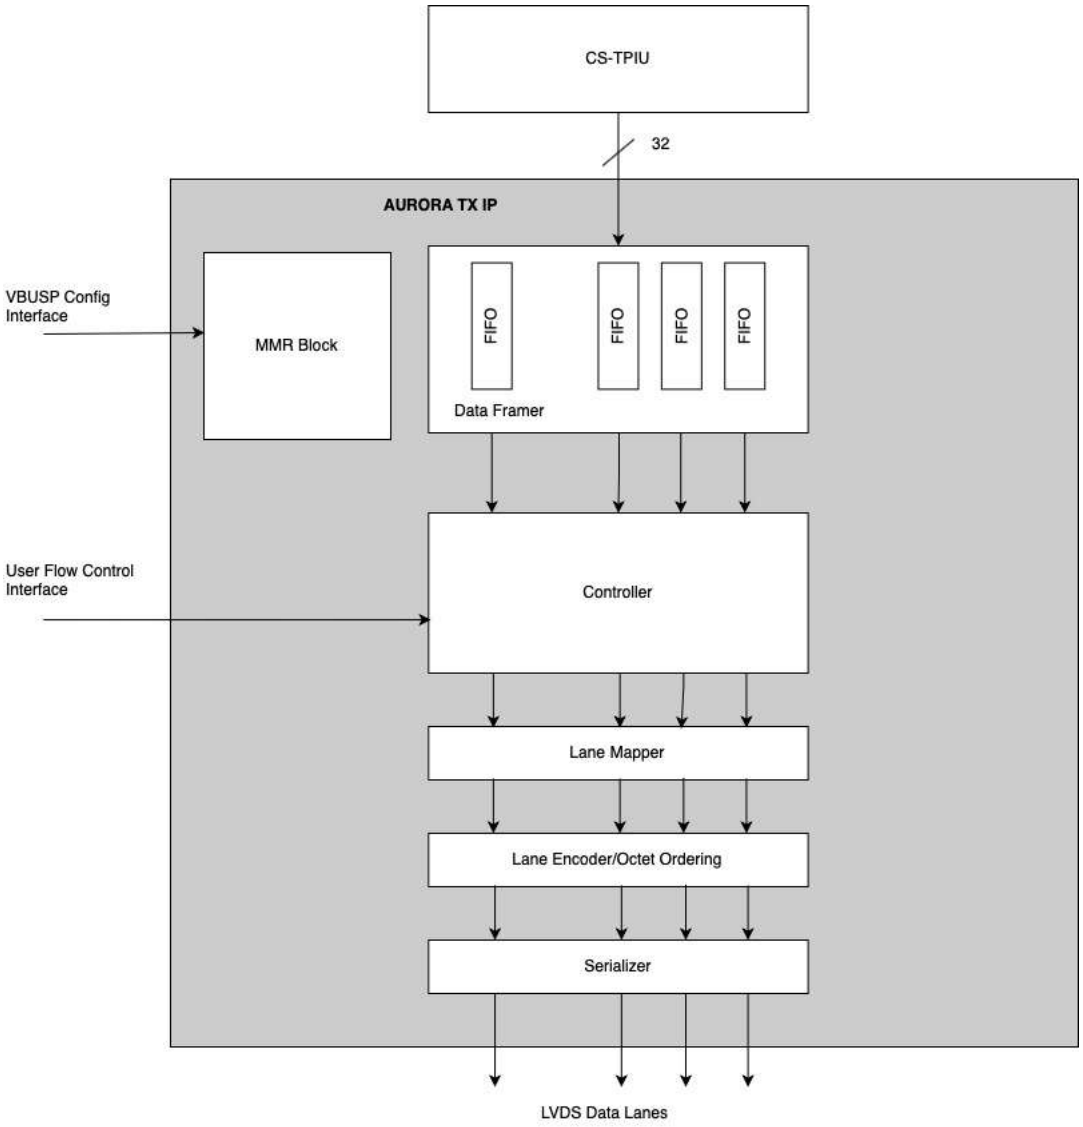

Figure 11-172. Block Diagram

11.2.3.2.2.1 Aurora UDP Packet Format

The following is the structure of a user data packet.

Figure 11-173. UDP Packet for 8b10b

Figure 11-174. UDP Packet for 64b66b

11.2.3.2.2.1.1 Header Data (Optional)

An optional 64-byte frame header is inserted at the start of every aurora packet. The header data should be written to the AURORA_TX_UDP_FRAME_HEADERn registers. AURORA_UDP_FRAME_HEADERn is an array of 32-bit registers numbered from 0 to 15.

The AURORA_TX_UDP_CONFIG_FRAME_HEADER_EN of AURORA_TX_UDP_CONFIG register specifies the amount of header data to be sent with the aurora packets in multiples of 4 bytes.

For example, if AURORA_TX_UDP_CONFIG_FRAME_HEADER_EN = 4, a 128-bit header is sent.

11.2.3.2.2.1.2 Packet Completion

The incoming TWP data is packetized to an aurora packet based on the AURORA_TX_UDP_CONFIG:AURORA_TX_UDP_CONFIG_PACK_MODE_SEL register. The available options are:

- Number of bytes transferred. This enables the delineation of aurora packets based on the number of received bytes through the TPIU interface. Configuring the AURORA_TX_UDP_SIZE register specifies the number of bytes. This register value should be a multiple of 4 bytes, as the input TPIU data-width is 32 bits. A write to the AURORA_TX_EOP_REQ_TRIGGER ends the packet abruptly without waiting for the AURORA_TX_UDP_SIZE to be completed. AURORA_TX_UDP_SIZE should be programmed to a value greater than 4.
- Number of TWP packets. This enables the delineation of aurora packets based on the number of TWP packets. Configuring the AURORA_TX_UDP_SIZE register specifies the number of packets. A write to the AURORA_TX_EOP_REQ_TRIGGER ends the packet abruptly without waiting for the AURORA_TX_UDP_SIZE to be completed.
- Software End of Packet signal. The third option enables only the AURORA_TX_EOP_REQ_TRIGGER to end the packet. An aurora packet without an ECP or SEP block is possible if this value is not asserted.

11.2.3.2.2.1.3 Idle Filtering

The idle filter removes all the padding packets from the input TWP stream for transmission through the aurora interface.

The TWP idle filter can be enabled by writing a value of 1 to the AURORA_TX_UDP_CONFIG:TWP_IDLE_FILTER_EN register.

11.2.3.2.2.1.4 Frame Sync Compression

The frame sync compression transmits N consecutive frame syncs and ignores all subsequent consecutive frame syncs. It can be used to avoid sending long frame sync packets when data is not available.

11.2.3.2.2.1.5 CRC

A CRC is computed on 32 bits of input data in a single clock cycle. The computed CRC is inserted at the end of an aurora packet. The CRC insertion is an optional feature which can be enabled by writing a value of 1 to the register AURORA_TX_UDP_CONFIG:CRC_EN.

- A 16-bit CRC is appended in 8b10b mode: $X^{16} + X^{15} + X^2 + 1$
- A 32-bit CRC is appended in 64b66b mode: $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$

11.2.3.2.2.1.6 TEST PATTERN ENABLE

When test mode is enabled, a linear feedback shift register (LSFR) is used to generate a test pattern which is transmitted as user data. Only CRC and pattern data is transmitted in a frame. The polynomial used for the LSFR is $x^{65} + x^{47} + 1$ with initial seed 0x1_6B61A3B5_EF91F65A.

A Ramp pattern is also possible. This generates data in increments of 0x1. To enable this pattern, set the AURORA_TX_TESTPATTERN_CTRL:RAMP_EN bit to 0x1.

11.2.3.2.2.1.7 BYPASS AURORA

Aurora protocol can be disabled by writing a value of 1 to the register AURORA_TX_UDP_CONFIG.BYPASS_EN.

In this mode, the unencoded 8b/10b User Data Packets are transmitted.

The LVDS Pad : LVDS Bit Clk is available.

An additional LVDS Pad is available : LVDS Frame Clock signal to indicate that atleast 1 lane has a Start of Packet/End of Packet.

No Initialization/Clock Compensation/UFC etc is sent. Only UDP.

When the receiver sees Frame Clock high, it indicates one of the following:

- Lane 0 is transmitting an SCP pair (unencoded). This is the “Start of a new packet”.
- One of the lanes is transmitting an ECP pair (unencoded) and subsequent higher lanes are transmitting an Idle packet. This is “End of packet”.

Because the uer has the qualifier of Frame Clock for SCP/ECP, there is no mistaking data as control.

LVDS Clock, Frame Clock, and data timing relationship are the same in CBUFF LVDS transmission as in AM273x and mmWave Gen1 Devices. The protocol relationship is as mentioned above.

11.2.3.2.3 Flow Control

11.2.3.2.3.1 Stall and Overflow Mechanism

Data loss due to overflow can occur only at the sniffer. There is no data loss at any other point in the chain. Overflow information is sent as an interrupt to the CPU and the Aurora Tx IP.

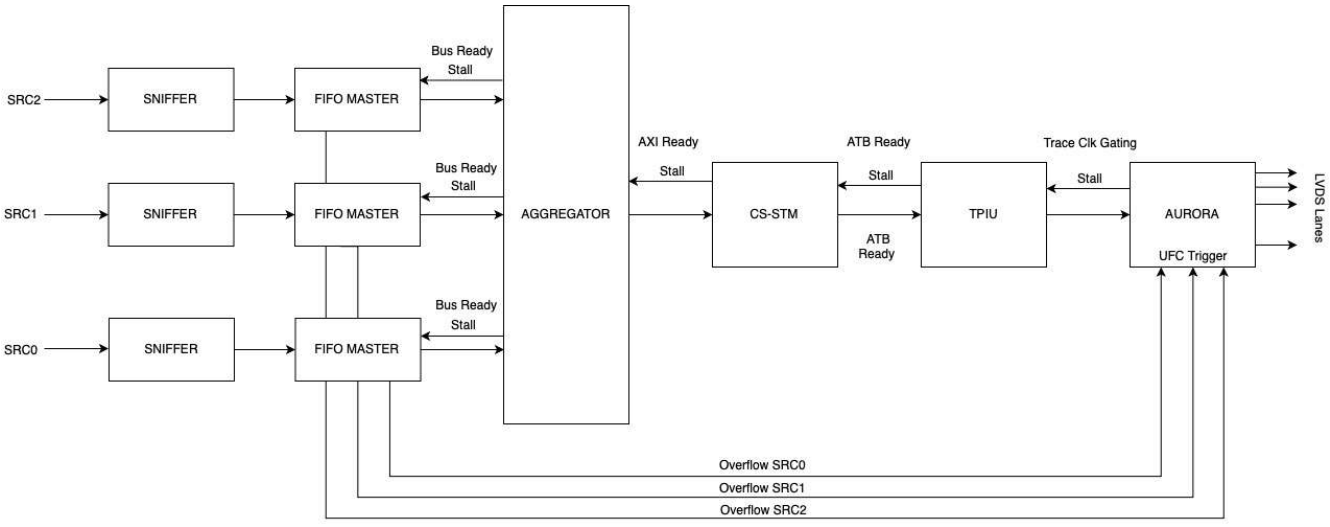

Figure 11-175. Stall and Overflow Mechanism

11.2.3.2.3.2 Aurora User Flow Control Packet

The Aurora Tx IP on receiving an overflow from a source can generate as User Flow Control Packet.

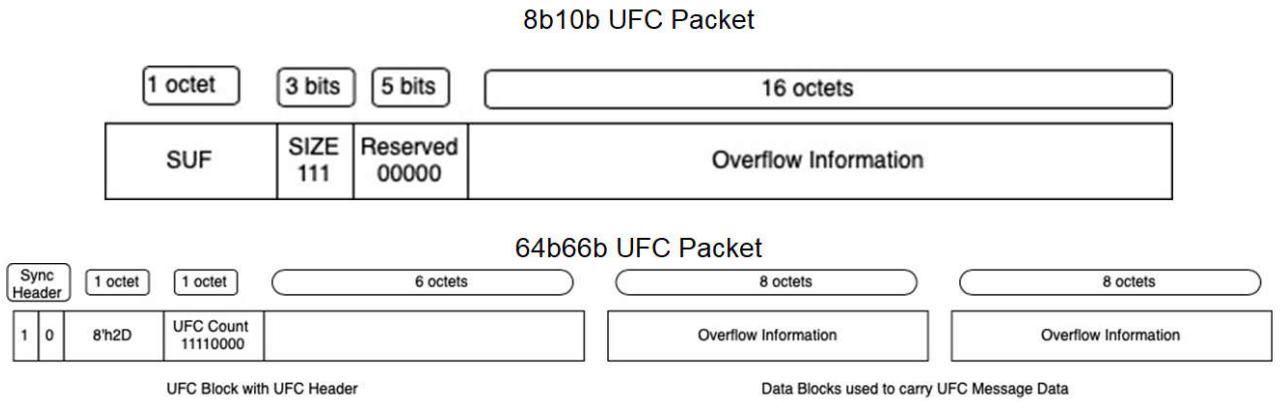

Figure 11-176. Aurora User Flow Control Packet

11.2.3.2.3.3 Aurora User Flow Control Packet Overflow Information Mapping

The following is the contents of the UFC packet.

SW_MSG0 is the data in register AURORA_TX_UFC_MESSAGE0

SW_MSG1 is the data in register AURORA_TX_UFC_MESSAGE1

Table 11-1257 shows the mapping for the hardware message.

Table 11-1257. HW_MSG Mapping

HW_MSG[63:0] Mapping	Integration
Bit [0]	Indicates SRC0 Overflow
Bit [1]	Indicates SRC1 Overflow
Bit [2]	Indicates SRC2 Overflow
Bit [3]	Indicates SRC3 Overflow
Bit [4]	Indicates SRC4 Overflow
Bit [5]	Indicates SRC5 Overflow

11.2.3.2.5 Global Flush

11.2.3.2.5.1 Architecture

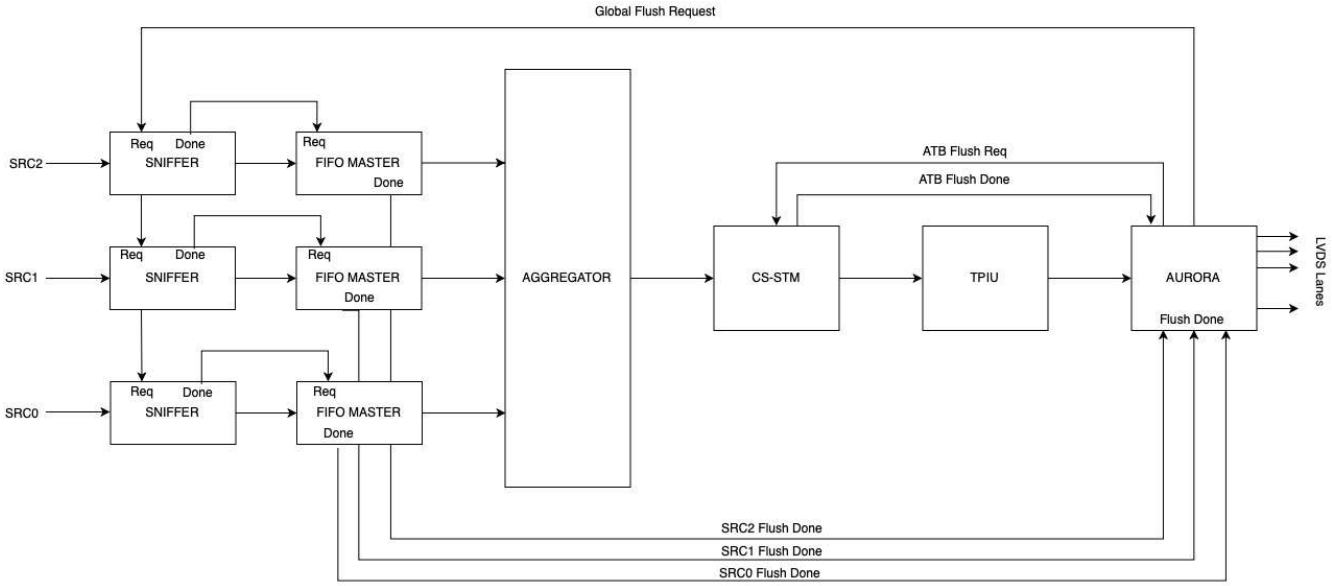

Figure 11-183. Global Flush Architecture

11.2.3.2.5.2 Sequence

Refer to Section 11.2.3.2.7 for more details on the software sequence.

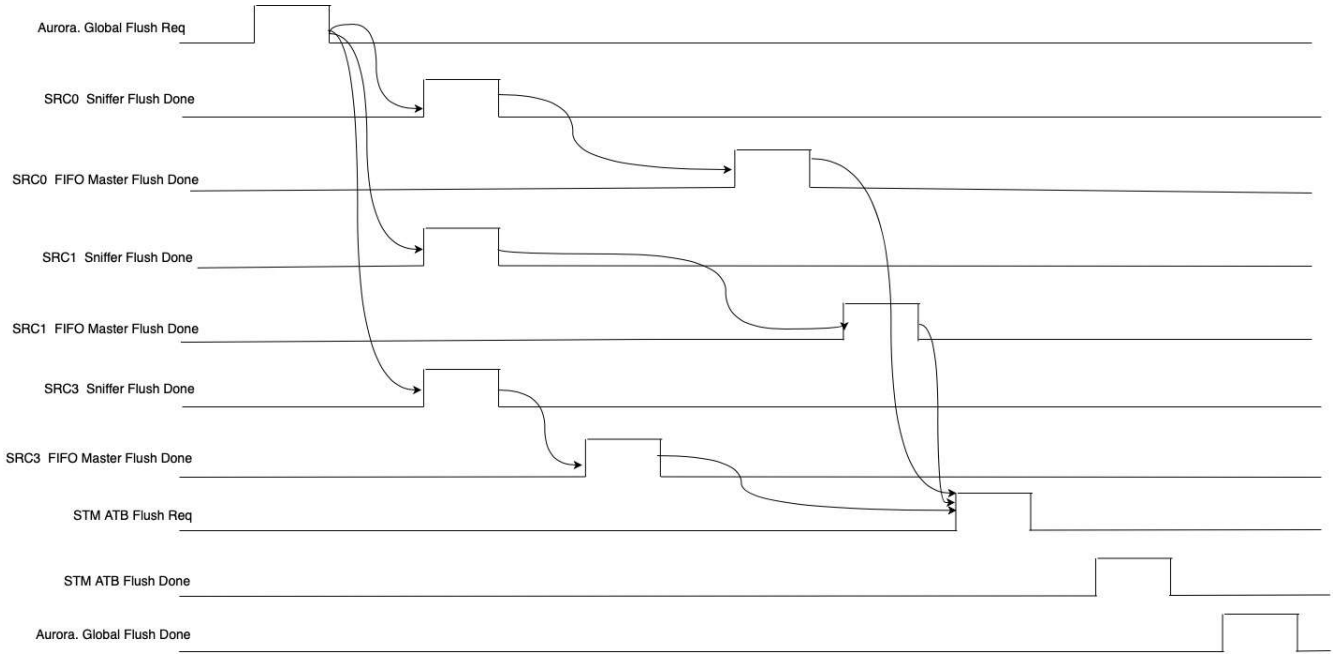

Figure 11-184. Global Flush Sequence

11.2.3.2.6 Interrupts

The IP generates two interrupt output lines. Each line has the following aggregated interrupts.

11.2.3.2.6.1 AURORA_TX_INTAGG

Table 11-1258 shows the bit aggregation to generate the interrupt. The register AURORA_TX_INTAGG_MASK is used to mask some of the aggregated events from generating an interrupt. On receiving an interrupt, the processor must read the AURORA_TX_INTAGG_STATUS register to analyze the event that caused the interrupt. Writing 0x1 to the corresponding bit set clears the interrupt. Only unmasked events generate an interrupt and their status latched in the AURORA_TX_INTAGG_STATUS register. AURORA_TX_INTAGG_STATUS_RAW latches any event assertion irrespective of the mask register.

Table 11-1258. AURORA_TX_INTAGG Bit Aggregation

Interrupt Number	Interrupt	Description
0	AURORA_TX_INIT_DONE	Indicates completion of Aurora Initialization sequence
1	AURORA_TX_FLUSH_DONE	Indicates that the Aurora IP has completed flush operation on its Data FIFO
2	AURORA_TX_EXT_FLUSH_DONE	Indicates that the MDO infrastructure has completed flushing its components
3	AURORA_TX_UFC_SENT	Indicates that a UFC packet has been generated as sent
4	AURORA_TX_CC_DONE	Indicate completion of Clock compensation sequence transmission
5	DATA_STOP_DONE	
6	AURORA_TX_EOP_DONE	Indicates completion of UDP packets
7	AURORA_TX_HEADER_DONE	Indicates completion of Frame Header transmission

11.2.3.2.6.2 AURORA_TX_ERRAGG

Table 11-1259 shows the bit aggregation to generate the interrupt. The register AURORA_TX_ERRAGG_MASK is used to mask some of the aggregated events from generating an interrupt. On receiving an interrupt, the processor must read the AURORA_TX_ERRAGG_STATUS register to analyze the event that caused the interrupt. Writing 0x1 to the corresponding bit set clears the interrupt. Only unmasked events generate an interrupt and their status latched in the AURORA_TX_ERRAGG_STATUS register. AURORA_TX_ERRAGG_STATUS_RAW latches any event assertion irrespective of the mask register.

Table 11-1259. AURORA_TX_ERRAGG Bit Aggregation

Interrupt Number	Interrupt	Description
0	AURORA_TX_UFC_ERR	Indicates that another UFC generation request was received with the IP was in the progress of transmitting the previous request

11.2.3.2.7 Programming Sequence

11.2.3.2.7.1 Programming Sequence for Typical Data Flow

1. Enable lvds PADS from TOP_RCM:
   - LVDS_PAD_CTRL0.LVDS_PAD_CTRL0 = 0
   - LVDS_PAD_CTRL1.LVDS_PAD_CTRL1 = 0
2. Program Aurora config registers:
   - AURORA_TX_CONFIG.AURORA_TX_CONFIG_ENABLE = 1
   - AURORA_TX_CONFIG.AURORA_TX_CONFIG_NUM_LANES = 1 (2 lanes active)
   - AURORA_TX_CONFIG.AURORA_TX_CONFIG_PROTOCOL_SEL = 1 (For Aurora 64b/66b)
   - AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_PACK_MODE_SEL = 1 (TWP packets)
   - AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_CRC_EN = 1
   - AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_TWP_SYNC_COMPRESSION_EN = 1
   - AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_TEST_PATTERN_EN = 0
   - AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_BYPASS_EN = 0
   - Configuring for an 8-byte Frame Header:
     AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_FRAME_HEADER_EN = 2 (Optional)
   - If FRAME_HEADER_EN > 0: AURORA_TX_UDP_FRAME_HEADER0 = 0x900
   - If FRAME_HEADER_EN > 1: AURORA_TX_UDP_FRAME_HEADER1 = 0xA00

- AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_TWP_IDLE_FILTER_EN = 1
- Mapping Logical Lane 0 and 1 to physical lanes 0 and 1, respectively: AURORA_TX_LANE_MAP= 0x98
- AURORA_TX_TWP_SYNC_CNT.AURORA_TX_TWP_SYNC_CNT_SYNC_CNT = 2
- AURORA_TX_UDP_SIZE.AURORA_TX_UDP_SIZE = 0x18
- AURORA_TX_CC_CNT.AURORA_TX_CC_CNT_SYNC_COUNT = 0x199C

3. For Aurora 64b66b only:
   - AURORA_TX_CB_CNT.AURORA_TX_CB_CNT_CB_COUNT = 0x199C
4. Lane initialization sequence count:
   - AURORA_TX_INIT_CNT_LRC.AURORA_TX_INIT_CNT_LRC = 0x3E8
   - AURORA_TX_INIT_CNT_ALIGN.AURORA_TX_INIT_CNT_ALIGN_ALIGN_LEN = 0x10
   - AURORA_TX_INIT_CNT_ALIGN.AURORA_TX_INIT_CNT_ALIGN_ALIGN_MUL = 0x7
5. Channel bonding sequence count:
   - AURORA_TX_INIT_CNT_BONDING.AURORA_TX_INIT_CNT_BONDING_BOND_LEN = 0x11
   - AURORA_TX_INIT_CNT_BONDING.AURORA_TX_INIT_CNT_BONDING_BOND_MUL = 0x5
   - AURORA_TX_INIT_CNT_BONDING.AURORA_TX_INIT_CNT_BONDING_NO_OF_IDLES = 0x4
6. For Aurora 8b10b only: Channel verification sequence count:
   - AURORA_TX_INIT_CNT_VERIFY.AURORA_TX_INIT_CNT_VERIFY_VERIFY_LEN = 0x6
   - AURORA_TX_INIT_CNT_VERIFY.AURORA_TX_INIT_CNT_VERIFY_VERIFY_MUL = 0x4
7. Assert init req:
   - AURORA_TX_INITIALIZE_REQ.AURORA_TX_INITIALIZE_REQ_TX_INIT = 1
8. Poll for init to get over:
   - AURORA_TX_INIT_STATUS.AURORA_TX_INIT_STATUS_TX_CH_RDY (to 1).
9. For a test pattern, follow this step. Else, skip to Step 11. At this stage, the test pattern can also be enabled so that Aurora starts sending test data generated internally within the Aurora module. This part is optional, and the user can skip this step to directly jump to next step:
   - AURORA_TX_TESTPATTERN_START_REQ = 1
   - Wait as long as needed to receive test pattern
   - AURORA_TX_TESTPATTERN_STOP_REQ = 1
10. Clock source selection
    - TOP_AURORA_TX.AURORA_TX_RESET_REQ.AURORA_TX_RESET_REQ_TX_RESET = 1
11. For MDO Data, follow these steps. Programming MDO registers; example scenario: Sniffer 2 , STM channel 3, threshold of 1024 bytes, write mode=0
    - SRC2_BW_CTRL Register (Offset = B0h) [Reset = X]
    - SRC2_CTRL Register (Offset = 84h) [Reset = X]
    - SRC2_THRESHOLD Register (Offset = ACh) [Reset = X]
    - SRC2_RANGE_START0 Register (Offset = 88h) [Reset = 00000000h]
    - SRC2_RANGE_END0 Register (Offset = 8Ch) [Reset = 00000000h]
    - SRC2_CHANNEL Register (Offset = B4h) [Reset = 00000000h] = 0x300 (For STM channel=3, set bits[31:8]=3)
    - Ensure guaranteed access: SRC2_CHANNEL Register (Offset = B4h) [Reset = 00000000h]
    - Enable the sniffer: TOP_MDO_INFRA.SRC2_CTRL_UN.SRC2_CTRL_ENABLE = 0x1
12. Programming STM regs; scenario: sniffer 2 , STM schannel 3, threshold of 1024 bytes, write mode=0 (SRC2_BW_CTRL Register (Offset = B0h) [Reset = X])
    - TOP_DEBUGSS.STMTCSR = 0x0 (Initializing to 0)
    - TOP_DEBUGSS.STMTCSR.EN = 0x1 (Global STM enable)
    - TOP_DEBUGSS.STMTCSR.TRACEID = 0x1 (Set trace ID to a nonzero value)
    - TOP_DEBUGSS.STMSPER.STMSPER = 0x8 (Enabling stimulus port:STM channel 3 - bit[3])
13. Assert data start:
    - AURORA_TX_DATA_START_REQ. DATA_START = 1
14. Trigger the transfer on the subsystem which the user wants to sniff.

11.2.3.2.7.2 To Stop Data Transmission with Flush of Data

1. Disable the sniffer when the user must stop sniffing:

- SRC2_BW_CTRL Register (Offset = B0h) [Reset = X]

2. Flush MDO-Aurora modules:
   - AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_PACK_MODE_SEL = 0x3
   - AURORA_TX_FLUSH_REQ.AURORA_TX_FLUSH_REQ_TRIGGER = 1
3. Poll for flush done:
   - AURORA_TX_INTAGG_STATUS_RAW.AURORA_TX_INTAGG_STATUS_RAW_INT1

11.2.3.2.7.3 To Stop Data Transmission Without Flush of Data

1. Stop Data:
   - AURORA_TX_UDP_CONFIG.AURORA_TX_UDP_CONFIG_PACK_MODE_SEL = 0x3
   - AURORA_TX_DATA_STOP_REQ.AURORA_TX_DATA_STOP_REQ_DATA_STOP = 1
2. Poll for Data Stop:
   - AURORA_TX_INTAGG_STATUS_RAW.AURORA_TX_INTAGG_STATUS_RAW_INT5

11.2.3.2.7.4 Aurora Programming Care-abouts

- Test patterns support a minimum transfer size of 16 bytes.
- Header-only transmission is not supported.
- Synch compression supports minimum 2 sync packets; less than this cannot be programmed in the AURORA_TX_TWP_SYNC_CNT register.
- For the header to be sent out before updating for next header, ensure the header done interrupt has occurred.

LVDS Aurora Muxing

Below table specifies all muxing modes for different functionality:

Register Details: TOP_CTRL:: MDO_CTRL_SRC:: MDO_CTRL_SRC_SELECT

4-Lane LVDS Packaging:

PAD NAME	Legacy Mode (Select = 2'b01)	Aurora Full data (Select = 2'b00)	Aurora bypass (Select = 2'b10)	Aurora (LOP) (Select = 2'b11)
LVDS_TXM1 LVDS_TXP1	Bit clock from cbuff	Data[2] from aurora	Bit clk from aurora	This mode is specific for 3-Lane LVDS packaging
LVDS_TXM2 LVDS_TXP2	Frame clk from cbuff	Data[3] from aurora	Frame clk from aurora	
LVDS_TXM0 LVDS_TXM0	Data[0] from cbuff	Data[0] from aurora	Data[0] from aurora	
LVDS_TXM3 LVDS_TXP3	Data[1] from cbuff	Data[1] from aurora	Data[1] from aurora	

3-Lane LVDS Packaging:

PAD NAME	Legacy Mode (Select = 2'b01)	Aurora Full data (Select = 2'b00)	Aurora bypass (Select = 2'b10)	Aurora (LOP) (Select = 2'b11)
LVDS_TXM1 LVDS_TXP1	Bit clock from cbuff	Data[2] from aurora	Bit clk from aurora	Bit clk from aurora
LVDS_TXM2 LVDS_TXP2	Frame clk from cbuff	Data[3] from aurora	Frame clk from aurora	Data[3] from aurora
LVDS_TXM0	Data[0] from cbuff	Data[0] from aurora	Data[0] from aurora	Data[0] from aurora

LVDS_TXM3 **LVDS_TXP3**	**Not used**	**Not used**	**Not used**	**Not used**

2-Lane LVDS Packaging

PAD NAME	Legacy Mode (Select = 2'b01)	Aurora Full data (Select = 2'b00)	Aurora bypass (Select = 2'b10)	Aurora (LOP) (Select = 2'b11)
LVDS_TXM1 **LVDS_TXP1**	This mode cannot be supported in 2-Lane LVDS	Data[2] from aurora	Bit clk from aurora	Bit clk from aurora
LVDS_TXM2 **LVDS_TXP2**		**Not used**	**Not used**	**Not used**
LVDS_TXM0		Data[0] from aurora	Data[0] from aurora	Data[0] from aurora
LVDS_TXM3 **LVDS_TXP3**		**Not used**	**Not used**	**Not used**

11.2.3.3 TOP_AURORA_TX Registers

This section provides information on the TOP_AURORA_TX Module Instance within this product. Each of the registers within the Module Instance is described separately below.

11.2.3.3.1 TOP_AURORA_TX Registers Mapping Summary

Table 11-1260. TOP_AURORA_TX Register Summary

Register Name	Type	Register Width (Bits)	Register Reset	Address Offset	Physical Address

10:08	PID_MAJOR	RO	0x2	
7:06	PID_CUSTOM	RO	0x0	
5:00	PID_MINOR	RO	0x13	

11.2.3.3.2.2 TOP_AURORA_TX:AURORA_TX_CONFIG

Address offset: 0x0000 0014

Physical address: 0x0306 0014

Instance: TOP_AURORA_TX

Type: RW

Table 11-1262. TOP_AURORA_TX:AURORA_TX_CONFIG

Bits	Field Name	Type	Reset	Description
18:16	AURORA_TX_CONFIG_NUM_LANES	RW	0x0	Selects the number of lanes for transmission 0 : 1 Lane 1 : 2 Lanes 2 : 3 Lanes 3 : 4 Lanes
2	AURORA_TX_CONFIG_STRICT_ALIGN	RW	1	Reserved for HW RnD. Do not modify
1	AURORA_TX_CONFIG_PROTOCOL_SEL	RW	0	Selects if the IP is in 8b/10b OR 64b/66b mode. 0 : 8b/10b 1 : 64b/66b
0	AURORA_TX_CONFIG_ENABLE	RW	0	Select to Enable or Disable IP. 0 : Disable 1 : Enable

11.2.3.3.2.3 TOP_AURORA_TX:AURORA_TX_LANE_MAP

Address offset: 0x0000 0018

Physical address: 0x0306 0018

Instance: TOP_AURORA_TX

Type: RO

Table 11-1263. TOP_AURORA_TX:AURORA_TX_LANE_MAP

Bits	Field Name	Type	Reset	Description
31:28:00	AURORA_TX_LANE_MAP_LANE7_MAP	RW	0x0	Reserved for HW RnD. Do not modify
27:24:00	AURORA_TX_LANE_MAP_LANE6_MAP	RW	0x0	Reserved for HW RnD. Do not modify
23:20	AURORA_TX_LANE_MAP_LANE5_MAP	RW	0x0	Reserved for HW RnD. Do not modify
19:16	AURORA_TX_LANE_MAP_LANE4_MAP	RW	0x0	Reserved for HW RnD. Do not modify

Table 11-1263. TOP_AURORA_TX:AURORA_TX_LANE_MAP (continued)

Bits	Field Name	Type	Reset	Description
15:12	AURORA_TX_LANE_MAP_LANE3_MAP	RW	0x0	Bits [2:0] bits determine the logical lane that is transported over the physical lane 3. 000 : Logical lane 0 is transported over physical lane 3 001 : Logical lane 1 is transported over physical lane 3. ... 111 : Logical lane 7 is transported over physical lane 3. Bit 3 determines if the entry is valid
11:08	AURORA_TX_LANE_MAP_LANE2_MAP	RW	0x0	Bits [2:0] determine the logical lane that is transported over the physical lane 2. 000 : Logical lane 0 is transported over physical lane 2 001 : Logical lane 1 is transported over physical lane 2. ... 111 : Logical lane 7 is transported over physical lane 2. Bit 3 determines if the entry is valid
7:04	AURORA_TX_LANE_MAP_LANE1_MAP	RW	0x0	Bits [2:0] determine the logical lane that is transported over the physical lane 1. 000 : Logical lane 0 is transported over physical lane 1 001 : Logical lane 1 is transported over physical lane 1. ... 111 : Logical lane 7 is transported over physical lane 1. Bit 3 determines if the entry is valid
3:00	AURORA_TX_LANE_MAP_LANE0_MAP	RW	0x0	Bits [2:0] determine the logical lane that is transported over the physical lane 0. 000 : Logical lane 0 is transported over physical lane 0 001 : Logical lane 1 is transported over physical lane 0. ... 111 : Logical lane 7 is transported over physical lane 0. Bit 3 determines if the entry is valid

11.2.3.3.2.4 TOP_AURORA_TX:AURORA_TX_UDP_CONFIG

Address offset: 0x0000 001C

Physical address: 0x0306 001C

Instance: TOP_AURORA_TX

Type: RW

Table 11-1264. TOP_AURORA_TX:AURORA_TX_UDP_CONFIG

Bits	Field Name	Type	Reset	Description
20:16	AURORA_TX_UDP_CONFIG_FRAME_HEADER_EN	RW	0x00	Header Enable configuration 0x0 : Disable Header transmission 0x1 - 0x10 : Number of 32 bit Header to be transmitted
8	AURORA_TX_UDP_CONFIG_BYPASS_EN	RW	0	Writing a value of 1'b1 : Bypass the aurora protocol. - No aurora framing is done 1'b0 : Normal Mode - Framing is done as per aurora protocol
7	AURORA_TX_UDP_CONFIG_TEST_PATTERN_EN	RW	0	Writing a value of 1'b1: Enable the test pattern generation when the aurora transmitter is in IDLE state.

Table 11-1264. TOP_AURORA_TX:AURORA_TX_UDP_CONFIG (continued)

Bits	Field Name	Type	Reset	Description
6	AURORA_TX_UDP_CONFIG_TWP_SYNC_COMPRESSION_EN	RW	0	Writing a value of 1'b1 : Enables the compression of incoming synchronisation packets. This allows only a configurable number of TWP synchronization packets define by AURORA_TX_TWP_SYNC_CNT::AURORA_TX_TWP_SYNC_CNT_SYNC_CNT to be send through aurora interface. 1'b0 : Disable the TWP padding packet filter.
5	AURORA_TX_UDP_CONFIG_CRC_EN	RW	0	Writing a value of 1'b1 : Enable the UDP CRC calculation 1'b0 : Disable UDP CRC calculation
4	AURORA_TX_UDP_CONFIG_TWP_IDLE_FILTER_EN	RW	0	Writing a value of 1'b1 : Filters out the incoming TWP Padding Packet from being send via aurora interface. 1'b0 : Disable the TWP padding packet filter.
1:00	AURORA_TX_UDP_CONFIG_PACK_MODE_SEL	RW	0x0	Configure to select AURORATX_UDP_SIZE format 0: Number of TWP Packets 1 : Number of Bytes 3: SW only

11.2.3.3.2.5 TOP_AURORA_TX:AURORA_TX_UDP_SIZE

Address offset: 0x0000 0020

Physical address: 0x0306 0020

Instance: TOP_AURORA_TX

Type: RW

Table 11-1265. TOP_AURORA_TX:AURORA_TX_UDP_SIZE

Bits	Field Name	Type	Reset	Description
31:00:00	AURORA_TX_UDP_SIZE_SIZE	RW	0x0000 0000	Configure the number of TWP packets or data bytes to be sent as one packet based on AURORATX_CTRL::PACK_MODE. If PACK_MODE=1 Value configure should be multiple of 4 Bytes.

11.2.3.3.2.6 TOP_AURORA_TX:AURORA_TX_UDP_FRAME_HEADER0

Address offset: 0x0000 0024

Physical address: 0x0306 0024

Bits	Field Name	Type	Reset	Description
16	AURORA_TX_EOP_DELAY_ENABLE	RW	0	Write 0x1 to this fiel to enable the delay configured in AURORA_TX_EOP_DEALY::DELAY
15:00	AURORA_TX_EOP_DELAY_DELAY	RW	0x0000	Internal Delay between the Data Framer and the Controller Block to stall data to the controller and force IDLES to be inserted by the controller after an ECP of a UDP. This is a feature added for Debug Purposes only and has not been tested

11.2.3.3.2.63 TOP_AURORA_TX:AURORA_TX_FLUSH_DELAY

Address offset: 0x0000 0178

Physical address: 0x0306 0178

Instance: TOP_AURORA_TX

Type: RW

Table 11-1323. TOP_AURORA_TX:AURORA_TX_FLUSH_DELAY

Bits	Field Name	Type	Reset	Description
7:00	AURORA_TX_FLUSH_DELAY_DELAY	RW	0x10	Write 0x1 to this field to enable the delay configured in AURORA_TX_EOP_DEALY::DELAY

11.2.3.3.2.64 TOP_AURORA_TX:AURORA_TX_STATUS

Address offset: 0x0000 0200

Physical address: 0x0306 0200

Instance: TOP_AURORA_TX

Type: RO

Table 11-1324. TOP_AURORA_TX:AURORA_TX_STATUS

Bits	Field Name	Type	Reset	Description
31:16:00	AURORA_TX_STATUS_DATAFRAMER	RO	0x0000	Dataframer Status fields Bit 16 : Write on Full FIFO Bit 17 : Read on Empty FIFO Bits [20:18] : Run State 000 : OFF 001 : INIT DONE 010 : TEST MODE 011 : DATA MODE 100 : WAITING FOR GLOBAL FLUSH DONE 101 : FLUSH IN PROGRESS Bits [26:21] : Data Available in Internal FIFO
3:00	AURORA_TX_STATUS_TX_STATE	RO	0x0	These read only bits indicate the state of the transmitter in 8B/10B and 64B/66B. 0000 : Reset, no transmission. 0001 : Initialization 0010 : Clock Compensation 0011 : Idle 0100 : UFC 0101 : Run (data) 0110 : Test (data) 0111 : Reserved 1111 : Reserved The user must note that these bits reflect the controller state and that the actual octets on the PHY lines may differ due to internal data path latencies.

11.2.3.3.2.65 TOP_AURORA_TX:AURORA_TX_INIT_STATUS

Address offset: 0x0000 0204

Physical address: 0x0306 0204

Instance: TOP_AURORA_TX

Type: RO

Table 11-1325. TOP_AURORA_TX:AURORA_TX_INIT_STATUS

Bits	Field Name	Type	Reset	Description
4	AURORA_TX_INIT_STATUS_TX_CH_RDY	RO	0	The status bit that indicates that the channel ready state has been reached. This bit is reset with the device reset and when the TX_RESET bit is set.
3	AURORA_TX_INIT_STATUS_TX_TXCB0	RO	0	The status bit that indicates that the TX_ TXCB0 state has been completed. This bit is reset with the device reset and when the TX_RESET bit is set.
2	AURORA_TX_INIT_STATUS_TX_INIT0	RO	0	The status bit that indicates that the TX_INIT0 state has been completed. This bit is reset with the device reset and when the TX_RESET bit is set.
1	AURORA_TX_INIT_STATUS_TX_RESET1	RO	0	The status bit that indicates that the TX_RESET1 state has been completed. This bit is reset with the device reset and when the TX_RESET bit is set.
0	AURORA_TX_INIT_STATUS_TX_RESET0	RO	0	The status bit that indicates that the TX_RESET0 state has been completed. This bit is reset with the device reset and when the TX_RESET bit is set.

11.2.3.3.2.66 TOP_AURORA_TX:AURORA_TX_CC_STATUS

Address offset: 0x0000 0208

Physical address: 0x0306 0208

Instance: TOP_AURORA_TX

Type: RW

Table 11-1326. TOP_AURORA_TX:AURORA_TX_CC_STATUS

Bits	Field Name	Type	Reset	Description
0	AURORA_TX_CC_STATUS_CC_COMP	RW	0	This bit reflects the state of the CC FSM. Read 0 : CC sequence is not complete. Read 1 : CC sequence is complete. Write 0 : No effect. Write 1 : Clears the bit. Setting the SEND_CC bit also clears this bit.

11.2.3.3.2.67 TOP_AURORA_TX:AURORA_TX_IDLE_STATUS

Address offset: 0x0000 020C

Physical address: 0x0306 020C

Instance: TOP_AURORA_TX

8	AURORA_TX_INTAGG_STATUS_INT8	RW	0	Reserved for HW RnD. Do not modify
7	AURORA_TX_INTAGG_STATUS_INT7	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of AURORA_TX_HEADER_DONE.
6	AURORA_TX_INTAGG_STATUS_INT6	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of AURORA_TX_EOP_DONE.

Table 11-1329. TOP_AURORA_TX:AURORA_TX_INTAGG_STATUS (continued)

Bits	Field Name	Type	Reset	Description
5	AURORA_TX_INTAGG_STATUS_INT5	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of DATA_STOP_DONE.
4	AURORA_TX_INTAGG_STATUS_INT4	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of AURORA_TX_CC_DONE
3	AURORA_TX_INTAGG_STATUS_INT3	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of AURORA_TX_UFC_SENT.
2	AURORA_TX_INTAGG_STATUS_INT2	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of AURORA_TX_EXT_FLUSH_DONE
1	AURORA_TX_INTAGG_STATUS_INT1	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of AURORA_TX_FLUSH_DONE
0	AURORA_TX_INTAGG_STATUS_INT0	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This field indicates assertion of AURORA_TX_INIT_DONE

11.2.3.3.2.70 TOP_AURORA_TX:AURORA_TX_INTAGG_STATUS_RAW

Address offset: 0x0000 0218

Physical address: 0x0306 0218

Instance: TOP_AURORA_TX

Type: RW

Table 11-1330. TOP_AURORA_TX:AURORA_TX_INTAGG_STATUS_RAW

Bits	Field Name	Type	Reset	Description
15	AURORA_TX_INTAGG_STATUS_RAW_INT15	RW	0	Reserved for HW RnD. Do not modify
14	AURORA_TX_INTAGG_STATUS_RAW_INT14	RW	0	Reserved for HW RnD. Do not modify
13	AURORA_TX_INTAGG_STATUS_RAW_INT13	RW	0	Reserved for HW RnD. Do not modify
12	AURORA_TX_INTAGG_STATUS_RAW_INT12	RW	0	Reserved for HW RnD. Do not modify
11	AURORA_TX_INTAGG_STATUS_RAW_INT11	RW	0	Reserved for HW RnD. Do not modify
10	AURORA_TX_INTAGG_STATUS_RAW_INT10	RW	0	Reserved for HW RnD. Do not modify
9	AURORA_TX_INTAGG_STATUS_RAW_INT9	RW	0	Reserved for HW RnD. Do not modify
8	AURORA_TX_INTAGG_STATUS_RAW_INT8	RW	0	Reserved for HW RnD. Do not modify
7	AURORA_TX_INTAGG_STATUS_RAW_INT7	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of AURORA_TX_HEADER_DONE- Indicates completion of Frame Header transmission.

Table 11-1330. TOP_AURORA_TX:AURORA_TX_INTAGG_STATUS_RAW (continued)

Bits	Field Name	Type	Reset	Description
6	AURORA_TX_INTAGG_STATUS_RAW_INT6	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of AURORA_TX_EOP_DONE-Indicates completion of UDP packets.
5	AURORA_TX_INTAGG_STATUS_RAW_INT5	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of DATA_STOP_DONE.
4	AURORA_TX_INTAGG_STATUS_RAW_INT4	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of AURORA_TX_CC_DONE-Indicate completion of Clock compensation sequence transmission.
3	AURORA_TX_INTAGG_STATUS_RAW_INT3	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of AURORA_TX_UFC_SENT-Indicates that a UFC packet has been generated as sent.
2	AURORA_TX_INTAGG_STATUS_RAW_INT2	RW	1	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of AURORA_TX_EXT_FLUSH_DONE-Indicates that the MDO infrastructure has completed flushing is components
1	AURORA_TX_INTAGG_STATUS_RAW_INT1	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of AURORA_TX_FLUSH_DONE -Indicates that the Aurora IP has completed flush operation on its Data FIFO
0	AURORA_TX_INTAGG_STATUS_RAW_INT0	RW	0	Read of 0x1 indicates a rising edge was detected on the corresponding event line . This is the raw status that will be asserted even if the event has been masked in AURORA_TX_INTAGG_MASK. This field indicates assertion of AURORA_TX_INIT_DONE - Indicates completion of Aurora Initilization sequence

11.3 Memory Interfaces

11.3.1 Quad Serial Peripheral Interface (QSPI)

11.3.1.1 Quad Serial Peripheral Interface Overview

The quad serial peripheral interface (QSPI) module is a kind of SPI module that allows single, dual, or quad read access to external SPI devices. This module has a memory mapped register interface, which provides a direct interface for accessing data from external SPI devices and thus simplifying software requirements. The QSPI works as a controller only.

The one QSPI in the device is primarily intended for fast booting from quad-SPI flash memories. Figure 11-185 shows the QSPI module overview.

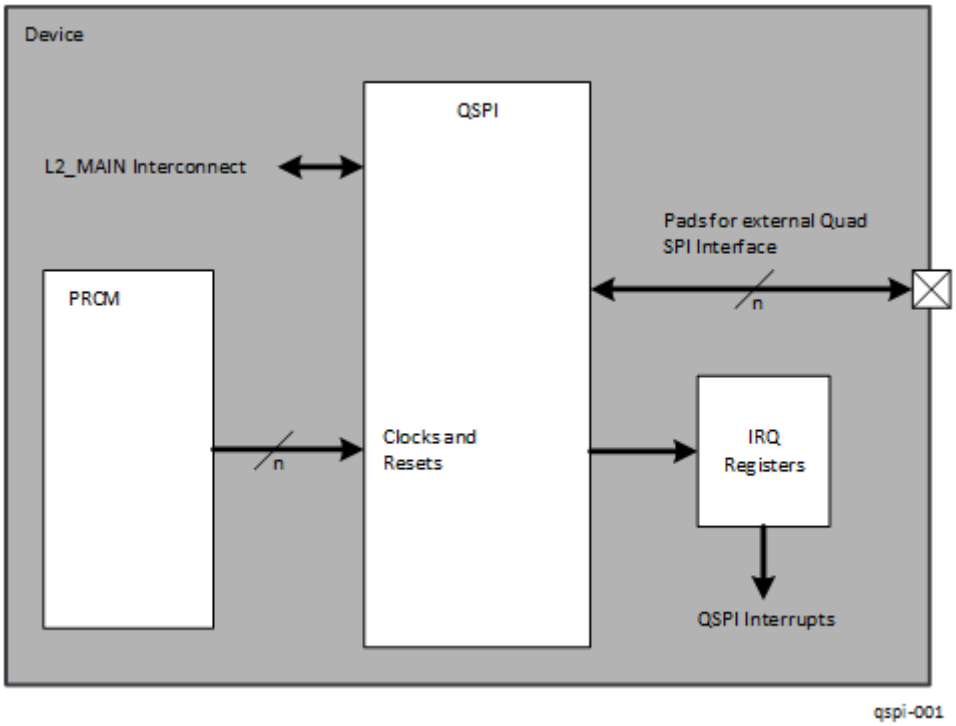

Figure 11-185. QSPI Overview

The QSPI supports the following features:

- General SPI features:
  - Programmable clock divider
  - Max four pin interface
  - Programmable length (from 1 to 128 bits) of the words transferred
  - Programmable number (from 1 to 4096) of the words transferred
  - 1 external chip-select signal
  - Support for 1 pin Write. Dual or quad writes are not supported
  - Support for 1-, 2-, or 4-pin SPI interface
  - Optional interrupt generation on word or frame (number of words) completion
  - Programmable delay between chip select activation and output data from 0 to 3 QSPI clock cycles
  - Programmable signal polarities
  - Programmable active clock edge
  - Software-controllable interface allowing for any type of SPI transfer
  - Control through L2_MAIN configuration port
- Serial flash interface (SFI) features:
  - Serial flash read/write interface
  - Additional registers for defining read and write commands to the external serial flash device
  - External flash support of up to 8 MB

- Fast read support, where fast read requires dummy bytes after address bytes; 0 to 3 dummy bytes can be configured.
- Dual read support
- Quad read support
- Little-endian support (only for memory mapped registers used to configure QSPI controller and not SPI content accesses)
- Linear increment addressing mode only

The QSPI supports only dual and quad reads. Dual or quad writes are not supported. In addition, there is no "pass through" mode supported where the data present on the QSPI input is sent to its output.

Note

The QSPI module does not support cache line wrap mode.

Note

QSPI supports downloading and booting SBL from QSPI flash, but eXecute-In-Place (XIP) and other QSPI boot options are **not** supported.

11.3.1.2 QSPI Environment

Figure 11-186 shows a typical connection of the QSPI module to the external quad-SPI flash memory.

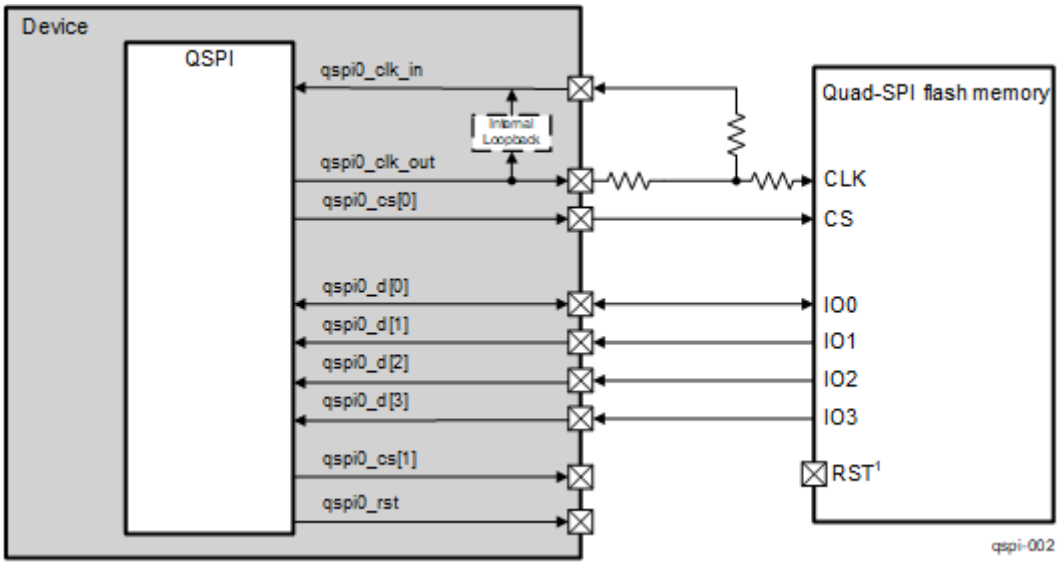

Figure 11-186. QSPI Connected to an External Quad-SPI Flash Memory

1. External flash memories that are larger than 128 Mb require an external reset pin for correct operation after SoC PORz reset. This reset must be triggered upon board reset to ensure the flash is in the correct state upon boot.

Table 11-1358 lists and describes the QSPI I/O signals.

Table 11-1358. QSPI I/O Signals

QSPI Signal/Pad name	I/O[1]	Description					
		3-pin[2] SPI Read (Single Read)	3-pin[2] SPI Write (Single Write)	4-pin[2] SPI Read (Single Read)	4-pin[2] SPI Write (Single Write)	4-pin[2] SPI Read (Dual Read)	6-pin[2] SPI Read (Quad Read)
qspi0_d[0]	IO	Used as SPI data input	Used as SPI data output	Not used	Used as SPI data output	Used as SPI data input 0	Used as SPI data input 0
qspi0_d[1]	I	Not used	Not used	Used as SPI data input	Not used	Used as SPI data input 1	Used as SPI data input 1

Table 11-1358. QSPI I/O Signals (continued)

QSPI Signal/Pad name	I/O(1)	Description					
		3-pin(2) SPI Read (Single Read)	3-pin(2) SPI Write (Single Write)	4-pin(2) SPI Read (Single Read)	4-pin(2) SPI Write (Single Write)	4-pin(2) SPI Read (Dual Read)	6-pin(2) SPI Read (Quad Read)
qspi0_d[2]	I	Not used	Not used	Not used	Not used	Not used	Used as SPI data input 2
qspi0_d[3]	I	Not used	Not used	Not used	Not used	Not used	Used as SPI data input 3
qspi0_sclk	O	Clock for the external SPI device					
qspi0_cs[0]	O	External SPI device chip-select 0					
qspi0_rtclk	I	The qspi0_sclk output must be connected to the qspi0_rtclk input, and is used for controlling the timing of the read return data when the QSPI module operates in Mode 0. In case Mode 3 is used, there is no need to connect the qspi0_sclk to the qspi0_rtclk.					

(1) I = Input; O = Output
(2) This is the pin count at the SPI flash memory side. The pin count at the device side is increased by one because of the qspi0_rtclk signal. References to the pin count throughout this chapter consider the pin count at the SPI flash memory side.

Note

To ensure proper timing, precise layout and routing requirements must be followed. For layout and routing requirements for all QSPI signals, see section “PCB Guidelines” of the device Data Manual.

11.3.1.3 QSPI Functional Description

11.3.1.3.1 QSPI Block Diagram

Initial device boot from external SPI flash memory can be accomplished through the QSPI module. The interface is a simple 4-wire SPI used for control or data transfers. The QSPI also supports a 3-wire SPI protocol where the qspi0_d[0] signal is used as a bidirectional for reads and writes. In addition, a 6-wire mode can be used to support quad read devices. Figure 11-187 shows the QSPI block diagram.

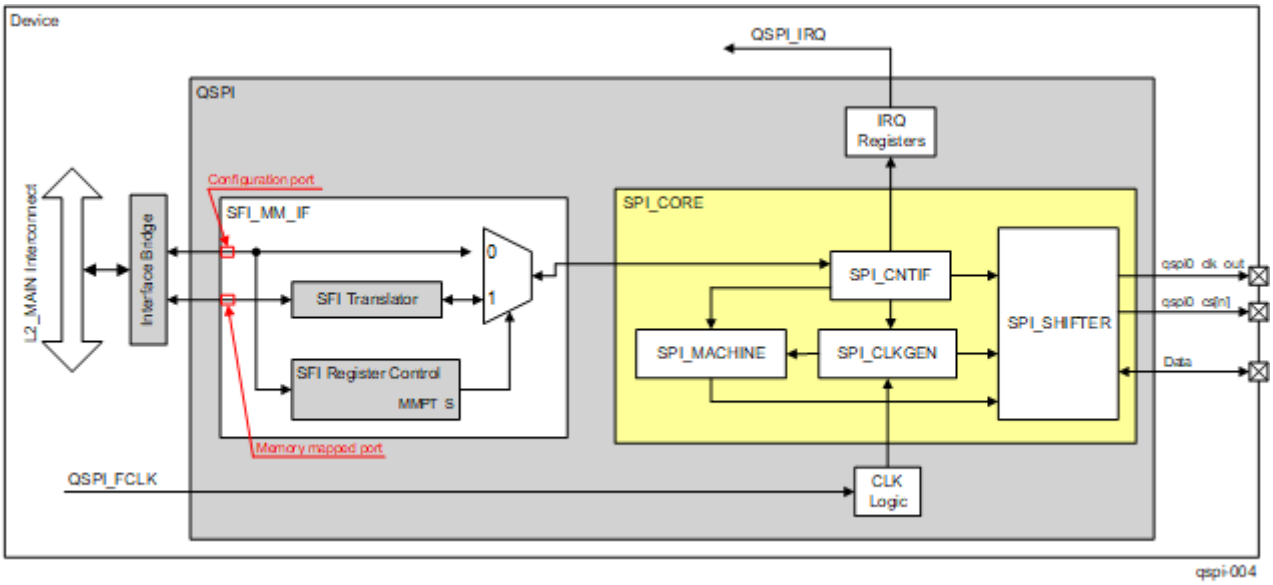

Figure 11-187. QSPI Block Diagram

The QSPI is composed of two blocks. The first one is the SFI memory-mapped interface (SFI_MM_IF) and the second one is the SPI core (SPI_CORE). The SFI_MM_IF block is associated only with SPI flash memories and is used for specifying typical for the SPI flash memories settings (read or write command, number of address and dummy bytes, and so on) unlike the SPI_CORE block, which is associated with the SPI interface itself and

is used to configure typical SPI settings (chip-select polarity, serial clock inactive state, SPI clock mode, length of the words transferred, and so on).

The SFI_MM_IF comprises the following two subblocks:
- SFI register control
- SFI translator

The SPI_CORE comprises the following four subblocks:
- SPI control interface (SPI_CNTIF)
- SPI clock generator (SPI_CLKGEN)
- SPI control state machine (SPI_MACHINE)
- SPI data shifter (SPI_SHIFTER)

In addition, an interface bridge connects the two ports (configuration port and memory-mapped port) of the SFI_MM_IF block to the L2_MAIN interconnect. There are no software controls associated with this interface bridge.

The QSPI supports long transfers through a frame-style sequence. In its generic SPI use mode, a word can be defined up to 128 bits and multiple words can be transferred during a single access. For each word, a device initiator must read or write the new data and then tell the QSPI to continue the current operation. Using this sequence, a maximum of 4096 128-bit words can be transferred in a single SPI read or write operation. This allows great flexibility when connecting the QSPI to various types of devices.

As opposed to the generic SPI use mode, the communication with serial flash-type devices requires sending a byte command, followed by sending bytes of data. Commands can be sent through the SPI_CORE block to communicate with a serial flash device; however, it is easier to do this using the SFI_MM_IF block because it is intended to ease the communication with serial flash devices. If the SPI_CORE is used to communicate with a serial flash device, software must load the command into the SPI data transfer register with additional configuration fields, perform the byte transfer, then place the data to be sent (or configure for receive) along with additional configuration fields, and perform that transfer. Reads and writes to serial flash devices are more specific. First, the read or write command byte is sent, followed by 1 to 4 bytes of address (corresponding to the address to read/write), then followed by the data write/receive phase. Data is always sent byte oriented. When the address is loaded, data can be continuously read or written, and the address will automatically increment to each byte address internally to the serial flash device.

Note

The SFI_MM_IF block only allows reading and writing to an externally connected SPI flash device. The SFI_MM_IF block does not allow reads or writes to internal configuration and status registers of the SPI flash device. These registers must be accessed through the features of the SPI_CORE block.

11.3.1.3.1.1 SFI Register Control

The SFI register control block consists of the following five configuration registers:
- QSPI_SPI_SETUP0_REG
- QSPI_SPI_SETUP1_REG
- QSPI_SPI_SETUP2_REG
- QSPI_SPI_SETUP3_REG
- QSPI_SPI_SWITCH_REG

The first four registers let the user define the following:
- Byte command for a serial flash read specified by the QSPI_SPI_SETUPi_REG[7:0] RCMD bit field
- Byte command for a serial flash write specified by the QSPI_SPI_SETUPi_REG[23:16] WCMD bit field
- Number of address bytes required for the particular type of serial flash specified by the QSPI_SPI_SETUPi_REG[9:8] NUM_A_BYTES bit field
- Number of “dummy bytes” that may be needed to support the fast read mode function of some serial flash devices. The QSPI_SPI_SETUPi_REG[11:10] NUM_D_BYTES bit field specifies the number of "dummy

bits." In addition, the QSPI_SPI_SETUPi_REG[28:24] NUM_D_BITS bit field can also specify the number of "dummy bits."
- Whether the read command is single (normal), dual, or quad read mode command. This is specified by the QSPI_SPI_SETUPi_REG[13:12] READ_TYPE bit field.
- i is equal to 0, 1, 2 and 3 and means that the QSPI_SPI_SETUPi_REG registers are associated with each of the four supported chip-selects [that is, four supported output SPI flash devices])

The QSPI_SPI_SWITCH_REG register acts as a static switch which allows the configuration port (shown in Figure 11-187) to connect directly to the SPI_CORE block, or allows the memory-mapped port (also shown in Figure 11-187) to connect to the SPI_CORE block. This is done using the QSPI_SPI_SWITCH_REG[0] MMPT_S bit.

In addition, the QSPI_SPI_SWITCH_REG[1] MM_INT_EN bit is used to enable or disable the word complete interrupt during operations using the memory-mapped port.

11.3.1.3.1.2 SFI Translator

The SFI translator block represents an FSM which, based on the configuration information loaded into the SFI register control block, converts each input read/write sequence into an SPI_CORE configuration sequence for access to the external serial flash memory.

A read sequence is converted into the following actions:
1. SPI chip-select goes active.
2. Read command byte is issued.
3. 1 to 4 address bytes, which correspond to the first address supplied, are issued.
4. 0 to 3 dummy bytes are issued, if “fast read” is supported.
5. Data bytes are read from the external SPI flash memory.
6. SPI chip-select goes inactive.

For linear addressing mode, action 5 is repeated until the byte count to be transferred reaches zero.

A write sequence is identical to a read sequence, except that a write sequence does not use dummy bytes.

Another important aspect with regard to writes is that a serial flash memory location can only be written to if the bits are erased in advance. Erased means the bits are set to 1. This means that writing only changes 1 contents to 0. It is not possible with this write to change the contents of a bit from 0 to 1. An erase command must be performed to do this operation. Erase commands cannot be executed on single byte locations. Depending on device types, there are page, block, and chip erase commands. To perform an erase command, the particular command must be sent over the SPI bus, and an internal register of the serial flash device must then be polled to determine when the erase completes. The erases must be done through the configuration port by software before performing any writes through the memory-mapped port. This means that writes are passed through to the serial flash device, but if the memory locations being modified are not properly erased before the write, the contents may not result in what was sent.

Note

The input to the SFI Memory Mapped Protocol Translator is 23 address lines. Therefore, the SFI mode of operation supports external flash size of up to 8MB

11.3.1.3.1.3 SPI Control Interface

The SPI control interface contains configuration registers used to configure the SPI core functionality of the QSPI. This block maintains all configuration settings for the SPI core (that is, settings specific for the SPI interface itself but not for the SPI flash memories).

The registers defined for this block are:
- The QSPI_PID register, which is read only and contains QSPI revision associated information
- The QSPI_SPI_CLOCK_CNTRL_REG register, which is used to control external SPI clock (qspi0_sclk)

- The QSPI_SPI_DC_REG register used to define the SPI clock mode and chip-select polarity for the four external SPI devices
- The QSPI_SPI_CMD_REG register used to control the operation of the SPI command. This register is also used to configure and transfer data.
- Four data registers used for reading the data received and for writing the data to be transferred. These registers are:
  - QSPI_SPI_DATA_REG
  - QSPI_SPI_DATA_REG_1
  - QSPI_SPI_DATA_REG_2
  - QSPI_SPI_DATA_REG_3

  These four registers compose a 128-bit shift register.
- The QSPI_SPI_STATUS_REG register, which contains status information

All of these registers can only be written if the QSPI is not busy. This means that they can be written if the QSPI_SPI_STATUS_REG[0] BUSY bit is 0x0. The QSPI becomes busy when a write to the QSPI_SPI_CMD_REG[18:16] CMD bit field is performed. Writing to this bit field starts an SPI transaction and sets the QSPI_SPI_STATUS_REG[0] BUSY bit to 0x1. The CMD bit field can be written again when the BUSY bit is 0x0. In addition, the start of the SPI transaction is synchronized to the qspi0_sclk clock and clearing of the BUSY bit is synchronized to the QSPI_FCLK clock.

The register group QSPI_SPI_DATA_REG_3, QSPI_SPI_DATA_REG_2, QSPI_SPI_DATA_REG_1 and QSPI_SPI_DATA_REG is treated as a single 128-bit word for shifting data in and out. The QSPI_SPI_DATA_REG_3 register is used for the most significant bits and the QSPI_SPI_DATA_REG is used for the least significant bits.This applies for both reads and writes. For example, after reading a 128-bit word (WLEN = 0x7F) the most significant bit of the data read, that is bit 127, will be located at QSPI_SPI_DATA_REG_3[31] position and the least significant bit, that is bit 0 of the data read, will be located at the QSPI_SPI_DATA_REG[0] position.

The data written to this register group should be right justified so that a data pre-shifting is not required. The QSPI_SPI_CMD_REG[25:19] WLEN bit field determines the location of the most significant bit and the bit position that will be shifted out first during a write. In order to shift out byte data the WLEN bit field should be set to 0x7 and the data byte should be written to the lower byte of the QSPI_SPI_DATA_REG register. By setting the word length to 0x7 the QSPI_SPI_DATA_REG register will look like a pseudo 8-bit shift register. When the user wants to write 40-bit long word the WLEN bit field should be set to 0x27, the 32 least significant bits of data should be written to the QSPI_SPI_DATA_REG and the rest 8 most significant bits of data should be written to the lower byte of the QSPI_SPI_DATA_REG_1 register. By setting WLEN to 0x27 these two registers will look like a pseudo 40-bit shift register. When the word length is greater than 64 bits the QSPI_SPI_DATA_REG_2 register is also used and the previosly described logic applies. The QSPI_SPI_DATA_REG_3 register is used together with the other three data registers when the word length is greater than 96 bits.

When dual or quad read mode is used the number of the words transferred must be even. This number is configured through the QSPI_SPI_CMD_REG[11:0] FLEN bit field.

Note

The QSPI module does not support a "pass through" mode where the data present on qspi0_d[1] is sent to qspi0_d[0], when 4-pin non-dual read mode is used. This means that setting the QSPI_SPI_CMD_REG[18:16] CMD bit field to 0x1 causes the QSPI only to read from an external device using the qspi0_d[1] pad as an input and if a write to the same external device is desired, the CMD bit field should be set to 0x2, which causes the qspi0_d[0] pad to be used as an output.

11.3.1.3.1.4 SPI Clock Generator

The SPI clock generator uses the QSPI_FCLK clock as an input, and generates the qspi0_sclk, which is a divided version of the QSPI_FCLK clock. The divide ratio is a 16-bit value configured through the QSPI_SPI_CLOCK_CNTRL_REG[15:0] DCLK_DIV bit field and thus provides a division factor in a range from

1 to 65536. The QSPI_FCLK clock is divided by the DCLK_DIV value + 1 to provide the qspi0_sclk clock. When DCLK_DIV = 0x0 the QSPI_FCLK clock equals the DCLK clock. The value in the DCLK_DIV bit field applies only when the QSPI_SPI_CLOCK_CNTRL_REG[31] CLKEN bit is set to 0x1. Figure 11-188 shows the SPI_CLKGEN block.

If the CLKEN bit is 0x0 the command specified in the QSPI_SPI_CMD_REG[18:16] CMD bit field is not executed and the QSPI_SPI_STATUS_REG[0] BUSY bit is not set. The command is executed only if the CLKEN bit is 0x1 before write to the CMD bit field.

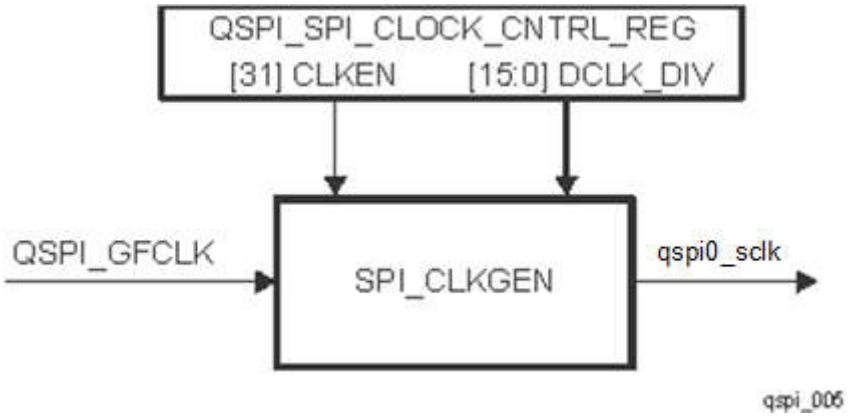

Figure 11-188. SPI_CLKGEN Block

11.3.1.3.1.5 SPI Control State-Machine

The SPI control state-machine (SPI_MACHINE) manages the operation of the SPI_CORE block. SPI_MACHINE takes control and configuration information from the registers in the SPI_CNTIF block as input and provides control information to the SPI data shifter. This information is used to control the SPI data port. The SPI_MACHINE also generates status information, which is sent back to the SPI_CNTIF block.

Writing a valid value to the QSPI_SPI_CMD_REG[18:16] CMD bit field sets immediately the QSPI_SPI_STATUS_REG[0] BUSY bit to 0x1, activates the corresponding qspi0_cs[n] (n = 0 to 1) and starts the SPI data transaction. The BUSY bit is cleared automatically when QSPI_SPI_CMD_REG[25:19] WLEN number of bits are shifted in or out. If the value of the QSPI_SPI_STATUS_REG®[27:16] WDCNT bit field is different than 0x0 and WLEN number of bits are shifted already, the SPI_MACHINE waits until another write to the CMD bit field is performed. If the command written to the CMD bit field is valid, then this increments the value of the WDCNT bit field from 0x0 and starts shifting data in or out again. This is repeated until the WDCNT bit field reaches the frame length (QSPI_SPI_CMD_REG[11:0] FLEN), that is, all words of the frame are shifted or till earlier frame termination occurs. While the SPI_MACHINE is waiting for write to the CMD bit field the corresponding qspi0_cs[n] (n = 0 to 1) remains active and the BUSY flag is set to 0x0. In addition, the bit length for each word can be changed during a frame from 1 to 128 bits using the QSPI_SPI_CMD_REG[25:19] WLEN bit field.

The SPI_MACHINE also provides a mechanism to terminate the frame earlier. This is done by writing an invalid command to the CMD bit field. An invalid command corresponds to the 0x0 and 0x4 (reserved) values of the CMD bit field. Writing one of these values when the the WDCNT bit field is not equal to 0x0 and when the BUSY flag is 0x0 terminates the frame earlier.

The corresponding qspi0_cs[n] (n = 0 to 1) becomes inactive when all words are shifted or when the frame terminates earlier.

11.3.1.3.1.6 SPI Data Shifter

The SPI data shifter handles the capture and generation of the SPI interface signals. Based on control signals from the SPI_MACHINE and SPI_CNTIF blocks, data is shifted in or out on falling or rising edge of qspi0_sclk

clock depending on the SPI clock mode selected. Table 11-1359 lists the four defined clock modes of operation for the QSPI.

Table 11-1359. SPI Clock Modes Definition

Mode	Settings in the QSPI_SPI_DC_REG Register		Description
	Value of the CKP bits	Value of the CKPH bits	
0	0	0	Data input captured on falling edge of qspi0_sclk clock. Data output generated on falling edge of qspi0_sclk clock
1	0	1	Data input captured on rising edge of qspi0_sclk clock. Data output generated on rising edge of qspi0_sclk clock
2	1	0	Data input captured on rising edge of qspi0_sclk clock. Data output generated on rising edge of qspi0_sclk clock
3	1	1	Data input captured on falling edge of qspi0_sclk clock. Data output generated on falling edge of qspi0_sclk clock

Note

Mode 1 and Mode 2 are not supported and should not be used.

The CKPi and CKPHi (i = 0 to 3) bits of the QSPI_SPI_DC_REG register control the clock modes. Each of these 4 bits corresponds to an output chip select.

Figure 11-189 shows all four clock modes. In addition, through the DDi (i = 0 to 3) bits of the QSPI_SPI_DC_REG register the data can be delayed from one to three qspi0_sclk clock cycles after the corresponding qspi0_cs[n] (n = 0 to 1) goes active. The active state of each chip-select can also be controlled through the CSPi (i = 0 to 3) bits of the QSPI_SPI_DC_REG register.

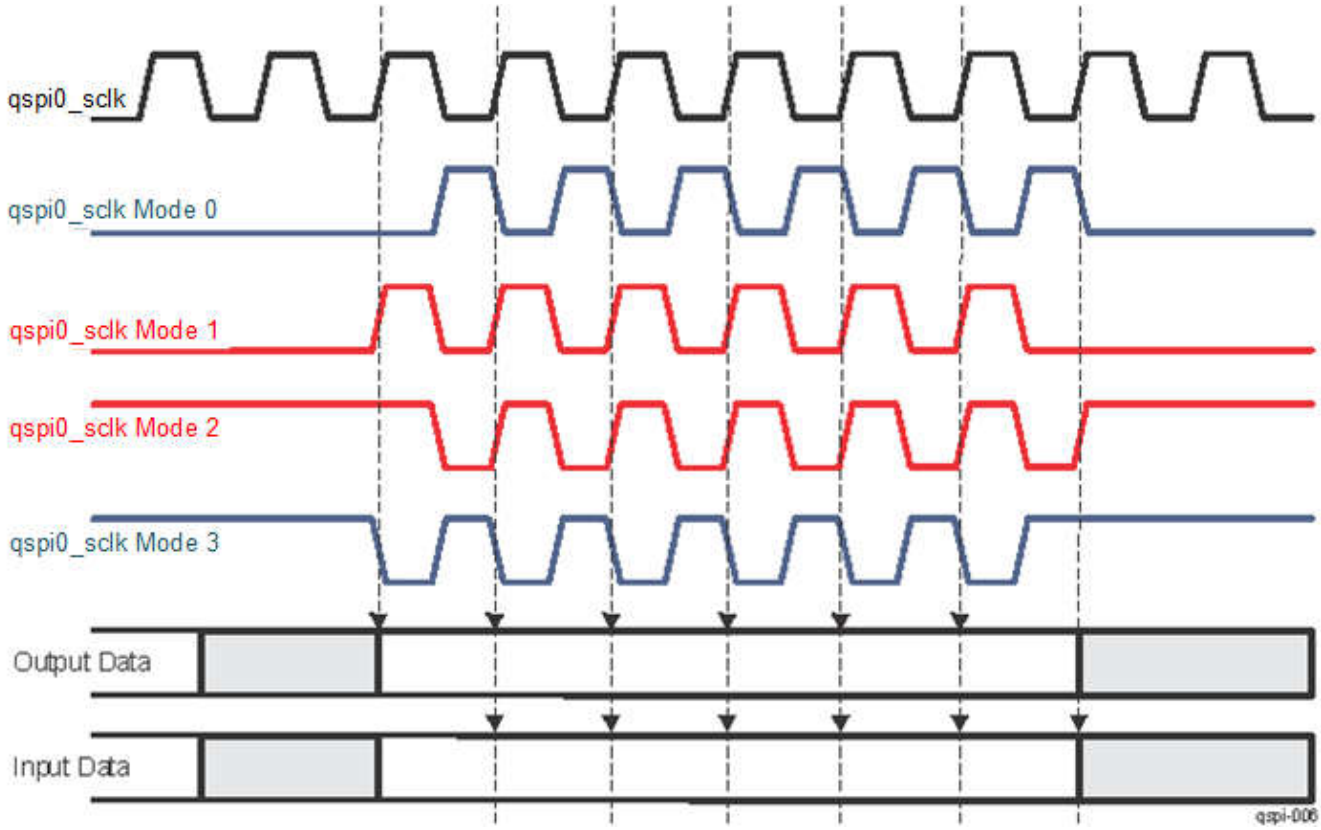

Figure 11-189. SPI Clock Modes

11.3.1.3.2 QSPI Clock Configuration

The QSPI complies with the PRCM peripheral-idle protocol. The QSPI_FCLK clock is gated based on the values loaded in the QSPI_SYSCONFIG[3:2] IDLE_MODE bit field. Three modes are supported:

- Force-idle: The QSPI_FCLK clock is gated unconditionally by the QSPI.
- No-idle: The QSPI_FCLK clock is never gated by the QSPI.
- Smart-idle: The QSPI_FCLK clock is gated by the QSPI, depending on its internal requirements.

11.3.1.3.3 QSPI Interrupt Requests

Figure 11-190 shows a logical representation of the QSPI interrupt generation scheme.

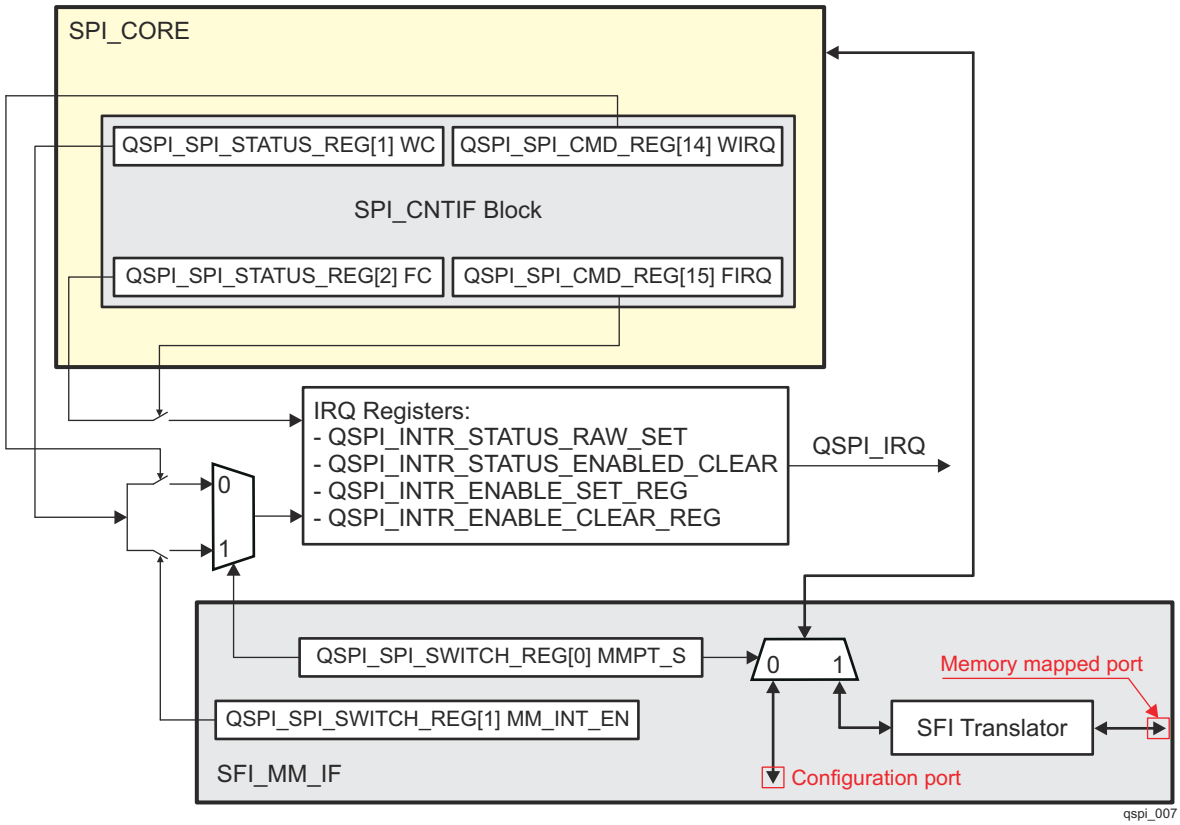

Figure 11-190. Logical Representation of the QSPI Interrupt Generation Scheme

QSPI_SPI_STATUS_REG[1] WC and QSPI_SPI_STATUS_REG[2] FC are status bits indicating whether word or frame transfer is complete. Setting the corresponding interrupt enable bit (WIRQ or FIRQ) in the QSPI_SPI_CMD_REG register allows these events (WC and FC) to generate an interrupt. The WC and FC bits are reset every time the user writes to the QSPI_SPI_CMD_REG register or reads the QSPI_SPI_STATUS_REG register. This is done to keep control parameters from changing the interface protocol signals while a transfer is in progress. Additionally, the QSPI_SPI_SWITCH_REG[1] MM_INT_EN bit is used to enable or disable the word complete interrupt during operations using the memory-mapped port.

When the QSPI_SPI_CMD_REG[14] WIRQ and QSPI_SPI_CMD_REG[15] FIRQ bits are set to 0x1 the following applies:

- The QSPI activates its interrupt line only if the interrupts are enabled by setting to 0x1 the corresponding bits in the QSPI_INTR_ENABLE_SET_REG register. These interrupts can be disabled by setting the corresponding bits in the QSPI_INTR_ENABLE_CLEAR_REG register to 0x1.
- After an interrupt has been serviced, software must clear the corresponding status flag. This is done by setting the corresponding bit in the QSPI_INTR_STATUS_ENABLED_CLEAR register to 0x1, which also clears the corresponding bit in the QSPI_INTR_STATUS_RAW_SET register. The status flags in the

QSPI_INTR_STATUS_RAW_SET register are set even if the corresponding interrupt is disabled unlike those in the QSPI_INTR_STATUS_ENABLED_CLEAR register, which are set only if the corresponding interrupt is enabled.

- The QSPI also generates an interrupt if a certain bit in the QSPI_INTR_STATUS_RAW_SET register is set to 0x1 and the corresponding interrupt is enabled through the QSPI_INTR_ENABLE_SET_REG register. This feature is useful during user software debugging. In addition, even if interrupts are not enabled a corresponding raw flag in the QSPI_INTR_STATUS_RAW_SET register is set to 0x1 when an IRQ condition occurs.
- Even if interrupts are not enabled, a certain status bit in the QSPI_INTR_STATUS_RAW_SET register can also be cleared by setting to 0x1 the corresponding bit in the QSPI_INTR_STATUS_ENABLED_CLEAR register.

It must be considered that the previously described scenario applies if the QSPI_SPI_CMD_REG[14] WIRQ and QSPI_SPI_CMD_REG[15] FIRQ bits are set to 0x1.

Note

The QSPI_IRQ interrupt line is activated only if at least one of the following conditions is met:

- The word complete interrupt is enabled:
  - during operations using the memory-mapped port by setting to 0x1 both the QSPI_SPI_SWITCH_REG[1] MM_INT_EN and QSPI_INTR_ENABLE_SET_REG[1] WIRQ_ENA_SET bits.
  - during operations using the configuration port by setting to 0x1 both the QSPI_SPI_CMD_REG[14] WIRQ and QSPI_INTR_ENABLE_SET_REG[1] WIRQ_ENA_SET bits.
- The frame complete interrupt is enabled setting to 0x1 both the QSPI_SPI_CMD_REG[15] FIRQ and QSPI_INTR_ENABLE_SET_REG[0] FIRQ_ENA_SET bits.

The QSPI_IRQ interrupt line is also activated when both the conditions are met.

Table 11-1360 lists the event flags and the corresponding mask bits of the sources which can cause interrupts.

Table 11-1360. QSPI Events

Event Flag	Event Mask	Description
QSPI_INTR_STATUS_RAW_SET[1] WIRQ_RAW QSPI_INTR_STATUS_ENABLED_CLEAR[1] WIRQ_ENA QSPI_SPI_STATUS_REG[1] WC	QSPI_INTR_ENABLE_SET_REG[1] WIRQ_ENA_SET QSPI_INTR_ENABLE_CLEAR_REG[1] WIRQ_ENA_CLR QSPI_SPI_CMD_REG[14] WIRQ	Word complete interrupt event. Asserted each time after a word is transferred or received.
QSPI_INTR_STATUS_RAW_SET[0] FIRQ_RAW QSPI_INTR_STATUS_ENABLED_CLEAR[0] FIRQ_ENA QSPI_SPI_STATUS_REG[2] FC	QSPI_INTR_ENABLE_SET_REG[0] FIRQ_ENA_SET QSPI_INTR_ENABLE_CLEAR_REG[0] FIRQ_ENA_CLR QSPI_SPI_CMD_REG[15] FIRQ	Frame complete interrupt event. Asserted each time after a frame is transferred or received.

Note

QSPI_IRQ can also be used to trigger DMA events

11.3.1.3.4 QSPI Memory Regions

Two memory regions are associated with the QSPI. The first memory region is dedicated to the configuration port. Using this memory region, all internal registers can be programmed and serial transfers made from the supported external SPI devices. The L2_MAIN start address at which the configuration port is available is 0x4820 0000. The second memory region is associated mainly with the memory-mapped port and is used for

communication directly with one of the two supported external SPI devices. The memory region for device 1 starts at 0x6000 0000 and the memory region for device 2 starts at 0x6200 0000

It is important to keep in mind that the configuration port provides an access to all the QSPI registers listed in the register summary. These are configuration registers and also four data registers. The configuration registers are used to configure typical SPI and serial flash memory settings and the four data registers are used for read and write operations. When communicating with an external SPI device (but not an SPI flash memory) the SPI_CORE module should be used and the data exchanged is available thorough these four data registers, which can be accessed only through the configuration port.

11.4 Industrial and Control Interfaces

11.4.1 Enhanced Capture (eCAP) Module

The enhanced Capture (eCAP) module is essential in systems where accurate timing of external events is important. This microcontroller implements 6 instances of the eCAP module.

11.4.1.1 Introduction

Uses for eCAP include:

- Speed measurements of rotating machinery (for example, toothed sprockets sensed via Hall sensors)
- Elapsed time measurements between position sensor pulses
- Period and duty cycle measurements of pulse train signals
- Decoding current or voltage amplitude derived from duty cycle encoded current/voltage sensors

The eCAP module described in this guide includes the following features:

- 4-event time-stamp registers (each 32 bits)
- Edge polarity selection for up to four sequenced time-stamp capture events
- Interrupt on either of the four events
- Single shot capture of up to four event time-stamps
- Continuous mode capture of time-stamps in a four-deep circular buffer
- Absolute time-stamp capture
- Difference (Delta) mode time-stamp capture
- All above resources dedicated to a single input pin
- When not used in capture mode, the ECAP module can be configured as a single channel PWM output

Note

eCAP may also be called RCSS_ECAPA.

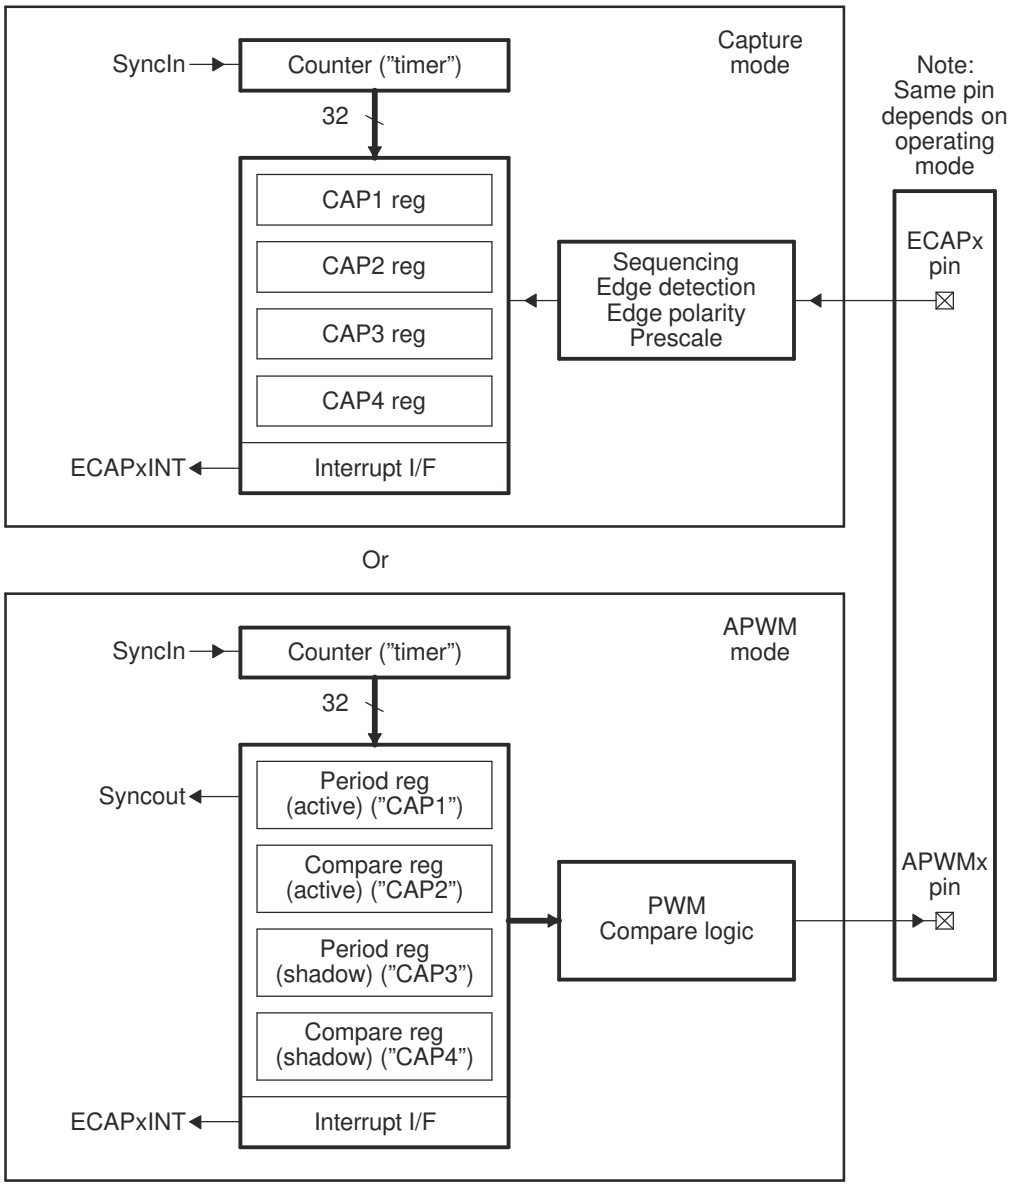
11.4.1.2 Description

In the context of this chapter, one eCAP channel has the following independent key resources:

- Dedicated input capture pin
- 32-bit time base (counter)
- 4 × 32-bit time-stamp capture registers (CAP1-CAP4)
- 4-stage sequencer (Modulo4 counter) that is synchronized to external events, ECAP pin rising/falling edges
- Independent edge polarity (rising/falling edge) selection for all 4 events
- Input capture signal prescaling (from 2 to 62)
- One-shot compare register (2 bits) to freeze captures after 1 to 4 time-stamp events
- Control for continuous time-stamp captures using a 4-deep circular buffer (CAP1-CAP4) scheme
- Interrupt capabilities on any of the 4 capture events

11.4.1.3 Capture and APWM Operating Mode

You can use the eCAP module resources to implement a single-channel PWM generator (with 32 bit capabilities) when it is not being used for input captures. The counter operates in count-up mode, providing a time-base for asymmetrical pulse width modulation (PWM) waveforms. The CAP1 and CAP2 registers become the active period and compare registers, respectively, while CAP3 and CAP4 registers become the period and capture shadow registers, respectively. Figure 11-191 is a high-level view of both the capture and auxiliary pulse-width modulator (APWM) modes of operation.



A. A single pin is shared between CAP and APWM functions. In capture mode, it is an input; in APWM mode, it is an output.

B. In APWM mode, writing any value to CAP1/CAP2 active registers also writes the same value to the corresponding shadow registers CAP3/CAP4. This emulates immediate mode. Writing to the shadow registers CAP3/CAP4 invokes the shadow mode.

Figure 11-191. Capture and APWM Modes of Operation

11.4.1.4 Capture Mode Description

Figure 11-192 shows the various components that implement the capture function.

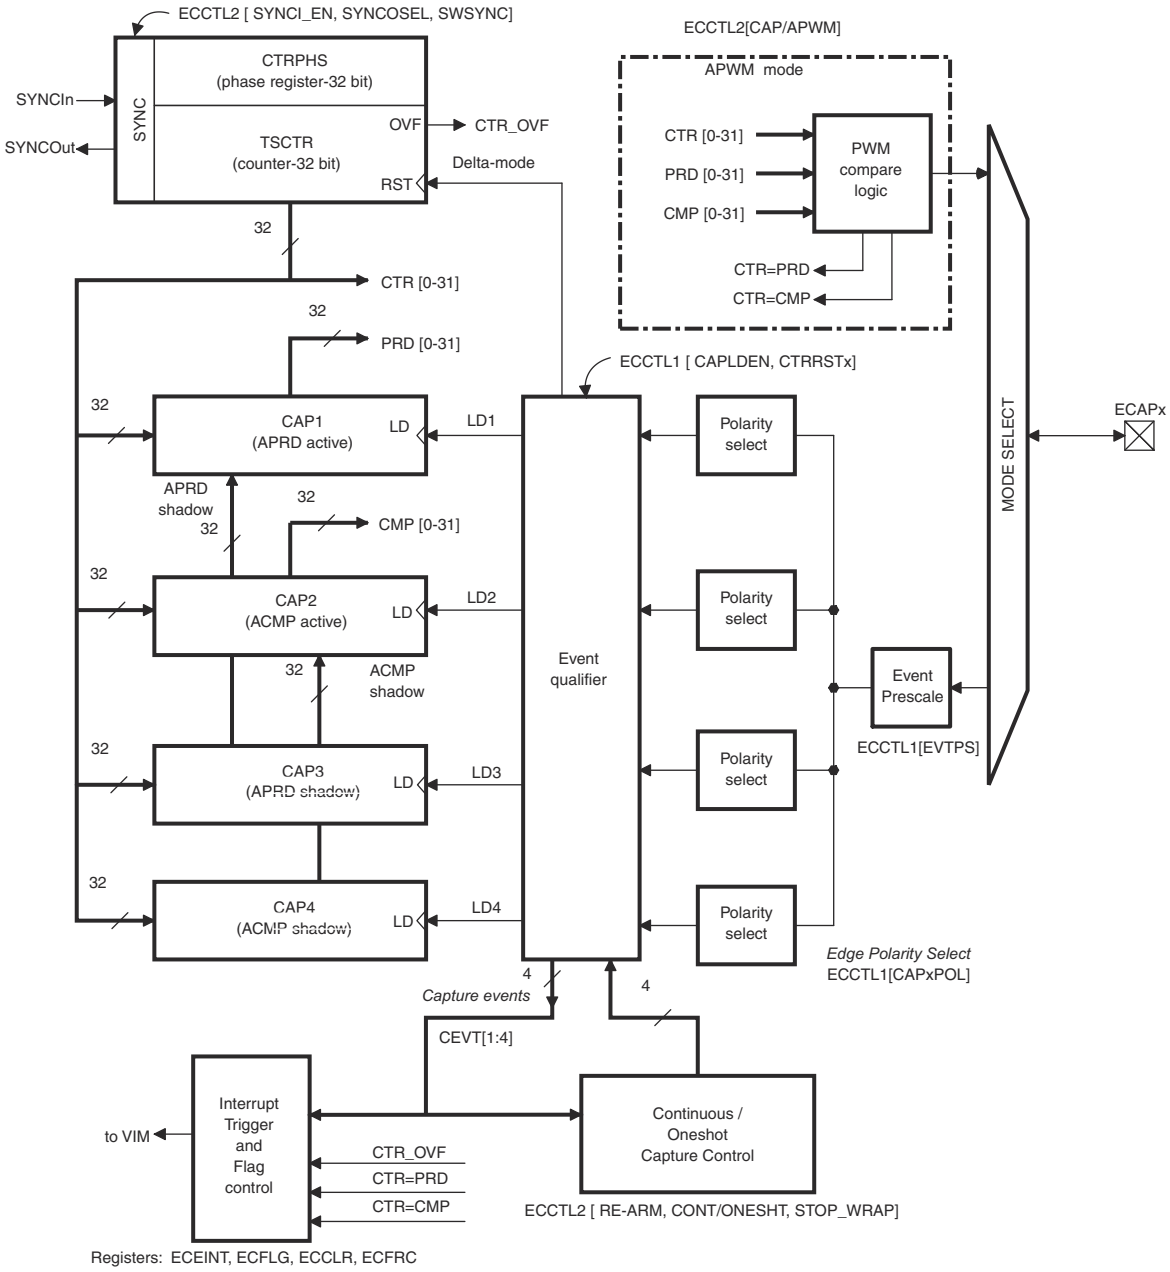


Figure 11-192. Capture Function Diagram

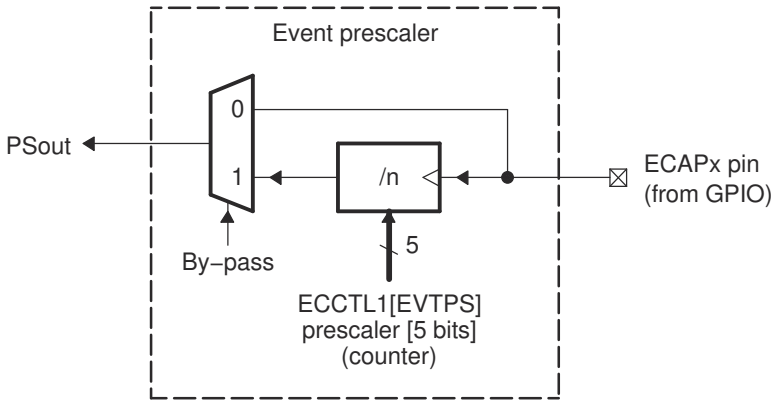
11.4.1.4.1 Event Prescaler

- An input capture signal (pulse train) can be prescaled by N = 2-62 (in multiples of 2) or can bypass the prescaler.

  This is useful when very high frequency signals are used as inputs. Figure 11-193 shows a functional diagram and Figure 11-194 shows the operation of the prescale function.



A. When a prescale value of 1 is chosen (that is, ECCTL1[13:9] = 0,0,0,0,0) the input capture signal by-passes the prescale logic completely.

Figure 11-193. Event Prescale Control

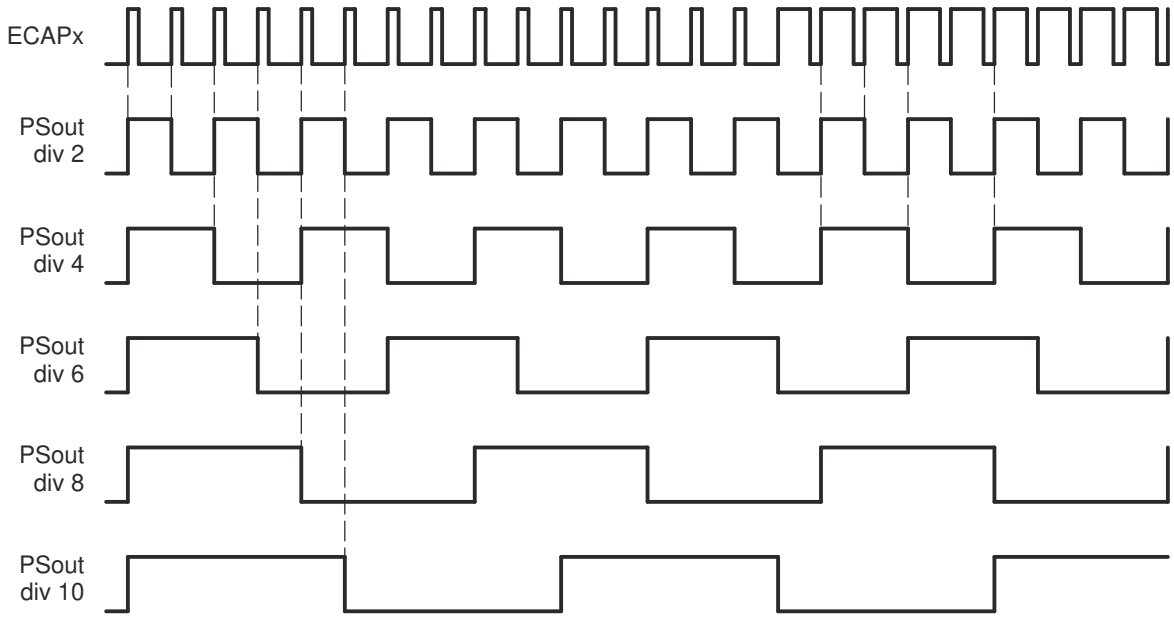


Figure 11-194. Prescale Function Waveforms

11.4.1.4.2 Edge Polarity Select and Qualifier

- Four independent edge polarity (rising edge/falling edge) selection MUXes are used, one for each capture event.
- Each edge (up to 4) is event qualified by the Modulo4 sequencer.
- The edge event is gated to its respective CAPx register by the Mod4 counter. The CAPx register is loaded on the falling edge.

11.4.1.4.3 Continuous/One-Shot Control

- The Mod4 (2 bit) counter is incremented via edge qualified events (CEVT1-CEVT4).
- The Mod4 counter continues counting (0->1->2->3->0) and wraps around unless stopped.
- A 2-bit stop register is used to compare the Mod4 counter output, and when equal stops the Mod4 counter and inhibits further loads of the CAP1-CAP4 registers. This occurs during one-shot operation.

The continuous/one-shot block controls the start/stop and reset (zero) functions of the Mod4 counter via a mono-shot type of action that can be triggered by the stop-value comparator and re-armed via software control.

Once armed, the eCAP module waits for 1-4 (defined by stop-value) capture events before freezing both the Mod4 counter and contents of CAP1-4 registers (that is, time-stamps).

Re-arming prepares the eCAP module for another capture sequence. Also re-arming clears (to zero) the Mod4 counter and permits loading of CAP1-4 registers again, providing the CAPLDEN bit is set.

In continuous mode, the Mod4 counter continues to run (0->1->2->3->0, the one-shot action is ignored, and capture values continue to be written to CAP1-4 in a circular buffer sequence.

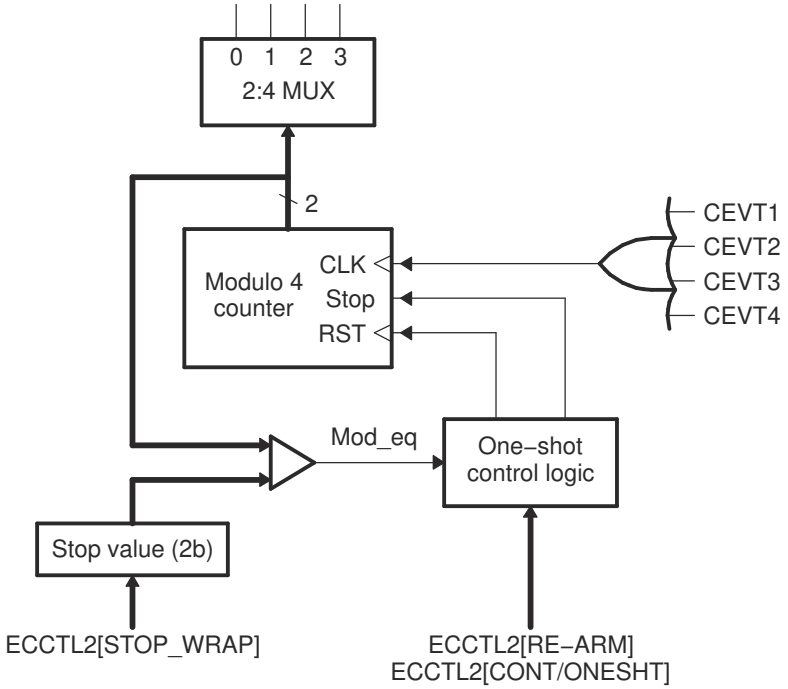

Figure 11-195. Details of the Continuous/One-shot Block

11.4.1.4.4 32-Bit Counter and Phase Control

This counter provides the time-base for event captures, and is clocked via the system clock.

A phase register is provided to achieve synchronization with other counters, via a hardware and software forced sync. This is useful in APWM mode when a phase offset between modules is needed.

On any of the four event loads, an option to reset the 32-bit counter is given. This is useful for time difference capture. The 32-bit counter value is captured first, then it is reset to 0 by any of the LD1-LD4 signals.

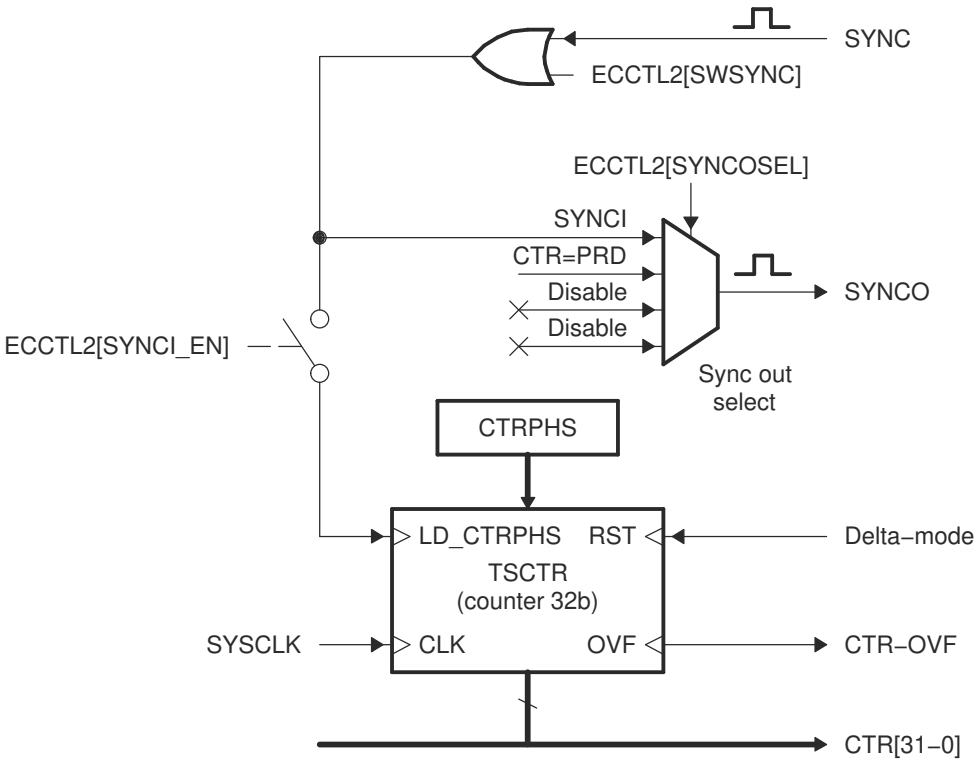

Figure 11-196. Details of the Counter and Synchronization Block

11.4.1.4.5 CAP1-CAP4 Registers

These 32-bit registers are fed by the 32-bit counter timer bus, CTR[0-31] and are loaded (that is, capture a time-stamp) when their respective LD inputs are strobed.

Loading of the capture registers can be inhibited via control bit CAPLDEN. During one-shot operation, this bit is cleared (loading is inhibited) automatically when a stop condition occurs, that is, StopValue = Mod4.

CAP1 and CAP2 registers become the active period and compare registers, respectively, in APWM mode.

CAP3 and CAP4 registers become the respective shadow registers (APRD and ACMP) for CAP1 and CAP2 during APWM operation.

11.4.1.4.6 Interrupt Control

An interrupt can be generated on capture events (CEVT1-CEVT4, CTROVF) or APWM events (CTR = PRD, CTR = CMP).

A counter overflow event (FFFFFFFF->00000000) is also provided as an interrupt source (CTROVF).

The capture events are edge and sequencer qualified (that is, ordered in time) by the polarity select and Mod4 gating, respectively.

One of these events can be selected as the interrupt source (from the eCAPx module) going to the PIE.

Seven interrupt events (CEVT1, CEVT2, CEVT3, CEVT4, CNTOVF, CTR=PRD, CTR=CMP) can be generated. The interrupt enable register (ECEINT) is used to enable/disable individual interrupt event sources. The interrupt flag register (ECFLG) indicates if any interrupt event has been latched and contains the global interrupt flag bit (INT). An interrupt pulse is generated to the PIE only if any of the interrupt events are enabled, the flag bit is 1, and the INT flag bit is 0. The interrupt service routine must clear the global interrupt flag bit and the serviced event via the interrupt clear register (ECCLR) before any other interrupt pulses are generated. You can force an interrupt event via the interrupt force register (ECFRC). This is useful for test purposes.

Note: The CEVT1, CEVT2, CEVT3, CEVT4 flags are only active in capture mode (ECCTL2[CAP_APWM == 0]). The CTR_PRD, CTR_CMP flags are only valid in APWM mode (ECCTL2[CAP_APWM == 1]). CNTOVF flag is valid in both modes.

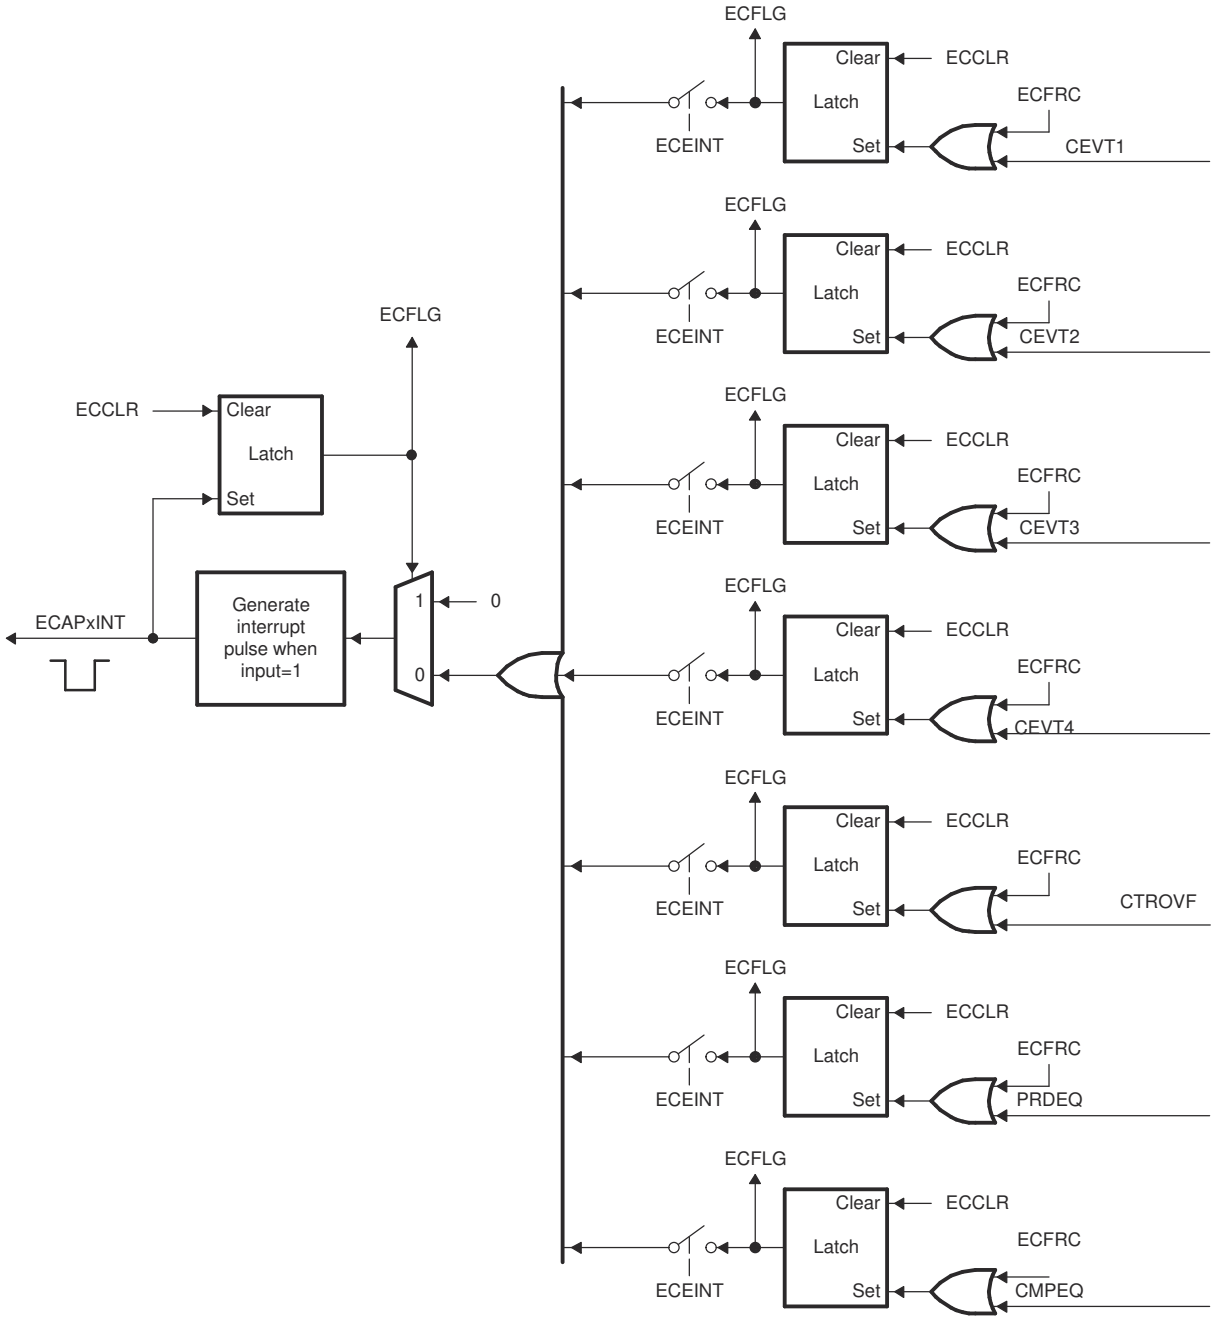

Figure 11-197. Interrupts in eCAP Module

11.4.1.4.7 Shadow Load and Lockout Control

In capture mode, this logic inhibits (locks out) any shadow loading of CAP1 or CAP2 from APRD and ACMP registers, respectively.

In APWM mode, shadow loading is active and two choices are permitted:

- Immediate - APRD or ACMP are transferred to CAP1 or CAP2 immediately upon writing a new value.

- On period equal, that is, CTR[31:0] = PRD[31:0]

11.4.1.4.8 APWM Mode Operation

Main operating highlights of the APWM section:

- The time-stamp counter bus is made available for comparison via 2 digital (32-bit) comparators.
- When CAP1/2 registers are not used in capture mode, their contents can be used as Period and Compare values in APWM mode.
- Double buffering is achieved via shadow registers APRD and ACMP (CAP3/4). The shadow register contents are transferred over to CAP1/2 registers either immediately upon a write, or on a CTR = PRD trigger.
- In APWM mode, writing to CAP1/CAP2 active registers will also write the same value to the corresponding shadow registers CAP3/CAP4. This emulates immediate mode. Writing to the shadow registers CAP3/CAP4 will invoke the shadow mode.
- During initialization, you must write to the active registers for both period and compare. This automatically copies the initial values into the shadow values. For subsequent compare updates, that is, during run-time, you only need to use the shadow registers.

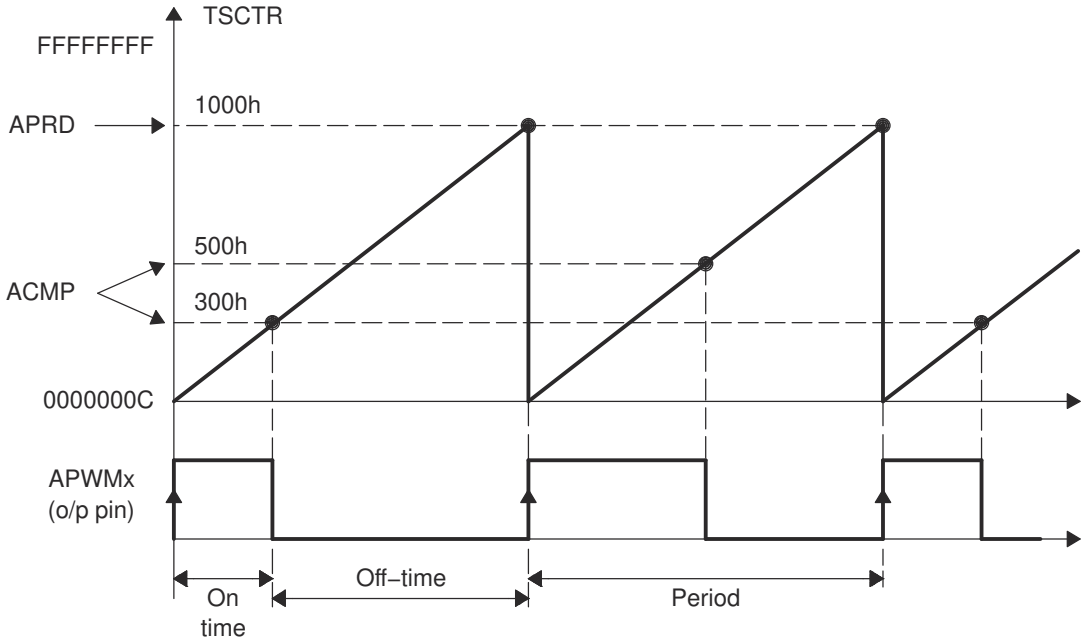

Figure 11-198. PWM Waveform Details Of APWM Mode Operation

The behavior of APWM active high mode (APWMPOL == 0) is as follows:

```
CMP = 0x00000000, output low for duration of period (0% duty)
```

```
CMP = 0x00000001, output high 1 cycle
```

```
CMP = 0x00000002, output high 2 cycles
```

```
CMP = PERIOD, output high except for 1 cycle (<100% duty)
```

```
CMP = PERIOD+1, output high for complete period (100% duty)
```

```
CMP > PERIOD+1, output high for complete period
```

The behavior of APWM active low mode (APWMPOL == 1) is as follows:

```
CMP = 0x00000000, output high for duration of period (0% duty)
```

```
CMP = 0x00000001, output low 1 cycle
```

```
CMP = 0x00000002, output low 2 cycles
```

```
CMP = PERIOD, output low except for 1 cycle (<100% duty)
```

```
CMP = PERIOD+1, output low for complete period (100% duty)
```

```
CMP > PERIOD+1, output low for complete period
```

11.4.1.5 ECAP Registers

Table 11-1382 lists the memory-mapped registers for the ECAP. All register offset addresses not listed in Table 11-1382 can be considered as reserved locations and the register contents should not be modified.

The base address for the control registers is FCF7 9300h for eCAP1, FCF7 9400h for eCAP2, FCF7 9500h for eCAP3, FCF7 9600h for eCAP4, FCF7 9700h for eCAP5, and FCF7 9800h for eCAP6.

Table 11-1386. CAP1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CAP1	R/W	0h	This register can be loaded (written) by: Time-Stamp (that is, counter value) during a capture event. Software - can be useful for test purposes. APRD shadow register (that is, CAP4) when used in APWM mode.

11.4.1.5.4 CAP2 Register (Offset = Ch) [reset = 0h]

CAP2 is shown in Figure 11-202 and described in Table 11-1387.

Return to Summary Table.

In APWM mode, writing to CAP1/CAP2 active registers also writes the same value to the corresponding shadow registers CAP3/CAP4. This emulates immediate mode. Writing to the shadow registers CAP3/CAP4 invokes the shadow mode.

Figure 11-202. CAP2 Register

7	6	5	4	3	2	1	0
SYNCO_SEL		SYNCI_EN	TSCTRSTOP	REARM	STOP_WRAP		CONT_ONESHT
R/W-0h		R/W-0h	R/W-0h	R/W-0h	R/W-1h		R/W-0h

Table 11-1392. ECCTL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
15-11	RESERVED	R	0h	Reserved
10	APWMPOL	R/W	0h	APWM output polarity select. This is applicable only in APWM operating mode. 0h = Output is active high (that is, Compare value defines high time). 1h = Output is active low (that is, Compare value defines low time).
9	CAP_APWM	R/W	0h	CAP/APWM operating mode select. 0h = ECAP module operates in capture mode. This mode forces the following configuration: inhibits TSCTR resets via CTR = PRD event, inhibits shadow loads on CAP1 and CAP2 registers, permits user to enable CAP1 to CAP4 register load, CAPx and APWMx pin operates as a capture input. 1h = ECAP module operates in APWM mode. This mode forces the following configuration: resets TSCTR on CTR = PRD event (period boundary, permits shadow loading on CAP1 and CAP2 registers, disables loading of time-stamps into CAP1 to CAP4 registers, CAPx and APWMx pin operates as a APWM output.
8	SWSYNC	R/W	0h	Software-forced Counter (TSCTR) Synchronizing. This provides a convenient software method to synchronize some or all ECAP time bases. In APWM mode, the synchronizing can also be done via the CTR = PRD event. Note: Selection CTR = PRD is meaningful only in APWM mode, however, you can choose it in CAP mode if you find doing so is useful. 0h = Writing a 0 has no effect. Reading always returns 0. 1h = Writing a 1 forces a TSCTR shadow load of current ECAP module and any ECAP modules down-stream providing the SYNCO_SEL bits are 0,0. After writing a 1, this bit returns to 0.
7-6	SYNCO_SEL	R/W	0h	Sync-Out Select. 0h = Select sync-in event to be the sync-out signal (pass through). 1h = Select CTR = PRD event to be the sync-out signal. 2h = Disable sync out signal. 3h = Disable sync out signal.
5	SYNCI_EN	R/W	0h	Counter (TSCTR) Sync-In select mode. 0h = Disable sync-in option. 1h = Enable counter (TSCTR) to be loaded from CTRPHS register upon either a SYNCI signal or a software force event.

Table 11-1392. ECCTL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	TSCTRSTOP	R/W	0h	Time Stamp (TSCTR) Counter Stop (freeze) Control. 0h = TSCTR is stopped. 1h = TSCTR is free-running.
3	REARM	R/W	0h	One-Shot Re-Arming Control, that is, wait for stop trigger. Note: The re-arm function is valid in one shot or continuous mode. 0h = Writing a 0 has no effect. Reading always returns 0. 1h = Arms the one-shot sequence as follows: resets the Mod4 counter to 0, unfreezes the Mod4 counter, enables capture register loads.
2-1	STOP_WRAP	R/W	1h	Stop value for one-shot mode. This is the number (between 1-4) of captures allowed to occur before the CAP(1-4) registers are frozen, that is, capture sequence is stopped. Notes: STOP_WRAP is compared to Mod4 counter and, when equal, two actions occur: 1) Mod4 counter is stopped (frozen). 2) Capture register loads are inhibited. In one-shot mode, further interrupt events are blocked until re-armed. Wrap value for continuous mode. This is the number (between 1-4) of the capture register in which the circular buffer wraps around and starts again. 0h = Stop after Capture Event 1 in one-shot mode. Wrap after Capture Event 1 in continuous mode. 1h = Stop after Capture Event 2 in one-shot mode. Wrap after Capture Event 2 in continuous mode. 2h = Stop after Capture Event 3 in one-shot mode. Wrap after Capture Event 3 in continuous mode. 3h = Stop after Capture Event 4 in one-shot mode. Wrap after Capture Event 4 in continuous mode.
0	CONT_ONESHT	R/W	0h	Continuous or one-shot mode control. This is applicable only in capture mode. 0h = Operate in continuous mode. 1h = Operate in one-shot mode.

11.4.1.5.9 ECCTL1 Register (Offset = 2Ah) [reset = 0h]

ECCTL1 is shown in Figure 11-206 and described in Table 11-1393.

11.4.1.5.11 ECEINT Register (Offset = 2Eh) [reset = 0h]

ECEINT is shown in Figure 11-208 and described in Table 11-1395.

Return to Summary Table.

The interrupt enable bits (CEVT1, ...) block any of the selected events from generating an interrupt. Events are still latched into the flag bit (ECFLG register) and can be forced/cleared via the ECFRC/ECCLR registers. The proper procedure for configuring peripheral modes and interrupts is as follows: 1) Disable global interrupts. 2) Stop eCAP counter. 3) Disable eCAP interrupts. 4) Configure peripheral registers. 5) Clear spurious eCAP interrupt flags. 6) Enable eCAP interrupts. 7) Start eCAP counter. 8) Enable global interrupts.

```

11.4.1.6.1 Example 1 - Absolute Time-Stamp Operation Rising Edge Trigger

Figure 11-211 shows an example of continuous capture operation (Mod4 counter wraps around). In this figure, TSCTR counts-up without resetting and capture events are qualified on the rising edge only, this gives period (and frequency) information.

On an event, the TSCTR contents (that is, time-stamp) is first captured, then Mod4 counter is incremented to the next state. When the TSCTR reaches FFFF FFFFh (that is, maximum value), it wraps around to 0000 0000h (not shown in Figure 11-211), if this occurs, the CTROVF (counter overflow) flag is set, and an interrupt (if enabled) occurs, CTROVF (counter overflow) Flag is set, and an Interrupt (if enabled) occurs. Captured Time-stamps are valid at the point indicated by the diagram, that is, after the 4th event, hence event CEVT4 can conveniently be used to trigger an interrupt and the CPU can read data from the CAPx registers.

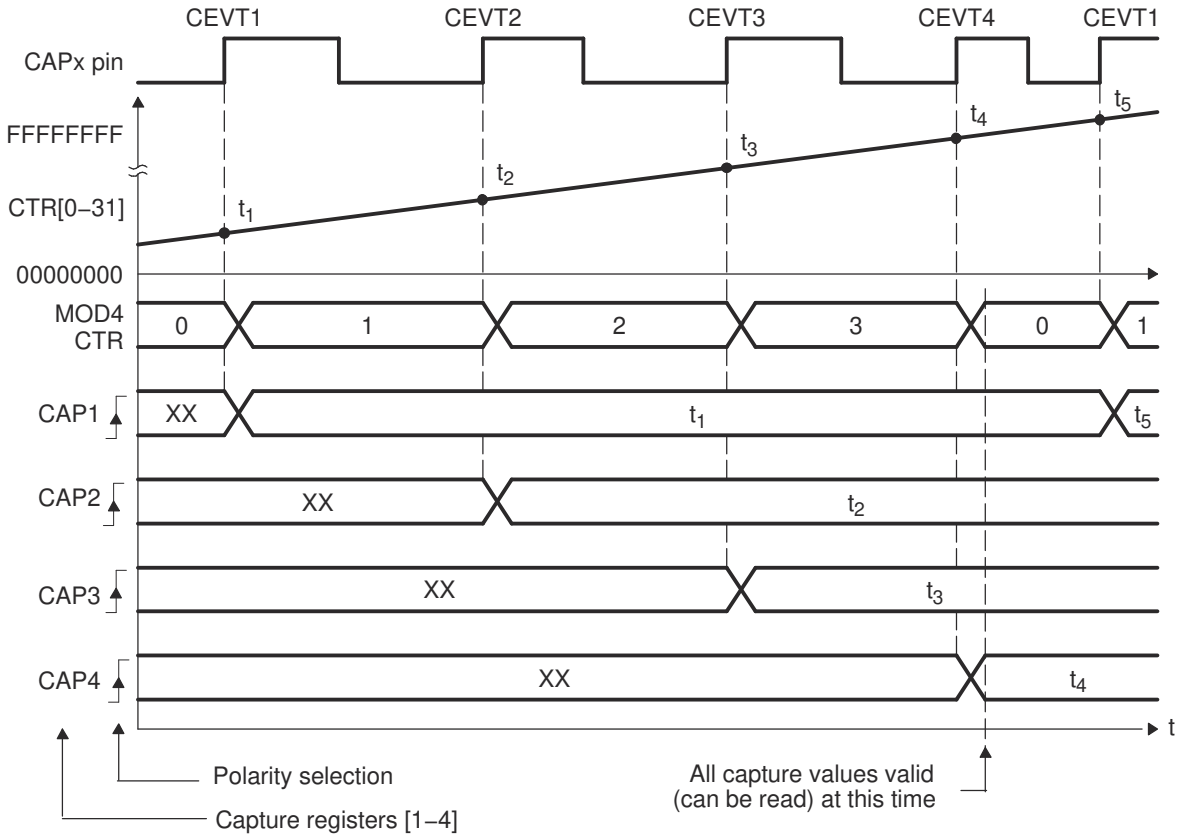

Figure 11-211. Capture Sequence for Absolute Time-stamp and Rising Edge Detect

11.4.1.6.2 Example 2 - Absolute Time-Stamp Operation Rising and Falling Edge Trigger

In Figure 11-212 the eCAP operating mode is almost the same as in the previous section except capture events are qualified as either rising or falling edge, this now gives both period and duty cycle information, that is, Period1 = $t_3 - t_1$, Period2 = $t_5 - t_3$, and so on; Duty Cycle1 (on-time %) = $(t_2 - t_1)$ / Period1 × 100%, and so on; Duty Cycle1 (off-time %) = $(t_3 - t_2)$ / Period1 × 100%, and so on.

 TSt4 = ECap1Regs.CAP4; // Fetch Time-Stamp captured at t4
 Period1 = TSt3-TSt1; // Calculate 1st period
 DutyOnTime1 = TSt2-TSt1; // Calculate On time
 DutyOffTime1 = TSt3-TSt2; // Calculate Off time
```

11.4.1.6.3 Example 3 - Time Difference (Delta) Operation Rising Edge Trigger

This example Figure 11-213 shows how the eCAP module can be used to collect Delta timing data from pulse train waveforms. Here Continuous Capture mode (TSCTR counts-up without resetting, and Mod4 counter wraps around) is used. In Delta-time mode, TSCTR is Reset back to Zero on every valid event. Here Capture events are qualified as Rising edge only. On an event, TSCTR contents (that is, time-stamp) is captured first, and then TSCTR is reset to Zero. The Mod4 counter then increments to the next state. If TSCTR reaches FFFF FFFFh (that is, maximum value), before the next event, it wraps around to 0000 0000h and continues, a CNTOVF (counter overflow) Flag is set, and an Interrupt (if enabled) occurs. The advantage of Delta-time Mode is that the CAPx contents directly give timing data without the need for CPU calculations, that is, Period1 = T_1, Period2 = T_2, and so on. As shown in the diagram, the CEVT1 event is a good trigger point to read the timing data, T_1, T_2, T_3, T_4 are all valid here.

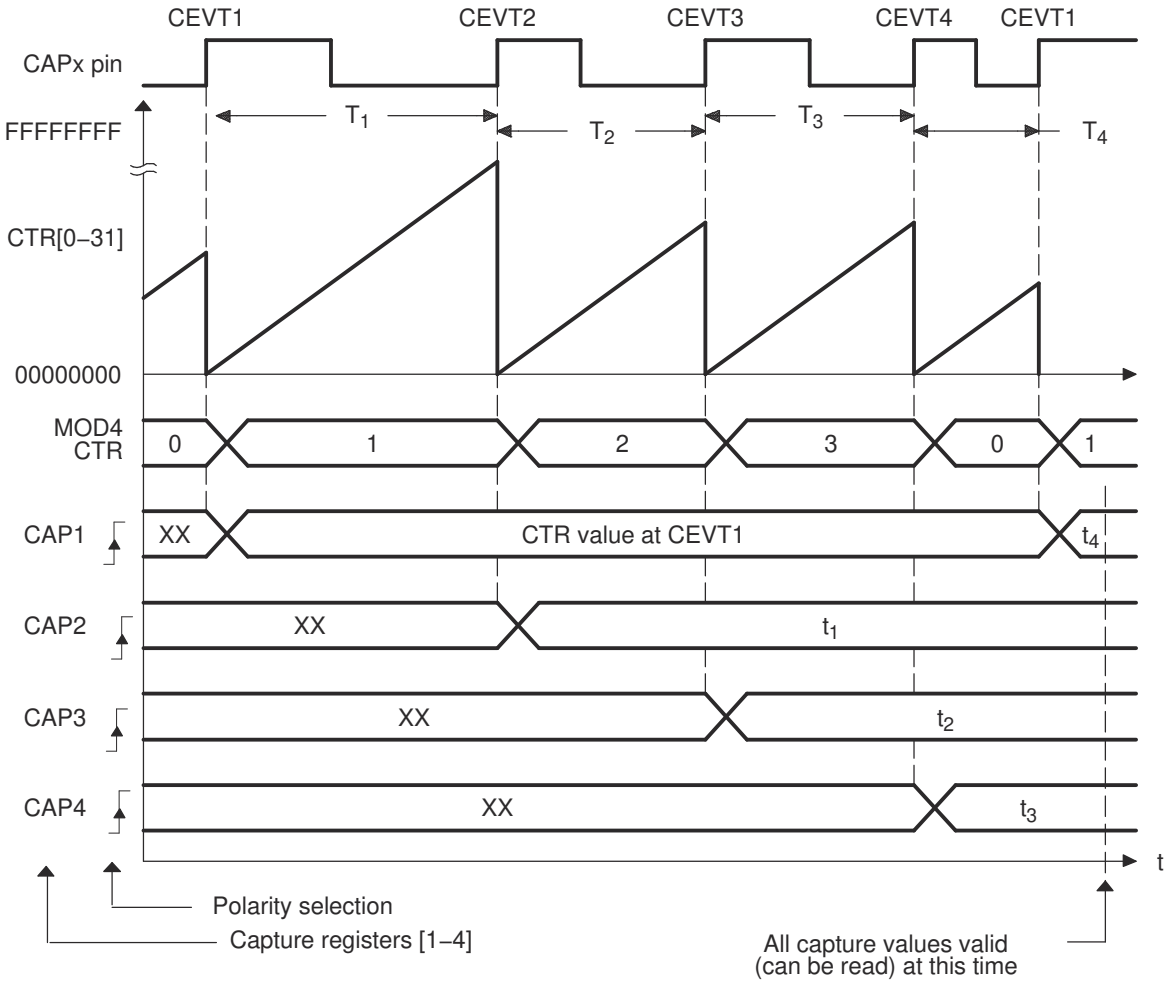

Figure 11-213. Capture Sequence for Delta Mode Time-stamp and Rising Edge Detect

11.4.1.6.3.1 Code snippet for CAP mode Delta Time, Rising Edge Trigger

```
// Code snippet for CAP mode Delta Time, Rising edge trigger
 // Initialization Time
 //=======================
 // ECAP module 1 config
 ECap1Regs.ECCTL1.bit.CAP1POL = EC_RISING;
 ECap1Regs.ECCTL1.bit.CAP2POL = EC_RISING;
 ECap1Regs.ECCTL1.bit.CAP3POL = EC_RISING;
 ECap1Regs.ECCTL1.bit.CAP4POL = EC_RISING;
 ECap1Regs.ECCTL1.bit.CTRRST1 = EC_DELTA_MODE;
 ECap1Regs.ECCTL1.bit.CTRRST2 = EC_DELTA_MODE;
 ECap1Regs.ECCTL1.bit.CTRRST3 = EC_DELTA_MODE;
 ECap1Regs.ECCTL1.bit.CTRRST4 = EC_DELTA_MODE;
 ECap1Regs.ECCTL1.bit.CAPLDEN = EC_ENABLE;

 ECap1Regs.ECCTL2.bit.SYNCI_EN = EC_DISABLE;
 ECap1Regs.ECCTL2.bit.TSCTRSTOP = EC_RUN; // Allow TSCTR to run
 // Run Time ( e.g. CEVT1 triggered ISR call)
 //=========================================
 // Note: here Time-stamp directly represents the Period value.
 Period4 = ECap1Regs.CAP1; // Fetch Time-Stamp captured at T1
 Period1 = ECap1Regs.CAP2; // Fetch Time-Stamp captured at T2
 Period2 = ECap1Regs.CAP3; // Fetch Time-Stamp captured at T3
 Period3 = ECap1Regs.CAP4; // Fetch Time-Stamp captured at T4
```

11.4.1.6.4 Example 4 - Time Difference (Delta) Operation Rising and Falling Edge Trigger

In Figure 11-214 the eCAP operating mode is almost the same as in previous section except Capture events are qualified as either Rising or Falling edge, this now gives both Period and Duty cycle information, that is, Period1 = T_1+T_2, Period2 = T_3+T_4, and so on; Duty Cycle1 (on-time %) = T_1 / Period1 × 100%, and so on; Duty Cycle1 (off-time %) = T_2 / Period1 × 100%, and so on.

During initialization, you must write to the active registers for both period and compare. This will then automatically copy the init values into the shadow values. For subsequent compare updates, during run-time, only the shadow registers must be used.

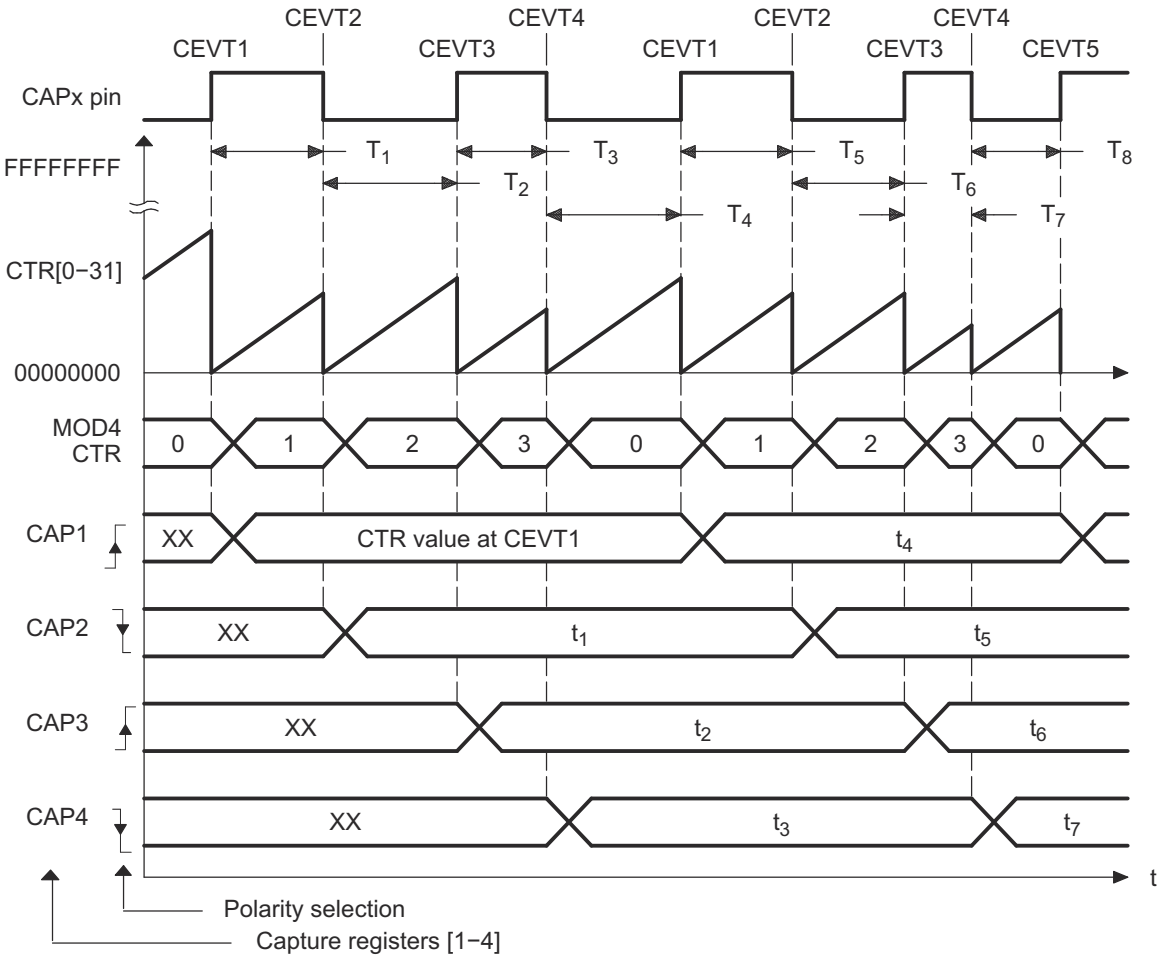

Figure 11-214. Capture Sequence for Delta Mode Time-stamp With Rising and Falling Edge Detect

 DutyOffTime2 = ECap1Regs.CAP1; // Fetch Time-Stamp captured at T1
 Period1 = DutyOnTime1 + DutyOffTime1;
 Period2 = DutyOnTime2 + DutyOffTime2;
```

11.4.1.7 Application of the APWM Mode

In this example, the eCAP module is configured to operate as a PWM generator. Here a very simple single channel PWM waveform is generated from output pin APWMx. The PWM polarity is active high, which means that the compare value (CAP2 reg is now a compare register) represents the on-time (high level) of the period. Alternatively, if the APWMPOL bit is configured for active low, then the compare value represents the off-time. Note here values are in hexadecimal (h) notation.

11.4.1.7.1 Simple PWM Generation (Independent Channel/s)

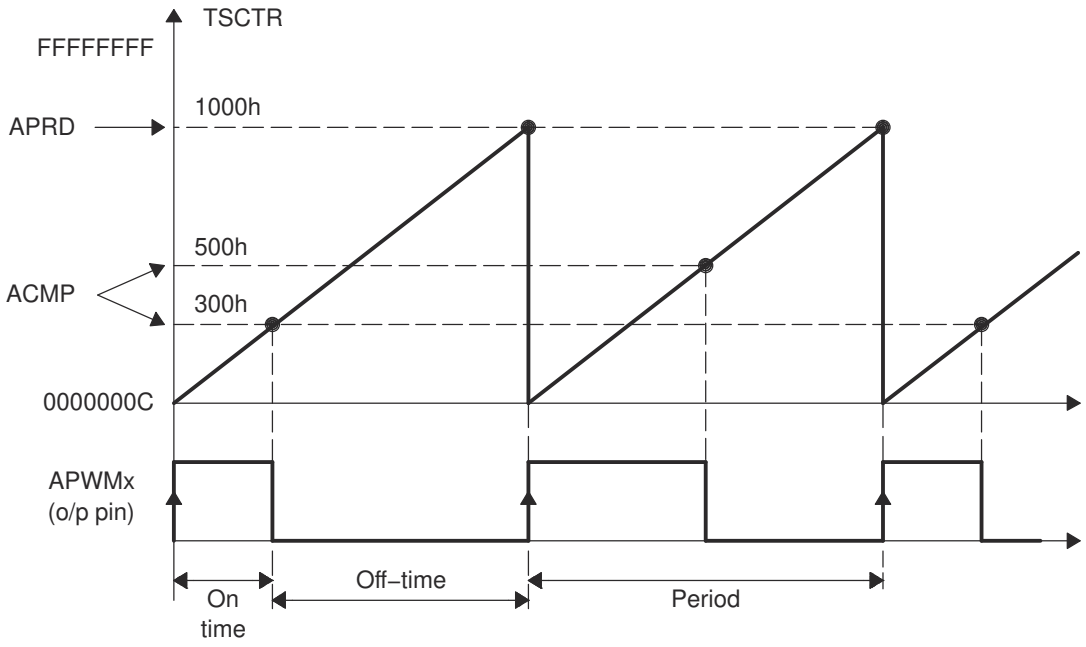

Figure 11-215. PWM Waveform Details of APWM Mode Operation

Example 11-1. Code Snippet for APWM Mode

```
// Code snippet for APWM mode Example 1
 // Initialization Time
 //======================
 // ECAP module 1 config
 ECap1Regs.CAP1 = 0x1000; // Set period value
 ECap1Regs.CTRPHS = 0x0; // make phase zero
 ECap1Regs.ECCTL2.bit.CAP_APWM = EC_APWM_MODE;
 ECap1Regs.ECCTL2.bit.APWMPOL = EC_ACTV_HI; // Active high
 ECap1Regs.ECCTL2.bit.SYNCI_EN = EC_DISABLE; // Synch not used
 ECap1Regs.ECCTL2.bit.SYNCO_SEL = EC_SYNCO_DIS; // Synch not used
 ECap1Regs.ECCTL2.bit.TSCTRSTOP = EC_RUN; // Allow TSCTR to run
 // Run Time (Instant 1, e.g. ISR call)
 //======================
 ECap1Regs.CAP2 = 0x300; // Set Duty cycle i.e. compare value
 // Run Time (Instant 2, e.g. another ISR call)
 //======================
 ECap1Regs.CAP2 = 0x500; // Set Duty cycle i.e. compare value
```

11.4.2 Enhanced Pulse Width Modulator (ePWM) Module

The enhanced pulse width modulator (ePWM) peripheral is a key element in controlling many of the power electronic systems found in both commercial and industrial equipments. The features supported by the ePWM make it especially suitable for digital motor control.

11.4.2.1 Introduction

An effective PWM peripheral must be able to generate complex pulse width waveforms with minimal CPU overhead or intervention. It needs to be highly programmable and very flexible while being easy to understand and use. The ePWM unit described here addresses these requirements by allocating all needed timing and control resources on a per PWM channel basis. Cross coupling or sharing of resources has been avoided; instead, the ePWM is built up from smaller single channel modules with separate resources that can operate together as required to form a system. This modular approach results in an orthogonal architecture and provides a more transparent view of the peripheral structure, helping users to understand its operation quickly.

In this document the letter x within a signal or module name is used to indicate a generic ePWM instance on a device. For example, output signals EPWMAx and EPWMBx refer to the output signals from the ePWMx instance. Thus, EPWMA0 and EPWMA1 belong to the first instance of ePWM - ePWMA.

Note

Images and image titles in this chapter may use the following naming conventions:

- EPWMxA to refer to EPWMx0
- EPWMxB to refer to EPWMx1
- EPWM1 to refer to EPWMA

11.4.2.1.1 Submodule Overview

The ePWM module represents one complete PWM channel composed of two PWM outputs: EPWMAx and EPWMBx. Multiple ePWM modules are instanced within a device as shown in *Multiple ePWM Modules*. Each ePWM instance is identical and is indicated by a numerical value starting with 1. For example, ePWM1 is the first instance and ePWM3 is the third instance in the system and ePWMx indicates any instance.

The ePWM modules are chained together via a clock synchronization scheme that allows them to operate as a single system when required. Additionally, this synchronization scheme can be extended to the capture peripheral modules (eCAP). Modules can also operate stand-alone.

Each ePWM module supports the following features:

- Dedicated 16-bit time-base counter with period and frequency control
- Two PWM outputs that can be used in the following configurations:
  - Two independent PWM outputs with single-edge operation
  - Two independent PWM outputs with dual-edge symmetric operation
  - One independent PWM output with dual-edge asymmetric operation
- Asynchronous override control of PWM signals through software.
- Programmable phase-control support for lag or lead operation relative to other ePWM modules.
- Hardware-locked (synchronized) phase relationship on a cycle-by-cycle basis.
- Dead-band generation with independent rising and falling edge delay control.
- Programmable trip zone allocation of both cycle-by-cycle trip and one-shot trip on fault conditions.
- A trip condition can force either high, low, or high-impedance state logic levels at PWM outputs.
- All events can trigger both CPU interrupts and ADC start of conversion (SOC)
- Programmable event prescaling minimizes CPU overhead on interrupts.
- PWM chopping by high-frequency carrier signal, useful for pulse transformer gate drives.

Each ePWM module is connected to the input/output signals shown in *Multiple ePWM Modules*. The signals are described in detail in subsequent sections.

Each ePWM module consists of eight submodules and is connected within a system via the signals shown in *Submodules and Signal Connections for an ePWM Module*.

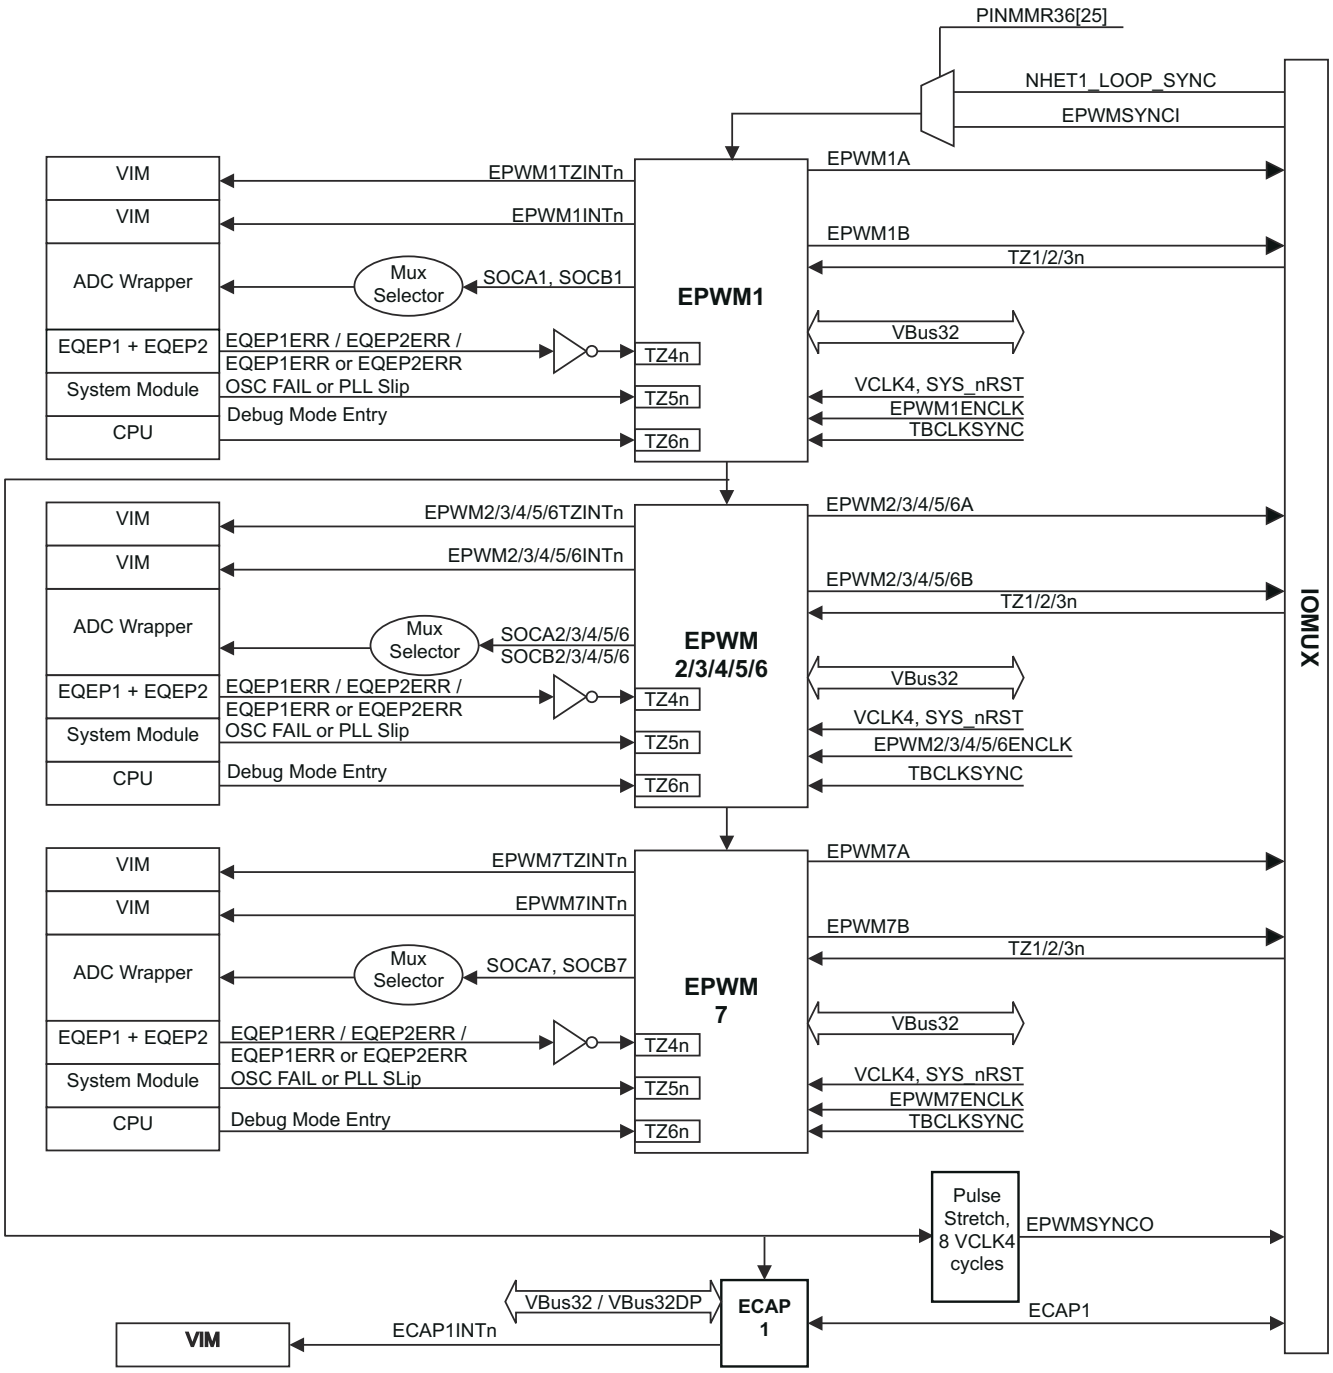

Figure 11-216. Multiple ePWM Modules

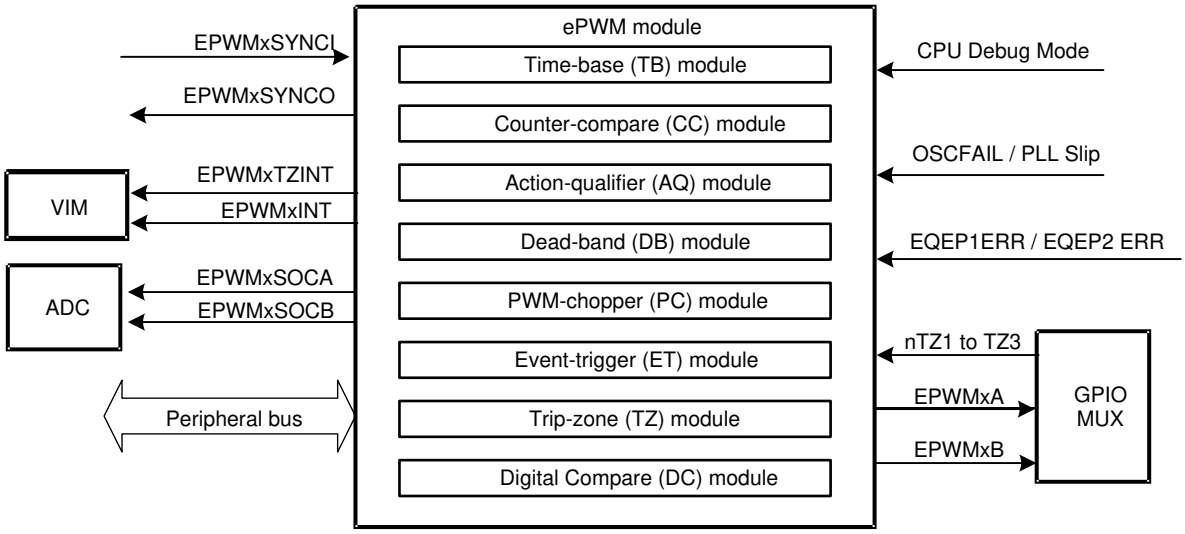

Figure 11-217. Submodules and Signal Connections for an ePWM Module

The main signals used by the ePWM module are:

- **PWM output signals .**

  The PWM output signals are made available external to the device through the Pinmux.
- **Trip-zone signals ($\overline{TZ1}$ to $\overline{TZ6}$).**

  These input signals alert the ePWM module of fault conditions external to the ePWM module. Each ePWM module can be configured to either use or ignore any of the trip-zone signals. The $\overline{TZ1}$ to $\overline{TZ3}$ trip-zone signals can be configured as asynchronous inputs, or double-synchronized using VCLK4, or double-synchronized and filtered through a 6-VCLK4-cycle counter before connecting to the ePWM modules. This selection is done by configuring registers in the Pinmux. $\overline{TZ4}$ is connected to an inverted eQEP1 error signal (EQEP1ERR), or to an inverted eQEP2 error signal (EQEP2ERR), or an OR-combination of EQEP1ERR and EQEP2ERR. This selection is also done via the Pinmux registers . $\overline{TZ5}$ is connected to the system clock fail status. This is asserted whenever an oscillator failure is detected, or a PLL slip is detected. $\overline{TZ6}$ is connected to the debug mode entry indicator output from the CPU. This allows you to configure a trip action when the CPU halts.
- **Time-base synchronization input (EPWMxSYNCI) and output (EPWMxSYNCO) signals**.

  The synchronization signals daisy chain the ePWM modules together. Each module can be configured to either use or ignore its synchronization input. The clock synchronization input and output signal are brought out to pins only for ePWM1 (ePWM module #1). The synchronization output for ePWM1 (EPWM1SYNCO) is also connected to the SYNCI of the first enhanced capture module (eCAP1).
- **ADC start-of-conversion signals (EPWMxSOCA and EPWMxSOCB).**

  Each ePWM module has two ADC start of conversion signals. Any ePWM module can trigger a start of conversion. Which event triggers the start of conversion is configured in the Event-Trigger submodule of the ePWM.
- **Peripheral Bus**

  The peripheral bus is 32-bits wide and allows both 16-bit and 32-bit writes to the ePWM register file.

11.4.2.1.2 Register Mapping

The complete ePWM module control and status register set is grouped by submodule as shown in Table 11-1401. Each register set is duplicated for each instance of the ePWM module. The start address for each ePWM register file instance on a device is specified in the specific part's datasheet.

Table 11-1401. ePWM Module Control and Status Register Set Grouped by Submodule

11.4.2.2 ePWM Submodules

Eight submodules are included in every ePWM peripheral. Each of these submodules performs specific tasks that can be configured by software.

11.4.2.2.1 Overview

Table 11-1402 lists the eight key submodules together with a list of their main configuration parameters. For example, if you need to adjust or control the duty cycle of a PWM waveform, then you should see the counter-compare submodule in Section 11.4.2.2.3 for relevant details.

Table 11-1402. Submodule Configuration Parameters

Submodule	Configuration Parameter or Option
Time-base (TB)	• Scale the time-base clock (TBCLK) relative to the system clock (VCLK4). • Configure the PWM time-base counter (TBCTR) frequency or period. • Set the mode for the time-base counter: – count-up mode: used for asymmetric PWM – count-down mode: used for asymmetric PWM – count-up-and-down mode: used for symmetric PWM • Configure the time-base phase relative to another ePWM module. • Synchronize the time-base counter between modules through hardware or software. • Configure the direction (up or down) of the time-base counter after a synchronization event. • Configure how the time-base counter will behave when the device is halted by an emulator. • Specify the source for the synchronization output of the ePWM module: – Synchronization input signal – Time-base counter equal to zero – Time-base counter equal to counter-compare B (CMPB) – No output synchronization signal generated.
Counter-compare (CC)	• Specify the PWM duty cycle for output EPWMx0 and/or output EPWMx1 • Specify the time at which switching events occur on the EPWMx0 or EPWMx1 output

Table 11-1402. Submodule Configuration Parameters (continued)

Submodule	Configuration Parameter or Option
Action-qualifier (AQ)	• Specify the type of action taken when a time-base or counter-compare submodule event occurs: – No action taken – Output EPWMx0 and/or EPWMx1 switched high – Output EPWMx0 and/or EPWMx1 switched low – Output EPWMx0 and/or EPWMx1 toggled • Force the PWM output state through software control • Configure and control the PWM dead-band through software
Dead-band (DB)	• Control of traditional complementary dead-band relationship between upper and lower switches • Specify the output rising-edge-delay value • Specify the output falling-edge delay value • Bypass the dead-band module entirely. In this case the PWM waveform is passed through without modification. • Option to enable half-cycle clocking for double resolution.
PWM-chopper (PC)	• Create a chopping (carrier) frequency. • Pulse width of the first pulse in the chopped pulse train. • Duty cycle of the second and subsequent pulses. • Bypass the PWM-chopper module entirely. In this case the PWM waveform is passed through without modification.
Trip-zone (TZ)	• Configure the ePWM module to react to one, all, or none of the trip-zone signals or digital compare events. • Specify the tripping action taken when a fault occurs: – Force EPWMx0 and/or EPWMx1 high – Force EPWMx0 and/or EPWMx1 low – Force EPWMx0 and/or EPWMx1 to a high-impedance state – Configure EPWMx0 and/or EPWMx1 to ignore any trip condition. • Configure how often the ePWM will react to each trip-zone signal: – One-shot – Cycle-by-cycle • Enable the trip-zone to initiate an interrupt. • Bypass the trip-zone module entirely.
Event-trigger (ET)	• Enable the ePWM events that will trigger an interrupt. • Enable ePWM events that will trigger an ADC start-of-conversion event. • Specify the rate at which events cause triggers (every occurrence or every second or third occurrence) • Poll, set, or clear event flags
Digital-compare (DC)	• Enables trip zone signals to create events and filtered events • Specify event-filtering options to capture TBCTR counter or generate blanking window

Code examples are provided in the remainder of this document that show how to implement various ePWM module configurations. These examples use the constant definitions in the device *EPwm_defines.h* file in the device-specific header file and peripheral examples software package.

11.4.2.2.2 Time-Base (TB) Submodule

Each ePWM module has its own time-base submodule that determines all of the event timing for the ePWM module. Built-in synchronization logic allows the time-base of multiple ePWM modules to work together as a single system. Figure 11-218 illustrates the time-base module's place within the ePWM.

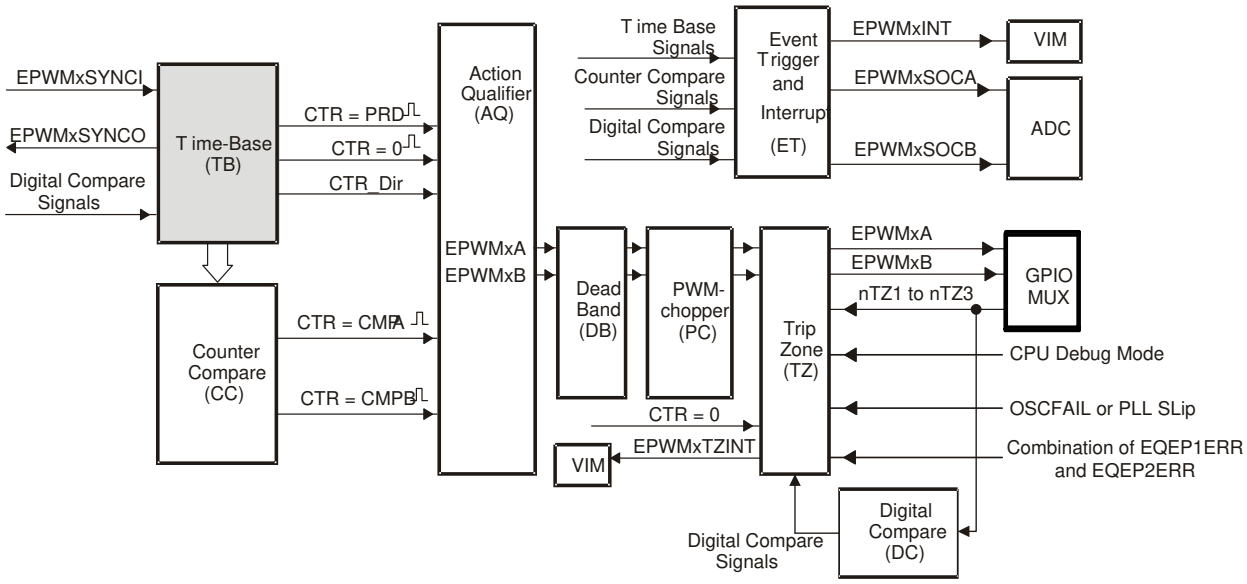

Figure 11-218. Time-Base Submodule Block Diagram

11.4.2.2.2.1 Purpose of the Time-Base Submodule

You can configure the time-base submodule for the following:

- Specify the ePWM time-base counter (TBCTR) frequency or period to control how often events occur.
- Manage time-base synchronization with other ePWM modules.
- Maintain a phase relationship with other ePWM modules.
- Set the time-base counter to count-up, count-down, or count-up-and-down mode.
- Generate the following events:
  - CTR = PRD: Time-base counter equal to the specified period (TBCTR = TBPRD) .
  - CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000).
- Configure the rate of the time-base clock; a prescaled version of the device peripheral clock domain (VCLK4). This allows the time-base counter to increment/decrement at a slower rate.

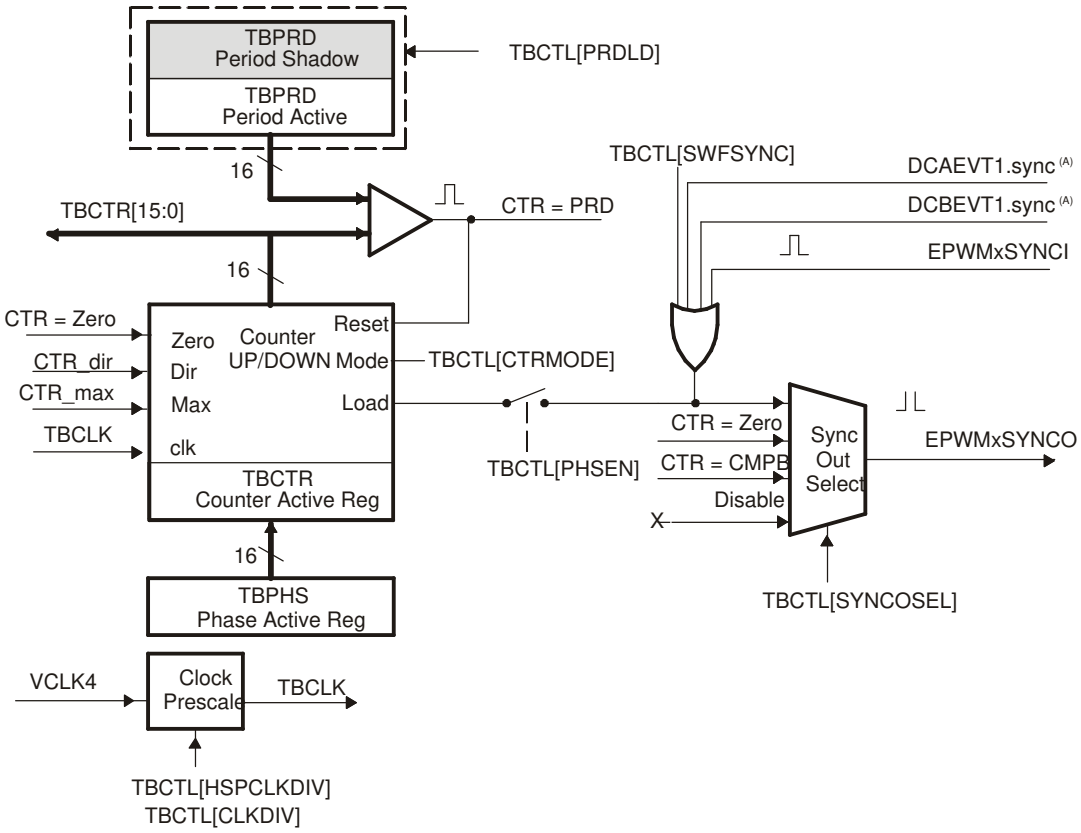
11.4.2.2.2.2 Controlling and Monitoring the Time-base Submodule

Table 11-1403 shows the registers used to control and monitor the time-base submodule.

Table 11-1403. Time-Base Submodule Registers

Register Name	Address Offset	Shadowed	Description
TBCTL	0x0002	No	Time-Base Control Register
TBSTS	0x0000	No	Time-Base Status Register
TBPHS	0x0004	No	Time-Base Phase Register
TBCTR	0x000A	No	Time-Base Counter Register
TBPRD	0x0008	Yes	Time-Base Period Register

The block diagram in Figure 11-219 shows the critical signals and registers of the time-base submodule. Table 11-1404 provides descriptions of the key signals associated with the time-base submodule.



A. These signals are generated by the digital compare (DC) submodule.

Figure 11-219. Time-Base Submodule Signals and Registers

Table 11-1404. Key Time-Base Signals

Signal	Description
EPWMxSYNCI	Time-base synchronization input. Input pulse used to synchronize the time-base counter with the counter of ePWM module earlier in the synchronization chain. An ePWM peripheral can be configured to use or ignore this signal. For the first ePWM module (EPWMA), this signal comes from a device pin or from the N2HET1 module. For subsequent ePWM modules, this signal is passed from another ePWM peripheral. For example, EPWM2SYNCI is generated by the ePWMA peripheral, EPWM3SYNCI is generated by ePWM2Band so forth. See *Time-Base Counter Synchronization* for information on the synchronization order of a particular device.
EPWMxSYNCO	Time-base synchronization output. This output pulse is used to synchronize the counter of an ePWM module later in the synchronization chain. The ePWM module generates this signal from one of three event sources: 1. EPWMxSYNCI (Synchronization input pulse) 2. CTR = Zero: The time-base counter equal to zero (TBCTR = 0x0000). 3. CTR = CMPB: The time-base counter equal to the counter-compare B (TBCTR = CMPB) register.
CTR = PRD	Time-base counter equal to the specified period. This signal is generated whenever the counter value is equal to the active period register value. That is when TBCTR = TBPRD.
CTR = Zero	Time-base counter equal to zero This signal is generated whenever the counter value is zero. That is when TBCTR equals 0x0000.
CTR = CMPB	Time-base counter equal to active counter-compare B register (TBCTR = CMPB). This event is generated by the counter-compare submodule and used by the synchronization out logic
CTR_dir	Time-base counter direction. Indicates the current direction of the ePWM's time-base counter. This signal is high when the counter is increasing and low when it is decreasing.
CTR_max	Time-base counter equal max value. (TBCTR = 0xFFFF) Generated event when the TBCTR value reaches its maximum value. This signal is only used only as a status bit
TBCLK	Time-base clock. This is a prescaled version of the system clock (VCLK4) and is used by all submodules within the ePWM. This clock determines the rate at which time-base counter increments or decrements.

11.4.2.2.2.3 Calculating PWM Period and Frequency

The frequency of PWM events is controlled by the time-base period (TBPRD) register and the mode of the time-base counter. Figure 11-220 shows the period (T_{pwm}) and frequency (F_{pwm}) relationships for the up-count, down-count, and up-down-count time-base counter modes when the period is set to 4 (TBPRD = 4). The time increment for each step is defined by the time-base clock (TBCLK) which is a prescaled version of the system clock (VCLK4).

The time-base counter has three modes of operation selected by the time-base control register (TBCTL):

- **Up-Down-Count Mode:**

  In up-down-count mode, the time-base counter starts from zero and increments until the period (TBPRD) value is reached. When the period value is reached, the time-base counter then decrements until it reaches zero. At this point the counter repeats the pattern and begins to increment.
- **Up-Count Mode:**

  In this mode, the time-base counter starts from zero and increments until it reaches the value in the period register (TBPRD). When the period value is reached, the time-base counter resets to zero and begins to increment once again.
- **Down-Count Mode:**

  In down-count mode, the time-base counter starts from the period (TBPRD) value and decrements until it reaches zero. When it reaches zero, the time-base counter is reset to the period value and it begins to decrement once again.

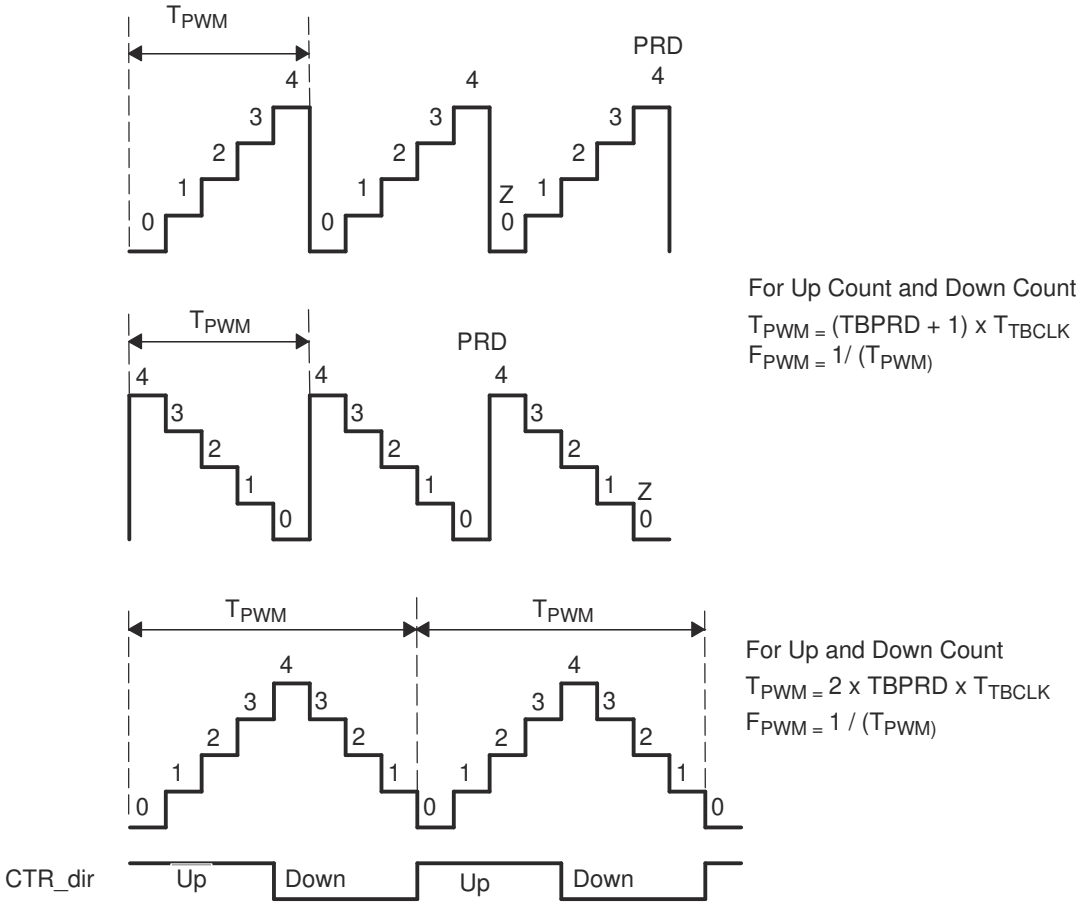


Figure 11-220. Time-Base Frequency and Period

11.4.2.2.2.3.1 Time-Base Period Shadow Register

The time-base period register (TBPRD) has a shadow register. Shadowing allows the register update to be synchronized with the hardware. The following definitions are used to describe all shadow registers in the ePWM module:

- **Active Register**

  The active register controls the hardware and is responsible for actions that the hardware causes or invokes.
- **Shadow Register**

  The shadow register buffers or provides a temporary holding location for the active register. It has no direct effect on any control hardware. At a strategic point in time the shadow register's content is transferred to the active register. This prevents corruption or spurious operation due to the register being asynchronously modified by software.

The memory address of the shadow period register is the same as the active register. Which register is written to or read from is determined by the TBCTL[PRDLD] bit. This bit enables and disables the TBPRD shadow register as follows:

- **Time-Base Period Shadow Mode:**

  The TBPRD shadow register is enabled when TBCTL[PRDLD] = 0. Reads from and writes to the TBPRD memory address go to the shadow register. The shadow register contents are transferred to the active register (TBPRD (Active) ← TBPRD (shadow)) when the time-base counter equals zero (TBCTR = 0x0000). By default the TBPRD shadow register is enabled.
- **Time-Base Period Immediate Load Mode:**

  If immediate load mode is selected (TBCTL[PRDLD] = 1), then a read from or a write to the TBPRD memory address goes directly to the active register.

11.4.2.2.2.3.2 Time-Base Clock Synchronization

Bit 1 of the device-level multiplexing control module (Pinmux) register PINMMR37 is defined as the TBCLKSYNC bit. The TBCLKSYNC bit allows users to globally synchronize all enabled ePWM modules to the time-base clock (TBCLK). When set, all enabled ePWM module clocks are started with the first rising edge of TBCLK aligned. For perfectly synchronized TBCLKs, the prescalers for each ePWM module must be set identically.

The proper procedure for enabling ePWM clocks is as follows:

1. Enable ePWM module clocks using the Pinmux control registers for each ePWM module instance
2. Set TBCLKSYNC = 0. This will stop the time-base clock within any enabled ePWM module.
3. Configure ePWM modules: prescaler values and ePWM modes.
4. Set TBCLKSYNC = 1.

11.4.2.2.2.3.3 Time-Base Counter Synchronization

A time-base synchronization scheme connects all of the ePWM modules on a device. Each ePWM module has a synchronization input (EPWMxSYNCI) and a synchronization output (EPWMxSYNCO). The input synchronization for the first instance (ePWMA) comes from an external pin. The synchronization connections for the remaining ePWM modules are shown in Figure 11-221.

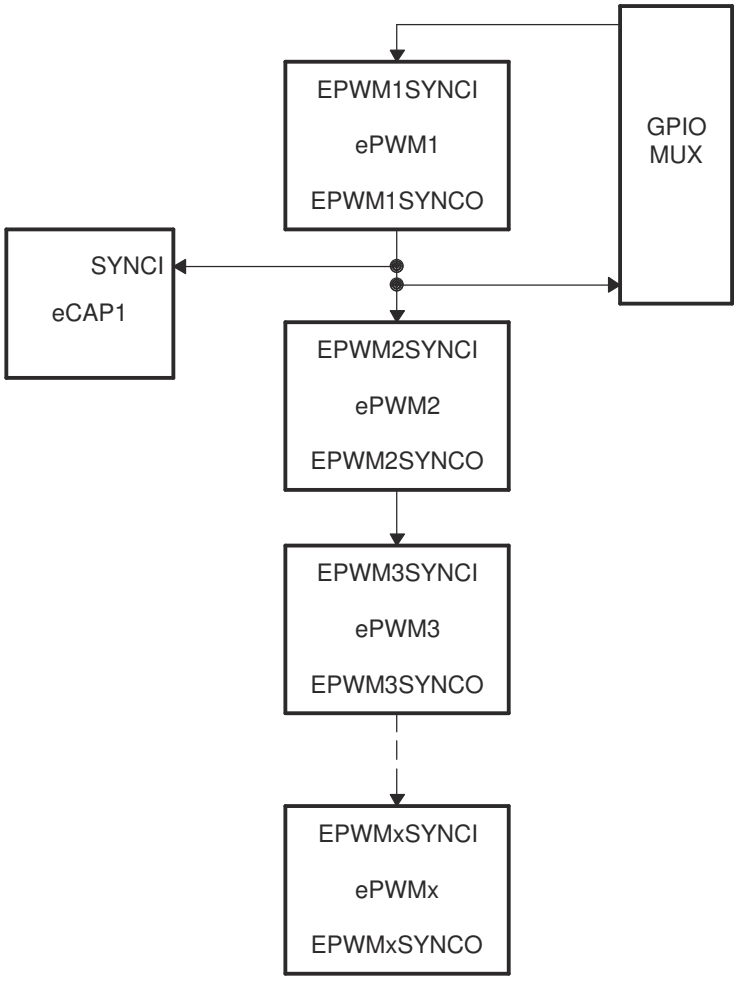

Figure 11-221. Time-Base Counter Synchronization Scheme

Each ePWM module can be configured to use or ignore the synchronization input. If the TBCTL[PHSEN] bit is set, then the time-base counter (TBCTR) of the ePWM module will be automatically loaded with the phase register (TBPHS) contents when one of the following conditions occur:

- **EPWMxSYNCI: Synchronization Input Pulse:**

  The value of the phase register is loaded into the counter register when an input synchronization pulse is detected (TBPHS → TBCTR). This operation occurs on the next valid time-base clock (TBCLK) edge.

  The delay from internal controller module to target modules is given by:
  - if (TBCLK = VCLK4): 2 × VCLK4
  - if (TBCLK != VCLK4): 1 TBCLK
- **Software Forced Synchronization Pulse:**

  Writing a 1 to the TBCTL[SWFSYNC] control bit invokes a software forced synchronization. This pulse is ORed with the synchronization input signal, and therefore has the same effect as a pulse on EPWMxSYNCI.
- **Digital Compare Event Synchronization Pulse:**

  DCAEVT1 and DCBEVT1 digital compare events can be configured to generate synchronization pulses which have the same affect as EPWMxSYNCI.

This feature enables the ePWM module to be automatically synchronized to the time base of another ePWM module. Lead or lag phase control can be added to the waveforms generated by different ePWM modules to synchronize them. In up-down-count mode, the TBCTL[PSHDIR] bit configures the direction of the time-base counter immediately after a synchronization event. The new direction is independent of the direction prior to the synchronization event. The PHSDIR bit is ignored in count-up or count-down modes. See Figure 11-222 through Figure 11-225 for examples.

Clearing the TBCTL[PHSEN] bit configures the ePWM to ignore the synchronization input pulse. The synchronization pulse can still be allowed to flow-through to the EPWMxSYNCO and be used to synchronize other ePWM modules. In this way, you can set up a controller time-base (for example, ePWMA) and downstream modules (ePWMB - ePWMx) may elect to run in synchronization with the controller.

11.4.2.2.2.4 Phase Locking the Time-Base Clocks of Multiple ePWM Modules

The TBCLKSYNC bit can be used to globally synchronize the time-base clocks of all enabled ePWM modules on a device. When TBCLKSYNC = 0, the time-base clock of all ePWM modules is stopped (default). When TBCLKSYNC = 1, all ePWM time-base clocks are started with the rising edge of TBCLK aligned. For perfectly synchronized TBCLKs, the prescaler bits in the TBCTL register of each ePWM module must be set identically. The proper procedure for enabling the ePWM clocks is as follows:

1. Enable ePWM module clocks using the IOMM control registers for each ePWM module instance
2. Set TBCLKSYNC = 0. This will stop the time-base clock within any enabled ePWM module.
3. Configure ePWM modules: prescaler values and ePWM modes.
4. Set TBCLKSYNC = 1.

11.4.2.2.2.5 Time-Base Counter Modes and Timing Waveforms

The time-base counter operates in one of four modes:

- Up-count mode which is asymmetrical.
- Down-count mode which is asymmetrical.
- Up-down-count which is symmetrical
- Frozen where the time-base counter is held constant at the current value

To illustrate the operation of the first three modes, the following timing diagrams show when events are generated and how the time-base responds to an EPWMxSYNCI signal.

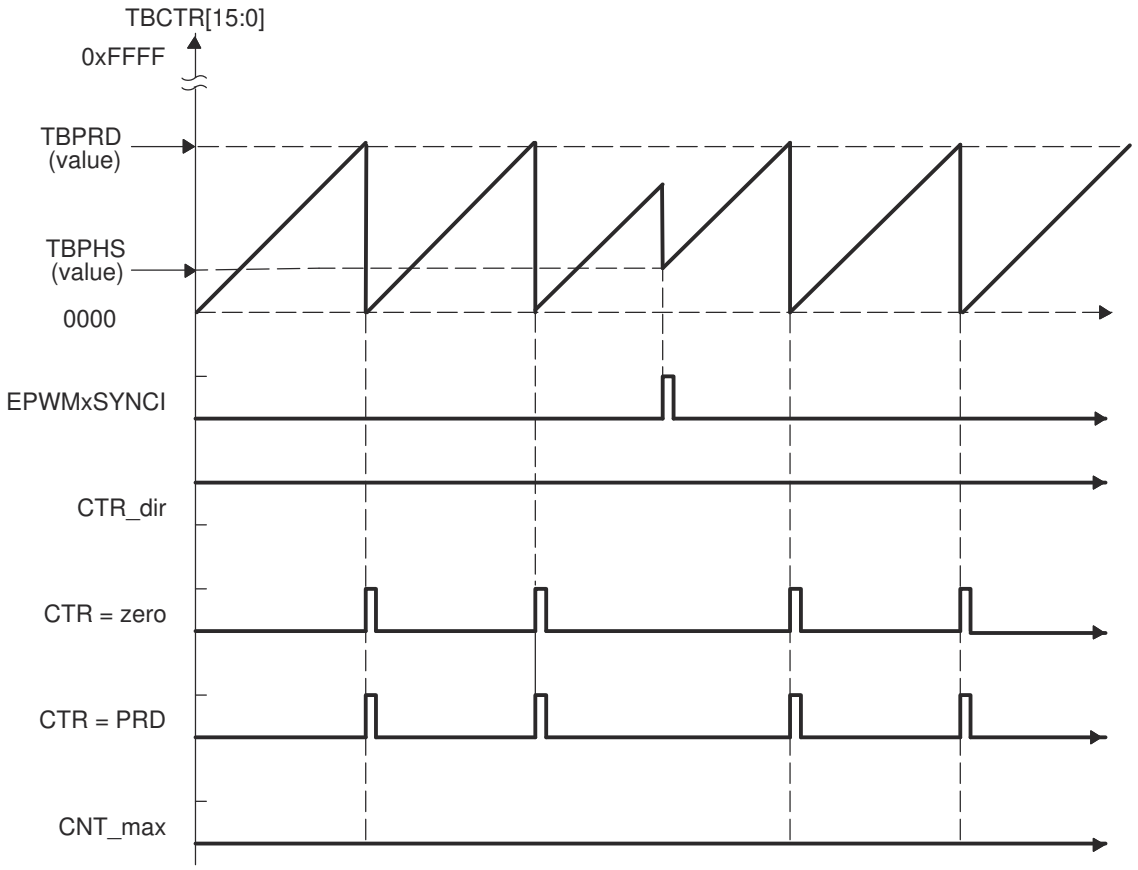

Figure 11-222. Time-Base Up-Count Mode Waveforms

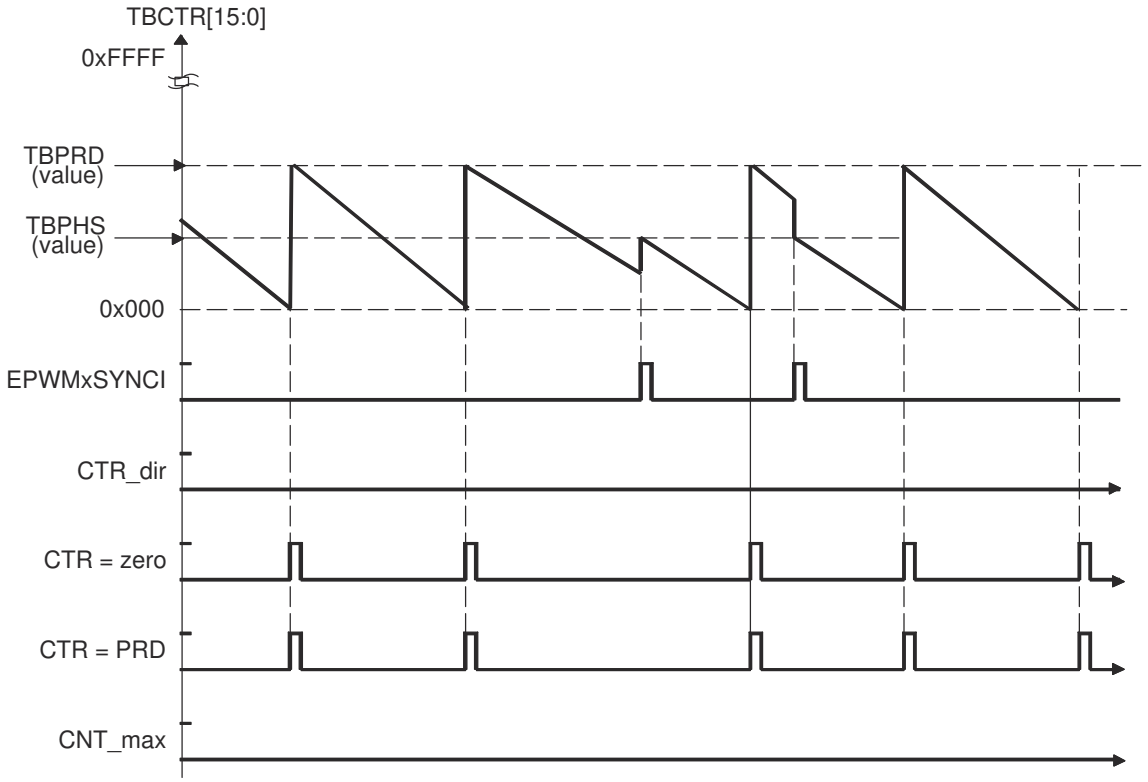

Figure 11-223. Time-Base Down-Count Mode Waveforms

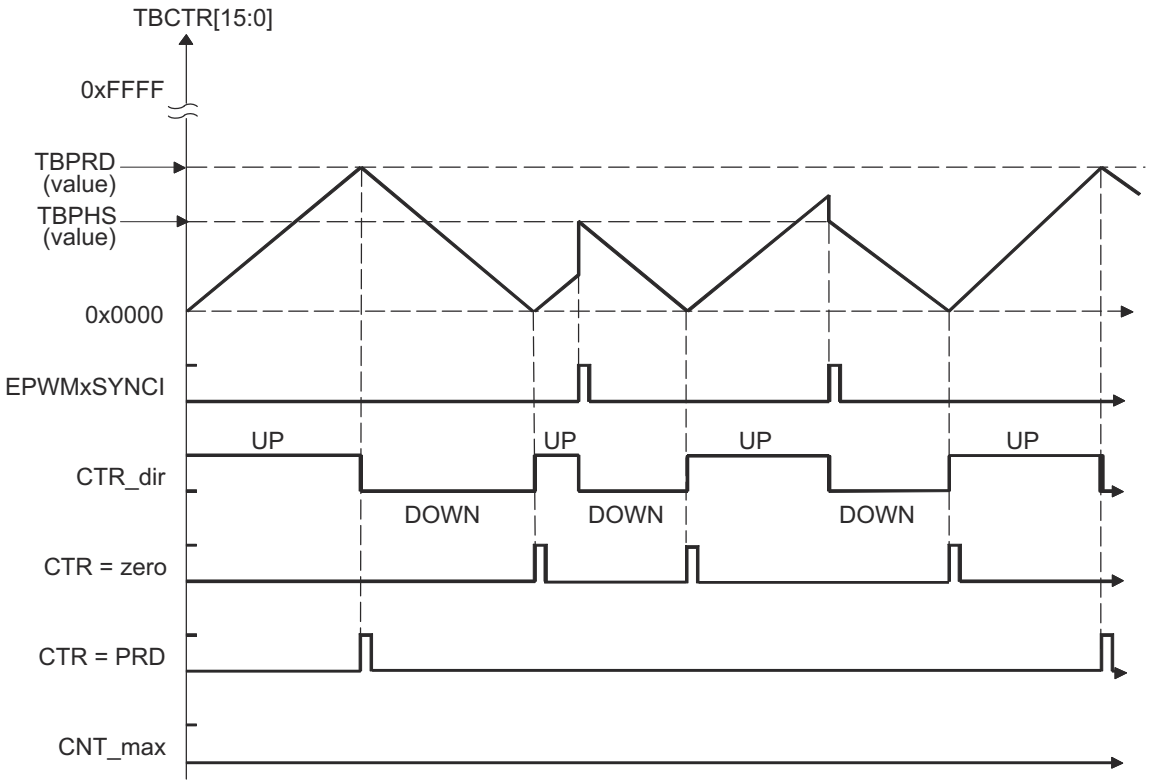

Figure 11-224. Time-Base Up-Down-Count Waveforms, TBCTL[PHSDIR = 0] Count Down On Synchronization Event

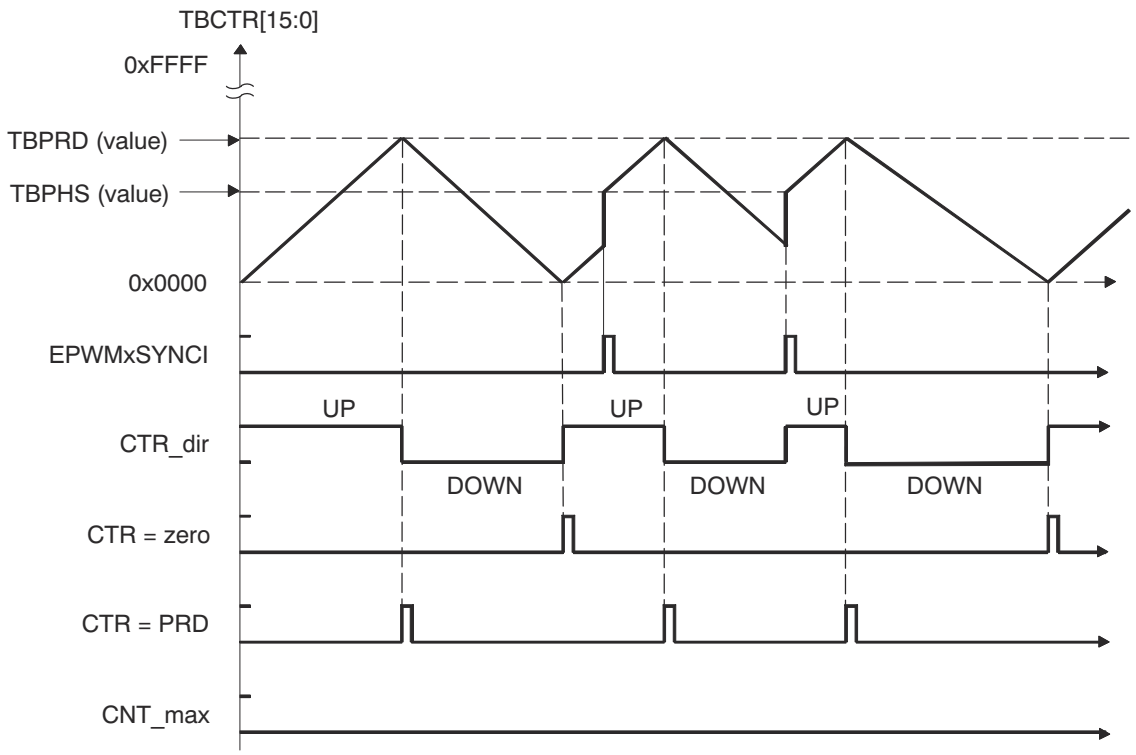

Figure 11-225. Time-Base Up-Down Count Waveforms, TBCTL[PHSDIR = 1] Count Up On Synchronization Event

11.4.2.2.3 Counter-Compare (CC) Submodule

Figure 11-226 illustrates the counter-compare submodule within the ePWM.

Figure 11-227 shows the basic structure of the counter-compare submodule.

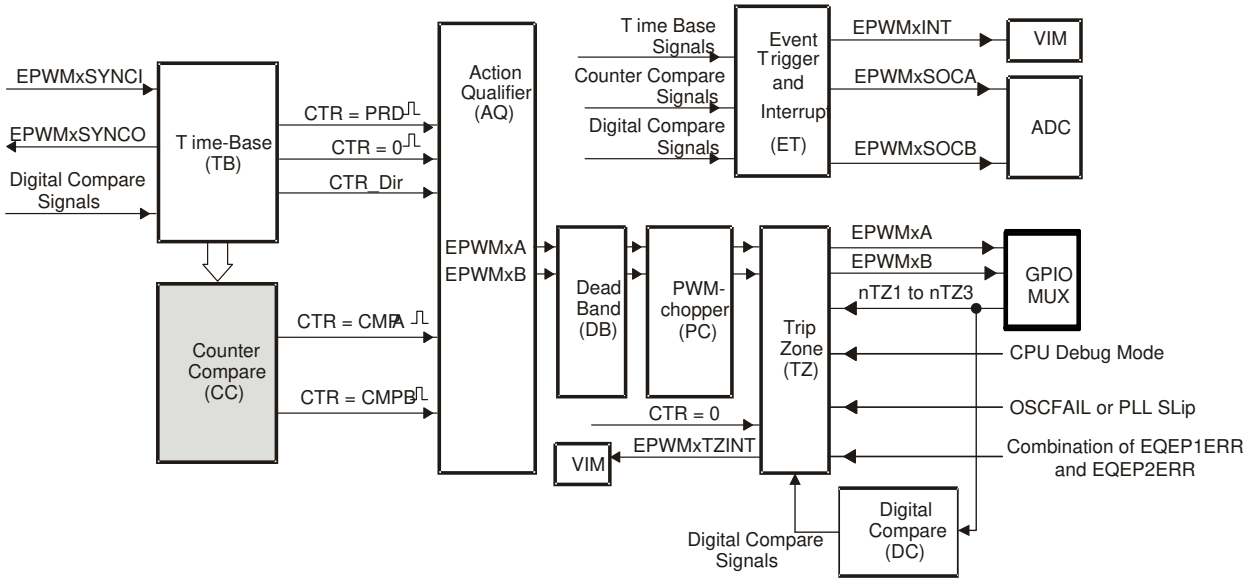

Figure 11-226. Counter-Compare Submodule

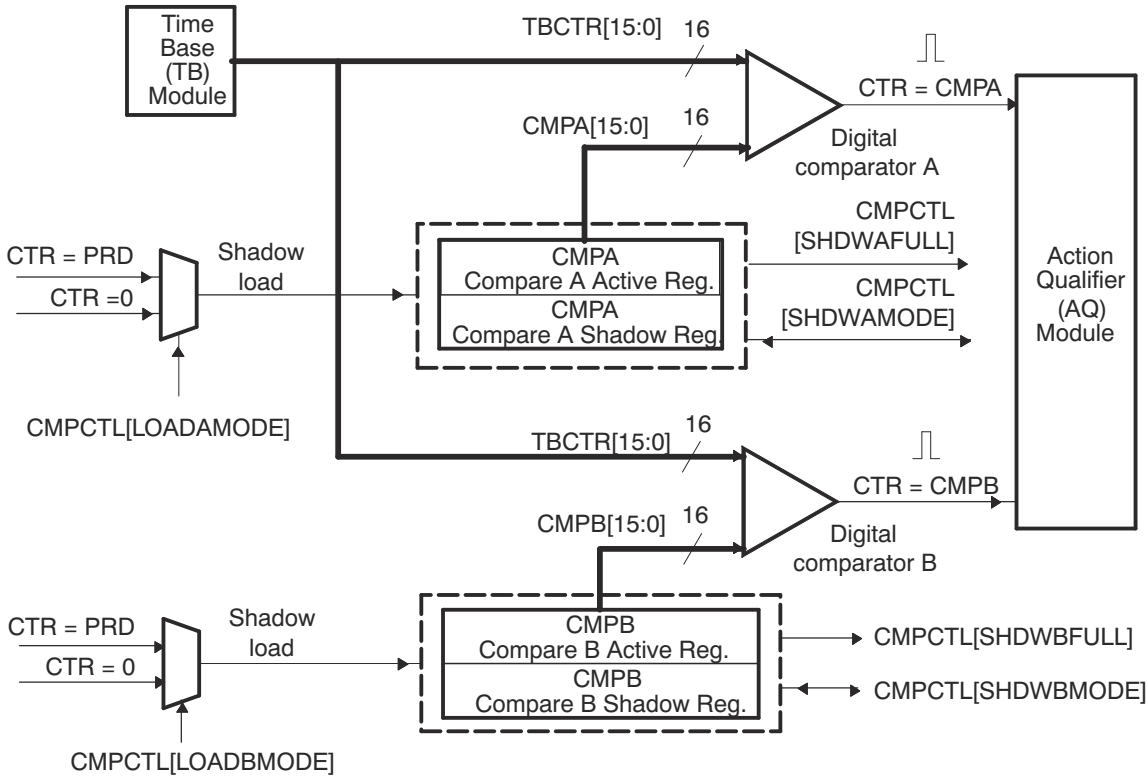

Figure 11-227. Detailed View of the Counter-Compare Submodule

11.4.2.2.3.1 Purpose of the Counter-Compare Submodule

The counter-compare submodule takes as input the time-base counter value. This value is continuously compared to the counter-compare A (CMPA) and counter-compare B (CMPB) registers. When the time-base counter is equal to one of the compare registers, the counter-compare unit generates an appropriate event.

The counter-compare:

- Generates events based on programmable time stamps using the CMPA and CMPB registers
  - CTR = CMPA: Time-base counter equals counter-compare A register (TBCTR = CMPA).
  - CTR = CMPB: Time-base counter equals counter-compare B register (TBCTR = CMPB)
- Controls the PWM duty cycle if the action-qualifier submodule is configured appropriately
- Shadows new compare values to prevent corruption or glitches during the active PWM cycle

11.4.2.2.3.2 Controlling and Monitoring the Counter-Compare Submodule

The counter-compare submodule operation is controlled and monitored by the registers shown in Table 11-1405:

Table 11-1405. Counter-Compare Submodule Registers

Register Name	Address Offset	Shadowed	Description
CMPCTL	0x000C	No	Counter-Compare Control Register.
CMPA	0x0010	Yes	Counter-Compare A Register
CMPB	0x0016	Yes	Counter-Compare B Register

The key signals associated with the counter-compare submodule are described in Table 11-1406.

Table 11-1406. Counter-Compare Submodule Key Signals

Signal	Description of Event	Registers Compared
CTR = CMPA	Time-base counter equal to the active counter-compare A value	TBCTR = CMPA
CTR = CMPB	Time-base counter equal to the active counter-compare B value	TBCTR = CMPB
CTR = PRD	Time-base counter equal to the active period. Used to load active counter-compare A and B registers from the shadow register	TBCTR = TBPRD
CTR = ZERO	Time-base counter equal to zero. Used to load active counter-compare A and B registers from the shadow register	TBCTR = 0x0000

11.4.2.2.3.3 Operational Highlights for the Counter-Compare Submodule

The counter-compare submodule is responsible for generating two independent compare events based on two compare registers:

1. CTR = CMPA: Time-base counter equal to counter-compare A register (TBCTR = CMPA).
2. CTR = CMPB: Time-base counter equal to counter-compare B register (TBCTR = CMPB).

For up-count or down-count mode, each event occurs only once per cycle. For up-down-count mode each event occurs twice per cycle if the compare value is between 0x0000-TBPRD and once per cycle if the compare value is equal to 0x0000 or equal to TBPRD. These events are fed into the action-qualifier submodule where they are qualified by the counter direction and converted into actions if enabled. Refer to Section 11.4.2.2.4.1 for more details.

The counter-compare registers CMPA and CMPB each have an associated shadow register. Shadowing provides a way to keep updates to the registers synchronized with the hardware. When shadowing is used, updates to the active registers only occur at strategic points. This prevents corruption or spurious operation due to the register being asynchronously modified by software. The memory address of the active register and the shadow register is identical. Which register is written to or read from is determined by the CMPCTL[SHDWAMODE] and CMPCTL[SHDWBMODE] bits. These bits enable and disable the CMPA shadow register and CMPB shadow register respectively. The behavior of the two load modes is as described:

Shadow Mode:

The shadow mode for the CMPA is enabled by clearing the CMPCTL[SHDWAMODE] bit and the shadow register for CMPB is enabled by clearing the CMPCTL[SHDWBMODE] bit. Shadow mode is enabled by default for both CMPA and CMPB.

If the shadow register is enabled then the content of the shadow register is transferred to the active register on one of the following events as specified by the CMPCTL[LOADAMODE] and CMPCTL[LOADBMODE] register bits:

- CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD).
- CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000)
- Both CTR = PRD and CTR = Zero

Only the active register contents are used by the counter-compare submodule to generate events to be sent to the action-qualifier.

Immediate Load Mode:

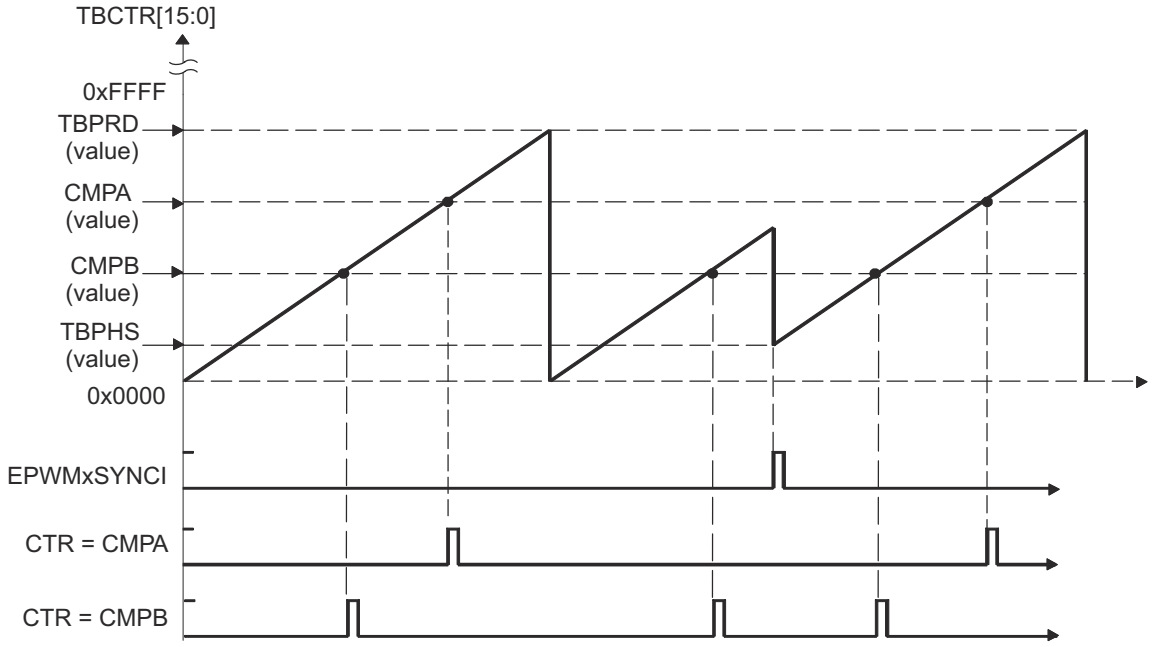
If immediate load mode is selected (that is, TBCTL[SHADWAMODE] = 1 or TBCTL[SHADWBMODE] = 1), then a read from or a write to the register will go directly to the active register.

11.4.2.2.3.4 Count Mode Timing Waveforms

The counter-compare module can generate compare events in all three count modes:

- Up-count mode: used to generate an asymmetrical PWM waveform.
- Down-count mode: used to generate an asymmetrical PWM waveform.
- Up-down-count mode: used to generate a symmetrical PWM waveform.

To best illustrate the operation of the first three modes, the timing diagrams in Figure 11-228 through Figure 11-231 show when events are generated and how the EPWMxSYNCI signal interacts.



An EPWMxSYNCI external synchronization event can cause a discontinuity in the TBCTR count sequence. This can lead to a compare event being skipped. This skipping is considered normal operation and must be taken into account.

Figure 11-228. Counter-Compare Event Waveforms in Up-Count Mode

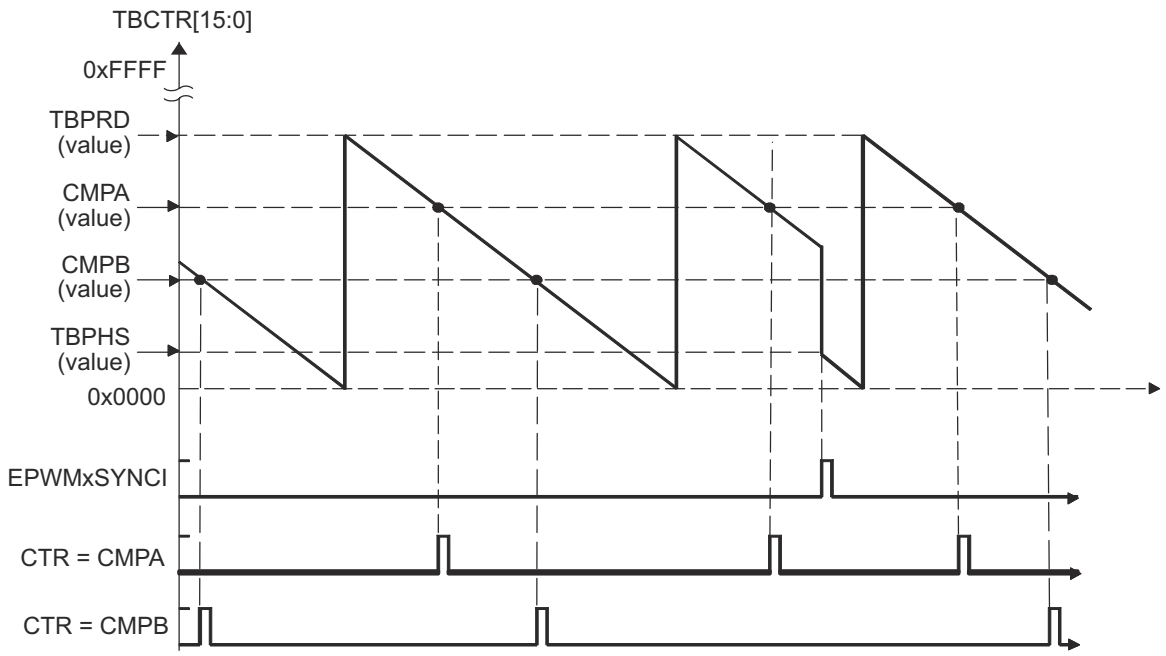


Figure 11-229. Counter-Compare Events in Down-Count Mode

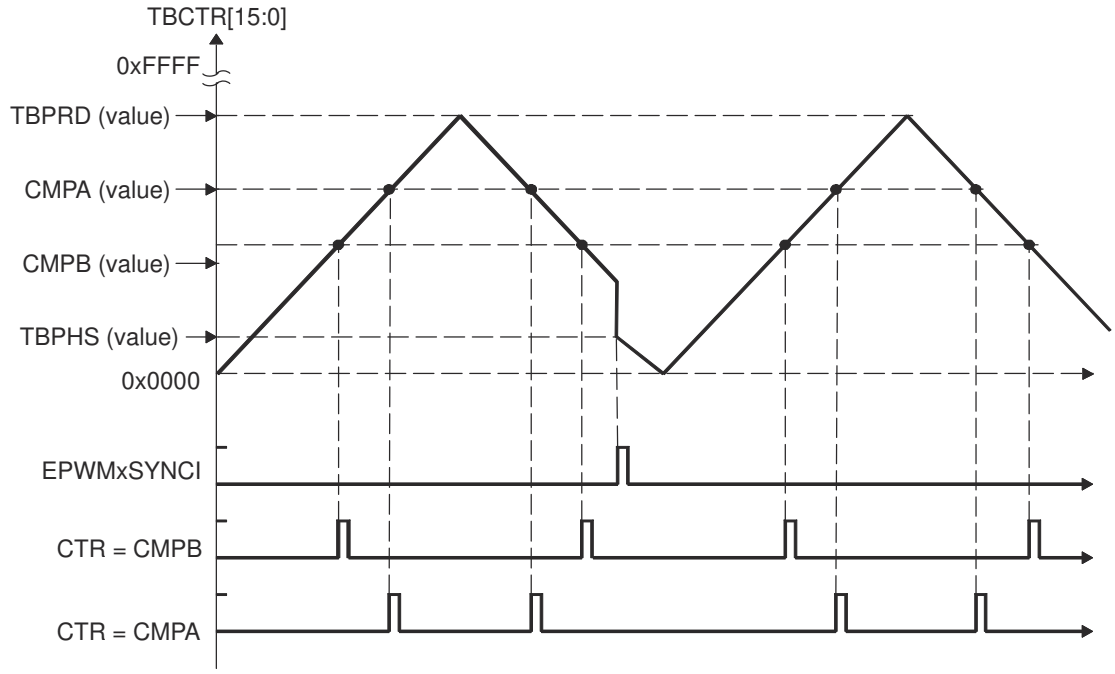

Figure 11-230. Counter-Compare Events In Up-Down-Count Mode, TBCTL[PHSDIR = 0] Count Down On Synchronization Event

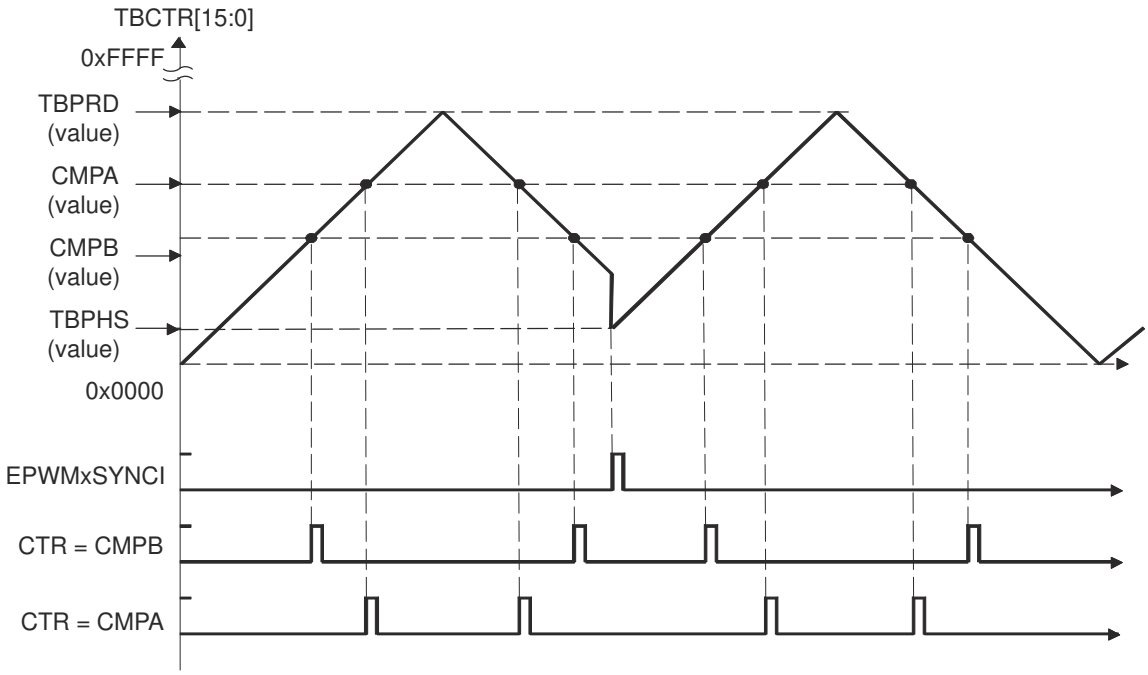

Figure 11-231. Counter-Compare Events In Up-Down-Count Mode, TBCTL[PHSDIR = 1] Count Up On Synchronization Event

11.4.2.2.4 Action-Qualifier (AQ) Submodule

Figure 11-232 shows the action-qualifier (AQ) submodule (see shaded block) in the ePWM system.

The action-qualifier submodule has the most important role in waveform construction and PWM generation. It decides which events are converted into various action types, thereby producing the required switched waveforms at the EPWMx0 and EPWMx1 outputs.

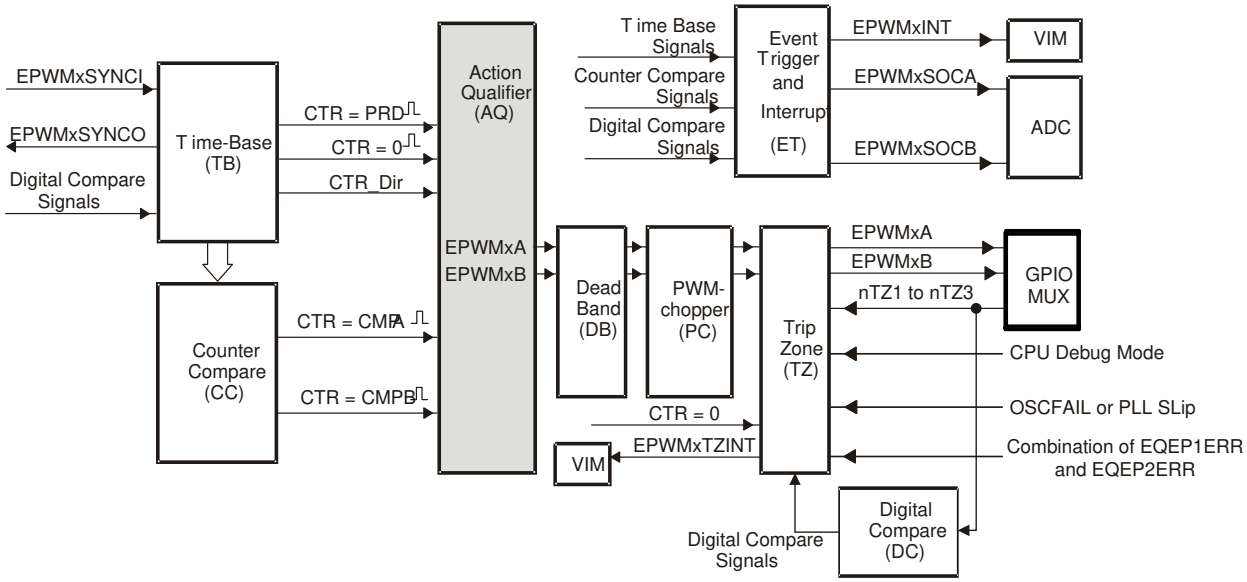

Figure 11-232. Action-Qualifier Submodule

11.4.2.2.4.1 Purpose of the Action-Qualifier Submodule

The action-qualifier submodule is responsible for the following:

- Qualifying and generating actions (set, clear, toggle) based on the following events:
  - CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD)
  - CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000)
  - CTR = CMPA: Time-base counter equal to the counter-compare A register (TBCTR = CMPA)
  - CTR = CMPB: Time-base counter equal to the counter-compare B register (TBCTR = CMPB)
- Managing priority when these events occur concurrently
- Providing independent control of events when the time-base counter is increasing and when it is decreasing

11.4.2.2.4.2 Action-Qualifier Submodule Control and Status Register Definitions

The action-qualifier submodule operation is controlled and monitored via the registers in Table 11-1407.

Table 11-1407. Action-Qualifier Submodule Registers

Register Name	Address Offset	Shadowed	Description
AQCTLA	0x0014	No	Action-Qualifier Control Register For Output A (EPWMx0)
AQCTLB	0x001A	No	Action-Qualifier Control Register For Output B (EPWMx1)
AQSFRC	0x0018	No	Action-Qualifier Software Force Register
AQCSFRC	0x001E	Yes	Action-Qualifier Continuous Software Force

The action-qualifier submodule is based on event-driven logic. It can be thought of as a programmable cross switch with events at the input and actions at the output, all of which are software controlled via the set of registers shown in Table 11-1407.

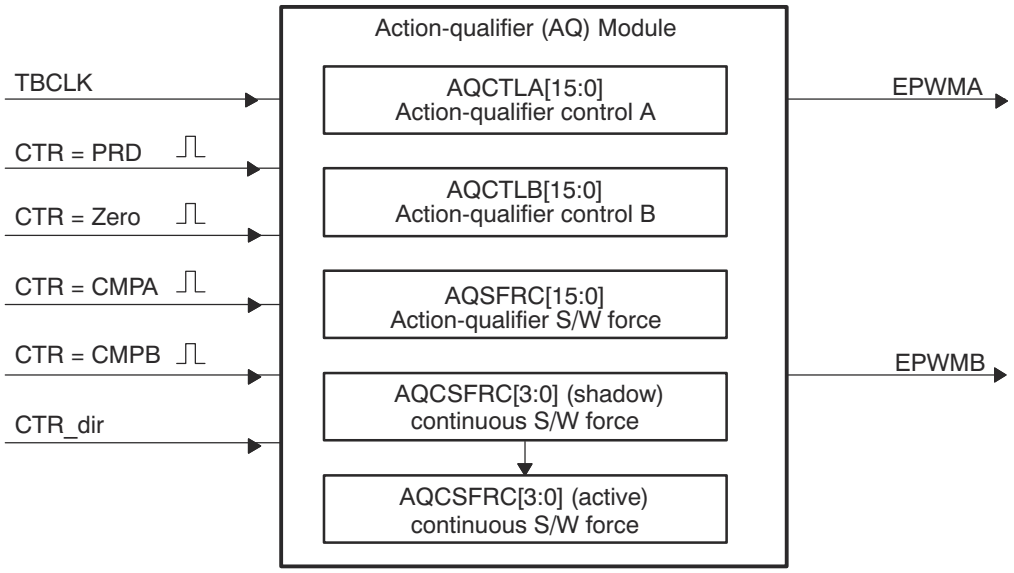

Figure 11-233. Action-Qualifier Submodule Inputs and Outputs

For convenience, the possible input events are summarized again in Table 11-1408.

Table 11-1408. Action-Qualifier Submodule Possible Input Events

Signal	Description	Registers Compared
CTR = PRD	Time-base counter equal to the period value	TBCTR = TBPRD
CTR = Zero	Time-base counter equal to zero	TBCTR = 0x0000
CTR = CMPA	Time-base counter equal to the counter-compare A	TBCTR = CMPA
CTR = CMPB	Time-base counter equal to the counter-compare B	TBCTR = CMPB
Software forced event	Asynchronous event initiated by software	

The software forced action is a useful asynchronous event. This control is handled by registers AQSFRC and AQCSFRC.

The action-qualifier submodule controls how the two outputs EPWMx0 and EPWMx1 behave when a particular event occurs. The event inputs to the action-qualifier submodule are further qualified by the counter direction (up or down). This allows for independent action on outputs on both the count-up and count-down phases.

The possible actions imposed on outputs EPWMxA and EPWMxB are:

- **Set High:**

  Set output EPWMx0 or EPWMx1 to a high level.
- **Clear Low:**

  Set output EPWMx0 or EPWMx1 to a low level.
- **Toggle:**

  If EPWMx0 or EPWMx1 is currently pulled high, then pull the output low. If EPWMx0 or EPWMx1 is currently pulled low, then pull the output high.
- **Do Nothing:**

  Keep outputs EPWMx0 and EPWMx1 at same level as currently set. Although the "Do Nothing" option prevents an event from causing an action on the EPWMx0 and EPWMx1 outputs, this event can still trigger interrupts and ADC start of conversion. See the Event-trigger Submodule description in Section 11.4.2.2.8 for details.

Actions are specified independently for either output (EPWMx0 or EPWMx1). Any or all events can be configured to generate actions on a given output. For example, both CTR = CMPA and CTR = CMPB can operate on output EPWMx1. All qualifier actions are configured via the control registers found at the end of this section.

For clarity, the drawings in this document use a set of symbolic actions. These symbols are summarized in Figure 11-234. Each symbol represents an action as a marker in time. Some actions are fixed in time (zero and period) while the CMPA and CMPB actions are moveable and their time positions are programmed via the counter-compare A and B registers, respectively. To turn off or disable an action, use the "Do Nothing option"; it is the default at reset.

S/W force	TB Counter equals:				Actions
	Zero	Comp A	Comp B	Period	
SW ✕	Z ✕	CA ✕	CB ✕	P ✕	Do Nothing
SW ↓	Z ↓	CA ↓	CB ↓	P ↓	Clear Low
SW ↑	Z ↑	CA ↑	CB ↑	P ↑	Set High
SW T	Z T	CA T	CB T	P T	Toggle

Figure 11-234. Possible Action-Qualifier Actions for EPWMxA and EPWMxB Outputs

11.4.2.2.4.3 Action-Qualifier Event Priority

It is possible for the ePWM action qualifier to receive more than one event at the same time. In this case events are assigned a priority by the hardware. The general rule is events occurring later in time have a higher priority and software forced events always have the highest priority. The event priority levels for up-down-count mode are shown in Table 11-1409. A priority level of 1 is the highest priority and level 7 is the lowest. The priority changes slightly depending on the direction of TBCTR.

Table 11-1409. Action-Qualifier Event Priority for Up-Down-Count Mode

Priority Level	Event If TBCTR is Incrementing TBCTR = Zero up to TBCTR = TBPRD	Event If TBCTR is Decrementing TBCTR = TBPRD down to TBCTR = 1
1 (Highest)	Software forced event	Software forced event
2	Counter equals CMPB on up-count (CBU)	Counter equals CMPB on down-count (CBD)
3	Counter equals CMPA on up-count (CAU)	Counter equals CMPA on down-count (CAD)
4	Counter equals zero	Counter equals period (TBPRD)
5	Counter equals CMPB on down-count (CBD)	Counter equals CMPB on up-count (CBU)
6 (Lowest)	Counter equals CMPA on down-count (CAD)	Counter equals CMPA on up-count (CBU)

Table 11-1410 shows the action-qualifier priority for up-count mode. In this case, the counter direction is always defined as up and thus down-count events will never be taken.

Table 11-1410. Action-Qualifier Event Priority for Up-Count Mode

Priority Level	Event
1 (Highest)	Software forced event
2	Counter equal to period (TBPRD)
3	Counter equal to CMPB on up-count (CBU)
4	Counter equal to CMPA on up-count (CAU)
5 (Lowest)	Counter equal to Zero

Table 11-1411 shows the action-qualifier priority for down-count mode. In this case, the counter direction is always defined as down and thus up-count events will never be taken.

Table 11-1411. Action-Qualifier Event Priority for Down-Count Mode

Priority Level	Event
1 (Highest)	Software forced event
2	Counter equal to Zero
3	Counter equal to CMPB on down-count (CBD)
4	Counter equal to CMPA on down-count (CAD)
5 (Lowest)	Counter equal to period (TBPRD)

It is possible to set the compare value greater than the period. In this case the action will take place as shown in Table 11-1412.

Table 11-1412. Behavior if CMPA/CMPB is Greater than the Period

Counter Mode	Compare on Up-Count Event CAD/CBD	Compare on Down-Count Event CAD/CBD
Up-Count Mode	If CMPA/CMPB ≤ TBPRD period, then the event occurs on a compare match (TBCTR=CMPA or CMPB). If CMPA/CMPB > TBPRD, then the event will not occur.	Never occurs.
Down-Count Mode	Never occurs.	If CMPA/CMPB < TBPRD, the event will occur on a compare match (TBCTR=CMPA or CMPB). If CMPA/CMPB ≥ TBPRD, the event will occur on a period match (TBCTR=TBPRD).
Up-Down-Count Mode	If CMPA/CMPB < TBPRD and the counter is incrementing, the event occurs on a compare match (TBCTR=CMPA or CMPB). If CMPA/CMPB is ≥ TBPRD, the event will occur on a period match (TBCTR = TBPRD).	If CMPA/CMPB < TBPRD and the counter is decrementing, the event occurs on a compare match (TBCTR=CMPA or CMPB). If CMPA/CMPB ≥ TBPRD, the event occurs on a period match (TBCTR=TBPRD).

11.4.2.2.4.4 Waveforms for Common Configurations

Note

The waveforms in this document show the ePWMs behavior for a static compare register value. In a running system, the active compare registers (CMPA and CMPB) are typically updated from their respective shadow registers once every period. The user specifies when the update will take place; either when the time-base counter reaches zero or when the time-base counter reaches period. There are some cases when the action based on the new value can be delayed by one period or the action based on the old value can take effect for an extra period. Some PWM configurations avoid this situation. These include, but are not limited to, the following:

Use up-down-count mode to generate a symmetric PWM:

- If you load CMPA/CMPB on zero, then use CMPA/CMPB values greater than or equal to 1.
- If you load CMPA/CMPB on period, then use CMPA/CMPB values less than or equal to TBPRD - 1.

  This means there will always be a pulse of at least one TBCLK cycle in a PWM period which, when very short, tend to be ignored by the system.

Use up-down-count mode to generate an asymmetric PWM:

- To achieve 50%-0% asymmetric PWM use the following configuration: Load CMPA/CMPB on period and use the period action to clear the PWM and a compare-up action to set the PWM. Modulate the compare value from 0 to TBPRD to achieve 50%-0% PWM duty.

When using up-count mode to generate an asymmetric PWM:

- To achieve 0-100% asymmetric PWM use the following configuration: Load CMPA/CMPB on TBPRD. Use the Zero action to set the PWM and a compare-up action to clear the PWM. Modulate the compare value from 0 to TBPRD + 1 to achieve 0-100% PWM duty.

See the *Using Enhanced Pulse Width Modulator (ePWM) Module for 0-100% Duty Cycle Control* Application Report (SPRAAI1)

Figure 11-235 shows how a symmetric PWM waveform can be generated using the up-down-count mode of the TBCTR. In this mode 0%-100% DC modulation is achieved by using equal compare matches on the up count and down count portions of the waveform. In the example shown, CMPA is used to make the comparison. When the counter is incrementing the CMPA match will pull the PWM output high. Likewise, when the counter is decrementing the compare match will pull the PWM signal low. When CMPA = 0, the PWM signal is low for the entire period giving the 0% duty waveform. When CMPA = TBPRD, the PWM signal is high achieving 100% duty.

When using this configuration in practice, if you load CMPA/CMPB on zero, then use CMPA/CMPB values greater than or equal to 1. If you load CMPA/CMPB on period, then use CMPA/CMPB values less than or equal to TBPRD - 1. This means there will always be a pulse of at least one TBCLK cycle in a PWM period which, when very short, tend to be ignored by the system.

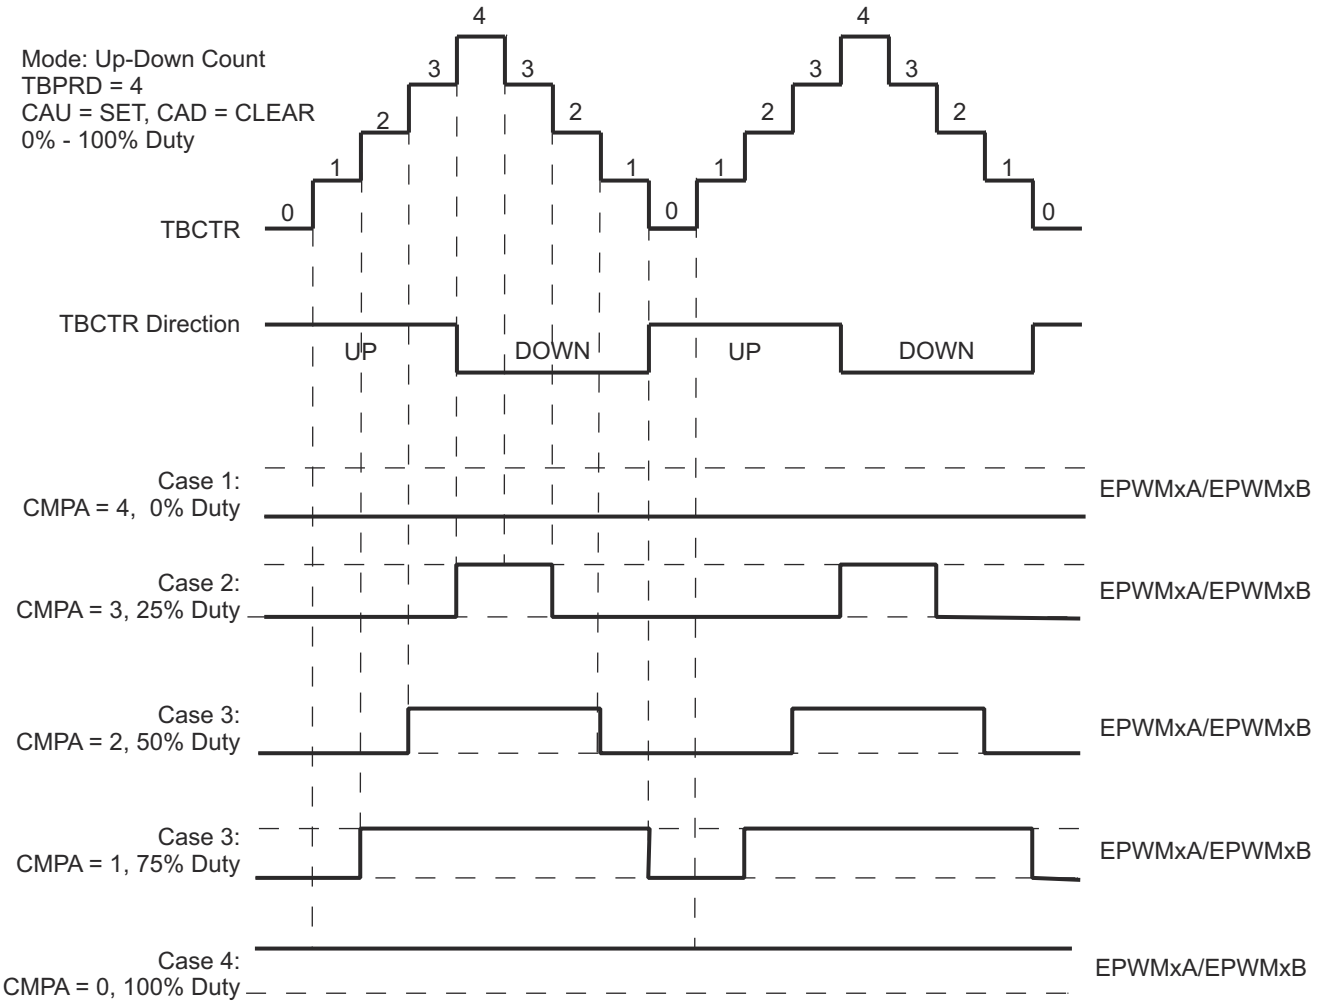

Figure 11-235. Up-Down-Count Mode Symmetrical Waveform

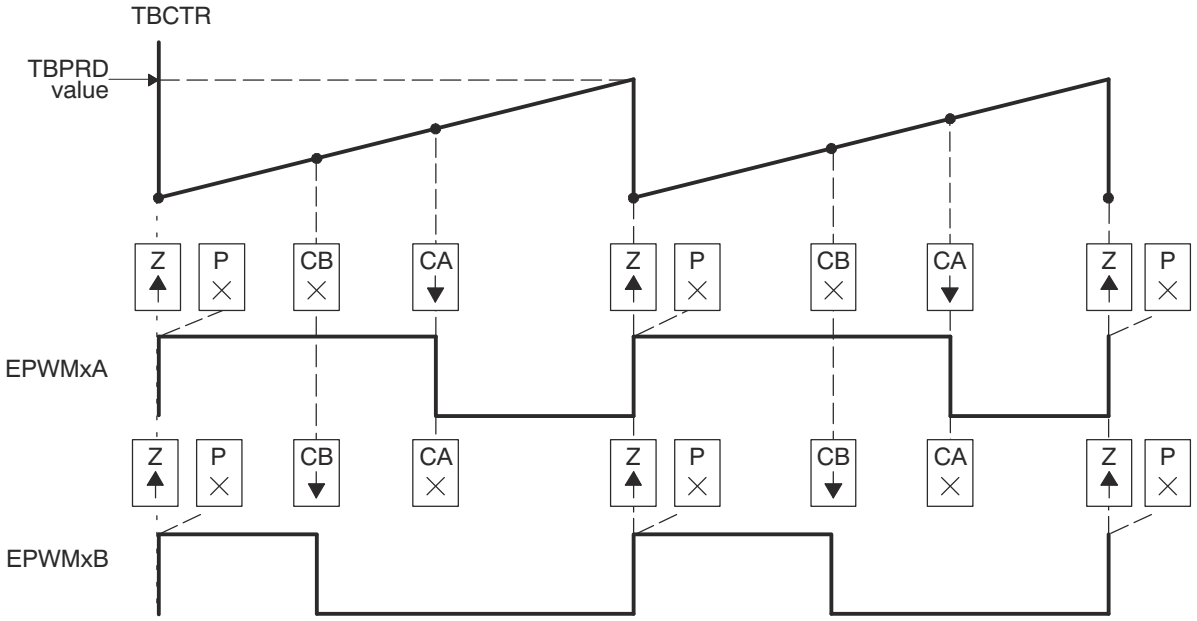
The PWM waveforms in Figure 11-236 through Figure 11-241 show some common action-qualifier configurations. The C-code samples in Example 11-2 through Example 11-7 shows how to configure an ePWM module for each case. Some conventions used in the figures and examples are as follows:

- TBPRD, CMPA, and CMPB refer to the value written in their respective registers. The active register, not the shadow register, is used by the hardware.
- CMPx, refers to either CMPA or CMPB
- EPWMxA and EPWMxB refer to the output signals from ePWMx
- Up-Down means Count-up-and-down mode, Up means up-count mode and Dwn means down-count mode
- Sym = Symmetric, Asym = Asymmetric



A. PWM period = (TBPRD + 1) × T_{TBCLK}
B. Duty modulation for EPWMxA is set by CMPA, and is active high (that is, high time duty proportional to CMPA).
C. Duty modulation for EPWMxB is set by CMPB and is active high (that is, high time duty proportional to CMPB).
D. The "Do Nothing" actions (X) are shown for completeness, but will not be shown on subsequent diagrams.
E. Actions at zero and period, although appearing to occur concurrently, are actually separated by one TBCLK period. TBCTR wraps from period to 0000.

Figure 11-236. Up, Single Edge Asymmetric Waveform, With Independent Modulation on EPWMxA and EPWMxB—Active High

// = = = = = = = = = = = = = = = = = = = = = = = = = = =
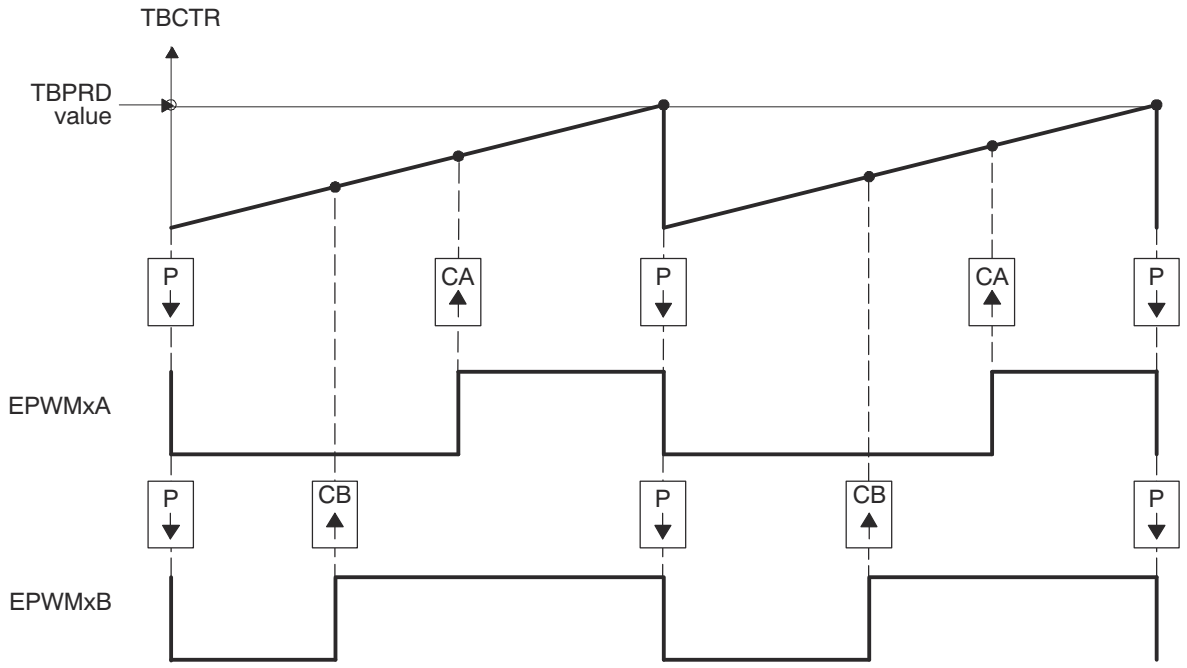
EPwm1Regs.CMPA.half.CMPA = Duty1A;              // adjust duty for output EPWM1A
EPwm1Regs.CMPB = Duty1B;                        // adjust duty for output EPWM1B
```

11.4.2.2.4.5



A. PWM period = (TBPRD + 1) × T_{TBCLK}
B. Duty modulation for EPWMxA is set by CMPA, and is active low (that is, the low time duty is proportional to CMPA).
C. Duty modulation for EPWMxB is set by CMPB and is active low (that is, the low time duty is proportional to CMPB).
D. Actions at zero and period, although appearing to occur concurrently, are actually separated by one TBCLK period. TBCTR wraps from period to 0000.

Figure 11-237. Up, Single Edge Asymmetric Waveform With Independent Modulation on EPWMxA and EPWMxB—Active Low

Example 11-3 contains a code sample showing initialization and run time for the waveforms in Figure 11-237.

Example 11-3. Code Sample for Figure 11-237

```
// Initialization Time
// = = = = = = = = = = = = = = = = = = = = = = = = =
EPwm1Regs.TBPRD = 600;                          // Period = 601 TBCLK counts
EPwm1Regs.CMPA.half.CMPA = 350;                 // Compare A = 350 TBCLK counts
EPwm1Regs.CMPB = 200;                           // Compare B = 200 TBCLK counts
EPwm1Regs.TBPHS = 0;                            // Set Phase register to zero
EPwm1Regs.TBCTR = 0;                            // clear TB counter
EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP;
EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE;         // Phase loading disabled
EPwm1Regs.TBCTL.bit.PRDLD = TB_SHADOW;
EPwm1Regs.TBCTL.bit.SYNCOSEL = TB_SYNC_DISABLE;

// Run Time
// = = = = = = = = = = = = = = = = = = = = = = = = =
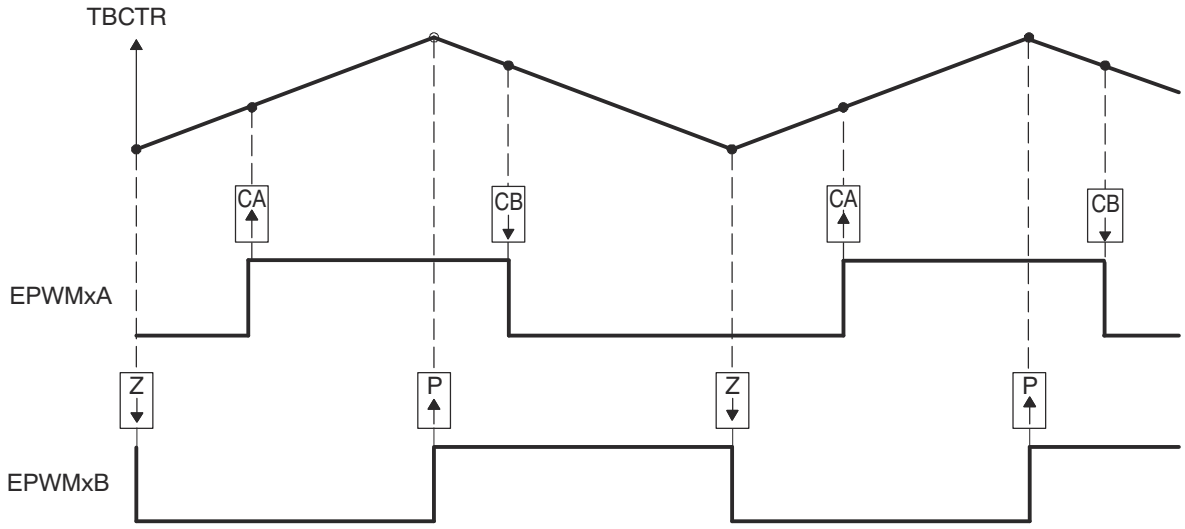
EPwm1Regs.CMPA.half.CMPA = Duty1A;          // adjust duty for output EPWM1A
EPwm1Regs.CMPB = Duty1B;                    // adjust duty for output EPWM1B
```

11.4.2.2.4.9



A. PWM period = 2 × TBPRD × TBCLK
B. Rising edge and falling edge can be asymmetrically positioned within a PWM cycle. This allows for pulse placement techniques.
C. Duty modulation for EPWMxA is set by CMPA and CMPB.
D. Low time duty for EPWMxA is proportional to (CMPA + CMPB).
E. To change this example to active high, CMPA and CMPB actions need to be inverted (that is, Set ! Clear and Clear Set).
F. Duty modulation for EPWMxB is fixed at 50% (utilizes spare action resources for EPWMxB)

Figure 11-241. Up-Down-Count, Dual Edge Asymmetric Waveform, With Independent Modulation on EPWMxA—Active Low

EPwm1Regs.CMPB = EdgePosB;
```

11.4.2.2.5 Dead-Band Generator (DB) Submodule

Figure 11-242 illustrates the dead-band submodule within the ePWM module.

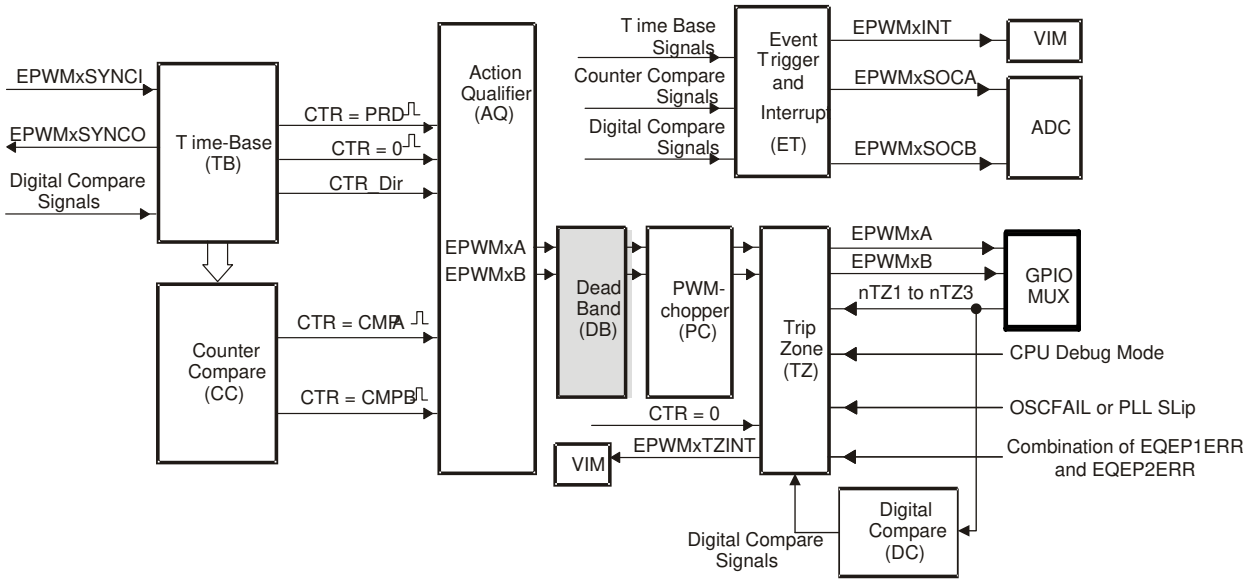

Figure 11-242. Dead_Band Submodule

11.4.2.2.5.1 Purpose of the Dead-Band Submodule

discussed how it is possible to generate the required dead-band by having full control over edge placement using both the CMPA and CMPB resources of the ePWM module. However, if the more classical edge delay-

based dead-band with polarity control is required, then the dead-band submodule described here should be used.

The key functions of the dead-band module are:

- Generating appropriate signal pairs (EPWMx0 and EPWMx1) with dead-band relationship from a single EPWMx0 input
- Programming signal pairs for:
  - Active high (AH)
  - Active low (AL)
  - Active high complementary (AHC)
  - Active low complementary (ALC)
- Adding programmable delay to rising edges (RED)
- Adding programmable delay to falling edges (FED)
- Can be totally bypassed from the signal path (note dotted lines in diagram)

11.4.2.2.5.2 Controlling and Monitoring the Dead-Band Submodule

The dead-band submodule operation is controlled and monitored via the following registers:

Table 11-1413. Dead-Band Generator Submodule Registers

Register Name	Address Offset	Shadowed	Description
DBCTL	0x001C	No	Dead-Band Control Register
DBRED	0x0022	No	Dead-Band Rising Edge Delay Count Register
DBFED	0x0020	No	Dead-Band Falling Edge Delay Count Register

11.4.2.2.5.3 Operational Highlights for the Dead-Band Submodule

The following sections provide the operational highlights.

The dead-band submodule has two groups of independent selection options as shown in Figure 11-243.

- **Input Source Selection:**

  The input signals to the dead-band module are the EPWMx0 and EPWMx1 output signals from the action-qualifier. In this section they will be referred to as EPWMxA In and EPWMxB In. Using the DBCTL[IN_MODE) control bits, the signal source for each delay, falling-edge or rising-edge, can be selected:
  - EPWMx0 In is the source for both falling-edge and rising-edge delay. This is the default mode.
  - EPWMx0 In is the source for falling-edge delay, EPWMxB In is the source for rising-edge delay.
  - EPWMx0 In is the source for rising edge delay, EPWMx1 In is the source for falling-edge delay.
  - EPWMx1 In is the source for both falling-edge and rising-edge delay.
- **Half Cycle Clocking:**

  The dead-band submodule can be clocked using half cycle clocking to double the resolution (that is, counter clocked at 2× TBCLK)
- **Output Mode Control:**

  The output mode is configured by way of the DBCTL[OUT_MODE] bits. These bits determine if the falling-edge delay, rising-edge delay, neither, or both are applied to the input signals.
- **Polarity Control:**

  The polarity control (DBCTL[POLSEL]) allows you to specify whether the rising-edge delayed signal and/or the falling-edge delayed signal is to be inverted before being sent out of the dead-band submodule.

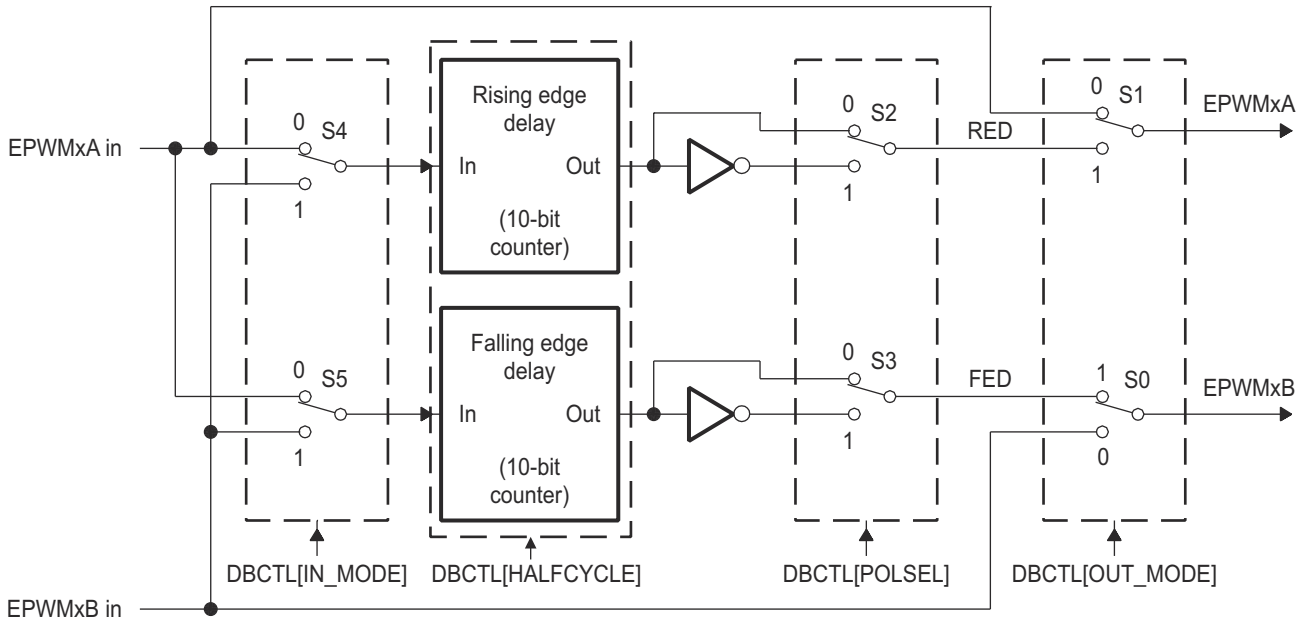

Figure 11-243. Configuration Options for the Dead-Band Submodule

Although all combinations are supported, not all are typical usage modes. Table 11-1414 documents some classical dead-band configurations. These modes assume that the DBCTL[IN_MODE] is configured such that EPWMx0 In is the source for both falling-edge and rising-edge delay. Enhanced, or non-traditional modes can be achieved by changing the input signal source. The modes shown in Table 11-1414 fall into the following categories:

- **Mode 1: Bypass both falling-edge delay (FED) and rising-edge delay (RED)**

  Allows you to fully disable the dead-band submodule from the PWM signal path.
- **Mode 2-5: Classical Dead-Band Polarity Settings:**

  These represent typical polarity configurations that should address all the active high/low modes required by available industry power switch gate drivers. The waveforms for these typical cases are shown in Figure 11-244. Note that to generate equivalent waveforms to Figure 11-244, configure the action-qualifier submodule to generate the signal as shown for EPWMx0.
- **Mode 6: Bypass rising-edge-delay and Mode 7: Bypass falling-edge-delay**

  Finally the last two entries in Table 11-1414 show combinations where either the falling-edge-delay (FED) or rising-edge-delay (RED) blocks are bypassed.

Table 11-1414. Classical Dead-Band Operating Modes

		DBCTL[POLSEL]		DBCTL[OUT_MODE]	
Mode	**Mode Description**	**S3**	**S2**	**S1**	**S0**
1	EPWMxA and EPWMxB Passed Through (No Delay)	X	X	0	0
2	Active High Complementary (AHC)	1	0	1	1
3	Active Low Complementary (ALC)	0	1	1	1
4	Active High (AH)	0	0	1	1
5	Active Low (AL)	1	1	1	1
6	EPWMxA Out = EPWMxA In (No Delay) EPWMxB Out = EPWMxA In with Falling Edge Delay	0 or 1	0 or 1	0	1
7	EPWMxA Out = EPWMxA In with Rising Edge Delay EPWMxB Out = EPWMxB In with No Delay	0 or 1	0 or 1	1	0

Figure 11-244 shows waveforms for typical cases where 0% < duty < 100%.

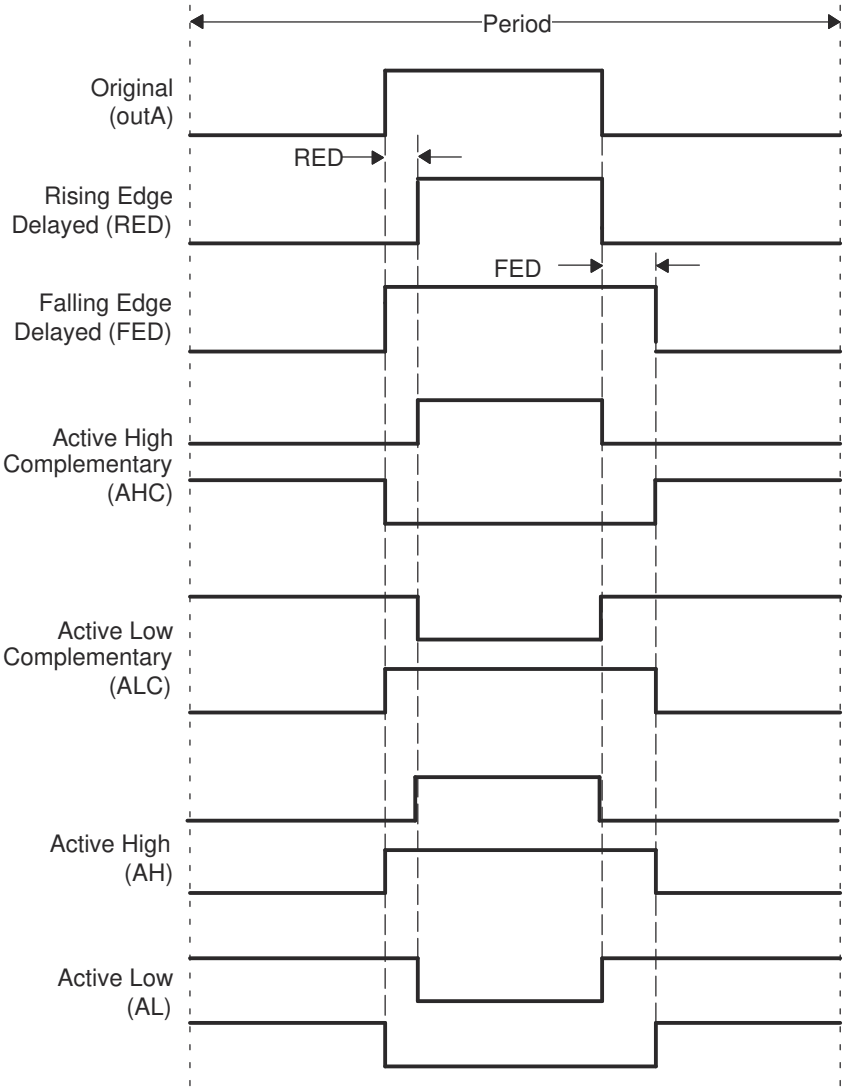

Figure 11-244. Dead-Band Waveforms for Typical Cases (0% < Duty < 100%)

The dead-band submodule supports independent values for rising-edge (RED) and falling-edge (FED) delays. The amount of delay is programmed using the DBRED and DBFED registers. These are 10-bit registers and their value represents the number of time-base clock, TBCLK, periods a signal edge is delayed by. For example, the formula to calculate falling-edge-delay and rising-edge-delay are:

$FED = DBFED \times T_{TBCLK}$

$RED = DBRED \times T_{TBCLK}$

Where T_{TBCLK} is the period of TBCLK, the prescaled version of VCLK4.

For convenience, delay values for various TBCLK options are shown in Table 11-1415.

Table 11-1415. Dead-Band Delay Values in µS as a Function of DBFED and DBRED

Dead-Band Value	Dead-Band Delay in µS		
DBFED, DBRED	TBCLK = VCLK4/1	TBCLK = VCLK4 /2	TBCLK = VCLK4/4
1	0.02 µS	0.03 µS	0.07 µS
5	0.08 µS	0.17 µS	0.33 µS
10	0.17 µS	0.33 µS	0.67 µS
100	1.67 µS	3.33 µS	6.67 µS
200	3.33 µS	6.67 µS	13.33 µS
400	6.67 µS	13.33 µS	26.67 µS
500	8.33 µS	16.67 µS	33.33 µS
600	10.00 µS	20.00 µS	40.00 µS
700	11.67 µS	23.33 µS	46.67 µS
800	13.33 µS	26.67 µS	53.33 µS
900	15.00 µS	30.00 µS	60.00 µS
1000	16.67 µS	33.33µS	66.67 µS

When half-cycle clocking is enabled, the formula to calculate the falling-edge-delay and rising-edge-delay becomes:

$FED = DBFED \times T_{TBCLK}/2$

$RED = DBRED \times T_{TBCLK}/2$

11.4.2.2.6 PWM-Chopper (PC) Submodule

Figure 11-245 illustrates the PWM-chopper (PC) submodule within the ePWM module.

The PWM-chopper submodule allows a high-frequency carrier signal to modulate the PWM waveform generated by the action-qualifier and dead-band submodules. This capability is important if you need pulse transformer-based gate drivers to control the power switching elements.

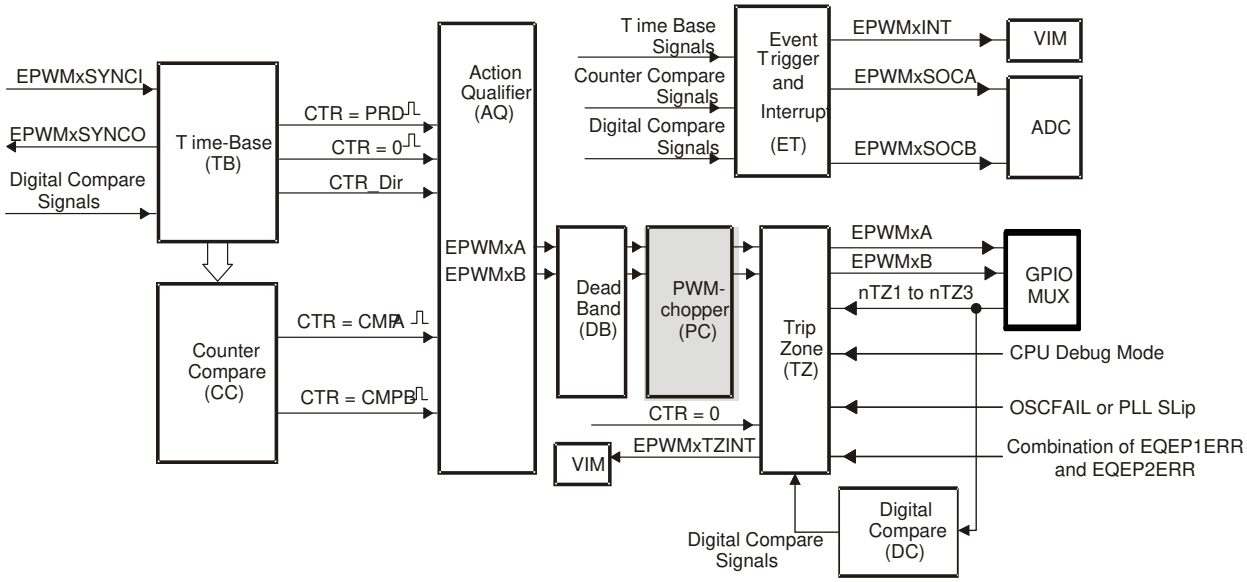

Figure 11-245. PWM-Chopper Submodule

11.4.2.2.6.1 Purpose of the PWM-Chopper Submodule

The key functions of the PWM-chopper submodule are:

- Programmable chopping (carrier) frequency
- Programmable pulse width of first pulse
- Programmable duty cycle of second and subsequent pulses
- Can be fully bypassed if not required

11.4.2.2.6.2 Controlling the PWM-Chopper Submodule

The PWM-chopper submodule operation is controlled via the registers in Table 11-1416.

Table 11-1416. PWM-Chopper Submodule Registers

Register Name	Address Offset	Shadowed	Description
PCCTL	0x003E	No	PWM-chopper Control Register

11.4.2.2.6.3 Operational Highlights for the PWM-Chopper Submodule

Figure 11-246 shows the operational details of the PWM-chopper submodule. The carrier clock is derived from VCLK4. Its frequency and duty cycle are controlled via the CHPFREQ and CHPDUTY bits in the PCCTL register. The one-shot block is a feature that provides a high energy first pulse to ensure hard and fast power switch turn on, while the subsequent pulses sustain pulses, ensuring the power switch remains on. The one-shot width is programmed via the OSHTWTH bits. The PWM-chopper submodule can be fully disabled (bypassed) via the CHPEN bit.

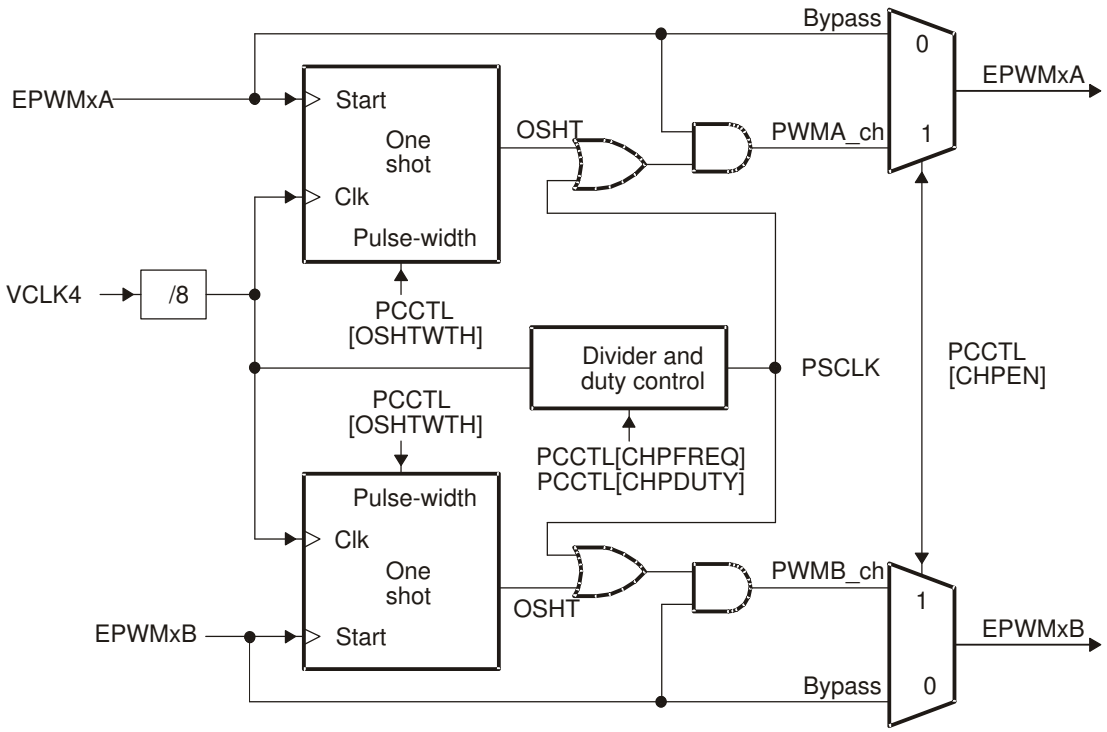

Figure 11-246. PWM-Chopper Submodule Operational Details

11.4.2.2.6.4 Waveforms

Figure 11-247 shows simplified waveforms of the chopping action only; one-shot and duty-cycle control are not shown. Details of the one-shot and duty-cycle control are discussed in the following sections.

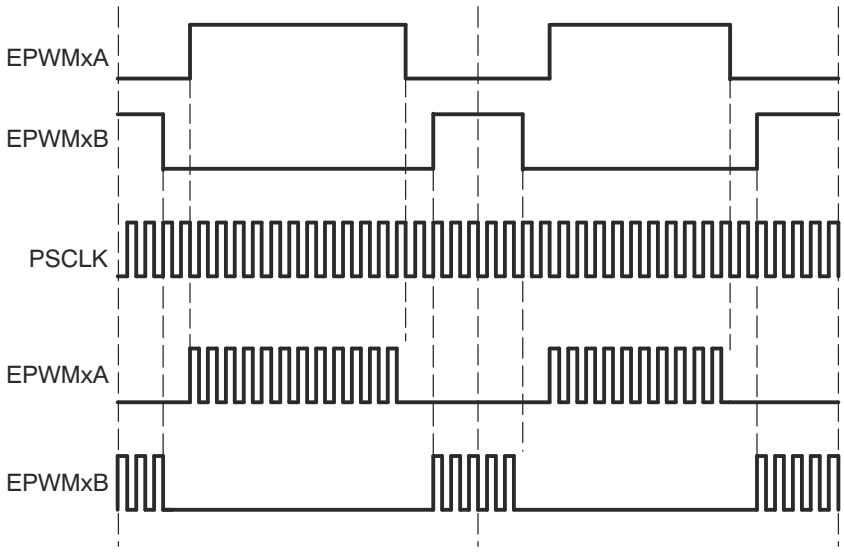

Figure 11-247. Simple PWM-Chopper Submodule Waveforms Showing Chopping Action Only

11.4.2.2.6.4.1 One-Shot Pulse

The width of the first pulse can be programmed to any of 16 possible pulse width values. The width or period of the first pulse is given by:

$T_{1stpulse} = T_{VCLK4} \times 8 \times OSHTWTH$

Where T_{VCLK4} is the period of the system clock (VCLK4) and OSHTWTH is the four control bits (value from 1 to 16)

Figure 11-248 shows the first and subsequent sustaining pulses and Table 11-1417 gives the possible pulse width values for a VCLK4 = 100 MHz.

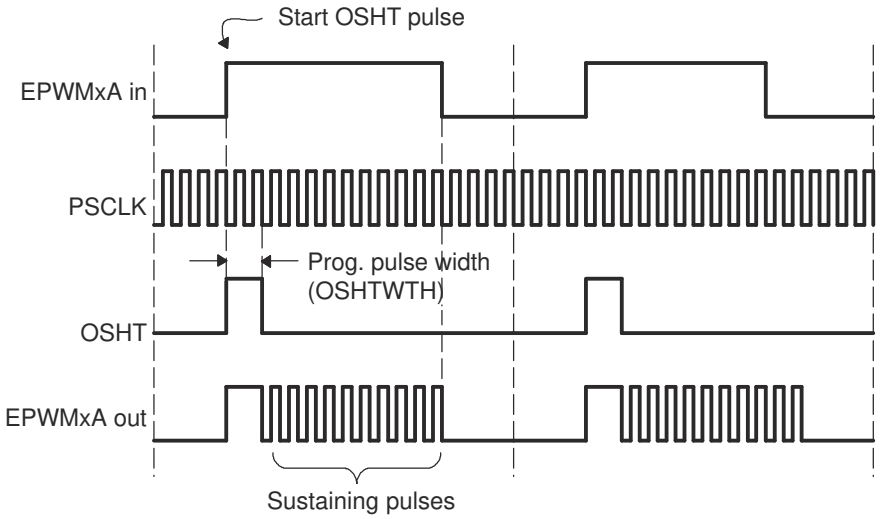

Figure 11-248. PWM-Chopper Submodule Waveforms Showing the First Pulse and Subsequent Sustaining Pulses

Table 11-1417. Possible Pulse Width Values for VCLK4 = 100 MHz

OSHTWTHz (hex)	Pulse Width (nS)
0	100
1	200
2	300
3	400
4	500
5	600
6	700
7	800
8	900
9	1000
A	1100
B	1200
C	1300
D	1400
E	1500

Table 11-1417. Possible Pulse Width Values for VCLK4 = 100 MHz (continued)

OSHTWTHz (hex)	Pulse Width (nS)
F	1600

11.4.2.2.6.4.2 Duty Cycle Control

Pulse transformer-based gate drive designs need to comprehend the magnetic properties or characteristics of the transformer and associated circuitry. Saturation is one such consideration. To assist the gate drive designer, the duty cycles of the second and subsequent pulses have been made programmable. These sustaining pulses ensure the correct drive strength and polarity is maintained on the power switch gate during the on period, and hence a programmable duty cycle allows a design to be tuned or optimized via software control.

Figure 11-249 shows the duty cycle control that is possible by programming the CHPDUTY bits. One of seven possible duty ratios can be selected ranging from 12.5% to 87.5%.

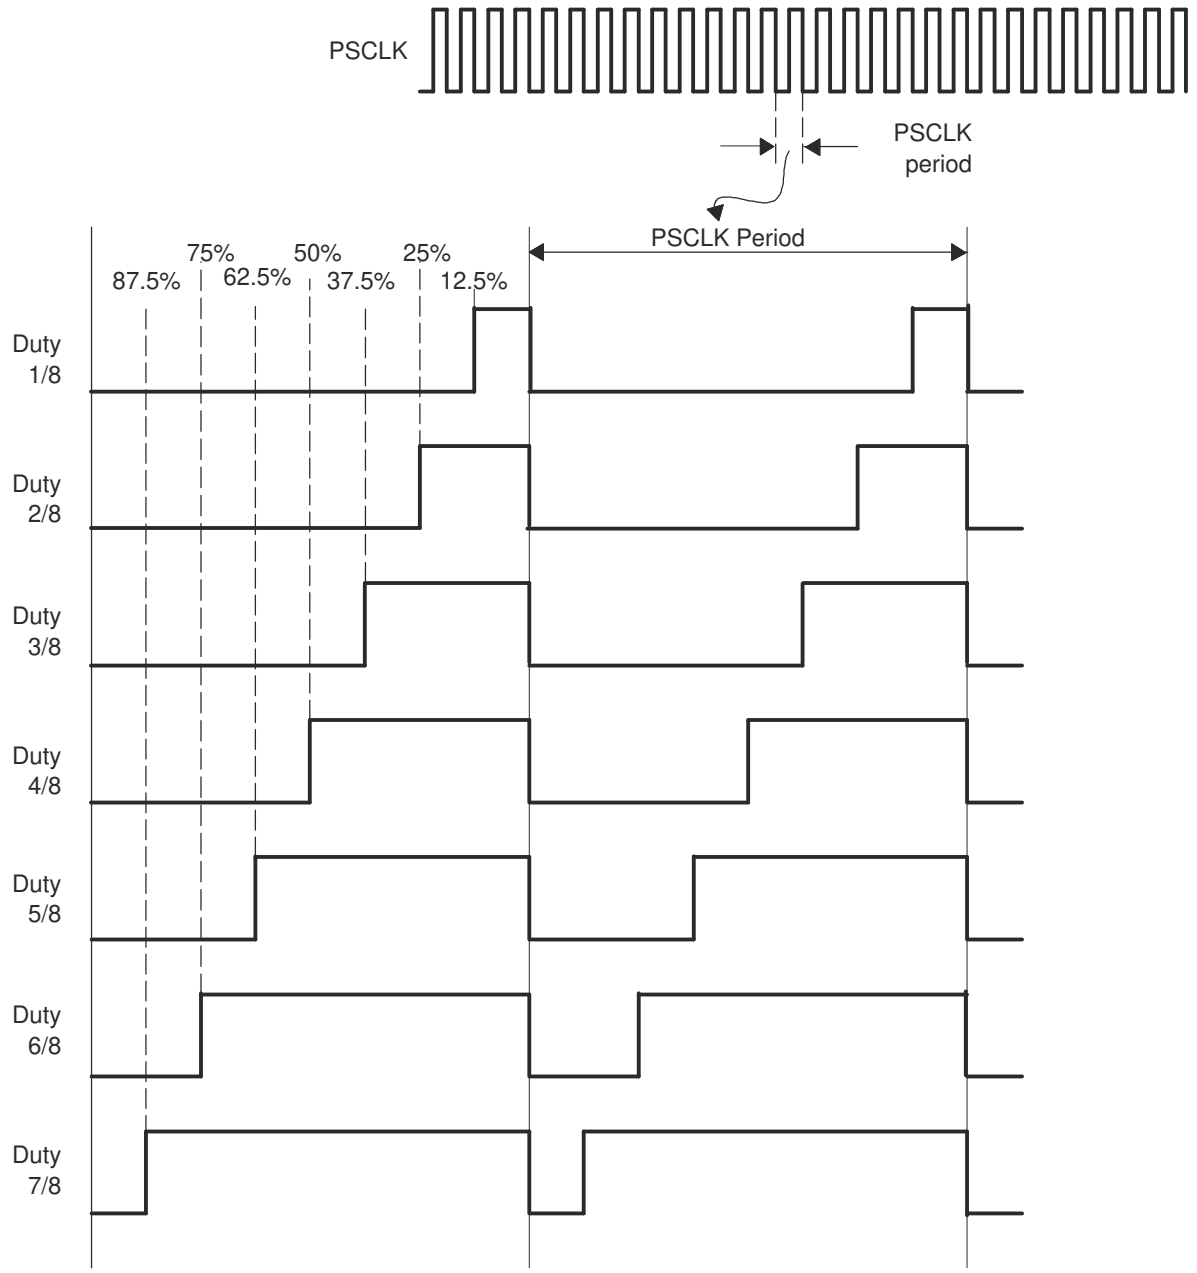

Figure 11-249. PWM-Chopper Submodule Waveforms Showing the Pulse Width (Duty Cycle) Control of Sustaining Pulses

11.4.2.2.7 Trip-Zone (TZ) Submodule

Figure 11-250 shows how the trip-zone (TZ) submodule fits within the ePWM module.

Each ePWM module is connected to six $\overline{TZn}$ signals ($\overline{TZ1}$ to $\overline{TZ6}$). $\overline{TZ1}$ to $\overline{TZ3}$ are sourced from the GPIO mux. $\overline{TZ4}$ is sourced from a combination of EQEP1ERR and EQEP2ERR signals. $\overline{TZ5}$ is connected to the system oscillator or PLL clock fail logic, and $\overline{TZ6}$ is sourced from the debug mode halt indication output from the CPU. These signals indicate fault or trip conditions, and the ePWM outputs can be programmed to respond accordingly when faults occur.

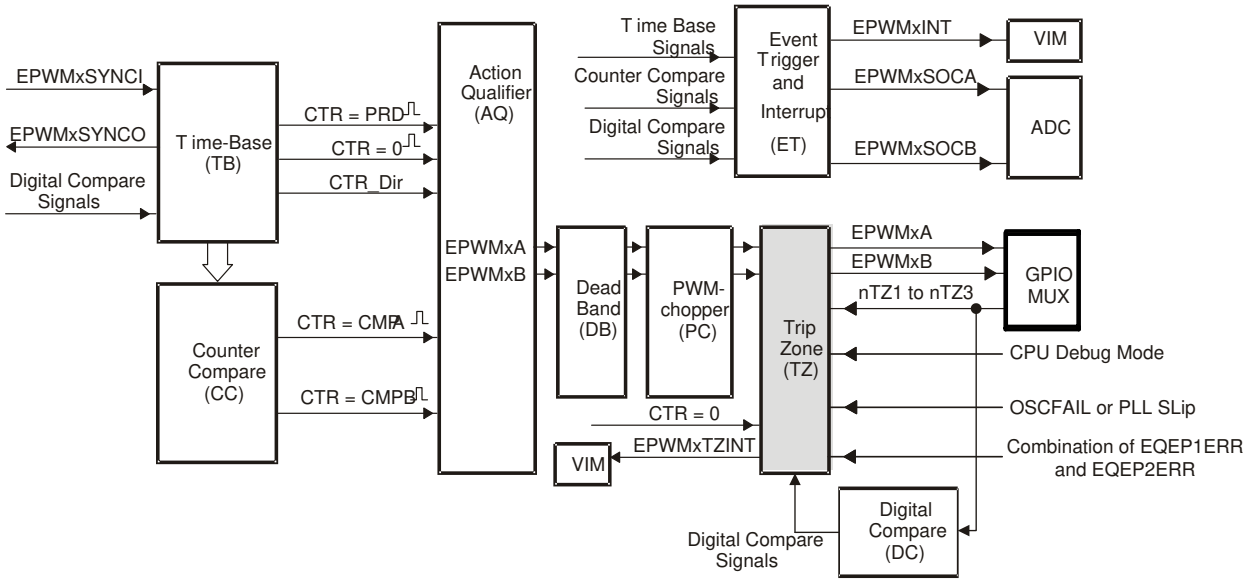

Figure 11-250. Trip-Zone Submodule

11.4.2.2.7.1 Purpose of the Trip-Zone Submodule

The key functions of the Trip-Zone submodule are:

- Trip inputs $\overline{TZ1}$ to $\overline{TZ6}$ are mapped to all ePWM modules.
- Upon a fault indication, either no action is taken or the ePWM outputs EPWMx0 and EPWMx1 can be forced to one of the following:
  - High
  - Low
  - High-impedance
- Support for one-shot trip (OSHT) for major short circuits or over-current conditions.
- Support for cycle-by-cycle tripping (CBC) for current limiting operation.
- Support for digital compare tripping (DC) based on state of on-chip analog comparator module outputs and/or $\overline{TZ1}$ to $\overline{TZ3}$ signals.
- Each trip-zone input and digital compare (DC) submodule DCAEVT1/2 or DCBEVT1/2 force event can be allocated to either one-shot or cycle-by-cycle operation.
- Interrupt generation is possible on any trip-zone input.
- Software-forced tripping is also supported.
- The trip-zone submodule can be fully bypassed if it is not required.

11.4.2.2.7.2 Controlling and Monitoring the Trip-Zone Submodule

The trip-zone submodule operation is controlled and monitored through the following registers:

Table 11-1418. Trip-Zone Submodule Registers

Register Name	Address Offset	Shadowed	Description [2]
TZSEL	0x0026	No	Trip-Zone Select Register
TZDCSEL	0x0024	No	Trip-zone Digital Compare Select Register [1]
TZCTL	0x002A	No	Trip-Zone Control Register
TZEINT	0x0028	No	Trip-Zone Enable Interrupt Register
TZFLG	0x002E	No	Trip-Zone Flag Register
TZCLR	0x002C	No	Trip-Zone Clear Register
TZFRC	0x0032	No	Trip-Zone Force Register

(1) This register is discussed in more detail in Section 11.4.2.2.9.
(2) All trip-zone registers are writable only in privileged mode.

11.4.2.2.7.3 Operational Highlights for the Trip-Zone Submodule

The following sections describe the operational highlights and configuration options for the trip-zone submodule.

The trip-zone signals $\overline{TZ1}$ to $\overline{TZ6}$ (also collectively referred to as $\overline{TZn}$) are active low input signals. When one of these signals goes low, or when a DCAEVT1/2 or DCBEVT1/2 force happens based on the TZDCSEL register event selection, it indicates that a trip event has occurred. Each ePWM module can be individually configured to ignore or use each of the trip-zone signals or DC events. Which trip-zone signals or DC events are used by a particular ePWM module is determined by the TZSEL register for that specific ePWM module. The trip-zone signals may or may not be synchronized to the system clock (VCLK4) and digitally filtered within the GPIO MUX block. A minimum of 3*TBCLK low pulse width on $\overline{TZn}$ inputs is sufficient to trigger a fault condition on the ePWM module. If the pulse width is less than this, the trip condition may not be latched. The asynchronous trip makes sure that if clocks are missing for any reason, the outputs can still be tripped by a valid event present on $\overline{TZn}$ inputs. The GPIOs or peripherals must be appropriately configured. For more information, see the IOMM chapter of the device technical reference manual.

Each $\overline{TZn}$ input can be individually configured to provide either a cycle-by-cycle or one-shot trip event for an ePWM module. DCAEVT1 and DCBEVT1 events can be configured to directly trip an ePWM module or provide a one-shot trip event to the module. Likewise, DCAVET2 and DCBEVT2 events can also be configured to directly trip an ePWM module or provide a cycle-by-cycle trip event to the module. This configuration is determined by the TZSEL[DCAEVT1/2], TZSEL[DCBEVT1/2], TZSEL[CBCn], and TZSEL[OSHTn] control bits (where n corresponds to the trip input) respectively.

- **Cycle-by-Cycle (CBC):**

  When a cycle-by-cycle trip event occurs, the action specified in the TZCTL[TZA] and TZCTL[TZB] bits is carried out immediately on the EPWMxA and/or EPWMxB output. Table 11-1419 lists the possible actions. In addition, the cycle-by-cycle trip event flag (TZFLG[CBC]) is set and a EPWMx_TZINT interrupt is generated if it is enabled in the TZEINT register and VIM peripheral.

  If the CBC interrupt is enabled via the TZEINT register, and DCAEVT2 or DCBEVT2 are selected as CBC trip sources via the TZSEL register, it is not necessary to also enable the DCAEVT2 or DCBEVT2 interrupts in the TZEINT register, as the DC events trigger interrupts through the CBC mechanism.

  The specified condition on the inputs is automatically cleared when the ePWM time-base counter reaches zero (TBCTR = 0x0000) if the trip event is no longer present. Therefore, in this mode, the trip event is cleared or reset every PWM cycle. The TZFLG[CBC] flag bit will remain set until it is manually cleared by writing to the TZCLR[CBC] bit. If the cycle-by-cycle trip event is still present when the TZFLG[CBC] bit is cleared, then it will again be immediately set.

- **One-Shot (OSHT):**

  When a one-shot trip event occurs, the action specified in the TZCTL[TZA] and TZCTL[TZB] bits is carried out immediately on the EPWMxA and/or EPWMxB output. Table 11-1419 lists the possible actions. In addition, the one-shot trip event flag (TZFLG[OST]) is set and a EPWMx_TZINT interrupt is generated if it is enabled in the TZEINT register and VIM peripheral. The one-shot trip condition must be cleared manually by writing to the TZCLR[OST] bit.

  If the one-shot interrupt is enabled via the TZEINT register, and DCAEVT1 or DCBEVT1 are selected as OSHT trip sources via the TZSEL register, it is not necessary to also enable the DCAEVT1 or DCBEVT1 interrupts in the TZEINT register, as the DC events trigger interrupts through the OSHT mechanism.
- **Digital Compare Events (DCAEVT1/2 and DCBEVT1/2):**

  A digital compare DCAEVT1/2 or DCBEVT1/2 event is generated based on a combination of the DCAH/DCAL and DCBH/DCBL signals as selected by the TZDCSEL register. The signals which source the DCAH/DCAL and DCBH/DCBL signals are selected via the DCTRIPSEL register and can be either trip zone input pins. For more information on the digital compare submodule signals, see Section 11.4.2.2.9.

  When a digital compare event occurs, the action specified in the TZCTL[DCAEVT1/2] and TZCTL[DCBEVT1/2] bits is carried out immediately on the EPWMxA and/or EPWMxB output. Table 11-1419 lists the possible actions. In addition, the relevant DC trip event flag (TZFLG[DCAEVT1/2] / TZFLG[DCBEVT1/2]) is set and a EPWMx_TZINT interrupt is generated if it is enabled in the TZEINT register and VIM peripheral.

  The specified condition on the pins is automatically cleared when the DC trip event is no longer present. The TZFLG[DCAEVT1/2] or TZFLG[DCBEVT1/2] flag bit will remain set until it is manually cleared by writing to the TZCLR[DCAEVT1/2] or TZCLR[DCBEVT1/2] bit. If the DC trip event is still present when the TZFLG[DCAEVT1/2] or TZFLG[DCBEVT1/2] flag is cleared, then it will again be immediately set.

The action taken when a trip event occurs can be configured individually for each of the ePWM output pins by way of the TZCTL register bit fields. One of four possible actions, shown in Table 11-1419, can be taken on a trip event.

Table 11-1419. Possible Actions On a Trip Event

TZCTL Register bit-field Settings	EPWMxA and/or EPWMxB	Comment
0,0	High-Impedance	Tripped
0,1	Force to High State	Tripped
1,0	Force to Low State	Tripped
1,1	No Change	Do Nothing. No change is made to the output.

Example 11-8. Trip-Zone Configurations

Scenario A:
A one-shot trip event on $\overline{TZ1}$ pulls both EPWMA0, EPWMA1 low and also forces EPWMB0 and EPWMB1 high.

- Configure the ePWMA registers as follows:
  - TZSEL[OSHT1] = 1: enables $\overline{TZ1}$ as a one-shot event source for ePWMA
  - TZCTL[TZA] = 2: EPWMA0 will be forced low on a trip event.
  - TZCTL[TZB] = 2: EPWMA1 will be forced low on a trip event.
- Configure the ePWMB registers as follows:
  - TZSEL[OSHT1] = 1: enables $\overline{TZ1}$ as a one-shot event source for ePWMB
  - TZCTL[TZA] = 1: EPWMB0 will be forced high on a trip event.
  - TZCTL[TZB] = 1: EPWMB1 will be forced high on a trip event.

Scenario B:
A cycle-by-cycle event on $\overline{TZ5}$ pulls both EPWMA0, EPWMA1 low.
A one-shot event on $\overline{TZ1}$ or $\overline{TZ6}$ puts EPWMB0 into a high impedance state.

- Configure the ePWM1 registers as follows:
  - TZSEL[CBC5] = 1: enables $\overline{TZ5}$ as a one-shot event source for ePWMA
  - TZCTL[TZA] = 2: EPWMA0 will be forced low on a trip event.
  - TZCTL[TZB] = 2: EPWMA1 will be forced low on a trip event.
- Configure the ePWM2 registers as follows:
  - TZSEL[OSHT1] = 1: enables $\overline{TZ1}$ as a one-shot event source for ePWMB
  - TZSEL[OSHT6] = 1: enables $\overline{TZ6}$ as a one-shot event source for ePWMB
  - TZCTL[TZA] = 0: EPWMB0 will be put into a high-impedance state on a trip event.
  - TZCTL[TZB] = 3: EPWMB1 will ignore the trip event.

11.4.2.2.7.4 Generating Trip Event Interrupts

Figure 11-251 and Figure 11-252 illustrate the trip-zone submodule control and interrupt logic, respectively. DCAEVT1/2 and DCBEVT1/2 signals are described in further detail in Section 11.4.2.2.9.

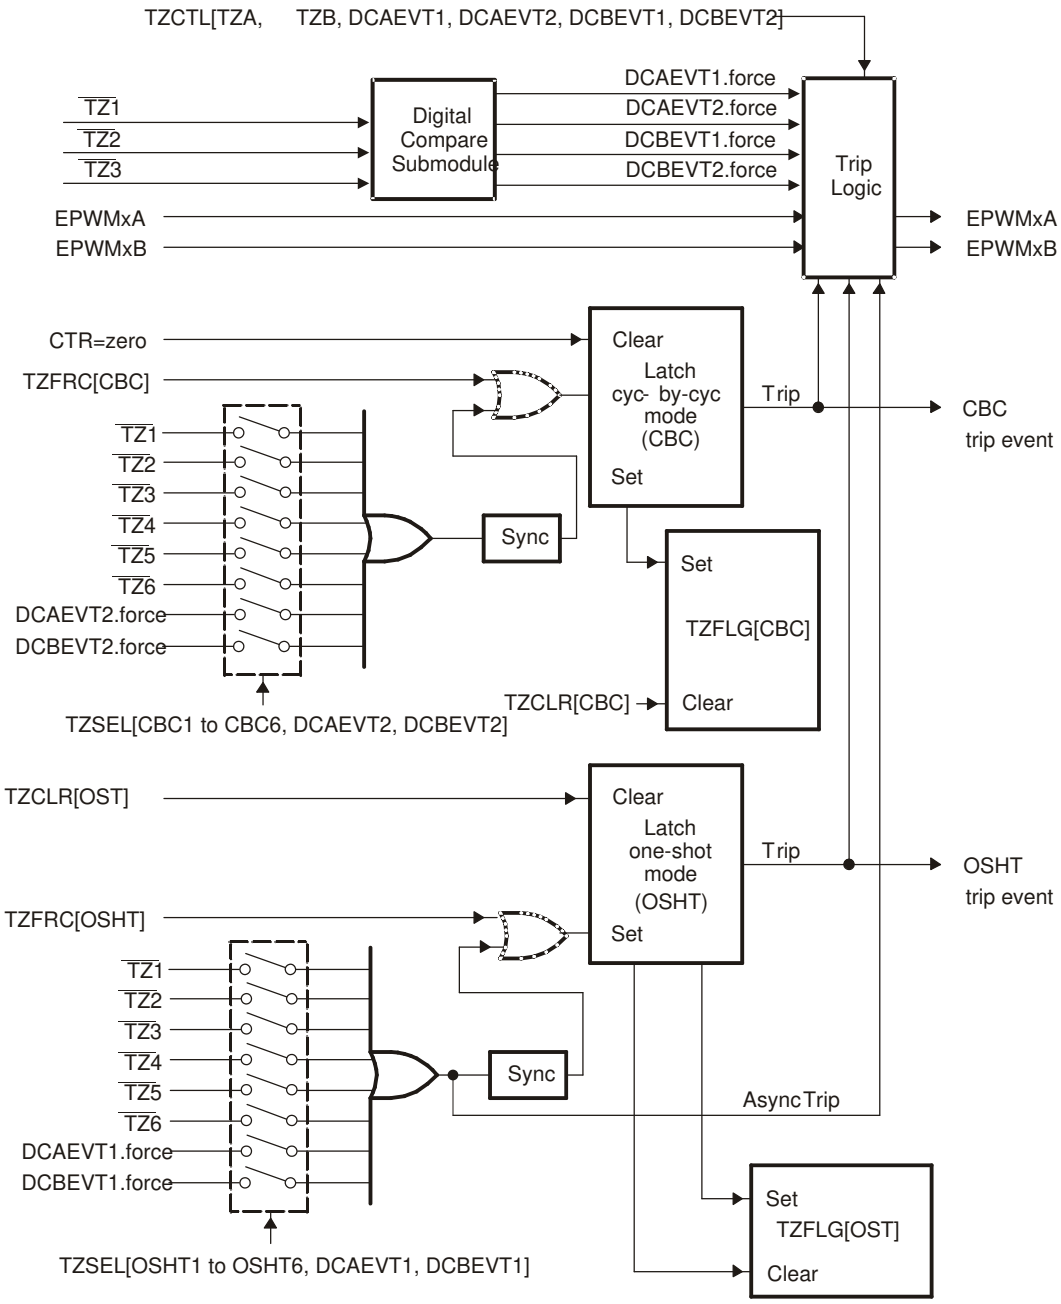

Figure 11-251. Trip-Zone Submodule Mode Control Logic

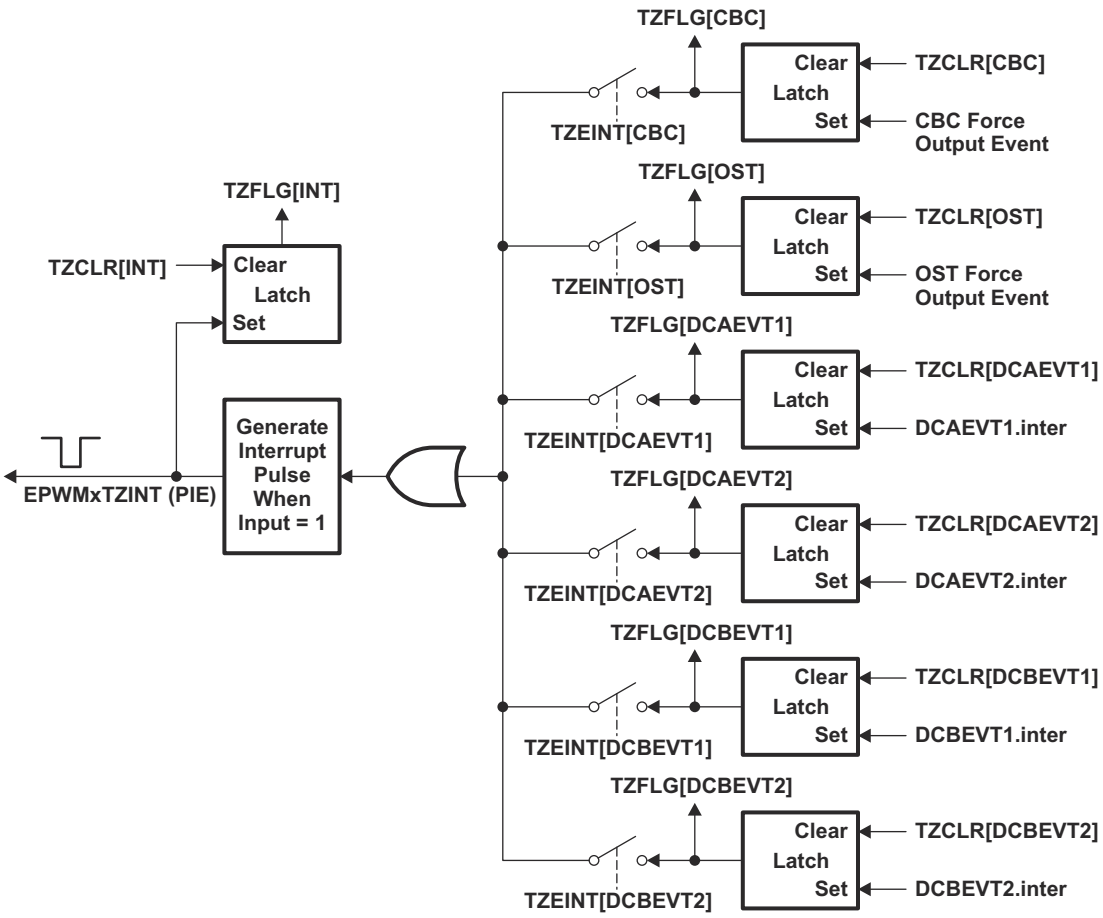

Figure 11-252. Trip-Zone Submodule Interrupt Logic

11.4.2.2.8 Event-Trigger (ET) Submodule

The key functions of the event-trigger submodule are:

- Receives event inputs generated by the time-base, counter-compare and digital-compare submodules
- Uses the time-base direction information for up/down event qualification
- Uses prescaling logic to issue interrupt requests and ADC start of conversion at:
  - Every event
  - Every second event
  - Every third event
- Provides full visibility of event generation via event counters and flags
- Allows software forcing of Interrupts and ADC start of conversion

The event-trigger submodule manages the events generated by the time-base submodule, the counter-compare submodule, and the digital-compare submodule to generate an interrupt to the CPU and/or a start of conversion pulse to the ADC when a selected event occurs. Figure 11-253 illustrates where the event-trigger submodule fits within the ePWM system.

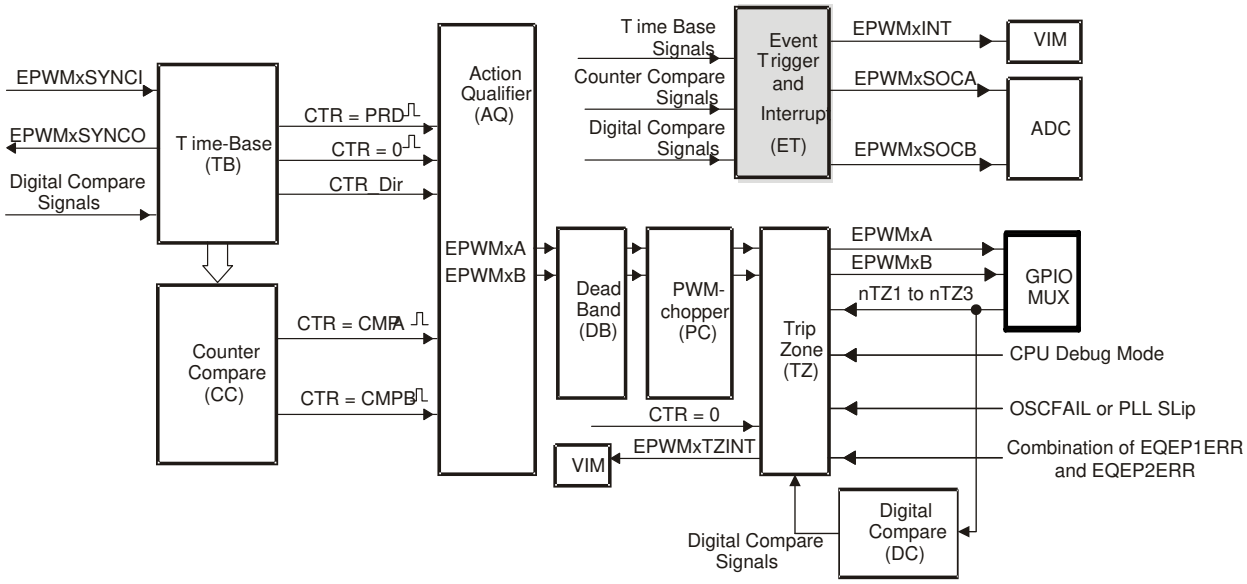

Figure 11-253. Event-Trigger Submodule

11.4.2.2.8.1 Operational Overview of the Event-Trigger Submodule

The following sections describe the event-trigger submodule's operational highlights.

Each ePWM module has one interrupt request line connected to the VIM and two start of conversion signals connected to the ADC module. As shown in Figure 11-254, the ePWMxSOCA and ePWMxSOCB signals are combined to generate four special signals that can be used to trigger an ADC start of conversion, and hence multiple modules can initiate an ADC start of conversion via the ADC trigger inputs.

The event-trigger submodule monitors various event conditions (the left side inputs to event-trigger submodule shown in Figure 11-255) and can be configured to prescale these events before issuing an Interrupt request or an ADC start of conversion. The event-trigger prescaling logic can issue Interrupt requests and ADC start of conversion at:

- Every event
- Every second event
- Every third event

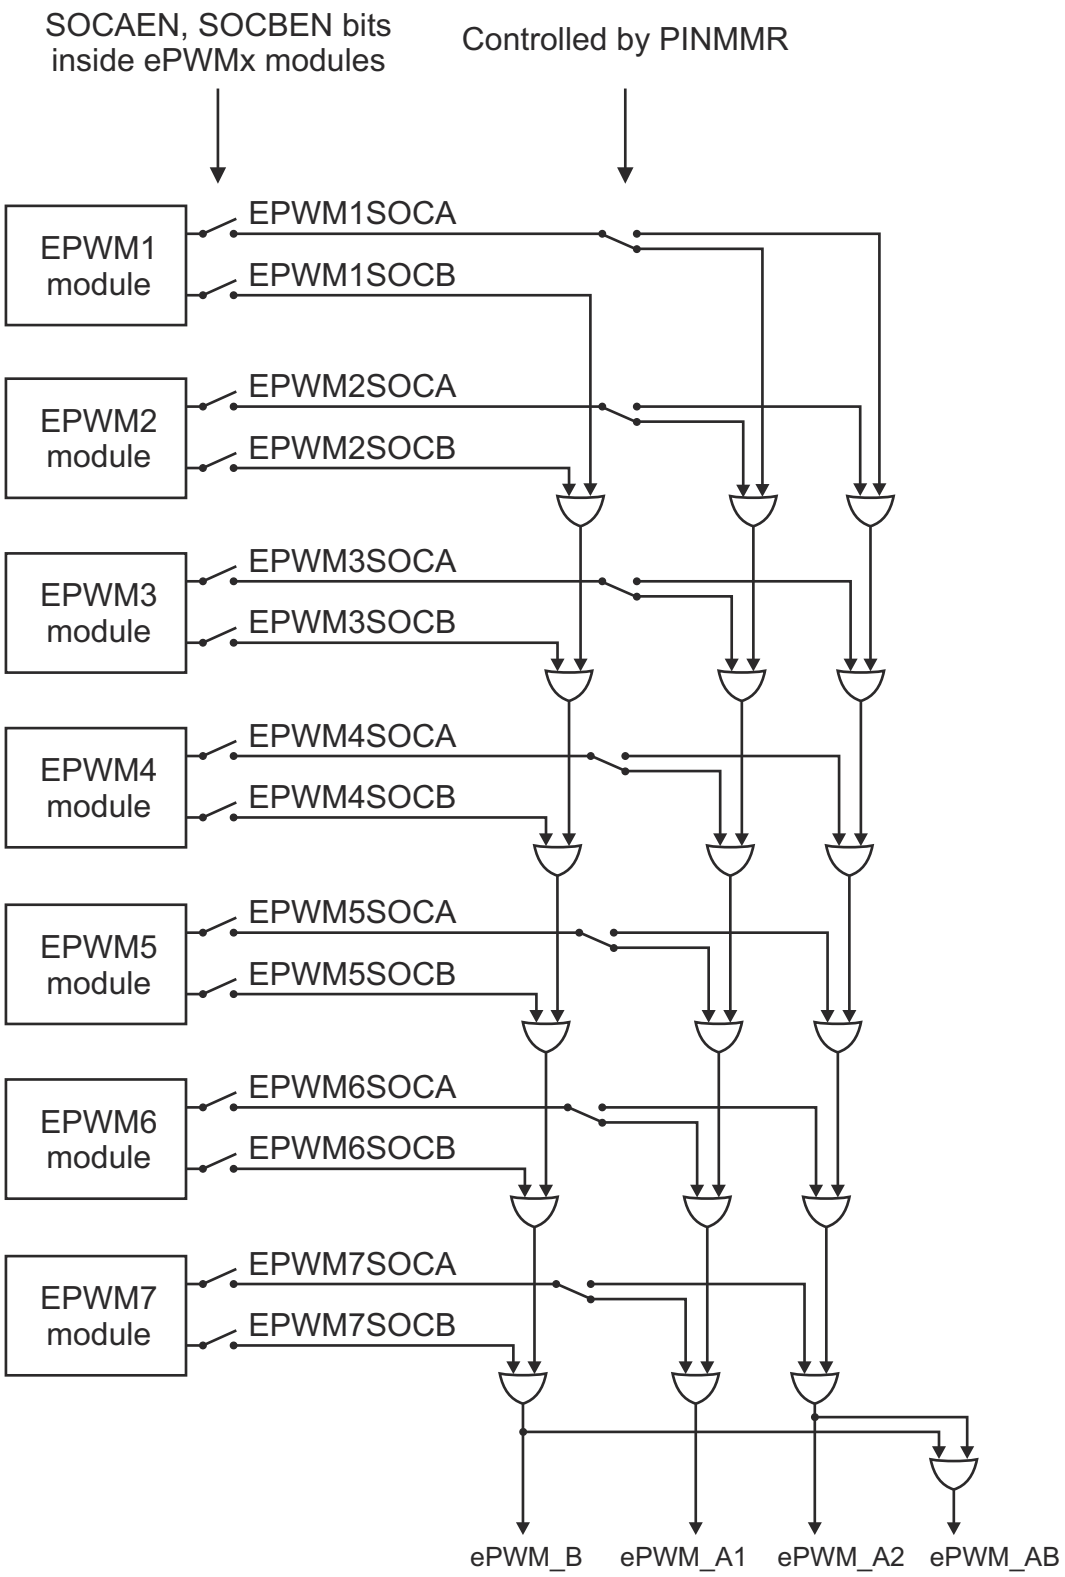

Figure 11-254. Event-Trigger Submodule Inter-Connectivity of ADC Start of Conversion

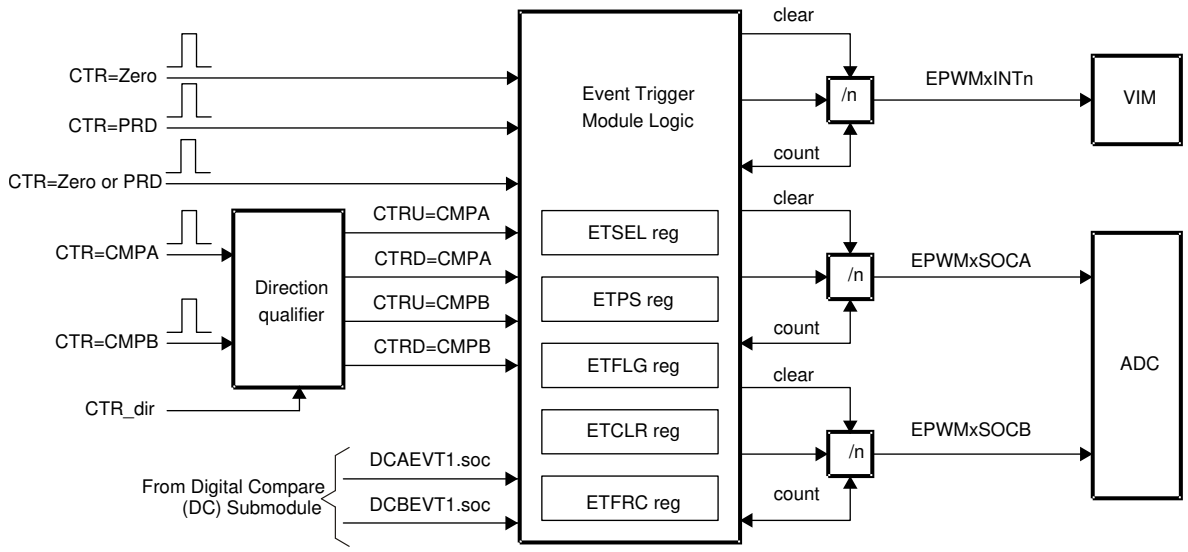

Figure 11-255. Event-Trigger Submodule Showing Event Inputs and Prescaled Outputs

The key registers used to configure the event-trigger submodule are shown in Table 11-1420.

Table 11-1420. Event-Trigger Submodule Registers

Register Name	Address Offset	Shadowed	Description
ETSEL	0x0030	No	Event-trigger Selection Register
ETPS	0x0036	No	Event-trigger Prescale Register
ETFLG	0x0034	No	Event-trigger Flag Register
ETCLR	0x003A	No	Event-trigger Clear Register
ETFRC	0x0038	No	Event-trigger Force Register

- ETSEL—This selects which of the possible events will trigger an interrupt or start an ADC conversion
- ETPS—This programs the event prescaling options mentioned above.
- ETFLG—These are flag bits indicating status of the selected and prescaled events.
- ETCLR—These bits allow you to clear the flag bits in the ETFLG register via software.
- ETFRC—These bits allow software forcing of an event. Useful for debugging or s/w intervention.

A more detailed look at how the various register bits interact with the Interrupt and ADC start of conversion logic are shown in Figure 11-256, Figure 11-257, and Figure 11-258.

Figure 11-256 shows the event-trigger's interrupt generation logic. The interrupt-period (ETPS[INTPRD]) bits specify the number of events required to cause an interrupt pulse to be generated. The choices available are:

- Do not generate an interrupt.
- Generate an interrupt on every event
- Generate an interrupt on every second event
- Generate an interrupt on every third event

Which event can cause an interrupt is configured by the interrupt selection (ETSEL[INTSEL]) bits. The event can be one of the following:

- Time-base counter equal to zero (TBCTR = 0x0000).
- Time-base counter equal to period (TBCTR = TBPRD).
- Time-base counter equal to zero or period (TBCTR = 0x0000 || TBCTR = TBPRD)
- Time-base counter equal to the compare A register (CMPA) when the timer is incrementing.
- Time-base counter equal to the compare A register (CMPA) when the timer is decrementing.

- Time-base counter equal to the compare B register (CMPB) when the timer is incrementing.
- Time-base counter equal to the compare B register (CMPB) when the timer is decrementing.

The number of events that have occurred can be read from the interrupt event counter (ETPS[INTCNT]) register bits. That is, when the specified event occurs the ETPS[INTCNT] bits are incremented until they reach the value specified by ETPS[INTPRD]. When ETPS[INTCNT] = ETPS[INTPRD] the counter stops counting and its output is set. The counter is only cleared when an interrupt is sent to the VIM.

When ETPS[INTCNT] reaches ETPS[INTPRD] the following behaviors will occur:

- If interrupts are enabled, ETSEL[INTEN] = 1 and the interrupt flag is clear, ETFLG[INT] = 0, then an interrupt pulse is generated and the interrupt flag is set, ETFLG[INT] = 1, and the event counter is cleared ETPS[INTCNT] = 0. The counter will begin counting events again.
- If interrupts are disabled, ETSEL[INTEN] = 0, or the interrupt flag is set, ETFLG[INT] = 1, the counter stops counting events when it reaches the period value ETPS[INTCNT] = ETPS[INTPRD].
- If interrupts are enabled, but the interrupt flag is already set, then the counter will hold its output high until the ENTFLG[INT] flag is cleared. This allows for one interrupt to be pending while one is serviced.

Writing to the INTPRD bits will automatically clear the counter INTCNT = 0 and the counter output will be reset (so no interrupts are generated). Writing a 1 to the ETFRC[INT] bit will increment the event counter INTCNT. The counter will behave as described above when INTCNT = INTPRD. When INTPRD = 0, the counter is disabled and hence no events will be detected and the ETFRC[INT] bit is also ignored.

The above definition means that you can generate an interrupt on every event, on every second event, or on every third event. An interrupt cannot be generated on every fourth or more events.

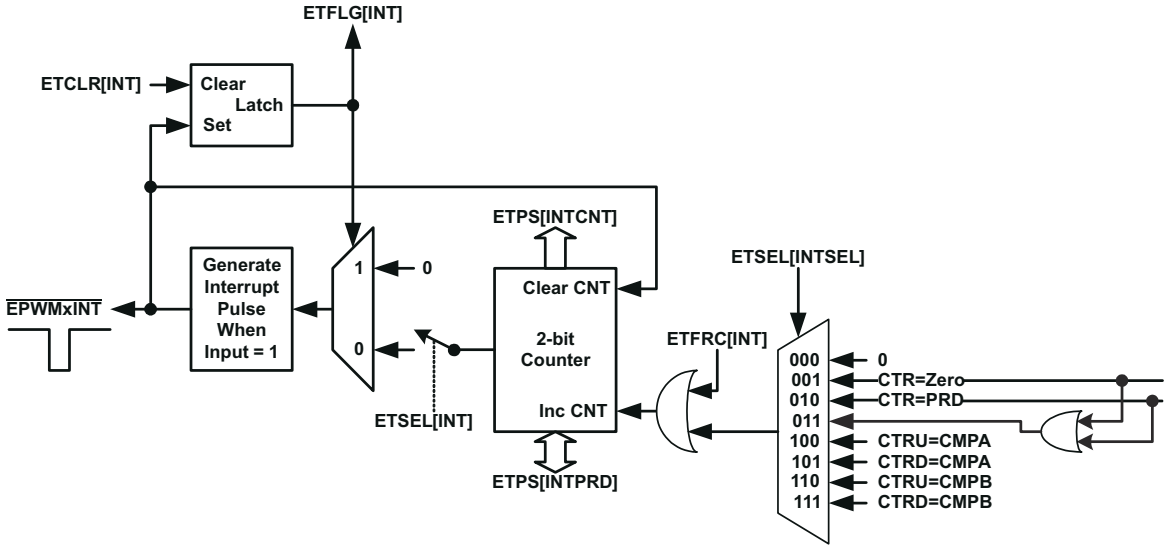

Figure 11-256. Event-Trigger Interrupt Generator

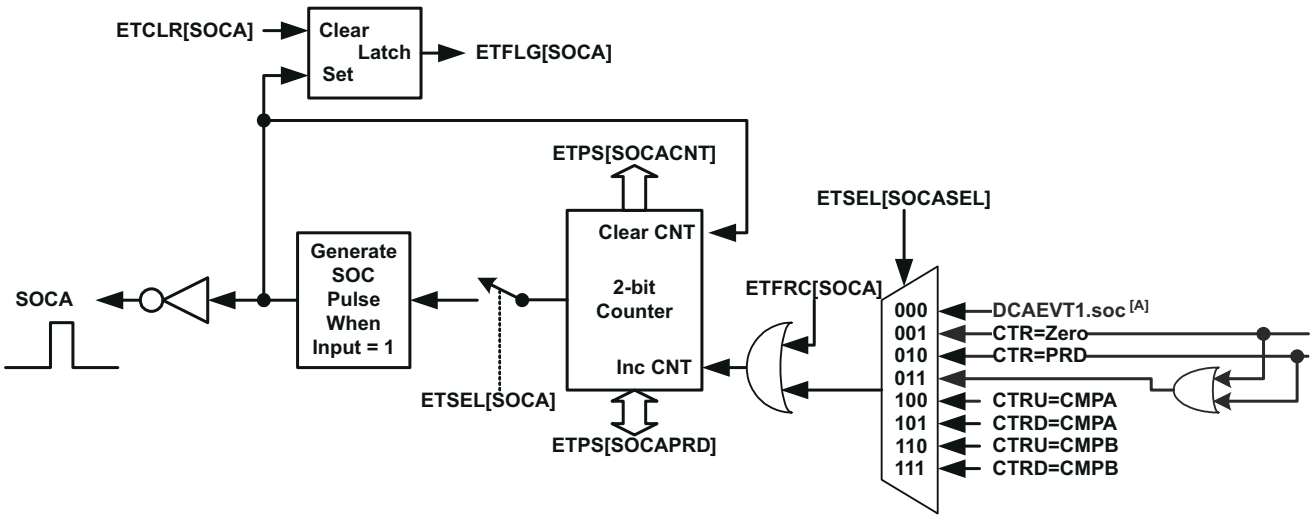
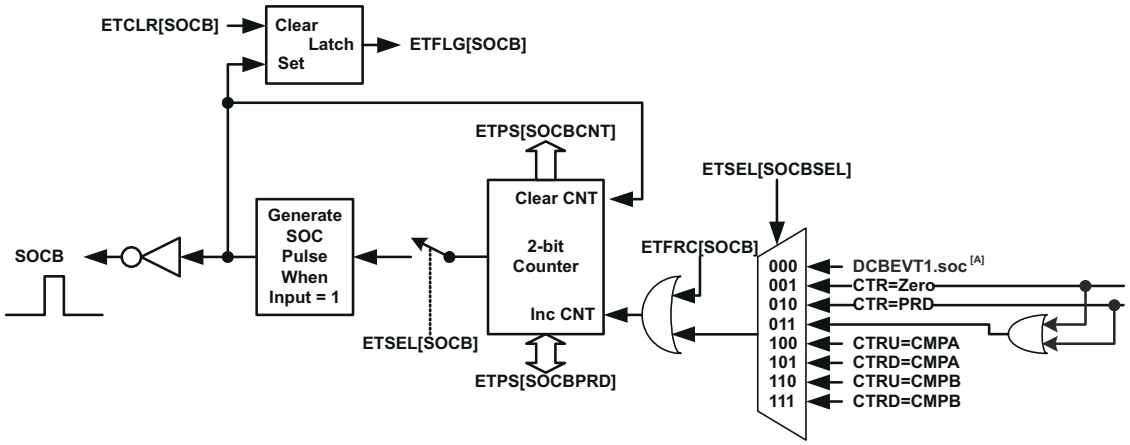
Figure 11-257 shows the operation of the event-trigger's start-of-conversion-A (SOCA) pulse generator. The ETPS[SOCACNT] counter and ETPS[SOCAPRD] period values behave similarly to the interrupt generator except that the pulses are continuously generated. That is, the pulse flag ETFLG[SOCA] is latched when a pulse is generated, but it does not stop further pulse generation. The enable/disable bit ETSEL[SOCAEN] stops pulse generation, but input events can still be counted until the period value is reached as with the interrupt generation logic. The event that will trigger an SOCA and SOCB pulse can be configured separately in the ETSEL[SOCASEL] and ETSEL[SOCBSEL] bits. The possible events are the same events that can be specified for the interrupt generation logic with the addition of the DCAEVT1.soc and DCBEVT1.soc event signals from the digital compare (DC) submodule.



A. The DCAEVT1.soc signals are signals generated by the Digital compare (DC) submodule described later in Section 11.4.2.2.9.

Figure 11-257. Event-Trigger SOCA Pulse Generator

Figure 11-258 shows the operation of the event-trigger's start-of-conversion-B (SOCB) pulse generator. The event-trigger's SOCB pulse generator operates the same way as the SOCA.



A. The DCBEVT1.soc signals are signals generated by the Digital compare (DC) submodule described later in Section 11.4.2.2.9.

Figure 11-258. Event-Trigger SOCB Pulse Generator

11.4.2.2.9 Digital Compare (DC) Submodule

Figure 11-259 illustrates where the digital compare (DC) submodule signals interface to other submodules in the ePWM system.

The digital compare (DC) submodule compares signals external to the ePWM module to directly generate PWM events/actions that then feed to the event-trigger, trip-zone, and time-base submodules. Additionally, blanking window functionality is supported to filter noise or unwanted pulses from the DC event signals.

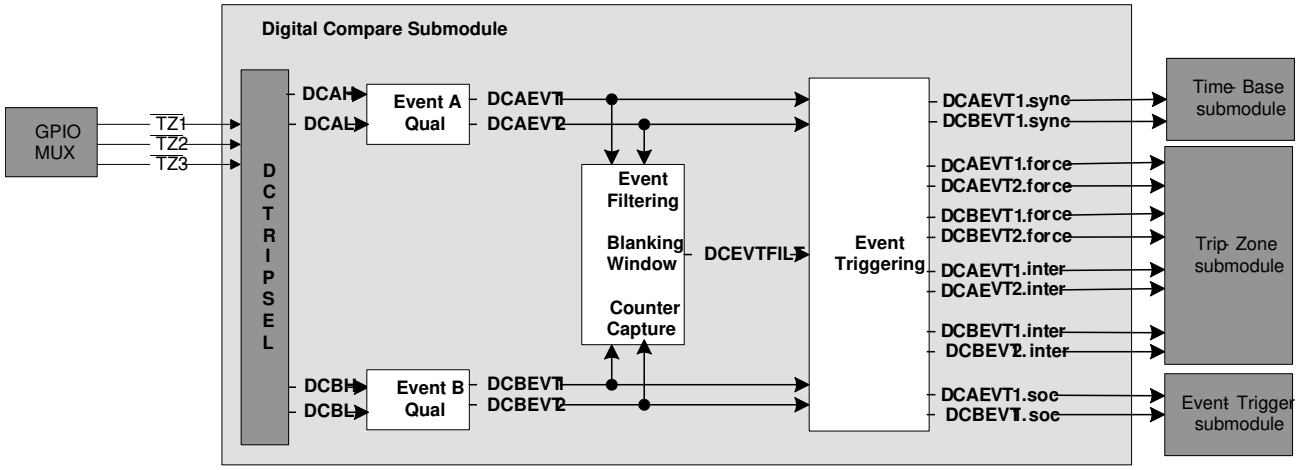


Figure 11-259. Digital-Compare Submodule High-Level Block Diagram

11.4.2.2.9.1 Purpose of the Digital Compare Submodule

The key functions of the digital compare submodule are:

- $\overline{TZ1}$, $\overline{TZ2}$, and $\overline{TZ3}$ inputs generate Digital Compare A High/Low (DCAH, DCAL) and Digital Compare B High/Low (DCBH, DCBL) signals.
- DCAH/L and DCBH/L signals trigger events which can then either be filtered or fed directly to the trip-zone, event-trigger, and time-base submodules to:
  - generate a trip zone interrupt
  - generate an ADC start of conversion
  - force an event
  - generate a synchronization event for synchronizing the ePWM module TBCTR.
- Event filtering (blanking window logic) can optionally blank the input signal to remove noise.

11.4.2.2.9.2 Controlling and Monitoring the Digital Compare Submodule

The digital compare submodule operation is controlled and monitored through the following registers:

Table 11-1421. Digital Compare Submodule Registers

Register Name	Address Offset	Shadowed	Description
TZDCSEL(1) (2)	0x0024	No	Trip Zone Digital Compare Select Register
DCTRIPSEL(1)	0x0062	No	Digital Compare Trip Select Register
DCACTL(1)	0x0060	No	Digital Compare A Control Register
DCBCTL(1)	0x0066	No	Digital Compare B Control Register
DCFCTL(1)	0x0064	No	Digital Compare Filter Control Register
DCCAPCTL(1)	0x006A	No	Digital Compare Capture Control Register
DCFOFFSET	0x0068	Writes	Digital Compare Filter Offset Register
DCFOFFSETCNT	0x006E	No	Digital Compare Filter Offset Counter Register
DCFWINDOW	0x006C	No	Digital Compare Filter Window Register
DCFWINDOWCNT	0x0072	No	Digital Compare Filter Window Counter Register
DCCAP	0x0070	Yes	Digital Compare Counter Capture Register

(1) These registers are writable only in privileged mode.
(2) The TZDCSEL register is part of the trip-zone submodule but is mentioned again here because of its functional significance to the digital compare submodule.

11.4.2.2.9.3 Operation Highlights of the Digital Compare Submodule

The following sections describe the operational highlights and configuration options for the digital compare submodule.

11.4.2.2.9.3.1 Digital Compare Events

As illustrated in Figure 11-259, trip zone inputs ($\overline{TZ1}$, $\overline{TZ2}$, and $\overline{TZ3}$) can be selected via the DCTRIPSEL bits to generate the Digital Compare A High and Low (DCAH/L) and Digital Compare B High and Low (DCBH/L) signals. Then, the configuration of the TZDCSEL register qualifies the actions on the selected DCAH/L and DCBH/L signals, which generate the DCAEVT1/2 and DCBEVT1/2 events (Event Qualification A and B).

Note

The $\overline{TZn}$ signals, when used as a DCEVT tripping functions, are treated as a normal input signal and can be defined to be active high or active low inputs. EPWM outputs are asynchronously tripped when either the $\overline{TZn}$, DCAEVTx.force, or DCBEVTx.force signals are active. For the condition to remain latched, a minimum of 3 × TBCLK sync pulse width is required. If pulse width is < 3 × TBCLK sync pulse width, the trip condition may or may not get latched by CBC or OST latches.

The DCAEVT1/2 and DCBEVT1/2 events can then be filtered to provide a filtered version of the event signals (DCEVTFILT) or the filtering can be bypassed. Filtering is discussed further in Section 11.4.2.2.9.3.2. Either the DCAEVT1/2 and DCBEVT1/2 event signals or the filtered DCEVTFILT event signals can generate a force to the trip zone module, a TZ interrupt, an ADC SOC, or a PWM sync signal.

- **force signal:**

  DCAEVT1/2.force signals force trip zone conditions which either directly influence the output on the EPWMxA pin (via TZCTL[DCAEVT1 or DCAEVT2] configurations) or, if the DCAEVT1/2 signals are selected as one-shot or cycle-by-cycle trip sources (via the TZSEL register), the DCAEVT1/2.force signals can effect the trip action via the TZCTL[TZA] configuration. The DCBEVT1/2.force signals behaves similarly, but affect the EPWMxB output pin instead of the EPWMxA output pin.

  The priority of conflicting actions on the TZCTL register is as follows (highest priority overrides lower priority):

  Output EPWMxA: TZA (highest) -> DCAEVT1 -> DCAEVT2 (lowest)

  Output EPWMxB: TZB (highest) -> DCBEVT1 -> DCBEVT2 (lowest)
- **interrupt signal:**

  DCAEVT1/2.interrupt signals generate trip zone interrupts to the VIM. To enable the interrupt, the user must set the DCAEVT1, DCAEVT2, DCBEVT1, or DCBEVT2 bits in the TZEINT register. Once one of these events occurs, an EPWMxTZINT interrupt is triggered, and the corresponding bit in the TZCLR register must be set in order to clear the interrupt.
- **soc signal:**

  The DCAEVT1.soc signal interfaces with the event-trigger submodule and can be selected as an event which generates an ADC start-of-conversion-A (SOCA) pulse via the ETSEL[SOCASEL] bit. Likewise, the DCBEVT1.soc signal can be selected as an event which generates an ADC start-of-conversion-B (SOCB) pulse via the ETSEL[SOCBSEL] bit.
- **sync signal:**

  The DCAEVT1.sync and DCBEVT1.sync events are ORed with the EPWMxSYNCI input signal and the TBCTL[SWFSYNC] signal to generate a synchronization pulse to the time-base counter.

Figure 11-260 and Figure 11-261 show how the DCAEVT1, DCAEVT2, or DCEVTFLT signals are processed to generate the digital compare A event force, interrupt, soc and sync signals.

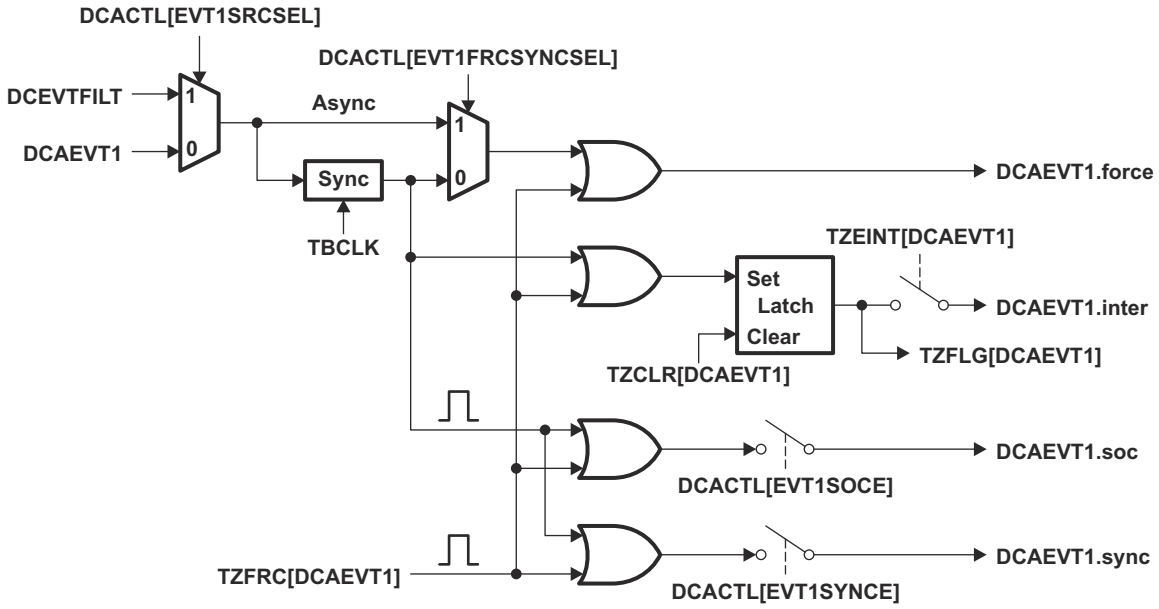

Figure 11-260. DCAEVT1 Event Triggering

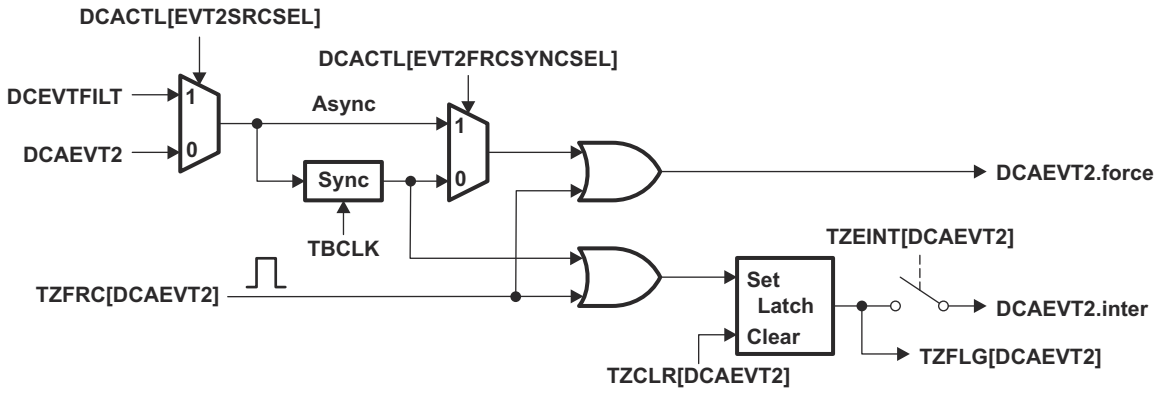

Figure 11-261. DCAEVT2 Event Triggering

Figure 11-262 and Figure 11-263 show how the DCBEVT1, DCBEVT2, or DCEVTFLT signals are processed to generate the digital compare B event force, interrupt, soc, and sync signals.

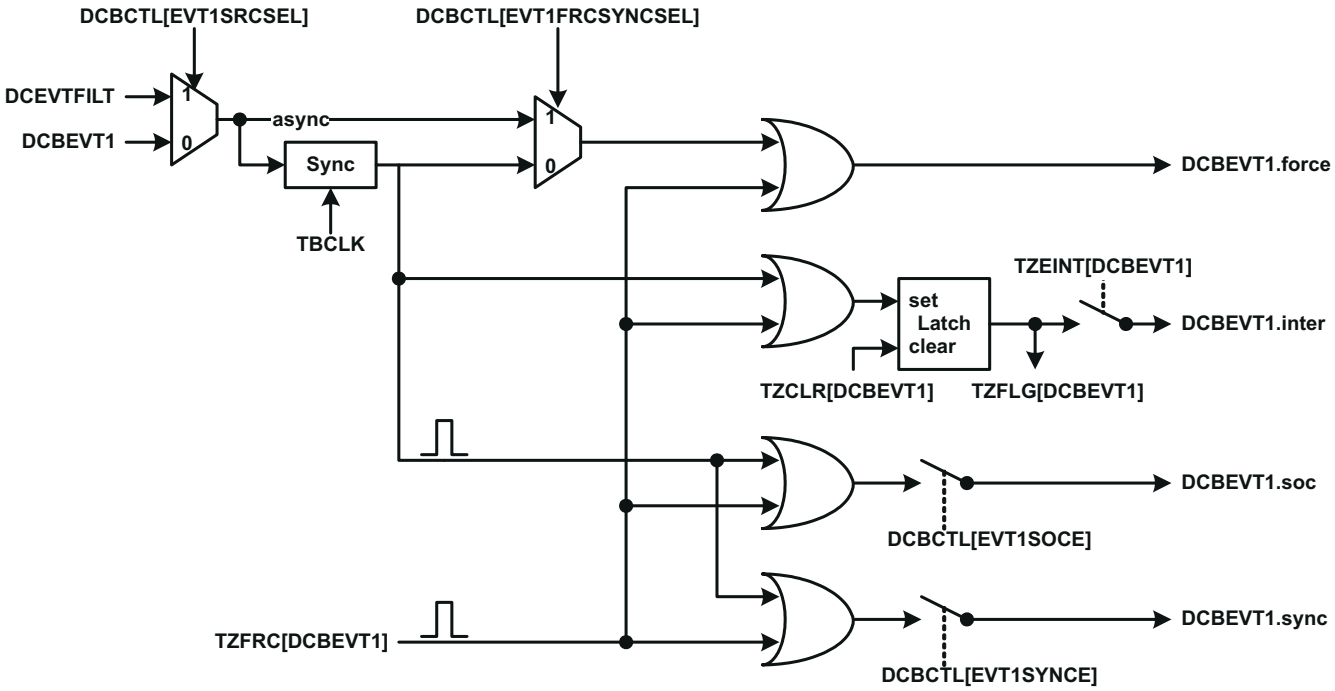

Figure 11-262. DCBEVT1 Event Triggering

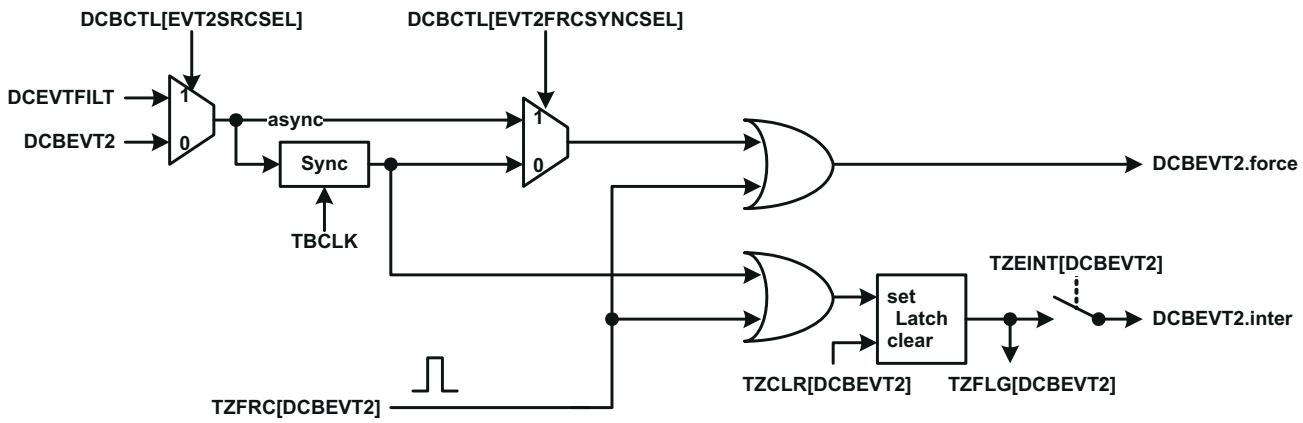

Figure 11-263. DCBEVT2 Event Triggering

11.4.2.2.9.3.2 Event Filtering

The DCAEVT1/2 and DCBEVT1/2 events can be filtered via event filtering logic to remove noise by optionally blanking events for a certain period of time. This is useful for cases where the analog comparator outputs may be selected to trigger DCAEVT1/2 and DCBEVT1/2 events, and the blanking logic is used to filter out potential noise on the signal prior to tripping the PWM outputs or generating an interrupt or ADC start-of-conversion. The event filtering can also capture the TBCTR value of the trip event. Figure 11-264 shows the details of the event filtering logic.

If the blanking logic is enabled, one of the digital compare events – DCAEVT1, DCAEVT2, DCBEVT1, DCBEVT2 – is selected for filtering. The blanking window, which filters out all event occurrences on the signal while it is active, will be aligned to either a CTR = PRD pulse or a CTR = 0 pulse (configured by the DCFCTL[PULSESEL] bits). An offset value in TBCLK counts is programmed into the DCFOFFSET register, which determines at what point after the CTR = PRD or CTR = 0 pulse the blanking window starts. The duration of the blanking window, in number of TBCLK counts after the offset counter expires, is written to the DCFWINDOW register by the application. During the blanking window, all events are ignored. Before and after the blanking window ends, events can generate soc, sync, interrupt, and force signals as before.

Figure 11-265 illustrates several timing conditions for the offset and blanking window within an ePWM period. Notice that if the blanking window crosses the CTR = 0 or CTR = PRD boundary, the next window still starts at the same offset value after the CTR = 0 or CTR = PRD pulse.

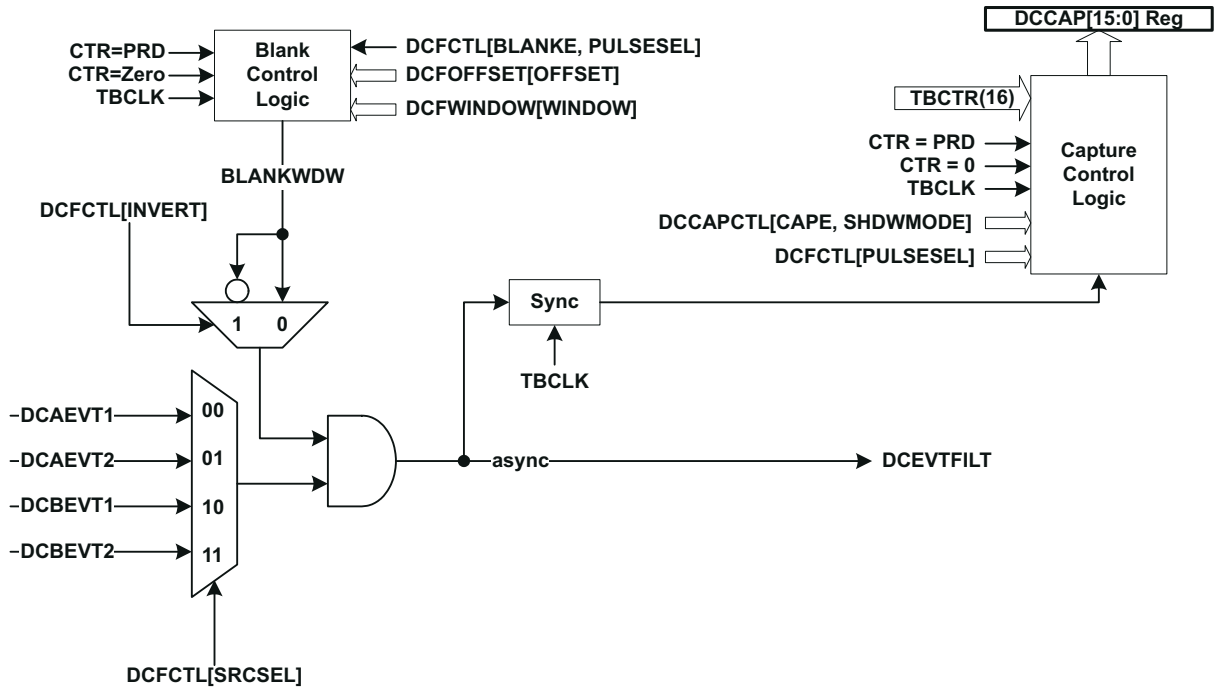

Figure 11-264. Event Filtering

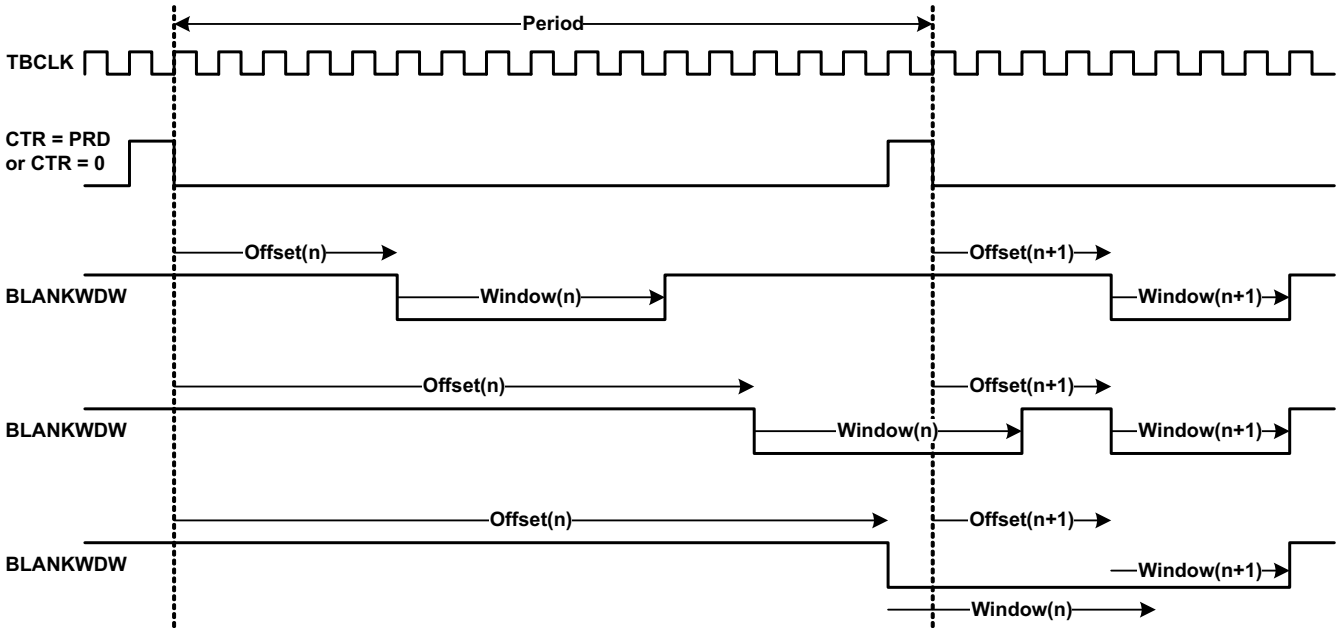

Figure 11-265. Blanking Window Timing Diagram

11.4.2.2.10 Proper Interrupt Initialization Procedure

When the ePWM peripheral clock is enabled it may be possible that interrupt flags may be set due to spurious events due to the ePWM registers not being properly initialized. The proper procedure for initializing the ePWM peripheral is as follows:

1. Disable global interrupts (CPU INTM flag)
2. Disable ePWM interrupts
3. Set TBCLKSYNC = 0
4. Initialize peripheral registers
5. Set TBCLKSYNC = 1
6. Clear any spurious ePWM flags (including interrupt flags)
7. Enable ePWM interrupts
8. Enable global interrupts

11.4.2.2.11

11.4.2.3 Application Examples

An ePWM module has all the local resources necessary to operate completely as a standalone module or to operate in synchronization with other identical ePWM modules.

11.4.2.3.1 Overview of Multiple Modules

Previously in this chapter, all discussions have described the operation of a single module. To facilitate the understanding of multiple modules working together in a system, the ePWM module described in reference is represented by the more simplified block diagram shown in Figure 11-266. This simplified ePWM block shows only the key resources needed to explain how a multiswitch power topology is controlled with multiple ePWM modules working together.

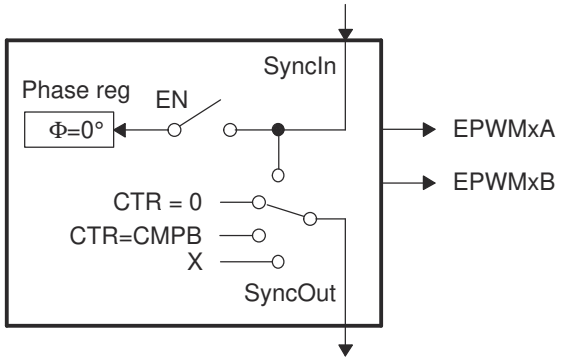

Figure 11-266. Simplified ePWM Module

11.4.2.3.2 Key Configuration Capabilities

The key configuration choices available to each module are as follows:

- Options for SyncIn
  - Load own counter with phase register on an incoming sync strobe—enable (EN) switch closed
  - Do nothing or ignore incoming sync strobe—enable switch open
  - Sync flow-through - SyncOut connected to SyncIn
  - Controller mode, provides a sync at PWM boundaries—SyncOut connected to CTR = PRD
  - Controller mode, provides a sync at any programmable point in time—SyncOut connected to CTR = CMPB
  - Module is in standalone mode and provides No sync to other modules—SyncOut connected to X (disabled)
- Options for SyncOut
  - Sync flow-through - SyncOut connected to SyncIn
  - Controller mode, provides a sync at PWM boundaries—SyncOut connected to CTR = PRD
  - Controller mode, provides a sync at any programmable point in time—SyncOut connected to CTR = CMPB
  - Module is in standalone mode and provides No sync to other modules—SyncOut connected to X (disabled)

For each choice of SyncOut, a module may also choose to load its own counter with a new phase value on a SyncIn strobe input or choose to ignore it, that is, via the enable switch. Although various combinations are possible, the two most common—controller module and target module modes—are shown in Figure 11-267.

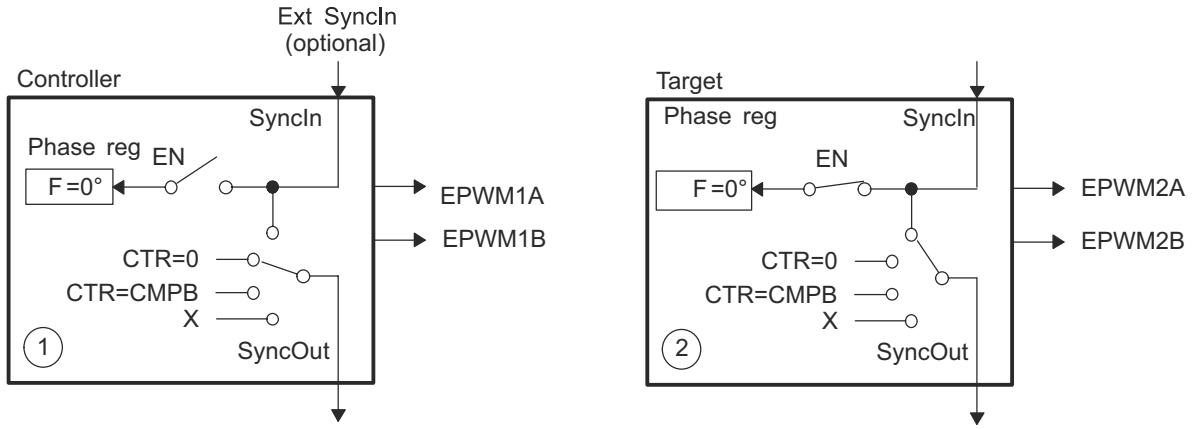

Figure 11-267. EPWM1 Configured as a Typical Controller, EPWM2 Configured as a Target

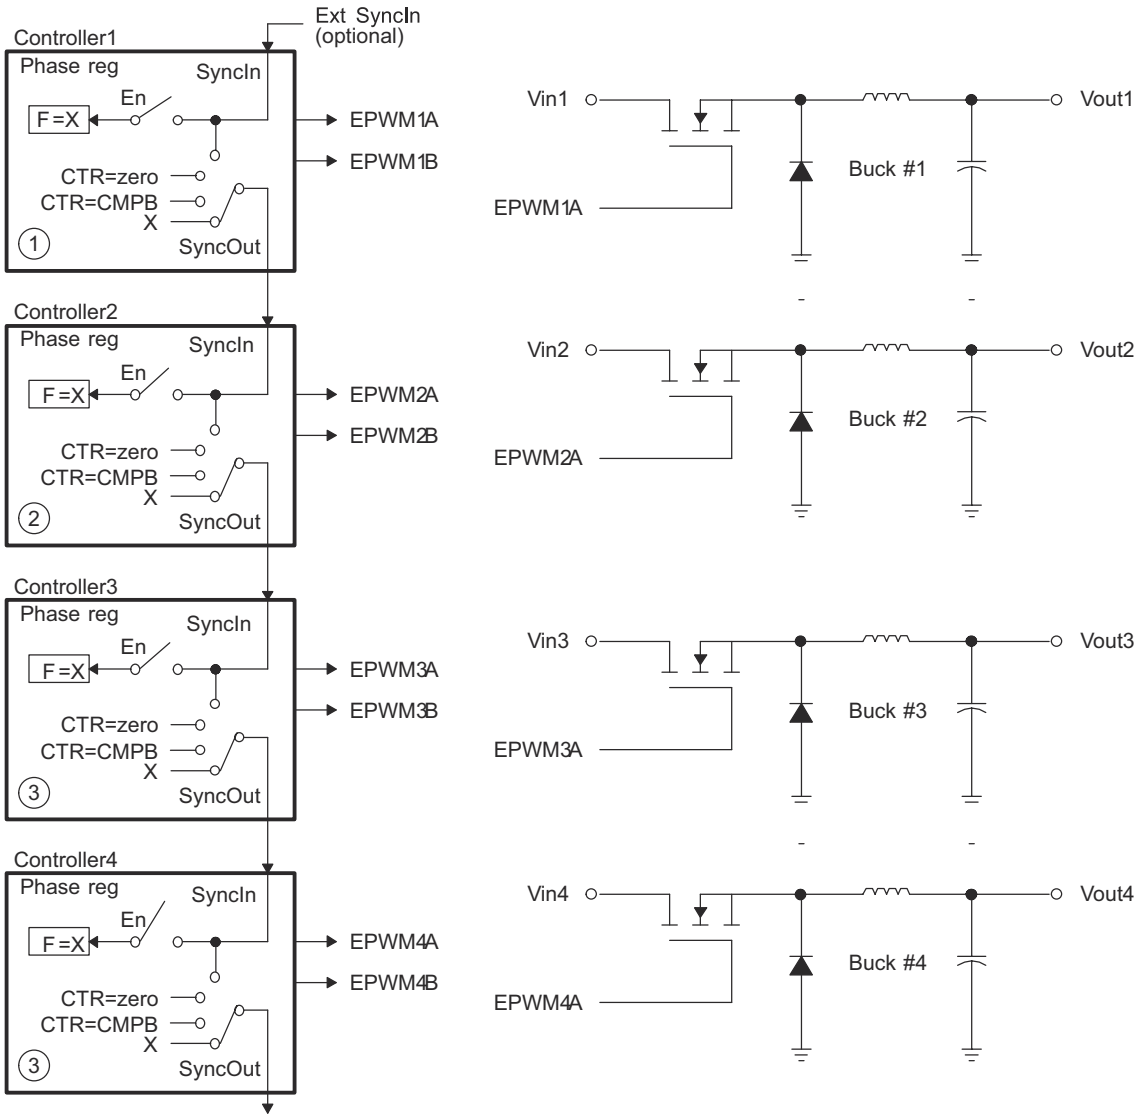
11.4.2.3.3 Controlling Multiple Buck Converters With Independent Frequencies

One of the simplest power converter topologies is the buck. A single ePWM module configured as a controller can control two buck stages with the same PWM frequency. If independent frequency control is required for each buck converter, then one ePWM module must be allocated for each converter stage. Figure 11-268 shows four buck stages, each running at independent frequencies. In this case, all four ePWM modules are configured as Controllers and no synchronization is used. Figure 11-269 shows the waveforms generated by the setup shown in Figure 11-268; note that only three waveforms are shown, although there are four stages.



A. Θ = X indicates value in phase register is a "don't care"

Figure 11-268. Control of Four Buck Stages. Here $F_{PWM1} \neq F_{PWM2} \neq F_{PWM3} \neq F_{PWM4}$

```

11.4.2.3.4 Controlling Multiple Buck Converters With Same Frequencies

If synchronization is a requirement, ePWM module 2 can be configured as a target and can operate at integer multiple (N) frequencies of module 1. The sync signal from controller to target ensures these modules remain locked. Figure 11-270 shows such a configuration; Figure 11-271 shows the waveforms generated by the configuration.

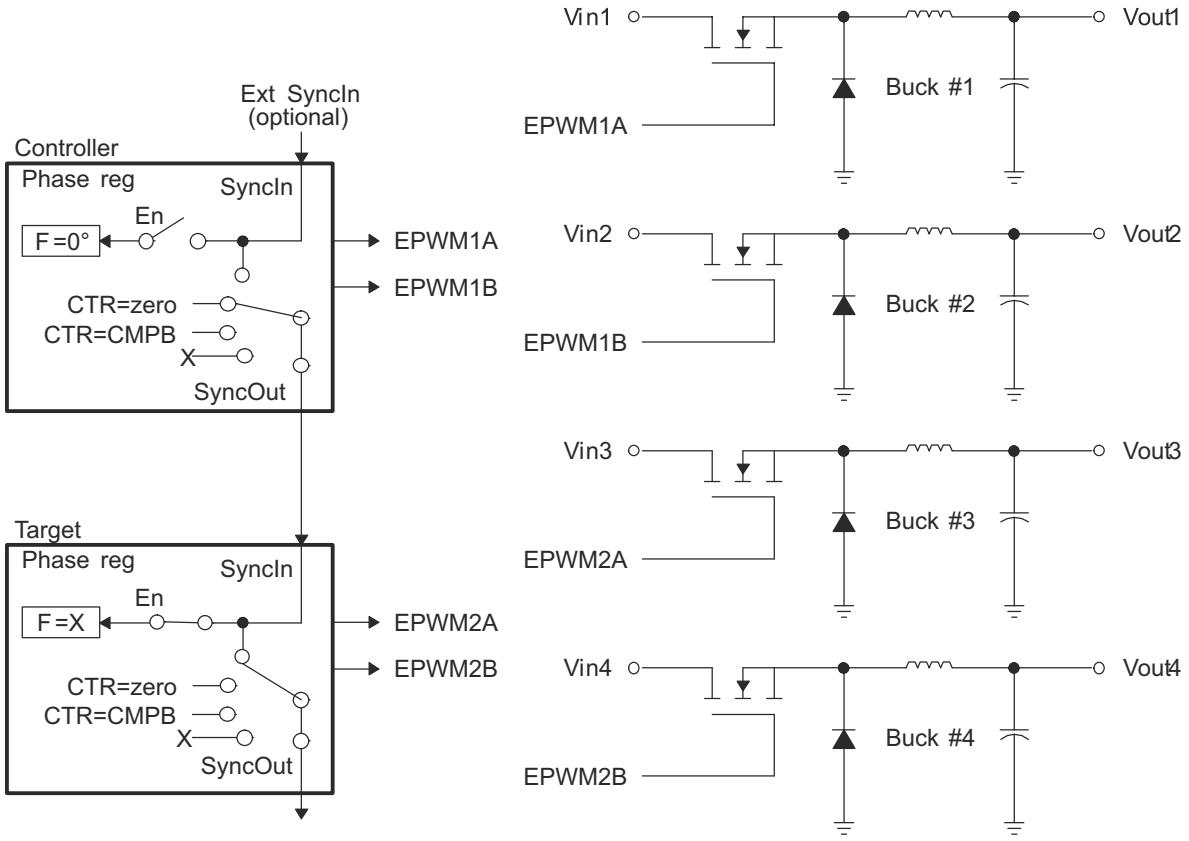

Figure 11-270. Control of Four Buck Stages. (Note: F_{PWM2} = N x F_{PWM1})

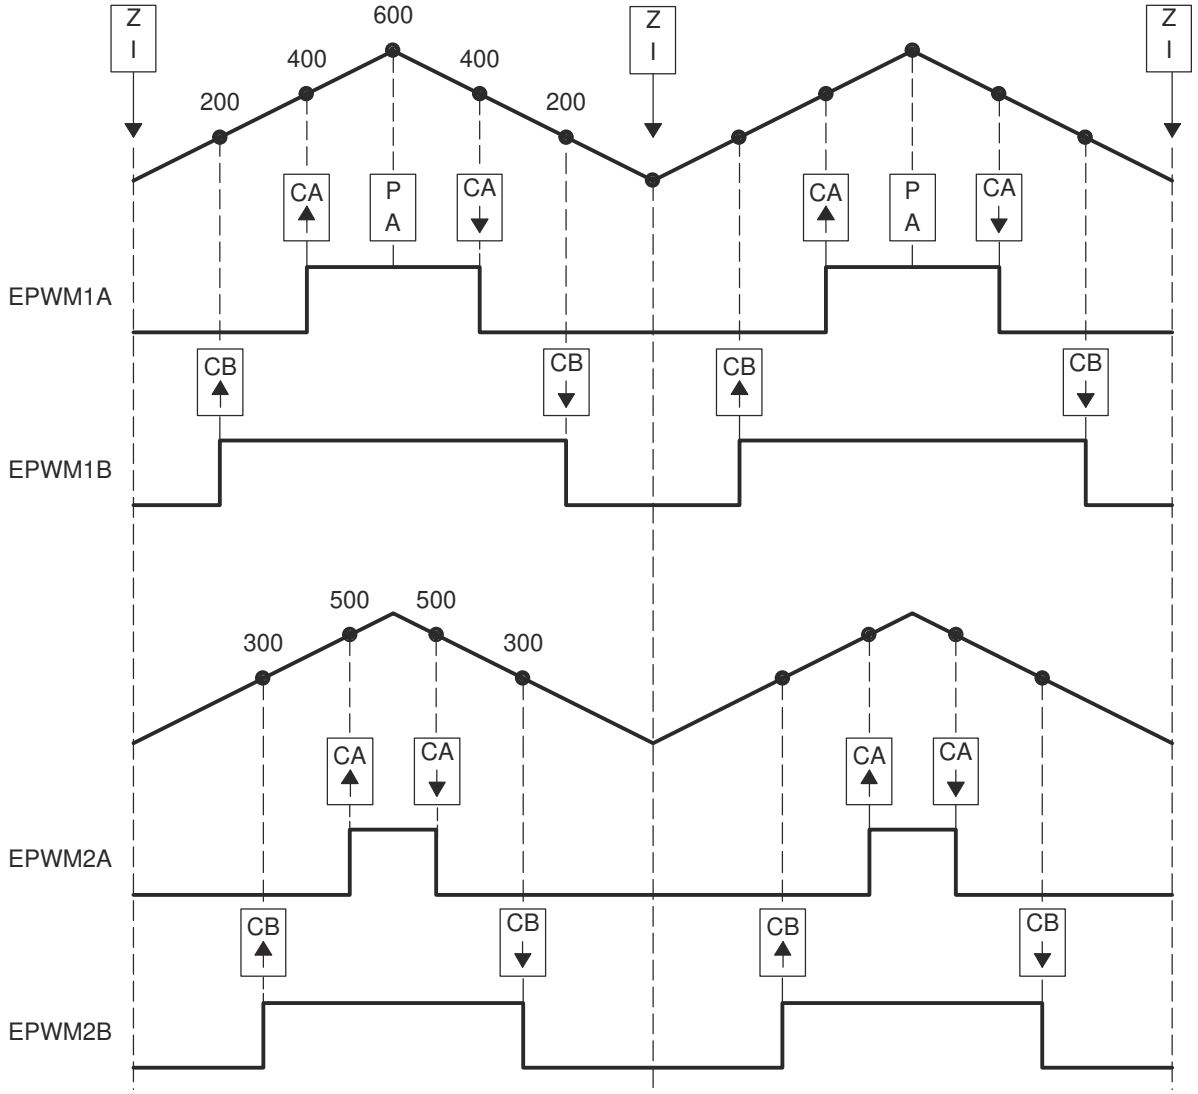

Figure 11-271. Buck Waveforms for Figure 11-270 (Note: $F_{PWM2} = F_{PWM1)}$)

Example 11-10. Code Snippet for Configuration in Figure 11-270

```
//=======================
// EPWM Module 1 config
     EPwm1Regs.TBPRD = 600;                          // Period = 1200 TBCLK counts
     EPwm1Regs.TBPHS.half.TBPHS = 0;                 // Set Phase register to zero
     EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UPDOWN; // Symmetrical mode
     EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE;         // Controller module
     EPwm1Regs.TBCTL.bit.PRDLD = TB_SHADOW;
     EPwm1Regs.TBCTL.bit.SYNCOSEL = TB_CTR_ZERO;     // Sync down-stream module
     EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
     EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
     EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO;  // load on CTR=Zero
     EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO;  // load on CTR=Zero
     EPwm1Regs.AQCTLA.bit.CAU = AQ_SET;              // set actions for EPWM1A
     EPwm1Regs.AQCTLA.bit.CAD = AQ_CLEAR;
     EPwm1Regs.AQCTLB.bit.CBU = AQ_SET;              // set actions for EPWM1B
     EPwm1Regs.AQCTLB.bit.CBD = AQ_CLEAR;
// EPWM Module 2 config
     EPwm2Regs.TBPRD = 600;                          // Period = 1200 TBCLK counts
     EPwm2Regs.TBPHS.half.TBPHS = 0;                 // Set Phase register to zero
     EPwm2Regs.TBCTL.bit.CTRMODE = TB_COUNT_UPDOWN; // Symmetrical mode
     EPwm2Regs.TBCTL.bit.PHSEN = TB_ENABLE;          // Target module
     EPwm2Regs.TBCTL.bit.PRDLD = TB_SHADOW;
     EPwm2Regs.TBCTL.bit.SYNCOSEL = TB_SYNC_IN;      // sync flow-through
     EPwm2Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
     EPwm2Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
     EPwm2Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO;  // load on CTR=Zero
     EPwm2Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO;  // load on CTR=Zero
     EPwm2Regs.AQCTLA.bit.CAU = AQ_SET;              // set actions for EPWM2A
     EPwm2Regs.AQCTLA.bit.CAD = AQ_CLEAR;
     EPwm2Regs.AQCTLB.bit.CBU = AQ_SET;              // set actions for EPWM2B
     EPwm2Regs.AQCTLB.bit.CBD = AQ_CLEAR;
//
// Run Time (Note: Example execution of one run-time instance)
//=====================================================
    EPwm1Regs.CMPA.half.CMPA = 400;                 // adjust duty for output EPWM1A
    EPwm1Regs.CMPB = 200;                           // adjust duty for output EPWM1B
    EPwm2Regs.CMPA.half.CMPA = 500;                 // adjust duty for output EPWM2A
    EPwm2Regs.CMPB = 300;                           // adjust duty for output EPWM2B
```

11.4.2.3.5 Controlling Multiple Half H-Bridge (HHB) Converters

Topologies that require control of multiple switching elements can also be addressed with these same ePWM modules. It is possible to control a Half-H bridge stage with a single ePWM module. This control can be extended to multiple stages. Figure 11-272 shows control of two synchronized Half-H bridge stages where stage 2 can operate at integer multiple (N) frequencies of stage 1. Figure 11-273 shows the waveforms generated by the configuration shown in Figure 11-272.

Module 2 (target) is configured for Sync flow-through; if required, this configuration allows for a third Half-H bridge to be controlled by PWM module 3 and also, most importantly, to remain in synchronization with controller module 1.

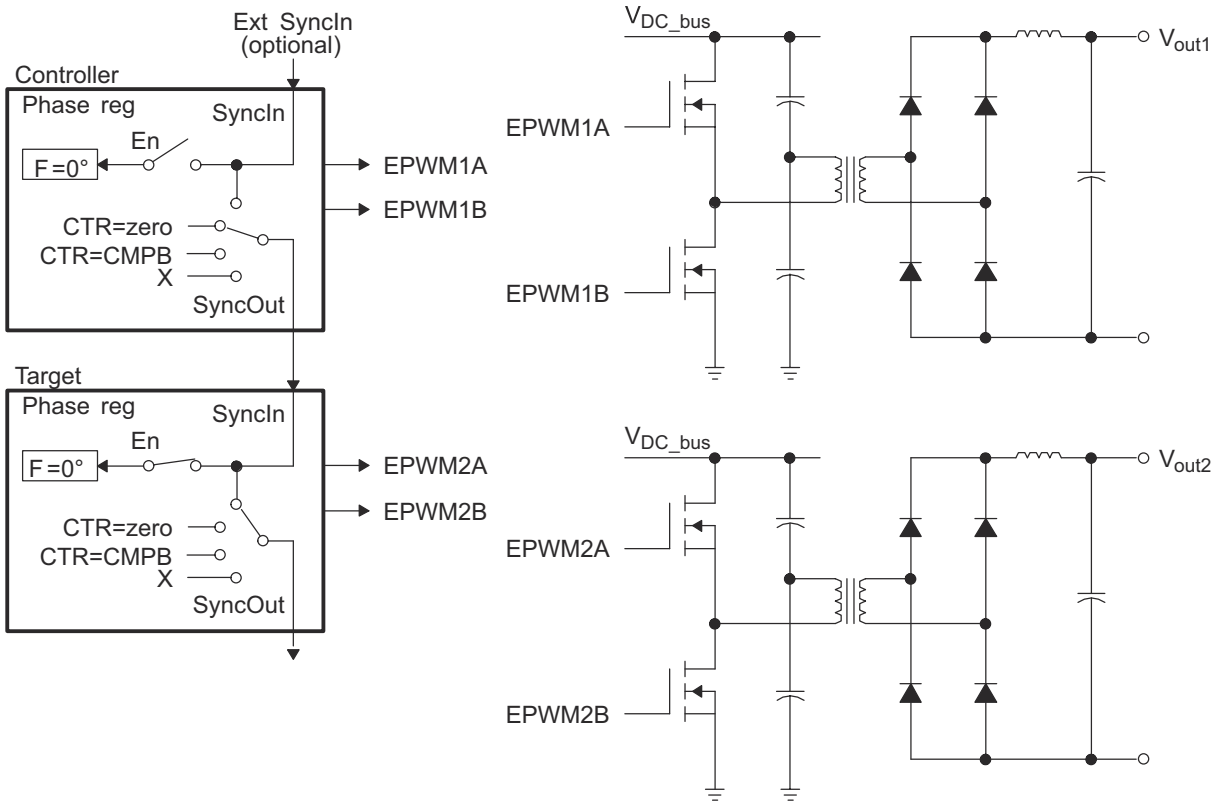

Figure 11-272. Control of Two Half-H Bridge Stages (F_{PWM2} = N x F_{PWM1})

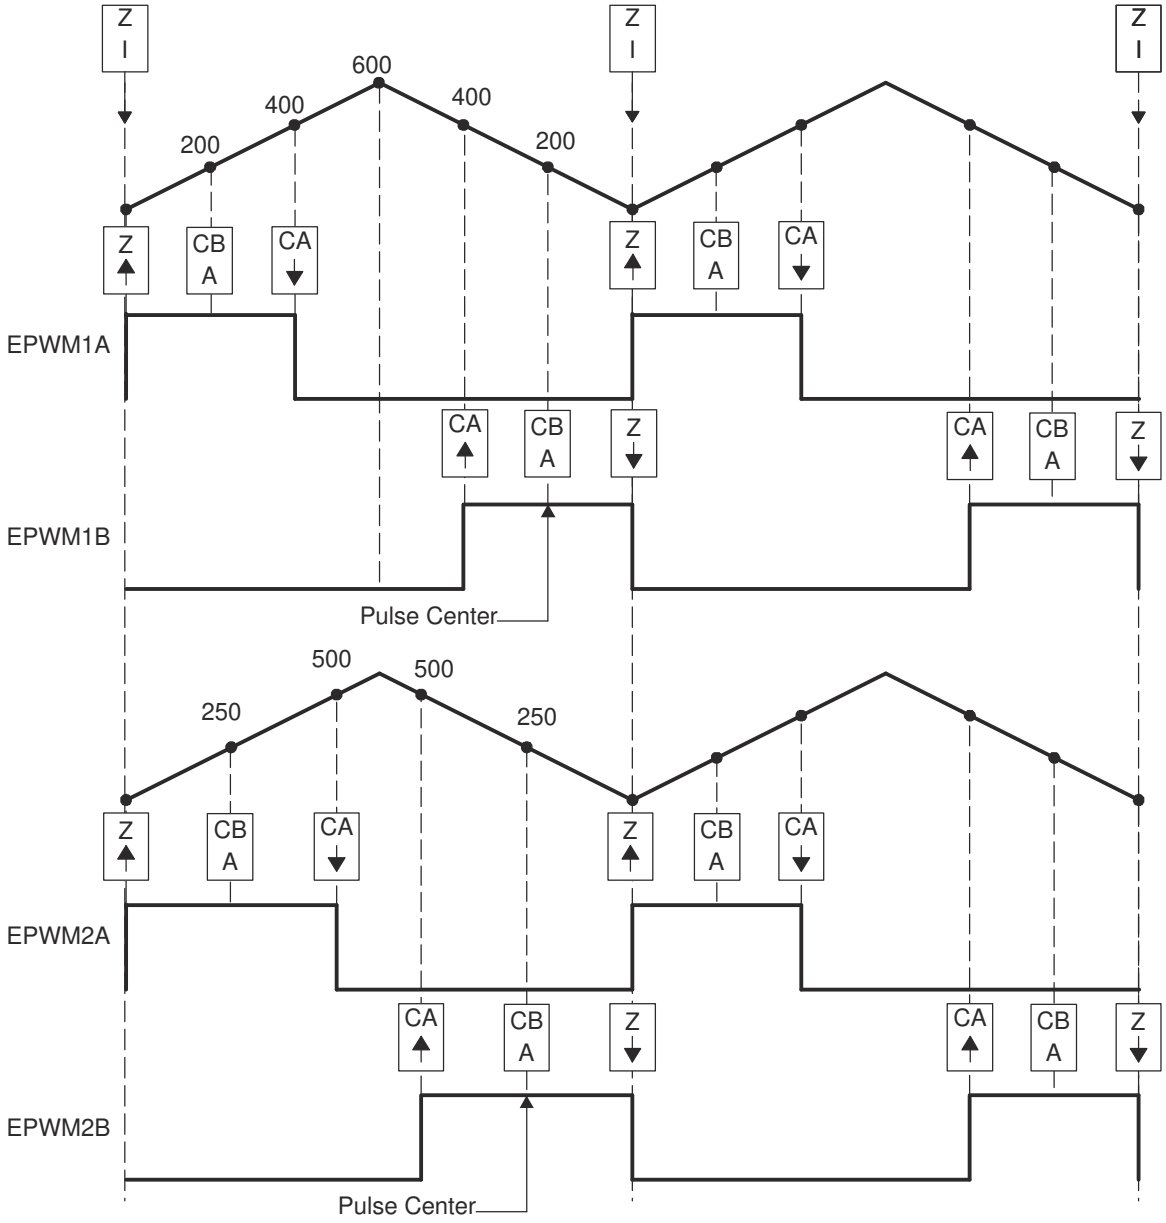

Figure 11-273. Half-H Bridge Waveforms for Figure 11-272 (Note: Here $F_{PWM2} = F_{PWM1}$)

Example 11-11. Code Snippet for Configuration in Figure 11-272

```
//=====================================================================
// Config
//=====================================================================
// Initialization Time
//=======================
// EPWM Module 1 config
     EPwm1Regs.TBPRD = 600;                          // Period = 1200 TBCLK counts
     EPwm1Regs.TBPHS.half.TBPHS = 0;                 // Set Phase register to zero
     EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UPDOWN; // Symmetrical mode
     EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE;         // Controller module

     EPwm2Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
     EPwm2Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
     EPwm2Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO;  // load on CTR=Zero
     EPwm2Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO;  // load on CTR=Zero
     EPwm2Regs.AQCTLA.bit.ZRO = AQ_SET;              // set actions for EPWM1A
     EPwm2Regs.AQCTLA.bit.CAU = AQ_CLEAR;
     EPwm2Regs.AQCTLB.bit.ZRO = AQ_CLEAR;            // set actions for EPWM1B
     EPwm2Regs.AQCTLB.bit.CAD = AQ_SET;
//=========================================================
     EPwm1Regs.CMPA.half.CMPA = 400;                 // adjust duty for output EPWM1A & EPWM1B
     EPwm1Regs.CMPB = 200;                           // adjust point-in-time for ADCSOC trigger
     EPwm2Regs.CMPA.half.CMPA = 500;                 // adjust duty for output EPWM2A & EPWM2B
     EPwm2Regs.CMPB = 250;                           // adjust point-in-time for ADCSOC trigger
```

11.4.2.3.5.1

11.4.2.3.6 Controlling Dual 3-Phase Inverters for Motors (ACI and PMSM)

The idea of multiple modules controlling a single power stage can be extended to the 3-phase Inverter case. In such a case, six switching elements can be controlled using three PWM modules, one for each leg of the inverter. Each leg must switch at the same frequency and all legs must be synchronized. A controller + two targets configuration can easily address this requirement. Figure 11-274 shows how six PWM modules can control two independent 3-phase inverters; each running a motor.

As in the cases shown in the previous sections, we have a choice of running each inverter at a different frequency (module 1 and module 4 are controllers as in Figure 11-274), or both inverters can be synchronized by using one controller (module 1) and five targets. In this case, the frequency of modules 4, 5, and 6 (all equal) can be integer multiples of the frequency for modules 1, 2, 3 (also all equal).

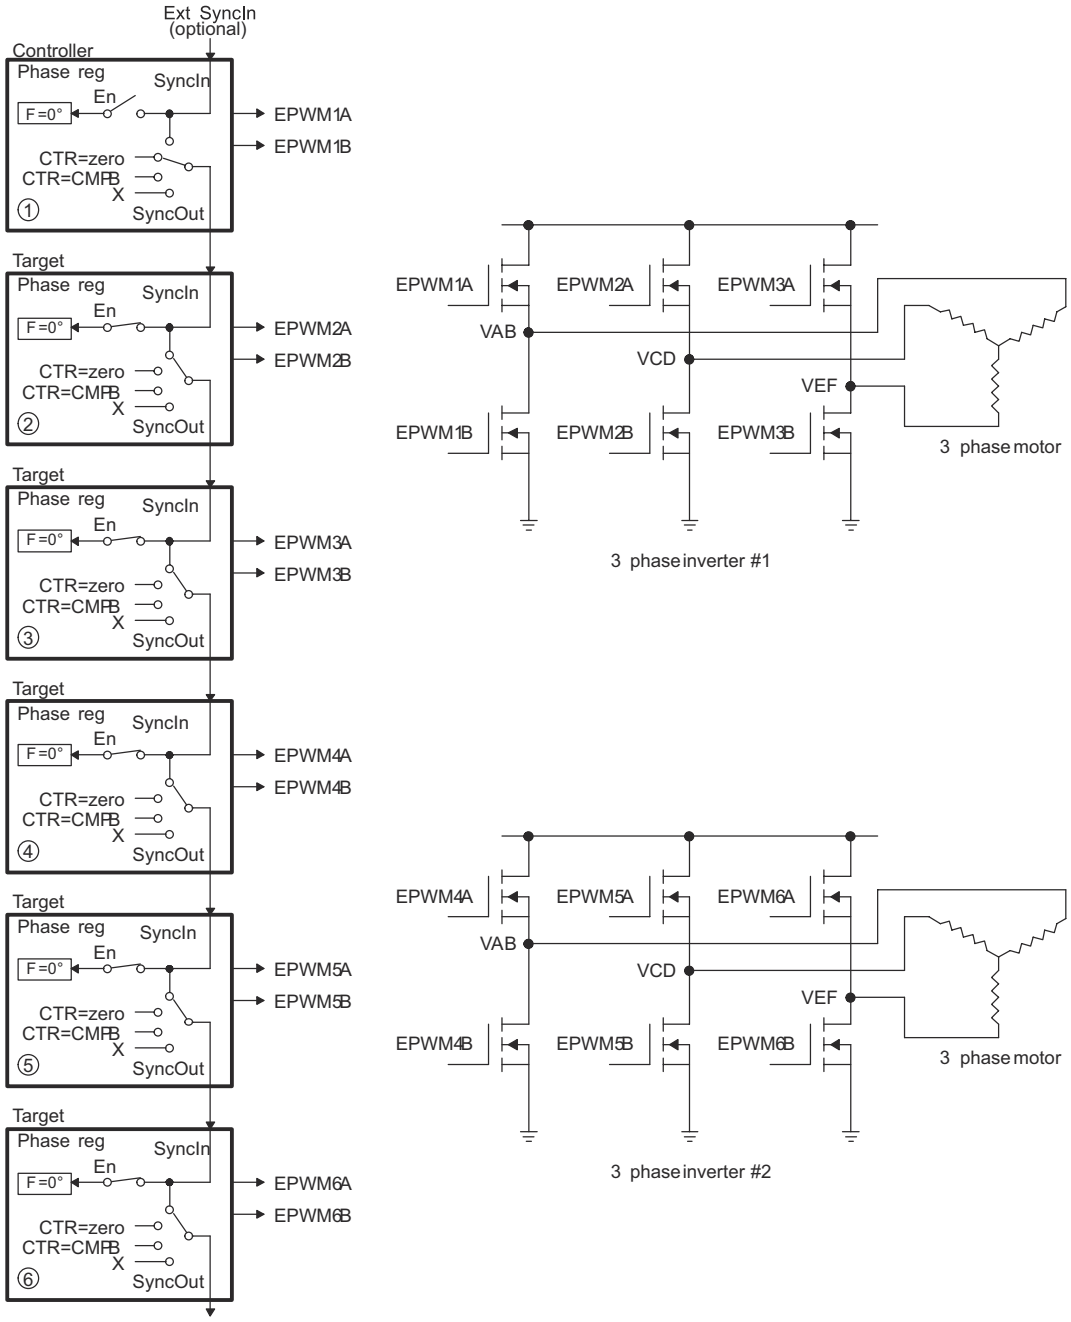

Figure 11-274. Control of Dual 3-Phase Inverter Stages as Is Commonly Used in Motor Control

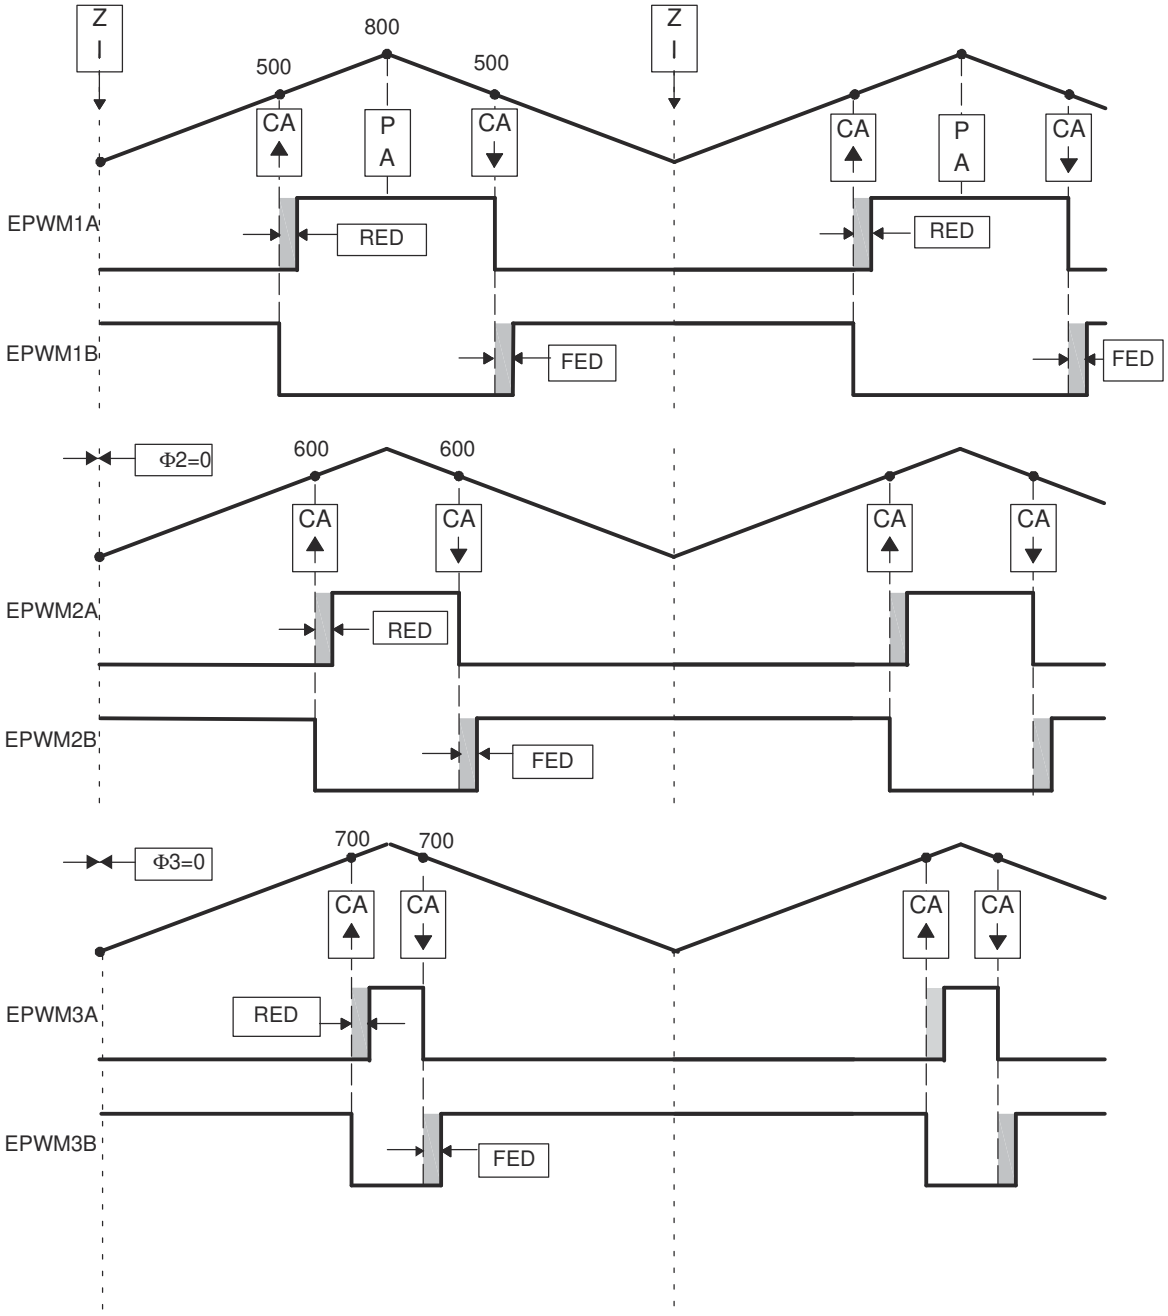

Figure 11-275. 3-Phase Inverter Waveforms for Figure 11-274 (Only One Inverter Shown)

11.4.2.3.7 Practical Applications Using Phase Control Between PWM Modules

So far, none of the examples have made use of the phase register (TBPHS). It has either been set to zero or its value has been a don't care. However, by programming appropriate values into TBPHS, multiple PWM modules can address another class of applications that rely on phase relationship between stages for correct operation. As described in the TB module section, a PWM module can be configured to allow a SyncIn pulse to cause the TBPHS register to be loaded into the TBCTR register. To illustrate this concept, Figure 11-276 shows a controller and target module with a phase relationship of 120°, that is, the target leads the controller.

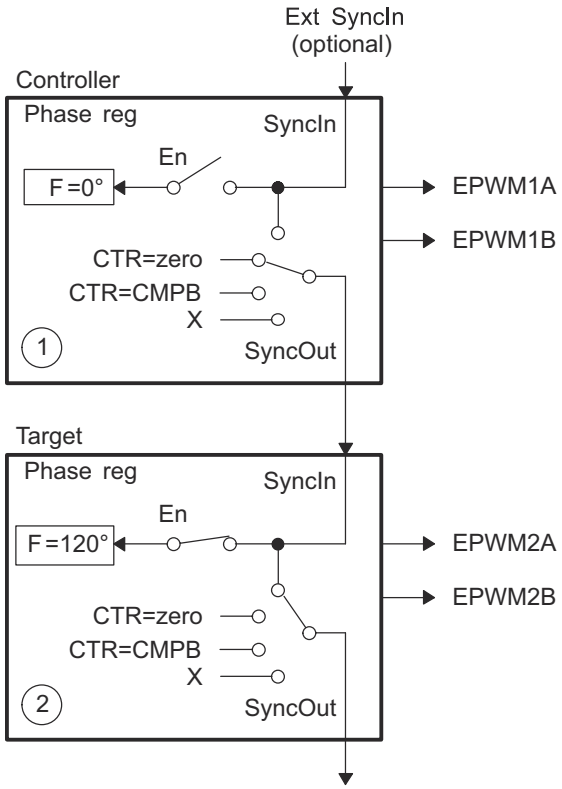

Figure 11-276. Configuring Two PWM Modules for Phase Control

Figure 11-277 shows the associated timing waveforms for this configuration. Here, TBPRD = 600 for both controller and target. For the target, TBPHS = 200 (that is, 200/600 X 360° = 120°). Whenever the controller generates a SyncIn pulse (CTR = PRD), the value of TBPHS = 200 is loaded into the target TBCTR register so the target time-base is always leading the controller's time-base by 120°.

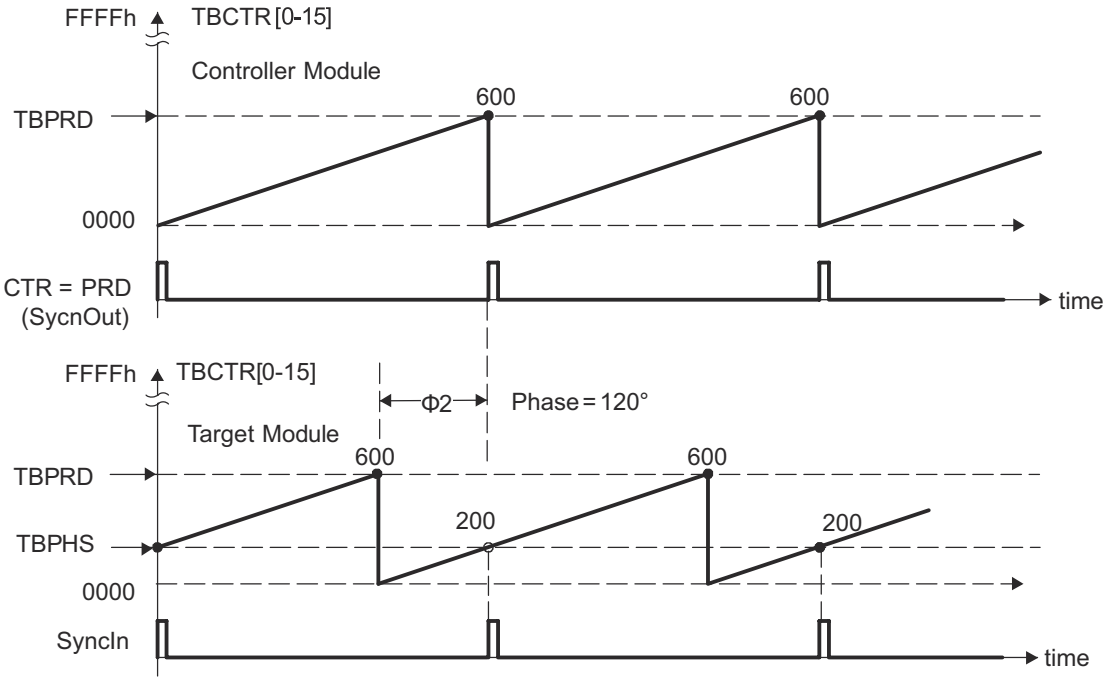

Figure 11-277. Timing Waveforms Associated With Phase Control Between 2 Modules

11.4.2.4 ePWM Module Control and Status Registers

Table 11-1422 lists the memory-mapped registers for the ePWM Module Control and Status Registers. All register offset addresses not listed in Table 11-1422 should be considered as reserved locations and the register contents should not be modified.

7	6	5	4	3	2	1	0
RESERVED					CTRMAX	SYNCI	CTRDIR
R-0h					R-0h	R/W-0h	R-1h

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -*n* = value after reset

Table 11-1423. TBSTS Register Field Descriptions

Bit	Field	Type	Reset	Description
15-3	RESERVED	R	0h	Reserved
2	CTRMAX	R	0h	Time-Base Counter Max Latched Status Bit 0h = Reading a 0 indicates the time-base counter never reached its maximum value. Writing a 0 will have no effect. 1h = Reading a 1 on this bit indicates that the time-base counter reached the max value 0xFFFF. Writing a 1 to this bit will clear the latched event.
1	SYNCI	R/W	0h	Input Synchronization Latched Status Bit 0h = Writing a 0 will have no effect. Reading a 0 indicates no external synchronization event has occurred. 1h = Reading a 1 on this bit indicates that an external synchronization event has occurred (EPWMxSYNCI). Writing a 1 to this bit will clear the latched event.
0	CTRDIR	R	1h	Time-Base Counter Direction Status Bit. At reset, the counter is frozen, therefore, this bit has no meaning. To make this bit meaningful, you must first set the appropriate mode via TBCTL[CTRMODE]. 0h = Time-Base Counter is currently counting down. 1h = Time-Base Counter is currently counting up.

11.4.2.4.2 TBCTL Register (Offset = 2h) [reset = 83h]

TBCTL is shown in Figure 11-279 and described in Table 11-1424.

Figure 11-279. TBCTL Register

15	14	13	12	11	10	9	8

R/W-1h	R/W-0h	R/W-0h		R/W-0h	R/W-0h	R/W-3h	

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -*n* = value after reset

Table 11-1424. TBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15-14	FREE_SOFT	R/W	0h	Emulation Mode Bits. These bits select the behavior of the ePWM time-base counter during emulation events: 0h = Stop after the next time-base counter increment or decrement. 1h = Stop when counter completes a whole cycle. In up-count mode, stop when the time-base counter = period (TBCTR = TBPRD). In down-count mode, stop when the time-base counter = 0x0000 (TBCTR = 0x0000). In up-down-count mode, stop when the time-base counter = 0x0000 (TBCTR = 0x0000). 2h = Free run 3h = Free run
13	PHSDIR	R/W	0h	Phase Direction Bit. This bit is only used when the time-base counter is configured in the up-down-count mode. The PHSDIR bit indicates the direction the time-base counter (TBCTR) will count after a synchronization event occurs and a new phase value is loaded from the phase (TBPHS) register. This is irrespective of the direction of the counter before the synchronization event. In the up-count and down-count modes this bit is ignored. 0h = Count down after the synchronization event. 1h = Count up after the synchronization event.
12-10	CLKDIV	R/W	0h	Time-base Clock Prescale Bits. These bits determine part of the time-base clock prescale value. TBCLK = VCLK4 / (HSPCLKDIV x CLKDIV) 0h = /1 (default on reset) 1h = /2 2h = /4 3h = /8 4h = /16 5h = /32 6h = /64 7h = /128

Table 11-1424. TBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-7	HSPCLKDIV	R/W	1h	High Speed Time-base Clock Prescale Bits. These bits determine part of the time-base clock prescale value. TBCLK = VCLK4 / (HSPCLKDIV x CLKDIV) 0h = /1 1h = /2 (default on reset) 2h = /4 3h = /6 4h = /8 5h = /10 6h = /12 7h = /14
6	SWFSYNC	R/W	0h	Software Forced Synchronization Pulse. This event is ORed with the EPWMxSYNCI input of the ePWM module. SWFSYNC is valid (operates) only when EPWMxSYNCI is selected by SYNCOSEL = 0. 0h = Writing a 0 has no effect and reads always return a 0. 1h = Writing a 1 forces a one-time synchronization pulse to be generated.
5-4	SYNCOSEL	R/W	0h	Synchronization Output Select. These bits select the source of the EPWMxSYNCO signal. 0h = EPWMxSYNC 1h = CTR = zero: Time-base counter equal to zero (TBCTR = 0x0000) 2h = CTR = CMPB : Time-base counter equal to counter-compare B (TBCTR = CMPB) 3h = Disable EPWMxSYNCO signal
3	PRDLD	R/W	0h	Active Period Register Load From Shadow Register Select 0h = The period register (TBPRD) is loaded from its shadow register when the time-base counter, TBCTR, is equal to 0. A write or read to the TBPRD register accesses the shadow register. 1h = Load the TBPRD register immediately without using a shadow register. A write or read to the TBPRD register directly accesses the active register.
2	PHSEN	R/W	0h	Counter Register Load From Phase Register Enable 0h = Do not load the time-base counter (TBCTR) from the time-base phase register (TBPHS) 1h = Load the time-base counter with the phase register when an EPWMxSYNCI input signal occurs or when a software synchronization is forced by the SWFSYNC bit, or when a digital compare sync event occurs.
1-0	CTRMODE	R/W	3h	Counter Mode. The time-base counter mode is normally configured once and not changed during normal operation. If you change the mode of the counter, the change will take effect at the next TBCLK edge and the current counter value shall increment or decrement from the value before the mode change. These bits set the time-base counter mode of operation as follows: 0h = Up-count mode 1h = Down-count mode 2h = Up-down-count mode 3h = Stop-freeze counter operation (default on reset)

11.4.2.4.3 TBPHS Register (Offset = 4h) [reset = 0h]

TBPHS is shown in Figure 11-280 and described in Table 11-1425.

Figure 11-280. TBPHS Register

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TBPHS															
R/W-0h															

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; *-n* = value after reset

Table 11-1425. TBPHS Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	TBPHS	R/W	0h	These bits set time-base counter phase of the selected ePWM relative to the time-base that is supplying the synchronization input signal. Valid values: 0-FFFFh If TBCTL[PHSEN] = 0, then the synchronization event is ignored and the time-base counter is not loaded with the phase. If TBCTL[PHSEN] = 1, then the time-base counter (TBCTR) will be loaded with the phase (TBPHS) when a synchronization event occurs. The synchronization event can be initiated by the input synchronization signal (EPWMxSYNCI) or by a software forced synchronization.

11.4.2.4.4 TBPRD Register (Offset = 8h) [reset = 0h]

TBPRD is shown in Figure 11-281 and described in Table 11-1426.

Figure 11-281. TBPRD Register

R/W-0h															

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; *-n* = value after reset

Table 11-1426. TBPRD Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	TBPRD	R/W	0h	These bits determine the period of the time-base counter. This sets the PWM frequency. Valid values: 0-FFFFh Shadowing of this register is enabled and disabled by the TBCTL[PRDLD] bit. By default this register is shadowed. If TBCTL[PRDLD] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the active register will be loaded from the shadow register when the time-base counter equals 0. If TBCTL[PRDLD] = 1, then the shadow is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware. The active and shadow registers share the same memory map address.

11.4.2.4.5 TBCTR Register (Offset = Ah) [reset = 0h]

TBCTR is shown in Figure 11-282 and described in Table 11-1427.

Figure 11-282. TBCTR Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; *-n* = value after reset

Table 11-1429. CMPA Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	CMPA	R/W	0h	The value in the active CMPA register is continuously compared to the time-base counter (TBCTR). When the values are equal, the counter-compare module generates a "time-base counter equal to counter compare A" event. This event is sent to the action-qualifier where it is qualified and converted it into one or more actions. These actions can be applied to either the EPWMxA or the EPWMxB output depending on the configuration of the AQCTLA and AQCTLB registers. The actions that can be defined in the AQCTLA and AQCTLB registers include: Do nothing, the event is ignored. Clear: Pull the EPWMxA and/or EPWMxB signal low Set: Pull the EPWMxA and/or EPWMxB signal high Toggle the EPWMxA and/or EPWMxB signal Shadowing of this register is enabled and disabled by the CMPCTL[SHDWAMODE] bit. By default this register is shadowed. If CMPCTL[SHDWAMODE] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the CMPCTL[LOADAMODE] bit field determines which event will load the active register from the shadow register. Before a write, the CMPCTL[SHDWAFULL] bit can be read to determine if the shadow register is currently full. If CMPCTL[SHDWAMODE] = 1, then the shadow register is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware. In either mode, the active and shadow registers share the same memory map address.

11.4.2.4.8 AQCTLA Register (Offset = 14h) [reset = 0h]

AQCTLA is shown in Figure 11-285 and described in Table 11-1430.

Table 11-1434. DBCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
15	HALFCYCLE	R/W	0h	Half Cycle Clocking Enable Bit: 0h = Full cycle clocking enabled. The dead-band counters are clocked at the TBCLK rate. 1h = Half cycle clocking enabled. The dead-band counters are clocked at TBCLK x 2.
14-6	RESERVED	R	0h	Reserved
5-4	IN_MODE	R/W	0h	Dead Band Input Mode Control. Bit 5 controls the S5 switch and bit 4 controls the S4 switch shown in . This allows you to select the input source to the falling-edge and rising-edge delay. To produce classical dead-band waveforms the default is EPWMxA In is the source for both falling and rising-edge delays. 0h = EPWMxA In (from the action-qualifier) is the source for both falling-edge and rising-edge delay. 1h = EPWMxB In (from the action-qualifier) is the source for rising-edge delayed signal. EPWMxA In (from the action-qualifier) is the source for falling-edge delayed signal. 2h = EPWMxA In (from the action-qualifier) is the source for rising-edge delayed signal. EPWMxB In (from the action-qualifier) is the source for falling-edge delayed signal. 3h = EPWMxB In (from the action-qualifier) is the source for both rising-edge delay and falling-edge delayed signal.

Table 11-1434. DBCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3-2	POLSEL	R/W	0h	Polarity Select Control. Bit 3 controls the S3 switch and bit 2 controls the S2 switch shown in . This allows you to selectively invert one of the delayed signals before it is sent out of the dead-band submodule. The following descriptions correspond to classical upper/lower switch control as found in one leg of a digital motor control inverter. These assume that DBCTL[OUT_MODE] = 1,1 and DBCTL[IN_MODE] = 0,0. Other enhanced modes are also possible, but not regarded as typical usage modes. 0h = Active high (AH) mode. Neither EPWMxA nor EPWMxB is inverted (default). 1h = Active low complementary (ALC) mode. EPWMxA is inverted. 2h = Active high complementary (AHC). EPWMxB is inverted. 3h = Active low (AL) mode. Both EPWMxA and EPWMxB are inverted.
1-0	OUT_MODE	R/W	0h	Dead-band Output Mode Control. Bit 1 controls the S1 switch and bit 0 controls the S0 switch shown in . This allows you to selectively enable or bypass the dead-band generation for the falling-edge and rising-edge delay. 0h = Dead-band generation is bypassed for both output signals. In this mode, both the EPWMxA and EPWMxB output signals from the action-qualifier are passed directly to the PWM-chopper submodule. In this mode, the POLSEL and IN_MODE bits have no effect. 1h = Disable rising-edge delay. The EPWMxA signal from the action-qualifier is passed straight through to the EPWMxA input of the PWM-chopper submodule. The falling-edge delayed signal is seen on output EPWMxB. The input signal for the delay is determined by DBCTL[IN_MODE]. 2h = The rising-edge delayed signal is seen on output EPWMxA. The input signal for the delay is determined by DBCTL[IN_MODE]. Disable falling-edge delay. The EPWMxB signal from the action-qualifier is passed straight through to the EPWMxB input of the PWM-chopper submodule. 3h = Dead-band is fully enabled for both rising-edge delay on output EPWMxA and falling-edge delay on output EPWMxB. The input signal for the delay is determined by DBCTL[IN_MODE].

11.4.2.4.17 TZSEL Register (Offset = 26h) [reset = 0h]

TZSEL is shown in Figure 11-294 and described in Table 11-1439.

One-Shot (OSHT) Trip-zone enable/disable (bits 15-8). When any of the enabled pins go low, a one-shot trip event occurs for this ePWM module. When the event occurs, the action defined in the TZCTL register is taken on the EPWMxA and EPWMxB outputs. The one-shot trip condition remains latched until the user clears the condition via the TZCLR register. Cycle-by-Cycle (CBC) Trip-zone enable/disable (bits 7-0). When any of the enabled pins go low, a cycle-by-cycle trip event occurs for this ePWM module. When the event occurs, the action defined in the TZCTL register is taken on the EPWMxA and EPWMxB outputs. A cycle-by-cycle trip condition is automatically cleared when the time-base counter reaches zero.

Bit	Field	Type	Reset	Description
15-14	SOCBCNT	R	0h	ePWM ADC Start-of-Conversion B Event (EPWMxSOCB) Counter Register. These bits indicate how many selected ETSEL[SOCBSEL] events have occurred: 0h = No events have occurred. 1h = 1 event has occurred. 2h = 2 events have occurred. 3h = 3 events have occurred.
13-12	SOCBPRD	R/W	0h	ePWM ADC Start-of-Conversion B Event (EPWMxSOCB) Period Select. These bits determine how many selected ETSEL[SOCBSEL] events need to occur before an EPWMxSOCB pulse is generated. To be generated, the pulse must be enabled (ETSEL[SOCBEN] = 1). The SOCB pulse will be generated even if the status flag is set from a previous start of conversion (ETFLG[SOCB] = 1). Once the SOCB pulse is generated, the ETPS[SOCBCNT] bits will automatically be cleared. 0h = Disable the SOCB event counter. No EPWMxSOCB pulse will be generated 1h = Generate the EPWMxSOCB pulse on the first event: ETPS[SOCBCNT] = 0,1 2h = Generate the EPWMxSOCB pulse on the second event: ETPS[SOCBCNT] = 1,0 3h = Generate the EPWMxSOCB pulse on the third event: ETPS[SOCBCNT] = 1,1
11-10	SOCACNT	R	0h	ePWM ADC Start-of-Conversion A Event (EPWMxSOCA) Counter Register. These bits indicate how many selected ETSEL[SOCASEL] events have occurred: 0h = No events have occurred. 1h = 1 event has occurred. 2h = 2 events have occurred. 3h = 3 events have occurred.

Table 11-1447. ETPS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-8	SOCAPRD	R/W	0h	ePWM ADC Start-of-Conversion A Event (EPWMxSOCA) Period Select. These bits determine how many selected ETSEL[SOCASEL] events need to occur before an EPWMxSOCA pulse is generated. To be generated, the pulse must be enabled (ETSEL[SOCAEN] = 1). The SOCA pulse will be generated even if the status flag is set from a previous start of conversion (ETFLG[SOCA] = 1). Once the SOCA pulse is generated, the ETPS[SOCACNT] bits will automatically be cleared. 0h = Disable the SOCA event counter. No EPWMxSOCA pulse will be generated 1h = Generate the EPWMxSOCA pulse on the first event: ETPS[SOCACNT] = 0,1 2h = Generate the EPWMxSOCA pulse on the second event: ETPS[SOCACNT] = 1,0 3h = Generate the EPWMxSOCA pulse on the third event: ETPS[SOCACNT] = 1,1
7-4	RESERVED	R	0h	Reserved
3-2	INTCNT	R	0h	ePWM Interrupt Event (EPWMx_INT) Counter Register. These bits indicate how many selected ETSEL[INTSEL] events have occurred. These bits are automatically cleared when an interrupt pulse is generated. If interrupts are disabled, ETSEL[INT] = 0 or the interrupt flag is set, ETFLG[INT] = 1, the counter will stop counting events when it reaches the period value ETPS[INTCNT] = ETPS[INTPRD]. 0h = No events have occurred. 1h = 1 event has occurred. 2h = 2 events have occurred. 3h = 3 events have occurred.
1-0	INTPRD	R/W	0h	ePWM Interrupt (EPWMx_INT) Period Select. These bits determine how many selected ETSEL[INTSEL] events need to occur before an interrupt is generated. To be generated, the interrupt must be enabled (ETSEL[INT] = 1). If the interrupt status flag is set from a previous interrupt (ETFLG[INT] = 1) then no interrupt will be generated until the flag is cleared via the ETCLR[INT] bit. This allows for one interrupt to be pending while another is still being serviced. Once the interrupt is generated, the ETPS[INTCNT] bits will automatically be cleared. Writing a INTPRD value that is the same as the current counter value will trigger an interrupt if it is enabled and the status flag is clear. Writing a INTPRD value that is less than the current counter value will result in an undefined state. If a counter event occurs at the same instant as a new zero or non-zero INTPRD value is written, the counter is incremented. 0h = Disable the interrupt event counter. No interrupt will be generated and ETFRC[INT] is ignored. 1h = Generate an interrupt on the first event INTCNT = 01 (first event) 2h = Generate interrupt on ETPS[INTCNT] = 1,0 (second event) 3h = Generate interrupt on ETPS[INTCNT] = 1,1 (third event)

11.4.2.4.26 ETFRC Register (Offset = 38h) [reset = 0h]

ETFRC is shown in Figure 11-303 and described in Table 11-1448.

Table 11-1455. DCFOFFSET Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	OFFSET	R	0h	Blanking Window Offset. Valid values: 0-FFFFh These 16-bits specify the number of TBCLK cycles from the blanking window reference to the point when the blanking window is applied. The blanking window reference is either period or zero as defined by the DCFCTL[PULSESEL] bit. This offset register is shadowed and the active register is loaded at the reference point defined by DCFCTL[PULSESEL]. The offset counter is also initialized and begins to count down when the active register is loaded. When the counter expires, the blanking window is applied. If the blanking window is currently active, then the blanking window counter is restarted.

11.4.2.4.34 DCCAPCTL Register (Offset = 6Ah) [reset = 0h]

DCCAPCTL is shown in Figure 11-311 and described in Table 11-1456.

Figure 11-311. DCCAPCTL Register

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; *-n* = value after reset

Table 11-1459. DCCAP Register Field Descriptions

Bit	Field	Type	Reset	Description
15-0	DCCAP	R	0h	Digital Compare Time-Base Counter Capture. Valid values: 0-FFFFh To enable time-base counter capture, set the DCCAPCLT[CAPE] bit to 1. If enabled, reflects the value of the time-base counter (TBCTR) on the low to high edge transition of a filtered (DCEVTFLT) event. Further capture events are ignored until the next period or zero as selected by the DCFCTL[PULSESEL] bit. Shadowing of DCCAP is enabled and disabled by the DCCAPCTL[SHDWMODE] bit. By default this register is shadowed. If DCCAPCTL[SHDWMODE] = 0, then the shadow is enabled. In this mode, the active register is copied to the shadow register on the TBCTR = TBPRD or TBCTR = zero as defined by the DCFCTL[PULSESEL] bit. CPU reads of this register will return the shadow register value. If DCCAPCTL[SHDWMODE] = 1, then the shadow register is disabled. In this mode, CPU reads will return the active register value. The active and shadow registers share the same memory map address.

11.4.2.4.38 DCFWINDOWCNT Register (Offset = 72h) [reset = 0h]

DCFWINDOWCNT is shown in Figure 11-315 and described in Table 11-1460.

15-8	RESERVED	R	0h	Any writes to these bit(s) must always have a value of 0.
7-0	WINDOWCNT	R	0h	Blanking Window Counter. Valid value: 0-FFh These 8 bits are read only and indicate the current value of the window counter. The counter counts down to zero and then stops until it is re-loaded when the offset counter reaches zero again.

11.4.3 CANFD

This chapter describes the Modular Controller Area Network (MCAN) module.

11.4.3.1 MCAN Overview

The Controller Area Network (CAN) is a serial communications protocol which efficiently supports distributed real-time control with a high level of security. CAN has high immunity to electrical interference and the ability to self-diagnose and repair data errors. In a CAN network, many short messages are broadcast to the entire network, which provides for data consistency in every node of the system.

The MCAN modules support both classic CAN and CAN FD (CAN with Flexible Data-Rate) specifications. CAN FD feature allows high throughput and increased payload per data frame. The classic CAN and CAN FD devices can coexist on the same network without any conflict.

The device supports up to two MCAN modules connecting to the CAN network through external (for the device) transceiver for connection to the physical layer. Each MCAN module supports up to 5 Mbit/s data rate and is compliant to ISO 11898-1:2015.

Note

The availabilty of CAN FD feature is device part number dependent. Refer to device Data Manual for more information.

shows the MCAN module overview.

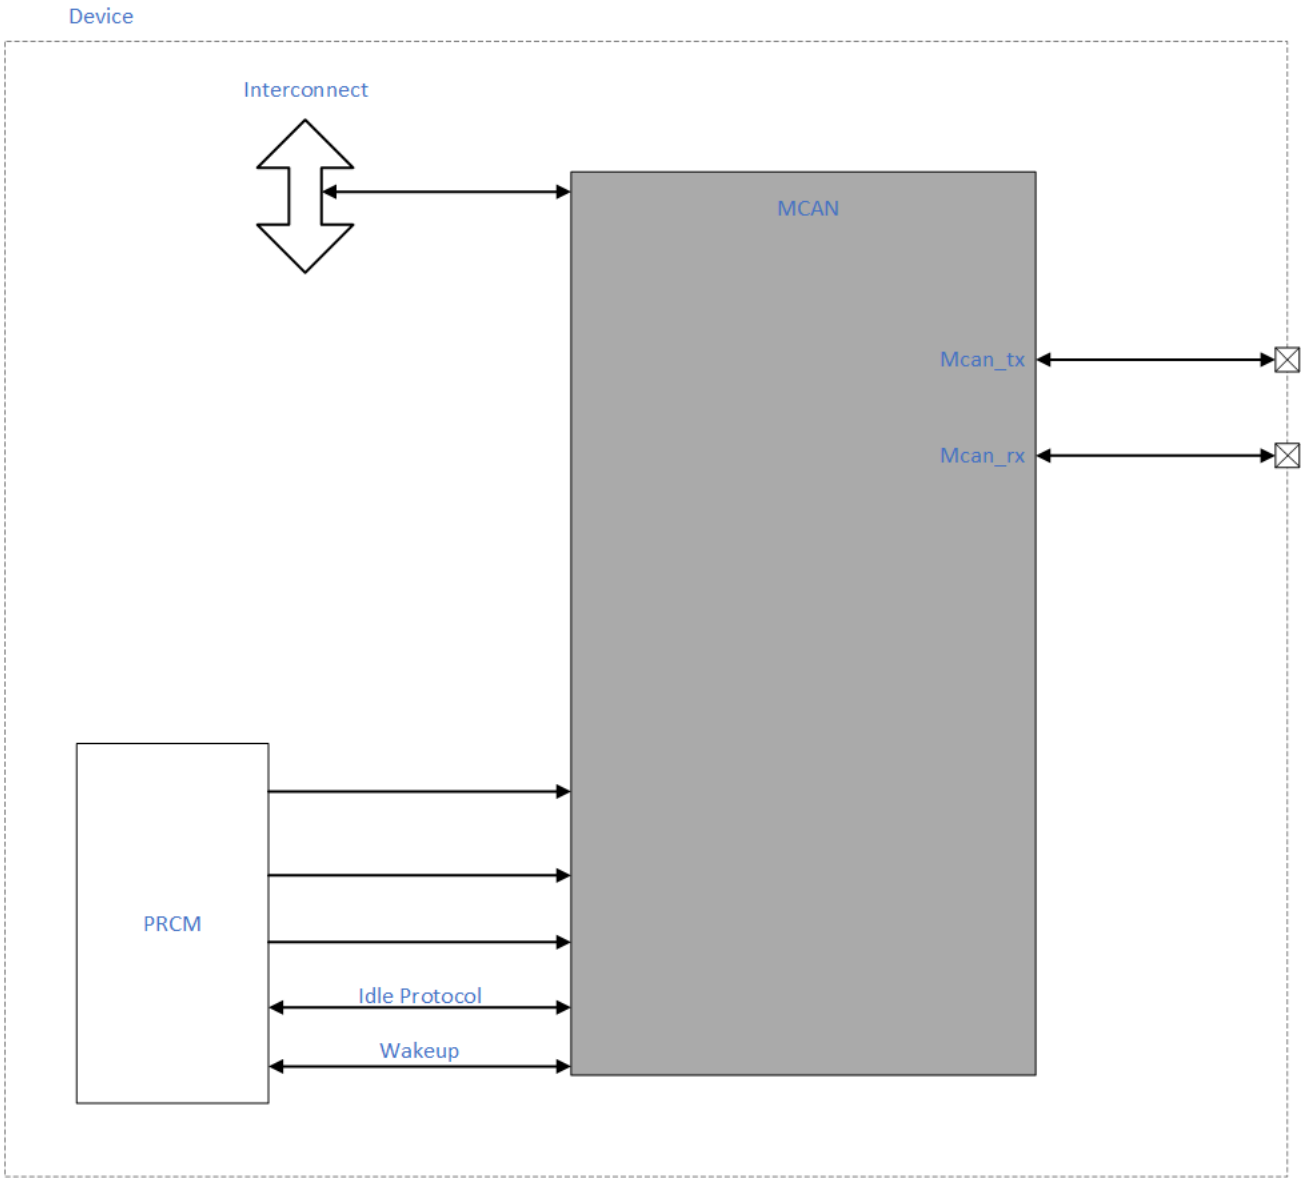

Figure 11-316. MCAN Module Overview

11.4.3.1.1 Features

Each MCAN module implements the following features:

- Conforms with ISO 11898-1:2015
- Full CAN FD support (up to 64 data bytes)
- AUTOSAR and SAE J1939 support
- Up to 32 dedicated Transmit Buffers
- Configurable Transmit FIFO, up to 32 elements
- Configurable Transmit Queue, up to 32 elements
- Configurable Transmit Event FIFO, up to 32 elements
- Up to 64 dedicated Receive Buffers
- Two configurable Receive FIFOs, up to 64 elements each
- Up to 128 filter elements
- Internal Loopback mode for self-test
- Maskable interrupts, two interrupt lines

- Two clock domains (CAN clock/Host clock)
- Parity/ECC support - Message RAM single error correction and double error detection (SECDED) mechanism
- Local power-down and wakeup support
- Timestamp Counter
- Full Message Memory capacity (4352 words).

Not supported features:

- Debug on CAN (Debug DMA)
- Host bus read and write bursts
- Host bus firewall
- GPIO mode
- External (IO) Loopback mode
- Device clock domains monitoring (using DCC module)

11.4.3.2 MCAN Environment

A CAN network physical layer consists of two-wire differential bus, usually twisted pair, and provides high level of interference immunity. External CAN transceiver IC is needed to access a CAN bus by the MCAN.

Figure 11-317 shows an overview of a typical MCAN application.

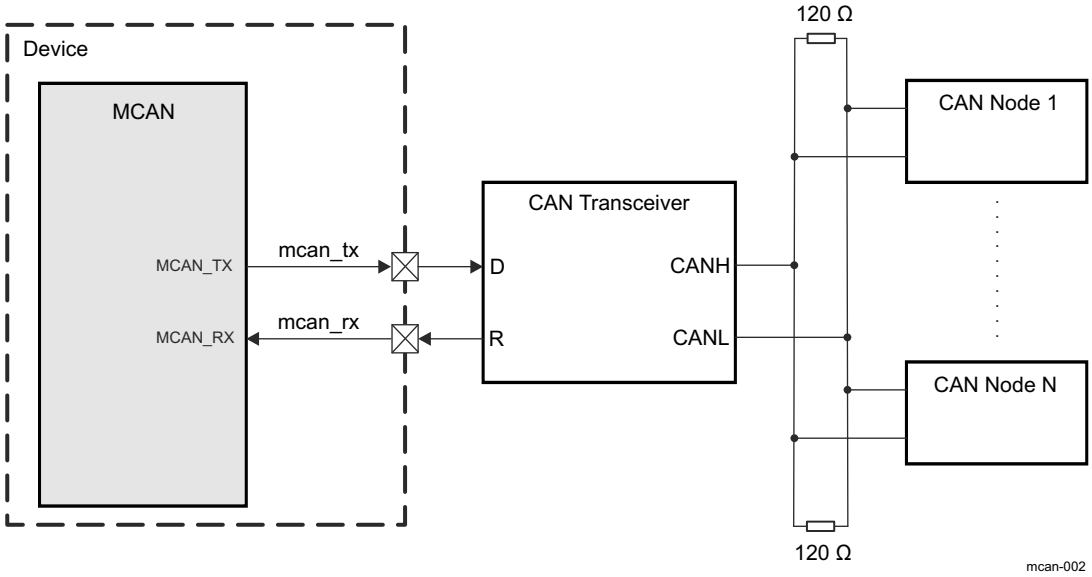

Figure 11-317. MCAN Typical Application

Table 11-1461 describes the external signals of the MCAN module.

Table 11-1461. MCAN I/O Description

Module Signal	Device Signal	I/O(1)	Description	Value at Reset
MCAN_RX	mcan_rx	I	Serial data input from external CAN tranceiver	HiZ
MCAN_TX	mcan_tx	O	Serial data output to external CAN tranceiver	1

(1) I = Input; O = Output

Note

The path from a module pin to device pad(s) is defined at the device I/O logic level. The control module registers assign the specific function to the device pads. For more information on control module settings, see *Pad Configuration Registers* of *Control Module*.

11.4.3.2.1 CAN Network Basics

- A CAN bus is a 2-wire differential bus using Non-Return-to-Zero (NRZ) encoding and has two states:
  - Recessive state (logical 1)
  - Dominant state (logical 0)
- The network is multicontroller. When two or more nodes (ECUs) attempt to transmit at the same time, a non-destructive arbitration technique guarantees messages are sent in order of priority and no messages are lost.
- The message transmission is multicast. Data messages transmitted are identifier based, not address based.
- Content of message is labeled by the identifier that is unique throughout the network (for example: rpm, temperature, position, pressure, and so forth).
- All nodes on network receive the message and each performs an acceptance test on the identifier. If message is relevant, it is processed, otherwise it is ignored.

- The unique identifier also determines the priority of the message (the lower the numerical value of the identifier, the higher the priority is).
- Data is transmitted and received using message frames, consisting of the following basic fields:
  - Arbitration field
  - Control field
  - Data field (up to 8 bytes for Classical CAN and up to 64 bytes for CAN FD)
  - CRC field
  - ACK field

For more information, see *ISO 11898-1:2015: CAN data link layer and physical signalling*.

11.4.3.3 MCAN Integration

MCAN Integration shows the integration of the MCAN module in the device.

Figure 11-318. MCAN Integration

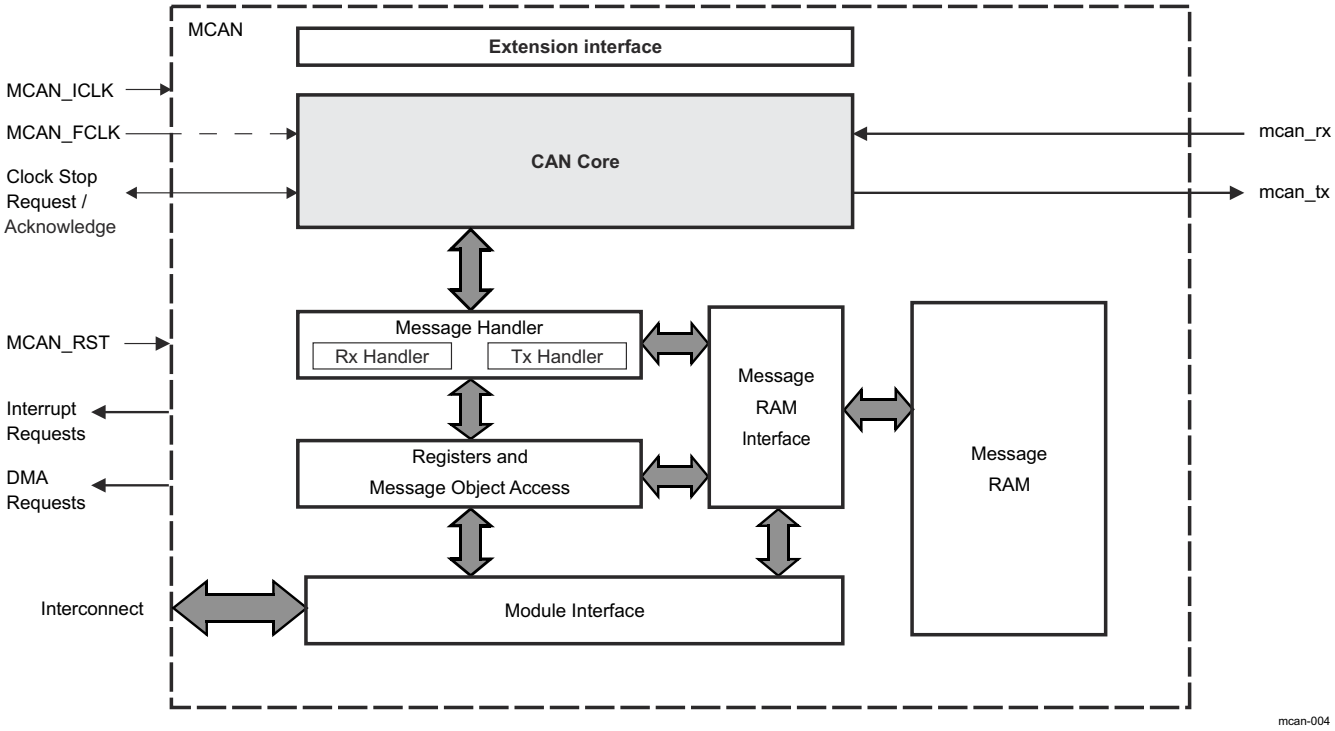

Table 11-1462 through Table 11-1464 summarize the integration of the MCAN module in the device.

Table 11-1462. MCAN Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect
MCAN	PD_L4PER	Yes	L4_PER2

	MCAN_DREQ_RX_FE2	DMA_CROSSBAR_163	-	MCAN RX Filter Event 2

Note

For more information about the DMA_CROSSBAR module, see *DMA_CROSSBAR Module Functional Description* in *Control Module*.

Note

For the description of the interrupt source, see Section 11.4.3.4.2, *Interrupt and DMA Requests*.

11.4.3.4 MCAN Functional Description

Each MCAN module performs CAN protocol communication according to ISO 11898-1:2015. The bit rate can be programmed to values up to 5 Mbit/s. Additional transceiver hardware is required for the connection to the physical layer (CAN bus).

For communication on a CAN network, individual message frames can be configured. The message frames and identifier masks are stored in the Message RAM.

All functions concerning the handling of messages are implemented in the Message Handler.

The register set of each MCAN module can be accessed directly via the module interface. These registers are used to control and configure the CAN core and the Message Handler, and to access the Message RAM.

Figure 11-319 shows a CAN module block diagram.

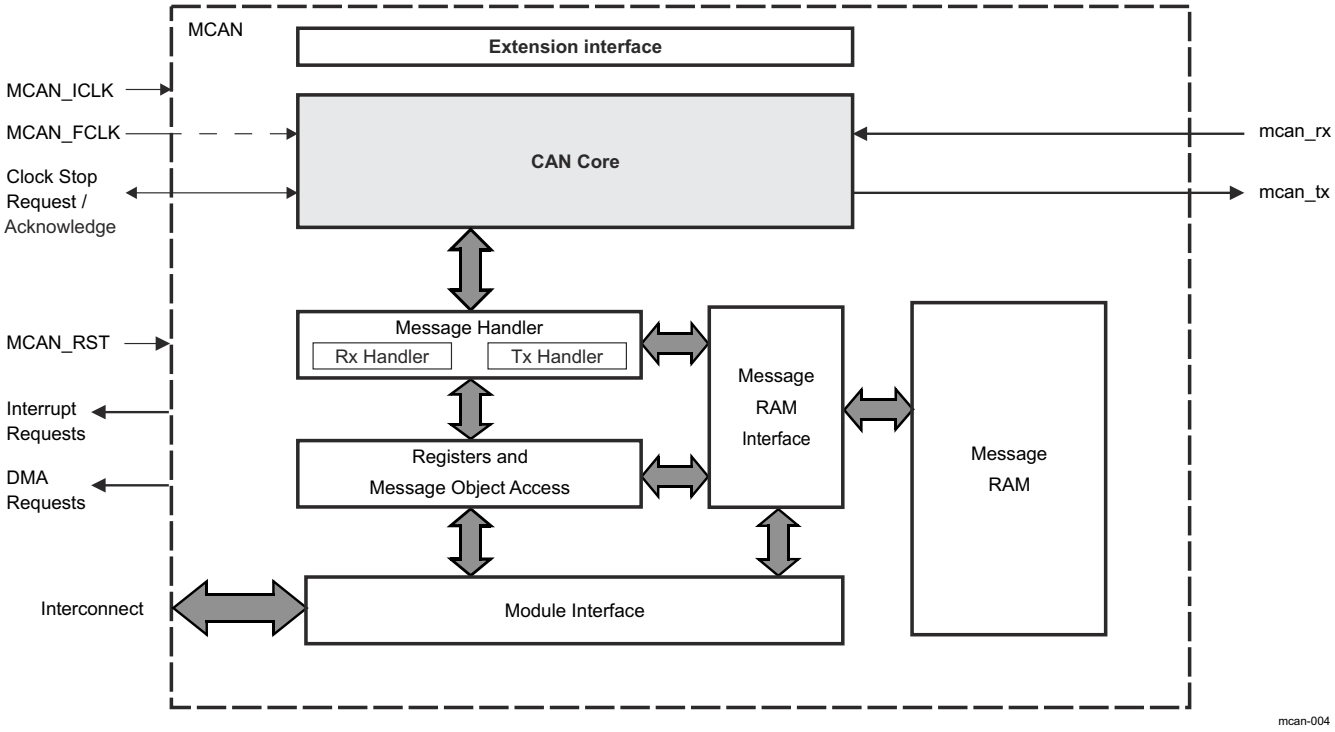

Figure 11-319. MCAN Block Diagram

The MCAN module blocks description:

- **CAN Core**: The CAN core consists of the CAN protocol controller and the Rx/Tx shift register. It handles all ISO 11898-1:2015 protocol functions and supports 11-bit and 29-bit identifiers.
- **Message Handler**: the Message Handler (Rx Handler and Tx Handler) is a state machine that controls the data transfer between the single-ported Message RAM and the CAN core's Rx/Tx shift register. It also handles the acceptance filtering and the Interrupt/DMA request generation as programmed in the control registers.
- **Message RAM**: the main purpose of the Message RAM is to store Rx/Tx messages, Tx Event elements, and Message ID Filter elements (for more information, see Section 11.4.3.4.11, *Message RAM*).
- **Message RAM Interface**: enables connection between the Message RAM and the other blocks in the MCAN module.
- **Registers and Message Object Access**: Data consistency is ensured by indirect accesses to the message objects. During normal operation, all software and DMA accesses to the Message RAM are done through interface registers. The interface registers have the same word-length as the Message RAM.
- **Module Interface**: The MCAN module registers are accessed by the user software through a 32-bit peripheral bus interface.

- **Clocking**: Two clocks are provided to the MCAN module: the peripheral synchronous clock (interface clock - MCAN_ICLK) and the peripheral asynchronous clock (functional clock - MCAN_FCLK).
- **Extension Interface**: All flags from the Interrupt Register (MCAN_IR) as well as selected internal status and control signals are routed to this interface.

11.4.3.4.1 Module Clocking Requirements

Two clocks are provided to each MCAN module:

- the peripheral synchronous clock (MCAN_ICLK) as the general module clock source
- and the peripheral asynchronous clock (MCAN_FCLK) provided to the CAN core for generating the CAN bit timing.

Within each MCAN module there is a synchronization mechanism implemented to ensure safe data transfer between the two clock domains. There are synchronization between the signals from the Host clock domain to the CAN clock domain and vice versa and between the reset signal (MCAN_RST) to the Host clock domain and to the CAN clock domain.

Note

MCAN_ICLK must always be higher or equal to MCAN_FCLK, in order to achieve a stable functionality of the MCAN module. Here, also the frequency shift of the modulated MCAN_ICLK has to be considered:

$f_{0,ICLK}(OCP) \pm \Delta f_{FM,ICLK}(OCP) \geq f_{FCLK}$

CAN-FD supports higher speeds of operation and as such has more stringent timing requirements than Classic CAN. For optimal performance, TI recommends using the lowest N-divider value that maintains a working PLL REF_CLK (GMAC_DSP_DPLL_CLK) for the system. Lower N-divider values increase the loop bandwidth of the PLL which in turn improves timing margins for CAN-FD.

For CAN-FD operations > 2 Mbps:

- For 20 MHz input clocks, N = 0 is the preferred configuration.

For CAN-FD operations < 2 Mbps:

- For 20 MHz input clocks, N = 0 is the preferred configuration.
- For 19.2 MHz input clocks, N = 11 is the preferred configuration.

For more information on how to configure the relevant clock source registers, see *PRCM* and the device data manual.

11.4.3.4.2 Interrupt and DMA Requests

Each MCAN module provides interrupt and DMA requests. They are configured via the Host CPU. The Suspend Mode prevents the interrupt and DMA requests from propagating to the Host CPU (for more information, see Section 11.4.3.4.4.8.2, *Suspend Mode*).

11.4.3.4.2.1 Interrupt Requests

Each MCAN module has two interrupt lines. The first interrupt line (INT0) is associated with the MCAN core. There are 30 internal interrupt sources. The interrupts are 'level high' interrupts.

For more information, see the following registers:

- Interrupt Register (MCAN_IR)
- Interrupt Enable (MCAN_IE)
- Interrupt Line Select (MCAN_ILS)
- Interrupt Line Enable (MCAN_ILE)

Each MCAN module is capable of issuing an ECC interrupt. After clearing the ECC interrupt source, the application software must also write 1 to MCANSS_ECC_EOI[8] ECC_EOI bit (for more information, see Section 11.4.3.4.7.2, *ECC Aggregator*).

The second interrupt line (INT1) is associated with the External Timestamp Counter. When the External Timestamp Counter rolls over it produces an interrupt (see Section 11.4.3.4.5.1, *External Timestamp Counter*).

For more information, see the following registers:

- Interrupt Clear Shadow Register (MCANSS_ICS)
- Interrupt Raw Status Register (MCANSS_IRS)
- Interrupt Enable Clear Shadow Register (MCANSS_IECS)
- Interrupt Enable Register (MCANSS_IE)
- Interrupt Enable Status (MCANSS_IES)
- End Of Interrupt (MCANSS_EOI)
- External Timestamp Prescaler (MCANSS_EXT_TS_PRESCALER)
- External Timestamp Unserviced Interrupts Counter (MCANSS_EXT_TS_UNSERVICED_INTR_CNTR)

11.4.3.4.2.2 DMA Requests

Functional transmit and Filter DMA requests are generated by each MCAN module based on the signaling in the Extention Interface. The DMA signaling uses a simple DMA request active high pulse. Only one Tx DMA event is provided by each MCAN module.

Standard and Extended message filters can be set to issue a pulse when a filter match occurs. These "Filter Events" can be used to DMA messages from the Rx FIFO. The events are high level single clock cycle (MCAN_ICLK) pulses. Only two Filter DMA events are provided by the MCAN module.

For more information about available Interrupt and DMA Requests, see Section 11.4.3.3, *MCAN Integration*.

11.4.3.4.2.3

For more information about available Interrupt and DMA Requests, see Section 11.4.3.3, *MCAN Integration*.

11.4.3.4.3 Fuseable CAN FD Operation Enable

The Flexible Datarate feature of each MCAN module can be enabled by writing 1 to MCAN_CCCR[8] FDOE bit. A value of 0 on the primary configuration port (mcanss_enable_fdoe) will force the MCAN_CCCR[8] FDOE bit during write to the MCAN_CCCR register which will prevent the device from enabling and using the CAN FD mode.

11.4.3.4.4 Operating Modes

11.4.3.4.4.1 Software Initialization

Setting the MCAN_CCCR[0] INIT bit to 1 starts a software initialization. This is done either by software or by a hardware reset, when an uncorrected bit error was detected in the Message RAM, or by going Bus_Off state. While the MCAN_CCCR[0] INIT bit is set, the message transfer is stopped and the status of the output MCAN_TX pin is recessive (high). The counters of the Error Management Logic (EML) are unchanged. Setting the MCAN_CCCR[0] INIT bit does not change any configuration register. Resetting the MCAN_CCCR[0] INIT bit finishes the software initialization. After waiting for the occurrence of a sequence of 11 consecutive recessive bits (indication for Bus_Idle state) the message transfer starts.

Access to the MCAN configuration registers is only enabled when both MCAN_CCCR[0] INIT and MCAN_CCCR[1] CCE bits are set (write protection).

The MCAN_CCCR[1] CCE bit can only be set/reset while the MCAN_CCCR[0] INIT = 1. The MCAN_CCCR[1] CCE bit is automatically reset when the MCAN_CCCR[0] INIT bit is reset.

The following registers are reset when the MCAN_CCCR[1] CCE bit is set:

- MCAN_HPMS - High Priority Message Status
- MCAN_RXF0S - Rx FIFO 0 Status
- MCAN_RXF1S - Rx FIFO 1 Status
- MCAN_TXFQS - Tx FIFO/Queue Status
- MCAN_TXBRP - Tx Buffer Request Pending
- MCAN_TXBTO - Tx Buffer Transmission Occurred

- MCAN_TXBCF - Tx Buffer Cancellation Finished
- MCAN_TXEFS - Tx Event FIFO Status

The Timeout Counter value MCAN_TOCV[15:0] TOC field is preset to the value configured by the MCAN_TOCC[31:16] TOP field when the MCAN_CCCR[1] CCE bit is set.

In addition the Tx Handler and Rx Handler are held in idle state while MCAN_CCCR[1] CCE = 1.

The following registers are only writeable while MCAN_CCCR[1] CCE = 0

- MCAN_TXBAR - Tx Buffer Add Request
- MCAN_TXBCR - Tx Buffer Cancellation Request

MCAN_CCCR[7] TEST and MCAN_CCCR[5] MON bits can only be set by the Host CPU while MCAN_CCCR[0] INIT = 1 and MCAN_CCCR[1] CCE = 1. Both bits may be reset at any time. The MCAN_CCCR[6] DAR bit can only be set/reset while MCAN_CCCR[0] INIT = 1 and MCAN_CCCR[1] CCE = 1.

11.4.3.4.4.2 Normal Operation

Once an MCAN module is initialized and the MCAN_CCCR[0] INIT bit is reset to zero, the MCAN module synchronizes itself to the CAN bus and is ready for communication. After passing the acceptance filtering, received messages including Message Identifier (ID) and Data Length Code (DLC) are stored into a dedicated Rx Buffer or into Rx FIFO 0/Rx FIFO 1.

For messages to be transmitted dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated.

Note

Automated transmission on reception of remote frames is not supported.

11.4.3.4.4.3 CAN FD Operation

There are two variants of CAN FD frame transmission:

- CAN FD frame transmission without bit rate switching
- CAN FD frame transmission where control field, data field, and CRC field are transmitted with a higher bit rate than the beginning and the end of the frame

In the CAN frames FDF = recessive (logical 1) signifies a CAN FD frame, FDF = dominant (logical 0) signifies a Classic CAN frame. In a CAN FD frame, the two bits following FDF - res and BRS, decide whether the bit rate inside of this CAN FD frame is switched. A CAN FD bit rate switch is signified by res = dominant and BRS = recessive. Note that the coding of res = recessive is reserved for future expansion of the protocol. In case the MCAN module receives a frame with FDF = recessive and res = recessive, it will signal a Protocol Exception Event by setting the MCAN_PSR[14] EXE bit. When Protocol Exception Handling is enabled (MCAN_CCCR[12] PXHD = 0), this causes the operation state to change from Receiver (MCAN_PSR[4:3] ACT = 10) to Integrating (MCAN_PSR[4:3] ACT = 00) at the next sample point. In case Protocol Exception Handling is disabled (MCAN_CCCR[12] PXHD = 1), the MCAN will treat a recessive res bit as an form error and will respond with an error frame.

CAN FD operation is enabled by programming the MCAN_CCCR[8] FDOE bit. In case MCAN_CCCR[8] FDOE = 1, transmission and reception of CAN FD frames is enabled. Transmission and reception of Classic CAN frames is always possible. Whether a CAN FD frame or a Classic CAN frame is transmitted can be configured via the FDF bit in the respective Tx Buffer element.

With MCAN_CCCR[8] FDOE = 0, received frames are interpreted as Classic CAN frames, which leads to the transmission of an error frame when receiving a CAN FD frame. When CAN FD operation is disabled, no CAN FD frames are transmitted even if the FDF bit of a Tx Buffer element is set. The MCAN_CCCR[8] FDOE and MCAN_CCCR[9] BRSE bits can only be changed while the MCAN_CCCR[0] INIT and MCAN_CCCR[1] CCE bits are both set. With MCAN_CCCR[8] FDOE = 0, the setting of bits FDF and BRS is ignored and frames are transmitted in Classic CAN format.

With MCAN_CCCR[8] FDOE = 1 and MCAN_CCCR[9] BRSE = 0, only FDF bit of a Tx Buffer element is evaluated. With MCAN_CCCR[8] FDOE = 1 and MCAN_CCCR[9] BRSE = 1, transmission of CAN FD frames with bit rate switching is enabled. All Tx Buffer elements with bits FDF and BRS set are transmitted in CAN FD format with bit rate switching.

A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system startup all nodes are transmitting Classic CAN messages until it is verified that they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.
- Wakeup messages in CAN Partial Networking have to be transmitted in Classic CAN format.
- End-of-line programming in case not all nodes are CAN FD capable. Non CAN FD nodes are held in Silent mode until programming has completed. Then all nodes switch back to Classic CAN communication.

In the CAN FD format, the DLC coding differs from the standard CAN format (see Table 11-1465).

Table 11-1465. DLC Coding

DLC	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Number of Data Bytes in Standard CAN	0	1	2	3	4	5	6	7	8	8	8	8	8	8	8	8
Number of Data Bytes in CAN FD	0	1	2	3	4	5	6	7	8	12	16	20	24	32	48	64

For CAN FD frames with bit rate switching, the bit timing will be switched inside the frame after the BRS (Bit Rate Switch) bit in case this bit is recessive. In the CAN FD arbitration phase, before the BRS bit, the nominal CAN bit timing (see Figure 11-320) is used as configured by the Nominal Bit Timing and Prescaler Register, MCAN_NBTP. In the following CAN FD data phase, the data phase bit timing is used as configured by the Data Bit Timing and Prescaler Register, MCAN_DBTP. The bit timing is switched back from the data phase timing at the CRC delimiter or when an error is detected, whichever occurs first.

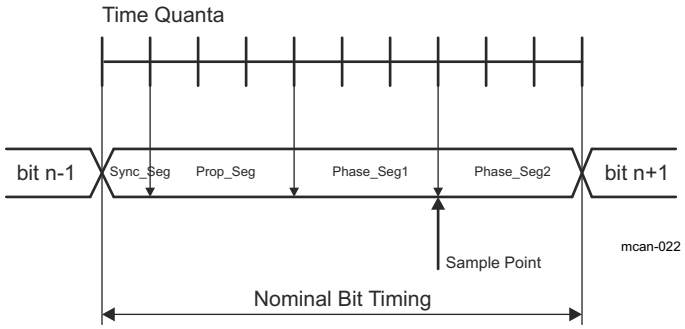

Figure 11-320. CAN Bit Timing

The maximum configurable data phase bit timing depends on the CAN clock frequency (MCAN_FCLK). Example: with MCAN_FCLK = 20 MHz and the shortest configurable bit time of 4 t_q (time quanta), the bit rate in the data phase is 5 Mbit/s.

For CAN FD with or without bit rate switching, the value of the ESI (Error Status Indicator) bit depends on the transmitter's error state (see MCAN_PSR[11] RESI bit) monitored at the start of the transmission. If the transmitter has an error passive flag, the ESI bit is transmitted recessive. Otherwise, it is transmitted dominant.

11.4.3.4.4.4 Transmitter Delay Compensation

11.4.3.4.4.4.1 Description

When only one CAN FD node is transmitting and all others are receivers the length of the bus line has no impact. When transmitting via the MCAN_TX pin, the MCAN module receives the transmitted data from its local

CAN transceiver via the MCAN_RX pin. The received data is delayed. If the transmitter delay is greater than TSEG1 (time segment before sample point), a bit error is detected.

The MCAN module provides a delay compensation mechanism to compensate the transmitter delay. The compensation mechanism enables transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver. Without transmitter delay compensation, the bit rate in the data phase is limited by the transmitter delay.

The mechanism enables configurations where the data bit time is shorter than the transmitter delay (described in detail in ISO 11898-1:2015). The transmitter delay compensation is enabled by setting the MCAN_DBTP[23] TDC bit to 1.

The delayed transmit data is compared against the received data at the Secondary Sample Point (SSP) in order to check for bit errors during the data phase of transmitting nodes. If a bit error is detected, the transmitter will react on this bit error at the next following regular sample point. During the arbitration phase, the delay compensation is always disabled.

The received bit is compared against the transmitted bit at the SSP. The SSP position is defined as the sum of the measured delay from the MCAN's transmit output MCAN_TX pin through the transceiver to the receive input MCAN_RX pin plus the transmitter delay compensation offset configured by the MCAN_TDCR[14:8] TDCO field (see Figure 11-321). The transmitter delay compensation offset is used to adjust the position of the SSP inside the received bit (example: half of the bit time in the data phase). The position of the SSP is rounded down to the next integer number of mtq (minimum time quantum).

The actual transmitter delay compensation value can be checked by reading the MCAN_PSR[22:16] TDCV field. This filed is cleared when the MCAN_CCCR[0] INIT bit is set and is updated at each transmission of CAN FD frame while the MCAN_DBTP[23] TDC bit is set.

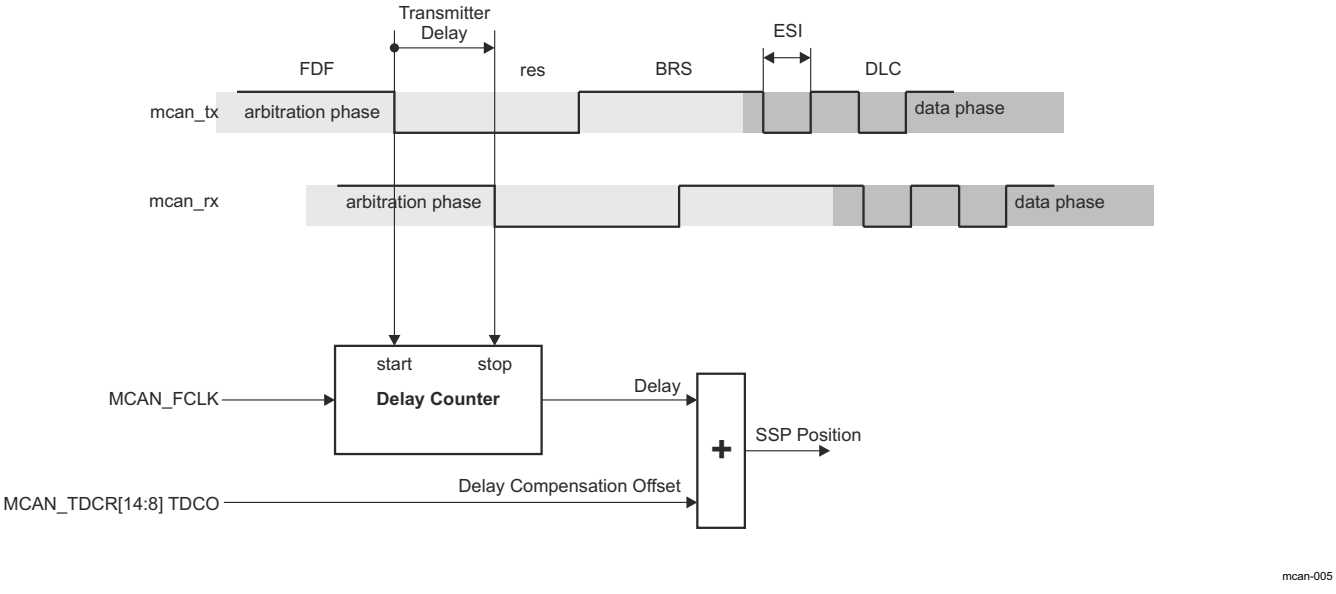

Figure 11-321. Transmitter Delay Measurement

11.4.3.4.4.4.2 Transmitter Delay Compensation Measurement

When transmitter delay compensation is enabled (by programming MCAN_DBTP[23] TDC = 1), the measurement is started within each transmitted CAN FD frame at the falling edge of FDF bit to bit res. The measurement is stopped when this edge is seen at the receive input MCAN_RX pin of the transmitter. The resolution of this measurement is one mtq (see Figure 11-321). The mtq (minimum time quantum) dimension is equal to the CAN clock period (MCAN_FCLK).

The use of a transmitter delay compensation filter window can be enabled by programming MCAN_TDCR[6:0] TDCF field. This filter feature defines a minimum value for the SSP position to avoid the case in which a dominant glitch inside the received FDF bit ends the delay compensation measurement before the falling edge of the received res bit, resulting in an early taken SSP position. Dominant edges on the MCAN_RX pin that would result in an earlier SSP position are ignored for transmitter delay measurement. The measurement is stopped when the SSP position is at least MCAN_TDCR[6:0] TDCF field and the MCAN_RX pin is low.

The following boundary conditions have to be considered:

- The sum of the measured delay from the MCAN_TX pin to the MCAN_RX pin and the configured transmitter delay compensation offset (MCAN_TDCR[14:8] TDCO field) has to be less than 6 bit times in the data phase.
- The sum of the measured delay from the MCAN_TX pin to the MCAN_RX pin and the configured transmitter delay compensation offset (MCAN_TDCR[14:8] TDCO) field has to be less or equal 127 mtq. In case this sum exceeds 127 mtq, the maximum value of 127 mtq is used for transmitter delay compensation.
- The data phase ends at the sample point of the CRC delimiter, that stops checking of receive bits at the SSPs.

11.4.3.4.4.5 Restricted Operation Mode

In Restricted Operation Mode, the CAN node is able to receive data and remote frames and acknowledge valid frames, but it does not send data frames, remote frames, active error frames, or overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The receive and transmit error counters (MCAN_ECR[14:8] REC and MCAN_ECR[7:0] TEC) are frozen while CAN error logging (MCAN_ECR[23:16] CEL) is active. The Host CPU can set the MCAN module into Restricted Operation Mode by setting MCAN_CCCR[2] ASM bit. The bit can only be set by the Host CPU at any time when both MCAN_CCCR[2] CCE and MCAN_CCCR[1] INIT bits are set to 1.

The Restricted Operation Mode is automatically entered when the Tx Handler is not able to read data from the Message RAM in time. To leave Restricted Operation Mode, the Host CPU has to reset MCAN_CCCR[2] ASM bit. This mode can be used in applications that adapt themselves to different CAN bit rates. In this case, the application tests different bit rates and leaves the Restricted Operation Mode after it has received a valid frame.

Note

The Restricted Operation Mode must not be combined with the Loop Back Mode.

11.4.3.4.4.6 Bus Monitoring Mode

Entering Bus Monitoring Mode is done by setting the MCAN_CCCR[5] MON bit to 1. In this mode (see ISO 11898-1:2015, *Bus Monitoring* section), the MCAN module is able to receive valid data and remote frames but cannot start a transmission. The MCAN module sends only recessive bits on the CAN bus. If the MCAN module is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the MCAN module monitors this dominant bit, although the CAN bus may remain in recessive state. In Bus Monitoring Mode, the MCAN_TXBRP register is held in reset state. The Bus Monitoring Mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. Figure 11-322 shows the connection of the MCAN_TX and MCAN_RX signals to the MCAN module in Bus Monitoring Mode.

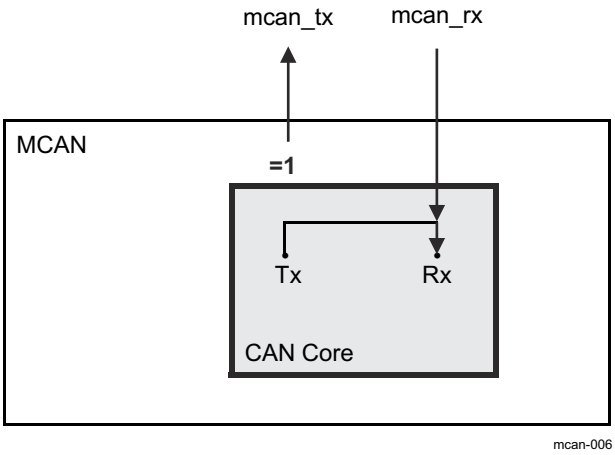

Figure 11-322. Connection of Signals in Bus Monitoring Mode

11.4.3.4.4.7 Disabled Automatic Retransmission (DAR) Mode

According to the CAN Specification (see ISO11898-1:2015, *Recovery Management* section), the MCAN module provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default, automatic retransmission is enabled (see the MCAN_CCCR[6] DAR bit).

11.4.3.4.4.7.1 Frame Transmission in DAR Mode

In DAR mode, all transmissions are automatically cancelled after they started on the CAN bus. A Tx Buffer's Tx Request Pending MCAN_TXBRP TRPx bit is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

Successful transmission:

- Corresponding Tx Buffer Transmission Occurred MCAN_TXBTO TOx bit is set
- Corresponding Tx Buffer Cancellation Finished MCAN_TXBCF CFx bit is not set

Successful transmission in spite of cancellation:

- Corresponding Tx Buffer Transmission Occurred MCAN_TXBTO TOx bit is set
- Corresponding Tx Buffer Cancellation Finished MCAN_TXBCF CFx bit is set

Arbitration lost or frame transmission disturbed:

- Corresponding Tx Buffer Transmission Occurred MCAN_TXBTO TOx bit is not set
- Corresponding Tx Buffer Cancellation Finished MCAN_TXBCF CFx bit is set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx Event FIFO element is written with Event Type ET = 10 (transmission in spite of cancellation).

11.4.3.4.4.8 Power Down (Sleep) Mode

Entering Power Down mode is controlled via the input clock stop request signal (mcanss_clkstp_clkstop_req) or MCAN_CCCR[4] CSR bit. As long as the clock stop request signal is active, the MCAN_CCCR[4] CSR bit is read as 1. When all pending transmission requests have completed, the MCAN module waits until bus idle state is detected. Then the MCAN module sets the MCAN_CCCR[1] INIT to 1 to prevent any further CAN transfers. The MCAN module acknowledges that it is ready for power down by setting the output clock stop acknowledge signal (mcanss_clkstop_clkstop_ack) to 1 and the MCAN_CCCR[3] CSA bit to 1. In this state, before the clocks are switched off, further register accesses can be made except to the MCAN_CCCR[1] INIT bit which is held at one. Now, the module clock inputs MCAN_ICLK and MCAN_FCLK may be switched off.

To leave power down mode, the application has to turn on the module clocks before resetting the input clock stop request signal respectively the MCAN_CCCR[4] CSR flag bit. The MCAN will acknowledge this by

resetting the output clock stop acknowledge signal respectively the MCAN_CCCR[3] CSA flag bit. Afterwards, the application can restart CAN communication by resetting MCAN_CCCR[1] INIT bit.

11.4.3.4.4.8.1 External Clock Stop Mode

The MCAN module supports two external clock stop modes:

- Immediate
- Graceful

In graceful clock stop mode, when the clock stop request is asserted, the MCAN core will respond with clock stop acknowledge when all pending Tx messages have been processed and an Idle line had been detected. The MCAN_CCCR[0] INIT bit will be set, the MCAN core will go and stay Idle.

The automatic wakeup feature is enabled by setting the MCANSS_CTRL[5] AUTOWAKEUP and MCANSS_CTRL[4] WAKEUPREQEN bits to 1 (for more information, see Section 11.4.3.4.4.8.3, *Wakeup request*). When external clock stop request is removed and no suspend request is active, a read-modify-write to the MCAN_CCCR[0] INIT bit is performed to clear it.

11.4.3.4.4.8.2 Suspend Mode

The MCAN module supports two suspend modes:

- Immediate
- Graceful

In graceful suspend mode (see the MCANSS_CTRL[3] FREE and MCANSS_CTRL[2] SOFT bits), when the suspend request is asserted, a clock stop request to the MCAN core is performed. The MCAN core will respond with clock stop acknowledge when all pending Tx messages have been processed and an Idle line had been detected. At that point, the MCAN_CCCR[0] INIT bit will be set, the MCAN core will go and stay Idle. The suspend state can be verified by reading MCAN_CCCR[0] INIT bit.

The automatic wakeup feature is enabled by setting the MCANSS_CTRL[5] AUTOWAKEUP and MCANSS_CTRL[4] WAKEUPREQEN bits to 1 (for more information, see Section 11.4.3.4.4.8.3, *Wakeup request*). When suspend request is removed, if no external clock stop request is active, a read-modify-write to the MCAN_CCCR[0] INIT bit is performed to clear it.

During suspend mode, the auto-clear feature is disabled. The following register fields have an auto-clear feature:

- MCAN_ECR[23:16] CEL
- MCAN_PSR[2:0] LEC
- MCAN_PSR[10:8] DLEC
- MCAN_PSR[11] RESI
- MCAN_PSR[12] RBRS
- MCAN_PSR[13] RFDF
- MCAN_PSR[14] PXE

11.4.3.4.4.8.3 Wakeup Request

Issuing a clock stop request puts the MCAN module into Power Down mode (Sleep Mode). During transition from IDLE to ACTIVE, if the MCANSS_CTRL[5] AUTOWAKEUP and MCANSS_CTRL[4] WAKEUPREQEN bits are enabled, after the MCAN Core respond to the removal of the clock stop request with removing the clock stop acknowledge, a read-modify-write will be issued to clear the MCAN_CCCR[0] INIT bit and the MCAN core will resume operation.

If the MCANSS_CTRL[4] WAKEUPREQEN bit is set, the MCAN module provides a wakeup request (SWakeup) on any of the following wakeup events:

- The receive MCAN_RX pin is dominant (logical 0)
- OCP access is performed

To clear the SWakeup in case any of these events is active, the MCANSS_CTRL[4] WAKEUPREQEN bit should be cleared. The MCAN module adds a third wakeup event source - interrupt line 0 (INT0). In this case the SWakeup is cleared by clearing the interrupt source.

11.4.3.4.4.9 Test Mode

The MCAN_TEST register write access is enabled by setting the test mode enable MCAN_CCCR[7] TEST bit to 1. The MCAN_TEST register allows the configuration of the test modes and test functions.

The CAN transmit MCAN_TX pin has four output functions. One of those functions can be selected by programming the MCAN_TEST[6:5] TX filed. Additionally to its default function (the serial data output) it can drive the CAN Sample Point signal to monitor the MCAN's bit timing and it can drive constant dominant or recessive values.

The actual value of the CAN receive MCAN_RX pin can be monitored from MCAN_TEST[7] RX bit. Both functions can be used to check the CAN bus physical layer. Due to the synchronization mechanism between CAN clock (MCAN_FCLK) and Host clock (MCAN_ICLK) domain, there may be a delay of several Host clock periods between writing to the MCAN_TEST[6:5] TX filed until the new configuration is visible at the output MCAN_TX pin. This applies also when reading input MCAN_RX pin via the MCAN_TEST[7] RX bit.

Note

Test modes should be used for self test only. The software control for MCAN_TX pin interferes with all CAN protocol functions. It is not recommended to use test modes for application.

11.4.3.4.4.9.1 Internal Loop Back Mode

The MCAN module can be set into Internal Loop Back Mode by programming MCAN_TEST[4] LBCK and MCAN_CCCR[5] MON bits to 1. The Internal Loop Back Mode is used for a 'Hot Selftest'. The 'Hot Selftest' allows the MCAN module to be tested without affecting a running CAN system connected to the MCAN_TX and MCAN_RX pins. In this mode MCAN_RX pin is disconnected from the MCAN module and MCAN_TX pin is held recessive. Figure 11-323 shows the connection of the MCAN_TX and MCAN_RX pins to the MCAN module in case of Internal Loop Back Mode.

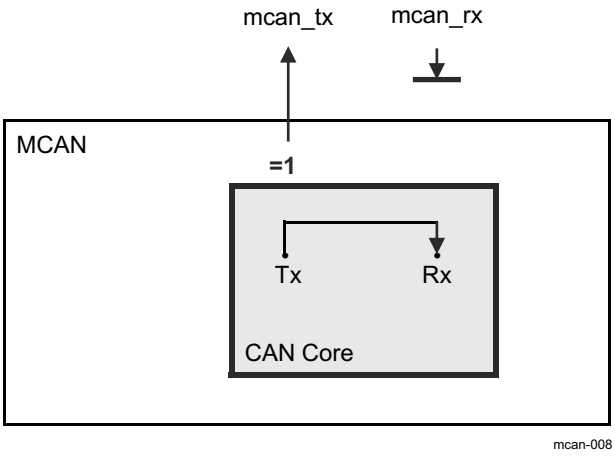

Figure 11-323. Internal Loop Back Mode

11.4.3.4.5 Timestamp Generation

The MCAN module has integrated a 16-bit wrap-around counter for timestamp generation. The timestamp counter prescaler MCAN_TSCC[19:16] TCP field can be configured to clock the counter in multiples of CAN bit times (1-16). The counter is readable via the MCAN_TSCV[15:0] TSC field. A write access to the MCAN_TSCV register resets the counter to zero. When the timestamp counter wraps around the interrupt MCAN_IR[16] TSW flag is set. On start of a frame reception/transmission the counter value is captured and stored into the

timestamp section of an Rx Buffer/Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element. For more information, see Section 11.4.3.4.11, *Message RAM*.

11.4.3.4.5.1 External Timestamp Counter

For CAN FD operation mode the MCAN core requires an External Timestamp Counter. An externally generated 16-bit vector may substitute the integrated 16-bit CAN bit time counter (internal timestamp counter) for receive and transmit timestamp generation. An external 16-bit timestamp counter can be used by programming the MCAN_TSCC[1:0] TSS field.

The External Timestamp Counter uses the interface clock (MCAN_ICLK) as a reference clock. The MCAN Core accepts a 16-bit timestamp. A 24-bit prescaler provides a programmable resolution for the timestamp (see MCANSS_EXT_TS_PRESCALER[23:0] PRESCALER field). When disabled the counter is reset back to zero. While enabled the counter keeps incrementing. When the timestamp rolls over the MCAN_IRQ_TS interrupt is generated. The MCAN module provides both pulse and level interrupt type for this interrupt.

When the timestamp rolls over the MCANSS_IRS register is set (see Figure 11-324). The MCANSS_IE register can be affected by writing to the MCAN_IESS register to set or to the MCANSS_IECS register to clear. The level interrupt is a reflection of both MCANSS_IRS and MCANSS_IE being set. The MCANSS_IES register reflects the level interrupt. When an rollover event occurs the interrupt counter is incremented. Writing to the MCANSS_ICS register to clear the MCANSS_IRS register will also decrement the interrupt counter. Writing to the MCANSS_EOI register will issue another pulse if the interrupt counter is not zero.

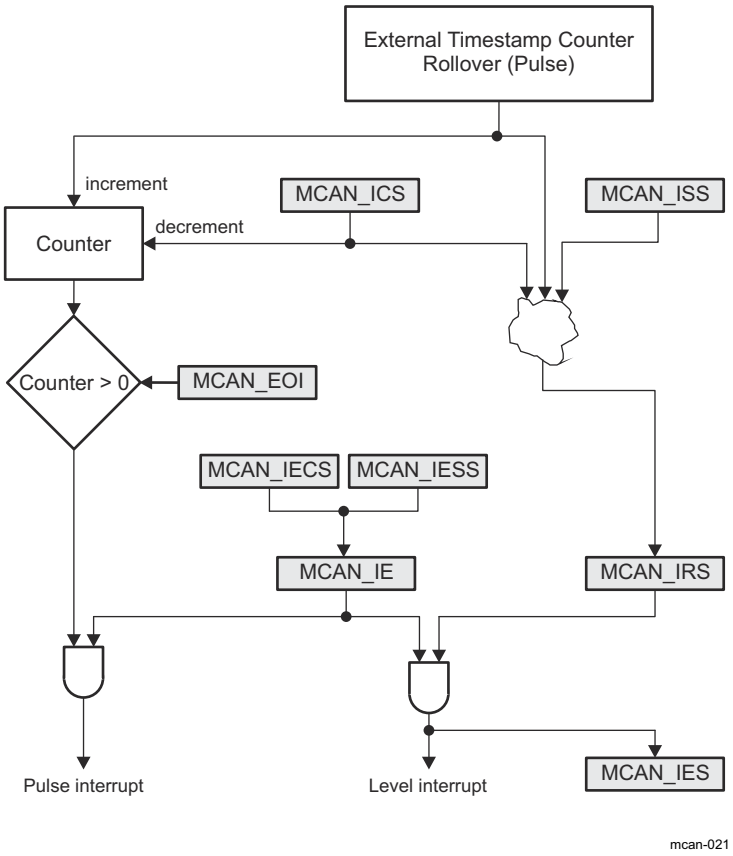

Figure 11-324. External Timestamp Counter Interrupt

11.4.3.4.6 Timeout Counter

The MCAN module has integrated a 16-bit Timeout Counter. It is used to signal timeout conditions for the Rx FIFO 0, Rx FIFO 1, and Tx Event FIFO Message RAM elements. The Timeout Counter is configured via the MCAN_TOCC register. It is enabled via the MCAN_TOCC[0] ETOC bit. The Timeout Counter operates

as down-counter and uses the same prescaler programmed by the MCAN_TSCC[19:16] TCP field as the Timestamp Counter. The actual counter value can be monitored from the MCAN_TOCV[15:0] TOC field. The Timeout Counter can be started only when MCAN_CCCR[1] INIT = 0 and stopped when MCAN_CCCR[1] INIT = 1 (example: when the MCAN enters Bus_Off state). The operation mode is selected by the MCAN_TOCC[2:1] TOS field. When Continuous Mode is selected, the counter starts when MCAN_CCCR[1] INIT = 0, a write to the MCAN_TOCV register presets the counter to the value configured by the MCAN_TOCC[31:16] TOP field and continues down-counting.

In case the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by the MCAN_TOCC[31:16] TOP field. Down-counting is started when the first FIFO element is stored. Writing to the MCAN_TOCV register has no effect. When the counter reaches zero, the interrupt MCAN_IR[18] TOO flag is set.

In Continuous Mode, the counter is immediately restarted at the value configured by the MCAN_TOCC[31:16] TOP field.

11.4.3.4.7 Safety

The Message Memory is wrapped in an ECC wrapper provididing SECDED parity functionalilty. The ECC wrapper is controlled by an ECC Aggregator.

11.4.3.4.7.1 ECC Wrapper

The ECC wrapper provides Single Error Correction (SEC) and Double Error Detection (DED) parity to the Message Memory content. It has side band signals for error notification. The ECC Wrapper implements an error injection test mode.

The error correction is done using a lazy write back. When an error is detected, it is noted in a FIFO Queue which waits for an access gap to write the data back and refresh the memory. If a transaction writes new data to the compromised entry before the lazy write back completes, the write back is discarded.

11.4.3.4.7.2 ECC Aggregator

This section describes the functional details of the ECC Aggregator module.

11.4.3.4.7.2.1 ECC Aggregator Overview

The ECC Aggregator module supports the following general features:

- Provides a mechanism to control and monitor the ECC RAM in the MCAN module.
- Provides software access to all the ECC related registers.
- Supports software readable status of ECC single/double-bit errors and associated info such as RAM address and data bit(s) that are in error.
- Aggregates level pending status from the ECC RAM into a single interrupt to the Host CPU.

The following feature is not supported:

- Statistics such as tracking the number of single and double-bit errors. If needed, these operations can be handled by software.

11.4.3.4.7.2.2 ECC Aggregator Registers

There are 3 groups of registers in the ECC aggregator module:

- Global registers - Aggregator Revision Register (MCANSS_ECC_AGGR_REVISION), ECC Vector Register (MCANSS_ECC_VECTOR), Misc Status Register (MCANSS_ECC_MISC_STATUS), ECC Control Register (MCANSS_ECC_CONTROL), and ECC Wrapper Revision Register (MCANSS_ECC_WRAP_REVISION).
- Control and status registers - ECC Error Control Registers (MCANSS_ECC_ERR_CTRL1 and MCANSS_ECC_ERR_CTRL2) and ECC Error Status Registers (MCANSS_ECC_ERR_STAT1 and MCANSS_ECC_ERR_STAT2).
- Interrupt registers - interrupt status, interrupt enable set, interrupt enable clear and EOI (End Of Interrupt) registers that are part of a standard interrupt module. For more information, see the following registers:
  - MCANSS_ECC_SEC_EOI_REG

- MCANSS_ECC_SEC_STATUS_REG0
- MCANSS_ECC_SEC_ENABLE_SET_REG0
- MCANSS_ECC_SEC_ENABLE_CLR_REG0
- MCANSS_ECC_DED_EOI_REG
- MCANSS_ECC_DED_STATUS_REG0
- MCANSS_ECC_DED_ENABLE_SET_REG0
- MCANSS_ECC_DED_ENABLE_CLR_REG0

11.4.3.4.7.2.3 Reads to ECC Control and Status Registers

The reads to the ECC control and status registers are triggered by writing a 'read message' to the ECC Vector Register as described below:

- Software writes value (the ECC RAM ID) to the MCANSS_ECC_VECTOR[10-0] ECC_VECTOR field to select the ECC RAM for control or status.
- Software writes 1 to the MCANSS_ECC_VECTOR[15] RD_SVBUS bit to trigger a read.
- Software writes read address to the MCANSS_ECC_VECTOR[23-16] RD_SVBUS_ADDRESS field.
- Software then polls the MCANSS_ECC_VECTOR[24] RD_SVBUS_DONE bit to check if it is 1. This bit indicates that the read operation has completed.
- Software reads the data from the ECC control or status register. The following clock cycle (MCAN_ICLK) returns the read data.

11.4.3.4.7.2.4 ECC Interrupts

The ECC aggregator module aggregates the level pending status from the ECC RAM into a single EOI-handshake based interrupt to the Host CPU. Software is expected to follow the sequence described below:

- Software enables the interrupts for the ECC RAM by writing to the MCANSS_ECC_SEC_ENABLE_SET_REG0/MCANSS_ECC_DED_ENABLE_SET_REG0 register.
- Software writes the ECC RAM ID in the MCANSS_ECC_VECTOR[10-0] ECC_VECTOR.
- Software writes the MCANSS_ECC_VECTOR[15] RD_SVBUS bit to trigger the read.
- Software writes the MCANSS_ECC_ERR_STAT1 register address to the MCANSS_ECC_VECTOR[23-16] RD_SVBUS_ADDRESS field. Software will need to load the 'read message' in the MCANSS_ECC_VECTOR register again if it needs to read the MCANSS_ECC_ERR_STAT2 register.
- Software polls the MCANSS_ECC_VECTOR[24] RD_SVBUS_DONE bit. When this bit is set, a read of the MCANSS_ECC_ERR_STAT1/MCANSS_ECC_ERR_STAT2 register is performed.
- After the interrupt has been serviced, software will clear the interrupt status by writing to the MCANSS_ECC_ERR_STAT1[8] CLR_ECC_SEC or MCANSS_ECC_ERR_STAT1[9] CLR_ECC_DED bit depending on the type of the ECC error.
- Software has to poll the MCANSS_ECC_ERR_STAT1 register to guarantee that the status bit has been cleared.
- Software will write to the MCANSS_ECC_SEC_EOI_REG/MCANSS_ECC_DED_EOI_REG register to clear the interrupt.
- After clearing the ECC interrupt source, the application software must also write 1 to the MCANSS_ECC_EOI[8] ECC_EOI bit.

11.4.3.4.8 Rx Handling

The Rx Handler controls the following operations:

- Acceptance filtering
- The transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs (Rx FIFO 0 or Rx FIFO 1)
- Rx FIFO Put and Get Index operations

11.4.3.4.8.1 Acceptance Filtering

The MCAN module is capable to configure two sets of acceptance filters - one set for standard and one set for extended identifiers. These filters can be assigned to an Rx Buffer or to one of the two Rx FIFOs.

The main features of the filter elements are:

- Each filter element can be configured as:
  - Range Filter (from - to)
  - Filter for specific IDs (for one or two dedicated IDs)
  - Classic Bit Mask Filter
- Each filter element can be enabled/disabled individually
- Each filter element can be configured for acceptance or rejection filtering
- Filters are checked sequentially and execution (acceptance filtering procedure) stops at the first matching filter element or when the end of the filter list is reached

Related configuration registers are:

- Global Filter Configuration (MCAN_GFC) register
- Standard ID Filter Configuration (MCAN_SIDFC) register
- Extended ID Filter Configuration (MCAN_XIDFC) register
- Extended ID AND Mask (MCAN_XIDAM) register

Depending on the configuration of the filter element (see SFEC/EFEC in Section 11.4.3.4.11, *Message RAM*) if filter matches, one of the following actions is performed:

- Received frame is stored in FIFO 0 or FIFO 1
- Received frame is stored in Rx Buffer
- Received frame is stored in Rx Buffer and generation of pulse at filter event pin is performed. This is high level single MCAN_ICLK pulse. For more information, see Section 11.4.3.4.2.1, *DMA Requests*.
- Received frame is rejected
- Set High Priority Message interrupt flag MCAN_IR[8] HPM
- Set High Priority Message interrupt flag MCAN_IR[8] HPM and store received frame in FIFO 0 or FIFO 1

Acceptance filtering starts when complete Message ID is received. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If a filter element matches - the Rx Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If an error condition occurs (for example: CRC error), this message is rejected with the following impact on the affected Rx Buffer or Rx FIFO:

- Rx Buffer:
  New Data flag (MCAN_NDAT1/MCAN_NDAT2) of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data (for error type see MCAN_PSR[2:0] LEC respectively MCAN_PSR[10:8] DLEC fields).
- Rx FIFO:
  Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data (for error type see MCAN_PSR[2:0] LEC respectively MCAN_PSR[10:8] DLEC fields). If matching Rx FIFO is configured to operate in overwrite mode, the boundary conditions described in Section 11.4.3.4.8.2.2 have to be considered.

11.4.3.4.8.1.1 Range Filter

Each filter element can be configured to operate as Range Filter (Standard Filter Type SFT = 00/Extended Filter Type EFT = 00). The filter matches for all received message frames with IDs in the range from SFID1 to SFID2 (SFID2 ≥ SFID1) respectively in the range from EFID1 to EFID2 (EFID2 ≥ EFID1). For more information see Section 11.4.3.4.11.5, *Standard Message ID Filter Element* and Section 11.4.3.4.11.6, *Extended Message ID Filter Element*.

There are two options for range filtering of extended frames:

- Extended Filter Type EFT = 00: The Extended ID AND Mask (MCAN_XIDAM) is used for Range Filtering. The Message ID of received frames is ANDed with the Extended ID AND Mask (MCAN_XIDAM) before the range filter is applied.
- Extended Filter Type EFT = 11: The Extended ID AND Mask (MCAN_XIDAM) is not used for Range Filtering.

11.4.3.4.8.1.2 Filter for specific IDs

Each filter element can be configured to filter one or two dedicated Message IDs (Standard Filter Type SFT =01/ Extended Filter Type EFT =01). To filter only one specific Message ID, the filter element has to be configured with SFID1 = SFID2 respectively EFID1 = EFID2. For more information see Section 11.4.3.4.11.5, *Standard Message ID Filter Element* and Section 11.4.3.4.11.6, *Extended Message ID Filter Element*.

11.4.3.4.8.1.3 Classic Bit Mask Filter

Classic bit mask filtering can filter groups of Message IDs (Standard Filter Type SFT =10/Extended Filter Type EFT =10). This is done by masking single bits of a received Message ID. In this case SFID1/EFID1 element is used as Message ID filter, while SFID2/EFID2 element is used as filter mask.

A 0 bit at the filter mask (SFID2/EFID2) will mask out the corresponding bit position of the configured Message ID filter (SFID1/EFID1) and the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are 1 are relevant for acceptance filtering.

There are two interesting cases:

- All mask bits are 1: a match occurs only when the received Message ID and the configured Message ID filter are identical.
- All mask bits are 0: all Message IDs match.

11.4.3.4.8.1.4 Standard Message ID Filtering

The standard Message ID (11-bit ID) filtering flow is shown in Figure 11-325. Section 11.4.3.4.11.5, *Standard Message ID Filter Element* describes the standard Message ID filter element.

The Remote Transmission Request (RTR) and Extended Identifier (XTD) bits of the received frames are compared against the list of configured filter elements. This is controlled by the following registers:

- Global Filter Configuration (MCAN_GFC) register
- Standard ID Filter Configuration (MCAN_SIDFC) register

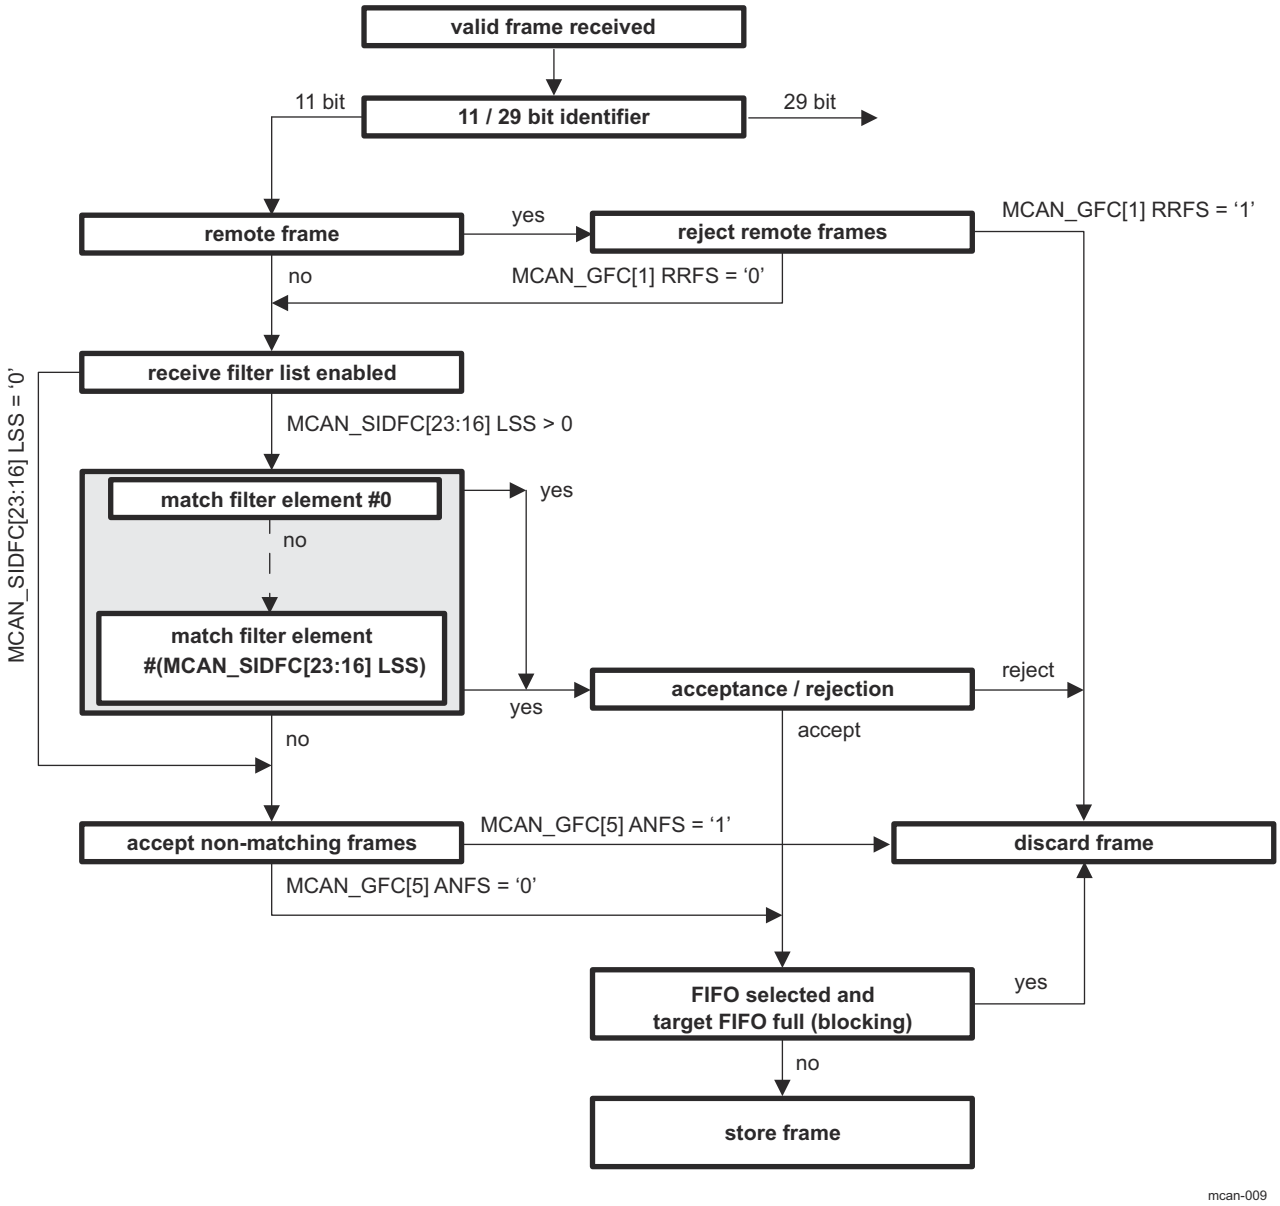

Figure 11-325. Standard Message ID Filter Path

11.4.3.4.8.1.5 Extended Message ID Filtering

The extended Message ID (29-bit ID) filtering flow is shown in Figure 11-326. Section 11.4.3.4.11.6, *Extended Message ID Filter Element* describes the extended Message ID filter element.

The Remote Transmission Request (RTR) and Extended Identifier (XTD) bits of the received frames are compared against the list of configured filter elements. This is controlled by the following registers:

- Global Filter Configuration (MCAN_GFC) register
- Extended ID Filter Configuration (MCAN_XIDFC) register

Note that before the filter list is executed the received identifier is ANDed with the Extended ID AND Mask (MCAN_XIDAM).

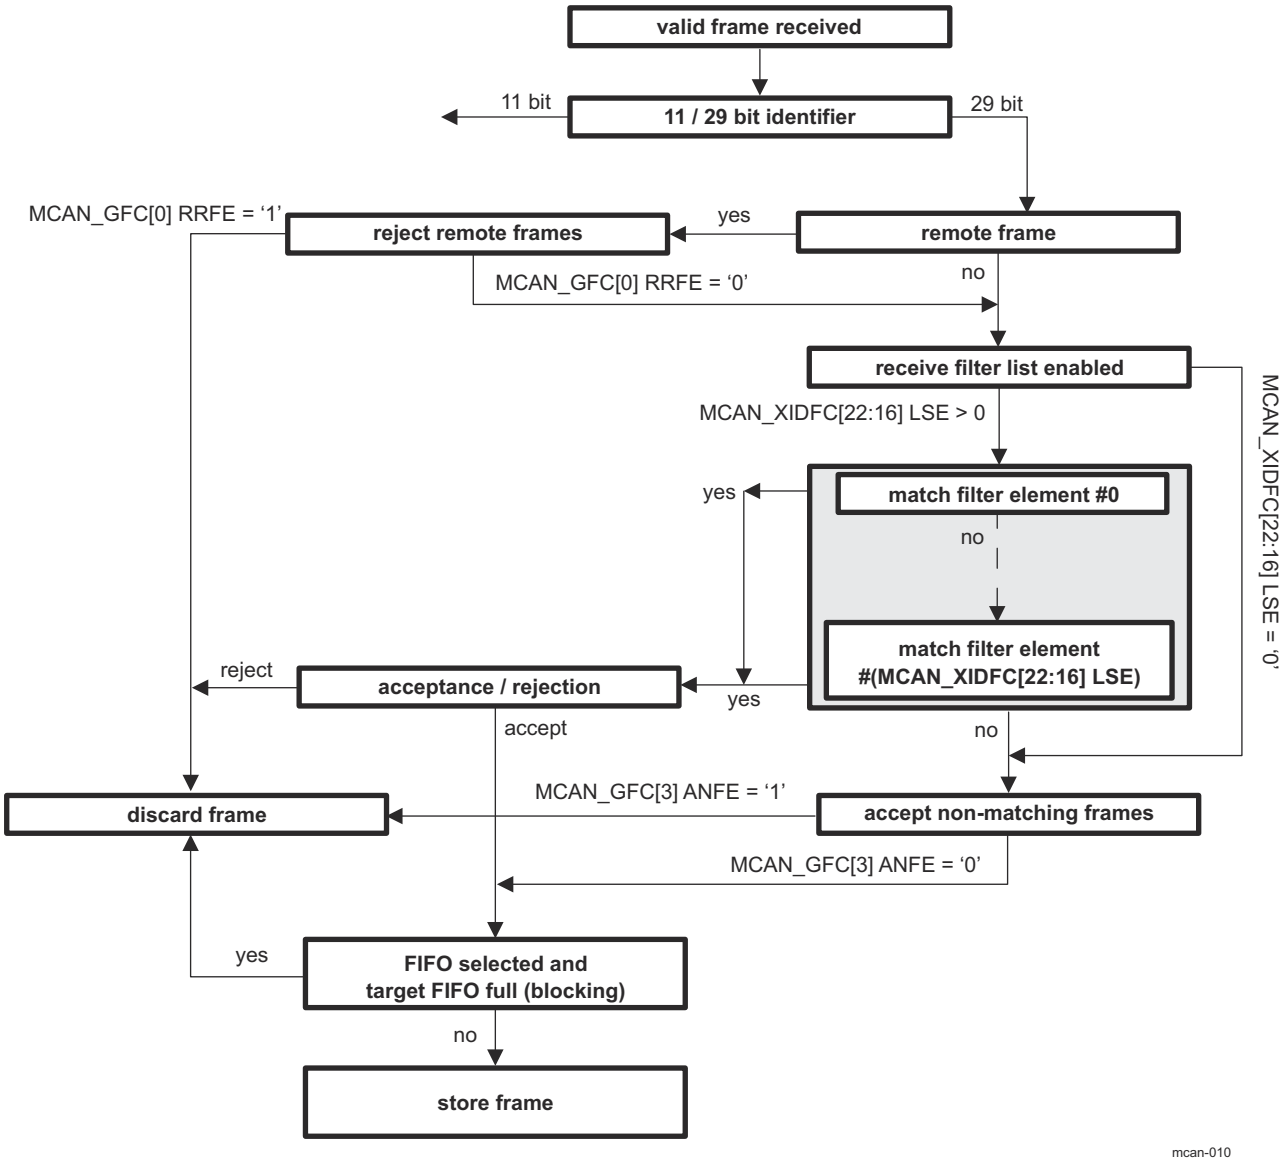

Figure 11-326. Extended Message ID Filter Path

11.4.3.4.8.2 Rx FIFOs

The configuration of the Rx FIFOs (Rx FIFO 0 and Rx FIFO 1) can be done via the MCAN_RXF0C and MCAN_RXF1C registers. Each Rx FIFO can be configured to store up to 64 received messages.

After acceptance filtering the received messages that passed are transferred to the Rx FIFO. The filter mechanisms available for the Rx FIFO 0 and Rx FIFO 1 is described in Section 11.4.3.4.8.1, *Acceptance Filtering*. Section 11.4.3.4.11.2, *Rx Buffer and FIFO Element* describes the Rx FIFO element.

The Rx FIFO watermark can be used to prevent an Rx FIFO overflow. If the Rx FIFO fill level reaches the Rx FIFO watermark configured by the MCAN_RXFnC[30:24] FnWM filed (where: n = 0 or 1) an interrupt flag MCAN_IR[1] RF0W/MCAN_IR[5] RF1W is set.

When the Rx FIFO Put Index reaches the Rx FIFO Get Index (MCAN_RXFnS[21:16] FnPI = MCAN_RXFnS[13:8] FnGI) an Rx FIFO Full condition is signalled by the MCAN_RXFnS[24] FnF status bit and interrupt flag MCAN_IR[2] RF0F/MCAN_IR[6] RF1F is set. Figure 11-327 shows Rx FIFO Status. The FIFOs fill level is presented in the MCAN_RXFnS[6:0] FnFL field (the number of elements stored in Rx FIFO).

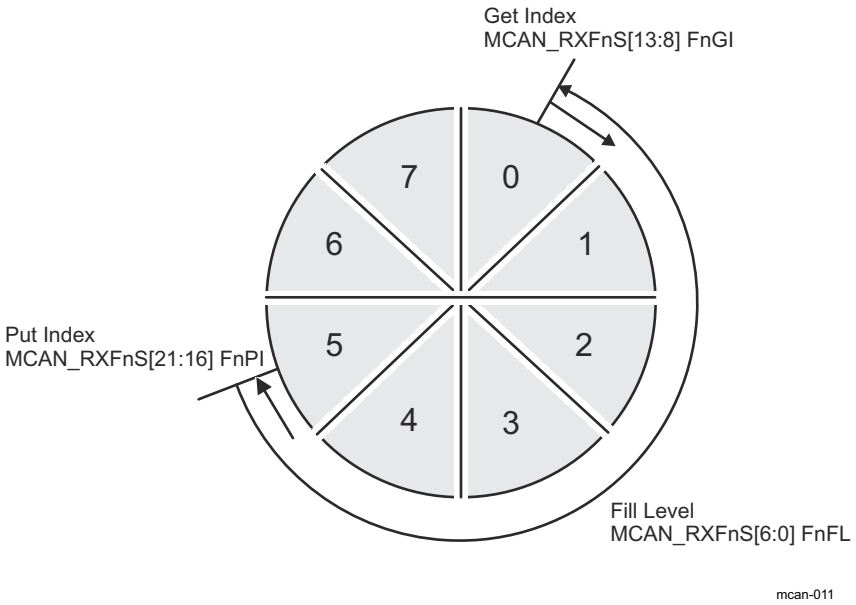

Figure 11-327. Rx FIFO Status

Rx FIFOs start address in the Message RAM (MCAN_RXFnC[15:2]FnSA field) have to be configured when reading from an Rx FIFO (Rx FIFO Get Index - MCAN_RXFnS[13:8] FnGI). Table 11-1466 presents Rx Buffer/Rx FIFO Element Size for different Rx Buffer / Rx FIFO Data Field Size which is configured via the MCAN_RXESC register.

Table 11-1466. Rx Buffer/Rx FIFO Element Size

MCAN_RXESC[10:8] RBDS MCAN_RXESC[2:0] F0DS/ MCAN_RXESC[6:4] F1DS	Data Field [bytes]	FIFO Element Size [RAM words]
000	8	4
001	12	5
010	16	6
011	20	7
100	24	8
101	32	10
110	48	14
111	64	18

11.4.3.4.8.2.1 Rx FIFO Blocking Mode

The Rx FIFO blocking mode is the default operation mode for the Rx FIFOs. It is configured by the MCAN_RXFnC[31] FnOM = 0.

If an Rx FIFO full condition is reached (MCAN_RXFnS[21:16] FnPI = MCAN_RXFnS[13:8] FnGI), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by the MCAN_RXFnS[24] FnF = 1 and interrupt flag MCAN_IR[2] RF0F/MCAN_IR[6] RF1F is set.

In case a message is received while the corresponding Rx FIFO is full, this message is rejected and the message lost condition is signalled by MCAN_RXFnS[25] RFnL = 1 and interrupt flag MCAN_IR[3] RFnL/ MCAN_IR[25] RFnL is set.

11.4.3.4.8.2.2 Rx FIFO Overwrite Mode

The Rx FIFO overwrite mode is configured by the MCAN_RXFnC[31] FnOM = 1. When an Rx FIFO full condition is reached (MCAN_RXFnS[21:16] FnPI = MCAN_RXFnS[13:8] FnGI) signalled by MCAN_RXFnS[24] FnF = 1, the next accepted message for the FIFO will overwrite the oldest FIFO message. Put index/Get index are both incremented by one.

In overwrite mode if an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (Put index) while the Host CPU is reading from the Message RAM (Get index). In this case inconsistent data may be read from the respective Rx FIFO element. The problem is solved by adding an offset to the Get index when reading from the Rx FIFO. The offset depends on how fast the Host CPU accesses the Rx FIFO. Figure 11-328 shows an offset of two with respect to the Get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

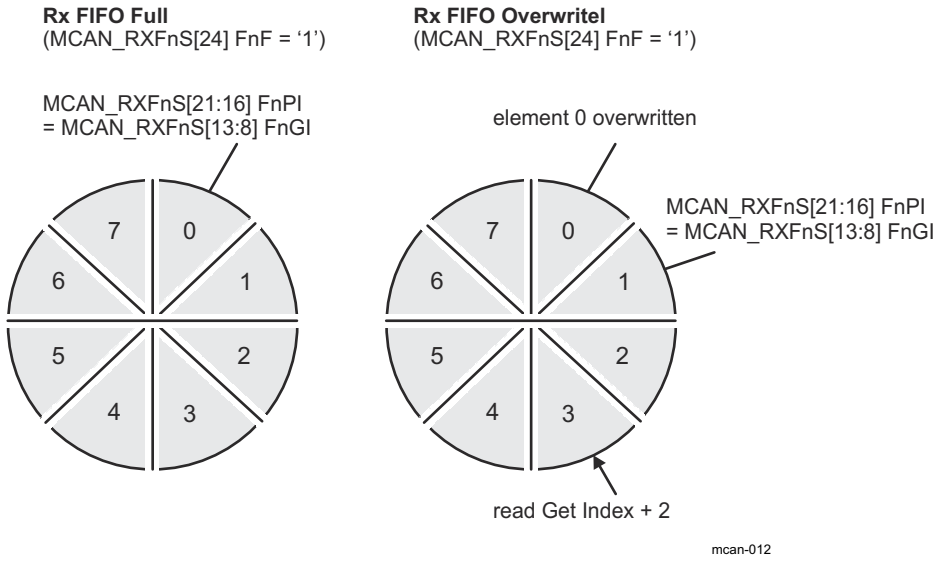

Figure 11-328. Rx FIFO Overflow Handling

After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index MCAN_RXFnA[5:0] FnAI. This increments the get index to that element number. In case the Put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (MCAN_RXFnS[24] FnF = 0).

11.4.3.4.8.3 Dedicated Rx Buffers

The MCAN supports up to 64 dedicated Rx Buffers. The start address of the Rx Buffers section in the Message RAM is configured via MCAN_RXBC[15:2] RBSA field. To store in an Rx Buffer a Standard or Extended Message ID Filter Element with SFEC/EFEC = 111 and SFID2/EFID2[10:9] = 00 has to be configured (see Section 11.4.3.4.11.5, *Standard Message ID Filter Element* and Section 11.4.3.4.11.6, *Extended Message ID Filter Element*).

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element (the format is the same as for an Rx FIFO element). In addition the flag MCAN_IR[19] DRX (Message stored in Dedicated Rx Buffer) is set.

Table 11-1467 shows Example Filter Configuration for Rx Buffers.

Table 11-1467. Example Filter Configuration for Rx Buffers

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID message 1	00	00 0000

Table 11-1467. Example Filter Configuration for Rx Buffers (continued)

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
1	ID message 2	00	00 0001
2	ID message 3	00	00 0010

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in register MCAN_NDAT1/MCAN_NDAT2 is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the Host CPU by writing a 1 to the respective bit position.

While an Rx Buffer's New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

11.4.3.4.8.3.1 Rx Buffer Handling

Rx Buffer Handling include the following steps:

- Reset interrupt flag MCAN_IR[19] DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

11.4.3.4.9 Tx Handling

The Tx Handler is used to handle the Tx requests. It controls the transfer of transmit messages from the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue to the CAN Core, the Tx Event FIFO, and the Put and Get Index operations. The MCAN module supports up to 32 Tx Buffers. These Tx Buffers can be configured as dedicated Tx Buffers, Tx FIFO, or Tx Queue and as combination of dedicated Tx Buffers/Tx FIFO or dedicated Tx Buffers/Tx Queue. For each Tx Buffer element Classical CAN or CAN FD transmission mode can be configured. Section 11.4.3.4.11.3 describes the Tx Buffer Element. Table 11-1468 shows the possible configurations for message transmission.

Table 11-1468. Possible Configurations for Message Transmission

MCAN_CCCR		Tx Buffer Element		Frame Transmission
MCAN_CCCR[9] BRSE	MCAN_CCCR[8] FDOE	FDF	BRS	
ignored	0	ignored	ignored	Classic CAN
0	1	0	ignored	Classic CAN
0	1	1	ignored	CAN FD without bit rate switching
1	1	0	ignored	Classic CAN
1	1	1	0	CAN FD without bit rate switching
1	1	1	1	CAN FD with bit rate switching

When the Tx Buffer Request Pending MCAN_TXBRP register is updated, or when a transmission has been started the Tx Handler starts scanning to check for the highest priority pending Tx request. The Tx Buffer with lowest Message ID has highest priority.

Note

AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation.

11.4.3.4.9.1 Transmit Pause

The transmit pause feature is intended for use in CAN networks where the CAN Message IDs are specific and cannot easily be changed. These Message IDs may have a higher priority than other defined Message IDs, while in a specific application their relative priority should be inverse. This allows for a case where one ECU sends a burst of CAN messages that cause another ECU's CAN messages to be delayed (paused).

The transmit pause feature is enabled by the MCAN_CCCR[14] TXP bit. By default this bit is disabled (MCAN_CCCR[14] TXP = 0). Each time after successfully transmitted message, a pause for two CAN bit times occurs before the start of the next transmission. This allows the other CAN nodes in the network to transmit messages even if their Message IDs have lower priority.

11.4.3.4.9.2 Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the Host CPU.

There are two options:

- Each dedicated Tx Buffer is configured with a specific Message ID.
- Two or more dedicated Tx Buffers are configured with the same Message ID. In this case the Tx Buffer with the lowest buffer number is transmitted first.

After the data section has been updated, a transmission is requested by an Add Request. This is done via the MCAN_TXBAR[x]ARn bit (where x = 0 - 31). The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

Table 11-1469 shows Tx Buffer/Tx FIFO/Tx Queue Element Size. A Dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM. The start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index from 0 to 31 (MCAN_TXFQS[20:16] TFQPI) × Element Size to the Tx Buffer Start Address MCAN_TXBC[15:2] TBSA field.

Table 11-1469. Tx Buffer/Tx FIFO/Tx Queue Element Size

MCAN_TXESC[2:0] TBDS	Data Field [bytes]	Element Size [RAM words]
000	8	4
001	12	5
010	16	6
011	20	7
100	24	8
101	32	10
110	48	14
111	64	18

11.4.3.4.9.3 Tx FIFO

Tx FIFO mode is configured by setting bit MCAN_TXBC[30] TFQM = 0. The stored in the Tx FIFO messages are transmitted starting with the message referenced by the Get Index MCAN_TXFQS[12:8] TFGI field. After each transmission the Get Index is incremented until the Tx FIFO is empty. The Tx FIFO Free Level MCAN_TXFQS[5:0] TFFL field indicates the number of the available free Tx FIFO elements. The Tx FIFO allows transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MCAN_TXFQS[20:16] TFQPI field. After each Add Request (MCAN_TXBAR[x] ARn = 1) the Put Index is incemented to the next free Tx FIFO element. When the Put Index reaches the Get Index (MCAN_TXFQS[20:16] TFQPI = MCAN_TXFQS[12:8] TFGI), Tx FIFO Full condition is signalled by bit MCAN_TXFQS[21] TFQF = 1. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level MCAN_TXFQS[5:0] TFFL field.

In case a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level MCAN_TXFQS[5:0] TFFL field is recalculated. In case transmission cancellation is applied to any other Tx Buffer - the Get Index and the FIFO Free Level remain unchanged.

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see Table 11-1469). The start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/Queue Put Index MCAN_TXFQS[20:16] TFQPI (from 0 to 31) × Element Size to the Tx Buffer Start Address MCAN_TXBC[15:2] TBSA field.

11.4.3.4.9.4 Tx Queue

Tx Queue mode is configured by setting bit MCAN_TXBC[30] TFQM = 1. The stored in the Tx Queue messages are transmitted starting with the highest priority message (lowest Message ID). In case two or more Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MCAN_TXFQS[20:16] TFQPI field. Each Add Request cyclically increments the Put Index to the next free Tx Buffer. In case of Tx Queue Full condition (MCAN_TXFQS[21] TFQF = 1), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use the MCAN_TXBRP register instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see Table 11-1469). The start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index MCAN_TXFQS[20:16] TFQPI (from 0 to 31) × Element Size to the Tx Buffer Start Address MCAN_TXBC[15:2] TBSA field.

11.4.3.4.9.5 Mixed Dedicated Tx Buffers/Tx FIFO

For this combination the Tx Buffers section in the Message RAM is separated in two parts:

- Dedicated Tx Buffers: the number of Dedicated Tx Buffers is configured by the MCAN_TXBC[21:16] NDTB field
- Tx FIFO: the number of Tx Buffers assigned to the Tx FIFO is configured by the MCAN_TXBC[29:24] TFQS field

If the MCAN_TXBC[29:24] TFQS field is empty (zero) - only Dedicated Tx Buffers are used.

Tx prioritization:

- Scan Dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by the MCAN_TXFQS[12:8] TFGI field)
- Buffer with lowest Message ID gets highest priority and is transmitted next

Figure 11-329 shows Mixed Dedicated Tx Buffers/Tx FIFO example.

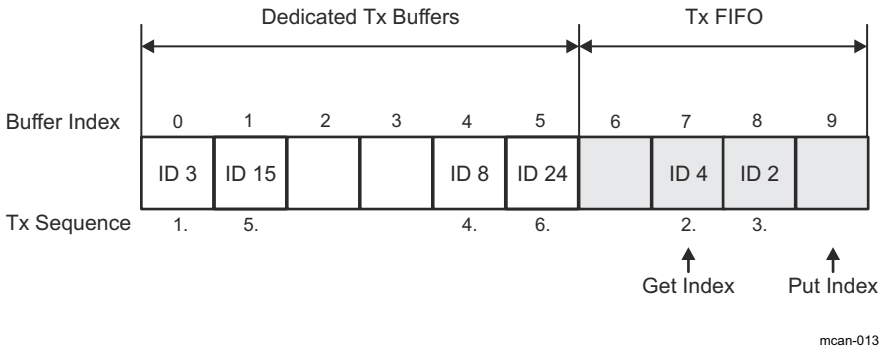

Figure 11-329. Mixed Dedicated Tx Buffers /Tx FIFO (example)

11.4.3.4.9.6 Mixed Dedicated Tx Buffers/Tx Queue

For this combination the Tx Buffers section in the Message RAM is separated in two parts:

- Dedicated Tx Buffers: the number of Dedicated Tx Buffers is configured by the MCAN_TXBC[21:16] NDTB field
- Tx Queue: the number of Tx Buffers assigned to the Tx Queue is configured by the MCAN_TXBC[29:24] TFQS field

If MCAN_TXBC[29:24] TFQS field is empty (zero) - only Dedicated Tx Buffers are used.

Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

Figure 11-330 shows Mixed Dedicated Tx Buffers/Tx Queue example.

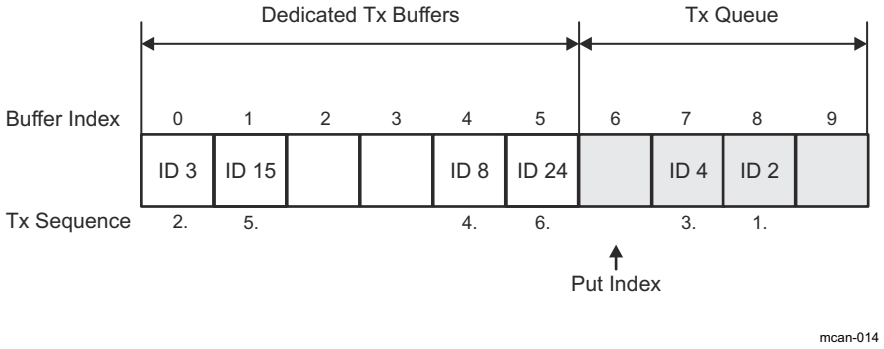

Figure 11-330. Mixed Dedicated Tx Buffers /Tx Queue (example)

11.4.3.4.9.7 Transmit Cancellation

This feature is especially intended for gateway and AUTOSAR based applications. The Host CPU can cancel a requested transmission from a dedicated Tx Buffer or a Tx Queue Buffer by setting bit MCAN_TXBCR[n] CRn = 1 (where n = 0 - 31). The corresponding bit position n is equivalent to the number of the Tx Buffer.

Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of the MCAN_TXBCF register (MCAN_TXBCF[n] CFn = 1).

If transmission from a Tx Buffer is already ongoing and a transmit cancellation is requested, the corresponding MCAN_TXBRP[n] TRPn bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MCAN_TXBTO[n] TOn and MCAN_TXBCF[n] CFn bits are set. If the transmission was not successful, only the corresponding bit MCAN_TXBCF[n] CFn = 1.

Note

If pending transmission is cancelled immediately before this transmission could have been started, a short time window occurs where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

11.4.3.4.9.8 Tx Event Handling

To support Tx Event Handling the Message RAM has implemented a Tx Event FIFO section. Up to 32 Tx Event FIFO elements can be configured. Section 11.4.3.4.11.4 describes the Tx Event FIFO element. After message transmission on the CAN bus, Message ID and Timestamp are stored in a Tx Event FIFO element. To link a Tx Event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

A Tx Event FIFO full condition is signalled by the MCAN_IR[14] TEFF bit. In this case no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented (MCAN_TXEFS[12:8] EFGI). In case a Tx Event occurs while the Tx Event FIFO is full, this event is rejected and interrupt flag MCAN_IR[15] TEFL bit is set.

The Tx Event FIFO watermark can be configured to avoid a Tx Event FIFO overflow. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by the MCAN_TXEFC[29:24] EFWM field, interrupt flag MCAN_IR[13] TEFW is set. When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MCAN_TXEFS[12:8] EFGI field has to be added to the Tx Event FIFO start address MCAN_TXEFC[15:2] EFSA field.

11.4.3.4.10 FIFO Acknowledge Handling

The Get Indices of the two Rx FIFOs (Rx FIFO 0 or Rx FIFO 1) and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index (see MCAN_RXF0A, MCAN_RXF1A, and MCAN_TXEFA). Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus one and thereby updates the FIFO Fill Level.

There are two use cases:

- A single element has been read from the FIFO: the Get Index value is written to the FIFO Acknowledge Index.
- A sequence of elements has been read from the FIFO: the Get Index value (Index of the last element read) is written to the FIFO Acknowledge Index at the end of that read sequence.

The Host CPU has free access to the Message RAM. The special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This can be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also changes the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

Note

The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The MCAN module does not check for erroneous values.

11.4.3.4.11 Message RAM

The MCAN module has implemented Message RAM. The main purpose of the Message RAM is to store:

- Receive Messages
- Transmit Messages
- Tx Event Elements
- Message ID Filter Elements

11.4.3.4.11.1 Message RAM Configuration

The MCAN module is configured to allocate 4352 words in the Message RAM. The Message RAM has a width of 32 bits.

Refer :Section 3.1 for the address range of the Message RAM.

The Message RAM is capable to include each of the sections listed in Figure 11-331. It is not necessary to configure each of the sections (a section in the Message RAM may be 0) and there is not restriction with respect to the sequence of the sections. For parity checking or ECC a respective number of bits has to be added to each word.

When the MCAN module addresses the Message RAM it addresses 32-bit words. The start addresses are configurable and they are 32-bit word addresses.

The element size can be configured for

- Rx FIFO 0 via the MCAN_RXESC[2:0] F0DS field
- Rx FIFO 1 via the MCAN_RXESC[6:4] F1DS field
- Rx Buffers via the MCAN_RXESC[10:8] RBDS field
- Tx Buffers via the MCAN_TXESC[2:0] TBDS field

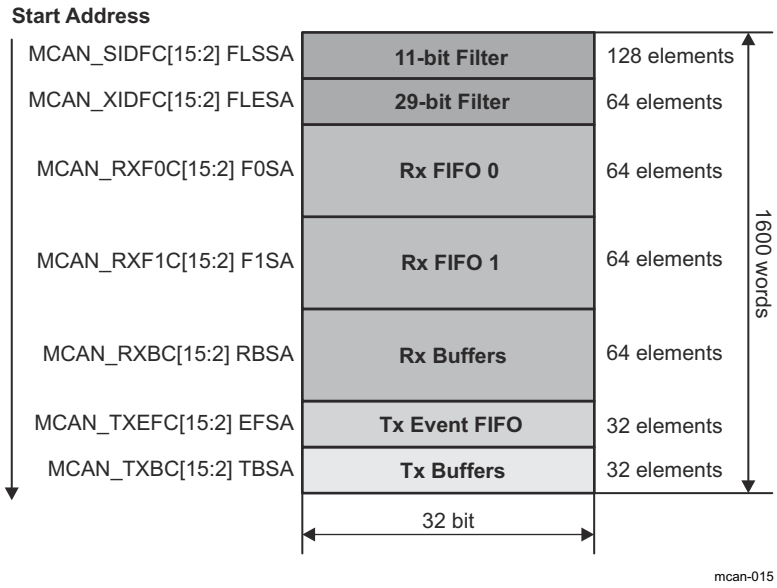

Figure 11-331. Message RAM Configuration

The Host CPU configures the following information in the Message RAM:

- Start addresses of the memory sections
- Number of elements in each section
- The size of the elements in some sections

Note

Above image is meant to allocate memory for 4352 words (max supported).

The MCAN module does not check for errors in the Message RAM configuration. The configuration of the start addresses of the different sections and the number of elements of each section has to be done carefully. This will prevent falsification or loss of data.

11.4.3.4.11.2 Rx Buffer and FIFO Element

Up to 64 Rx Buffers and two Rx FIFOs can be configured in the Message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via the MCAN_RXESC register.

Figure 11-332 shows Rx Buffer/Rx FIFO element structure.

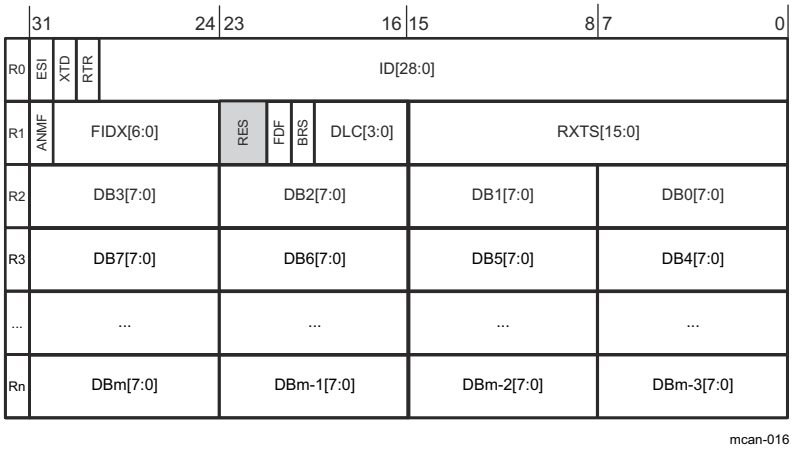

Figure 11-332. Rx Buffer/Rx FIFO Element Structure

Table 11-1470 shows Rx Buffer/Rx FIFO element field descriptions.

Table 11-1470. Rx Buffer/Rx FIFO Element Field Descriptions

Word	Bits	Field Name	Description
R0	31	ESI	Error State Indicator • 0x0: Transmitting node is error active • 0x1: Transmitting node is error passive
	30	XTD	Extended Identifier Signals to the Host CPU whether the received frame has a standard or extended identifier. • 0x0: 11-bit standard identifier • 0x1: 29-bit extended identifier
	29	RTR	Remote Transmission Request Signals to the Host CPU whether the received frame is a data frame or a remote frame. • 0x0: Received frame is a data frame • 0x1: Received frame is a remote frame **Note:** There are no remote frames in CAN FD format. In case a CAN FD frame was received (FDF = 1), RTR bit reflects the state of the reserved r1 bit (RES[23]).
	28:0	ID[28:0]	Identifier Standard or extended identifier depending on XTD bit. A standard identifier is stored into ID[28:18].

Table 11-1470. Rx Buffer/Rx FIFO Element Field Descriptions (continued)

Word	Bits	Field Name	Description
R1	31	ANMF	Accepted Non-matching Frame Acceptance of non-matching frames may be enabled via the MCAN_GFC[5:4] ANFS and MCAN_GFC[3:2] ANFE fields. • 0x0: Received frame matching filter index FIDX field • 0x1: Received frame did not match any Rx filter element
	30:24	FIDX[6:0]	Filter Index 0x0-0x7F (0-127): Index of matching Rx acceptance filter element (invalid if ANMF = 1). Range is 0 to MCAN_SIDFC[23:16] LSS - 1 respectively MCAN_XIDFC[22:16] LSE - 1.
	23:22	RES	Reserved
	21	FDF	FD Format • 0x0: Standard frame format • 0x1: CAN FD frame format (new DLC-coding and CRC)
	20	BRS	Bit Rate Switch • 0x0: Frame received without bit rate switching • 0x1: Frame received with bit rate switching
	19:16	DLC[3:0]	Data Length Code • 0x0-0x8 (0-8): CAN + CAN FD: received frame has 0-8 data bytes • 0x9-0xF (9-15): CAN: received frame has 8 data bytes • 0x9-0xF (9-15): CAN FD: received frame has 12/16/20/24/32/48/64 data bytes
	15:0	RXTS[15:0]	Rx Timestamp Timestamp Counter value captured on start of frame reception. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN_TSCC[19:16] TCP.
R2	31:24	DB3[7:0]	Data Byte 3
	23:16	DB2[7:0]	Data Byte 2
	15:8	DB1[7:0]	Data Byte 1
	7:0	DB0[7:0]	Data Byte 0
R3	31:24	DB7[7:0]	Data Byte 7
	23:16	DB6[7:0]	Data Byte 6
	15:8	DB5[7:0]	Data Byte 5
	7:0	DB4[7:0]	Data Byte 4
...	...	...	...
Rn	31:24	DBm[7:0]	Data Byte m
	23:16	DBm-1[7:0]	Data Byte m-1
	15:8	DBm-2[7:0]	Data Byte m-2
	7:0	DBm-3[7:0]	Data Byte m-3

Note: Depending on the configuration of the element size (MCAN_RXESC), between two and sixteen 32-bit words (Rn = 3-17) are used for storage of a CAN message's data field.

11.4.3.4.11.3 Tx Buffer Element

The Tx Buffers section can be configured to hold dedicated Tx Buffers as well as a Tx FIFO/Tx Queue. In case that the Tx Buffers section is shared by dedicated Tx buffers and a Tx FIFO/Tx Queue, the dedicated Tx Buffers start at the beginning of the Tx Buffers section followed by the buffers assigned to the Tx FIFO or Tx Queue. The Tx Handler makes difference between dedicated Tx Buffers and Tx FIFO/Tx Queue via the MCAN_TXBC[29:24] TFQS and MCAN_TXBC[21:16] NDTB fields. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via the MCAN_TXESC register.

Figure 11-333 shows Tx Buffer element structure.

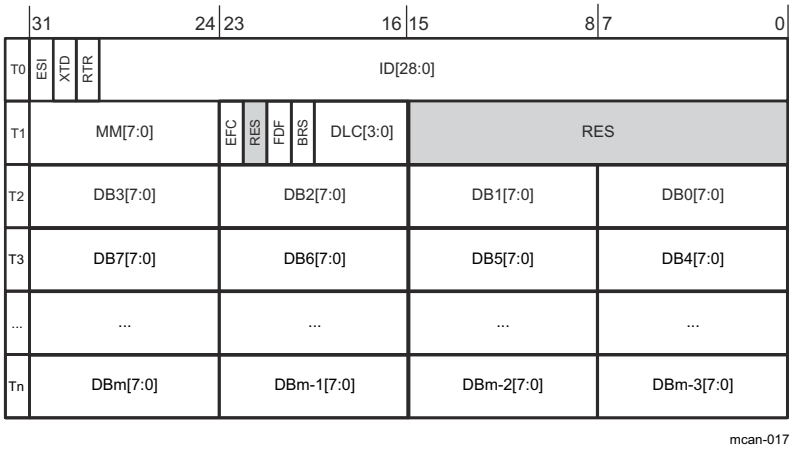

Figure 11-333. Tx Buffer Element Structure

Table 11-1471 shows Tx Buffer element field descriptions.

Table 11-1471. Tx Buffer Element Field Descriptions

Word	Bits	Field Name	Description
T0	31	ESI	Error State Indicator • 0x0: ESI bit in CAN FD format depends only on error passive flag • 0x1: ESI bit in CAN FD format transmitted recessive **Note:** The ESI bit of the transmit buffer is or'ed with the error passive flag to decide the value of the ESI bit in the transmitted CAN FD frame. As required by the CAN FD protocol specification, an error active node may optionally transmit the ESI bit recessive, but an error passive node will always transmit the ESI bit recessive.
	30	XTD	Extended Identifier • 0x0: 11-bit standard identifier • 0x1: 29-bit extended identifier
	29	RTR	Remote Transmission Request • 0x0: Transmit data frame • 0x1: Transmit remote frame **Note:** When RTR = 1, the MCAN module transmits a remote frame according to ISO11898-1:2015, even if the MCAN_CCCR[8] FDOE bit enables the transmission in CAN FD format.
	28:0	ID[28:0]	Identifier Standard or extended identifier depending on XTD bit. A standard identifier has to be written to ID[28:18].

Table 11-1471. Tx Buffer Element Field Descriptions (continued)

Word	Bits	Field Name	Description
T1	31:24	MM[7:0]	Message Marker Written by Host CPU during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status (see also MM[7:0] field in Table 11-1472).
	23	EFC	Event FIFO Control • 0x0: Don't store Tx events • 0x1: Store Tx events
	22	RES	Reserved
	21	FDF	FD Format • 0x0: Frame transmitted in Classic CAN format • 0x1: Frame transmitted in CAN FD format
	20	BRS	Bit Rate Switch • 0x0: CAN FD frames transmitted without bit rate switching • 0x1: CAN FD frames transmitted with bit rate switching **Note:** ESI, FDF, and BRS bits are only evaluated when CAN FD operation is enabled vie the MCAN_CCCR[8] FDOE bit. BRS bit is only evaluated when in addition the MCAN_CCCR[9] BRSE = 1.
	19:16	DLC[3:0]	Data Length Code • 0x0-0x8 (0-8): CAN + CAN FD: transmit frame has 0-8 data bytes • 0x9-0xF (9-15): CAN: transmit frame has 8 data bytes • 0x9-0xF (9-15): CAN FD: transmit frame has 12/16/20/24/32/48/64 data bytes
	15:0	RES	Reserved
T2	31:24	DB3[7:0]	Data Byte 3
	23:16	DB2[7:0]	Data Byte 2
	15:8	DB1[7:0]	Data Byte 1
	7:0	DB0[7:0]	Data Byte 0
T3	31:24	DB7[7:0]	Data Byte 7
	23:16	DB6[7:0]	Data Byte 6
	15:8	DB5[7:0]	Data Byte 5
	7:0	DB4[7:0]	Data Byte 4
...	...	...	...
Tn	31:24	DBm[7:0]	Data Byte m
	23:16	DBm-1[7:0]	Data Byte m-1
	15:8	DBm-2[7:0]	Data Byte m-2
	7:0	DBm-3[7:0]	Data Byte m-3

Note: Depending on the configuration of the element size (MCAN_TXESC), between two and sixteen 32-bit words (Tn = 3-17) are used for storage of a CAN message's data field.

11.4.3.4.11.4 Tx Event FIFO Element

Each element stores information about transmitted messages. By reading the Tx Event FIFO the Host CPU gets this information in the order the messages were transmitted. Status information about the Tx Event FIFO can be obtained from the MCAN_TXEFS register.

Figure 11-334 shows Tx Event FIFO element structure.

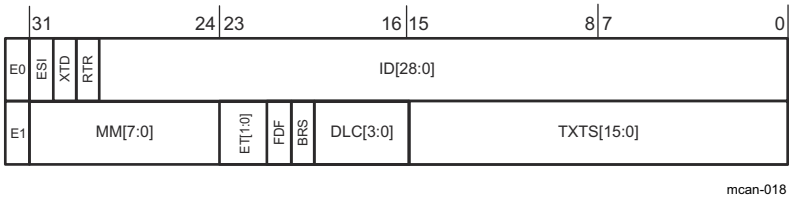

Figure 11-334. Tx Event FIFO Element Structure

Table 11-1472 shows Tx Event FIFO element field descriptions.

Table 11-1472. Tx Event FIFO Element Field Descriptions

Word	Bits	Field Name	Description
E0	31	ESI	Error State Indicator • 0x0: Transmitting node is error active • 0x1: Transmitting node is error passive
	30	XTD	Extended Identifier • 0x0: 11-bit standard identifier • 0x1: 29-bit extended identifier
	29	RTR	Remote Transmission Request • 0x0: Data frame transmitted • 0x1: Remote frame transmitted
	28:0	ID[28:0]	Identifier Standard or extended identifier depending on XTD bit. A standard identifier has to be written to ID[28:18].

Table 11-1472. Tx Event FIFO Element Field Descriptions (continued)

Word	Bits	Field Name	Description
E1	31:24	MM[7:0]	Message Marker Copied from Tx Buffer into Tx Event FIFO element for identification of Tx message status (see also MM[7:0] field in Table 11-1471).
	23:22	ET[1:0]	Event Type • 0x0: Reserved • 0x1: Tx event • 0x2: Transmission in spite of cancellation (always set for transmissions in DAR mode) • 0x3: Reserved
	21	FDF	FD Format • 0x0: Standard frame format • 0x1: CAN FD frame format (new DLC-coding and CRC)
	20	BRS	Bit Rate Switch • 0x0: Frame transmitted without bit rate switching • 0x1: Frame transmitted with bit rate switching
	19:16	DLC[3:0]	Data Length Code • 0x0-0x8 (0-8): CAN + CAN FD: frame with 0-8 data bytes transmitted • 0x9-0xF (9-15): CAN: frame with 8 data bytes transmitted • 0x9-0xF (9-15): CAN FD: frame with 12/16/20/24/32/48/64 data bytes transmitted
	15:0	TXTS[15:0]	Tx Timestamp Timestamp Counter value captured on start of frame transmission. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN_TSCC[19:16] TCP filed.

11.4.3.4.11.5 Standard Message ID Filter Element

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a Standard Message ID Filter element, its address is the Filter List Standard Start Address MCAN_SIDFC[15:2] FLSSA field plus the index of the filter element (0-127).

Figure 11-335 shows Standard Message ID Filter element structure.

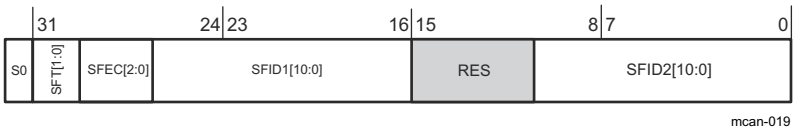

Figure 11-335. Standard Message ID Filter Element Structure

Table 11-1473 shows Standard Message ID Filter element field descriptions.

Table 11-1473. Standard Message ID Filter Element Field Descriptions

Word	Bits	Field Name	Description
S0	31:30	SFT[1:0]	Standard Filter Type • 0x0: Range filter from SFID1 to SFID2 (SFID2 ≥ SFID1) • 0x1: Dual ID filter for SFID1 or SFID2 • 0x2: Classic filter: SFID1 = filter; SFID2 = mask • 0x3: Filter element disabled **Note:** With SFT = 11 the filter element is disabled and the acceptance filtering continues (same behaviour as with SFEC = 000)
	29:27	SFEC[2:0]	Standard Filter Element Configuration All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = 100, 101, or 110 a match sets interrupt flag MCAN_IR[8]HPM and, if enabled, an interrupt is generated. In this case the MCAN_HPMS register is updated with the status of the priority match. • 0x0: Disable filter element • 0x1: Store in Rx FIFO 0 if filter matches • 0x2: Store in Rx FIFO 1 if filter matches • 0x3: Reject ID if filter matches • 0x4: Set priority if filter matches • 0x5: Set priority and store in FIFO 0 if filter matches • 0x6: Set priority and store in FIFO 1 if filter matches • 0x7: Store into Rx Buffer, configuration of SFT[1:0] ignored
	26:16	SFID1[10:0]	Standard Filter ID 1 When filtering for Rx Buffers this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.
	15:11	RES	Reserved
	10:0	SFID2[10:0]	Standard Filter ID 2 This bit field has a different meaning depending on the configuration of SFEC: • 1) SFEC = 001 - 110 Second ID of standard ID filter element • 2) SFEC = 111 Filter for Rx Buffers
		SFID2[10:9]	This filed is decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence. • 0x0: Store message into an Rx Buffer • 0x1: Debug Message A • 0x2: Debug Message B • 0x3: Debug Message C **Note:** Debug feature is not supported.
		SFID2[8:6]	This field is used to control the filter event pins at the Extension Interface. A one at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one MCAN_ICKL period in case the filter matches. **Note:** Only two filter event pins are supported.
		SFID2[5:0]	This field defines the offset to the Rx Buffer Start Address MCAN_RXBC[15:2] RBSA field for storage of a matching message.

11.4.3.4.11.6 Extended Message ID Filter Element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended Message ID Filter element, its address is the Filter List Extended Start Address MCAN_XIDFC[15:2] FLESA field plus two times the index of the filter element (0-63).

Figure 11-336 shows Extended Message ID Filter element structure.

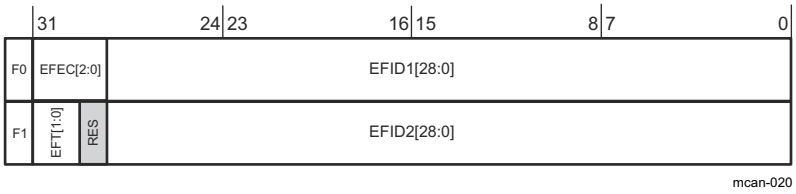

Figure 11-336. Extended Message ID Filter Element Structure

Table 11-1474 shows Extended Message ID Filter element field descriptions.

Table 11-1474. Extended Message ID Filter Element Field Descriptions

Word	Bits	Field Name	Description
F0	31:29	EFEC[2:0]	Extended Filter Element Configuration All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = 100, 101, or 110 a match sets interrupt flag MCAN_IR[8]HPM and, if enabled, an interrupt is generated. In this case the MCAN_HPMS register is updated with the status of the priority match. • 0x0: Disable filter element • 0x1: Store in Rx FIFO 0 if filter matches • 0x2: Store in Rx FIFO 1 if filter matches • 0x3: Reject ID if filter matches • 0x4: Set priority if filter matches • 0x5: Set priority and store in FIFO 0 if filter matches • 0x6: Set priority and store in FIFO 1 if filter matches • 0x7: Store into Rx Buffer or as debug message, configuration of EFT[1:0] ignored
	28:0	EFID1[28:0]	Extended Filter ID 1 First ID of extended ID filter element. When filtering for Rx Buffers this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only XIDAM masking mechanism (see Section 11.4.3.4.8.1.5, *Extended Message ID Filtering*) is used.

Table 11-1474. Extended Message ID Filter Element Field Descriptions (continued)

Word	Bits	Field Name	Description
F1	31:30	EFT[1:0]	Extended Filter Type • 0x0: Range filter from EFID1 to EFID2 (EFID2 ≥ EFID1) • 0x1: Dual ID filter for EFID1 or EFID2 • 0x2: Classic filter: EFID1 = filter, EFID2 = mask • 0x3: Range filter from EFID1 to EFID2 (EFID2 ≥ EFID1), XIDAM mask not applied
	29	RES	Reserved
	28:0	EFID2[28:0]	Extended Filter ID 2 This bit field has a different meaning depending on the configuration of EFEC: • 1) EFEC = 001 - 110 Second ID of extended ID filter element • 2) EFEC = 111 Filter for Rx Buffers
		EFID2[10:9]	This field decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence. • 0x0: Store message into an Rx Buffer • 0x1: Debug Message A • 0x2: Debug Message B • 0x3: Debug Message C **Note:** Debug feature is not supported.
		EFID2[8:6]	This field is used to control the filter event pins at the Extension Interface. A one at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one MCAN_ICKL period in case the filter matches. **Note:** Only two filter event pins are supported.
		EFID2[5:0]	This field defines the offset to the Rx Buffer Start Address MCAN_RXBC[15:2] RBSA field for storage of a matching message.

11.4.3.5 MCAN Register Manual

Note

After hardware reset, the registers of the MCAN module hold the values shown in the register descriptions.

Additionally, the Bus_Off state is reset and the MCAN_TX pin is set to recessive (high). The MCAN_CCCR[0] INIT bit is set to enable the software initialization. The MCAN module will not influence the CAN bus until the software resets the MCAN_CCCR[0] INIT bit.

11.4.3.5.1 MSS_MCAN_CFG Registers

Table 11-1476 lists the memory-mapped registers for the MSS_MCAN_CFG registers. All register offset addresses not listed in Table 11-1476 should be considered as reserved locations and the register contents should not be modified.

Table 11-1476. MSS_MCAN_CFG Registers

Complex bit access types are encoded to fit into small table cells. Table 11-1477 shows the codes that are used for access types in this section.

Table 11-1477. MSS_MCAN_CFG Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write

Table 11-1477. MSS_MCAN_CFG Access Type Codes (continued)

Access Type	Code	Description
W0C	W 0C	Write 0 to clear
Reset or Default Value		
-n		Value after reset or the default value

11.4.3.5.1.1 SS_PID Register (Offset = 0h) [Reset = 00000000h]

SS_PID is shown in Table 11-1478.

Return to the Summary Table.

SS_PID

Table 11-1478. SS_PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	SCHEME	R	0h	PID register scheme
29-28	BU	R	0h	Business Unit: 10 = Processors
27-16	MODULE_ID	R	0h	Module ID
15-11	RTL	R	0h	RTL revision. Will vary depending on release.
10-8	MAJOR	R	0h	Major revision
7-6	CUSTOM	R	0x0	Custom
5-0	MINOR	R	0h	Minor revision

11.4.3.5.1.2 SS_CTRL Register (Offset = 4h) [Reset = 00000000h]

SS_CTRL is shown in Table 11-1479.

Return to the Summary Table.

SS_CTRL

Table 11-1479. SS_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	NU0	R	0x0	Reserved
6	EXT_TS_CNTR_EN	R/W	0x0	External TimeStamp Counter Enable
5	AUTOWAKEUP	R/W	0x0	Automatic Wakeup Enable
4	WAKEUPREGEN	R/W	0x0	Wakeup Request Enable
3	DBGSUSP_FREE	R/W	0h	0-Honor Debug Suspend, 1-Disregard debug suspend
2-0	NU	R	0x0	Reserved

11.4.3.5.1.3 SS_STAT Register (Offset = 8h) [Reset = 00000000h]

SS_STAT is shown in Table 11-1480.

Return to the Summary Table.

SS_STAT

Table 11-1480. SS_STAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	NU1	R	0x0	Reserved
2	EN_FDOE	R	0h	Reflects the value of mcanss_enable_fdoe configuration port x=mcanss_enable_fdoe
1	MMI_DONE	R	0h	0:Memory Initialization is in progress, 1:Memory Intialization Done
0	NU	R	0x0	Reserved

11.4.3.5.1.4 SS_ICS Register (Offset = Ch) [Reset = 00000000h]

SS_ICS is shown in Table 11-1481.

Return to the Summary Table.

SS_ICS

Table 11-1481. SS_ICS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU2	R	0x0	Reserved
0	ICS	W	0x0	This bit contains the External TimeStamp Counter Overflow Interrupt status. Write '1' to clear bits. (ICS - Interrupt Clear Shadow Register)

11.4.3.5.1.5 SS_IRS Register (Offset = 10h) [Reset = 00000000h]

SS_IRS is shown in Table 11-1482.

Return to the Summary Table.

SS_IRS

Table 11-1482. SS_IRS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU3	R	0x0	Reserved
0	IRS	R	0x0	External TimeStamp Counter Overflow Interrupt status. Read raw interrupt status. (IRS - Interrupt Raw Status Register)

11.4.3.5.1.6 SS_IECS Register (Offset = 14h) [Reset = 00000000h]

SS_IECS is shown in Table 11-1483.

Return to the Summary Table.

SS_IECS

Table 11-1483. SS_IECS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU4	R	0x0	Reserved
0	IECS	W	0x0	External TimeStamp Counter Overflow Interrupt. Write '1' to clear bits. (IECS - Interrupt Enable Clear Shadow Register)

11.4.3.5.1.7 SS_IE Register (Offset = 18h) [Reset = 00000000h]

SS_IE is shown in Table 11-1484.

Return to the Summary Table.

SS_IE

Table 11-1484. SS_IE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU5	R	0x0	Reserved
0	IE	R/W	0x0	External TimeStamp Counter Overflow Interrupt. Write '1' to set interrupt enable. Read returns interrupt enable. (IE - Interrupt Enable Register)

11.4.3.5.1.8 SS_IES Register (Offset = 1Ch) [Reset = 00000000h]

SS_IES is shown in Table 11-1485.

Return to the Summary Table.

SS_IES

Table 11-1485. SS_IES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU6	R	0x0	Reserved
0	IES	R	0x0	External TimeStamp Counter Overflow Interrupt. Read Enabled Interrupts. (IES - Interrupt Enable Status)

11.4.3.5.1.9 SS_EOI Register (Offset = 20h) [Reset = 00000000h]

SS_EOI is shown in Table 11-1486.

Return to the Summary Table.

SS_EOI

Table 11-1486. SS_EOI Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU7	R	0x0	Reserved
7-0	EOI	W	0x0	Write with bit position of targeted interrupt. (E.g. Ext TS is bit 0). Upon write, level interrupt will clear and if unserviced interrupt counter > 1 will issue another pulse interrupt. Field values: ext_ts_eoi(0): EOI value for External TS interrupt mcan_0_eoi(1): EOI value for mcan[0] interrupt mcan_1_eoi(2): EOI value for mcan[1] interrupt (EOI - End Of Interrupt)

11.4.3.5.1.10 SS_EXT_TS_PS Register (Offset = 24h) [Reset = 00000000h]

SS_EXT_TS_PS is shown in Table 11-1487.

Return to the Summary Table.

SS_EXT_TS_PS

Table 11-1487. SS_EXT_TS_PS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	NU8	R	0x0	Reserved
23-0	PRESCALE	R/W	0x0	External Timestamp Prescaler reload value. External Timestamp count rate is host clock rate divided by this value with one exception: a value of 0 has the same effect as 1 .

11.4.3.5.1.11 SS_EXT_TS_USIC Register (Offset = 28h) [Reset = 00000000h]

SS_EXT_TS_USIC is shown in Table 11-1488.

Return to the Summary Table.

SS_EXT_TS_USIC

Table 11-1488. SS_EXT_TS_USIC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	NU9	R	0x0	Reserved
4-0	EXT_TS_INTR_CNTR	R	0x0	Number of unserviced rollover interrupts. If >1 an EOI write will issue another pulse interrupt (EXT_TS_USIC - External TImeStamp Unserviced Interrupts Counter)

11.4.3.5.1.12 CREL Register (Offset = 200h) [Reset = 00000000h]

CREL is shown in Table 11-1489.

Return to the Summary Table.

CREL

Table 11-1489. CREL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	REL	R	0h	Core Release
27-24	STEP	R	0h	Step of Core Release
23-20	SUBSTEP	R	0h	Sub-Step of Core Release
19-16	YEAR	R	0h	Time Stamp Year
15-8	MON	R	0h	Time Stamp Month
7-0	DAY	R	0h	Time Stamp Day

11.4.3.5.1.13 ENDN Register (Offset = 204h) [Reset = 00000000h]

ENDN is shown in Table 11-1490.

Return to the Summary Table.

ENDN

Table 11-1490. ENDN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ETV	R	0h	Endianess test value

11.4.3.5.1.14 CUST Register (Offset = 208h) [Reset = 00000000h]

CUST is shown in Table 11-1491.

Return to the Summary Table.

CUST

Table 11-1491. CUST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CUST	R	0x0	Custom

11.4.3.5.1.15 DBTP Register (Offset = 20Ch) [Reset = 00000000h]

DBTP is shown in Table 11-1492.

Return to the Summary Table.

DBTP

Table 11-1492. DBTP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	NU13	R	0x0	Reserved
23	TDC	R/W	0x0	Transmitter Delay Compensation
22-21	NU12	R	0x0	Reserved
20-16	DBRP	R/W	0x0	Data Baud Rate Prescaler
15-13	NU11	R	0x0	Reserved
12-8	DTSEG1	R/W	0h	Data time segment before smaple point
7-4	DTSEG2	R/W	0h	Data time segment after sample point
3-0	DSJW	R/W	0h	Data resynchronization Jump Width

11.4.3.5.1.16 TEST Register (Offset = 210h) [Reset = 00000000h]

TEST is shown in Table 11-1493.

Return to the Summary Table.

TEST

Table 11-1493. TEST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	NU15	R	0x0	Reserved
7	RX	R	0x0	Receive Pin
6-5	TX	R/W	0x0	Control of Transmit Pin
4	LBCK	R/W	0x0	Loop Back Mode
3-0	NU14	R	0x0	Reserved

11.4.3.5.1.17 RWD Register (Offset = 214h) [Reset = 00000000h]

RWD is shown in Table 11-1494.

Return to the Summary Table.

RWD

Table 11-1494. RWD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU16	R	0x0	Reserved
15-8	WDV	R	0x0	Watchdog Value
7-0	WDC	R/W	0x0	Watchdog Counter Value

11.4.3.5.1.18 CCCR Register (Offset = 218h) [Reset = 00000000h]

CCCR is shown in Table 11-1495.

Return to the Summary Table.

CCCR

Table 11-1495. CCCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	NU18	R/W	0x0	Reserved
14	TXP	R/W	0x0	Transmit Pause
13	EFBI	R/W	0x0	Edge Filtering durign Bus Integration
12	PXHD	R/W	0x0	Protocol Exception Handling Disable
11-10	NU17	R	0x0	Reserved
9	BRSE	R/W	0x0	Bit Rate Switch Enable
8	FDOE	R/W	0x0	FD Operation Enable
7	TEST	R/W	0x0	Test Mode enable
6	DAR	R/W	0x0	Disable Automatic Regransmission
5	MON	R/W	0x0	Bus Monitoring Mode
4	CSR	R/W	0x0	Clock Stop Request
3	CSA	R	0x0	Clock Stop Acknowledge
2	ASM	R/W	0x0	Restriced Operation Mode
1	CCE	R/W	0x0	Configuration Change Enable
0	INIT	R/W	0h	Initialization

11.4.3.5.1.19 NBTP Register (Offset = 21Ch) [Reset = 00000000h]

NBTP is shown in Table 11-1496.

Return to the Summary Table.

NBTP

Table 11-1496. NBTP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	NSJW	R/W	0h	Nominal Resynchronization Jump Width
24-16	NBRP	R/W	0x0	Nominal Baud Rate Prescaler
15-8	NTSEG1	R/W	0h	Nominal Time segment before sample point
7	NU19	R	0x0	Reserved
6-0	NTSEG2	R/W	0h	Nominal Time segment after sample point

11.4.3.5.1.20 TSCC Register (Offset = 220h) [Reset = 00000000h]

TSCC is shown in Table 11-1497.

Return to the Summary Table.

TSCC

Table 11-1497. TSCC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	NU21	R	0x0	Reserved
19-16	TCP	R/W	0x0	Timestamp Counter Prescaler
15-2	NU20	R	0x0	Reserved
1-0	TSS	R/W	0x0	Timestamp Select

11.4.3.5.1.21 TSCV Register (Offset = 224h) [Reset = 00000000h]

TSCV is shown in Table 11-1498.

Return to the Summary Table.

TSCV

Table 11-1498. TSCV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU22	R	0x0	Reserved
15-0	TSC	R/W	0x0	Timestamp Counter

11.4.3.5.1.22 TOCC Register (Offset = 228h) [Reset = 00000000h]

TOCC is shown in Table 11-1499.

Return to the Summary Table.

TOCC

Table 11-1499. TOCC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TOP	R/W	0h	Timeout Period
15-3	NU23	R	0x0	Reserved
2-1	TOS	R/W	0x0	Timeout Select
0	ETOC	R/W	0x0	Enable Timeout Counter

11.4.3.5.1.23 TOCV Register (Offset = 22Ch) [Reset = 00000000h]

TOCV is shown in Table 11-1500.

Return to the Summary Table.

TOCV

Table 11-1500. TOCV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU24	R	0x0	Reserved
15-0	TOC	R/W	0h	Timeout Counter

11.4.3.5.1.24 RES00 Register (Offset = 230h) [Reset = 00000000h]

RES00 is shown in Table 11-1501.

Return to the Summary Table.

RES00

Table 11-1501. RES00 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES00	R	0x0	Reserved

11.4.3.5.1.25 RES01 Register (Offset = 234h) [Reset = 00000000h]

RES01 is shown in Table 11-1502.

Return to the Summary Table.

RES01

Table 11-1502. RES01 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES01	R	0x0	Reserved

11.4.3.5.1.26 RES02 Register (Offset = 238h) [Reset = 00000000h]

RES02 is shown in Table 11-1503.

Return to the Summary Table.

RES02

Table 11-1503. RES02 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES02	R	0x0	Reserved

11.4.3.5.1.27 RES03 Register (Offset = 23Ch) [Reset = 00000000h]

RES03 is shown in Table 11-1504.

Return to the Summary Table.

RES03

Table 11-1504. RES03 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES03	R	0x0	Reserved

11.4.3.5.1.28 ECR Register (Offset = 240h) [Reset = 00000000h]

ECR is shown in Table 11-1505.

Return to the Summary Table.

ECR

Table 11-1505. ECR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	NU25	R	0x0	Reserved
23-16	CEL	R	0x0	CAN Error Logging
15	RP	R	0x0	Recieve Error Passive
14-8	REC	R	0x0	Recieve Error Counter
7-0	TEC	R	0x0	Transmit Error Counter

11.4.3.5.1.29 PSR Register (Offset = 244h) [Reset = 00000000h]

PSR is shown in Table 11-1506.

Return to the Summary Table.

PSR

Table 11-1506. PSR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	NU27	R	0x0	Reserved
22-16	TDCV	R	0x0	Transmitter Delay Compensation Value
15	NU26	R	0x0	Reserved
14	PXE	R	0x0	Protocol Exception Event
13	RFDF	R	0x0	Recieved a CAN FD Message
12	RBRS	R	0x0	BRS flag of last recieved CAN FD Message
11	RESI	R	0x0	ESI flag of last recieved CAN FD Message
10-8	DLEC	R	0h	Data Phase Last Error Code
7	BO	R	0x0	Bus_Off status
6	EW	R	0x0	Warning Status
5	EP	R	0x0	Error Passive
4-3	ACT	R	0x0	Activity
2-0	LEC	R	0h	Last Error Code

11.4.3.5.1.30 TDCR Register (Offset = 248h) [Reset = 00000000h]

TDCR is shown in Table 11-1507.

Return to the Summary Table.

TDCR

Table 11-1507. TDCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	NU29	R	0x0	Reserved
14-8	TDCO	R/W	0x0	Transmitter Delay Compensation Offset
7	NU28	R	0x0	Reserved
6-0	TDCF	R/W	0x0	Transmitter Delay Compensation Filter Window Length

11.4.3.5.1.31 RES04 Register (Offset = 24Ch) [Reset = 00000000h]

RES04 is shown in Table 11-1508.

Return to the Summary Table.

RES04

Table 11-1508. RES04 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES04	R	0x0	Reserved

11.4.3.5.1.32 IR Register (Offset = 250h) [Reset = 00000000h]

IR is shown in Table 11-1509.

Return to the Summary Table.

IR

Table 11-1509. IR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	NU30	R	0x0	Reserved
29	ARA	R/W	0x0	Access to Reserved Address
28	PED	R/W	0x0	Protocol Error in data Phase
27	PEA	R/W	0x0	Protocol Error in Arbitration Phase
26	WDI	R/W	0x0	Watchdog Interrupt
25	BO	R/W	0x0	Bus_Off Status
24	EW	R/W	0x0	Warning Status
23	EP	R/W	0x0	Error Passive
22	ELO	R/W	0x0	Error Logging Overflow
21	BEU	R/W	0x0	Bit Error Uncorrected
20	BEC	R/W	0x0	Bit Error Corrected
19	DRX	R/W	0x0	Message stored to Dedicated Rx Buffer
18	TOO	R/W	0x0	Timeout Occurred
17	MRAF	R/W	0x0	Message RAM Access Failure
16	TSW	R/W	0x0	Timestamp Wraparound
15	TEFL	R/W	0x0	Tx Event FIFO Element Lost
14	TEFF	R/W	0x0	Tx Event FIFO Full
13	TEFW	R/W	0x0	Tx Event FIFO Watermark Reached
12	TEFN	R/W	0x0	Tx Event FIFO New Entry
11	TFE	R/W	0x0	Tx FIFO Empty
10	TCF	R/W	0x0	Transmission Cancellation Finished
9	TC	R/W	0x0	Transmission Complete
8	HPM	R/W	0x0	High Priority Message
7	RF1L	R/W	0x0	Rx FIFO 1 Message Lost
6	RF1F	R/W	0x0	Rx FIFO 1 Full

1	RF0W	R/W	0x0	Rx FIFO 0 Watermark Reached
0	RF0N	R/W	0x0	Rx FIFO 0 New Message

11.4.3.5.1.33 IE Register (Offset = 254h) [Reset = 00000000h]

IE is shown in Table 11-1510.

Return to the Summary Table.

IE

Table 11-1510. IE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	NU31	R	0x0	Reserved
29	ARAE	R/W	0x0	Accees to Reserve Address Interrupt Enable
28	PEDE	R/W	0x0	Protocol Error in Data Phase Interrupt Enable
27	PEAE	R/W	0x0	Protocol Error in Arbitration Phase Interrupt Enable
26	WDIE	R/W	0x0	Watchdog Interrupt Enable
25	BOE	R/W	0x0	Bus_Off Status Interrupt Enable
24	EWE	R/W	0x0	Warning Status Interrupt Enable
23	EPE	R/W	0x0	Error Passive Interrupt Enable
22	ELOE	R/W	0x0	Error Logging Overflow Interrupt Enable
21	BEUE	R/W	0x0	Bit Error Uncorrected Interrupt Enable
20	BECE	R/W	0x0	Bit Error Corrected Interrupt Enable
19	DRX	R/W	0x0	Message stored to Dedicated Rx Buffer Interrupt Enable
18	TOOE	R/W	0x0	Timeout Occurred Interrupt Enable
17	MRAFE	R/W	0x0	Message RAM Access Failure Interrupt Enable
16	TSWE	R/W	0x0	Timestamp Wraparound Interrupt Enable
15	TEFLE	R/W	0x0	Tx Event FIFO Event Lost Interrupt Enable
14	TEFFE	R/W	0x0	Tx Event FIFO Full Interrupt Enable
13	TEFWE	R/W	0x0	Tx Event FIFO Watermark Reached Interrupt enable
12	TEFNE	R/W	0x0	Tx Event FIFO New Entry Interrupt Enable
11	TFEE	R/W	0x0	Tx FIFO Empty Interrupt Enable
10	TCFE	R/W	0x0	Transmission Cancellation Finishied Interrupt Enable
9	TCE	R/W	0x0	Transmission Completed Interrupt Enable
8	HPME	R/W	0x0	High Priority message Interrupt Enable
7	RF1LE	R/W	0x0	rx FIFO 1 Message Lost Interrupt Enable
6	RF1FE	R/W	0x0	Rx FIFO 1 Full Interrupt Enable
5	RF1WE	R/W	0x0	Rx FIFO 1 Watermark Reached Interrupt Enable
4	RF1NE	R/W	0x0	Rx FIFO 1 New Message Interrupt Enable
3	RF0LE	R/W	0x0	Rx FIFO 0 Message Lost Interrupt Enable
2	RF0FE	R/W	0x0	Rx FIFO 0 Full Interrupt Enable
1	RF0WE	R/W	0x0	Rx FIFO 0 Watermark Reached Interrupt Enable
0	RF0NE	R/W	0x0	Rx FIFO 0 New Message Interrupt Enable

11.4.3.5.1.34 ILS Register (Offset = 258h) [Reset = 00000000h]

ILS is shown in Table 11-1511.

Return to the Summary Table.

ILS

Table 11-1511. ILS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	NU32	R	0x0	Reserved
29	ARAL	R/W	0x0	Accees to Reserve Address Interrupt Line
28	PEDL	R/W	0x0	Protocol Error in Data Phase Interrupt Line
27	PEAL	R/W	0x0	Protocol Error in Arbitration Phase Interrupt Line
26	WDIL	R/W	0x0	Watchdog Interrupt Line
25	BOL	R/W	0x0	Bus_Off Status Interrupt Line
24	EWL	R/W	0x0	Warning Status Interrupt Line
23	EPL	R/W	0x0	Error Passive Interrupt Line
22	ELOL	R/W	0x0	Error Logging Overflow Interrupt Line
21	BEUL	R/W	0x0	Bit Error Uncorrected Interrupt Line
20	BECL	R/W	0x0	Bit Error Corrected Interrupt Line

18	TOOL	R/W	0x0	Timeout Occurred Interrupt Line
17	MRAFL	R/W	0x0	Message RAM Access Failure Interrupt Line
16	TSWL	R/W	0x0	Timestamp Wraparound Interrupt Line
15	TEFLL	R/W	0x0	Tx Event FIFO Event Lost Interrupt Line
14	TEFFL	R/W	0x0	Tx Event FIFO Full Interrupt Line
13	TEFWL	R/W	0x0	Tx Event FIFO Watermark Reached Interrupt Line
12	TEFNL	R/W	0x0	Tx Event FIFO New Entry Interrupt Line
11	TFEL	R/W	0x0	Tx FIFO Empty Interrupt Line
10	TCFL	R/W	0x0	Transmission Cancellation Finishied Interrupt Line
9	TCL	R/W	0x0	Transmission Completed Interrupt Line
8	HPML	R/W	0x0	High Priority message Interrupt Line
7	RF1LL	R/W	0x0	rx FIFO 1 Message Lost Interrupt Line
6	RF1FL	R/W	0x0	Rx FIFO 1 Full Interrupt Line
5	RF1WL	R/W	0x0	Rx FIFO 1 Watermark Reached Interrupt Line
4	RF1NL	R/W	0x0	Rx FIFO 1 New Message Interrupt Line
3	RF0LL	R/W	0x0	Rx FIFO 0 Message Lost Interrupt Line
2	RF0FL	R/W	0x0	Rx FIFO 0 Full Interrupt Line
1	RF0WL	R/W	0x0	Rx FIFO 0 Watermark Reached Interrupt Line
0	RF0NL	R/W	0x0	Rx FIFO 0 New Message Interrupt Line

11.4.3.5.1.35 ILE Register (Offset = 25Ch) [Reset = 00000000h]

ILE is shown in Table 11-1512.

Return to the Summary Table.

ILE

Table 11-1512. ILE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU33	R	0x0	Reserved
1	EINT1	R/W	0x0	Enable Interrupt Line 1
0	EINT0	R/W	0x0	Enable Interrupt Line 0

11.4.3.5.1.36 RES05 Register (Offset = 260h) [Reset = 00000000h]

RES05 is shown in Table 11-1513.

Return to the Summary Table.

RES05

Table 11-1513. RES05 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES05	R	0x0	Reserved

11.4.3.5.1.37 RES06 Register (Offset = 264h) [Reset = 00000000h]

RES06 is shown in Table 11-1514.

Return to the Summary Table.

RES06

Table 11-1514. RES06 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES06	R	0x0	Reserved

11.4.3.5.1.38 RES07 Register (Offset = 268h) [Reset = 00000000h]

RES07 is shown in Table 11-1515.

Return to the Summary Table.

RES07

Table 11-1515. RES07 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES07	R	0x0	Reserved

11.4.3.5.1.39 RES08 Register (Offset = 26Ch) [Reset = 00000000h]

RES08 is shown in Table 11-1516.

Return to the Summary Table.

RES08

Table 11-1516. RES08 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES08	R	0x0	Reserved

11.4.3.5.1.40 RES09 Register (Offset = 270h) [Reset = 00000000h]

RES09 is shown in Table 11-1517.

Return to the Summary Table.

RES09

Table 11-1517. RES09 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES09	R	0x0	Reserved

11.4.3.5.1.41 RES10 Register (Offset = 274h) [Reset = 00000000h]

RES10 is shown in Table 11-1518.

Return to the Summary Table.

RES10

Table 11-1518. RES10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES10	R	0x0	Reserved

11.4.3.5.1.42 RES11 Register (Offset = 278h) [Reset = 00000000h]

RES11 is shown in Table 11-1519.

Return to the Summary Table.

RES11

Table 11-1519. RES11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES11	R	0x0	Reserved

11.4.3.5.1.43 RES12 Register (Offset = 27Ch) [Reset = 00000000h]

RES12 is shown in Table 11-1520.

Return to the Summary Table.

RES12

Table 11-1520. RES12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES12	R	0x0	Reserved

11.4.3.5.1.44 GFC Register (Offset = 280h) [Reset = 00000000h]

GFC is shown in Table 11-1521.

Return to the Summary Table.

GFC

Table 11-1521. GFC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	NU34	R	0x0	Reserved
5-4	ANFS	R/W	0x0	Accept Non-matching Frames Standard
3-2	ANFE	R/W	0x0	Accept Non-matching Frames Extended
1	RRFS	R/W	0x0	reject Remote Frames Standard
0	RRFE	R/W	0x0	reject Remote Frames Extended

11.4.3.5.1.45 SIDFC Register (Offset = 284h) [Reset = 00000000h]

SIDFC is shown in Table 11-1522.

Return to the Summary Table.

SIDFC

Table 11-1522. SIDFC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	NU36	R	0x0	Reserved
23-16	LSS_S	R/W	0x0	List Size Standard
15-2	FLSSA_S	R/W	0x0	Filter List Standard Start Address
1-0	NU35	R	0x0	Reserved

11.4.3.5.1.46 XIDFC Register (Offset = 288h) [Reset = 00000000h]

XIDFC is shown in Table 11-1523.

Return to the Summary Table.

XIDFC

Table 11-1523. XIDFC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	NU38	R	0x0	Reserved
23-16	LSS_X	R/W	0x0	List Size Standard
15-2	FLSSA_X	R/W	0x0	Filter List Standard Start Address
1-0	NU37	R	0x0	Reserved

11.4.3.5.1.47 RES13 Register (Offset = 28Ch) [Reset = 00000000h]

RES13 is shown in Table 11-1524.

Return to the Summary Table.

RES13

Table 11-1524. RES13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES13	R	0x0	Reserved

11.4.3.5.1.48 XIDAM Register (Offset = 290h) [Reset = 00000000h]

XIDAM is shown in Table 11-1525.

Return to the Summary Table.

XIDAM

Table 11-1525. XIDAM Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	NU39	R	0x0	Reserved
28-0	EIDM	R/W	0h	Extended ID Mask

11.4.3.5.1.49 HPMS Register (Offset = 294h) [Reset = 00000000h]

HPMS is shown in Table 11-1526.

Return to the Summary Table.

HPMS

Table 11-1526. HPMS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU40	R	0x0	Reserved
15	FLST	R	0x0	Filter List
14-8	FIDX	R	0x0	Filter Index
7-6	MSI	R	0x0	Message Storeage Indicator
5-0	BIDX	R	0x0	Buffer Index

11.4.3.5.1.50 NDAT1 Register (Offset = 298h) [Reset = 00000000h]

NDAT1 is shown in Table 11-1527.

Return to the Summary Table.

NDAT1

Table 11-1527. NDAT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ND0_31	R/W	0x0	New Data 0-31

11.4.3.5.1.51 NDAT2 Register (Offset = 29Ch) [Reset = 00000000h]

NDAT2 is shown in Table 11-1528.

Return to the Summary Table.

NDAT2

Table 11-1528. NDAT2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ND32_63	R/W	0x0	New Data 32-63

11.4.3.5.1.52 RXF0C Register (Offset = 2A0h) [Reset = 00000000h]

RXF0C is shown in Table 11-1529.

Return to the Summary Table.

RXF0C

Table 11-1529. RXF0C Register Field Descriptions

Bit	Field	Type	Reset	Description
31	F0OM	R/W	0x0	Rx FIFO 0 Operation Mode
30-24	F0WM	R/W	0x0	Rx FIFO 0 Watermark
23	NU42_1	R	0x0	Reserved
22-16	F0S	R/W	0x0	Rx FIFO 0 Size
15	NU42	R	0x0	Reserved
14-2	F0SA	R/W	0x0	Rx FIFO 0 Start Address
1-0	NU41	R	0x0	Reserved

11.4.3.5.1.53 RXF0S Register (Offset = 2A4h) [Reset = 00000000h]

RXF0S is shown in Table 11-1530.

Return to the Summary Table.

RXF0S

Table 11-1530. RXF0S Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	NU46	R	0x0	Reserved
25	RF0L	R	0x0	Rx FIFO 0 Message Lost
24	F0F	R	0x0	Rx FIFO 0 Full
23-22	NU45	R	0x0	Reserved
21-16	F0PI	R	0x0	Rx FIFO 0 Put Index
15-14	NU44	R	0x0	Reserved
13-8	F0GI	R	0x0	Rx FIFO 0 Get Index
7	NU43	R	0x0	Reserved
6-0	F0FL	R	0x0	Rx FIFO 0 Fill Level

11.4.3.5.1.54 RXF0A Register (Offset = 2A8h) [Reset = 00000000h]

RXF0A is shown in Table 11-1531.

Return to the Summary Table.

RXF0A

Table 11-1531. RXF0A Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	NU47	R	0x0	Reserved
5-0	F0AI	R/W	0x0	Rx FIFO 0 Acknowledge Index

11.4.3.5.1.55 RXBC Register (Offset = 2ACh) [Reset = 00000000h]

RXBC is shown in Table 11-1532.

Return to the Summary Table.

RXBC

Table 11-1532. RXBC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	NU49	R	0x0	Reserved
15-2	RBSA	R/W	0x0	Rx Buffer Start Address
1-0	NU48	R	0x0	Reserved

11.4.3.5.1.56 RXF1C Register (Offset = 2B0h) [Reset = 00000000h]

RXF1C is shown in Table 11-1533.

Return to the Summary Table.

RXF1C

Table 11-1533. RXF1C Register Field Descriptions

Bit	Field	Type	Reset	Description
31	F1OM	R/W	0x0	Rx FIFO 0 Operation Mode
30-24	F1WM	R/W	0x0	Rx FIFO 0 Watermark
23	NU50_1	R	0x0	Reserved
22-16	F1S	R/W	0x0	Rx FIFO 0 Size
15	NU50	R	0x0	Reserved
14-2	F1SA	R/W	0x0	Rx FIFO 0 Start Address
1-0	NU499	R	0x0	Reserved

11.4.3.5.1.57 RXF1S Register (Offset = 2B4h) [Reset = 00000000h]

RXF1S is shown in Table 11-1534.

Return to the Summary Table.

RXF1S

Table 11-1534. RXF1S Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	NU54	R	0x0	Reserved
25	RF1L	R	0x0	Rx FIFO 0 Message Lost
24	F1F	R	0x0	Rx FIFO 0 Full
23-22	NU53	R	0x0	Reserved
21-16	F1PI	R	0x0	Rx FIFO 0 Put Index
15-14	NU52	R	0x0	Reserved
13-8	F1GI	R	0x0	Rx FIFO 0 Get Index
7	NU51	R	0x0	Reserved
6-0	F1FL	R	0x0	Rx FIFO 0 Fill Level

11.4.3.5.1.58 RXF1A Register (Offset = 2B8h) [Reset = 00000000h]

RXF1A is shown in Table 11-1535.

Return to the Summary Table.

RXF1A

Table 11-1535. RXF1A Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	NU55	R	0x0	Reserved
5-0	F1AI	R/W	0x0	Rx FIFO 0 Acknowledge Index

11.4.3.5.1.59 RXESC Register (Offset = 2BCh) [Reset = 00000000h]

RXESC is shown in Table 11-1536.

Return to the Summary Table.

RXESC

Table 11-1536. RXESC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU58	R	0x0	Reserved
10-8	RBDS	R/W	0x0	Rx Buffer data Field Size
7	NU57	R	0x0	Reserved
6-4	F1DS	R/W	0x0	Rx FIFO 1 Data Field Size
3	NU56	R	0x0	Reserved
2-0	F0DS	R/W	0x0	Rx FIFO 0 Data Field Size

11.4.3.5.1.60 TXBC Register (Offset = 2C0h) [Reset = 00000000h]

TXBC is shown in Table 11-1537.

Return to the Summary Table.

TXBC

Table 11-1537. TXBC Register Field Descriptions

Bit	Field	Type	Reset	Description
31	NU61	R	0x0	Reserved
30	TFQM	R	0x0	Tx FIFO/Queue Mode
29-24	TFQS	R	0x0	Transmit FIFO/Queue Size
23-22	NU60	R	0x0	Reserved
21-16	NDTB	R	0x0	Number of Dedicated Transmit Buffers
15-2	TBSA	R	0x0	Tx Buffers Start Address
1-0	NU59	R	0x0	Reserved

11.4.3.5.1.61 TXFQS Register (Offset = 2C4h) [Reset = 00000000h]

TXFQS is shown in Table 11-1538.

Return to the Summary Table.

TXFQS

Table 11-1538. TXFQS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-22	NU64	R	0x0	Reserved
21	TFQF	R	0x0	Tx FIFO/Queue Full
20-16	TFQPI	R	0x0	Tx FIFO/Queue Put Index
15-13	NU63	R	0x0	Reserved
12-8	TFGI	R	0x0	Tx Queue Get Index
7-6	NU62	R	0x0	Reserved
5-0	TFFL	R	0x0	Tx FIFO Free Level

11.4.3.5.1.62 TXESC Register (Offset = 2C8h) [Reset = 00000000h]

TXESC is shown in Table 11-1539.

Return to the Summary Table.

TXESC

31-0	RES15	R	0x0	Reserved

11.4.3.5.1.72 TXEFC Register (Offset = 2F0h) [Reset = 00000000h]

TXEFC is shown in Table 11-1549.

Return to the Summary Table.

TXEFC

Table 11-1549. TXEFC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	NU68	R/W	0x0	Reserved
29-24	EFWM	R/W	0x0	Event FIFO Watermark
23-22	NU67	R/W	0x0	Reserved
21-16	EFS	R/W	0x0	Event FIFO Size
15-2	EFSA	R/W	0x0	Event FIFO Start Address
1-0	NU66	R/W	0x0	Reserved

11.4.3.5.1.73 TXEFS Register (Offset = 2F4h) [Reset = 00000000h]

TXEFS is shown in Table 11-1550.

Return to the Summary Table.

TXEFS

Table 11-1550. TXEFS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	NU72	R	0x0	Reserved
25	TEFL	R	0x0	Tx Event FIFO Element Lost
24	EFF	R	0x0	Event FIFO Full
23-21	NU71	R	0x0	Reserved
20-16	EFPI	R	0x0	Event FIFO Put Index
15-13	NU70	R	0x0	Reserved
12-8	EFGI	R	0x0	Event FIFO Get Index
7-6	NU69	R	0x0	Reserved
5-0	EFFL	R	0x0	Event FIFO FIll Level

11.4.3.5.1.74 TXEFA Register (Offset = 2F8h) [Reset = 00000000h]

TXEFA is shown in Table 11-1551.

Return to the Summary Table.

TXEFA

Table 11-1551. TXEFA Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	NU73	R	0x0	Reserved
4-0	EFAI	R	0x0	Event FIFO Acknowledge Index

11.4.3.5.1.75 RES16 Register (Offset = 2FCh) [Reset = 00000000h]

RES16 is shown in Table 11-1552.

Return to the Summary Table.

RES16

Table 11-1552. RES16 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	RES16	R	0x0	Reserved

11.4.3.5.2 MSS_MCAN_ECC Registers

Table 11-1553 lists the memory-mapped registers for the MSS_MCAN_ECC registers. All register offset addresses not listed in Table 11-1553 should be considered as reserved locations and the register contents should not be modified.

Table 11-1553. MSS_MCAN_ECC Registers

Offset	Acronym	Register Name	Section
0h	REV	REV	Go
8h	VECTOR	VECTOR	Go
Ch	STAT	STAT	Go
14h	CTRL	CTRL	Go
18h	ERR_CTRL1	ERR_CTRL1	Go
1Ch	ERR_CTRL2	ERR_CTRL2	Go
20h	ERR_STAT1	ERR_STAT1	Go
24h	ERR_STAT2	ERR_STAT2	Go
28h	ERR_STAT3	ERR_STAT3	Go
3Ch	SEC_EOI_REG	SEC_EOI_REG	Go

80h	SEC_ENABLE_SET_REG0	SEC_ENABLE_SET_REG0	Go
C0h	SEC_ENABLE_CLR_REG0	SEC_ENABLE_CLR_REG0	Go
13Ch	DED_EOI_REG	DED_EOI_REG	Go
140h	DED_STATUS_REG0	DED_STATUS_REG0	Go
180h	DED_ENABLE_SET_REG0	DED_ENABLE_SET_REG0	Go
1C0h	DED_ENABLE_CLR_REG0	DED_ENABLE_CLR_REG0	Go
200h	AGGR_ENABLE_SET	AGGR_ENABLE_SET	Go
204h	AGGR_ENABLE_CLR	AGGR_ENABLE_CLR	Go
208h	AGGR_STATUS_SET	AGGR_STATUS_SET	Go
20Ch	AGGR_STATUS_CLR	AGGR_STATUS_CLR	Go

Complex bit access types are encoded to fit into small table cells. Table 11-1554 shows the codes that are used for access types in this section.

Table 11-1554. MSS_MCAN_ECC Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

11.4.3.5.2.1 REV Register (Offset = 0h) [Reset = 66A03A01h]

REV is shown in Table 11-1555.

Return to the Summary Table.

Aggregator Revision Register

Table 11-1555. REV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	SCHEME	R	1h	Scheme
29-28	BU	R	2h	bu
27-16	MODULE_ID	R	6A0h	Module ID
15-11	REVRTL	R	7h	RTL version
10-8	REVMAJ	R	2h	Major version
7-6	CUSTOM	R	0h	Custom version
5-0	REVMIN	R	1h	Minor version

11.4.3.5.2.2 VECTOR Register (Offset = 8h) [Reset = 00000000h]

VECTOR is shown in Table 11-1556.

Return to the Summary Table.

ECC Vector Register

Table 11-1556. VECTOR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	NU1	R	0h	Reserved
24	RD_SVBUS_DONE	R/W	0h	Status to indicate if read on serial VBUS is complete, write of any value will clear this bit. Writing 1 to any bit will clear the corresponding bits. Reads do not alter the value of the field.
23-16	RD_SVBUS_ADDR	R/W	0h	Read address
15	RD_SVBUS	R/W	0h	Write 1 to trigger a read on the serial VBUS. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field.
14-11	NU0	R	0h	Reserved
10-0	ECC_VEC	R/W	0h	Value written to select the corresponding ECC RAM for control or status

11.4.3.5.2.3 STAT Register (Offset = Ch) [Reset = 00000002h]

STAT is shown in Table 11-1557.

Return to the Summary Table.

Misc Status

Table 11-1557. STAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU2	R	0h	Reserved
10-0	NUM_RAMS	R	2h	Indicates the number of RAMS serviced by the ECC aggregator

11.4.3.5.2.4 CTRL Register (Offset = 14h) [Reset = 00000187h]

CTRL is shown in Table 11-1558.

Return to the Summary Table.

CTRL

Table 11-1558. CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	NU3	R	0h	TI Internal : Reserved
8	CHECK TIMEOUT	W	1h	TI Internal : Check timeout
7	CHECK PARITY	W	1h	TI Internal : Check Parity
6	ERROR_ONCE	W	0h	TI Internal : Force Error only once
5	FORCE_N_ROW	W	0h	TI Internal : Force Error on any RAM read
4	FORCE_DED	W	0h	TI Internal : Force Double Bit Error
3	FORCE_SEC	W	0h	TI Internal : Force Single Bit Error
2	EN_RMW	W	1h	TI Internal : Enable rmw
1	ECC_CHK	W	1h	TI Internal : Enable ECC check
0	ECC_EN	W	1h	TI Internal : Enable ECC

11.4.3.5.2.5 ERR_CTRL1 Register (Offset = 18h) [Reset = 00000000h]

ERR_CTRL1 is shown in Table 11-1559.

Return to the Summary Table.

ERR_CTRL1

Table 11-1559. ERR_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ECC_ROW	R/W	0h	TI Internal : Row address where single or double-bit error needs to be applied. This is ignored if force_n_row is set

11.4.3.5.2.6 ERR_CTRL2 Register (Offset = 1Ch) [Reset = 00000000h]

ERR_CTRL2 is shown in Table 11-1560.

Return to the Summary Table.

ERR_CTRL2

Table 11-1560. ERR_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	ECC_BIT2	R/W	0h	TI Internal : Data bit that needs to be flipped if double bit error needs to be forced
15-0	ECC_BIT1	R/W	0h	TI Internal : Data bit that needs to be flipped when force_sec is set

11.4.3.5.2.7 ERR_STAT1 Register (Offset = 20h) [Reset = 00000000h]

ERR_STAT1 is shown in Table 11-1561.

Return to the Summary Table.

ERR_STAT1

Table 11-1561. ERR_STAT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	ECC_BIT1_STS	R	0h	TI Internal : Data bit that corresponds to the single-bit error
15	CLR_ECC_CTRL_REG	W	0h	TI Internal : Clear Ctrl Reg Error Status. Write 1 to clear. This bit is self clearing.
14-13	CLR_ECC_PAR	W	0h	TI Internal : Clear Parity Error Status. Write 1 to clear. This bit is self clearing.
12	CLR_ECC_OTHER	W	0h	TI Internal : Clear Other Error Status. Write 1 to clear. This bit is self clearing.
11-10	CLR_ECC_DED	W	0h	TI Internal : Clear Double Bit Error Status. Write 1 to clear. This bit is self clearing.
9-8	CLR_ECC_SEC	W	0h	TI Internal : Clear Single Bit Error Status. Write 1 to clear. This bit is self clearing.
7	ECC_CTRL_REG	W	0h	TI Internal : Force ctrl reg pending interrupt. Write 1 to set. This bit is self clearing.
6-5	ECC_PAR	W	0h	TI Internal : Force ECC parity pending interrupt. Write 1 to set. This bit is self clearing.
4	ECC_OTHER	W	0h	TI Internal : Force ECC other pending interrupt. Write 1 to set. This bit is self clearing.
3-2	ECC_DED	W	0h	TI Internal : Force ECC DED pending interrupt. Write 1 to set. This bit is self clearing.
1-0	ECC_SEC	W	0h	TI Internal : Force ECC SEC pending interrupt. Write 1 to set. This bit is self clearing.

11.4.3.5.2.8 ERR_STAT2 Register (Offset = 24h) [Reset = 00000000h]

ERR_STAT2 is shown in Table 11-1562.

Return to the Summary Table.

ERR_STAT2

Table 11-1562. ERR_STAT2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ECC_ROW	R	0h	TI Internal : Row address where the single or double-bit error has occurred

11.4.3.5.2.9 ERR_STAT3 Register (Offset = 28h) [Reset = 00000000h]

ERR_STAT3 is shown in Table 11-1563.

Return to the Summary Table.

ERR_STAT3

Table 11-1563. ERR_STAT3 Register Field Descriptions

31-10	NU6	R	0h	TI Internal : Reserved
9	CLR_TIMEOUT_PEND	W	0h	TI Internal : Clear timeout pending
8-2	NU5	R	0h	TI Internal : Reserved
1	TIMEOUT_PEND	W	0h	TI Internal : Timeout pending
0	NU4	R	0h	TI Internal : Reserved

11.4.3.5.2.10 SEC_EOI_REG Register (Offset = 3Ch) [Reset = 00000000h]

SEC_EOI_REG is shown in Table 11-1564.

Return to the Summary Table.

EOI Register

Table 11-1564. SEC_EOI_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU7	R	0h	Reserved
0	SEC_EOI_WR	R/W	0h	EOI Register. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field. This bit is self clearing, reading this bit will return 0.

11.4.3.5.2.11 SEC_STATUS_REG0 Register (Offset = 40h) [Reset = 00000000h]

SEC_STATUS_REG0 is shown in Table 11-1565.

Return to the Summary Table.

Interrupt Status Register 0

Table 11-1565. SEC_STATUS_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU8	R	0h	Reserved
1	CTRL_EDC_VBUSS_PEND	R	0h	Interrupt Pending Status for ctrl_edc_vbuss_pend.
0	SEC_PEND	R	0h	Interrupt Pending Status for msgmem_pend.

11.4.3.5.2.12 SEC_ENABLE_SET_REG0 Register (Offset = 80h) [Reset = 00000000h]

SEC_ENABLE_SET_REG0 is shown in Table 11-1566.

Return to the Summary Table.

Interrupt Enable Set Register 0

Table 11-1566. SEC_ENABLE_SET_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU9	R	0h	Reserved
1	CTRL_EDC_VBUSS_ENABLE_SET	R/W	0h	Interrupt Enable Set Register for ctrl_edc_vbuss_pend. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field.
0	SEC_EN_SET	R/W	0h	Interrupt Enable Set Register for msgmem_pend. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field.

11.4.3.5.2.13 SEC_ENABLE_CLR_REG0 Register (Offset = C0h) [Reset = 00000000h]

SEC_ENABLE_CLR_REG0 is shown in Table 11-1567.

Return to the Summary Table.

Interrupt Enable Clear Register 0

Table 11-1567. SEC_ENABLE_CLR_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU10	R	0h	Reserved
1	CTRL_EDC_VBUSS_ENABLE_CLR	R/W	0h	Interrupt Enable Clear Register for ctrl_edc_vbuss_pend. Writing 1 to any bit will clear the corresponding bits. Reads do not alter the value of the field. Reading this bit will return 0.
0	SEC_EN_CLR	R/W	0h	Interrupt Enable Clear Register for msgmem_pend. Writing 1 to any bit will clear the corresponding bits. Reads do not alter the value of the field. Reading this bit will return 0.

11.4.3.5.2.14 DED_EOI_REG Register (Offset = 13Ch) [Reset = 00000000h]

DED_EOI_REG is shown in Table 11-1568.

Return to the Summary Table.

EOI Register

Table 11-1568. DED_EOI_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	NU11	R	0h	Reserved
0	DED_EOI_WR	R/W	0h	EOI Register. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field. This bit is self clearing, reading this bit will return 0.

11.4.3.5.2.15 DED_STATUS_REG0 Register (Offset = 140h) [Reset = 00000000h]

DED_STATUS_REG0 is shown in Table 11-1569.

Return to the Summary Table.

Interrupt Status Register 0

Table 11-1569. DED_STATUS_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU12	R	0h	Reserved
1	CTRL_EDC_VBUSS_PEND	R	0h	Interrupt Pending Status for ctrl_edc_vbuss_pend.
0	DED_PEND	R	0h	Interrupt Pending Status for msgmem_pend.

11.4.3.5.2.16 DED_ENABLE_SET_REG0 Register (Offset = 180h) [Reset = 00000000h]

DED_ENABLE_SET_REG0 is shown in Table 11-1570.

Return to the Summary Table.

Interrupt Enable Set Register 0

Table 11-1570. DED_ENABLE_SET_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU13	R	0h	Reserved
1	CTRL_EDC_VBUSS_ENABLE_SET	R/W	0h	Interrupt Enable Set Register for ctrl_edc_vbuss_pend. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field.
0	DED_EN_SET	R/W	0h	Interrupt Enable Set Register for msgmem_pend. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field.

11.4.3.5.2.17 DED_ENABLE_CLR_REG0 Register (Offset = 1C0h) [Reset = 00000000h]

DED_ENABLE_CLR_REG0 is shown in Table 11-1571.

Return to the Summary Table.

Interrupt Enable Clear Register 0

Table 11-1571. DED_ENABLE_CLR_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU14	R	0h	Reserved
1	CTRL_EDC_VBUSS_ENABLE_CLR	R/W	0h	Interrupt Enable Clear Register for ctrl_edc_vbuss_pend. Writing 1 to any bit will clear the corresponding bits. Reads do not alter the value of the field. Reading this bit will return 0.
0	DED_EN_CLR	R/W	0h	Interrupt Enable Clear Register for msgmem_pend. Writing 1 to any bit will clear the corresponding bits. Reads do not alter the value of the field. Reading this bit will return 0.

11.4.3.5.2.18 AGGR_ENABLE_SET Register (Offset = 200h) [Reset = 00000000h]

AGGR_ENABLE_SET is shown in Table 11-1572.

Return to the Summary Table.

AGGR interrupt enable set Register

Table 11-1572. AGGR_ENABLE_SET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU15	R	0h	Reserved
1	TIMEOUT	R/W	0h	Interrupt Enable Set Register for svbus timeout errors. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field.
0	PARITY	R/W	0h	Interrupt Enable Set Register for parity errors. Writing 1 to any bit will set the corresponding bit. Reads do not alter the value of the field.

11.4.3.5.2.19 AGGR_ENABLE_CLR Register (Offset = 204h) [Reset = 00000000h]

AGGR_ENABLE_CLR is shown in Table 11-1573.

Return to the Summary Table.

AGGR interrupt enable clear Register

Table 11-1573. AGGR_ENABLE_CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU16	R	0h	Reserved
1	TIMEOUT	R/W	0h	Interrupt Enable Clear for svbus timeout errors. Writing 1 to any bit will clear the corresponding bits. Reads do not alter the value of the field. Reading this bit will return 0.
0	PARITY	R/W	0h	Interrupt Enable Clear for parity errors. Writing 1 to any bit will clear the corresponding bits. Reads do not alter the value of the field. Reading this bit will return 0.

11.4.3.5.2.20 AGGR_STATUS_SET Register (Offset = 208h) [Reset = 00000000h]

AGGR_STATUS_SET is shown in Table 11-1574.

Return to the Summary Table.

AGGR interrupt status set Register

Table 11-1574. AGGR_STATUS_SET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	NU17	R	0h	Reserved
3-2	TIMEOUT	R/W	0h	Interrupt status set for svbus timeout errors. A write to increment field. Writing a value to this field increment the field value by the value written. Reads do not alter the value of the field.
1-0	PARITY	R/W	0h	Interrupt status set for parity errors. A write to increment field. Writing a value to this field increment the field value by the value written. Reads do not alter the value of the field.

11.4.3.5.2.21 AGGR_STATUS_CLR Register (Offset = 20Ch) [Reset = 00000000h]

AGGR_STATUS_CLR is shown in Table 11-1575.

Return to the Summary Table.

AGGR interrupt status clear Register

Table 11-1575. AGGR_STATUS_CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	NU18	R	0h	Reserved
3-2	TIMEOUT	R/W	0h	Interrupt status clear for svbus timeout errors. A write to decrement field. Writing a value to this field decrements the field value by the value written. Reads do not alter the value of the field.
1-0	PARITY	R/W	0h	Interrupt status clear for parity errors. A write to decrement field. Writing a value to this field decrements the field value by the value written. Reads do not alter the value of the field.

11.5 Audio Interfaces

11.5.1 Multichannel Audio Serial Port (McASP)

This section describes the multichannel audio serial port (McASP).

11.5.1.1 McASP Overview

This section introduces the multichannel audio serial port (McASP) module and describes its main functions and connections in the device.

Note

The McASP is also known as RCSS_MCASP.

The McASP functions as a general-purpose audio serial port optimized to the requirements of various audio applications. The McASP module can operate in both transmit and receive modes. The McASP is useful for time-division multiplexed (TDM) stream, Inter-IC Sound (I2S) protocols reception and transmission as well as for an intercomponent digital audio interface transmission (DIT). The McASP has the flexibility to gluelessly connect to a Sony/Philips digital interface (S/PDIF) transmit physical layer component.

Although intercomponent digital audio interface reception (DIR) mode (i.e. S/PDIF stream receiving) is not natively supported by the McASP module, a specific TDM mode implementation for the McASP receivers allows an easy connection to external DIR components (for example, S/PDIF to I2S format converters).

The device have integrated three McASP modules with:

- McASP1 supporting up to 16 channels with independent TX/RX clock/sync domain
- McASP2 and McASP3 support up to 6 channels with independent TX/RX clock/sync domain.

shows the McASP modules in the device.

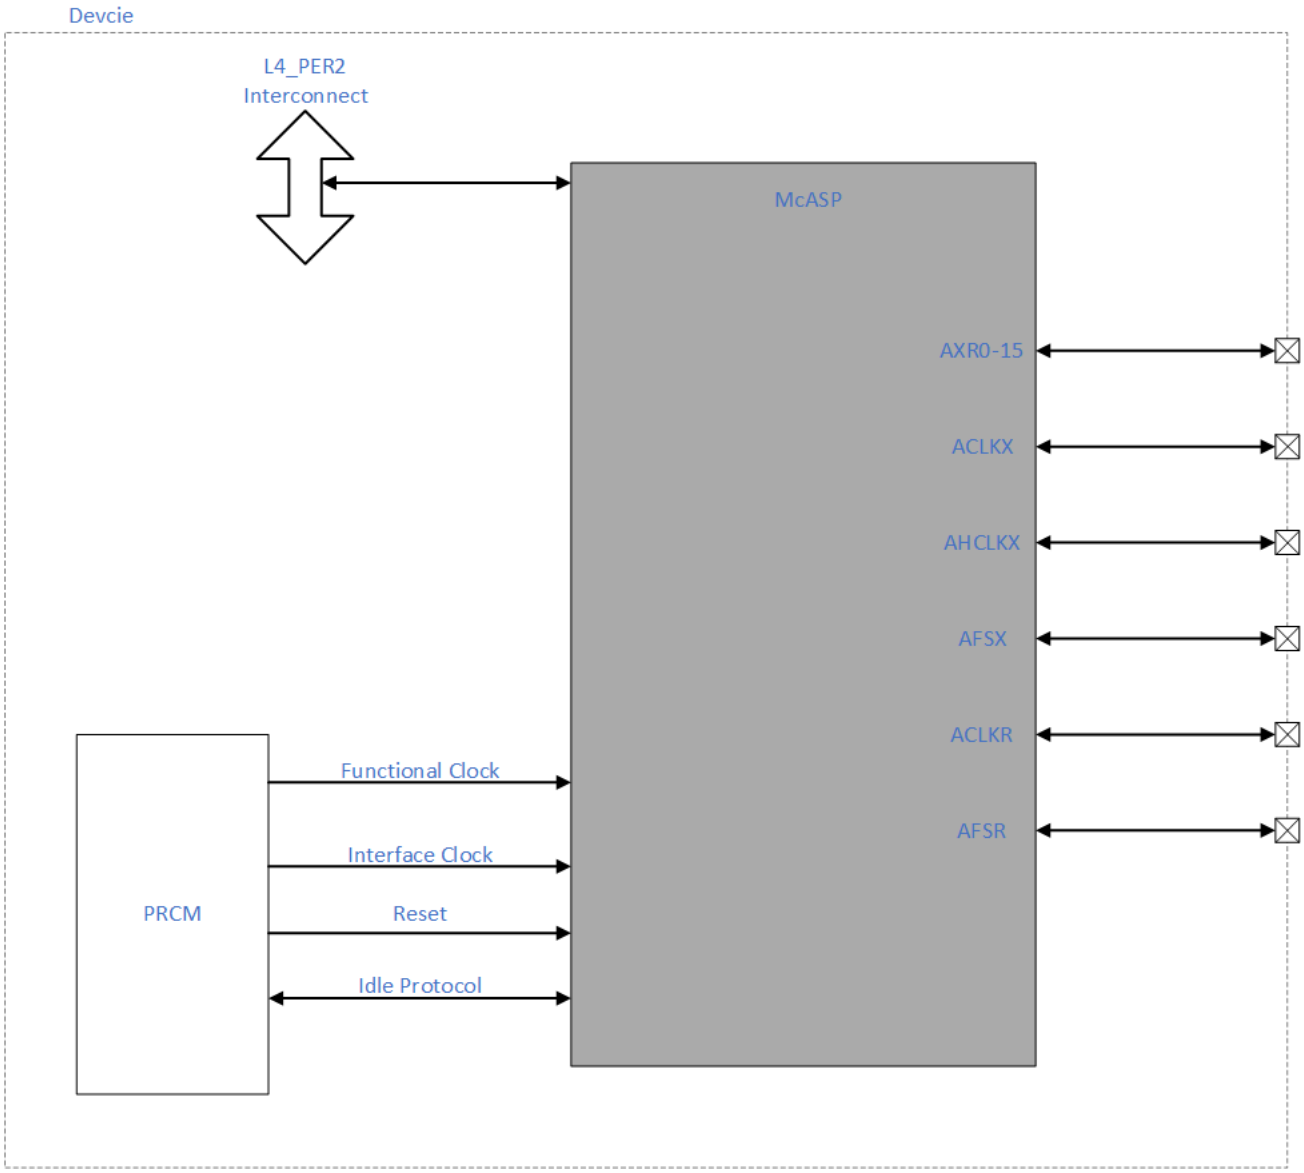

Figure 11-337. McASP Modules Overview

McASP module includes the following main features:

- Independent serializer for each AXRx channel.
- Idle request/acknowledge protocol
- A single 32-bit buffer per serializer for transmit and receive operations
- 2 x interconnect slave interface ports:
  - A configuration (CFG) port supplied with an internal L4-interconnect interface clock
  - A slave DMA data port synchronized with functional clock
- Two independent clock generator modules for transmit and receive.
  - Clocking flexibility allows the McASP to receive and transmit at different rates. For example, the McASP can receive data at 48 kHz but output up-sampled data at 96 kHz or 192 kHz.
- McASP module functional clock can be generated:
  - internally (master mode)
  - supplied over McASP serial interface (slave mode)
  - has a controllable functional clock divide ratio

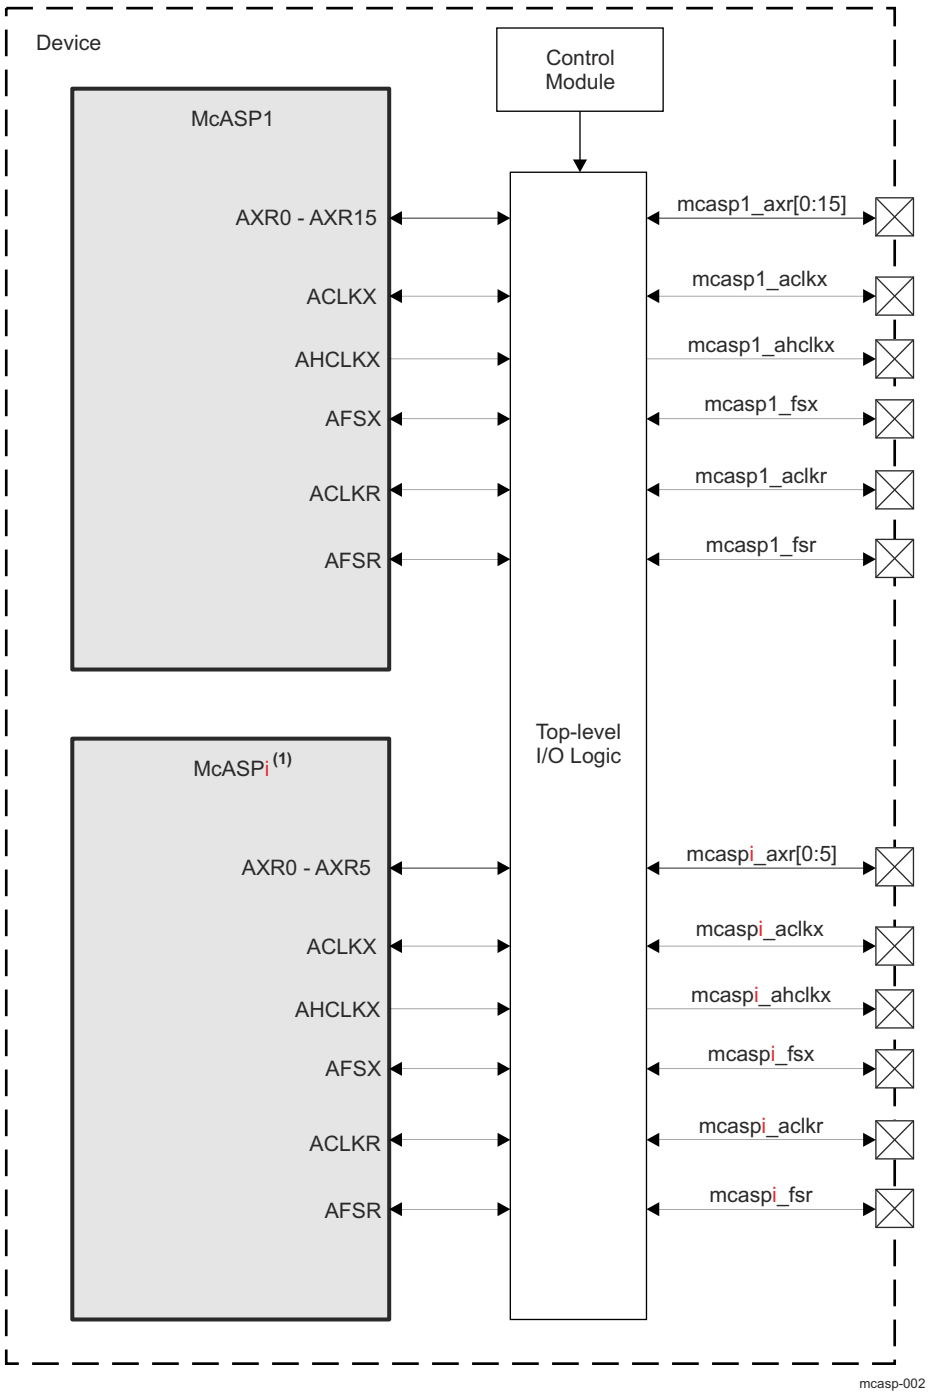
- Independent transmit and receive modules, each includes:
  - Programmable clock and frame sync generator.
  - TDM streams from 2 to 32, and 384 time slots.
  - Support for time slot sizes of 8, 12, 16, 20, 24, 28, and 32 bits.
  - Data formatter for bit manipulation.
- Glueless connection to audio analog-to-digital converters (ADC), digital-to-analog converters (DAC), codec, digital audio interface receiver (DIR), and S/PDIF transmit physical layer components.
- Wide variety of I2S and similar bit-stream format.
- Integrated digital audio interface transmitter (DIT):
  - S/PDIF, IEC60958-1, AES-3 formats.
  - Enhanced channel status/user data RAM.
- 384-slot TDM with external digital audio interface receiver (DIR) device.
  - For DIR reception, an external DIR receiver integrated circuit should be used with I2S output format and connected to the McASP receive section.
- Support for 2x DMA requests (one per direction):
  - 1 level-sensitive transmit direct memory access (DMA) request common for all of the McASP serializers
  - 1 level-sensitive receive direct memory access (DMA) request common for all of the McASP serializers
  - All transmit DMA requests are mapped to the device DMA crossbar
- One transmit interrupt request common for all serializers
- One receive interrupt request common for all serializers
- Each of the Rx and Tx interrupts is propagated to different host processors via the device Interrupt Crossbar

Note

Because a serializer receive and transmit channels data is shared on the same McASP data pin, user can choose to have either Tx or Rx function from a serializer, not both at the same time.

11.5.1.2 McASP Environment

This section describes the McASP application fields from an environment point of view (external connections), along with the McASP connectivity options. This section also lists all of the possible interfaces and describes the protocol and data format used in each case. Figure 11-338 shows the McASP modules in their environment in the device.



A. i = 2 and 3

Figure 11-338. McASP Environment

11.5.1.2.1 McASP Signals

Table 11-1576 describes the McASP pins, their corresponding signal names at device level and specifies their links to functions.

Table 11-1576. McASP I/O Signals

Module Pin Name	Device Level Signal Name	I/O[1]	Description	Module Pin Reset Value
		McASP1 module		
AXR0	mcasp1_axr[0]	I/O	Audio transmit/receive data - channel 0	HiZ
AXR1	mcasp1_axr[1]	I/O	Audio transmit/receive data - channel 1	HiZ
AXR2	mcasp1_axr[2]	I/O	Audio transmit/receive data - channel 2	HiZ
AXR3	mcasp1_axr[3]	I/O	Audio transmit/receive data - channel 3	HiZ

Table 11-1576. McASP I/O Signals (continued)

Module Pin Name	Device Level Signal Name	I/O(1)	Description	Module Pin Reset Value
ACLKX	mcasp3_aclkx	I/O	Transmit bit clock	HiZ
AHCLKX	mcasp3_ahclkx	O	Transmit high-frequency master clock	HiZ
AFSX	mcasp3_fsx	I/O	Transmit frame synchronization	HiZ
ACLKR	mcasp3_aclkr	I/O	Receive bit clock	HiZ
AFSR	mcasp3_fsr	I/O	Receive frame synchronization	HiZ

(1) I = Input; O = Output; I/O = Bidirectional

Note

For the mcaspx_aclkx, mcaspx_ahclkx and mcaspx_aclkr signals to work properly, the INPUTENABLE bit of the appropriate CTRL_CORE_PAD_x registers should be set to 0x1 because of retiming purposes.

Note

The path from module pin to device pad(s) is defined at the device I/O logic level. The I/O logic maps the module signals to the different pads of the device and is programmable in the Control Module registers. For more information, refer to the *Pad Configuration Registers* and *Control Module Register Manual* in *Control Module*.

Note

Except the pad configuration registers, additional Control Module registers have to be configured to map McASP2 and McASP3 signals to the device pads. The MUXMODE field of the corresponding pad configuration register has to be set to 0xF and the corresponding bit in CTRL_CORE_SMA_SW_14 and CTRL_CORE_SMA_SW_15 has to be set to 0x1.

Note

A serializer AXR data pin is shared between the transmit and receive logic of that serializer. The direction of data is determined in the MCASP_PDIR and the function (Tx or Rx) is selected in the corresponding serializer control register MCASP_XRSRCTLn.

11.5.1.2.2 Protocols and Data Formats

11.5.1.2.2.1 Protocols Supported

The McASP supports a wide variety of protocols:

- Transmit section supports:
  - Wide variety of I2S and similar bit-stream formats.
  - TDM streams from 2 to 32 time slots.
  - S/PDIF, IEC60958-1, AES-3 formats.
- Receive section supports:
  - Wide variety of I2S and similar bit-stream formats.
  - TDM streams from 2 to 32 time slots.
  - TDM stream of 384 time slots specifically designed for easy interface to external digital interface receiver (DIR) device transmitting DIR frames to McASP using the I2S protocol (one time slot for each DIR subframe).

The transmit and receive sections of the module may be individually programmed to support the following options on the basic serial protocol:

- Programmable clock and frame sync polarity (rising or falling edge): ACLKR/X, AHCLKR/X, and AFSR/X.
- Slot length (number of bits per time slot): 8, 12, 16, 20, 24, 28, 32 bits supported.
- Word length (bits per word): 8, 12, 16, 20, 24, 28, 32 bits; always less than or equal to the time slot length.
- First-bit data delay: 0, 1, 2 bit clocks.
- Left/right alignment of word inside slot.
- Bit order: MSB first or LSB first.
- Bit mask/pad/rotate function.
  - Automatically aligns data internally in either Q31 or integer formats.
  - Automatically masks nonsignificant bits (sets to 0, 1, or extends value of another bit).

Note

In I2S mode, the transmit and receive sections can support simultaneous transfers on up to all serial data pins operating as 192 kHz stereo channels.

In DIT mode for McASP, additional features of the transmitters are:

- Transmit-only mode 384 time slots (subframe) per frame.
- Biphase encoded LVCMOS output
- Channel status RAM (384 bits).
- User data RAM (384 bits).
- Separate valid bit (V) for subframe A, B.
- Stereo Support Only (Mono means send data 2x via software)

In DIT mode, the transmitter can support a 192 kHz frame rate (stereo) on up to all serial data pins simultaneously (note that the internal bit clock for DIT runs two times faster than the equivalent bit clock for I2S mode, due to the need to generate Biphase Mark Encoded Data).

Note

The McASP does NOT natively support DIR-mode reception (i.e. receiving in the S/PDIF format). To allow this, the McASP can use a DIR-input to I2S-output converter implemented by an external device (i.e. external DIR component). To facilitate reception in this case, the TDM mode of McASP receivers logic is extended to support a non-standard 384-slot TDM stream.

Note

An external transceiver must be connected to the McASP port in the device to translate the electrical signals delivered by the McASP (1.2 V or 1.8 V LVCMOS levels) to the electrical levels of the S/PDIF standard.

11.5.1.2.2.2 Definition of Terms

The serial bitstream transmitted or received by a McASP serializer is a long sequence of 1s and 0s on an audio transmit/receive pins AXRn. However, the sequence has a hierarchical organization that can be described in terms of frames of data, slots, words, and bits.

A basic synchronous serial interface consists of three important components: clock, frame sync, and data. Figure 11-339 shows two of the three basic components: the clock signal (ACLKX/ACLKR) and the data signals AXRn. Figure 11-339 does not specify whether the clock is for transmit (ACLKX) or receive (ACLKR) because the definitions of terms apply to both receive and transmit interfaces. In operation, each transmitter and receiver uses the signals ACLKX and ACLKR as serial clock, respectively. Optionally, a receiver can use ACLKX as the serial clock when a transmitter and receiver (not from the same serializer) of the McASP are configured to operate synchronously.

- Bit:

A bit is the smallest entity in the serial data stream. The beginning and end of each bit is marked by an edge of the serial clock. The duration of a bit is a serial clock period. A '1' is represented by a logic high on AXRn pins for the entire duration of the bit. A 0 is represented by a logic low on an AXRn pin for the entire duration of the bit.

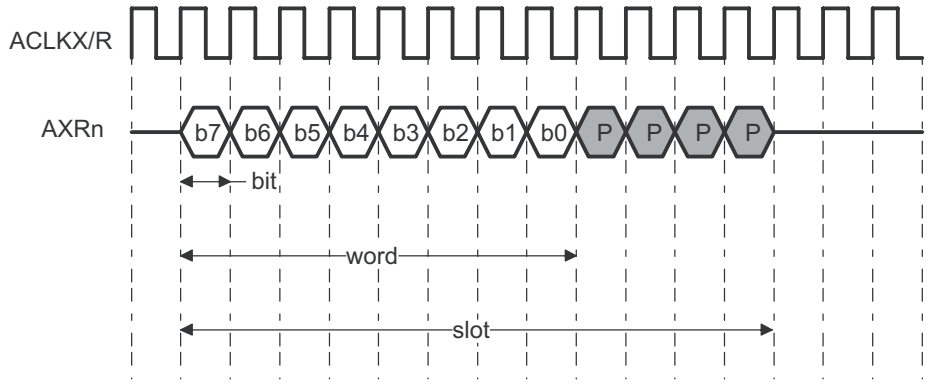
- Word:

  A word is a group of bits that make up the data being transferred between the McASP and the external device. Figure 11-339 shows an 8-bit word.

- Slot:

  A slot consists of the bits that make up the word and can consist of additional bits used to pad the word to a convenient number of bits for the interface between the McASP and the external device. In Figure 11-339, the audio data consists of only 8 bits of useful data (8-bit word), but it is padded with four 0s (12-bit slot) to satisfy the desired protocol in interfacing to an external device. Within a slot, the bits can be shifted out of the McASP on an AXRn pin with either MSB or LSB first.

  When the word size is smaller than the slot size, the word can be aligned to the left of the slot (beginning) or to the right of the slot (end). The additional bits in the slot not belonging to the word can be padded with 0, 1, or with one of the bits (typically, the MSB or LSB) from the data word, i.e. left-aligned words within a slot are terminated with padding bits and right-aligned words within a slot are preceded by padding bits to fit in the slot size. Figure 11-340 shows these options.



(1) b7:b0 - bits. Bits b7 to b0 form a word.

(2) P - pad bits. Bits b7 to b0, together with the 4 pad bits, form a slot.

(3) In this example, the data is transmitted MSB first, left-aligned.

mcasp-003

Figure 11-339. Definition of Bit, Word, and Slot

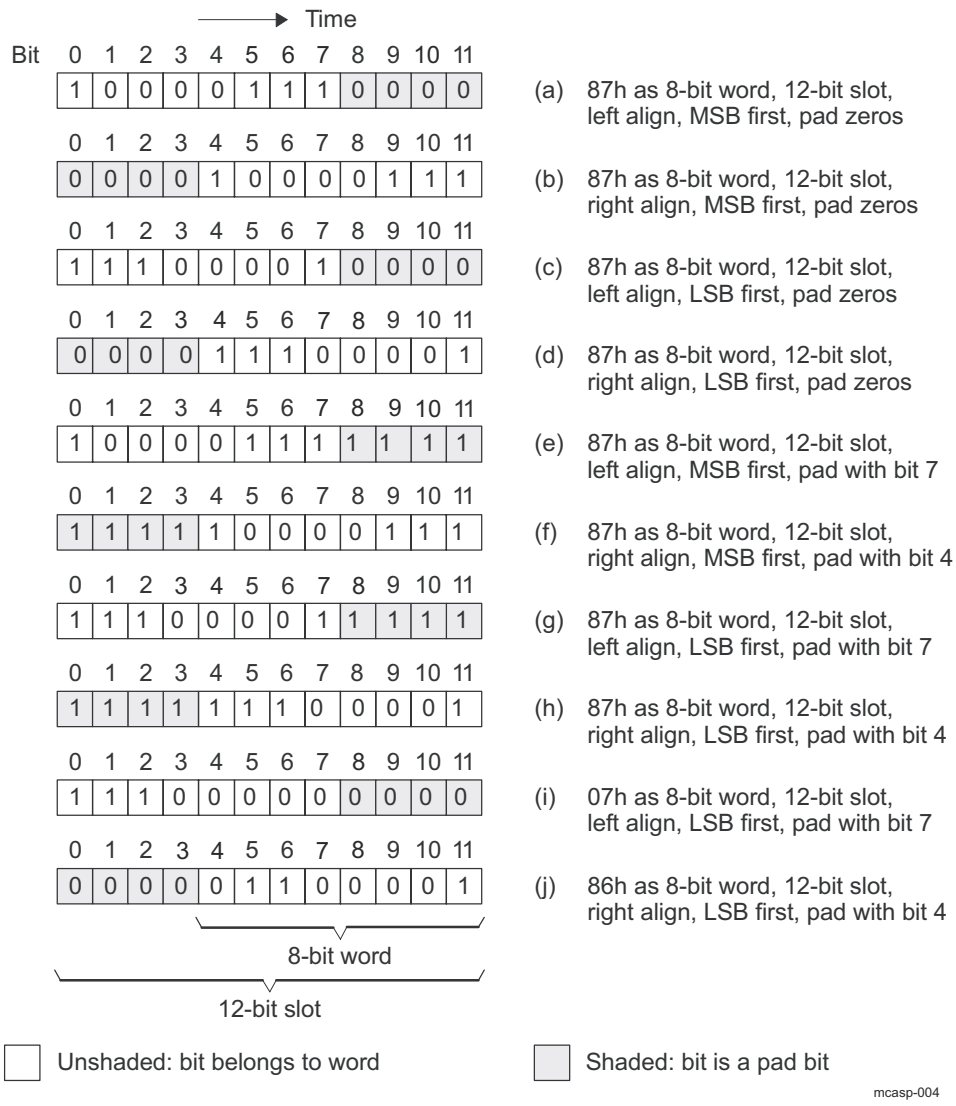


Figure 11-340. Bit Order and Word Alignment Within a Slot Examples

- Frame

  The third basic element of a synchronous serial interface is the frame synchronization signal, also referred to as frame sync in this chapter. A frame contains one or multiple slots, as determined by the desired protocol. Figure 11-341 shows an example frame of data and the frame definitions. In operation, the transmitter uses AFSX, and the receiver - AFSR signal. Figure 11-341 does NOT specify whether the frame sync (FS) is for transmit (AFSX) or receive (AFSR) because the definitions of terms apply to both receive and transmit interfaces. In operation, each transmitter/receiver uses AFSX/AFSR as a frame synchronization signal, respectively. Optionally, the receiver can use AFSX as the frame sync when the transmitter and receiver of the McASP are configured to operate synchronously. This example shows two slots in a frame (I2S format) and a frame-sync (FS) duration of a slot length.

  This section shows only the generic definition of the frame sync. For more information about the frame-sync formats required for the transfer modes and protocols (TDM-mode and DIT-mode supported formats), see Section 11.5.1.2.2.3, *TDM Format* and Section 11.5.1.2.2.5, *S/PDIF-Coding Format*.

Note

All of the McASP serializers share the same, device pad accessible, clock and frame signals, as follows:

– AHCLKX, ACLKX, and AFSX for the transmitting section
– ACLKR and AFSR for the receiving section

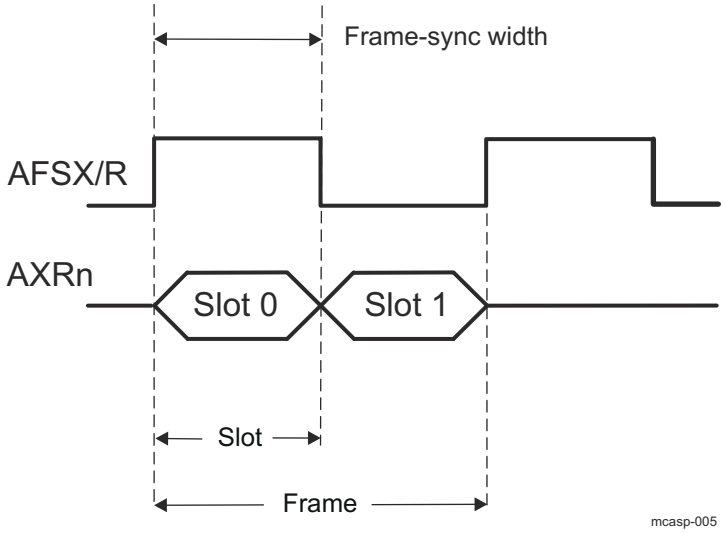

Figure 11-341. Definition of Frame and Frame-Sync Width

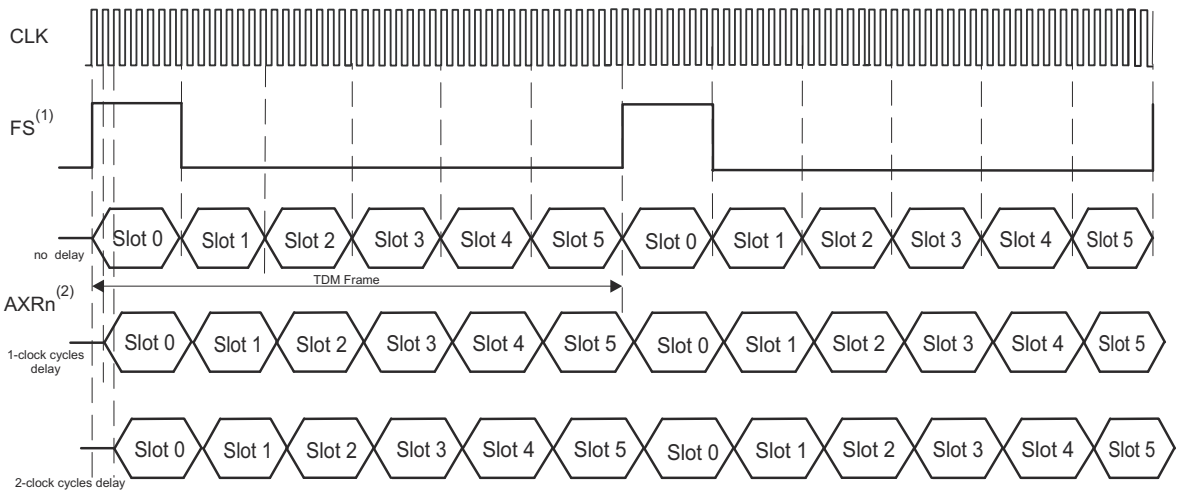
The following terms are used throughout this chapter:

- TDM: Time-division multiplexed. See Section 11.5.1.2.2.3 for details on the TDM protocol
- I2S: Inter-Integrated Sound protocol, commonly used on audio interfaces. The McASP supports the I2S protocol as part of the TDM mode (when configured as a 2-slot frame).
- DIT: Digital audio interface transmit. The McASP supports transmitting in S/PDIF format on each AXRn data pin.
- DIR: Digital audio interface receive. The McASP does NOT natively support receiving in S/PDIF format on AXRn data pins and requires an external DIR-to-TDM or DIR-to-I2S converter chip for a DIR-frame reception.
- Slot or time slot: For DIT/DIR format, a McASP time slot corresponds to a DIT/DIR subframe.

11.5.1.2.2.3 TDM Format

The TDM format is used to transfer data between the host CPU and one or more analog-to-digital converter (ADC), digital-to-analog converter (DAC), or S/PDIF receiver (DIR) devices. An example for a 6-slot (channel) TDM transmission on one McASP data pin - AXRn is illustrated on Figure 11-342.



(1) - Frame sync duration of 1 slot - length is shown. A single bit - duration of FS is also supported

(2) - Slot 0 of AXRn stream is being offset with 0-, 1-, and 2- clock cycle delay from the frame sync, respectively.

mcasp-006

Figure 11-342. TDM Format - 6 channel example

The TDM format uses three signals In a basic synchronous serial interface: data (AXRn), clock (CLK) and frame sync (FS). The data signal present on AXRn pin is fully synchronous to the serial clock (ACLKX or ACLKR). The data bits are grouped into words and slots (see also Section 11.5.1.2.2.2), the latter being also refered to as the "time-slots" or "channels" in TDM terminology. A frame consists of multiple time-slots. Each TDM frame is marked by the frame sync signal (AFSX or AFSR). The TDM transfer is continuous and periodic, with no delays between slots.

Within a certain frame, the last bit of slot N is followed immediately on the next serial clock with the first bit of the next slot N+1. On the boundary between two adjacent TDM-frames, the last bit of the last slot from the frame M, is followed immediately on the next clock cycle with the first bit of the first slot from the next frame M+1. For McASP, there is an option to offset the first bit of the first slot with a 0-,1- or 2-cycle delay from the frame sync signal.

The frame sync - AFSX/AFSR only marks the beginning of slot 0 and start of a new frame. Since it does not determine the boundaries of a slot, there is a requirement for a connected transmitter and receiver to agree on the number of transferred bits per slot.

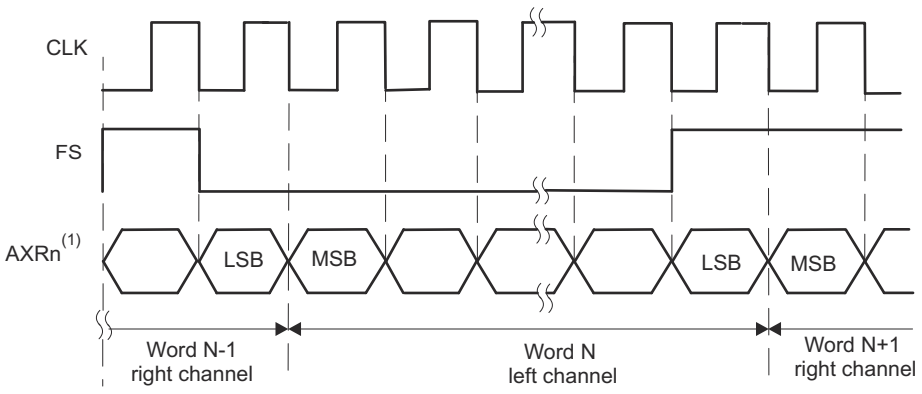
In a typical audio system involving McASP module, a single TDM data frame is transferred during each sample period Ts of a data converter. The user has following choices to implement multiple channels:

- Use more data slots (on a price of higher speed serial clock) per frame transmitted/received on just one of the available McASP data pins AXRn.
- Use less number of slots per TDM frame (requires a slower serial clock), making them available on several of the McASP pins AXRn.

11.5.1.2.2.4 I2S Format

The TDM transfer mode of the McASP supports the I2S format when frame is configured to have 2 slots. I2S format is specifically designed to transfer a stereo channel (left and right) over a single data pin AXRn. "Slots" are also commonly referred to as "channels". The frame width duration in the I2S format equals size of a slot. The frame signal is also referred to as "word select" in the I2S format.

The I2S protocol is illustrated on Figure 11-343.



(1) - The example shows I2S data MSB-first transmission with 1-clock cycle delay between FS and data MSB

mcasp-036

Figure 11-343. I2S Format Overview

11.5.1.2.2.5 S/PDIF Coding Format

The McASP transmitter supports the S/PDIF format with 3.3V biphase-mark encoded output. The S/PDIF format is supported by the DIT- transfer mode of the McASP. This section briefly discusses the S/PDIF coding format.

Note

The DIR- reception of S/PDIF format frames is NOT natively supported from the device McASP. For this purpose, an external DIR-to-TDM transfer mode adapter can be used between the remote device S/PDIF transmitter output and the McASP TDM-only compatible receiver input.

11.5.1.2.2.5.1 Biphase-Mark Code

In S/PDIF format, the digital signal is coded using the biphase-mark code (BMC). For each serializer transmitter n, the clock, frame, and data are embedded in only one signal - the data signal AXRn. In the BMC system, each data bit is encoded into two logical states (00, 01, 10, or 11) at the pin. These two logical states form a cell. The duration of the cell, which equals the duration of the data bit, is called a time interval. A logical 1 is represented by two transitions of the signal within a time interval, which corresponds to a cell with logical states 01 or 10. A logical 0 is represented by one transition within a time interval, which corresponds to a cell with logical states 00 or 11. In addition, the logical level at the start of a cell is inverted from the level at the end of the previous cell. Figure 11-344 and Table 11-1577 show how data is encoded to the BMC format.

As shown in Figure 11-344, the clock frequency is twice the unencoded data bit rate. In addition, the clock is always programmed to 128 × f_s, where f_s is the sample rate (see Section 11.5.1.2.2.5.3, *Frame Format*, for details on how this clock rate is derived based on the S/PDIF format). The device receiving in S/PDIF format can recover the clock and frame information from the BMC signal.

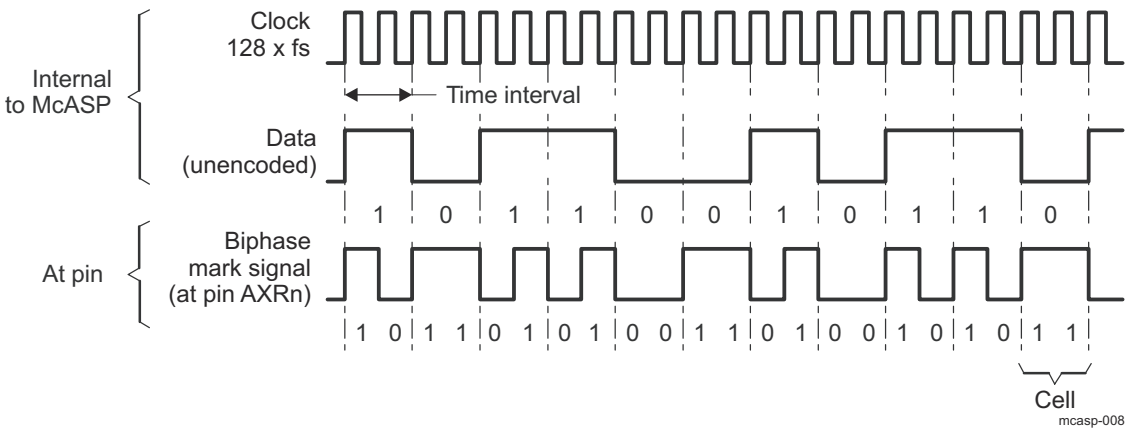


Figure 11-344. Biphase-Mark Code

Table 11-1577. Biphase-Mark Encoder

Data (Unencoded)	Previous State at Pin AXRn	BMC-Encoded Cell Output at Pin AXRn
0	0	11
0	1	00
1	0	10
1	1	01

11.5.1.2.2.5.2 S/PDIF Subframe Format

Every audio sample transmitted in a subframe consists of 32 S/PDIF time intervals (or cells), numbered 0 to 31. Figure 11-345 shows a subframe.

- Time intervals 0–3 carry one of the three permitted preambles to signify the type of audio sample in the current subframe. The preamble is not encoded in BMC format, and therefore the preamble code can contain more than two consecutive 0 or 1 logical states in a row. See Table 11-1578.
- Time intervals 4–27 carry the audio sample word in linear 2s-complement representation. The MSB is carried by time interval 27. When a 24-bit coding range is used, the LSB is in time interval 4. When a 20-bit coding range is used, time intervals 8-27 carry the audio sample word with the LSB in time interval 8. Time intervals 4–7 may be used for other applications and are designated auxiliary sample bits.
- If the source provides fewer bits than the interface allows (20 or 24), the unused LSBs are set to logical 0. For a nonlinear PCM audio application or a data application, the main data field can carry any other information.
- Time interval 28 carries the validity bit (V) associated with the main data field in the subframe.
- Time interval 29 carries the user data channel (U) associated with the main data field in the subframe.
- Time interval 30 carries the channel status information (C) associated with the main data field in the subframe. The channel status indicates if the data in the subframe is digital audio or some other type of data.
- Time interval 31 carries a parity bit (P) such that time intervals 4–31 carry an even number of 1s and an even number of 0s (even parity). As listed in Table 11-1578, the preambles (time intervals 0–3) are also defined with even parity.

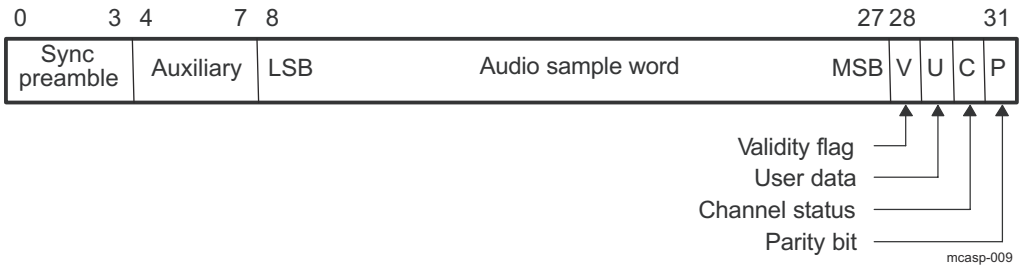

Figure 11-345. S/PDIF Subframe Format

As listed in Table 11-1578, the McASP DIT generates only one polarity of preambles, and it assumes the previous logical state is 0. This is because the McASP assures an even-polarity encoding scheme when transmitting in DIT mode. If an underrun condition occurs, the DIT resynchronizes to the correct logic level on the AXRn pin before continuing with the next transmission.

Table 11-1578. Preamble Codes

Preamble Code(1)	Previous Logical State	Logical States on pin AXRn(2)	Description
B (or Z)	0	1110 1000	Start of a block and subframe 1
M (or X)	0	1110 0010	Subframe 1
W (or Y)	0	1110 0100	Subframe 2

(1) Historically, preamble codes are referred to as B, M, and W. For use in professional applications, preambles are referred to as Z, X, and Y, respectively.
(2) The preamble is not BMC-encoded. Each logical state is synchronized to the serial clock. These eight logical states make up time slots (cells) 0 to 3 in the S/PDIF stream.

11.5.1.2.2.5.3 Frame Format

An S/PDIF frame is composed of two subframes (see Figure 11-346). For linear coded audio applications, the rate of frame transmission normally corresponds exactly to the source sampling frequency f_s. The S/PDIF format clock rate is therefore 128 × f_s (128 = 32 cells per subframe × 2 clocks per cell × 2 subframes per sample). For example, for an S/PDIF stream at a 192-kHz sampling frequency, the serial clock is 128 × 192 kHz = 24.58 MHZ.

In 2-channel operation mode, the samples taken from both channels are transmitted by time multiplexing in consecutive subframes. Both subframes contain valid data (cell 28 validity bits for A- and B- channels, both set to '0'). The first subframe (left or A channel in stereophonic operation and primary channel in monophonic operation) normally starts with preamble M. However, the preamble of the first subframe changes to preamble B once every 192 frames to identify the start of the block structure used to organize the channel status information. The second subframe (right or B channel in stereophonic operation and secondary channel in monophonic operation) always starts with preamble W.

In single-channel operation mode in a professional application, the frame format is the same as in the 2-channel mode. Data is carried in the first subframe and may be duplicated in the second subframe. If the second subframe is not carrying duplicate data, cell 28 (validity bit) is set to logical 1.

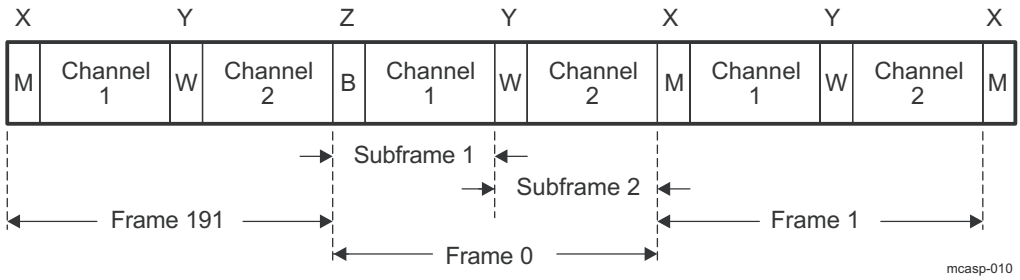

Figure 11-346. S/PDIF Frame Format

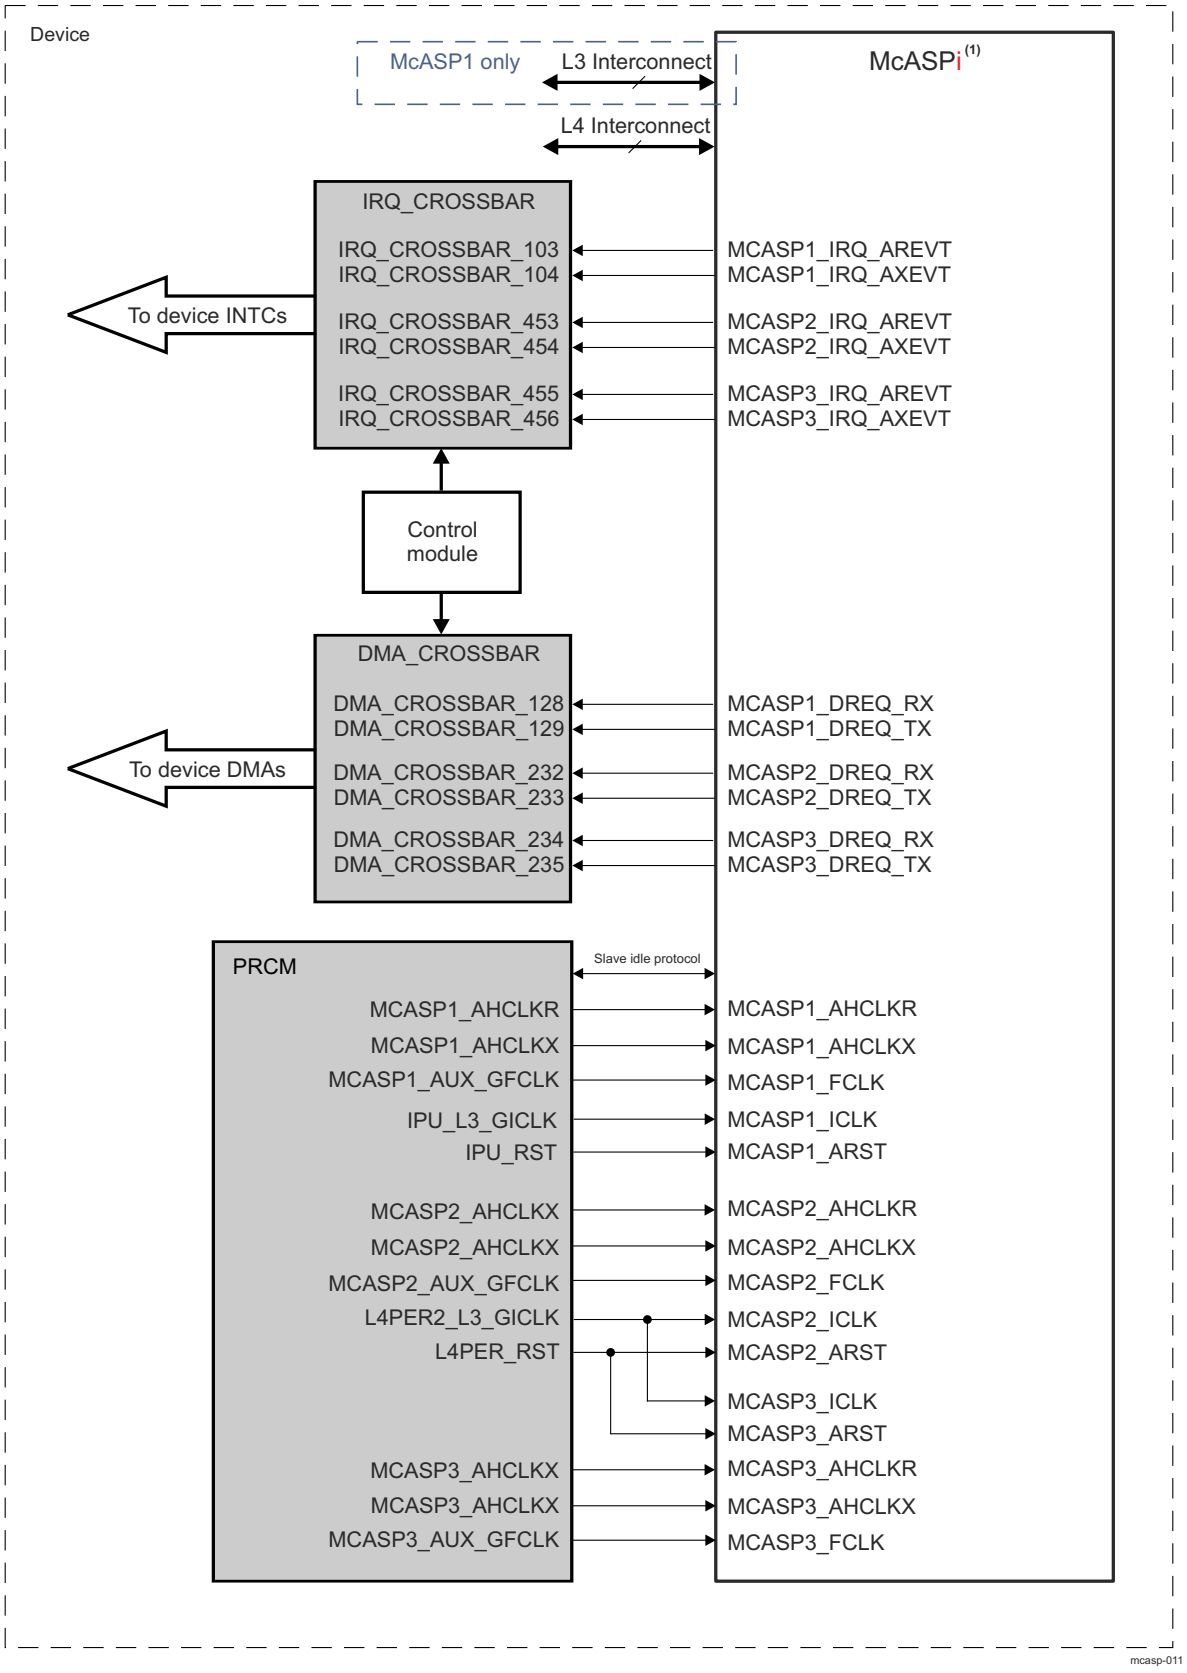
11.5.1.3 McASP Integration

This section describes module integration in the device, including information about clocks, resets, and hardware requests.

McASP module includes the following features:

- Slave idle protocol
- One DMA request for transmit event
- One DMA request for receive event
- One interrupt request (IRQ) for transmit
- One interrupt request (IRQ) for receive

Figure 11-347 shows McASP integration.



A. i = 1 to 3

Figure 11-347. McASP Integration

Note

For more information about the slave idle protocol, see *Module Level Clock Management* in *Power, Reset, and Clock Management*.

Table 11-1579 through Table 11-1581 summarize McASP integration in the device.

Table 11-1579. McASP Integration Attributes

Module Instance	Attributes		
	Power Domain	Wake-Up Capability	Interconnect

	MCASP3_DREQ_TX	DMA_CROSSBAR_235	-	McASP3 module transmit event request

Note

The **Default Mapping** column in Table 11-1581 *McASP Hardware Requests* shows the default mapping of module IRQ and DREQ source signals. These module IRQ and DREQ source signals can also be mapped to other lines of each device Interrupt or DMA controller through the DMA_CROSSBAR modules, respectively.
For more information about the DMA_CROSSBAR module, see *DMA_CROSSBAR Module Functional Description*, in *Control Module*.
For more information about the device interrupt controllers, see *Interrupt Controllers*.
For more information about the device DSP1_EDMA , see *DSP Integrated EDMA Subsystem*.

Note

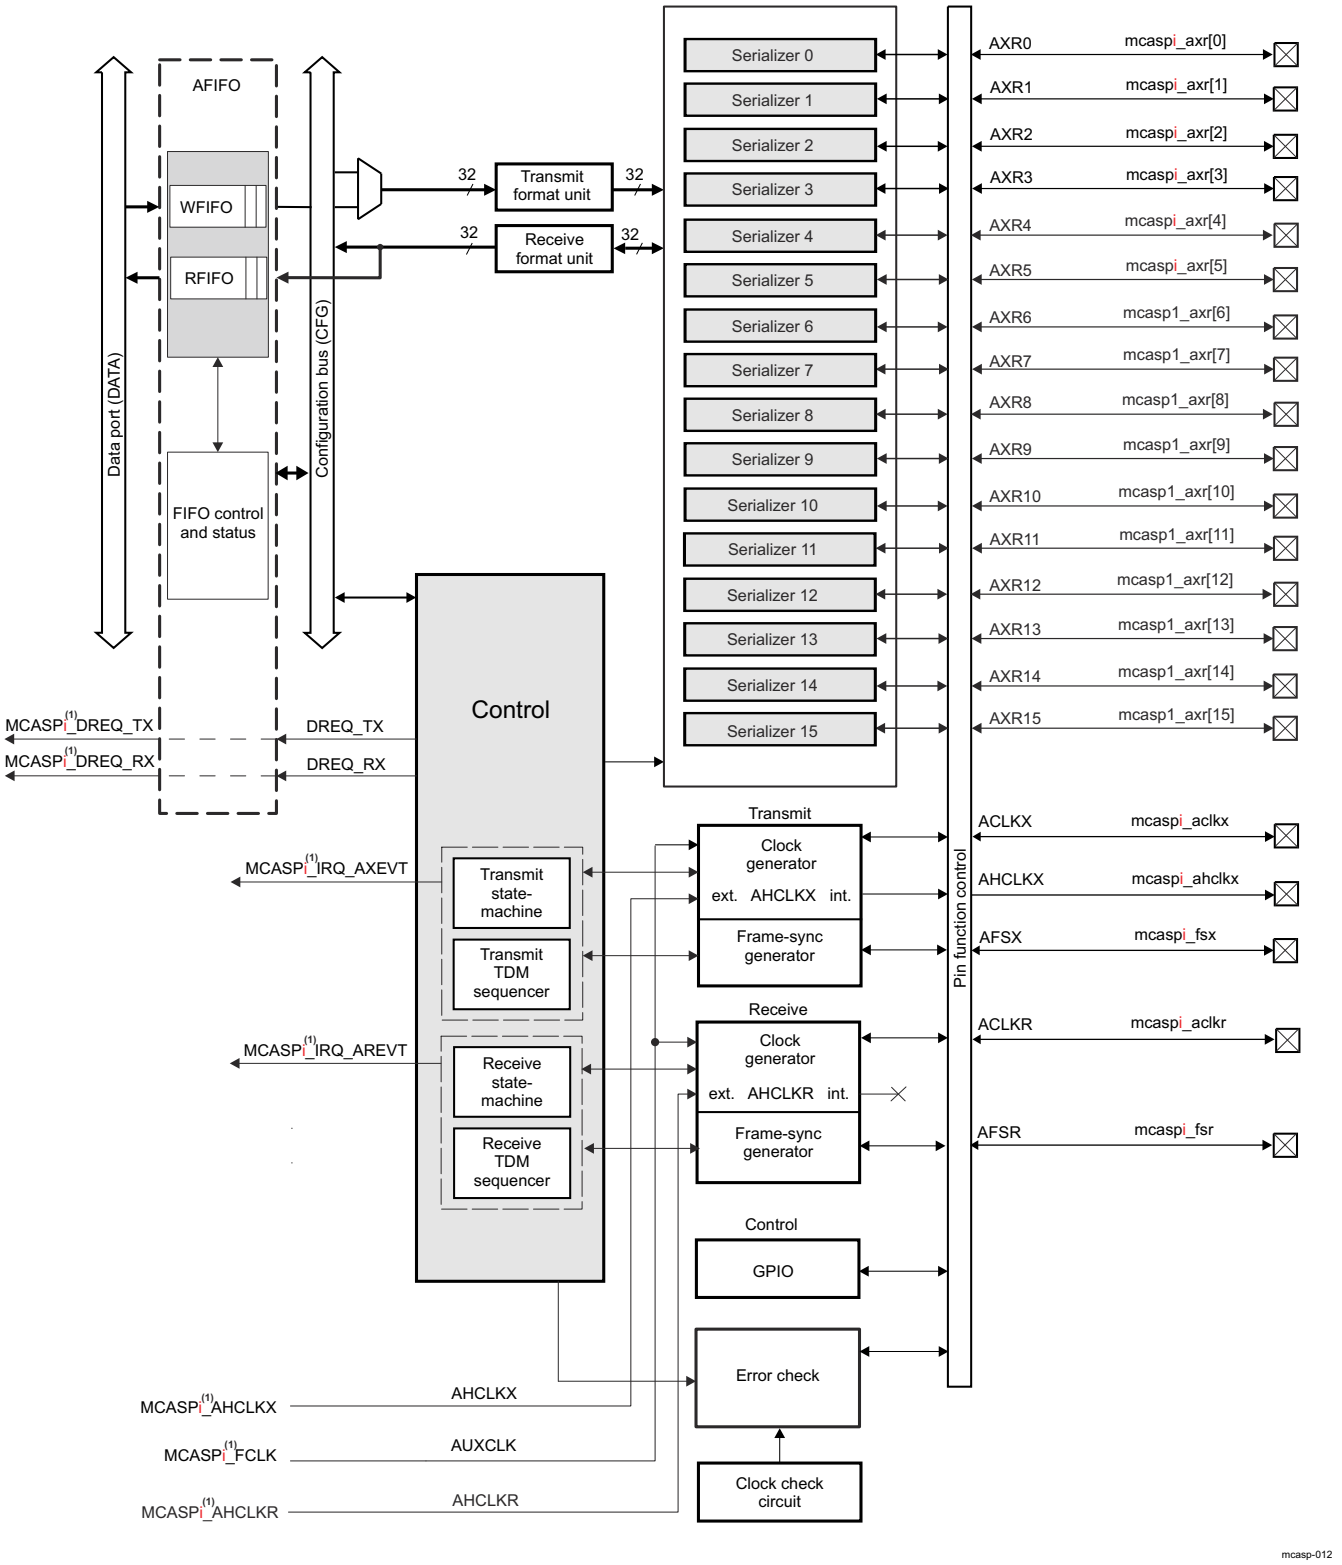
- For the description of the interrupt source, see Section 11.5.1.4.12, *McASP Events and Interrupt Requests*.
- For the description of the DMA source, see Section 11.5.1.4.13, *DMA Requests*.

11.5.1.4 McASP Functional Description

In the text throughout this section a single instance of McASP is described assuming that all modules are functionally identical. For module availability and integration differences, see Section 11.5.1.2, *McASP Environment*, and Section 11.5.1.3, *McASP Integration*

11.5.1.4.1 McASP Block Diagram

Figure 11-348 shows the major blocks of the McASP module. McASP1 has 16 serializers , and McASP2 and McASP3 have 6 serializers each. The serializers share a clock and frame-sync generator, format unit, and error-checking logic independently for the receive and transmit part.



A. i = 1 to 3

Figure 11-348. McASP Module Block Diagram

Note

The internal and external clocks mentioned in this section are with respect to clock and frame-sync generator modules.

11.5.1.4.2 McASP Clock and Frame-Sync Configurations

There are three scenarios to provide clock source signals for the Tx part and four scenarios for the Rx part of the McASP serializers. The first three scenarios are identical between the Tx and Rx part of the McASP. They feature an asynchronous operation between receiver and transmitter channels using independent Tx/Rx bit rate clock sources (either internal or external).

In the first scenario, the transmit - XCLK and receive - RCLK serial clocks (clock at the bit rate) are generated internally by passing through a couple of clock dividers off the internal functional clock source (AUXCLK). In this case, the bit rate clock is generated internally and is driven out on the pin ACLKX for the Tx part and pin ACLKR for the Rx part, respectively. An internally generated high-frequency clock can be optionally driven out onto the AHCLKX pin for the Tx part to serve as a reference clock for other components in the system.

In the second scenario, an external for the device clock, is passed on the ACLKX (for the TX part) and ACLKR (for the RX part) pins which are configured as inputs. In this case the Rx- /Tx- high-speed clock logic is bypassed for the XCLK/RCLK generation.

In the third (mixed) scenario, an externally driven (master) high-frequency clock is applied on the AHCLKX (for the TX part) pin, which is configured as input. In this case the AHCLKX clock frequency can be divided down via programming the ACLKX associated divider to produce the necessary bit rate clock. The high-speed clock divider can NOT be used.

In the fourth clock generation scenario the bit rate clock for McASP receivers - RCLK is derived from the bit rate clock of the McASP transmitters - XCLK for a synchronous operation between transmitters and receivers. Hence, the whole receiver clock generator logic is bypassed.

A typical role of the McASP frame sync signal is to carry the left/right clock (LRCLK) signal when transmitting and receiving stereo data.

For an asynchronous operation, the AFSX (Tx part) and AFSR (Rx part) frame synchronization signals can be sourced internally or delivered externally independently for the Tx and Rx channels. During synchronous operation the receive frame sync - AFSR signal is derived from the transmit frame sync - AFSX signal. A synchronous and asynchronous mode applies to bit rate clock and frame sync signals at the same time.

11.5.1.4.2.1 McASP Transmit Clock

The transmit high-speed and transmit clock configuration is controlled by the following registers:

- MCASP_ACLKXCTL
- MCASP_AHCLKXCTL

In case, the transmit bit clock, ACLKX, is generated internally, the MCASP_ACLKXCTL[5] CLKXM bit must be set to 1. Thus, the clock is divided down by a programmable bit clock divider (the MCASP_ACLKXCTL[4:0] CLKXDIV bit field) from the source signal.

If the transmit high-frequency master clock, AHCLKX, is also sourced internally (that is first scenario described in Section 11.5.1.4.2, the MCASP_AHCLKXCTL[15] HCLKXM bit must be set to 1. Thus, the clock is divided down by a programmable high-clock divider (the MCASP_ACLKXCTL[11:0] HCLKXDIV bit field) from the McASP internal clock source AUXCLK.

Internally, the McASP always shifts transmit data at the rising edge of the internal transmit clock - XCLK, (see Figure 11-349). The CLKXP mux determines if ACLKX needs to be inverted to become XCLK. If MCASP_ACLKXCTL[7] CLKXP = 0, the CLKXP mux directly passes ACLKX signal to XCLK. As a result, the McASP shifts transmit data at the rising edge of ACLKX. If MCASP_ACLKXCTL[7] CLKXP = 1, the CLKX mux passes the inverted version of ACLKX to XCLK. As a result, the McASP shifts transmit data at the falling edge of ACLKX.

It can be seen in Figure 11-349 that XCLK is propagated to the Rx clock logic, to allow an internally synchronous operation between McASP transmitters and receivers. This is used for example in the McASP loopback mode.

Note

The polarity of ACLKX can be controlled in MCASP_ACLKXCTL[7] CLKXP, regardless of ACLKX signal being internally or externally sourced.

In addition, there is an option to invert polarity of the AHCLKX master high speed clock via writing the MCASP_AHCLKXCTL[14] HCLKXP bit.

Note

In a similar way, the polarity of AHCLKX clock can be controlled in MCASP_AHCLKXCTL[14] HCLKXP, regardless of the AHCLKX signal being internally or externally sourced.

Figure 11-349 is the block diagram of the transmit clock generator.

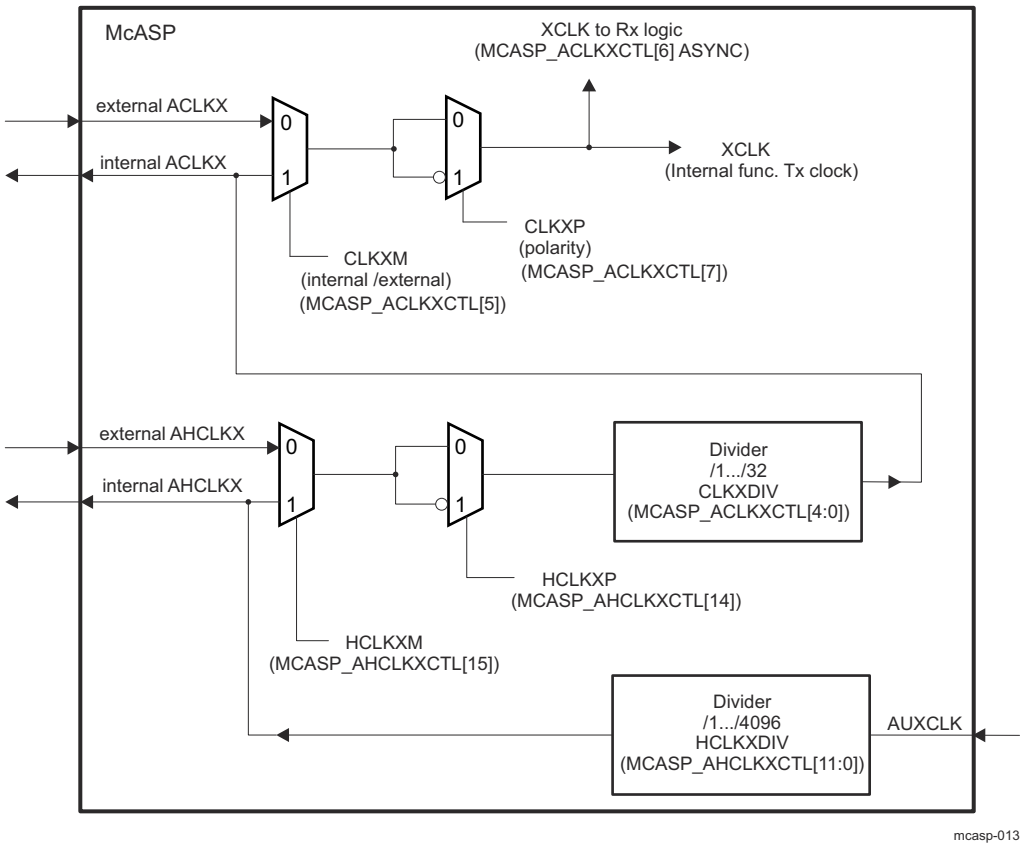


Figure 11-349. Transmit Clock Generator Block Diagram

Note

In this device:

- ACLKX is mapped on the device ball mcaspi_aclkx, where i = 1 to 3
- internal AHCLKX is mapped on the device ball mcaspi_ahclkx
- external AHCLKX is mapped on MCASPi_AHCLKX clock from the PRCM

For more on McASP integration, see Section 11.5.1.2, *McASP Environment*, and Section 11.5.1.3, *McASP Integration*.

11.5.1.4.2.2 McASP Receive Clock

The McASP receive clock generator is built on a very similar to the transmit clock generator (but independent) circuit.

The receive clock configuration is controlled by the following registers:

- MCASP_ACLKRCTL
- MCASP_AHCLKRCTL

In case, the receive bit clock, ACLKR, is generated internally (but asynchronously to XCLK), the MCASP_ACLKRCTL[5] CLKRM bit must be set to 1. Thus, the clock is divided down by a programmable bit clock divider (the MCASP_ACLKRCTL[4:0] CLKRDIV bit field) from the source signal.

If the receive high-frequency master clock, AHCLKR, is also sourced internally (that is, first scenario described in Section 11.5.1.4.2) and the MCASP_AHCLKRCTL[15] HCLKRM bit must be set to 1. Thus, the clock is divided down by a programmable high-clock divider (the MCASP_AHCLKRCTL[11:0] HCLKRDIV bit field) from the McASP internal clock source AUXCLK.

Note

The polarity of ACLKR can be controlled in MCASP_ACLKRCTL[7] CLKRP, regardless of ACLKR signal being internally or externally sourced.

In a similar way, the polarity of AHCLKR clock can be controlled in MCASP_AHCLKRCTL[14] HCLKRP, regardless of the AHCLKR signal being internally or externally sourced.

There is an option for the McASP receiver to be configured to operate synchronously to the ACLKX and AFSX signals. The XCLK output of the Tx Clock generator (see Figure 11-349 and Figure 11-350) becomes source of the receive clock (RCLK output), when the MCASP_ACLKXCTL[6] ASYNC bit in the transmit clock control register is set to '0b0'. For more information, refer to Section 11.5.1.4.2.4.

Figure 11-350 is the block diagram of the receive clock generator.

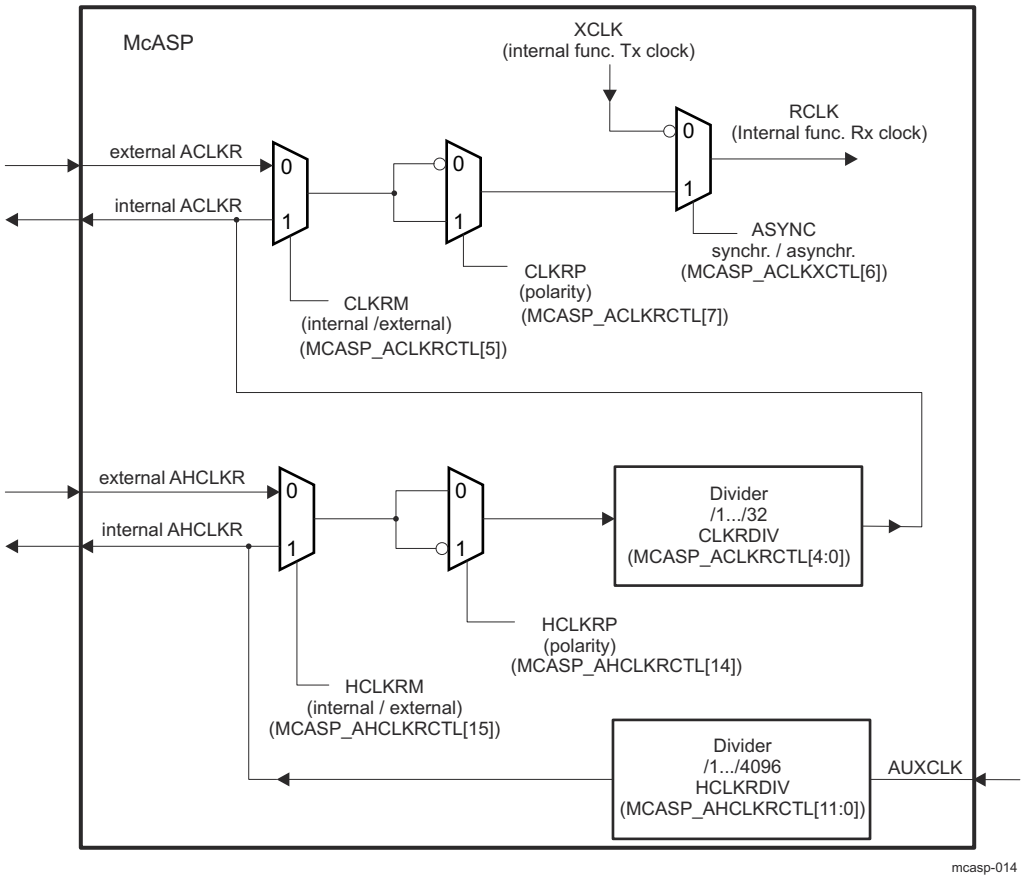

Figure 11-350. Receive Clock Generator Block Diagram

Note

In this device:

- ACLKR is mapped on the device ball mcaspi_aclkr, where i = 1 to 3
- internal AHCLKR is tied-off
- external AHCLKR is mapped on PRCM MCASPi_AHCLKR from PRCM

For more on McASP integration, see Section 11.5.1.2, *McASP Environment*, and Section 11.5.1.3, *McASP Integration*.

11.5.1.4.2.3 Frame-Sync Generator

There are two different modes for frame sync: burst and TDM. The McASP frame sync generator logic is illustrated in Figure 11-351. I/O buffers are not part of the McASP module, and are not shown in the figure.

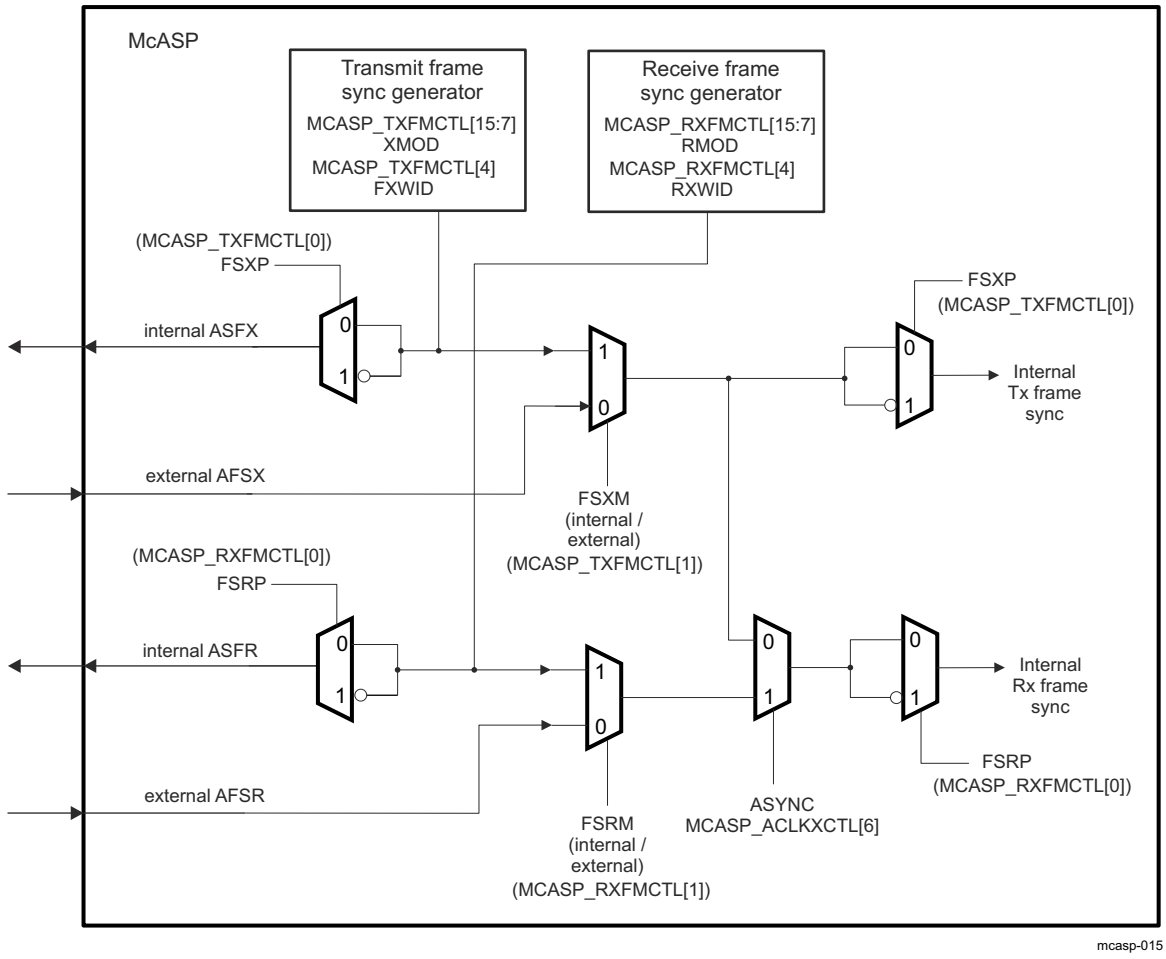

Figure 11-351. Frame Sync Generator Block Diagram

Note

For more on McASP integration, see Section 11.5.1.2, *McASP Environment*, and Section 11.5.1.3, *McASP Integration*.

For the transmit logic, following frame-sync generator configurations can be selected:

- Internally/externally generated frame-sync via configuring bit MCASP_TXFMCTL[1] FSXM
- Frame-sync polarity: Rising edge or falling edge via configuring bit MCASP_TXFMCTL[0] FSXP
- Frame-sync width: "single bit" or "single word" via configuring bit MCASP_TXFMCTL[4] FXWID
- Frame sync mode - the appropriate frame sync generation pattern for the selected transfer mode is defined in the bitfield MCASP_TXFMCTL[15:7] XMOD, as follows:
  - For DIT mode (384 slots) - MCASP_TXFMCTL[15:7] XMOD = 0x180
  - For I2S mode (2 TDM slots) - MCASP_TXFMCTL[15:7] XMOD = 0x2
  - For TDM mode (from 3 to 32 TDM slots) - MCASP_TXFMCTL[15:7] XMOD set in range 0x3 - 0x20
- Bit delay: 0, 1, or 2 cycles before the first data bit. This delay is defined in MCASP_TXFMCTL[17:16] XDATDLY

For the receive logic, following frame-sync generator configurations can be selected:

- Internally/externally generated frame-sync via configuring bit MCASP_RXFMCTL[1] FSRM
- Frame-sync polarity: Rising edge or falling edge via configuring bit MCASP_RXFMCTL[0] FSRP
- Frame-sync width: "single bit" or "single word" via configuring bit MCASP_RXFMCTL[4] FRWID

- Frame sync mode - the appropriate frame sync generation pattern for the selected transfer mode is defined in the bitfield MCASP_RXFMCTL[15:7] RMOD, as follows:
  - For I2S mode (2 TDM slots) - MCASP_RXFMCTL[15:7] RMOD = 0x2
  - For TDM mode (from 3 to 32 TDM slots) - MCASP_RXFMCTL[15:7] RMOD set in range 0x3 - 0x20
  - For the special 384-slot TDM mode - MCASP_RXFMCTL[15:7] RMOD=0x180
- Bit delay: 0, 1, or 2 cycles before the first data bit. This delay is defined in MCASP_RXFMT[17:16] RDATDLY
- Selecting the source (AFSX or AFSR) of receiver internal frame synchronization. This is done in the same bit - MCASP_ACLKXCTL[6] ASYNC, used to define the receiver internal clock source. For more details, refer to Section 11.5.1.4.2.4.

Regardless of the AFSX/AFSR being internally generated or externally sourced, the polarity of AFSX/AFSR is determined by FSXP/FSRP, respectively, to be either rising or falling edge. If FSXP/FSRP = 0, the frame sync polarity is rising edge. If FSXP/FSRP = 1, the frame sync polarity is falling edge.

Note

Certain restrictions apply to the receive and transmit logic settings, when MCASP_ACLKXCTL[6] ASYNC is set to 0b0. They are described in Section 11.5.1.4.2.4.

11.5.1.4.2.4 Synchronous and Asynchronous Transmit and Receive Operations

Synchronous Transmit and Receive Operations -

When MCASP_ACLKXCTL[6] ASYNC is written to 0b0, the transmit and receive sections operate synchronously to the transmit section clock and transmit frame sync signals.

Though Rx section may have a different data format, it has to be configured to have the same slot size than the transmit section one. As shown on the Figure 11-350, with the ASYNC bit set to 0b0, the RCLK becomes an inverted version of the transmit clock generator XCLK output.

When MCASP_ACLKXCTL[6] ASYNC = 0b0, both Rx and Tx sections use the same clock and frame sync signals. For this reason, they must be aligned on the following settings:
- MCASP_TXDITCTL[0] DITEN = 0 (that is, transmission in TDM mode is enabled)
- The total number of bits per frame must be the same (that is, RSSZ * RMOD product value must equal XSSZ * XMOD product value)
- The settings in MCASP_ACLKRCTL are NOT considered
- FSXM must match FSRM
- FXWID must match FRWID

For all other settings, the transmit and receive sections may be programmed independently.

Asynchronous Transmit and Receive Operations -

When MCASP_ACLKRCTL[6] ASYNC = 0b1, Tx and Rx operate independently from each other with separate clock and frame sync signals.

Note

Synchronous transmit and receive operations are allowed only in the McASP TDM (I2S) mode (i.e. when MCASP_TXDITCTL[0] DITEN=0b0).

11.5.1.4.3 Serializers

The McASP serializers shift serial data in (Rx) and out (Tx) of the McASP. A given serializer n consists of a shift register (XRSRn) with a single-entry data buffer XRBUFn used either for transmitting (write accessible in register MCASP_TXBUFn) or for receiving (read accessible in register MCASP_RXBUFn) data. In addition, each serializer has a dedicated control register (MCASP_XRSRCTLn) and a serial bidirectional data pin - AXRn. The register MCASP_XRSRCTLn allows n-th serializer to be configured as a transmitter, receiver, or as inactive.

There are transmit and receive data formatting units to support data alignment options of the McASP which are shared between all Tx and Rx serializers, respectively.

A given serializer XRSRn shifter configured as a receiver in MCASP_XRSRCTLn, shifts in data through McASP corresponding device level bidirectional data pad AXRn. A given serializer XRSRn shifter configured as a transmitter in MCASP_XRSRCTLn, shifts out data on McASP corresponding device level bidirectional data pad AXRn.

The serializer is clocked from the transmit section clock (ACLKX signal) if configured to transmit or clocked from the receive section clock (ACLKR signal) if configured to receive. A serializer configured to transmit and receive operates in lockstep, which means that for McASP there are at most a couple of zones, one for transmit and one for receive.

Figure 11-352 is the serializer block diagram.

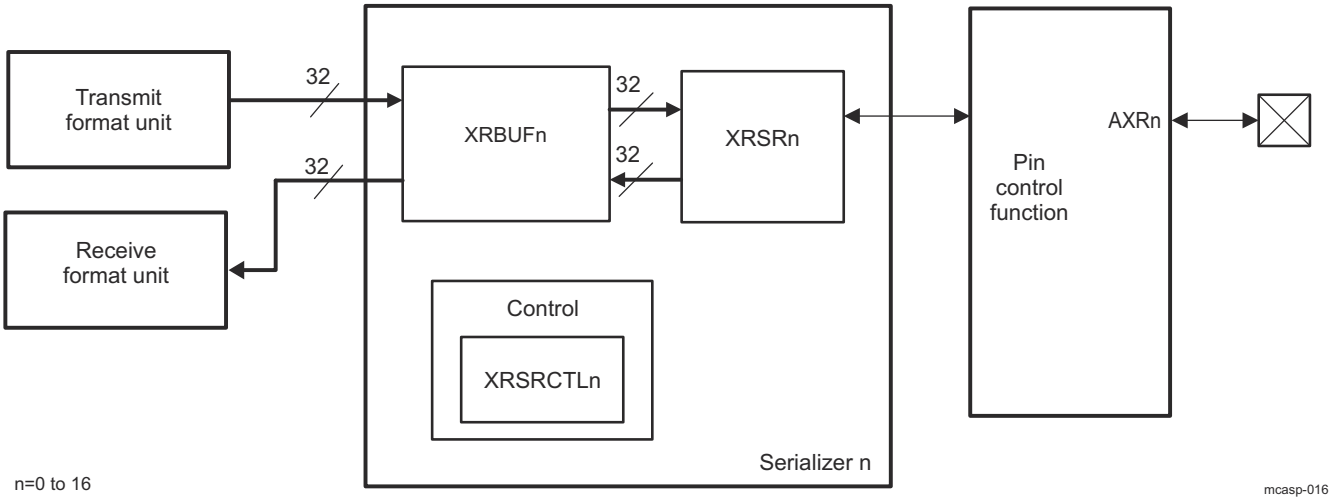

Figure 11-352. Individual Serializer and Connections Within McASP

Transmission on the n-th serializer is performed as follows:

The McASP is serviced by writing data into the register MCASP_TXBUFn, which is an alias of the serializer data buffer - XRBUFn for transmit function. The data automatically passes through the transmit format unit before reaching the XRBUFn register in the serializer. The data is then copied from the XRBUFn to XRSRn and shifted out from AXRn synchronously to the serial clock.

Reception from the n-th serializer is performed as follows:

The data is shifted into the McASP XRSRn serializer register through the AXRn pin, bit by bit. Once the entire slot becomes available within the XRSRn shift register, the data is copied into the serializer data buffer - XRBUFn,and can be accessed in the MCASP_RXBUFn register, which is an alias of the serializer data buffer - XRBUFn for receive function. When software reads the data from this register, the McASP passes the data through the receive format unit, hence it returns the formatted data.

Serializer controls:

A serializer n is configured as inactive via setting bitfield MCASP_XRSRCTLn[1:0] SRMOD to 0x0.

For a transmitting serializer, the MCASP_XRSRCTLn[3:2] DISMOD bitfield, defines the AXRn pin output state, during inactive slots (HIGH, LOW or Hi-Z).

Transmit function for the n-th serializer is selected via setting bitfield MCASP_XRSRCTLn[1:0] SRMOD to 0x1.

Receive function for the n-th serializer is selected via setting bitfield MCASP_XRSRCTLn[1:0] SRMOD to 0x2.

In the DIT-transmission mode (that is S/PDIF format data transmission): in addition to the data, the serializer shifts out other DIT-specific information accordingly (preamble, user data, etc.). For more information, see Section 11.5.1.2.2.5

11.5.1.4.4 Format Units

The McASP has one transmit data formatting unit and one receive data formatting unit, shared between the device McASP serializers. These units automatically remap the data bits within the transmitted or received words between a natural format for the device processors (for example, a Q31 representation) and the required format for the external serial device (for example I2S format). During the remapping process, the format unit can also mask off certain bits.

Since all transmitters share the same data formatting unit, the McASP only supports one transmit format at a time. For example, the McASP does NOT transmit in "I2S format" on serializer 0, while transmitting "Left Justified" on serializer 1. Likewise, the receiver section of the McASP only supports one data format at a time, and this format applies to all receiving serializers.

Note

The McASP can transmit in one format while receiving in a completely different format.

The bit mask and pad stage of each of Tx and Rx format units includes a full 32-bit mask register, allowing selected individual bits to either pass through the stage unchanged, or be masked off. The bit mask and pad then pad the value of the masked off bits by inserting either a 0, a 1, or one of the original 32 bits as the pad value. The last option allows for sign-extension when the sign bit is selected to pad the remaining bits. The rotate right stage performs bitwise rotation by a multiple of 4 bits (between 0 and 28 bits), programmable by the MCASP_RXFMT/MCASP_TXFMT register. Note that this is a rotation process, not a shifting process, so bit 0 gets shifted back into bit 31 during the rotation. The bit order - reversal stage either passes all 32 bits directly through, or swaps them. This allows for either MSB or LSB first data formats. If bit order reversal is not enabled, then the McASP will naturally transmit and receive in an LSB first order. Finally, note that the RDATDLY/XDATDLY bits in the MCASP_RXFMT/MCASP_TXFMT also determine the data format. For example, the difference between I2S format and left-justified is determined by the delay between the frame sync edge and the first data bit of a given time slot. For I2S format, RDATDLY/XDATDLY should be set to a 1-bit delay, whereas for left-justified format, it should be set to a 0-bit delay. The combination of all the options in MCASP_RXFMT/MCASP_TXFMT means that the McASP supports a wide variety of data formats, both on the serial data lines, and in the device CPU data representation.

11.5.1.4.4.1 Transmit Format Unit

The McASP transmit formatting unit consists of three stages :

- Bit mask (masks off bits)
- Rotate right (aligns data within word)
- Bit reversal (selects between MSB-first or LSB-first)

Figure 11-353 shows the transmit formatting unit.

The McASP transmitter supports serial formats of:

- Slot (or Time slot) size = 8, 12, 16, 20, 24, 28, 32 bits
- Word size ≤ Slot size
- Alignment: when more bits/slot than bits/words, then:
  - Left aligned = word shifted first, remaining bits are pad
  - Right aligned = pad bits are shifted first, word occupies the last bits in slot
- Order of bits shifted out:
  - MSB: most-significant bit of word is shifted out first, last bit is LSB
  - LSB: least-significant bit of word is shifted out last, last bit is MSB

Hardware support for these serial formats comes from the programmable options in the bitstream format register - MCASP_TXFMT:

- XRVRS: bit reverse (1) or no bit reverse (0)
- XROT: rotate right by 0, 4, 8, 12, 16, 20, 24, or 28 bits
- XSSZ: transmit slot size of 8, 12, 16, 20, 24, 28, or 32 bits

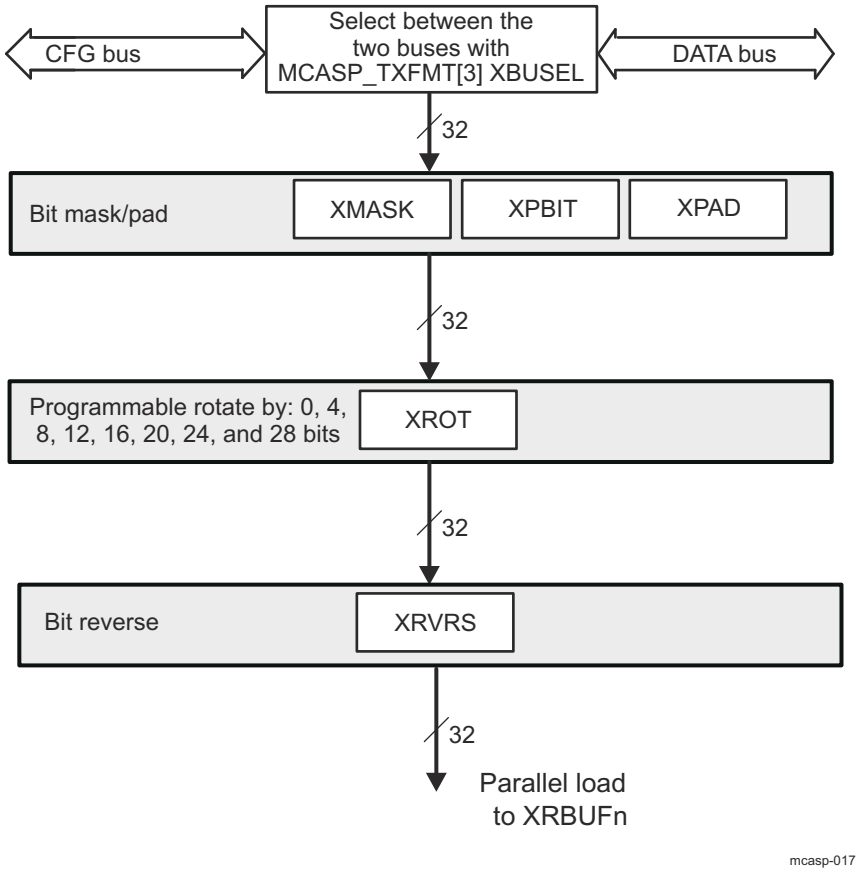

Figure 11-353. Transmit Format Unit

As shown in Figure 11-353, the data to the transmit format unit can come from the configuration port (CFG) or the data port (DATA). The selection is made through the MCASP_TXFMT[3] XBUSEL bit. According to port type selected, data transfer has different behaviour. For more details, refer to the Section 11.5.1.4.10.1.3, *Transfers Through the DATA Port*, and Section 11.5.1.4.10.1.4, *Transfers Through the Configuration (CFG) Bus*.

In the transmit format unit (TFU), the input data bits are first masked-off with the MCASP_TXMASK[31:0] XMASK contents. The masked data is then right-rotated to MCASP_TXFMT[2:0] XROT positions, to produce the output word for a TDM- or DIT- transmission.

The bit mask stage includes a full 32-bit mask register, allowing selected individual bits to pass through the stage unchanged or be masked off.

11.5.1.4.4.1.1 TDM Mode Transmission Data Alignment Settings

The TDM-mode transmission settings are relevant for I2S-protocol and protocols using more than 2 TDM-slots.

XSSZ should always be programmed to match the slot size of the serial stream.

Note

Note that, TDM word size is not directly programmed into the McASP, but rather is used to determine the rotation needed in the XROT field.

The Table 11-1582 show the XRVRS and XROT fields for each serial format and for both integer and Q31 fractional internal representations.

The Table 11-1582 assumes that all slot size (SLOT in Table 11-1582) and word size (WORD in Table 11-1582) options are multiples of 4, since the transmit rotate right unit only supports rotation by multiples of 4. However, the bit mask/pad unit does allow for any number of significant digits. For example, a Q31 number may have 19 significant digits (word) and be transmitted in a 24-bit slot; this would be formatted as a word size of 20 bits and a slot size of 24 bits. However, it is possible to set the bit mask unit to only pass the 19 most-significant digits (program the mask value to FFFF E000h). The digits that are not significant can be set to a selected pad value, which can be any one of the significant digits, a fixed value of 0, or a fixed value of 1.

The transmit bit mask/pad unit operates on data as an initial step of the transmit format unit, and the data is aligned in the same representation as it is written to the transmitter by the MPU or DSP (typically Q31 or integer).

Table 11-1582. McASP TFU TDM Mode Settings

Bit Stream Order	Bit Stream Alignment	Internal Numeric Representation	MCASP_TXFMT bits	
			XROT(1)	XRVRS
MSB first(2)	Left aligned	Q31 fraction	0	1
MSB first	Right aligned	Q31 fraction	SLOT - WORD	1
LSB first	Left aligned	Q31 fraction	32 - WORD	0
LSB first	Right aligned	Q31 fraction	32 - SLOT	0
MSB first(2)	Left aligned	Integer	WORD	1
MSB first	Right aligned	Integer	SLOT	1
LSB first	Left aligned	Integer	0	0
LSB first	Right aligned	Integer	(32 - (SLOT - WORD)) % 32	0

(1) WORD = Word size rounded up to the nearest multiple of 4; SLOT = slot size; % = modulo operator
(2) To transmit in I2S format, select MSB first, left aligned, and also select XDATDLY = 01 (1 bit delay)

11.5.1.4.4.1.2 DIT Mode Transmission Data Alignment Settings

In case of a DIT-mode (S/PDIF protocol) transmission, while left-aligned Q31 data should be right-rotated to a multiple by 4 positions, no right-rotation is required for a right-aligned Q31 data. Because this is a rotation process, not a shifting process, bit 0 gets shifted back into bit 31 during the process.

The MCASP_TXFMT[17:16] XDATDLY bit field must be set to a 0-bit delay (0x0 value).

For left-aligned Q31 data, the following transmit format unit settings process the data into right-aligned data, ready for transmission:

- MCASP_TXFMT[2:0] XROT =
  - 0x2 (rotate right by 8 bits) - for a 24-bit output audio data
  - 0x3 (rotate right by 12 bits) - for a 20-bit output audio data
  - 0x4 (rotate right by 16 bits) - for a 16-bit output audio data
- MCASP_TXFMT[15] XRVRS = 0x0 – Bit reversal is not enabled; the McASP naturally transmits and receives in a LSB-first order.
- MCASP_TXMASK[32] XMASK = 0xFFFFFF00 – 0xFFFF0000
- MCASP_TXFMT[14:13] XPAD = 0x0 (Pad extra bits with 0s.)

For right-aligned data, the following transmit format unit settings process the data into right-aligned audio data ready for transmission:

- MCASP_TXFMT[2:0] XROT = 0x0 (rotate right by 0 bits regardless of the audio word length)
- MCASP_TXFMT[15] XRVRS = 0x0 – Bit reversal is not enabled; the McASP naturally transmits and receives in a LSB-first order.
- MCASP_TXMASK[32] XMASK = 0x00FFFFFF – 0x0000FFFF
- MCASP_TXFMT[14:13] XPAD = 0x0 (Pad extra bits with 0s.)

The example settings provided in Table 11-1583 should be applied to McASP in cases of DIT-transmitting a Q31 data as a 24-bit, 20-bit and 16-bit left- or right- aligned audio word, respectively. Note that the listed settings let the McASP TFU preserve the most significant bits and cut only the LSBs of the original Q31 CPU data:

Table 11-1583. McASP TFU DIT-Mode Example Settings

Output Audio Word Alignment	Audio Word Length	Right-rotation (multiple of 4-bit positions)	XMASK	XROT
LEFT	16	16	0xFFFF0000	0x4
LEFT	20	12	0xFFFFF000	0x3
LEFT	24	8	0xFFFFFF00	0x2
RIGHT	16	0	0x0000FFFF	0x0
RIGHT	20	0	0x000FFFFF	0x0
RIGHT	24	0	0x00FFFFFF	0x0

Assuming that a Q31 data word 0xFA5AFxxx (where x-marked nibbles of the data are applied as padding bits of the word) is generated on the McASP CFG (peripheral) port. To transmit a left-aligned 20-bit version of same word, preserving the MSBs, according to the Table 11-1583, the user must set XMASK=0xFFFFF000, and to select a right-rotation to 12 positions (XROT=0x3).

- After applying 0-s (XPAD=0) as masking-off bits at the first TFU stage, word is transformed to the word 0xFA5AF000.
- After a rotation by 12 positions to the right is performed in TFU, the 20-bit output word obtained is: 0x000FA5AF.Thus the word gets ready for transmission being mapped with its LS-bit as bit 8 and its MS-bit as bit 27 within a S/PDIF bitstream. This word is shifted in a LSB-to-MSB order (XRVRS = 0x0) out of the XRSR register during a DIT-transmission.

Assuming that a right-aligned Q31 data word - 0x yyyyE4B4 is generated by software on the McASP CFG (peripheral) port (with the presumption that y-marked nibbles of the input data are applied as padding bits). To transmit a right-aligned 16-bit version of same word, preserving the MSBs, according to the table McASP TFU Example Settings, user is supposed to set XMASK=0x0000FFFF, and to select right-rotation to 0 positions (XROT=0x0).

- After masking-off with 0s at first TFU stage, word is transformed to 0x0000E4B4.
- Since no rotation is applied, the 16-bit output word obtained is actually the one obtained in the masking stage – 0x0000E4B4.

The above examples use internal representation in integer and Q31 notation, but other fractional notations are also possible.

11.5.1.4.4.2 Receive Format Unit

The McASP receive formatting unit consists of three stages:

- Bit mask (masks off bits)
- Rotate right (aligns data within word)
- Bit reversal (selects between MSB first or LSB first)

Figure 11-354 shows the receive format unit (RFU).

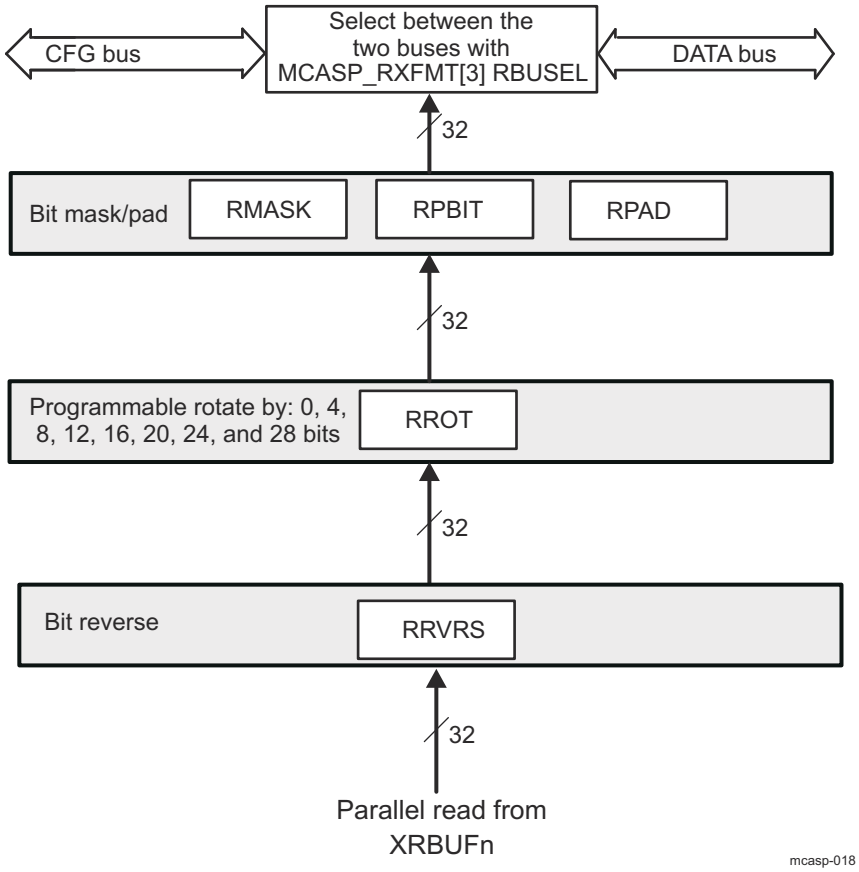

Figure 11-354. Receive Format Unit

The McASP receiver supports serial formats of:

- Slot or time slot size = 8, 12, 16, 20, 24, 28, 32 bits
- Word size ≤ Slot size
- Alignment when more bits are available per slot than bits per word within the slot, then:
  - Left aligned = word shifted first, remaining bits are pad
  - Right aligned = pad bits are shifted first, word occupies the last bits in slot
- Order of bits shifted out:
  - MSB: most-significant bit of word is shifted out first, last bit is LSB
  - LSB: least-significant bit of word is shifted out last, last bit is MSB

Hardware support for these serial formats comes from the programmable options in the receive bitstream format register - MCASP_RXFMT:

- RRVRS: bit reverse (1) or no bit reverse (0)
- RROT: rotate right by 0, 4, 8, 12, 16, 20, 24, or 28 bits
- RSSZ: receive slot size of 8, 12, 16, 20, 24, 28, or 32 bits

As shown on Figure 11-354, the data processed in the RFU can be output to host CPU through the configuration port (CFG) or the data port (DATA). The selection is made through the MCASP_RXFMT[3] RBUSEL bit. According to port type selected, data transfer has different behaviour. For more details, refer to the Section 11.5.1.4.10.1.3, *Transfers Through the DATA Port*, and Section 11.5.1.4.10.1.4, *Transfers Through the Configuration (CFG) Bus*.

11.5.1.4.4.2.1 TDM Mode Reception Data Alignment Settings

RSSZ should always be programmed to match the slot size of the serial stream.

Note

Note that the word size is not directly programmed into the McASP, but rather is used to determine the rotation needed in the RROT field.

Table 11-1584 shows the RRVRS and RROT fields for each serial format and for both integer and Q31 fractional internal representations.

Table 11-1584. McASP RFU Settings

Bit Stream Order	Bit Stream Alignment	Internal Numeric Representation	MCASP_RXFMT bits	
			RROT(1)	RRVRS
MSB first(2)	Left aligned	Q31 fraction	SLOT	1
MSB first	Right aligned	Q31 fraction	WORD	1
LSB first	Left aligned	Q31 fraction	(32 - (SLOT - WORD)) % 32	0
LSB first	Right aligned	Q31 fraction	0	0
MSB first(2)	Left aligned	Integer	SLOT - WORD	1
MSB first	Right aligned	Integer	0	1
LSB first	Left aligned	Integer	32 - SLOT	0
LSB first	Right aligned	Integer	32 - WORD	0

(1) WORD = Word size rounded up to the nearest multiple of 4; SLOT = slot size; % = modulo operator
(2) To receive in I2S format, select MSB first, left aligned, and also select RDATDLY = 01 (1 bit delay)

The Table 11-1584 assumes that all slot size and word size options are multiples of 4; since the receive rotate right unit only supports rotation by multiples of 4. However, the bit mask/pad unit does allow for any number of significant digits. For example, a Q31 number may have 19 significant digits (word) and be received in a 24-bit slot; this would be formatted as a word size of 20 bits and a slot size of 24 bits. However, it is possible to set the bit mask unit to only pass the 19 most-significant digits (program the mask value to FFFF E000h). The digits that are not significant can be set to a selected pad value, which can be any one of the significant digits, a fixed value of 0, or a fixed value of 1. The receive bit mask/pad unit operates on data as the final step of the receive format unit (see Figure 11-354), and the data is aligned in the same representation as it is read from the receiver (typically Q31 or integer, for example).

11.5.1.4.5 State-Machines

The receive and transmit sections have independent state machines.

Each state-machine controls the interactions between the various units in the McASP Rx and Tx sections, respectively. In addition, each state-machine keeps track of error conditions and serial port status. No serial transfers can occur until the RX/TX state-machine is released from reset.

The transmit state-machine is controlled by the transmit bitstream format register (MCASP_TXFMT) and it reports the McASP status and error conditions in the transmitter status register (MCASP_TXSTAT).

Similarly, the receive state-machine is controlled by the receive bitstream format register (MCASP_RXFMT) and it reports the McASP status and error conditions in the receiver status register (MCASP_RXSTAT).

11.5.1.4.6 TDM Sequencers

There are separate TDM sequencers for the transmit section and the receive section. Each TDM sequencer keeps track of the slot count. In addition, the TDM sequencer checks the bits of MCASP_RXTDM/ MCASP_TXTDM and determines if the McASP should receive/transmit in that time slot.

There are two possibilities for a slot: The McASP either performs Rx/Tx operations during the time slot (transmit/ receive bit is active), or the McASP skips Rx/Tx operations during the time slot (transmit/receive bit is inactive). In the latter case, no transfers between the XRBUF and XRSR registers in the serializer would occur during that time slot.

In addition, during time of inactive slots, the serializers programmed as transmitters place their data output pins - AXRn in a predetermined state - logic low, high, or high impedance (tri-stated) as programmed in each serializer control register MCASP_XRSRCTLn[3:2] DISMOD. Refer also to Section 11.5.1.4.9.2.1, *TDM Time Slots Generation and Processing*, for details on how DMA event or interrupt generations are handled during inactive time slots in TDM mode.

In case of a DIT-transmission (S/PDIF transfers): the time division multiplexing (TDM) sequencer is used to count the 384 subframes (slots) in the DIT block. If currently transmitting slot 1, slot 2 (next value of the TDM slot counter) should be used during the encode phase to select the appropriate C, V, and U bit, because the data encoded and written to a MCASP_TXBUFn register during the current time slot (slot 1) is actually shifted out on the next time slot.

The transmit TDM sequencer is controlled by the MCASP_TXTDM register and reports the current transmit slot to the MCASP_TXTDMSLOT[9:0] XSLOTCNT bit field.

11.5.1.4.7 McASP Software Reset

The McASP can be put into reset through the global transmit and receive control register (MCASP_GBLCTL). A valid serial clock must be supplied to the McASP to assert the software reset bits in the MCASP_GBLCTL register.

11.5.1.4.8 McASP Power Management

Table 11-1585 describes power-management features available to the McASP.

Table 11-1585. Local Power-Management Features

Feature	Registers	Description
Slave idle modes	PWRIDLESYSCONFIG[1:0] IDLE_MODE	Force-idle, no-idle, and smart-idle modes are available.

CAUTION

No wakeup schema is supported for the McASP. To ensure a correct behavior after enabling McASP at device PRCM level, the user software is strongly recommended to choose *No Idle* mode, setting PWRIDLESYSCONFIG[1:0] IDLE_MODE to 0x1. Before disabling McASP at device PRCM level, user software is strongly recommended to choose a *Smart-Idle* mode, setting PWRIDLESYSCONFIG[1:0] IDLE_MODE to 0x2.

11.5.1.4.9 Transfer Modes

11.5.1.4.9.1 Burst Transfer Mode

The McASP supports a burst transfer mode, which is useful for nonaudio data such as passing control information between two processors. Burst transfer mode uses a synchronous serial format similar to the TDM mode. The frame sync generation is not periodic or time-driven as in TDM mode, but data driven, and the frame sync is generated for each data word transferred.

When operating in burst frame sync mode (see Figure 11-355), as specified for transmit (MCASP_TXFMCTL[15:7] = 0) and receive (MCASP_RXFMCTL[15:7] RMOD = 0), one slot is shifted for each active edge of the frame sync signal that is recognized. Additional clocks after the slot and before the next frame sync edge are ignored.

In burst frame sync mode, the frame sync delay may be specified as 0, 1, or 2 serial clock cycles. This is the delay between the frame sync active edge and the start of the slot. The frame sync signal lasts for a single bit clock duration (MCASP_RXFMCTL[4] FRWID = 0, MCASP_TXFMCTL[4] FXWID = 0).

For transmit, when generating the transmit frame sync internally, the frame sync begins when the previous transmission has completed and when all the XBUFn (for every serializer set to operate as a transmitter) has been updated with new data.

For receive, when generating the receive frame sync internally, frame sync begins when the previous transmission has completed and when all the RBUFn (for every serializer set to operate as a receiver) has been read.

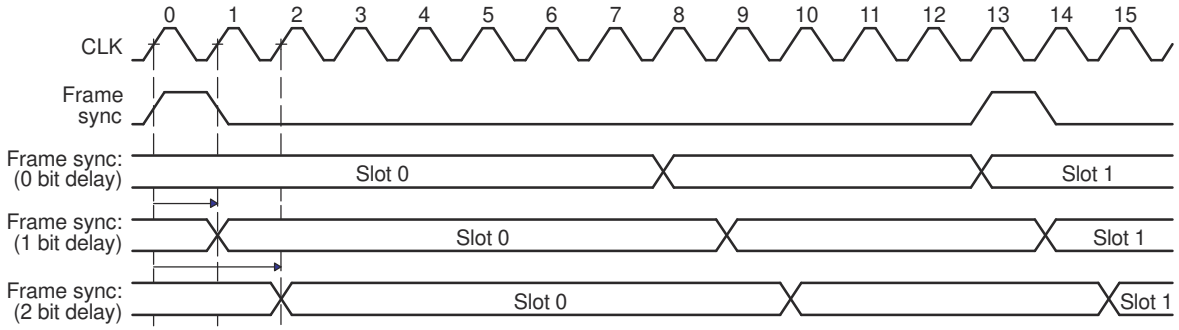

Figure 11-355. Burst Frame Sync Mode

The control registers must be configured as follows for the burst transfer mode. The burst mode specific bit fields are in bold face:

- MCASP_PFUNC: The clock, frame, data pins must be configured for McASP function.
- MCASP_PDIR: The clock, frame, data pins must be configured to the direction desired.
- MCASP_PDOUT, MCASP_PDIN, MCASP_PDSET, MCASP_PDCLR: Not applicable. Leave at default.
- MCASP_GBLCTL: Follow the initialization sequence in Section 11.5.1.5.1.2, *McASP Global Initialization*, to configure this register.
- MCASP_AMUTE: Not applicable. Leave at default.
- MCASP_LBCTL: If loopback mode is desired, configure this register according to Section 24.6.4.14 Loopback Modes, otherwise leave this register at default.
- MCASP_TXDITCTL: DITEN must be left at default 0 to select non-DIT mode. Leave the register at default.
- MCASP_RXMASK/MCASP_TXMASK: Mask desired bits according to Section 11.5.1.4.4, *Format Units*.
- MCASP_RXFMT/MCASP_TXFMT: Program all fields according to data format desired. See Section 11.5.1.4.4, *Format Units*.
- MCASP_RXFMT/MCASP_TXFMT: Clear RMOD/XMOD bits to 0 to indicate burst mode. Clear FRWID/FXWID bits to 0 for single bit frame sync duration. Configure other fields as desired.
- MCASP_ACLKRCTL/MCASP_ACLKRCTL: Program all fields according to bit clock desired. See Section 11.5.1.4.2, *McASP Clock and Frame-Sync Configurations*.
- MCASP_AHCLKRCTL/MCASP_AHCLKRCTL: Program all fields according to high-frequency clock desired. See Section 11.5.1.4.2, *McASP Clock and Frame-Sync Configurations*.
- MCASP_RXTDM/MCASP_TXTDM: Program RTDMS0/XTDMS0 to 1 to indicate one active slot only. Leave other fields at default.
- MCASP_EVTCTLR/MCASP_EVTCTLX: Program all fields according to interrupts desired.
- MCASP_RXCLKCHK/MCASP_TXCLKCHK: Not applicable. Leave at default.
- MCASP_XRSRCTLn: Program SRMOD to inactive/transmitter/receiver as desired. DISMOD is not applicable and should be left at default.
- MCASP_DITCSRAi, MCASP_DITCSRBi, MCASP_DITUDRAi, MCASP_DITUDRBi: Not applicable. Leave at default.

11.5.1.4.9.2 Time-Division Multiplexed (TDM) Transfer Mode

The McASP time-division multiplexed (TDM) transfer mode supports the TDM format discussed in Section 11.5.1.2.2.3.

Transmitting data in the TDM transfer mode requires a minimum set of pins:

- ACLKX - transmit bit clock
- AFSX - transmit frame sync (or commonly called left/right clock)
- One or more serial data pins, AXRn, whose serializers are configured to transmit

For more details on McASP transmitting serializers clock and frame sync options, refer to the Section 11.5.1.4.2.1, *Transmit Clock*, and Section 11.5.1.4.2.3, *Frame-Sync Generator* .

Similarly, to receive data in the TDM transfer mode requires a minimum set of pins:

- ACLKR - receive bit clock
- AFSR - receive frame sync (or commonly called left/right clock)
- One or more serial data pins, AXRn, whose serializers are configured to receive

For more details on McASP receiving serializers clock and frame sync options, refer to Section 11.5.1.4.2.2, *Receive Clock*, and Section 11.5.1.4.2.3, *Frame-Sync Generator* .

The control registers must be configured as follows for the TDM mode. The TDM mode specific bit fields are highlighted in bold:

- MCASP_PFUNC: The clock, frame, data pins must be configured for McASP function.
- MCASP_PDIR: The clock, frame, data pins must be configured to the direction desired.
- MCASP_PDOUT, MCASP_PDIN, MCASP_PDSET, MCASP_PDCLR: Not applicable. Leave at default.
- MCASP_GBLCTL: Follow the initialization sequence is described in the Section 11.5.1.5.2, *Operational Modes Configuration*.
- MCASP_AMUTE: Leave this register at default state.
- MCASP_LBCTL: If loopback mode is desired, configure this register according to Section 11.5.1.4.14, otherwise leave this register at default.
- MCASP_TXDITCTL: DITEN must be left at default 0 to select TDM mode (transmitters only).
- MCASP_RXMASK/MCASP_TXMASK: Mask desired bits according to Section 11.5.1.4.4, *Format Units*.
- MCASP_RXFMT/MCASP_TXFMT: Program all fields according to data format desired. See the Section 11.5.1.4.4, *Format Units*.
- MCASP_RXFMCTL/MCASP_TXFMCTL: Set RMOD/XMOD bits to (0x2 - 0x20) for Rx/Tx (2- 32 slots) TDM mode. In addition, set RMOD to 0x180 if 384-slot TDM stream has to be received by McASP. Configure other fields as desired.
- MCASP_ACLKRCTL/MCASP_ACLKXCTL: Program all fields according to bit clock desired. For more inforamtion, refer to Section 11.5.1.4.2.
- MCASP_AHCLKRCTL/MCASP_AHCLKXCTL: Program all fields according to high-frequency clock desired. For more details, refer to Section 11.5.1.4.2.
- MCASP_RXTDM/MCASP_TXTDM: Program all fields according to the time slot characteristics desired.
- MCASP_EVTCTLX: Program all fields according to transmit interrupts desired.
- MCASP_RXCLKCHK/MCASP_TXCLKCHK: Program all fields according to clock checking desired.
- MCASP_XRSRCTLn: Program all fields according to serializer operation desired.

Note

The MCASP_DITCSRAi, MCASP_DITCSRBi, MCASP_DITUDRAi, MCASP_DITUDRBi (i=0 to 5) settings are NOT applicable in TDM transfer modes. They have to be kept at their default values.

11.5.1.4.9.2.1 TDM Time Slots Generation and Processing

TDM mode on the McASP can extend to support multiprocessor applications, with up to 32 time slots per frame. For each of the time slots, the McASP may be configured to participate or to be inactive by configuring MCASP_TXTDM and/or MCASP_RXTDM registers.

The TDM sequencer (separate ones for transmit and receive) functions in this mode. The TDM sequencer counts the slots beginning with the frame sync. For each slot, the TDM sequencer checks the respective bit in either MCASP_TXTDM or MCASP_RXTDM to determine if the McASP transmits/receives in that time slot.

Note

If a MCASP_TXTDM/MCASP_RXTDM bit defines an active slot (number of slot matches the bit position), the McASP functions normally during that time slot; otherwise, the McASP is inactive during that time slot; no update to the buffer occurs, and no event is generated. McASP (transmit only) data pins are automatically set to a high-impedance state, 0, or 1 during that slot, as determined by bitfield MCASP_XRSRCTLn[3:2] DISMOD.

Figure 11-356 shows when the transmit DMA event - AXEVT is generated. See Section 11.5.1.4.10.1, *Data Ready Status and Event/Interrupt Generation* for details on data ready and the initialization period indication. The transmit DMA event for an active time slot (slot N) is generated during the previous time slot (slot N - 1), regardless of the previous time slot (slot N - 1) being active or inactive.

During an active transmit time slot (slot N), if the next time slot (slot N + 1) is configured to be active, the copy from XRBUFn to XRSRn generates the DMA event for time slot N + 1. If the next time slot (slot N + 1) is configured to be inactive, then the DMA event will be delayed to time slot M - 1. In this case, slot M is the next active time slot. The DMA event for time slot M is generated during the first bit time of slot M - 1.

The receive DMA event is generated after data is received in the buffer (looks back in time). If a time slot is disabled, then no data is copied to the buffer for that time slot and no DMA event is generated.

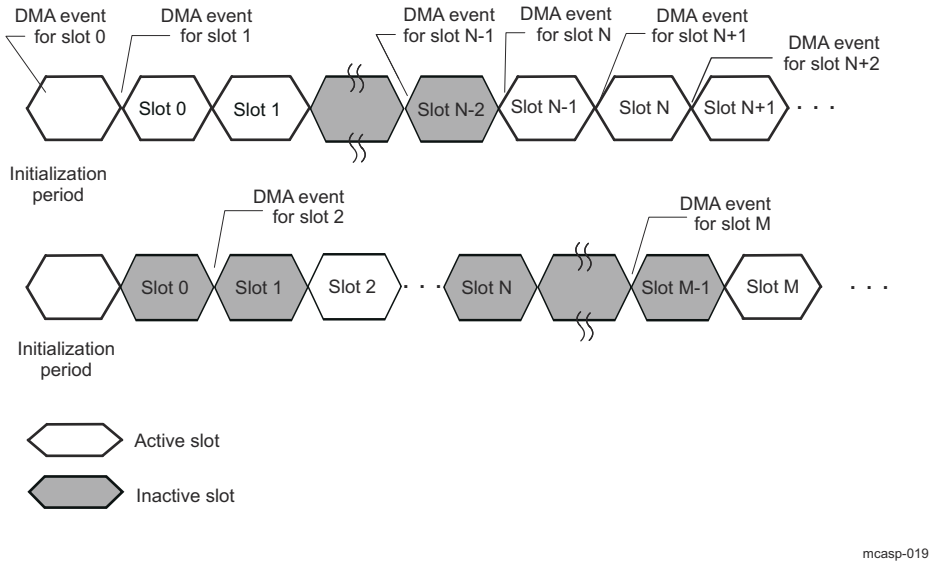

Figure 11-356. Transmit DMA Event (AXEVT) Generation in TDM Time Slots

11.5.1.4.9.2.2 Special 384-Slot TDM Mode for Connection to External DIR

The McASP receiver also supports a 384 time slot TDM mode (DIR mode), to support S/PDIF receiver ICs whose natural block (block corresponds to McASP frame) size is 384 samples. The receive TDM time slot register (MCASP_RXTDM) should be programmed to all 1s during reception of a DIR block. Other TDM functionalities (for example, inactive slots) are not supported (only the slot counter counts the 384 subframes in a block). To receive data in DIR mode, the following pins are typically needed:

- ACLKR - receive bit clock
- AFSR - receive frame sync (or commonly called left/right clock)
- In this mode, AFSR should be connected to a DIR which outputs a start of block signal, instead of LRCLK
- One or more serial data pins, AXRn, whose serializers have been configured to receive
- For this special DIR mode, the control registers can be configured just as for TDM mode, except set RMOD in MCASP_RXFMCTL to 384 (0x180) to receive 384 time slots

11.5.1.4.9.3 DIT Transfer Mode

The DIT transfer mode of the McASP also supports transmission of audio data in S/PDIF, AES-3, and IEC-60958 formats. These formats are designed to carry audio data between different systems through an optical or coaxial cable. The DIT mode applies only to a serializer configured as transmitter, not as receiver. For a description of the S/PDIF format, see Section 11.5.1.2.2.5, *S/PDIF Coding Format*.

11.5.1.4.9.3.1 Transmit DIT Encoding

When the McASP operates in DIT mode, the data transmitted is output as a biphase-mark encoded bitstream, with preamble, channel status, user data, validity, and parity automatically stuffed into the bitstream by the McASP. The McASP includes separate validity bits for even/odd subframes and two 384-bit RAM modules to hold channel status and user data bits.

Note

The transmit TDM time slot register (MCASP_TXTDM) should be programmed to all 1s during DIT mode. TDM functionality is not supported in DIT mode, except that the TDM slot counter counts the DIT subframes.

To transmit data in DIT mode, the following pins are typically required:

- AHCLKX – transmit high-frequency master clock (The internal clock source can be used instead.)
- One serial data pin (AXRn) of a serializer n configured to transmit.

For DIT Mode Transmission Data Alignment Settings see Section 11.5.1.4.4.1.2.

If the McASP is configured to transmit in the DIT mode on more than one serial data pin, the bit streams on all pins will be synchronized. In addition, although they will carry unique audio data, they will carry the same channel status, user data, and validity information.

The actual 24-bit audio data must always be in bit positions 23–0 after passing through the first three stages of the transmit format unit.

11.5.1.4.9.3.2 Transmit DIT Clock and Frame-Sync Generation

The DIT transmitter works only in the following configuration:

- In the transmit frame control register (MCASP_TXFMCTL):
  - Internally generated transmit frame sync, FSXM = 1
  - Rising-edge frame sync, FSXP = 0
  - Bit-width frame sync, FXWID = 0
  - 384-slot TDM, XMOD = 1 1000 0000b
- In the transmit clock control register (MCASP_ACLKXCTL), ASYNC = 1
- In the transmit bitstream format register (MCASP_TXFMT), XSSZ = 1111 (32-bit slot size)

All combinations of AHCLKX and ACLKX are supported.

The following summarizes the register configurations required for DIT mode. DIT mode-specific bit fields are in bold face:

- MCASP_PFUNC: The data pin - AXRn must be configured for McASP function. If AHCLKX is used, it must also be configured for McASP function. Other pins can be configured to function as GPIOs, if desired.
- MCASP_PDIR: The data pin must be configured as output. If internal clock source AUXCLK is used as the reference clock, it may be output as the AHCLKX device level signal by configuring AHCLKX pin as an output.
- MCASP_GBLCTL: Global initialization
- MCASP_AMUTE: Leave this register at default state.
- MCASP_TXDITCTL: The DITEN bit must be set to 0b1 to enable DIT mode. Configure other bits as desired.
- MCASP_TXMASK: Mask the desired bits, depending upon left-aligned or right-aligned internal data.

- MCASP_TXFMT: XDATDLY = 0. XRVRS = 0. XPAD = 0. XSSZ = Fh (32-bit slot). XBUSEL = configured as desired. The XROT bit is configured, as described in the Section 11.5.1.4.4.1.2 .
- MCASP_TXFMCTL: Configure the bits according to former discussions.
- MCASP_ACLKXCTL: ASYNC = 1. Program the CLKXDIV bits to obtain the bit clock rate desired. CLKXM = 1.
- MCASP_AHCLKXCTL: Program the HCLKXDIV bits to obtain the high-frequency bit clock rate desired.
- MCASP_TXTDM: Set to FFFF FFFFh for all active slots for DIT transfers.
- MCASP_EVTCTLX: Program all fields according to the interrupts desired.
- MCASP_TXCLKCHK: Program all fields according to the clock checking desired.
- MCASP_XRSRCTLn: Set SRMOD = 1 (transmitter) for the DIT pins.
- MCASP_DITCSRAi and MCASP_DITCSRBi: Program the channel status bits as desired.
- MCASP_DITUDRAi and MCASP_DITUDRBi: Program the user data bits as desired.

Note

In DIT mode, the transmitter can support a 192 kHz frame rate (stereo) on up to 2 serial data pins simultaneously (note that the internal bit clock for DIT runs two times faster than the equivalent bit clock for TDM (I2S) mode, due to the need to generate Biphase Mark Encoded Data - see Section 11.5.1.2.2.5.1).

11.5.1.4.9.3.3 DIT Channel Status and User Data Register Files

The channel status registers (MCASP_DITCSRAi and MCASP_DITCSRBi) and user data registers (MCASP_DITUDRAi and MCASP_DITUDRBi) are not double-buffered. Typically, programmers use one of the synchronizing interrupts, such as the last slot, to create an event at a safe time so the register may be updated. In addition, the software reads the transmit TDM slot counter to determine which word of the register is being used.

It is a software requirement to avoid writing to the word of user data and channel status that are being used to encode the current time slot; otherwise, it is undetermined whether old or new data is used to encode the bitstream.

The DIT subframe format is defined in Section 11.5.1.2.2.5.2, *S/PDIF Subframe Format*. The channel status information (C) and user data (U) are defined in the following DIT control registers:

- MCASP_DITCSRA0 to MCASP_DITCSRA5: The 192 bits in these six registers contain the channel status information for the left channel within each frame.
- MCASP_DITCSRB0 to MCASP_DITCSRB5: The 192 bits in these six registers contain the channel status information for the right channel within each frame.
- MCASP_DITUDRA0 to MCASP_DITUDRA5: The 192 bits in these six registers contain the user data information for the left channel within each frame.
- MCASP_DITUDRB0 to MCASP_DITUDRB5: The 192 bits in these six registers contain the user data information for the right channel within each frame.
- The S/PDIF block format is shown in Figure 11-346. There are 192 frames within a block (frame 0 to frame 191). There are two subframes within each frame (subframes 1 and 2 for the left and right channels, respectively).

The channel status and user data information sent on each subframe is summarized in Table 11-1586.

Table 11-1586. Channel Status and User Data for Each DIT Block

11.5.1.4.10 Data Transmission and Reception

The McASP is serviced by writing data to the MCASP_TXBUFn registers for transmit operations, and by reading data from the MCASP_RXBUFn registers for receive operations. The McASP sets status flags and notifies the software whenever data is ready to be serviced. The Section 11.5.1.4.10.1, *Data Ready Status and Event/ Interrupt Generation*, discusses data-ready status in details.

The McASP transmit/receive XRBUFn buffer can be accessed through one of the two peripheral ports of the device:

- DATA port: This port is dedicated to DMA initiated data transfers on the device for McASP transmit (Tx) purposes.
- Configuration bus (CFG): The configuration bus- CFG port is used for peripheral configuration control and receive/transmit data transfers initiated by the host CPU in the device.

Section 11.5.1.4.10.1.3, *Transfers Through the Data Port (DATA)*, and Section 11.5.1.4.10.1.4, *Transfers Through the Configuration Bus (CFG),* discuss how to perform transfers through the data port (DATA) and the configuration port (CFG), respectively.

A device CPU and DMA usages are discussed in Section 11.5.1.4.10.1.5, *Using the device CPUs for McASP Servicing*, and Section 11.5.1.4.10.1.6, *Using the DMA for McASP Servicing*, respectively.

McASP DATA port allows DMAs to access the McASP transmit buffer more efficiently on the L3_MAIN-interconnect or L4_PER2 interconect, using burst transfers. The physical addresses to access these registers are listed in .

11.5.1.4.10.1 Data Ready Status and Event/Interrupt Generation

11.5.1.4.10.1.1 Transmit Data Ready

The transmit data ready flag - XDATA in the MCASP_TXSTAT register reflects the data ready status of XRBUFn buffers for all of the active slot transmitting serializers. The XDATA flag is set whenever data is transferred from a transmitting serializer buffer - XRBUFn to its corresponding XRSRn shift register. Thus, the XDATA bit indicates the global event that some of the serializers data buffer - XRBUFn is emptied and ready to accept new data from the host (CPU or DMA). The transmit data ready event is individually indicated per serializer in its corresponding control register MCASP_XRSRCTLn[4] XRDY status bit. When this bit is set to 0b1, it notifies to host that this serializer Tx buffer must be serviced (written). When MCASP_TXBUFn is written to by the host, the MCASP_XRSRCTLn[4] XRDY is deasserted to 0b0. As XDATA global flag is an OR-event of all active serializers XRDY flags, it indicates to software the moment, when write service operation has to be initiated by the McASP host (XDATA=0b1). The XRDY flags have to be sequentially scanned by user software to determine which serializer MCASP_TXBUFn register has to be currently written. Once all requested MCASP_TXBUFn are written, the serializers control XRDY flags are cleared to 0b0. As a consequence, XDATA flag is deasserted to 0b0, to indicate to SW that write operation is completed for all serializers.

The global XDATA flag can be cleared when the MCASP_TXSTAT[5] XDATA bit is written to 0b1, or once MCASP_TXBUFn registers of all the serializers, that have previously raised their XRDY flags, are written with corresponding active slot data by the host.

Whenever XDATA is set, the AXEVT event is automatically generated on MCASPi_DREQ_TX line (if enabled in the MCASP_XEVTCTL register) to notify the DMA of the MCASP_TXBUFn empty status. An interrupt - MCASPi_IRQ_AXEVT can be also generated if the XDATA interrupt is enabled in the MCASP_EVTCTLX register (for details, see Section 11.5.1.4.12.1, *Transmit Data Ready Interrupt*).

For DMA requests, the McASP does not require that MCASP_TXSTAT be read between DMA events. This means that, even if MCASP_TXSTAT already has the XDATA flag set to 1 from a previous request, the next transfer triggers another DMA request.

Because the serializer acts in lockstep, only one DMA event is generated to indicate that the transmit serializer is ready to be written to with new data.

Figure 11-357 shows the timing details of when AXEVT is generated at the McASP boundary. In this example, as soon as the last bit (A0) of word A is transmitted, the McASP sets the XDATA flag and generates an AXEVT event. However, it takes up to five McASP interface clocks (AXEVT latency) before AXEVT is active at the McASP boundary. Upon AXEVT, the CPU can begin servicing the McASP by writing word C into the MCASP_TXBUFn (service time). The CPU must write word C into the MCASP_TXBUFn within the setup time required by the McASP (setup time).

The maximum service time (see Figure 11-357) can be calculated as:

Service Time = Time Slot – AXEVT Latency –Setup Time

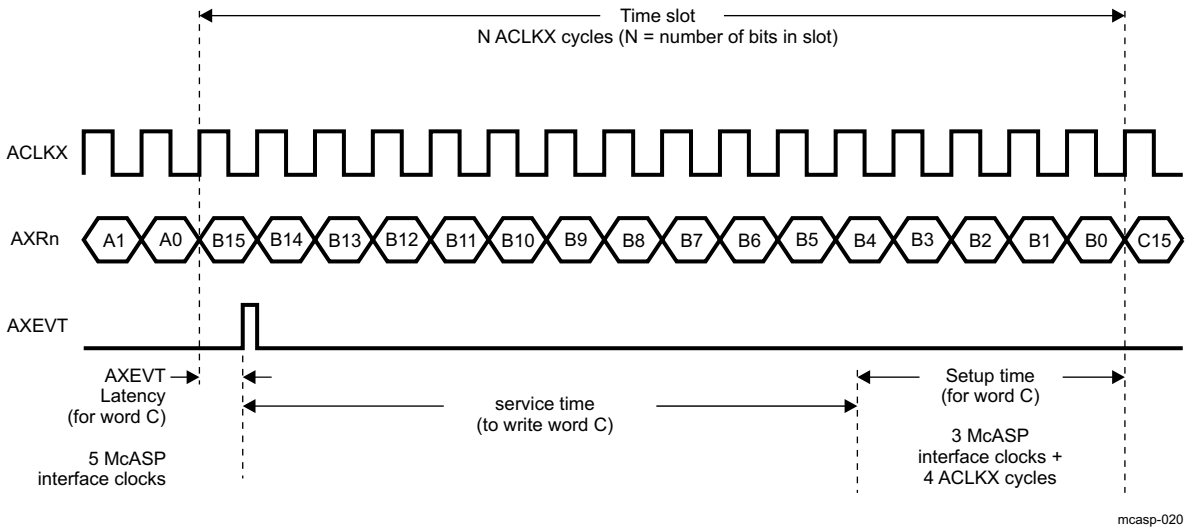

Figure 11-357. Service Time Upon Transmit DMA Event (AXEVT)

11.5.1.4.10.1.2 Receive Data Ready

Similarly, the receive data ready flag - RDATA in the MCASP_RXSTAT register reflects the data ready status of XRBUFn buffers for all of the active slot receiving serializers. The RDATA flag is set whenever data is transferred from a receiving serializer shift register XRSRn to its corresponding XRBUFn data buffer. Thus, the RDATA bit indicates the global event that some of the receivers data buffer - RXBUFn already contains received data (i.e. a buffer is full) and is ready to transfer it to the host (MPU/DSP). The receive data ready event is individually indicated per serializer in its corresponding control register MCASP_XRSRCTLn [5] RRDY status bit. When this bit is set to 0b1, it notifies to host that this serializer Rx buffer must be serviced (read). When MCASP_RXBUFn is read from the host, the MCASP_XRSRCTLn [5] RRDY is deasserted to 0b0. As RDATA global flag is an OR-event of all active serializers RRDY flags, it indicates to software the moment, when read service operation has to be initiated by the McASP host (RDATA=0b1). The RRDY flags have to be sequentially scanned by user software to determine which serializer MCASP_RXBUFn register has to be currently read. Once all requested MCASP_RXBUFn are read, the serializers control RRDY flags are cleared to 0b0. As a consequence, RDATA flag is deasserted to 0b0, to indicate to SW that read operation is completed for all serializers.

The global RDATA flag can be cleared when the MCASP_RXSTAT[5] RDATA bit is written to 0b1, or once MCASP_RXBUFn registers of all the serializers, that have previously raised their RRDY flags, are read by the host.

Whenever RDATA is set, the AREVT event is automatically generated on MCASPi_DREQ_RX line (if enabled in the MCASP_REVTCTL register) to notify the DMA of the MCASP_RXBUFn full status. An interrupt - MCASPi_IRQ_AREVT can be also generated if the RDATA interrupt is enabled in the MCASP_EVTCTLR register (for details, see Section 11.5.1.4.12.1, *Receive Data Ready Interrupt*).

Figure 11-358 shows the timing details of when AREVT event is generated at the McASP boundary. In this example, as soon as the last bit (bit A0) of Word A is received, the McASP sets the RDATA flag and generates an AREVT event. However, it takes up to five McASP interface clocks (AREVT Latency) before AREVT is active at the McASP boundary. Upon AREVT, the CPU can begin servicing the McASP by reading Word A from the MCASP_RXBUFn (service time). The CPU must read Word A from the MCASP_RXBUFn register no later than the setup time required by the McASP (Setup Time).

The maximum service time (see Figure 11-358) can be calculated as:
Service Time = Time Slot - AREVT Latency - Setup Time

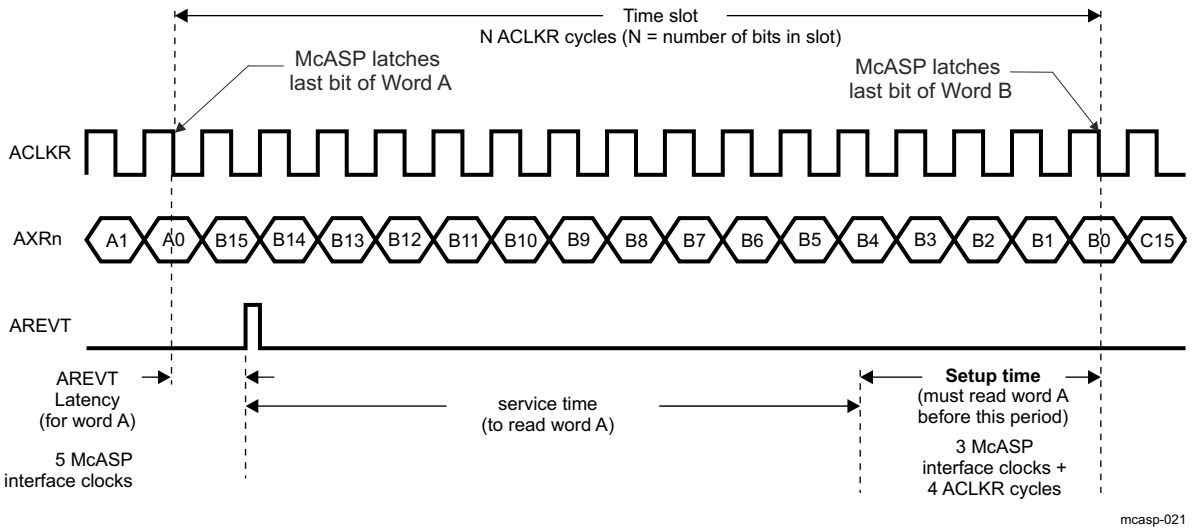

Figure 11-358. CPU Service Time Upon Receive Event (AREVT)

11.5.1.4.10.1.3 Transfers Through the Data Port (DATA)

CAUTION

To perform internal transfers through the DATA port, clear the XBUSEL/RBUSEL bit to 0b0 in the MCASP_TXFMT/MCASP_RXFMT register, respectively. Failure to do so may result in software malfunction.

Note

McASP1, whose data portis accessible directly via L3_MAIN, does not support FIFO/constant addressing modes. Incrementing transfers must be used instead.

In a typical McASP transfer scenario, the DMA Controller write accesses the XRBUFn transmit buffer through the McASP data port (DATA) on L3_MAIN Interconect for McASP1 and on L4_PER2 Interconect for McASP2/3 . CPU hosts can access both XRBUFn transmit and receive data buffers on their corresponding DATA port address via DATA port corresponding address. To perform transfers through the DATA port, simply have the DMA Controller write the McASP Tx buffer through Interconect DATA port location. Refer to . Although the transfer is passed through an integrated AFIFO transmit/receive buffer, the host (DMA or CPU) must follow the described below procedure to access the data buffers of each serializer, regardless the AFIFO is enabled or disabled. The AFIFO operation is described in Section 11.5.1.4.11.

For accesses through the DATA port, the DMA/CPU services all the serializers through accessing only a single address. In addition, as can be seen in , the same physical DATA port address is used regardless of a read or write access is performed. The McASP automatically cycles through the active slot transmitting/receiving serializers, internally generating the appropriate offsets.

Note

DATA port allows the DMA/CPU to automatically access only the data buffers. There is no way for DMA/CPU to access the McASP configuration registers addressing their corresponding McASP DATA port.

For transmit operations through the DATA port, the host must always write to the same transmit buffer DATA port address (which is same than the receive buffer DATA port adress) to service all of the active slot transmitting

serializers. Regardless of McASP serializer 0 being configured inactive or active, the user software must always configure the destination address to match the DATA port location of TXBUF buffer (See).

In addition, the DMA/CPU must write the buffers of all transmitting serializers in incremental (although not necessarily consecutive) order. For example, if only serializers 1 and 3 are set up as active transmitters, to the same transmit buffer DATA port address twice - first data for serializer 1 and second data for serializer 3 upon each transmit data ready event. This exact servicing order must be followed so that data appears in the appropriate serializers.

Note

For write transfers through McASP DATA port it is preferable to use DMA on corresponding Interconect. This is because DMAs initiated traffic gets better advantage of the burst transfers supported by DATA port.

For receive operations through the DATA port, the DMA/CPU must always read from the same receive buffer DATA port address (which is same than the transmit buffer DATA port adress) to service all of the active slot receiving serializers. Regardless of McASP serializer 0 being configured inactive or active, the user software must always configure the DMA/CPU source address to match the DATA port location of RXBUF buffer (See).

In addition, reads from the receive buffer for all active slot receiving serializers through the Rx DATA port return data in incremental (although not necessarily consecutive) order. For example, if serializers 0, 1 and 3 are set up as active receivers, the MPU should read from the same receive buffer DATA port address three times to obtain data for serializers 0,1 and 3 in this exact order, upon each receive data ready event.

Note

To service a serializer for a transmit or receive operation through the McASP DATA port, the initiator always writes (preferably DMA) and reads from the same address (refer to), respectively.

See , *McASP_DATA Register Summary*, for more details about XRBUFn buffer physical address corresponding to the McASP DATA port on:

- Main Interconect (L3_MAIN or L4_PER2)

Note

When transmitting through the DATA port, the DMA/CPU must write data (at the same address) to each serializer configured as *active* (active slot selected in MCASP_TXTDM) and *transmit* (Tx enabled in MCASP_XRSRCTLn) within each time slot. Failure to do so results in a buffer underrun condition (see Section 11.5.1.4.15.1, *Buffer Underrun Error - Transmitter*). Similarly, when DMA/CPU receives, data must be read from each serializer configured as *active* (active slot selected in MCASP_RXTDM) and *receive* (Rx enabled in MCASP_XRSRCTLn) within each time slot. Failure to do results in a buffer overrun condition (see Section 11.5.1.4.15.2, *Buffer Overrun Error - Receiver*).

11.5.1.4.10.1.4 Transfers Through the Configuration Bus (CFG)

CAUTION

To perform internal transfers through the configuration bus, set the XBUSEL/RBUSEL bit to 1 in the MCASP_TXFMT/MCASP_RXFMT registers, respectively. Failure to do so may result in software malfunction.

Note

McASP1, whose data port is accessible directly via L3_MAIN does not support FIFO/constant addressing modes. Incrementing transfers must be used instead.

In this method, the DMA/CPU accesses the XRBUFn transmit or receive buffer through corresponding configuration bus (CFG) address.

The exact XRBUFn transmit/receive buffer physical address for any particular serializer is determined by adding the transmit/receive buffer alias register offset for that particular serializer to the base address of McASP CFG port actual for L4_PER2 accesses. The XRBUFn buffer of the n-th serializer configured as a transmitter is aliased - MCASP_TXBUFn in the CFG port address space. For example, the XRBUF2 transmit buffer is mapped as the MCASP_TXBUF2 register. Similarly, the XRBUFn buffer of the n-th serializer configured as a receiver is aliased - MCASP_RXBUF in the CFG port address space. For example, the XRBUF3 receive buffer is mapped as the MCASP_RXBUF3 register.

Accessing the XRBUF through the DATA port (see Section 11.5.1.4.10.1.3) is different than CFG port accesses because the DATA port access demands the same physical address, regardless of transfer direction or current channel index , while accessing through the peripheral configuration port - CFG, the DMA/CPU must provide the exact MCASP_TXBUFn or MCASP_RXBUF address upon accessing n-th serializer TX or RX buffer, respectively. For more details about MCASP_TXBUFn and MCASP_RXBUF addresses corresponding to McASP CFG port, see , *MCASP_CFG Register Summary*.

11.5.1.4.10.1.5 Using a Device CPU for McASP Servicing

The device CPUs can be used to service the McASP transmit channels through interrupts (upon MCASPi_IRQ_AXEVT and MCASPi_IRQ_AREVT interrupts). Another way to service the transmit and receive channels, a polling of the XDATA bit in the MCASP_TXSTAT register and RDATA bit in the MCASP_RXSTAT register can be performed by device CPUs, respectively. As discussed in Section 11.5.1.4.10.1.3, *Transfers Through the Data Port (DATA)*, and Section 11.5.1.4.10.1.4, *Transfers Through the Configuration Bus (CFG)* , the device CPUs can access McASP XRBUF serializer buffer through their corresponding DATA and CFG port locations.

To use the device CPUs to service the McASP through interrupts, the XDATA/RDATA bit must be enabled in the respective MCASP_EVTCTLX/MCASP_EVTCTLR registers, to generate interrupts MCASPi_IRQ_AXEVT/ MCASPi_IRQ_AREVT to the device CPUs upon data ready

11.5.1.4.10.1.6 Using the DMA for McASP Servicing

The typical scenario is to use the DMA to service the McASP transmit and receive logic through the DATA port, although the DMA can also service the McASP through the configuration bus (CFG). The transfer passes through integrated AFIFO transmit/receive buffer. If AFIFO is enabled, DMA requests are collected and fed to a device DMA controller (see Figure 11-348). The data transfer is managed by the AFIFO according to generated transmit and receive events in the McASP and data is fed to transmit buffers and fetched from receive buffers as described in Section 11.5.1.4.11. The generation of transmit and receive request is described below. After generation of transmit/receive DMA events from McASP module, these events are collected in AFIFO and on specific AFIFO conditions described in Section 11.5.1.4.11 the requests (transmit or receive) are forwarded to a DMA controller via MCASPi_DREQ_TX and MCASPi_DREQ_RX outputs. If the AFIFO is disabled (default state) it is transperrant for the McASP module and all request are directly sent to the DMA controller.

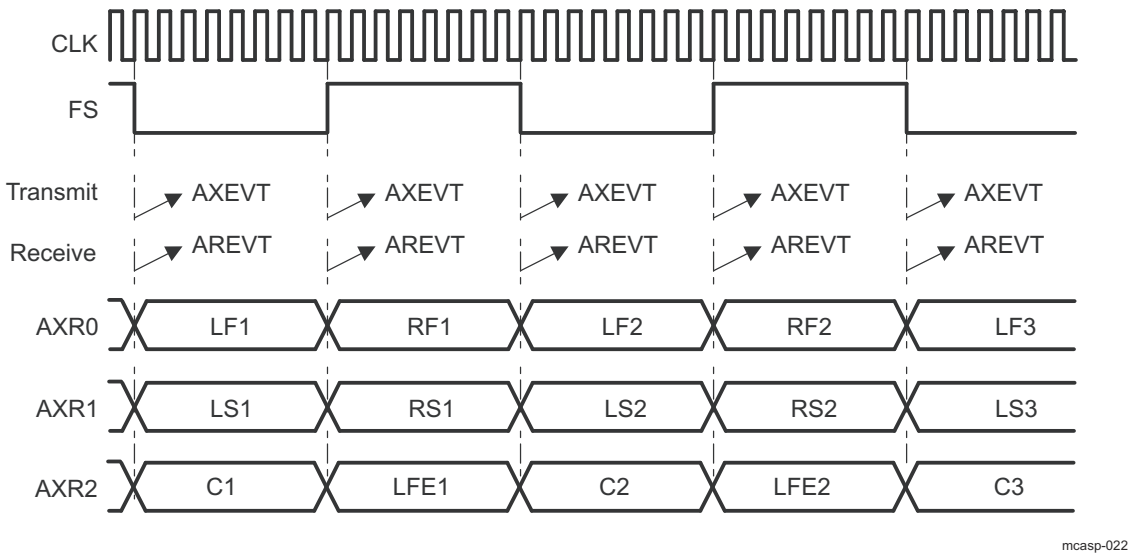

Figure 11-359. DMA Transmit and Receive Event in an Audio Example – One Event

In transmit mode, the DMA event - AXEVT (MCASPi_DREQ_TX output), which is triggered upon each XDATA transition from 0 to 1, is used to service the McASP TXBUFn transmit buffers. In receive mode, the DMA event AREVT (MCASPi_DREQ_RX output) which is triggered upon each RDATA transition from 0 to 1, is used to service the McASP RXBUFn receive buffers.

Figure 11-359 is an example of an audio system with six audio channels (LF, RF, LS, RS, C and LFE) transmitted or received through the McASP signals - AXR0, AXR1 and AXR2. It shows the points at which events AXEVT/AREVT are triggered.

In Figure 11-359, a Tx DMA event AXEVT is triggered on each time slot. In the example, AXEVT is triggered for each of the transmit audio channel time slot (time slot for channels LF, LS, and C; and time slot for channels RF, RS, LFE). Transmit DMA events are generated automatically upon transmit data ready, provided that DMA TX requests generation is enabled in the MCASP_XEVTCTL register. Similarly, Rx DMA event AREVT is triggered for each of the receive audio channel time slot. Receive DMA events are generated automatically upon receive data ready, provided that DMA RX requests generation is enabled in the MCASP_REVTCTL register.

11.5.1.4.11 McASP Audio FIFO (AFIFO)

The AFIFO contains two FIFOs: one Read FIFO (RFIFO), and one Write FIFO (WFIFO). The RFIFO and the WFIFO are the same size: 64 32-bit Words. To ensure backward compatibility with existing software, both the Read and Write FIFOs are disabled by default. See Figure 11-360 for a high-level block diagram of the AFIFO. The AFIFO may be enabled/disabled and configured via the WFIFOCTL and RFIFOCTL registers. Note that if the Read or Write FIFO is to be enabled, it must be enabled prior to initializing the receive/transmit section of the McASP.

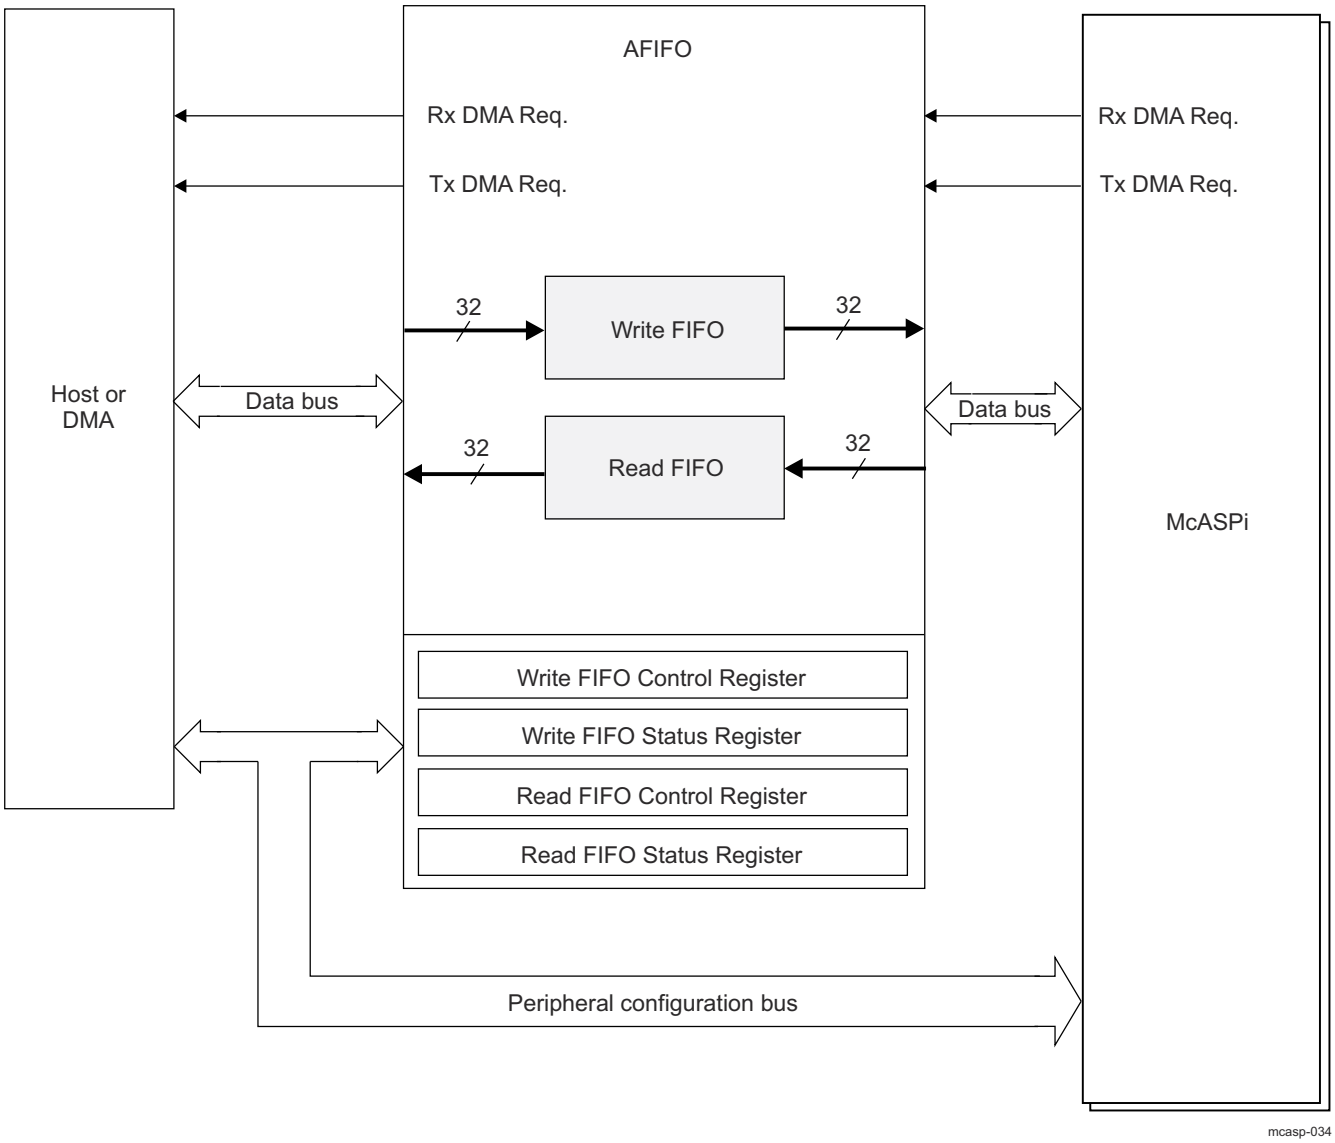

Figure 11-360. McASP Audio FIFO (AFIFO) Block Diagram

11.5.1.4.11.1 AFIFO Data Transmission

When the Write FIFO is disabled, transmit DMA requests pass through directly from the McASP to the host/DMA controller. Whether the WFIFO is enabled or disabled, the McASP generates transmit DMA requests as needed; the AFIFO is “invisible” to the McASP. When the Write FIFO is enabled, transmit DMA requests from the McASP are sent to the AFIFO, which in turn generates transmit DMA requests to the host/DMA controller. If the Write FIFO is enabled, upon a transmit DMA request from the McASP, the WFIFO writes WNUMDMA 32-bit words to the McASP if and when there are at least WNUMDMA words in the Write FIFO. If there are not, the WFIFO waits until this condition has been satisfied. At that point, it writes WNUMDMA words to the McASP. (See description for WFIFOCTL[7:0] WNUMDMA.) If the host CPU writes to the Write FIFO, independent of a transmit DMA request, the WFIFO will accept host writes until full. After this point, excess data will be discarded. Note that when the WFIFO is first enabled, it will immediately issue a transmit DMA request to the host. This is because it begins in an empty state, and is therefore ready to accept data.

11.5.1.4.11.1.1 Transmit DMA Event Pacer

The AFIFO may be configured to delay making a transmit DMA request to the host until the Write FIFO has enough space for a specified number of words. In this situation, the number of transmit DMA requests to the

host or DMA controller is reduced. If the Write FIFO has space to accept WNUMEVT 32-bit words, it generates a transmit DMA request to the host and then waits for a response. Once WNUMEVT words have been written to the FIFO, it checks again to see if there is space for WNUMEVT 32-bit words. If there is space, it generates another transmit DMA request to the host, and so on. In this fashion, the Write FIFO will attempt to stay filled. Note that if transmit DMA event pacing is desired, WFIFOCTL[15:8] WNUMEVT should be set to a non-zero integer multiple of the value in WFIFOCTL[7:0] WNUMDMA. If transmit DMA event pacing is not desired, then the value in WFIFOCTL[15:8] WNUMEVT should be set equal to the value in WFIFOCTL[7:0] WNUMDMA.

11.5.1.4.11.2 AFIFO Data Reception

When the Read FIFO is disabled, receive DMA requests pass through directly from McASP to the host/DMA controller. Whether the RFIFO is enabled or disabled, the McASP generates receive DMA requests as needed; the AFIFO is “invisible” to the McASP. When the Read FIFO is enabled, receive DMA requests from the McASP are sent to the AFIFO, which in turn generates receive DMA requests to the host/DMA controller. If the Read FIFO is enabled and the McASP makes a receive DMA request, the RFIFO reads RNUMDMA 32-bit words from the McASP, if and when the RFIFO has space for RNUMDMA words. If it does not, the RFIFO waits until this condition has been satisfied; at that point, it reads RNUMDMA words from the McASP. (See description for RFIFOCTL[7:0] RNUMDMA.) If the host CPU reads the Read FIFO, independent of a receive DMA request, and the RFIFO at that time contains less than RNUMEVT words, those words will be read correctly, emptying the FIFO.

11.5.1.4.11.2.1 Receive DMA Event Pacer

The AFIFO may be configured to delay making a receive DMA request to the host until the Read FIFO contains a specified number of words. In this situation, the number of receive DMA requests to the host or DMA controller is reduced. If the Read FIFO contains at least RNUMEVT 32-bit words, it generates a receive DMA request to the host and then waits for a response. Once RNUMEVT 32-bit words have been read from the RFIFO, the RFIFO checks again to see if it contains at least another RNUMEVT words. If it does, it generates another receive DMA request to the host, and so on. In this fashion, the Read FIFO will attempt to stay empty. Note that if receive DMA event pacing is desired, RFIFOCTL[15:8] RNUMEVT should be set to a non-zero integer multiple of the value in RFIFOCTL[7:0] RNUMDMA. If receive DMA event pacing is not desired, then the value in RFIFOCTL[15:8] RNUMEVT should be set equal to the value in RFIFOCTL[7:0] RNUMDMA.

11.5.1.4.11.3 Arbitration Between Transmit and Receive DMA Requests

If both the WFIFO and the RFIFO are enabled and a transmit DMA request and receive DMA request occur simultaneously, priority is given to the transmit DMA request. Once a transfer is in progress, it is allowed to complete. If only the WFIFO is enabled and a transmit DMA request and receive DMA request occur simultaneously, priority is given to the transmit DMA request. Once a transfer is in progress, it is allowed to complete. If only the RFIFO is enabled and a transmit DMA request and receive DMA request occur simultaneously, priority is given to the receive DMA request. Once a transfer is in progress, it is allowed to complete.

11.5.1.4.12 McASP Events and Interrupt Requests

Table 11-1587 lists all the transmit event flags. Table 11-1588 lists all the Receive event flags. Source of each of these TX/RX events can be a TX/RX channel from any McASPi serializer configured as transmitter or receiver respectivly.

Table 11-1587. TX Events[2]

Event Mask	Event Flag	Map to [1]	Description
MCASP_EVTCTLX[0] XUNDRN	MCASP_TXSTAT[0] XUNDRN	MCASPi_IRQ_AXEVT	Transmit buffer underrun
MCASP_EVTCTLX[1] XSYNCERR	MCASP_TXSTAT[1] XSYNCERR	MCASPi_IRQ_AXEVT	Unexpected transmit frame sync
MCASP_EVTCTLX[2] XCKFAIL	MCASP_TXSTAT[2] XCKFAIL	MCASPi_IRQ_AXEVT	Transmit clock failure
MCASP_EVTCTLX[3] XDMAERR	MCASP_TXSTAT[7] XDMAERR	MCASPi_IRQ_AXEVT	DATA port transmit error
MCASP_EVTCTLX[4] XLAST	MCASP_TXSTAT[4] XLAST	MCASPi_IRQ_AXEVT	Transmit last slot interrupt
MCASP_EVTCTLX[5] XDATA	MCASP_TXSTAT[5] XDATA	MCASPi_IRQ_AXEVT	Transmit data-ready interrupt
MCASP_EVTCTLX[7] XSTAFRM	MCASP_TXSTAT[6] XSTAFRM	MCASPi_IRQ_AXEVT	Transmit start of frame interrupt

Table 11-1587. TX Events[2] (continued)

Event Mask	Event Flag	Map to [1]	Description
n.a.	MCASP_TXSTAT[8] XERR	n.a.	OR-event of all Tx-error events: (XDMAERR | XCKFAIL | XUNDRN | XSYNCERR). It is cleared ONLY when all error flags are cleared
n.a.	MCASP_TXSTAT[3] XTDMSLOT	n.a.	Qualifies the current TDM slot as an odd or an even slot.

(1) Every McASPi module generates separate IRQ event.
(2) Global events for all transmitting serializers in a single McASPi module.

Table 11-1588. RX Events[2]

Event Mask	Event Flag	Map to[1]	Description
MCASP_EVTCTLR[0] ROVRN	MCASP_RXSTAT[0] ROVRN	MCASPi_IRQ_AREVT	Receive buffer overrun
MCASP_EVTCTLR[1] RSYNCERR	MCASP_RXSTAT[1] RSYNCERR	MCASPi_IRQ_AREVT	Unexpected receive frame sync
MCASP_EVTCTLR[2] RCKFAIL	MCASP_RXSTAT[2] RCKFAIL	MCASPi_IRQ_AREVT	Receive clock failure
MCASP_EVTCTLR[3] RDMAERR	MCASP_RXSTAT[7] RDMAERR	MCASPi_IRQ_AREVT	DATA port receive error
MCASP_EVTCTLR[4] RLAST	MCASP_RXSTAT[4] RLAST	MCASPi_IRQ_AREVT	Receive last slot
MCASP_EVTCTLR[5] RDATA	MCASP_RXSTAT[5] RDATA	MCASPi_IRQ_AREVT	Receive data-ready
MCASP_EVTCTLR[7] RSTAFRM	MCASP_RXSTAT[6] RSTAFRM	MCASPi_IRQ_AREVT	Receive start of frame
n.a.	MCASP_RXSTAT[8] RERR	n.a.	OR-event of all Rx-error events: (RDMAERR | RCKFAIL | ROVRN | RSYNCERR). RERR event is cleared once all error flags are cleared.
n.a.	MCASP_RXSTAT[3] RTDMSLOT	n.a.	Qualifies the current TDM slot as an odd or an even slot.

(1) Every McASP module generates separate IRQ event.
(2) Global events for all receiving serializers in a single McASPi module. These events and masks are available in same format for every McASPi module

Software has to read the MCASP_TXSTAT/MCASP_RXSTAT register to determine which event occurs at a global level for McASP Tx/Rx logic. In addition user software has to scan the XRDY/RRDY read-only flags in the MCASP_XRSRCTLn registers to determine which active serializer is the actual source of the event.

A Tx interrupt line (MCASPi_IRQ_AXEVT) is asserted (active high) when one of the MCASP_TXSTAT notified events occurs, provided that it is enabled in its corresponding MCASP_EVTCTLX bit. Similarly, a Rx interrupt line (MCASPi_IRQ_AREVT) is asserted (active high) when one of MCASP_RXSTAT notified events occurs, provided that it is enabled in its corresponding MCASP_EVTCTLR bit. See also Section 11.5.1.4.12.4, *Multiple Interrupts* and the Section 11.5.1.4.10.1, *Data Ready Status and Event/Interrupt Generation*.

11.5.1.4.12.1 Transmit Data Ready Event and Interrupt

The transmit data-ready interrupt (XDATA) is generated if XDATA is 1 in the MCASP_TXSTAT register and XDATA is enabled in MCASP_EVTCTLX. The Section 11.5.1.4.10.1, *Data Ready Status and Event/Interrupt Generation*, provides details on when XDATA is set in the MCASP_TXSTAT register.

A transmit-start-of-frame interrupt (XSTAFRM) is triggered by the recognition of a transmit frame sync.

A transmit-last-slot interrupt (XLAST) is a qualified version of the data-ready interrupt (XDATA). It has the same behavior than the data-ready interrupt, but is further qualified by having the data requested belonging to the last slot (the slot that just ended is the next-to-last TDM slot, the current slot is the last slot).

11.5.1.4.12.2 Receive Data Ready Event and Interrupt

The receive data-ready interrupt (RDATA) is generated if RDATA is 1 in the MCASP_RXSTAT register and RDATA is enabled in MCASP_EVTCTLR. The Section 11.5.1.4.10.1, *Data Ready Status and Event/Interrupt Generation*, provides details on when RDATA flag is set in the MCASP_RXSTAT register.

A receiver start of frame (RSTAFRM) interrupt is triggered by the recognition of a receiver frame sync.

A receiver last slot (RLAST) interrupt is a qualified version of the data ready interrupt (RDATA). It has the same behavior as the data ready interrupt, but is further qualified by having the data in the buffer come from the last TDM time slot (the slot that just ended was last TDM slot).

11.5.1.4.12.3 Error Interrupt

Upon detection, the following error conditions generate interrupt flags:

In the transmit status register (MCASP_TXSTAT):

- Transmit underrun (XUNDRN)
- Unexpected transmit frame sync (XSYNCERR)
- Transmit clock failure (XCKFAIL)
- Transmit DATA port error (XDMAERR)

Each interrupt source also has a corresponding enable bit in the transmit interrupt control register (MCASP_EVTCTLX). If the enable bit is set, an interrupt is requested when the interrupt flag is set in MCASP_TXSTAT. If the enable bit is not set, no interrupt request is generated. However, the interrupt flag may be polled.

In the receive status register (MCASP_RXSTAT) :

- Receiver overrun (ROVRN)
- Unexpected receive frame sync (RSYNCERR)
- Receive clock failure (RCKFAIL)
- Receive DATA port error (RDMAERR)

Each interrupt source also has a corresponding enable bit in the receive interrupt control register (MCASP_EVTCTLR). If the enable bit is set, an interrupt is requested when the interrupt flag is set in MCASP_RXSTAT. If the enable bit is not set, no interrupt request is generated. However, the interrupt flag may be polled.

11.5.1.4.12.4 Multiple Interrupts

This only applies to interrupts and not to DMA requests. The following terms are defined:

- **Active Interrupt Request:** a flag in MCASP_TXSTAT is set and the interrupt is enabled in MCASP_EVTCTLX.
- **Outstanding Interrupt Request:** An interrupt request has been issued on one of the McASP transmit interrupt port, but that request has not yet been serviced.
- **Serviced:** The CPUs write to MCASP_TXSTAT to clear one or more of the active interrupt request flags.

The first interrupt request to become active for the serializer with the interrupt flag set in MCASP_TXSTAT/ MCASP_RXSTAT and the interrupt enabled in MCASP_EVTCTLX/MCASP_EVTCTLR generates a request on the McASP transmit or receive interrupt port.

If more than one interrupt request becomes active in the same cycle, a single interrupt request is generated on the McASP transmit or receive interrupt port. Subsequent interrupt requests that become active while the first interrupt request is outstanding do not immediately generate a new request pulse on the McASP transmit or receive interrupt port.

The interrupt is serviced with the CPU writing to MCASP_TXSTAT/MCASP_RXSTAT. If any interrupt requests are active after the write, a new request is generated on the McASP transmit or receive interrupt port.

One outstanding interrupt request is allowed on each port, so a transmit and a receive interrupt request may both be outstanding at the same time.

11.5.1.4.13 DMA Requests

The McASP can generate one DMA request to the DMA_CROSSBAR to transmit (MCASPi_DREQ_TX) or receive (MCASPi_DREQ_RX) data. A DMA request to transmit data is generated if the XDATDMA bit in the

MCASP_XEVTCTL register is cleared. A DMA request to receive data is generated if the RDATDMA bit in the MCASP_REVTCTL register is cleared.

11.5.1.4.14 Loopback Modes

The McASP features a digital loopback mode (DLB) that allows loopback test transfers in TDM mode between McASP transmitters and receivers within the same device. In loopback mode, the output of a transmit serializer is connected internally to the input of a receive serializer. Therefore, a receiver data can be checked against a transmitter data to ensure that the McASP settings are correct. Digital loopback mode applies to TDM mode only (2 to 32 slots in a frame). It does not apply to DIT mode (XMOD = 0x180) or burst mode (XMOD = 0).

Figure 11-361shows the basic logical connection of the serializers in loopback mode.

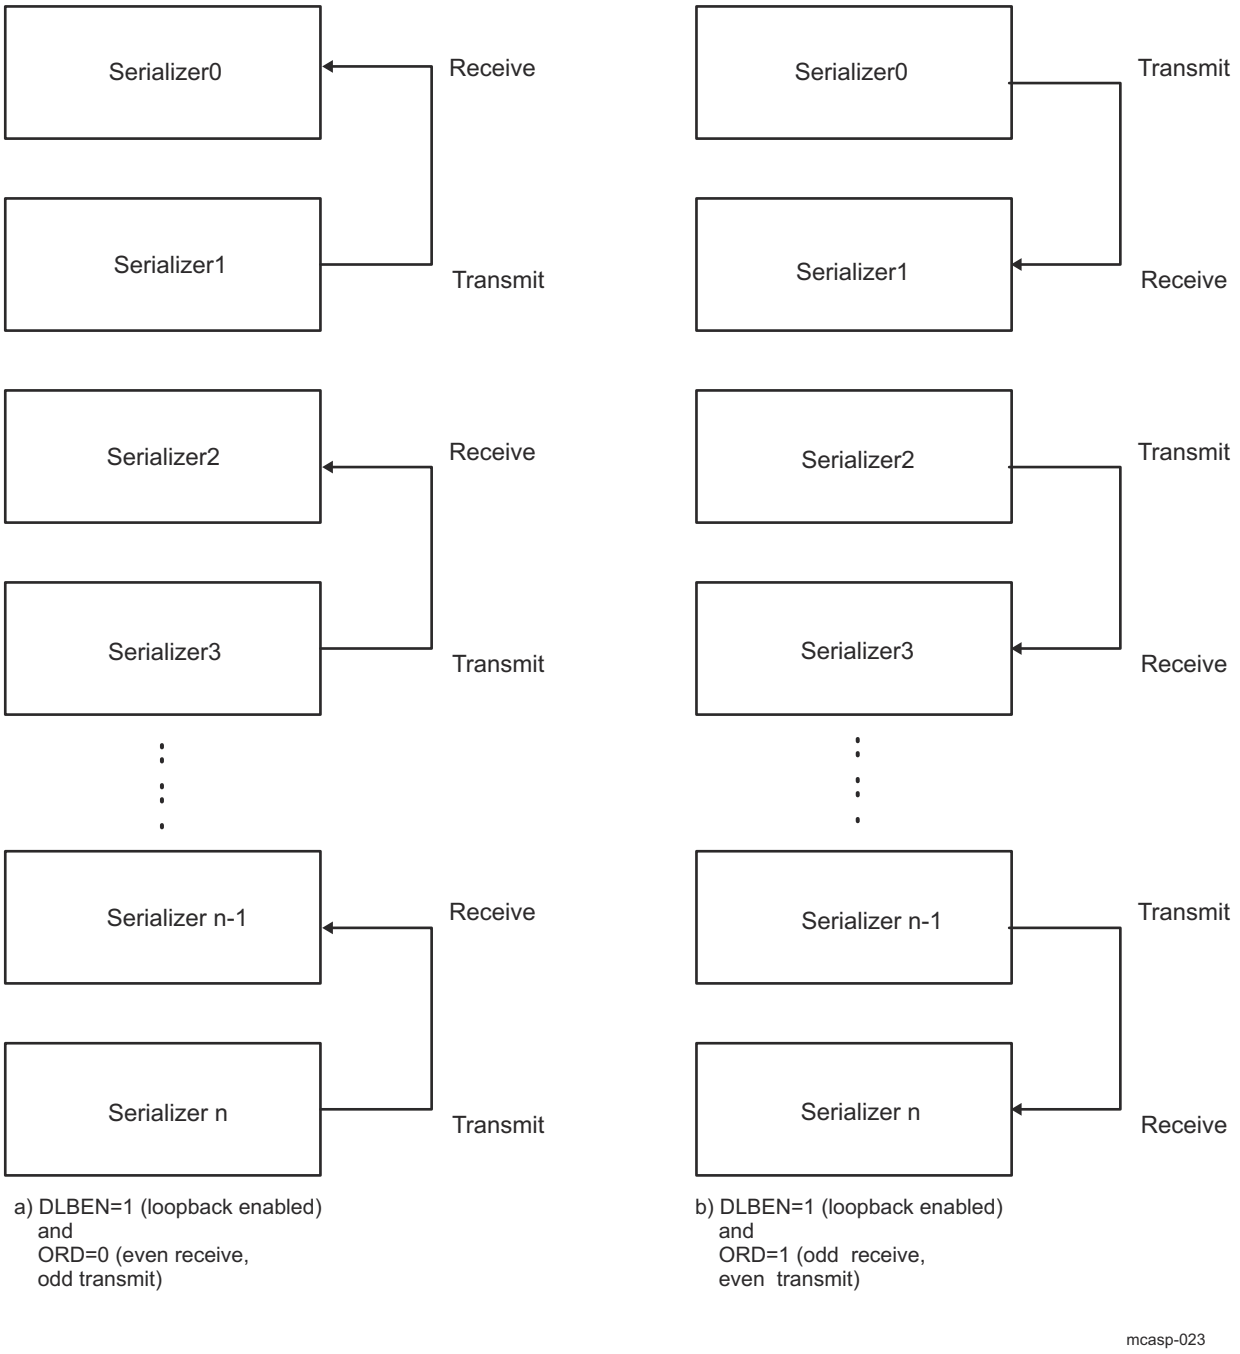

Figure 11-361. McASP Serializers Operation in Loopback Mode

Two types of loopback connections are possible, selected by the ORD bit in the digital loopback control register - MCASP_LBCTL as follows:

- ORD = 0: Outputs of odd serializers are connected to inputs of even serializers. If this mode is selected, the odd serializers must be configured as transmitters and even serializers as receivers.
- ORD = 1: Outputs of even serializers are connected to inputs of odd serializers. If this mode is selected, the even serializers must be configured as transmitters and odd serializers as receivers.

User can choose in software (bit IOLBEN of the MCASP_LBCTL) between a McASP module internal loopback and a device I/O level loopback.

When a **McASP internal loopback** is selected (MCASP_LBCTL[4] IOLBEN=0b0), it is NOT necessary to configure MCASP_PFUNC and MCASP_PDIR registers for McASP pin settings. Nevertheless, data can be optionally made externally visible at the I/O pin of the transmit serializer, if the pin is configured as a McASP output pin by setting the corresponding MCASP_PFUNC bit to 0 (i.e. to function as McASP, not GPIO) and MCASP_PDIR bit to 1 (output).

When a **device I/O level loopback** is selected (MCASP_LBCTL[4] IOLBEN=0b1), the MCASP_PFUNC and MCASP_PDIR registers must be configured with the appropriate settings for all AXRn pins, according to ORD bit configuration.

In case of device I/O loopback, the connectivity is externally applied between device pads (i.e. reaching device I/O buffers).

Hence, the corresponding padconfiguration registers must be appropriately configured in the device Control Module - CTRL_MODULE_CORE_PAD. For more details, see *Pad Configuration Rregisters* in *Control Module*.

When In loopback mode, the transmit clock and frame sync are used by both the transmit and receive sections of the McASP. The transmit and receive sections operate synchronously. This is achieved by setting the MODE bitfield of the MCASP_LBCTL register to 0x1 and the ASYNC bit of the MCASP_ACLKXCTL register to 0b0.

11.5.1.4.14.1 Loopback Mode Configurations

This is a summary of the settings required for digital loopback mode for TDM format :

- The MCASP_LBCTL[0] DLBEN bit must be set to 0b1 to enable a loopback mode. It must be kept at 0b0 during normal McASP operation.
- The MCASP_LBCTL[4] IOLBEN bit must be set to select between internal (McASP local) loopback mode or device I/O level loopback mode.
- The MCASP_LBCTL[3:2] MODE bitfield must be set to 0x1 for both the transmit and receive sections to use the transmit clock and frame sync generator.
- The MCASP_LBCTL[1] ORD must be programmed appropriately to select odd or even serializers to be transmitters or receivers.
- The corresponding serializers must be configured accordingly.
- The bit - MCASP_ACLKXCTL[6] ASYNC must be cleared to 0b0 to ensure synchronous transmit and receive operations.
- The bitfields - MCASP_RXFMCTL[15:7] RMOD and MCASP_TXFMCTL[15:7] XMOD must be set within range (0x2- 0x20) to indicate TDM mode.

Note

Loopback mode does not apply to DIT or burst mode, because McASP receivers do NOT natively support DIR - reception.

11.5.1.4.15 Error Reporting

The McASP includes error-checking capability for the serial protocol and data underrun. In addition, the McASP includes a timer that continually measures the high-frequency master clock every 32 AHCLKX clock cycles. The value of the timer can be read to get a measurement of the clock frequency and has a minimum and maximum range setting that can set an error flag if the master clock goes out of a specified range.

When one or more errors (software selectable) are detected, an interrupt can be generated if desired, based on one or more error sources.

11.5.1.4.15.1 Buffer Underrun Error -Transmitter

A buffer underrun occurs when a serializer is instructed by the transmit state-machine to transfer data from XRBUFn buffer to XRSRn shift register, but the corresponding (MCASP_TXBUFn) register has not yet been written with new data since the last time the transfer occurred. When this occurs, the transmit state-machine sets the XUNDRN flag.

An underrun is checked only once per time slot. The MCASP_TXSTAT[0] XUNDRN flag is set when an underrun condition occurs. Once set, the XUNDRN flag remains set until the host explicitly writes 1 to the XUNDRN bit to clear it.

In DIT mode, a pair of BMC zeros is shifted out when an underrun occurs (four bit times at 128 bfs). By shifting out a pair of zeros, a clock can be recovered on the receiver. To recover, reset the McASP and restart with the proper initialization.

In TDM mode, during an underrun case, a long stream of zeros are shifted out causing the DACs to mute. To recover, reset the McASP and start again with the proper initialization.

11.5.1.4.15.2 Buffer Overrun Error-Receiver

A buffer overrun occurs when a serializer is instructed to transfer data from XRSRn shift register to XRBUFn receiver buffer, but the corresponding MCASP_RXBUFn register has not yet been read since the last time the transfer occured. When this occurs, the receiver state machine sets the overrun flag - ROVRN. However, the individual serializer writes over the data in the XRBUFn buffer register (destroying the previous sample) and continues shifting.

An overrun is checked only once per time slot. The MCASP_RXSTAT[0] ROVRN flag is set when an overrun condition occurs. It is possible that an overrun occurs on one time slot but then the host catches up and does not cause an overrun on the following time slots. However, once the ROVRN flag is set, it remains set until the host explicitly writes a 1 to the ROVRN bit to clear the ROVRN bit.

11.5.1.4.15.3 DATA Port Error - Transmitter

A transmit DATA port error, as indicated by the XDMAERR flag in the MCASP_TXSTAT register, occurs when the DMA or device CPU writes more words to the DATA port of the McASP than it should.

The MCASP_TXSTAT[7] XDMAERR=0b1 indicates that the DMA or device CPU wrote too many words to the McASP DATA port for a given transmit DMA event. Writing too few words results in a transmit underrun error setting XUNDRN in MCASP_TXSTAT.

While XDMAERR occurs infrequently, an occurrence indicates a serious loss of synchronization between the McASP and the DMA or device CPU. The McASP transmitter and the DMA must be reinitialized to resynchronize them.

11.5.1.4.15.4 DATA Port Error - Receiver

A receive DATA port error, as indicated by the RDMAERR flag in the MCASP_RXSTAT register, occurs when the DMA or device CPU reads more words from the DATA port of the McASP than it should.

The MCASP_RXSTAT[7] RDMAERR indicates that the DMA or device CPU read too many words from the McASP DATA port for a given receive AREVT event. Reading too few words results in a receiver overrun error setting ROVRN in MCASP_RXSTAT.

While RDMAERR occurs infrequently, an occurrence indicates a serious loss of synchronization between the McASP and the DMA or device CPU. The McASP receiver and the DMA must be reinitialized to resynchronize them.

11.5.1.4.15.5 Unexpected Frame Sync Error

An unexpected frame sync occurs in when:

- in burst mode and TDM mode, the next active edge of the frame sync occurs early such that the current slot will not be completed by the time the next slot is scheduled to begin.
- in TDM mode, an unexpected frame sync occurs also if the frame sync does NOT occur exactly during the correct bit clock (not a cycle earlier or later) and before slot 0.

When an unexpected frame sync occurs, there are two possible actions depending upon when the unexpected frame sync occurs:

1. **Early:** An early unexpected frame sync occurs when the McASP is in the process of completing the current frame and a new frame sync is detected (not including overlap that occurs due to a 1 or 2 bit frame sync delay). When an early unexpected frame sync occurs:
   - Error event flag is set (XSYNCERR, if an unexpected transmit frame sync occurs; RSYNCERR, if an unexpected receive frame sync occurs).
   - Current frame is not resynchronized. The number of bits in the current frame is completed. The next frame sync, which occurs after the current frame is completed, will be resynchronized.
2. **Late:** A late unexpected frame sync occurs when there is a gap or delay between the last bit of the previous frame and the first bit of the next frame. When a late unexpected frame sync occurs (as soon as the gap is detected):
   - Error event flag is set (XSYNCERR, if an unexpected transmit frame sync occurs; RSYNCERR, if an unexpected receive frame sync occurs).
   - Resynchronization occurs upon the arrival of the next frame sync.

Late frame sync is detected the same way in burst mode and TDM mode. However, in burst mode, late frame sync is not meaningful and its interrupt enable should not be set.

11.5.1.4.15.6 Clock Failure Detection

11.5.1.4.15.6.1 Clock Failure Check Startup

It is initially expected of the clock failure circuits to generate an error until at least one measurement is taken. Therefore, the clock failure interrupts, clock switch, and mute functions should not be enabled immediately, but only after a specific startup procedure.

To start the transmit clock failure check procedure:

1. Configure the transmit clock failure detect logic (XMIN, XMAX, XPS) in the transmit clock check control register (MCASP_TXCLKCHK).
2. Clear the transmit clock failure flag (XCKFAIL) in the transmit status register (MCASP_TXSTAT).
3. Wait until the first measurement is taken (> 32 AHCLKX clock periods).
4. Verify that no clock failure is detected.
5. Repeat Step 2 through Step 4 until the clock is running and is no longer issuing clock failure errors.
6. After the transmit clock is measured and falls within the acceptable range, the following can be enabled:
   a. The transmit clock failure interrupt enable bit (XCKFAIL) in the transmitter interrupt control register (MCASP_EVTCTLX)

To start the receive clock failure check procedure:

1. Configure receive clock failure detect logic (RMIN, RMAX, RPS) in the receive clock check control register (MCASP_RXCLKCHK).
2. Clear receive clock failure flag (RCKFAIL) in the receive status register (MCASP_RXSTAT).
3. Wait until first measurement is taken (> 32 AHCLKR clock periods).
4. Verify no clock failure is detected.
5. Repeat steps 2–4 until clock is running and is no longer issuing clock failure errors.
6. After the receive clock is measured and falls within the acceptable range, the following may be enabled:
   a. the receive clock failure (RCKFAIL) interrupt enable bit in the receive interrupt control register (MCASP_EVTCTLR)

11.5.1.4.15.6.2 Transmit Clock Failure Check and Recovery

The transmit clock failure check circuit (see Figure 11-362) works off the internal McASP interface clock and the external high-frequency serial clock (AHCLKX). It continually counts the number of interface clocks for every 32 high-rate serial clock (AHCLKX) periods, and stores the count in XCNT of the transmit clock check control register (MCASP_TXCLKCHK) every 32 high-rate serial clock cycles.

The logic compares the count against a user-defined minimum allowable boundary (XMIN), and automatically flags an interrupt (XCKFAIL in MCASP_TXSTAT) when an out-of-range condition occurs. An out-of-range minimum condition occurs when the count is less than XMIN. The logic continually compares the current count (from the running interface clock counter) to the maximum allowable boundary (XMAX). This is so that if the

external clock completely stops, the counter value is not copied to XCNT. An out-of-range maximum condition occurs when the count is greater than XMAX. The XMIN and XMAX fields are 8-bit unsigned values, and the comparison is performed using unsigned arithmetic.

An out-of-range count may indicate that an unstable clock was detected or that the audio source has changed and a new sample rate is being used.

For the transmit clock failure check circuit to operate correctly, the high-frequency serial clock divider must be taken out of reset.

If a clock failure is detected, the transmit clock failure flag (XCKFAIL) in MCASP_TXSTAT is set. This causes an interrupt if the transmit clock failure interrupt enable bit (XCKFAIL) in MCASP_EVTCTLX is set.

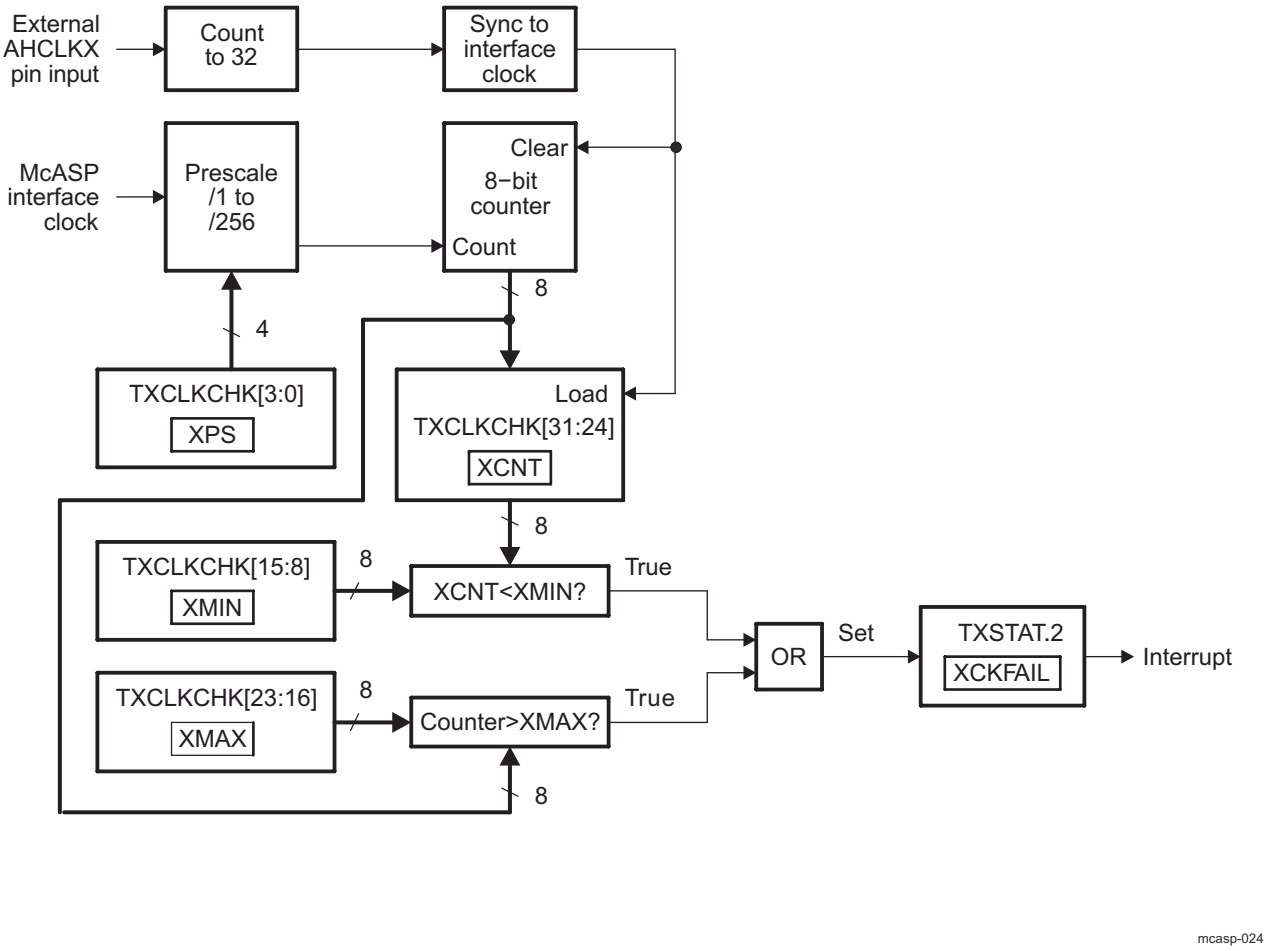

Figure 11-362. Transmit Clock Failure Detection Circuit Block Diagram

11.5.1.4.15.6.3 Receive Clock Failure Check and Recovery

The receive clock failure check circuit (see Figure 11-363) works off both the internal McASP interface clock and the high-frequency serial clock (AHCLKR) coming from the device clock generator. It continually counts the number of interface clocks for every 32 high rate serial clock (AHCLKR) periods, and stores the count in RCNT of the receive clock check control register (MCASP_RXCLKCHK) every 32 high rate serial clock cycles.

The logic compares the count against a user-defined minimum allowable boundary (RMIN) and automatically flags an event (RCKFAIL in MCASP_RXSTAT) when an out-of-range condition occurs. An out-of-range minimum condition occurs when the count is smaller than RMIN. The logic continually compares the current count (from the running interface clock counter) against the maximum allowable boundary (RMAX). This is in case the external clock completely stops, so that the counter value is not copied to RCNT. An out-of-range maximum

condition occurs when the count is greater than RMAX. Note that the RMIN and RMAX fields are 8-bit unsigned values, and the comparison is performed using unsigned arithmetic.

An out-of-range count may indicate either that an unstable clock was detected or that the audio source has changed and a new sample rate is being used.

In order for the receive clock failure check circuit to operate correctly, the high-frequency serial clock divider must be taken out of reset.

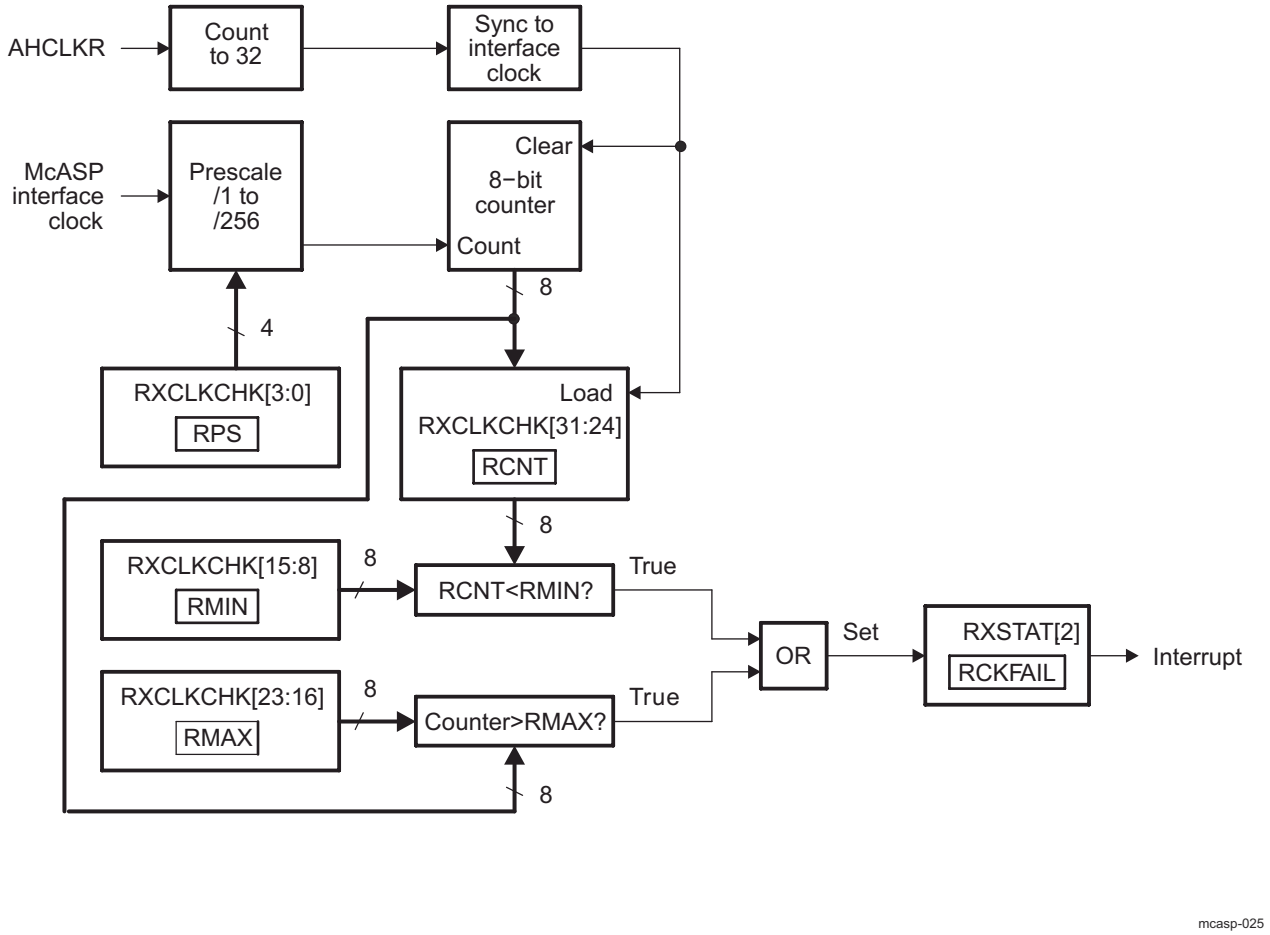

Figure 11-363. Receive Clock Failure Detection Circuit Block Diagram

11.5.1.5 McASP Low-Level Programming Model

This section describes the low-level hardware programming sequences for the configuration and use of the McASP module.

11.5.1.5.1 Global Initialization

11.5.1.5.1.1 Surrounding Modules Global Initialization

This section identifies the requirements for initializing the surrounding modules when the McASP module is used for the first time after a device reset. This initialization of surrounding modules is based on the integration and environment of the McASP (for more information, see Section 11.5.1.3, *McASP Integration*, and Section 11.5.1.2, *McASP Environment*).

Table 11-1589, describes the global initialization of surrounding modules.

Table 11-1589. Global Initialization of Surrounding Modules

Surrounding Modules	Comments
PRCM	Module functional and interface clocks must be enabled. (See *Clock Management Functional Description*, in *Power, Reset, and Clock Management*.)
Control module	Module-specific pad muxing and other pad configurations must be set in the control module. (See *Pad Configuration Registers*, in *Control Module*).
(Optional) DMA_CROSSBAR	DMA configuration must be done to enable the McASP DMA data channel requests. For more information on DMA_CROSSBAR module configuration, see *DMA_CROSSBAR Module Functional Description*, in *Control Module*.
(Optional) L4_PER2 and L3_MAIN Interconnects	For more information about the interconnect configuration, see *L3_MAIN Interconnect Overview* in *L3 Interconnect*.

Note

The DMA_CROSSBAR configurations are required when the interrupt and DMA-based communication modes are used. Further initialization of the selected DMA controllers of the host CPU must be done for full functionality of the McASP DMA lines.

11.5.1.5.1.2 McASP Global Initialization

11.5.1.5.1.2.1 Main Sequence – McASP Global Initialization for DIT-Transmission

The procedure in Table 11-1590 initializes the McASP serializers transmitters to operate in DIT-mode (S/PDIF-transmission protocol) after a power-on reset (POR).

CAUTION

Before performing McASP global initialization, If external clock ACLKR is used, it must be running already for proper synchronization of the MCASP_GBLCTL register.

Table 11-1590. McASP Transmitters Global Initialization for DIT-Mode Operation

Step	Register/Bit Field/Programming Model	Value
1. Apply software reset to different McASP components.	MCASP_GBLCTL[12:8]	0x00
2. Poll the bits to ensure the active reset value (0x00) is successfully latched into the register.	MCASP_GBLCTL[12:8]	=0x00
3. Configure the local power management.	PWRIDLESYSCONFIG[1:0] IDLE_MODE	0x1
4. Configure the transmit format unit.	See Section 11.5.1.5.1.2.1.1.	
5. Configure the transmit frame sync generator.	See Section 11.5.1.5.1.2.1.2.	
6. Configure the transmit clock generator.	See Section 11.5.1.5.1.2.1.3.	
7. Configure the TDM sequencer—set all slots active.	MCASP_TXTDM[31:0] XTDMS	0xFFFF FFFF

Table 11-1590. McASP Transmitters Global Initialization for DIT-Mode Operation (continued)

Step	Register/Bit Field/Programming Model	Value
8. Configure the desired n-th serializer (n=0 to 3) for transmit mode operation. (3)	MCASP_XRSRCTLn [1:0] SRMOD	0x1
9. Configure the McASP pins functionality.	See Section 11.5.1.5.1.2.1.4.	
10. Enable the McASP DIT - transmission mode.	MCASP_TXDITCTL[0] DITEN	0x1(2)
11. Configure DIT-specific subframe fields.	See Table 11-1595.	
12. Release from reset state the divider that outputs the AHCLKX clock.(1)	MCASP_GBLCTL[9] XHCLKRST	0x1
13. Poll the bit to ensure that it is successfully latched in the register.	MCASP_GBLCTL[9] XHCLKRST	=0x1
14. Release from reset state the divider that outputs the ACLKX clock. (1)	MCASP_GBLCTL[8] XCLKRST	0x1
15. Poll the bit to ensure that it is successfully latched in the register.	MCASP_GBLCTL[8] XCLKRST	=0x1

(1) During reset state the local McASP internal clock dividers maintain a 1:1 ratio at their outputs. The values stored in the MCASP_AHCLKXCTL and MCASP_ACLKXCT registers are ignored; hence, the transmission clock does not stop during the reset state of the dividers.
(2) This globally configures all active transmitters to operate in DIT-mode.
(3) For an unused serializer n, write MCASP_XRSRCTLn [1:0] SRMOD=0x0 to disable it.

11.5.1.5.1.2.1.1 Subsequence – Transmit Format Unit Configuration for DIT-Transmission

The procedure in Table 11-1591 configures the transmit frame format unit of the McASP module for a DIT-transmission.

Note

- The first transmit data bit always has a 0-bit delay.
- The bitstream is always transmitted in least-significant-bit (LSB)-first order.
- Pad value for extra bits in a certain slot is always 0.

Table 11-1591. Transmit Format Unit Configuration for DIT-Transmission

Step	Register/Bit Field/Programming Model	Value
Configure the slot size to 32 bits.	MCASP_TXFMT[7:4] XSSZ	0xF
IF: the data to transmit is left- aligned	Software test condition	
Set data mask in the range 0xFFFF FF00 – 0xFFFF 0000.	MCASP_TXMASK[31:0] XMASK	0x-(1)
Rotate data right by a multiple-of-4- bit positions.	MCASP_TXFMT[2:0] XROT	0x- (1)
ELSE		
Set data mask in the range 0x00FF FFFF– 0x0000 FFFF.	MCASP_TXMASK[31:0] XMASK	0x-(1)
Rotate data right by 0-bit positions.	MCASP_TXFMT[2:0] XROT	0x0
ENDIF		
Select to write data to active serializers transmit buffers using peripheral (CFG) or DATA port	MCASP_TXFMT[3] XBUSEL	0x-

(1) Refer to Section 11.5.1.4.4.1, *Transmit Fromat Unit* and Section 11.5.1.4.4.1.2, *DIT-Mode Transmission Data Alignment Settings.*

11.5.1.5.1.2.1.2 Subsequence – Transmit Frame Synchronization Generator Configuration for DIT-Transmission

The procedure in Table 11-1592 configures the transmit frame synchronization generator of the McASP module.

Note

The frame synchronization signal is always rising-edge active and always has a single-bit width.

Table 11-1592. Transmit Frame-Synchronization Generator Configuration for DIT-Transmission

Step	Register/Bit Field/Programming Model	Value
Select 384-slot size block.	MCASP_TXFMCTL[15:7] XMOD	0x180
Select internally-generated transmit frame sync.	MCASP_TXFMCTL[1] FSXM	0x1

11.5.1.5.1.2.1.3 Subsequence – Transmit Clock Generator Configuration for DIT-Transmission

Note

By default, the ACLKX and AHCLKX clocks are generated only from the McASP internal clock source.

The procedure in Table 11-1593 configures the transmit clock generator of the McASP module.

Table 11-1593. Transmit Clock Generator Configuration in DIT-Mode

Step	Register/Bit Field/Programming Model	Value
Set the divisor for the internally generated high frequency clock– AHCLKX.	MCASP_AHCLKXCTL[11:0] HCLKXDIV	0x-
Set he divisor for the internally generated transmission clock– ACLKX.	MCASP_ACLKXCTL[4:0] CLKXDIV	0x-
Configure the transmit clock failure detect logic.	See Section 11.5.1.4.15.6.1, *Clock Failure Check Startup*.	

11.5.1.5.1.2.1.4 Subsequence - McASP Pins Functional Configuration

The procedure in Table 11-1594 configures the McASP pins for McASP functionality.

Table 11-1594. McASP Pins Functional Configuration

Step	Register/Bit Field/Programming Model	Value
Configure module different pins to have McASP functionality.	MCASP_PFUNC[31:0]	0x0
Configure the McASP pins as outputs: AFSX AHCLKX ACLKX Desired i-th McASP data pin AXRi is configured as an output for DIT-transmission.	MCASP_PDIR[28] AFSX; MCASP_PDIR[27] AHCLKX; MCASP_PDIR[26] ACLKX; MCASP_PDIR [i] AXRi	0x1 0x1 0x1 0x1

11.5.1.5.1.2.1.5 Subsequence – DIT-specific Subframe Fields Configuration

The procedure in Table 11-1595 configures the DIT-specific subframe fields as part of the S/PDIF format data.

Table 11-1595. DIT-Specific Subframe Fields Configuration

Step	Register/Bit Field/Programming Model	Value
Configure the valid bit value for odd time slots.	MCASP_TXDITCTL[3] VB	0x-
Configure the valid bit value for even time slots.	MCASP_TXDITCTL[2] VA	0x-
Configure the user data bit for each subframe A and B in a 384-slot S/PDIF block.	MCASP_DITUDRAi[31:0] DITUDRAi, where i = 0 to 5 MCASP_DITUDRBi[31:0] DITUDRBi, where i = 0 to 5	0x- 0x-
Configure the channel status bit for each subframe A and B in a 384-slot S/PDIF block.	MCASP_DITCSRAi[31:0], where i = 0 to 5 MCASP_DITCSRBi[31:0], where i = 0 to 5	0x- 0x-

11.5.1.5.1.2.2 Main Sequence – McASP Global Initialization for TDM-Reception

The procedure in Table 11-1596 initializes a McASP serializer n receiver(s) to operate in TDM-mode (the only mode supported by McASP receivers) after a power-on reset (POR). This is used for I2S (2-slot TDM) and other TDM-based audio protocols reception.

CAUTION

Before performing McASP global initialization, If external clock ACLKR is used, it must be running already for proper synchronization of the MCASP_GBLCTL register.

Note

The McASP receivers support only TDM-frames (including 384-TDM frames) reception. DIT-frames reception (i.e. S/PDIF stream) can be implemented indirectly via an external DIR-chip converter with DIT-input and TDM (I2S)-compatible output connected to device McASP receiver input (TDM-only compatible).

Table 11-1596. McASP Receivers Global Initialization for TDM-Mode Operation

Step	Register/Bit Field/Programming Model	Value
1. Apply software reset to different McASP receive components.	MCASP_GBLCTL[4:0]	0x00
2. Poll the bits to ensure the active reset value (0x00) is successfully latched into the register.	MCASP_GBLCTL[4:0]	=0x00
3. Configure the local power management.	PWRIDLESYSCONFIG[1:0] IDLE_MODE	0x1
4. Configure the receive format unit.	See Section 11.5.1.5.1.2.2.1.	
5. Configure the receive frame sync generator.	See Section 11.5.1.5.1.2.2.2.	
6. Configure the receive clock generator.	See Section 11.5.1.5.1.2.2.3.	
7. Program all bits -RTDMSk (where k=0 to 31) according to the time slot characteristics desired (positions of active versus inactive slots within a frame).	MCASP_RXTDM [k] RTDMSk , where k=0 to 31	0x-
8. Configure the desired n-th serializer for receive mode operation. (4)	MCASP_XRSRCTLn [1:0] SRMOD	0x2
9. Configure the McASP pins functionality.	See Section 11.5.1.5.1.2.2.4.	
10. Optional: Configure a McASP Rx channel for a loopback operation (TDM mode only) in MCASP_LBCTL [31:0].	See Section 11.5.1.4.14.1, *Loopback Mode Configurations*.	0x-(5)
11. Release from reset state the divider that outputs the AHCLKR clock.(1) See also (2).	MCASP_GBLCTL[1] RHCLKRST	0x1
12. Poll the bit to ensure that it is successfully latched in the register. See also (2).	MCASP_GBLCTL[1] RHCLKRST	=0x1
13. Release from reset state the divider that outputs the ACLKR clock. (1) See also (3).	MCASP_GBLCTL[0] RCLKRST	0x1
14. Poll the bit to ensure that it is successfully latched in the register. See also (3).	MCASP_GBLCTL[0] RCLKRST	=0x1

(1) During reset state the local McASP internal clock dividers maintain a 1:1 ratio at their outputs. The values stored in the MCASP_AHCLKRCTL and MCASP_ACLKRCTL registers are ignored; hence, the reception clock does not stop during the reset state of the dividers.
(2) This step is necessary even if external high-frequency serial clocks are used.
(3) This step can be skipped if external serial clocks are used and they are running.
(4) For an unused serializer n, write MCASP_XRSRCTLn [1:0] SRMOD=0x0 to disable it.
(5) In this case the receiver clock and frame sync are derived from the McASP transmitter logic, so MCASP_ACLKXCTL[6] ASYNC must be set to 0b0. Neither McASP internal receiver clock and frame sync generators, nor external clock and frame sync source are used.

11.5.1.5.1.2.2.1 Subsequence – Receive Format Unit Configuration in TDM Mode

The procedure in Table 11-1597 configures the receive frame format unit of the McASP module for TDM slots reception.

Table 11-1597. Receive Format Unit Configuration for TDM-Reception

Step	Register/Bit Field/Programming Model	Value
Configure the desired TDM-slot size	MCASP_RXFMT[7:4] RSSZ	0x-(1)
Set data mask out value (0x0000 0000 - 0xFFFF FFFF).	MCASP_RXMASK[31:0] RMASK	0x-(2)
Select a padding value for masked-out bits.	MCASP_RXFMT[14:13] RPAD	0x-
Specify position (0x0-0x1F) of the bit in corresponding register MCASP_RXBUFn which value to be used as a pad value in case MCASP_RXFMT[14:13] RPAD=0x2.	MCASP_RXFMT[12:8] RPBIT	0x-
Rotate data right by a multiple of 4- bit positions.	MCASP_RXFMT[2:0] RROT	0x- (3)
Received stream bit order (LSB- or MSB-first). Must be set to 0x1 for an I2S stream reception (MSB-first).	MCASP_RXFMT[15] RRVRS	0x- (3)
Specify a delay between frame sync and first bit of data in number of bits. Must be set to 0x1 for an I2S stream reception.	MCASP_RXFMT[17:16] RDATDLY	0x-
Select to read data from active serializers receive buffers using peripheral (CFG) or DATA port	MCASP_RXFMT[3] RBUSEL	0x-

(1) Refer to Section 11.5.1.4.4.2, *Receive Format Unit*, regarding options for received TDM-slot sizes.
(2) For more details on Rx masking value, refer to Section 11.5.1.4.4.2.1, *TDM - Mode Reception Data Alignment Settings*
(3) For more details on rotation and received TDM stream bit order, refer to Section 11.5.1.4.4.2.1, *TDM - Mode Reception Data Alignment Settings* and Table 11-1584, *McASP RFU Settings*.

11.5.1.5.1.2.2.2 Subsequence – Receive Frame Synchronization Generator Configuration in TDM Mode

The procedure in Table 11-1598 configures the transmit frame synchronization generator of the McASP module.

Note

The same bit - MCASP_ACLKXCTL[6] ASYNC which is used to determine if McASP receivers and transmitters work synchronously on the same clock, is also used to define if receiver frame sync is derived from the transmit frame sync generator, or generated independently in the receiver (either inernally or externally sourced). Hence, the settings in below table Table 11-1598 have no effect, if MCASP_ACLKXCTL[6] ASYNC = 0.

Table 11-1598. Receive Frame-Synchronization Generator Configuration for TDM-Reception

Step	Register/Bit Field/Programming Model	Value
Select number of TDM slots per frame. Must be set to 0x2, in case of an I2S-reception. For more details on frame-sync generator, refer to Section 11.5.1.4.2.3.	MCASP_RXFMCTL[15:7] RMOD	0x-(1)
Choose the receive frame sync width -single bit/single word. For more details on frame-sync generator, refer to Section 11.5.1.4.2.3.	MCASP_RXFMCTL[4] FRWID	0x-
Select start of received frame sync polarity - rising / falling edge. For more details on frame-sync generator, refer to Section 11.5.1.4.2.3.	MCASP_RXFMCTL[0] FSRP	0x-
IFreceive frame sync - FS is internally generated	Software test condition	
Select internally- generated receive frame sync. For more details on frame-sync generator, refer to Section 11.5.1.4.2.3.	MCASP_RXFMCTL[1] FSRM	0b1

Table 11-1598. Receive Frame-Synchronization Generator Configuration for TDM-Reception (continued)

Step	Register/Bit Field/Programming Model	Value
If McASP receiver is required to output internally generated frame, AFSR pin must be set as an output in step 9 of the sequence documented in the Table 11-1596. This must not be done in current step because the frame control register - MCASP_TXFMCTL must be appropriately configured prior to AFSR pin outputting a frame to an external device.	MCASP_PDIR[31] AFSR	0b1
ELSE		
Select externally- generated receive frame sync. For more details on frame-sync generator, refer to Section 11.5.1.4.2.3.	MCASP_RXFMCTL[1] FSRM	0b0
Setup the AFSR pin as input (device level: mcaspi_fsr)	MCASP_PDIR[31] AFSR	0b0
ENDIF		
To generate McASP receive frame sync in receiver logic, select an asynchronous frame sync.	MCASP_ACLKXCTL[6] ASYNC	0b1

(1) Must be set to 0x180 in case of 384-TDM slot frame reception from a DIR component I2S-output. For more details on TDM-frame settings, refer to Section 11.5.1.4.9.2 .

11.5.1.5.1.2.2.3 Subsequence – Receive Clock Generator Configuration

The procedure in Table 11-1599 configures the receive clock generator of the McASP module.

Note

The settings in below table Table 11-1599 have no effect, if MCASP_ACLKXCTL[6] ASYNC = 0 (i.e. receive clock is sourced from the inverted version of the transmit clock). For example, such is the case when McASP loopback mode is used.

Table 11-1599. Receive Clock Generator Configuration

Step	Register/Bit Field/Programming Model	Value
To use the McASP receive clock generator, select an asynchronous receiver clock schema (ASYNC=1). Otherwise an inverted version of transmit clock XCLK is used (receiver synchronized with transmitter).	MCASP_ACLKXCTL[6] ASYNC	0b1
IF receive clock - RCLK is internally generated	Software test condition	
The high-speed receive clock - AHCLKR is internally generated based on AUXCLK		
Select an internally-generated high-frequency clock.	MCASP_AHCLKRCTL[15] HCLKRM	0b1
Select the internal high-speed clock source polarity: non-inverted or inverted.	MCASP_AHCLKRCTL[14] HCLKRP	0x-
Set the divisor for the internally generated high-frequency clock – AHCLKR in range (1 - 4096).	MCASP_AHCLKRCTL[11:0] HCLKRDIV	0x-
Select an internally-generated receive clock.	MCASP_ACLKRCTL[5] CLKRM	0b1
Receiver samples on rising/falling edge. Select Rx sampling on the rising edge if transmitter shifts out on falling edge, and vice versa.	MCASP_ACLKRCTL[7] CLKRP	0x-
Set the divisor for the internally generated receive clock– ACLKR in range (1 - 32).	MCASP_ACLKRCTL[4:0] CLKRDIV	0x-

Table 11-1599. Receive Clock Generator Configuration (continued)

Step	Register/Bit Field/Programming Model	Value
Optional: If McASP receiver is required to output internally generated clock, ACLKR pin must be set as an output in step 9 of the sequence documented in the Table 11-1596. This must not be done in current step because the clock control register - MCASP_ACLKRCTL must be appropriately configured prior to ACLKR pin outputting a receive clock to an external device.	MCASP_PDIR[29] ACLKR	0b1
ELSE		
Select an externally-generated receive clock. Note that in this case the AHCLKR signal path and the CLKRDIV divider are NOT used.	MCASP_ACLKRCTL[5] CLKRM	0b0
Receiver samples on rising/falling edge. Select Rx sampling on the rising edge if transmitter shifts out on falling edge, and vice versa.	MCASP_ACLKRCTL[7] CLKRP	0x-
Setup an input directon for the ACLKR pin	MCASP_PDIR[29] ACLKR	0b0
ENDIF		
Configure the transmit clock failure detect logic.	See Section 11.5.1.4.15.6.1, *Clock Failure Check Startup*.	

11.5.1.5.1.2.2.4 Subsequence—McASP Receiver Pins Functional Configuration

The procedure in Table 11-1600 configures the McASP pins for McASP functionality.

Table 11-1600. McASP Receiver Pins Functional Configuration

Step	Register/Bit Field/Programming Model	Value
Configure module different pins to have McASP functionality.	MCASP_PFUNC[31:0]	0x0
Configure the McASP pins direction: AFSR ACLKR Desired n-th McASP data pin AXRn is configured as an input for receiving.	MCASP_PDIR[31] AFSR; MCASP_PDIR[29] ACLKR; MCASP_PDIR[n] AXRn;	0x-(1) 0x- (2) 0x0

(1) See Table 11-1598.
(2) For more details on McASP clock configurations, refer to Table 11-1599.

11.5.1.5.1.2.3 Main Sequence – McASP Global Initialization for TDM -Transmission

The procedure in Table 11-1601 initializes a McASP serializer n transmitter(s) to operate in TDM-mode after a power-on reset (POR). This is used for I2S (2-slot TDM) and other TDM-based audio protocols transmission.

CAUTION

Before performing McASP global initialization, If external clock ACLKR is used, it must be running already for proper synchronization of the MCASP_GBLCTL register.

Table 11-1601. McASP Transmitters Global Initialization for TDM-Mode Operation

Step	Register/Bit Field/Programming Model	Value
1. Apply software reset to different McASP transmit components.	MCASP_GBLCTL[12:8]	0x00
2. Poll the bits to ensure the active reset value (0x00) is successfully latched into the register.	MCASP_GBLCTL[12:8]	=0x00
3. Configure the local power management.	PWRIDLESYSCONFIG[1:0] IDLE_MODE	0x1
4. Configure the transmit format unit.	See Section 11.5.1.5.1.2.3.1.	
5. Configure the transmit frame sync generator.	See Section 11.5.1.5.1.2.3.2.	

Table 11-1601. McASP Transmitters Global Initialization for TDM-Mode Operation (continued)

Step	Register/Bit Field/Programming Model	Value
6. Configure the transmit clock generator.	See Section 11.5.1.5.1.2.3.3.	
7. Program all bits - XTDMSk, where k=0 to 31, according to the time slot characteristics desired (positions of active versus inactive slots within a frame).	MCASP_TXTDM [k] XTDMSk, where k=0 to 31(4)	0x-
8. Configure the desired n-th serializer for transmit mode operation. (3)	MCASP_XRSRCTLn[1:0] SRMOD;	0x1
9. Setup all active transmitters to operate in TDM mode.	MCASP_TXDITCTL[0] DITEN	0x0(2)
10. Configure the McASP pins functionality.	See Section 11.5.1.5.1.2.3.4.	
11. Optional: Configure a McASP Tx channel for loopback operation (TDM mode only) in MCASP_LBCTL [31:0].	See Section 11.5.1.4.14.1, *Loopback Mode Configurations*.	0x-
12. Release from reset state the divider that outputs the AHCLKR clock. See (1)	MCASP_GBLCTL[9] XHCLKRST	0x1
13. Poll the bit to ensure that it is successfully latched in the register.	MCASP_GBLCTL[9] XHCLKRST	=0x1
14. Release from reset state the divider that outputs the ACLKR clock. See (1)	MCASP_GBLCTL[8] XCLKRST	0x1
15. Poll the bit to ensure that it is successfully latched in the register.	MCASP_GBLCTL[8] XCLKRST	=0x1

(1) During reset state the local McASP internal clock dividers maintain a 1:1 ratio at their outputs. The values stored in the MCASP_AHCLKX and MCASP_ACLKX registers are ignored; hence, the transmission clock does not stop during the reset state of the dividers.
(2) All active transmit channels operate either in TDM mode or in DIT mode depending on DITEN value. There is no option to choose Tx Mode between DIT and TDM separately per serializer transmitter.
(3) For an unused serializer n, write MCASP_XRSRCTLn [1:0] SRMOD=0x0 to disable it.
(4) Appropriately program in bitfield MCASP_XRSRCTLn [3:2] DISMOD, the desired level (high-impedance state, 0, or 1) at AXRn output, during time of inactive slots. Note, that this setting does NOT apply when all slots are programmed to be active within a frame (in particular DIT-mode).

11.5.1.5.1.2.3.1 Subsequence – Transmit Format Unit Configuration in TDM Mode

The procedure in Table 11-1602 configures the transmit frame format unit of the McASP module for TDM slots transmission.

Table 11-1602. Transmit Format Unit Configuration for TDM-Transmission

Step	Register/Bit Field/Programming Model	Value
Configure the desired TDM-slot size	MCASP_TXFMT[7:4] XSSZ	0x-(1)
Set data mask out value (0x0000 0000 - 0xFFFF FFFF).	MCASP_TXMASK[31:0] XMASK	0x-(2)
Select a padding value for masked-out bits.	MCASP_TXFMT[14:13] XPAD	0x-
Specify position (0x0-0x1F) of the bit in corresponding register MCASP_TXBUFn which value to be used as a pad value in case MCASP_TXFMT[14:13] XPAD=0x2.	MCASP_TXFMT[12:8] XPBIT	0x-
Rotate data right by a multiple of 4- bit positions.	MCASP_TXFMT[2:0] XROT	0x- (3)
transmitted stream bit order (LSB- or MSB-first). Must be set to 0x1 for an I2S stream transmission (MSB-first).	MCASP_TXFMT[15] XRVRS	0x- (3)
Specify a delay between frame sync and first bit of data in number of bits. Must be set to 0x1 for an I2S stream transmission.	MCASP_TXFMT[17:16] XDATDLY	0x-
Select to write data to active serializers transmit buffers using peripheral (CFG) or DATA port	MCASP_TXFMT[3] XBUSEL	0x-

(1) Refer to Section 11.5.1.4.4.1, *Transmit Format Unit* , regarding options for transmitted TDM-slot sizes.

(2) For more details on Tx masking value, refer to Section 11.5.1.4.4.1.1, *TDM - Mode Transmission Data Alignment Settings*
(3) For more details on rotation and transmitd TDM stream bit order, refer to Section 11.5.1.4.4.1.1, *TDM - Mode Transmission Data Alignment Settings* and Table 11-1582, *McASP TFU TDM Mode Settings*.

11.5.1.5.1.2.3.2 Subsequence – Transmit Frame Synchronization Generator Configuration in TDM Mode

The procedure in Table 11-1603 configures the transmit frame synchronization generator of the McASP module.

Table 11-1603. Transmit Frame-Synchronization Generator Configuration for TDM-Transmission

Step	Register/Bit Field/Programming Model	Value
Select number of TDM slots per frame (2 - 32). Must be set to 0x2, in case of an I2S-transmission. For more details on frame-sync generator, refer to Section 11.5.1.4.2.3.	MCASP_TXFMCTL[15:7] XMOD	0x-
Choose the transmit frame sync width -single bit/single word. For more details on frame-sync generator, refer to Section 11.5.1.4.2.3.	MCASP_TXFMCTL[4] FXWID	0x-
Select start of transmit frame sync polarity - rising / falling edge. For more details on frame-sync generator, refer to Section 11.5.1.4.2.3.	MCASP_TXFMCTL[0] FSXP	0x-
IF transmit frame sync - FS is internally generated	Software test condition	
Select internally- generated transmit frame sync. For more details on frame-sync generator, refer to Section 11.5.1.4.2.3.	MCASP_TXFMCTL[1] FSXM	0b1
If McASP transmitter is required to output internally generated frame, AFSX pin must be set as an output in step 10 of the sequence documented in the Table 11-1601. This must NOT be done in current step because the frame control register - MCASP_TXFMCTL must be appropriately configured prior to AFSX pin outputting a frame sync to an external device.	MCASP_PDIR[28] AFSX	0b1
ELSE		
Select externally- generated transmit frame sync. For more details on frame-sync generator, refer to Section 11.5.1.4.2.3.	MCASP_TXFMCTL[1] FSXM	0b0
Setup the AFSX pin as input	MCASP_PDIR[28] AFSX	0b0

11.5.1.5.1.2.3.3 Subsequence – Transmit Clock Generator Configuration for TDM Cases

The procedure in Table 11-1604 configures the transmit clock generator of the McASP module.

Table 11-1604. Transmit Clock Generator Configuration for TDM Cases

Step	Register/Bit Field/Programming Model	Value
IF transmit clock - XCLK is internally generated	Software test condition	
IF high-speed transmit clock - AHCLKX is internally generated based on AUXCLK	Software test condition	
Select an internally-generated high-frequency clock.	MCASP_AHCLKXCTL[15] HCLKXM	0b1
Select the high-frequency clock source polarity: non-inverted or inverted.	MCASP_AHCLKXCTL[14] HCLKXP	0x-
Set the divisor for the internally generated high-frequency clock – AHCLKX in range (1 - 4096).	MCASP_AHCLKXCTL[11:0] HCLKXDIV	0x-

Table 11-1604. Transmit Clock Generator Configuration for TDM Cases (continued)

Step	Register/Bit Field/Programming Model	Value
Optional: If McASP transmitter is required to output internally generated high-frequency clock, AHCLKX pin must be set as an output in step 10 of the sequence documented in the Table 11-1601. This must NOT be done in current step because the clock control register - MCASP_AHCLKXCTL must be appropriately configured prior to AHCLKX pin outputting a high-speed clock to an external device.	MCASP_PDIR[27] AHCLKX	0b1
ELSE		
Select an externally-generated high frequency clock (HCLKXDIV divider can not be used).	MCASP_AHCLKXCTL[15] HCLKXM	0b0
Select the high-speed transmit clock source polarity: non-inverted or inverted.	MCASP_AHCLKXCTL[14] HCLKXP	0x-
Setup an input directon for the AHCLKX pin	MCASP_PDIR[27] AHCLKX	0b0
ENDIF		
Select an internally-generated transmit clock.	MCASP_ACLKXCTL[5] CLKXM	0b1
Transmitter samples on rising/falling edge. Select Tx shifting out data on the rising edge if receiver samples on falling edge, and vice versa.	MCASP_ACLKXCTL[7] CLKXP	0x-
Set the divisor for the internally generated transmit clock– ACLKX in range (1 - 32).	MCASP_ACLKXCTL[4:0] CLKXDIV	0x-
Optional: If McASP transmitter is required to output internally generated clock, ACLKX pin) must be set as an output in step 10 of the sequence documented in the Table 11-1601. This must NOT be done in current step because the clock control register - MCASP_ACLKXCTL must be appropriately configured prior to ACLKX pin outputting a transmit clock to an external device.	MCASP_PDIR[26] ACLKX	0b1
ELSE		
Select an externally-generated transmit clock. Note that in this case the AHCLKX signal path and the CLKXDIV divider are NOT used.	MCASP_ACLKXCTL[5] CLKXM	0b0
Transmitter samples on rising/falling edge. Select Tx shifting out data on the rising edge if receiver samples on falling edge, and vice versa.	MCASP_ACLKXCTL[7] CLKXP	0x-
Setup an input directon for the ACLKX pin	MCASP_PDIR[26] ACLKX	0b0
ENDIF		
Configure the transmit clock failure detect logic.	See Section 11.5.1.4.15.6.1, *Clock Failure Check Startup*.	

11.5.1.5.1.2.3.4 Subsequence—McASP Transmit Pins Functional Configuration

The procedure in Table 11-1605 configures the McASP pins for McASP functionality.

Table 11-1605. McASP Transmit Pins Functional Configuration

Step	Register/Bit Field/Programming Model	Value
Configure module different pins to have McASP functionality.	MCASP_PFUNC[31:0]	0x0
Configure the McASP pins direction: AFSX AHCLKX ACLKX Desired n-th McASP data pin AXRn is configured as an ouput for transmission.	MCASP_PDIR[28] AFSR; MCASP_PDIR[27] AHCLKR; MCASP_PDIR[26] ACLKR; MCASP_PDIR[n] AXRn	0x-(1) 0x-(2) 0x- (2) 0x1

(1) See Table 11-1603.

11.5.1.5.2 Operational Modes Configuration

11.5.1.5.2.1 McASP Transmission Modes

11.5.1.5.2.1.1 Main Sequence – McASP DIT- /TDM- Polling Transmission Method

Figure 11-364 shows the McASP DIT-/TDM- polling method.

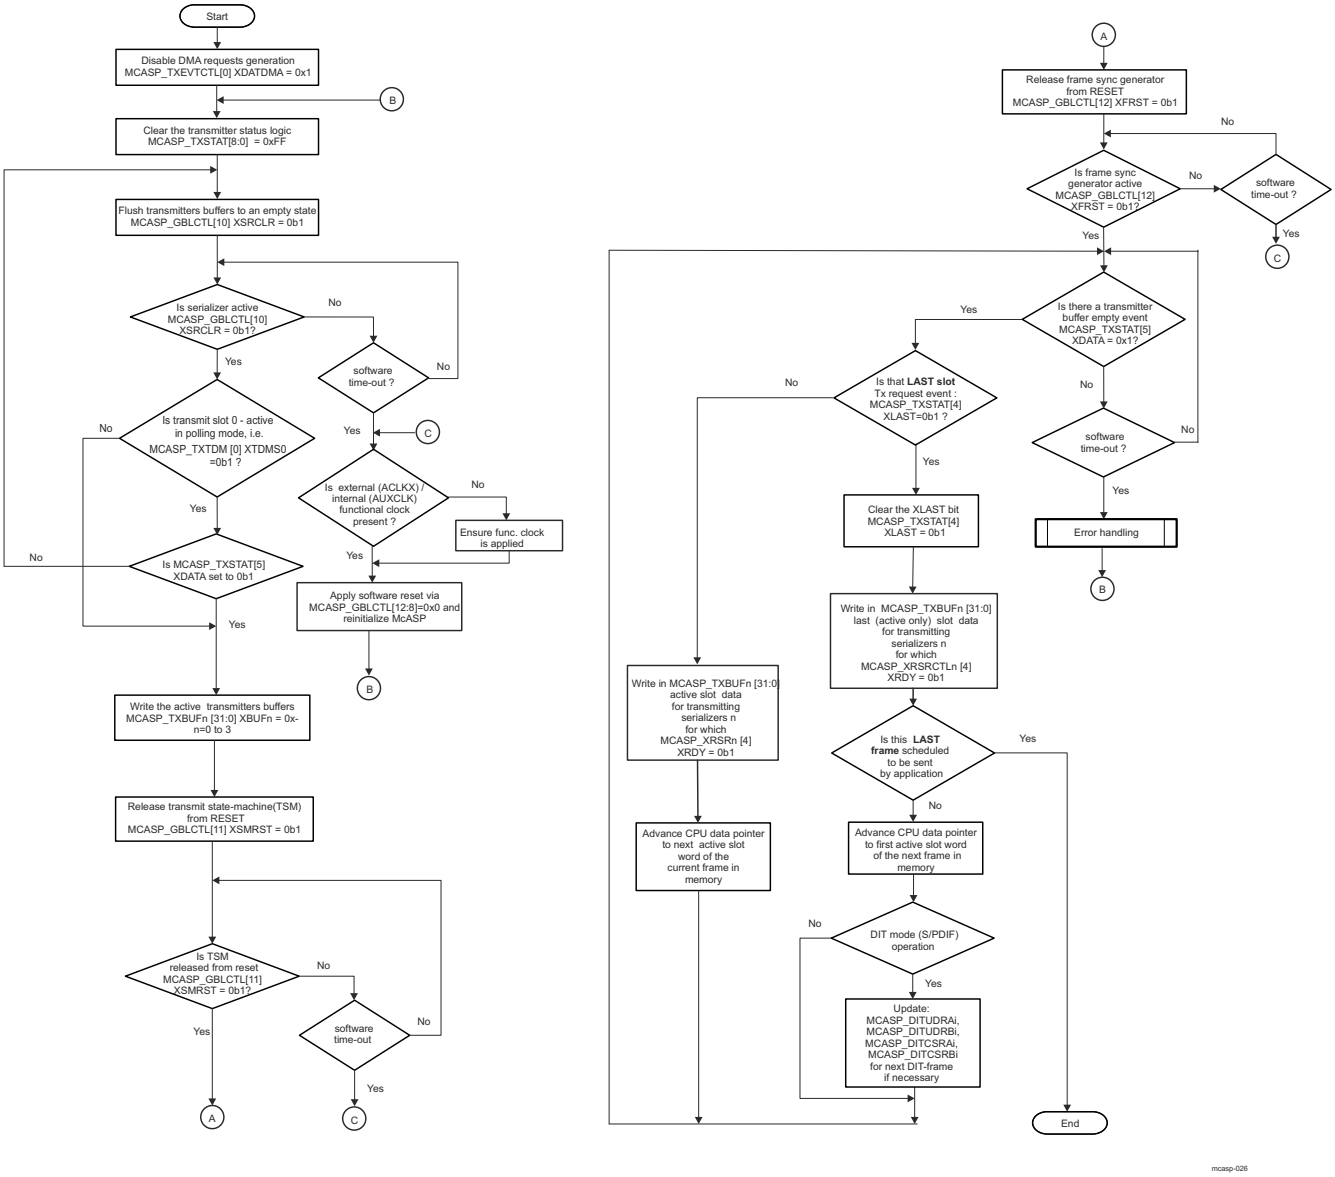

Figure 11-364. McASP DIT- /TDM- Transmission Polling Method

summarizes the register call for the transmission DIT-/TDM- polling mode.

Table 11-1606 summarizes the subprocess call for the DIT-/TDM- transmission polling mode.

Table 11-1606. Subprocess Call Summary for Main Sequence – McASP DIT-/TDM- Transmission Polling Method

Subprocess Name	Cross-Reference
Error handling	Figure 11-370

11.5.1.5.2.1.2 Main Sequence – McASP DIT- /TDM - Interrupt Transmission Method

Figure 11-365 shows the initial setup for interrupt-based transmission.

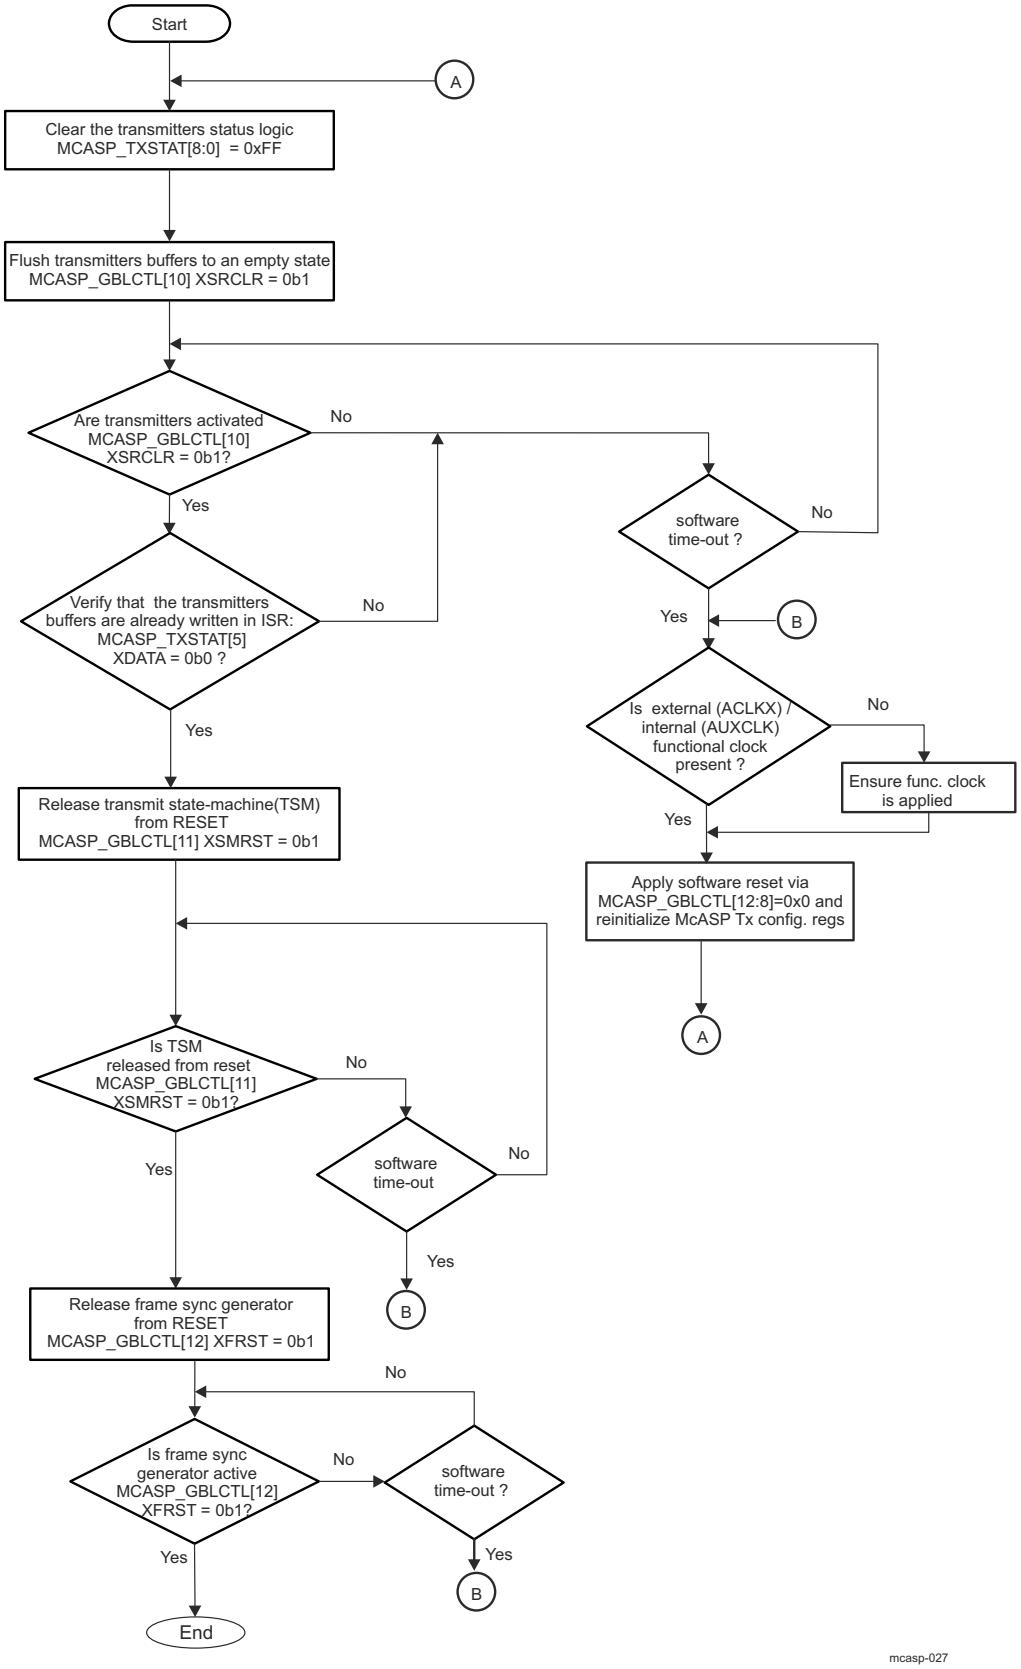

Figure 11-365. Subsequence – DIT-/TDM- Transmission Startup Procedure

Table 11-1607 shows the configuration of the McASP using an interrupt method for DIT-/TDM- transmission.

Table 11-1607. McASP DIT-/TDM- Interrupt Transmission Model

Step	Register/Bit Field/Programming Model	Value
Disable Tx DMA requests generation.	MCASP_XEVTCTL[0] XDATDMA	0x1
Enable the data ready event transmit interrupt.	MCASP_EVTCTLX[5] XDATA	0x1
Optional: Enable the transmit error event interrupts.	MCASP_EVTCTLX[2] XCKFAIL MCASP_EVTCTLX[1] XSYNCERR MCASP_EVTCTLX[0] XUNDRN	0x1 0x1 0x1
Optional: Enable the start of frame interrupt. Optional: Enable the last slot data interrupt (useful for DIT user data/ channel status next S/PDIF frame info update.)	MCASP_EVTCTLX [7] XSTAFRM MCASP_EVTCTLX[4] XLAST	0x1 0x1
IFwrite transfer is through the McASP DATA port (MCASP_TXFMT[3] XBUSEL is set to 0b0).	Software test condition (setting is done in step4 of the *McASP Transmitters Global Initialization* - see Table 11-1590)	
Enable the DATA port error based interrupt.	MCASP_EVTCTLX[3] XDMAERR	0x1
ELSE		
Disable the DATA port error based interrupt.	MCASP_EVTCTLX[3] XDMAERR	0x0
ENDIF		
DIT/TDM - Transmission Startup Procedure	See Figure 11-365.	

11.5.1.5.2.1.3 Main Sequence –McASP DIT- /TDM - Mode DMA Transmission Method

Table 11-1608 shows the configuration of the McASP using the DMA method for transmission. Possible interrupt error event servicing is also considered. shows the initial setup for DMA - based transmission.

Note

Because of the DATA port burst access capability with the DMA method, it is strongly recommended that DMA transfers are initiated through the McASP DATA port.

Table 11-1608. McASP DMA Transmission Model with Interrupt Events Servicing

Step	Register/Bit Field/Programming Model	Value
Recommended: Select DATA port to access the transmit buffers.	MCASP_TXFMT[3] XBUSEL	0x0
Enable the Tx DMA requests generation.	MCASP_XEVTCTL[0] XDATDMA	0x0
Enable the Tx DMA error event, because of McASP DATA port usage.	MCASP_EVTCTLX[3] XDMAERR	0x1
Optional: Enable the transmit error event interrupts.	MCASP_EVTCTLX[2] XCKFAIL MCASP_EVTCTLX[1] XSYNCERR MCASP_EVTCTLX[0] XUNDRN	0x1 0x1 0x1
Optional: Enable the start of frame interrupt. Optional: Enable the last slot data interrupt.	MCASP_EVTCTLX [7] XSTAFRM MCASP_EVTCTLX[4] XLAST	0x1 0x1
Disable the data ready event transmit interrupt, as DMA is used to service this request.	MCASP_EVTCTLX[5] XDATA	0x0
DMA startup transmission procedure. This procedure is identical than the one shown in Figure 11-365. The only difference is that DMA automatically services all the AXEVT events raised by the McASP, and no CPU data processing intervention is required. The CPU is involved only in error handling shown in Figure 11-368.	See Figure 11-365.	

11.5.1.5.2.2 McASP Reception Modes

11.5.1.5.2.2.1 Main Sequence – McASP Polling Reception Method

Figure 11-366 shows the McASP polling reception method.

Note

The McASP polling reception model considers thedevice CPUs as the accessor of audio data from the McASP receive buffers.

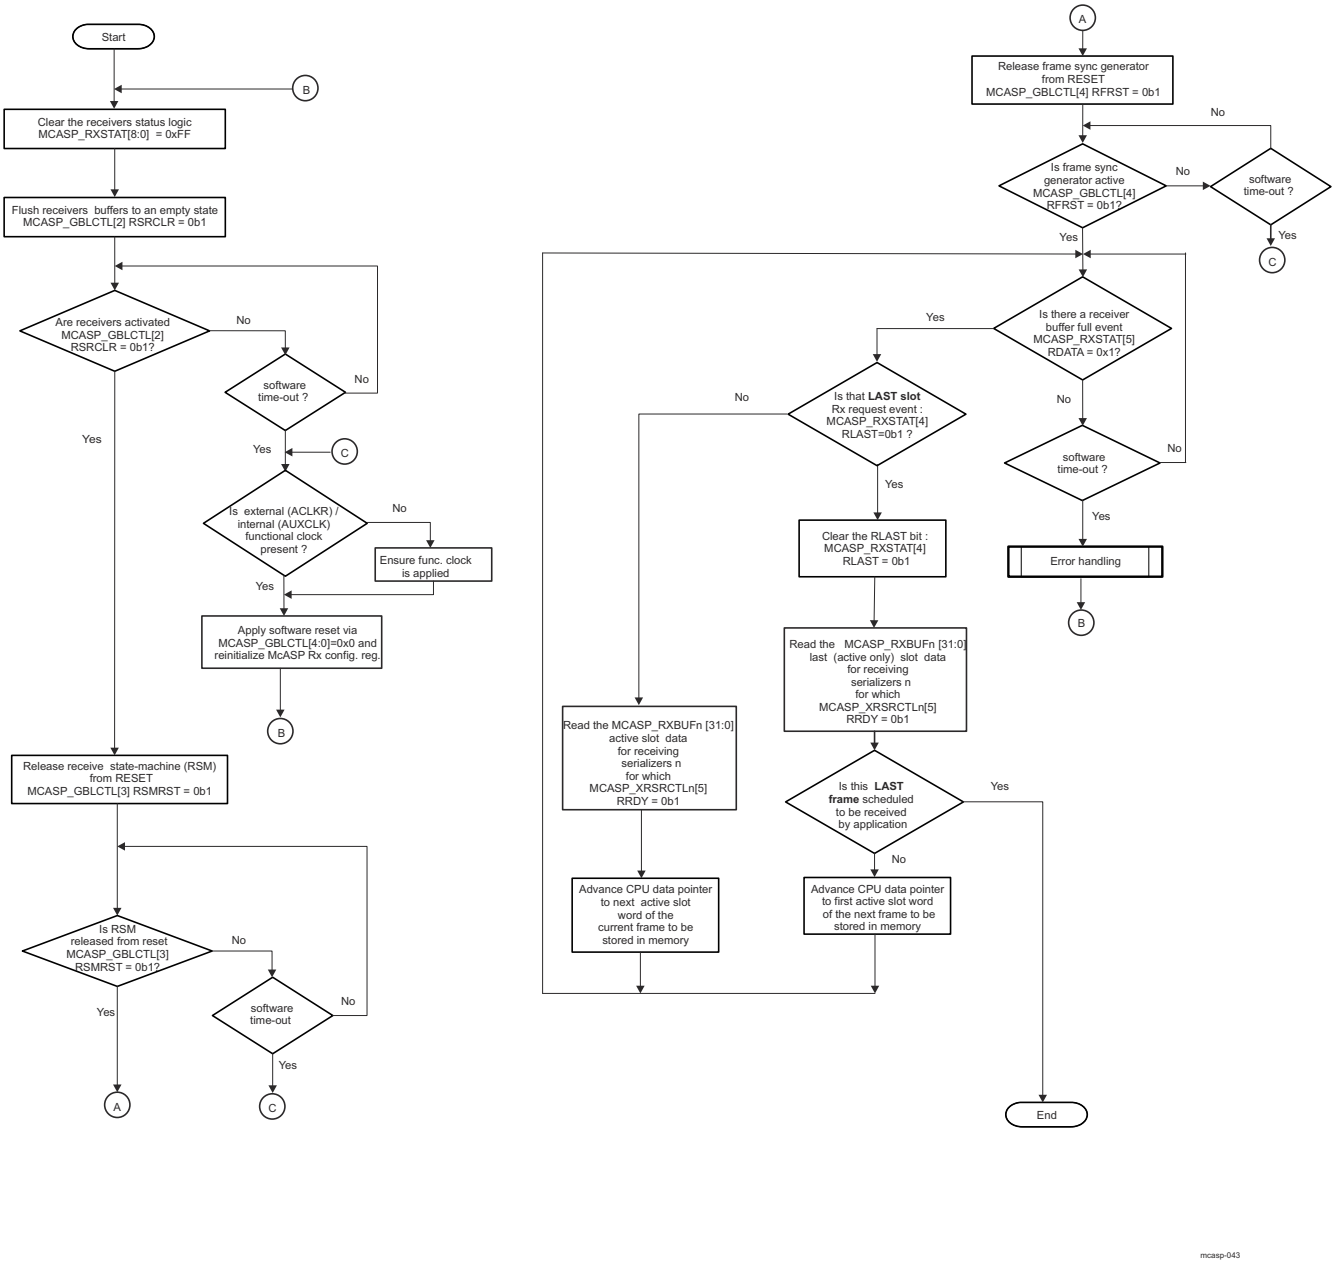

Figure 11-366. McASP Polling Reception Method

Table 11-1609 summarizes the subprocess call for the polling mode.

Table 11-1609. Subprocess Call Summary for Main Sequence – McASP Reception Polling Method

Subprocess Name	Cross-Reference
Error handling	Figure 11-371

11.5.1.5.2.2.2 Main Sequence – McASP TDM - Interrupt Reception Method

Figure 11-367 shows the initial setup for interrupt-based reception.

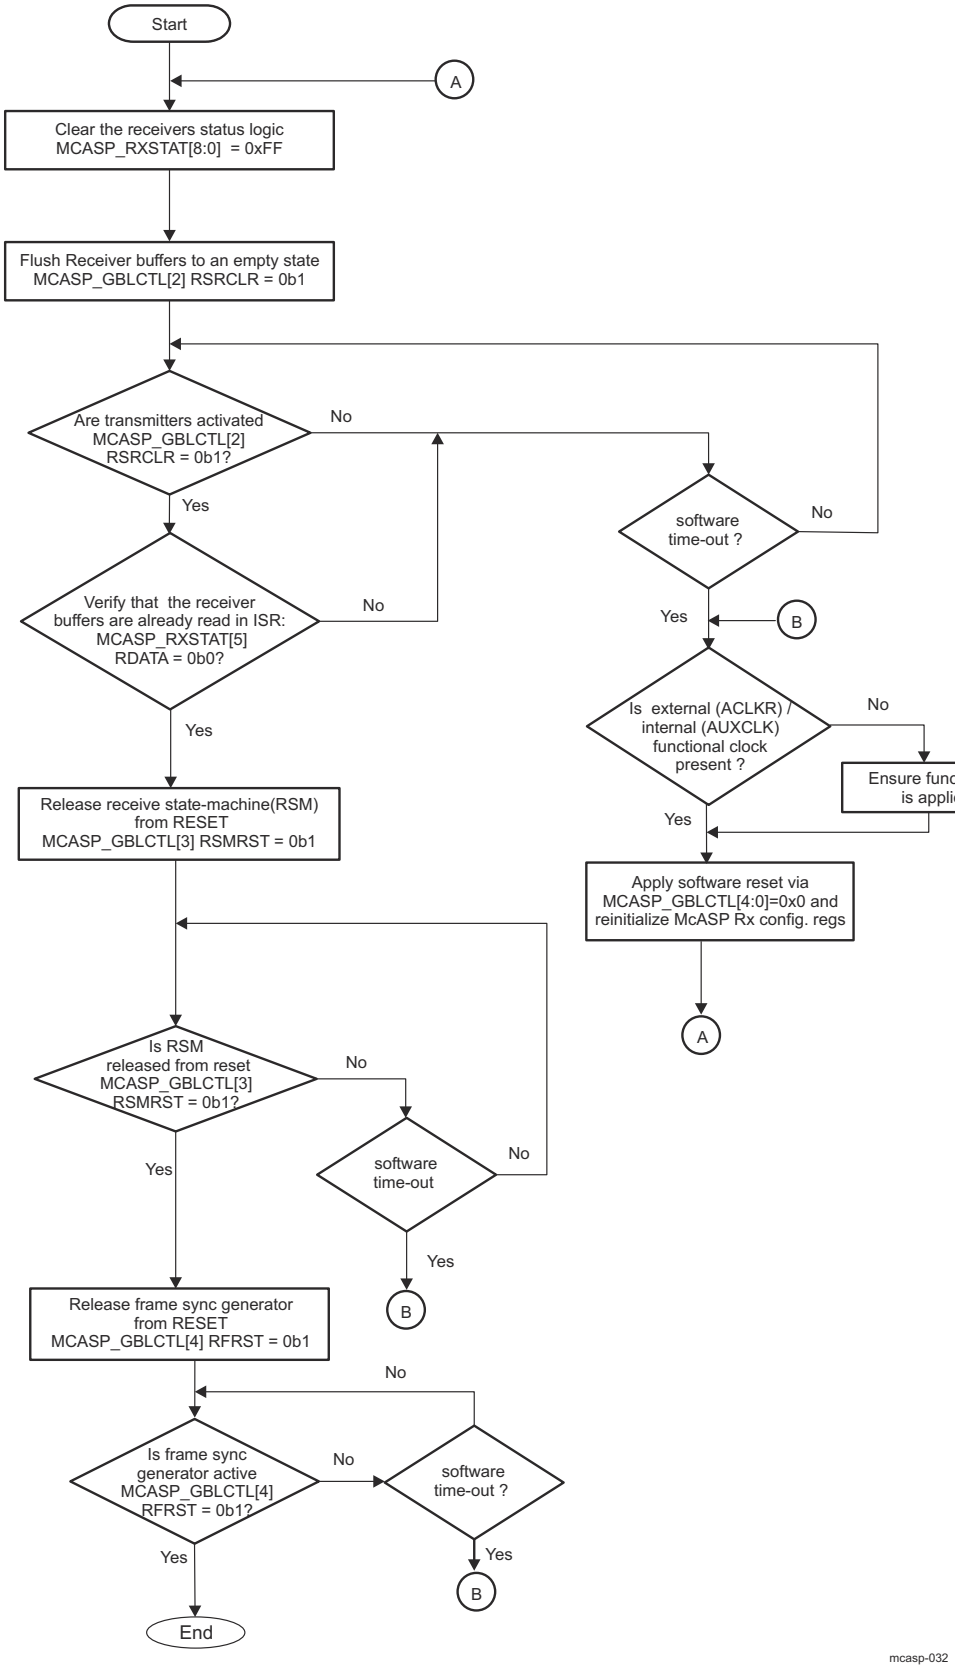

Figure 11-367. Subsequence – TDM - Reception Startup Procedure

Table 11-1610 shows the configuration of the McASP using an interrupt method for TDM- reception.

Table 11-1610. McASP TDM- Interrupt Reception Model

Step	Register/Bit Field/Programming Model	Value
Disable Rx DMA requests generation.	MCASP_REVTCTL[0] RDATDMA	0x1
Enable the data ready event receive interrupt.	MCASP_EVTCTLR[5] RDATA	0x1
Optional: Enable the receive error event interrupts.	MCASP_EVTCTLR[2] RCKFAIL MCASP_EVTCTLR[1] RSYNCERR MCASP_EVTCTLR[0] ROVRN	0x1 0x1 0x1
Optional: Enable the start of frame interrupt. Optional: Enable the last slot data interrupt	MCASP_EVTCTLR [7] RSTAFRM MCASP_EVTCTLR[4] RLAST	0x1 0x1
IF read transfer is through the McASP DATA port (MCASP_RXFMT[3] RBUSEL is set to 0b0).	Software test condition (setting is done in step4 of the *McASP Receivers Global Initialization for TDM-Mode Operation* - see Table 11-1596)	
Enable the DATA port error based interrupt.	MCASP_EVTCTLR[3] RDMAERR	0x1
ELSE		
Disable the DATA port error based interrupt.	MCASP_EVTCTLR[3] RDMAERR	0x0
ENDIF		
TDM - Transmission Startup Procedure	See Figure 11-367.	

11.5.1.5.2.2.3 Main Sequence – McASP TDM - Mode DMA Reception Method

Table 11-1611 shows the configuration of the McASP using the DMA method for reception. Possible interrupt error event servicing is also considered. shows the initial setup for DMA - based transmission.

Note

Because of the DATA port burst access capability with the DMA method, it is strongly recommended that DMA transfers are initiated through the McASP DATA port.

Table 11-1611. McASP DMA Reception Model with Interrupt Events Servicing

Step	Register/Bit Field/Programming Model	Value
Recommended: Select DATA port to access the transmit buffers.	MCASP_RXFMT[3] RBUSEL	0x0
Enable the Rx DMA requests generation.	MCASP_REVTCTL[0] RDATDMA	0x0
Enable the Rx DMA error event, because of McASP DATA port usage.	MCASP_EVTCTLR[3] RDMAERR	0x1
Optional: Enable the receive error event interrupts.	MCASP_EVTCTLR2] RCKFAIL MCASP_EVTCTLR[1] RSYNCERR MCASP_EVTCTLR[0] ROVRN	0x1 0x1 0x1
Optional: Enable the start of frame interrupt. Optional: Enable the last slot data interrupt.	MCASP_EVTCTLR [7] RSTAFRM MCASP_EVTCTLR[4] RLAST	0x1 0x1
Disable the data ready event receive interrupt, as DMA is used to service this request.	MCASP_EVTCTLR[5] RDATA	0x0
DMA startup reception procedure. This procedure is identical than the one shown in Figure 11-367. The only difference is that DMA automatically services all the AREVT events raised by the McASP, and no CPU data processing intervention is required. The CPU is involved only in error handling shown in Figure 11-369.	See Figure 11-367.	

11.5.1.5.2.3 McASP Event Servicing

11.5.1.5.2.3.1 McASP DIT-/TDM- Transmit Interrupt Events Servicing

Figure 11-368 shows the flow of DIT-/TDM- mode transmit interrupt events servicing for the McASP module.

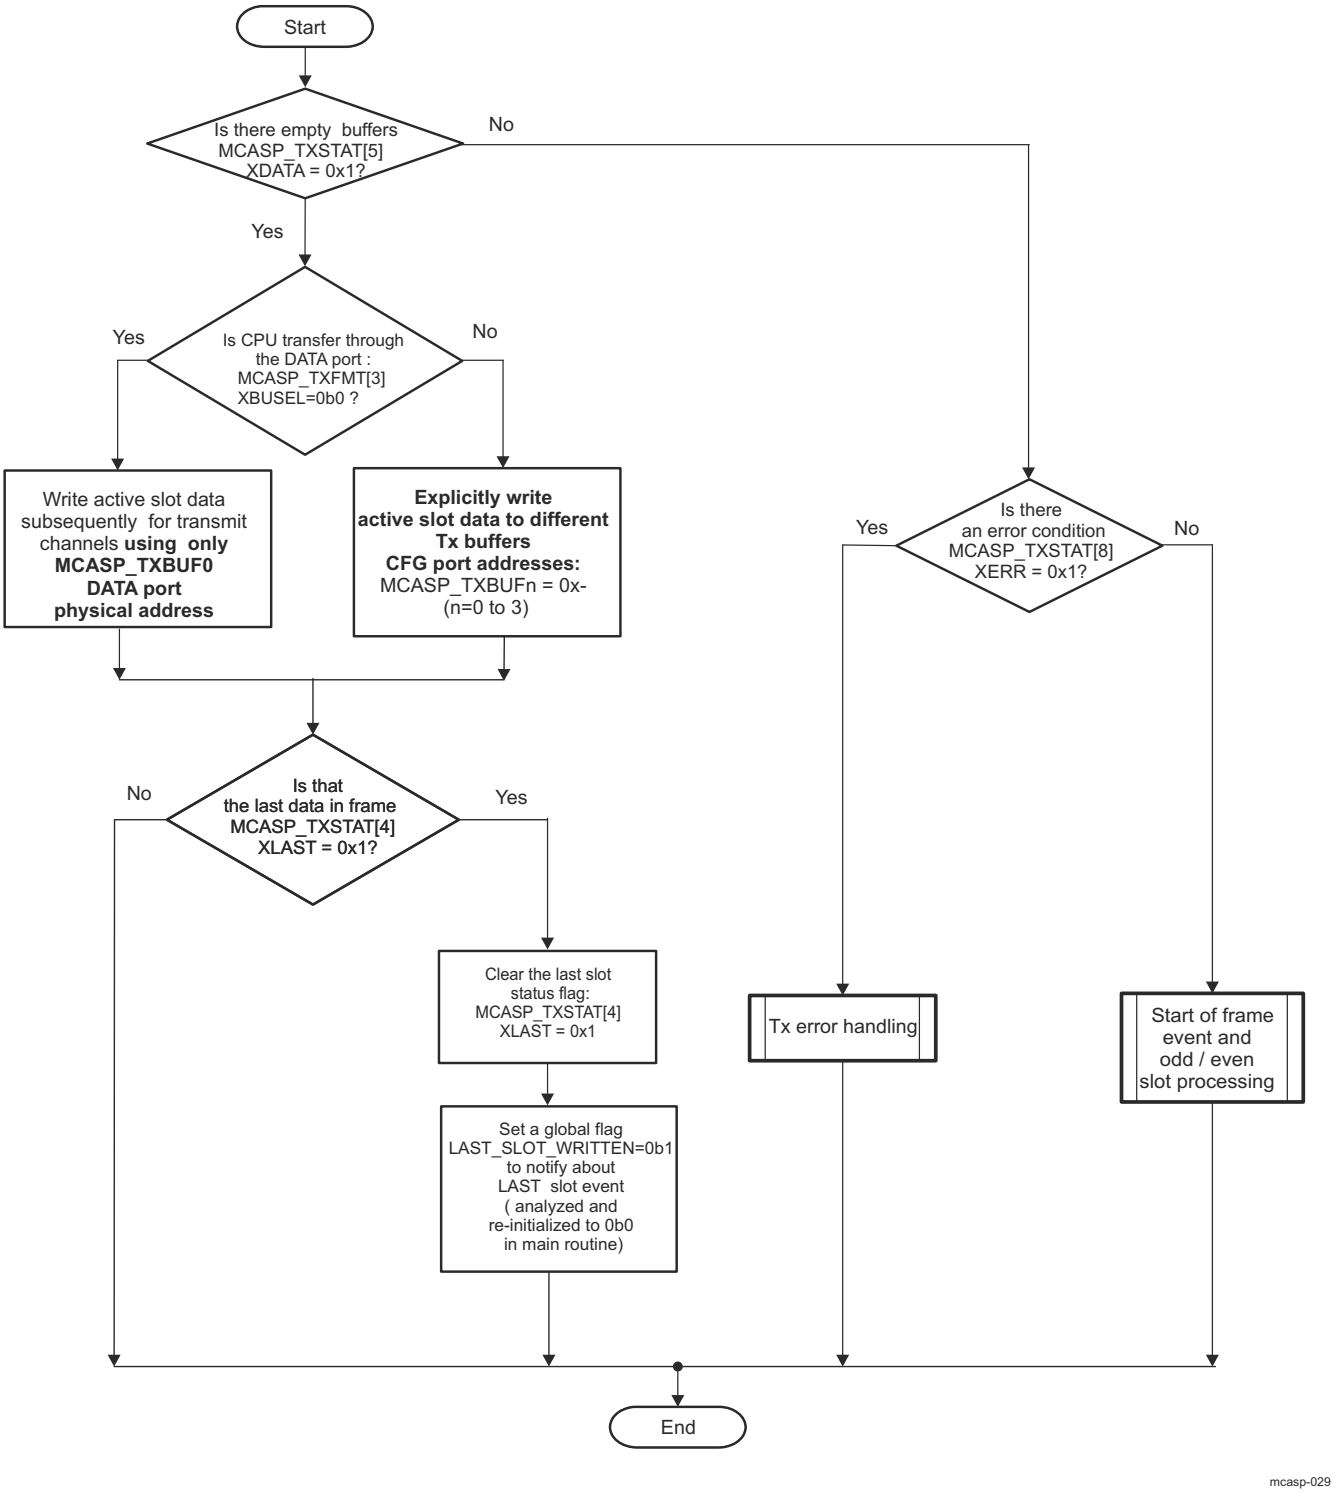

Figure 11-368. McASP Transmit Interrupt Events Servicing

11.5.1.5.2.3.2 McASP TDM- Receive Interrupt Events Servicing

Figure 11-369 shows the flow of DIT-/TDM- mode transmit interrupt events servicing for the McASP module.

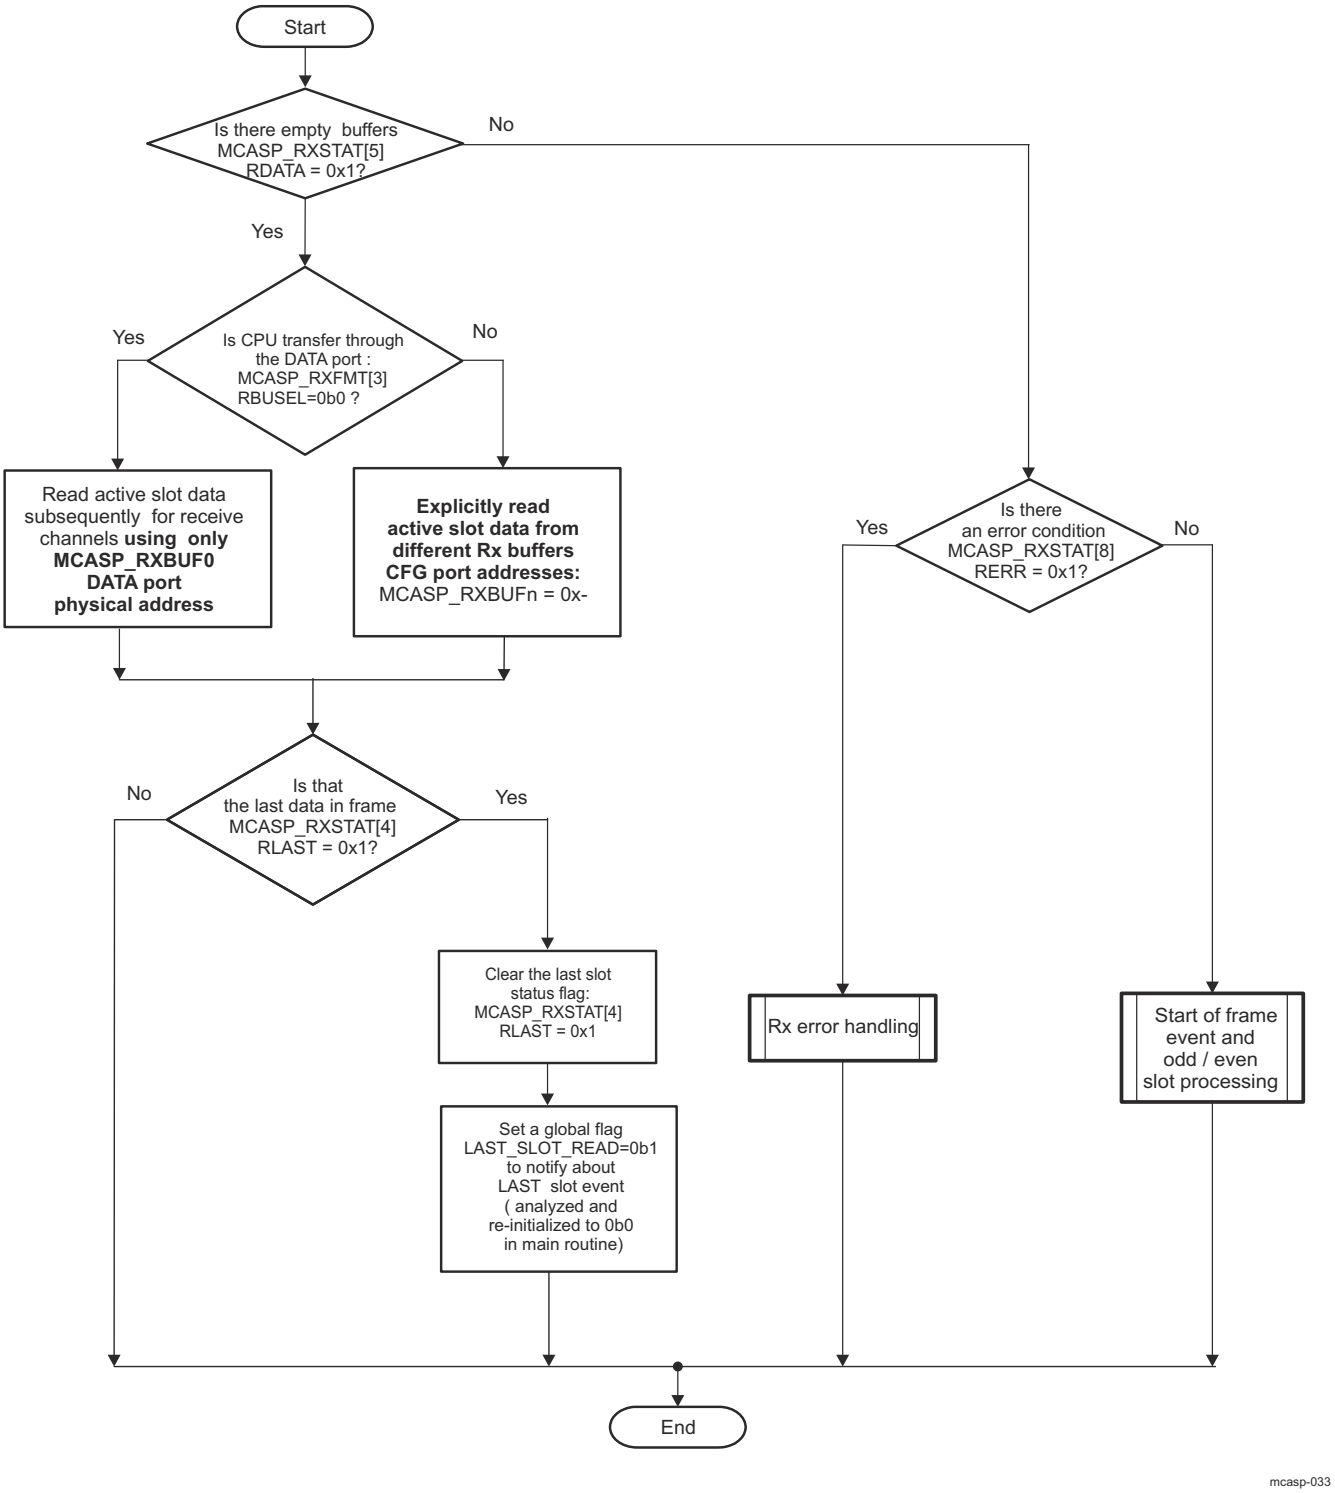

Figure 11-369. McASP Receive Interrupt Events Servicing

Table 11-1612 lists the subprocess call summary for receive interrupt events servicing.

Table 11-1612. Subprocess Call Summary for Receive Interrupt Events Servicing

Subprocess Name	Cross-Reference
McASP receive error handling	Figure 11-371

Table 11-1612. Subprocess Call Summary for Receive Interrupt Events Servicing (continued)

Subprocess Name	Cross-Reference
Start of frame handling	Section 11.5.1.4.12.2

11.5.1.5.2.3.3 Subsequence – McASP DIT-/TDM -Modes Transmit Error Handling

Figure 11-370 shows the transmit error handling schema for the McASP, which can be implemented as part of the Tx interrupt service routine or as part of the Tx polling sequence.

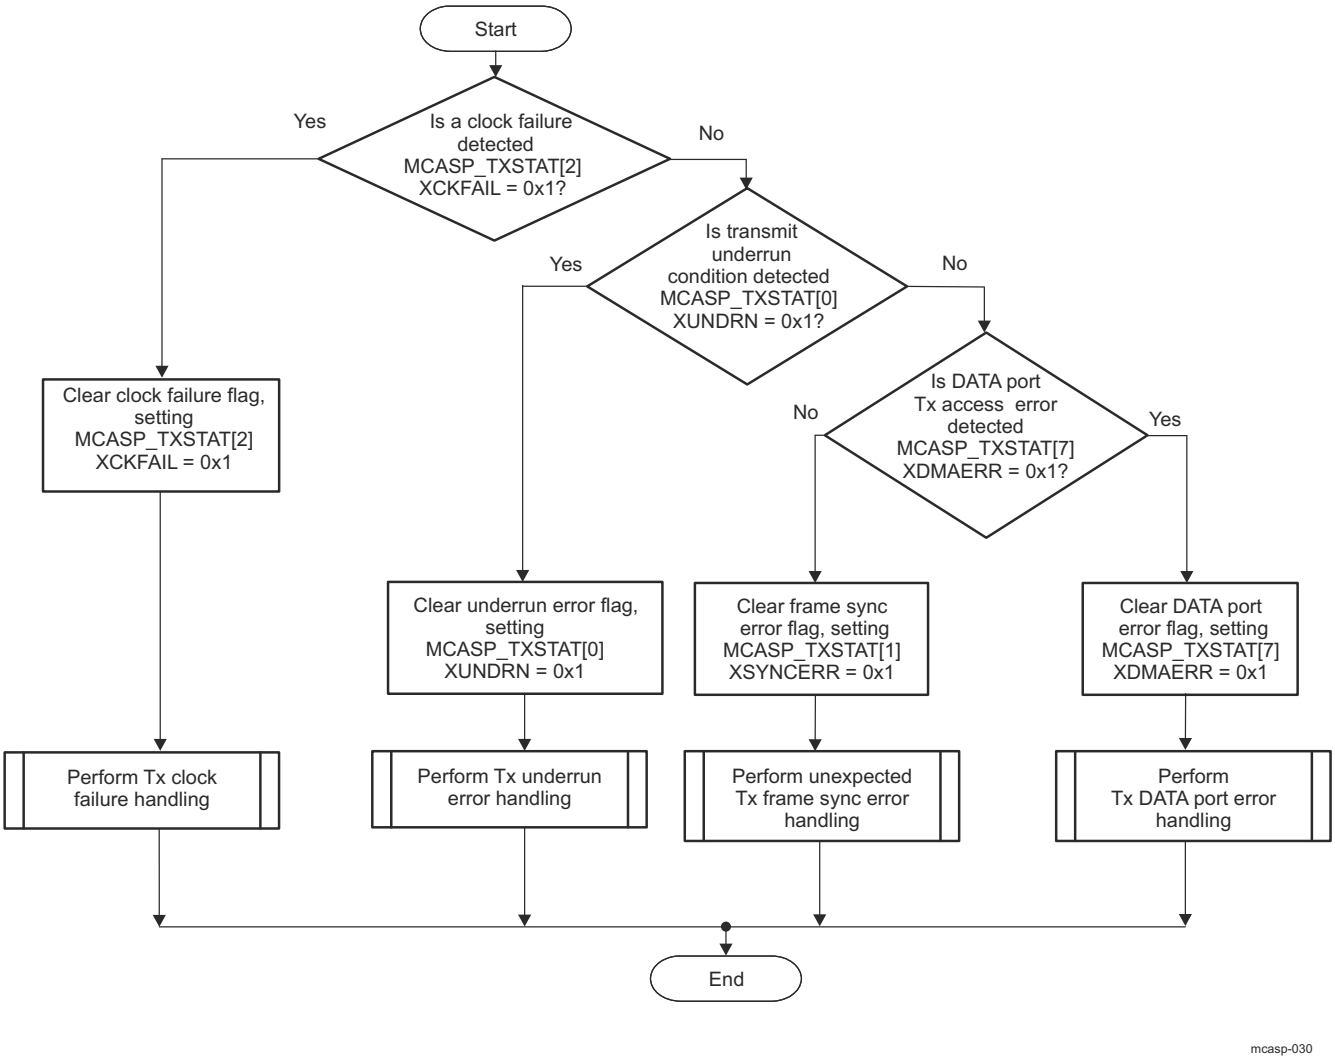

Figure 11-370. McASP Transmit Error Handling

Note

- For more information about transmit clock failure handling, see Section 11.5.1.4.15.6.2, *Transmit Clock Failure Check and Recovery*.
- For more information about transmit buffer underrun handling, see Section 11.5.1.4.15.1, *Buffer Underrun Error -Transmitter*.
- For more information about DATA port Tx error handling, see Section 11.5.1.4.15.3, *DATA Port Error - Transmitter*.
- For more information about unexpected Tx frame sync error handling, see Section 11.5.1.4.15.5, *Unexpected Frame Sync Error*.

11.5.1.5.2.3.4 Subsequence – McASP Receive Error Handling

Figure 11-371 shows the receive error handling schema for the McASP, which can ONLY be implemented as part of the Rx polling sequence.

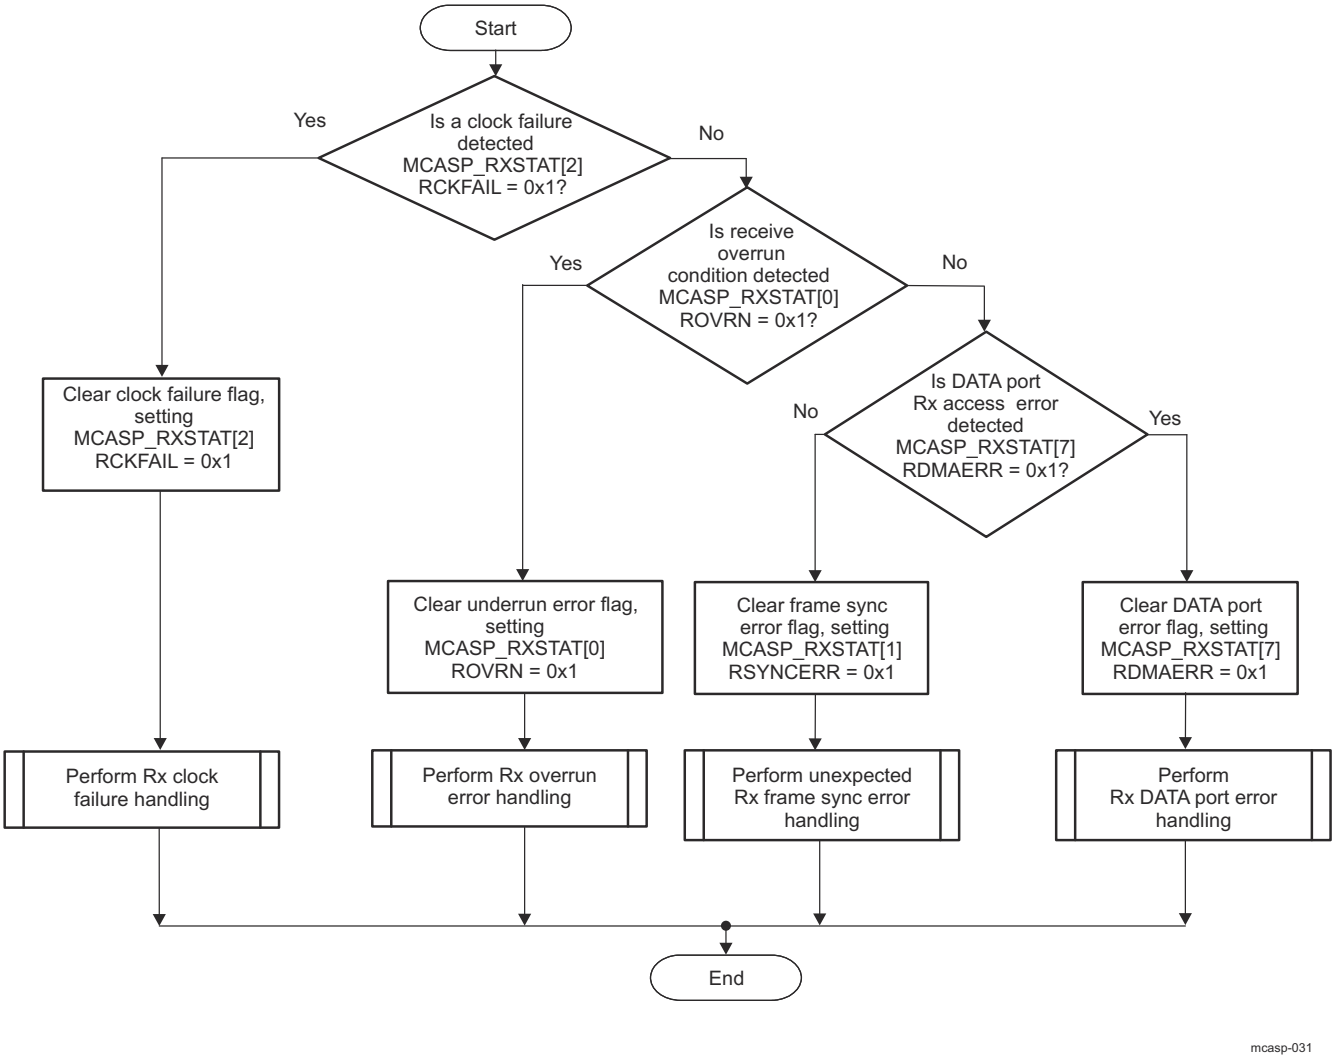

Figure 11-371. McASP Receive Error Handling

Note

- For more information about receive clock failure handling, see Section 11.5.1.4.15.6.3, *Receive Clock Failure Check and Recovery*.
- For more information about receive buffer overrun handling, see Section 11.5.1.4.15.2, *Buffer Overrun Error - Receiver*.
- For more information about DATA port Rx error handling, see Section 11.5.1.4.15.4, *DATA Port Error - Receiver*.
- For more information about unexpected Rx frame sync error handling, see Section 11.5.1.4.15.5, *Unexpected Frame Sync Error*.

11.5.1.6 McASP Register Manual

11.5.1.6.1 McASP Instance Summary

summarizes the McASP instances.

Table 11-1613. McASP Instance Summary

Module Name	Base Address L3_MAIN Interconnect	Base Address L4_PER2 Interconnect	Size
MCASP1_CFG	-	0x051E 0000	4 KiB
MCASP2_CFG	-	0x0520 0000	4 KiB

Note

The address locations listed in and , *MCASP_CFG Register Mapping Summary*, are relevant for accessing:

- All McASP configuration registers
- MCASP_TXBUFn registers
- MCASP_RXBUFn registers

through the McASP peripheral configuration (CFG) port.

The MCASP_TXFMT[3] XBUSEL bit must be set to 0b1, to allow CFG port write accesses to the McASP XRBUFn buffer. The MCASP_RXFMT[3] RBUSEL bit must be set to 0b1, to allow CFG port read accesses to the McASP XRBUFn buffer.

11.5.1.6.2.2 MCASP_CFG Register Description

The tables below describe the individual MCASP_CFG register bits.

Note

For all of the below described registers the indexes n and N are applying to serializers (not slots).

Register descriptions cover the superset McASP (16 serializers and all signals pinned out). For the particular McASP instantiation, please refer to Section 11.5.1.2, *McASP Environment*, and Section 11.5.1.3, *McASP Integration*.

Table 11-1619. MCASP_PDOUT

Address Offset	0x0000 0018		
Physical Address	0x051E 0018 0x0520 0018 0x0522 0018	**Instance**	MCASP1_CFG_PER2_L4 MCASP2_CFG_PER2_L4 MCASP3_CFG_PER2_L4

Description

Pin data output register - holds a value for data out at all times, and may be read back at all times. The value held by MCASP_PDOUT is not affected by writing to MCASP_PDIR and MCASP_PFUNC. However, the data value in MCASP_PDOUT is driven out onto the McASP pin only if the corresponding bit in MCASP_PFUNC is set to 1 (GPIO function) and the corresponding bit in MCASP_PDIR is set to 1 (output).

When reading data, it returns the corresponding bit value in MCASP_PDOUT[n]; it does not return the input from the I/O pin.

When writing data, writes to the corresponding MCASP_PDOUT[n] bit.

PDOUT has these aliases or alternate addresses:

- MCASP_PDSET - when written to at this address, writing a 1 to a bit in MCASP_PDSET sets the corresponding bit in MCASP_PDOUT to 1; writing a 0 has no effect and keeps the bits in MCASP_PDOUT unchanged.
- MCASP_PDCLR - when written to at this address, writing a 1 to a bit in MCASP_PDCLR clears the corresponding bit in MCASP_PDOUT to 0; writing a 0 has no effect and keeps the bits in MCASP_PDOUT unchanged

There is only one set of data-out bits, MCASP_PDOUT[31:0]. The other registers, MCASP_PDSET and MCASP_PDCLR, are just different addresses for the same control bits, with different behaviors during writes.

Some register bits might not be functional for all McASP instances, due to corresponding McASP pin not being pinned out on a particular device part number. Refer to device-specific DM for more information on the supported McASP features.

Table 11-1621. MCASP_PDCLR

Address Offset	0x0000 0020		
Physical Address	0x051E 0020 0x0520 0020 0x0522 0020	**Instance**	MCASP1_CFG_PER2_L4 MCASP2_CFG_PER2_L4 MCASP3_CFG_PER2_L4
Description	The pin data clear register is an alias of the pin data output register (MCASP_PDOUT) for writes only. Writing a 1 to the MCASP_PDCLR bit clears the corresponding bit in MCASP_PDOUT and, if MCASP_PFUNC = 1 (GPIO function) and MCASP_PDIR = 1 (output), drives a logic low on the pin. Some register bits might not be functional for all McASP instances, due to corresponding McASP pin not being pinned out on a particular device part number. Refer to device-specific DM for more information on the supported McASP features.

Table 11-1622. MCASP_GBLCTL

Address Offset	0x0000 0044		
Physical Address	0x051E 0044 0x0520 0044 0x0522 0044	**Instance**	MCASP1_CFG_PER2_L4 MCASP2_CFG_PER2_L4 MCASP3_CFG_PER2_L4
Description	Global transmit control register - provides initialization of the transmit and receive sections. The bit fields in MCASP_GBLCTL are synchronized and latched by the transmitter and receiver corresponding clocks - ACLKX (bits [12:8]) and ACLKR (bits [4:0]), respectively. Before programming MCASP_GBLCTL, ensure that the serial clocks are running. If the corresponding external serial clocks - ACLKX and ACLKR, are not yet running, select the internal serial clock source in AHCLKXCTL, AHCLKRCTL, ACLKXCTL and ACLKRCTL before programming the MCASP_GBLCTL. Also, after programming any bits in MCASP_GBLCTL, do not proceed until reading back from MCASP_GBLCTL and verifying that the bits in MCASP_GBLCTL are latched.		
Type	RW

Bits	Field Name	Description	Type	Reset
31:13	RESERVED	Reserved	RW	0x00000

Bits	Field Name	Description	Type	Reset
12	XFRST	Transmit frame-sync generator reset enable bit 0x0: The transmit frame-sync generator is reset. 0x1: The transmit frame-sync generator is active. When released from reset, the transmit frame-sync generator begins counting serial clocks and generating frame sync as programmed.	RW	0
11	XSMRST	Transmit state-machine reset enable bit 0x0: The transmit state-machine is held in reset. AXR[n] pin state: If MCASP_PFUNC[n] = 0 and MCASP_PDIR[n] = 1, the corresponding serializer [n] drives the AXR[n] pin to the state specified for inactive time slot. 0x1: The transmit state-machine is released from reset. When released from reset, the transmit state-machine immediately transfers data from XBUF[n] to XRSR[n]. The transmit state-machine sets the underrun flag (XUNDRN) in MCASP_XSTAT, if XBUF[n] have not been preloaded with data before reset is released. The transmit state-machine also immediately begins detecting frame sync and is ready to transmit. Transmission of TDM time slot begins at slot 0 after reset is released.	RW	0
10	XSRCLR	Transmit serializer clear enable bit. By clearing and then setting this bit, the transmit buffer is flushed to an empty state (XDATA = 1). If XSMRST = 1, XSRCLR = 1, XDATA = 1, and XBUF is not loaded with new data before the start of the next active time slot, an underrun occurs. 0x0: The transmit serializer is cleared. 0x1: The transmit serializer is active. When the transmit serializer is first taken out of reset (XSRCLR changes from 0 to 1), the transmit data ready bit (XDATA) in MCASP_XSTAT is set to indicate XBUF is ready to be written.	RW	0
9	XHCLKRST	Transmit high-frequency clock divider reset enable bit 0x0: The transmitter high-frequency clock divider is held in reset and passes through its input as divide-by-1. 0x1: The transmitter high-frequency clock divider is running.	RW	0
8	XCLKRST	Transmit clock divider reset enable bit 0x0: The transmit clock divider is held in reset. When the clock divider is in reset, it passes through a divide-by-1 of its input. 0x1: The transmit clock divider is running.	RW	0
7:5	RESERVED	Reserved	RW	0x0
4	RFRST	Receive frame sync generator reset enable bit. 0x0: Receive frame sync generator is reset. 0x1: Receive frame sync generator is active. When released from reset, the receive frame sync generator begins counting serial clocks and generating frame sync as programmed.	RW	0
3	RSMRST	Receive state machine reset enable bit. 0x0: Receive state machine is held in reset. 0x1: Receive state machine is released from reset. When released from reset, the receive state machine immediately begins detecting frame sync and is ready to receive. Receive TDM time slot begins at slot 0 after reset is released.	RW	0
2	RSRCLR	Receive serializer clear enable bit. By clearing then setting this bit, the receive buffer is flushed. 0x0: Receive serializers are cleared. 0x1: Receive serializers are active.	RW	0

4	RLAST	Receive last slot interrupt enable bit 0x0: Interrupt is disabled. A receive-last-slot interrupt does not generate a McASP receive interrupt (RINT). 0x1: Interrupt is enabled. A receive-last-slot interrupt generates a McASP receive interrupt (RINT).	RW	0
3	RDMAERR	Receive DMA error interrupt enable bit 0x0: Interrupt is disabled. A receive DMA error interrupt does not generate a McASP receive interrupt (RINT). 0x1: Interrupt is enabled. A receive DMA error interrupt generates a McASP receive interrupt (RINT).	RW	0
2	RCKFAIL	Receive clock failure interrupt enable bit 0x0: Interrupt is disabled. A receive clock failure interrupt does not generate a McASP receive interrupt (RINT). 0x1: Interrupt is enabled. A receive clock failure interrupt generates a McASP receive interrupt (RINT).	RW	0

Bits	Field Name	Description	Type	Reset
1	RSYNCERR	Unexpected receive frame-sync interrupt enable bit 0x0: Interrupt is disabled. An unexpected receive frame-sync interrupt does not generate a McASP receive interrupt (RINT). 0x1: Interrupt is enabled. An unexpected receive frame-sync interrupt generates a McASP receive interrupt (RINT).	RW	0
0	ROVRN	Receiver overrun interrupt enable bit 0x0: Interrupt is disabled. A receiver overrun interrupt does not generate a McASP receive interrupt (RINT). 0x1: Interrupt is enabled. A receiver overrun interrupt generates a McASP receive interrupt (RINT).	RW	0

Table 11-1634. MCASP_RSTAT

Address Offset	0x0000 0080		
Physical Address	0x051E 0080 0x0520 0080 0x0522 0080	**Instance**	MCASP1_CFG_PER2_L4 MCASP2_CFG_PER2_L4 MCASP3_CFG_PER2_L4
Description	The receiver status register (MCASP_RXSTAT) provides the receiver status and receive TDM time slot number.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																							RERR	RDMAERR	RSTAFRM	RDATA	RLAST	RTDMSLOT	RCKFAIL	RSYNCERR	ROVRN

Bits	Field Name	Description	Type	Reset
31:9	RESERVED		RW	0x00 0000
8	RERR	RERR bit always returns a logic-OR of: ROVRN | RSYNCERR | RCKFAIL | RDMAERR Allows a single bit to be checked to determine if a receiver error has occurred. 0x0: No errors have occurred. 0x1: An error has occurred.	RW	0
7	RDMAERR	Receive DMA error flag. RDMAERR is set when the CPU or DMA reads more serializers through the DMA port in a given time slot than were programmed as receivers. This bit is cleared by writing a 1 to this bit. Writing a 0 to this bit has no effect. 0x0: Receive DMA error did not occur. 0x1: Receive DMA error did occur.	RW	0
6	RSTAFRM	Receive start of frame flag. This bit is cleared by writing a 1 to this bit. Writing a 0 to this bit has no effect. 0x0: No new receive frame sync (AFSR) is detected. 0x1: A new receive frame sync (AFSR) is detected.	RW	0
5	RDATA	Receive data ready flag. This bit is cleared by writing a 1 to this bit. Writing a 0 to this bit has no effect. 0x0: No new data in RBUF. 0x1: Data is transferred from XRSR to RBUF and ready to be serviced by the CPUs or DMA. When RDATA is set, it always causes a DMA event (AREVT).	RW	0

Bits	Field Name	Description	Type	Reset
4	RLAST	Receive last slot flag. RLAST is set along with RDATA, if the current slot is the last slot in a frame. This bit is cleared by writing a 1 to this bit. Writing a 0 to this bit has no effect. 0x0: Current slot is not the last slot in a frame. 0x1: Current slot is the last slot in a frame. RDATA is also set.	RW	0
3	RTDMSLOT	Returns the LSB of RSLOT. Allows a single read of MCASP_RXSTAT to determine whether the current TDM time slot is even or odd. 0x0: Current TDM time slot is odd. 0x1: Current TDM time slot is even.	RW	0
2	RCKFAIL	Receive clock failure flag. RCKFAIL is set when the receive clock failure detection circuit reports an error. This bit is cleared by writing a 1 to this bit. Writing a 0 to this bit has no effect. 0x0: Receive clock failure did not occur. 0x1: Receive clock failure did occur.	RW	0
1	RSYNCERR	Unexpected receive frame sync flag. RSYNCERR is set when a new receive frame sync (AFSR) occurs before it is expected. This bit is cleared by writing a 1 to this bit. Writing a 0 to this bit has no effect. 0x0: Unexpected receive frame sync did not occur. 0x1: Unexpected receive frame sync did occur.	RW	0
0	ROVRN	Receiver overrun flag. ROVRN is set when the receive serializer is instructed to transfer data from XRSR to RBUF, but the former data in RBUF has not yet been read by the CPU or DMA. This bit is cleared by writing a 1 to this bit. Writing a 0 to this bit has no effect. 0x0: Receiver overrun did not occur. 0x1: Receiver overrun did occur.	RW	0

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Reserved	RW	0x000000
7	XSTAFRM	Transmit start of frame interrupt enable bit 0x0: Interrupt is disabled. A transmit-start-of-frame interrupt does not generate a McASP transmit interrupt (XINT). 0x1: Interrupt is enabled. A transmit-start-of-frame interrupt generates a McASP transmit interrupt (XINT).	RW	0
6	RESERVED	Reserved	RW	0
5	XDATA	Transmit data-ready interrupt enable bit 0x0: Interrupt is disabled. A transmit data-ready interrupt does not generate a McASP transmit interrupt (XINT). 0x1: Interrupt is enabled. A transmit data-ready interrupt generates a McASP transmit interrupt (XINT).	RW	0
4	XLAST	Transmit last slot interrupt enable bit 0x0: Interrupt is disabled. A transmit-last-slot interrupt does not generate a McASP transmit interrupt (XINT). 0x1: Interrupt is enabled. A transmit-last-slot interrupt generates a McASP transmit interrupt (XINT).	RW	0
3	XDMAERR	Transmit DMA error interrupt enable bit 0x0: Interrupt is disabled. A transmit DMA error interrupt does not generate a McASP transmit interrupt (XINT). 0x1: Interrupt is enabled. A transmit DMA error interrupt generates a McASP transmit interrupt (XINT).	RW	0
2	XCKFAIL	Transmit clock failure interrupt enable bit 0x0: Interrupt is disabled. A transmit clock failure interrupt does not generate a McASP transmit interrupt (XINT). 0x1: Interrupt is enabled. A transmit clock failure interrupt generates a McASP transmit interrupt (XINT).	RW	0

Bits	Field Name	Description	Type	Reset
1	XSYNCERR	Unexpected transmit frame-sync interrupt enable bit 0x0: Interrupt is disabled. An unexpected transmit frame-sync interrupt does not generate a McASP transmit interrupt (XINT). 0x1: Interrupt is enabled. An unexpected transmit frame-sync interrupt generates a McASP transmit interrupt (XINT).	RW	0
0	XUNDRN	Transmitter underrun interrupt enable bit 0x0: Interrupt is disabled. A transmitter underrun interrupt does not generate a McASP transmit interrupt (XINT). 0x1: Interrupt is enabled. A transmitter underrun interrupt generates a McASP transmit interrupt (XINT).	RW	0

Table 11-1646. MCASP_XSTAT

Address Offset	0x0000 00C0		
Physical Address	0x051E 00C0 0x0520 00C0 0x0522 00C0	**Instance**	MCASP1_CFG_PER2_L4 MCASP2_CFG_PER2_L4 MCASP3_CFG_PER2_L4
Description	Transmitter status register - If the McASP logic attempts to set an interrupt flag in the same cycle that the CPU writes to the flag to clear it, the McASP logic has priority and the flag remains set. This also causes the generation of a new interrupt request.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																							XERR	XDMAERR	XSTAFRM	XDATA	XLAST	XTDMSLOT	XCKFAIL	XSYNCERR	XUNDRN

Bits	Field Name	Description	Type	Reset
31:9	RESERVED	Reserved	RW	0x000000
8	XERR	XERR bit always returns a logic-OR of: XUNDRN | XSYNCERR | XCKFAIL | XDMAERR. Allows a single bit to be checked to determine if a transmitter error interrupt has occurred. 0x0: No errors have occurred. 0x1: An error has occurred.	RW	0
7	XDMAERR	Transmit DMA error flag. XDMAERR is set when the CPU or DMA writes more words to the DATA port of the McASP in a given time slot than it should. Causes a transmit interrupt (XINT) if this bit and XDMAERR in MCASP_EVTCTLX are set. This bit is cleared by writing a 1 to it. Writing a 0 has no effect. 0x0: Transmit DMA error did not occur. 0x1: Transmit DMA error occurred.	RW	0
6	XSTAFRM	Transmit start of frame flag. Causes a transmit interrupt (XINT) if this bit and XSTAFRM in MCASP_EVTCTLX are set. This bit is cleared by writing a 1 to it. Writing a 0 has no effect. 0x0: No new transmit frame sync (AFSX) is detected. 0x1: A new transmit frame sync (AFSX) is detected.	RW	0
5	XDATA	Transmit data ready flag. Causes a transmit interrupt (XINT) if this bit and XDATA in MCASP_EVTCTLX are set. This bit is cleared by writing a 1 to iit. Writing a 0 has no effect 0x0: XBUF[n] is written and is full 0x1: Data is copied from XBUF[n] to XRSR[n]. XBUF[n] is empty and ready to be written. XDATA is also set when the transmit serializers are taken out of reset. When XDATA is set, it always causes a DMA event (AXEVT).	RW	0

Bits	Field Name	Description	Type	Reset
4	XLAST	Transmit last slot flag. XLAST, along with XDATA, are set if the current slot is the last slot in a frame. Causes a transmit interrupt (XINT) if this bit and XLAST in MCASP_EVTCTLX are set. This bit is cleared by writing a 1 to iit. Writing a 0 has no effect. 0x0: Current slot is not the last slot in a frame. 0x1: Current slot is the last slot in a frame. XDATA is also set.	RW	0
3	XTDMSLOT	Returns the LSB of XSLOT. Allows a single read of XSTAT to determine whether the current TDM time slot is even or odd. read 0x0: Current TDM time slot is odd. read 0x1: Current TDM time slot is even.	R	0
2	XCKFAIL	Transmit clock failure flag. XCKFAIL is set when the transmit clock failure detection circuit reports an error. Causes a transmit interrupt (XINT) if this bit and XCKFAIL in MCASP_EVTCTLX are set. This bit is cleared by writing a 1 to iit. Writing a 0 has no effect. 0x0: Transmit clock failure did not occur. 0x1: Transmit clock failure occurred	RW	0
1	XSYNCERR	Unexpected transmit frame-sync flag. XSYNCERR is set when a new transmit frame sync (AFSX) occurs before it is expected. Causes a transmit interrupt (XINT) if this bit and XSYNCERR in MCASP_EVTCTLX are set. This bit is cleared by writing a 1 to iit. Writing a 0 has no effect. 0x0: Unexpected transmit frame sync did not occur 0x1: Unexpected transmit frame sync occurred.	RW	0
0	XUNDRN	Transmitter underrun flag. XUNDRN is set when the transmit serializer is instructed to transfer data from XBUF[n] to XRSR[n], but XBUF[n] has not yet been serviced with new data since the last transfer. Causes a transmit interrupt (XINT) if this bit and XUNDRN in MCASP_EVTCTLX are set. This bit is cleared by writing a 1 to iit. Writing a 0 has no effect. 0x0: Transmitter underrun did not occur 0x1: Transmitter underrun occurred.	RW	0

5	RRDY	Receive buffer ready bit. RRDY indicates the current receive buffer state. Always reads 0 when programmed as a transmitter or as inactive. If SRMOD bit is set to receive (2h), RRDY switches from 0 to 1 whenever data is transferred from XRSRn to RBUFn. Read 0x0: Receive buffer (MCASP_RXBUFn) is empty. Read 0x1: Receive buffer (MCASP_RXBUFn) contains data and needs to be read before the start of the next time slot or a receiver overrun occurs.	R	0
4	XRDY	Transmit buffer ready bit. XRDY indicates the current transmit buffer state. Always reads 0 when programmed as a receiver or as inactive. If SRMOD bit is set to transmit (1h), XRDY switches from 0 to 1 when XSRCLR in GBLCTL is switched from 0 to 1 to indicate an empty transmitter. XRDY remains set until XSRCLR is forced to 0, data is written to the corresponding transmit buffer, or SRMOD bit is changed to receive (2h) or inactive (0). Read 0x0: The transmit buffer (MCASP_TXBUFn) contains data. Read 0x1: The transmit buffer (MCASP_TXBUFn) is empty and needs to be written before the start of the next time slot or a transmit underrun occurs.	R	0
3:2	DISMOD	Serializer pin drive mode bit. Drive on pin when in inactive TDM slot of transmit mode or when serializer is inactive. This field only applies if the pin is configured as a McASP pin (PFUNC = 0). 0x0: Drive on pin is 3-state. 0x1: Reserved 0x2: Drive on pin is logic low. 0x3: Drive on pin is logic high.	RW	0x0
1:0	SRMOD	Serializer mode bit 0x0:The serializer is inactive 0x1:The serializer is operating in transmit mode. 0x2: The serializer is operating in receive mode. 0x3: Reserved	RW	0x0

11.6 Camera Subsystem

11.6.1 CSI2-RX

11.6.1.1 CSI2 Interface

11.6.1.1.1 CSI Overview

The AM273x integrates two four-lane CSI2 receiver interfaces (2 × DHPYv0.92 + CSI-RX) in the Radar processing subsystem. The prime functionality of these interfaces is to support the reception of radar front end raw data (raw ADC data or 1st D FFT data), Chirp Quality, and monitoring data from the Radar Frontend device.

11.6.1.1.1.1 CSI2 Interface Features

- The Two CSI2 camera interfaces: CSI2-A (primary) and CSI2-B (secondary)
- Transfer pixels and data received by the CSI2 digital physical layer receiver to the system memory.
- Use unidirectional data link
- Both CSI2-A and CSI2-B support four configurable data links in addition to the clock signaling.
- Maximum data rate of 1 Gbps per data lane
- Data merger for 2-, 3-, or 4-data lane configuration
- Maximum data rate of 1 Gbps per data lane, possible configurations are:
  - One data lane: 1000 Mbps (824 Mbps if lane 4 is used)
  - Two data lanes: 2 × 1000 Mbps (2 × 824 Mbps if lane 4 is used
  - Three data lanes: 3 × 1000 Mbps (3 × 824 Mbps if lane 4 is used)
  - Four data lanes: 4 × 824 Mbps
- Error detection and correction by the protocol engine
- Direct memory access (DMA) engine integrated with dedicated first in first out (FIFO)
- One-dimensional (1D) and two-dimensional (2D) addressing mode
- Burst support
- Eight contexts to support eight dedicated configurations of virtual channel ID and data types
- Ping-pong mechanism for double-buffering
- All primary and secondary MIPI-defined formats are supported.
- Conversion of the RGB formats
- On-the-fly differential pulse code modulation (DPCM) decompression
- On-the-fly image cropping and A-law/DPCM compression
- Configuration of the complex input/output (I/O) physical layer (PHY) (MIPI D-PHY-compliant receiver PHY solution [D-PHY mode]
-
-
-

In addition to the above features, the CSI IP has been enhanced to support the following additional features.

- Support for 8/10/12/14/16-bits RAW data mode with capability of sign extension to align with 16-bit memory addressing for RAW10/12/14 modes
  - The CSI2 IP supports sign-extension in “EXP16” data modes. The below MMR bits are provided to enable sign extension instead of zero padding while writing into the CSI2 internal FIFO.
    - RCSS_CTRL: RCSS_CSI2A/B_CFG_SIGN_EXT_EN
- Interrupts for each of the DMA contexts (RCSS_CSI2A/B_EOL_CNTX0_INT…RCSS_CSI2A/B_EOL_CNTX7_INT)
  - 8 line end interrupts are generated corresponding to the 8 CSI2 contexts. These interrupts are generated after the last word of N line data (N= RCSS_CSI2A/B_CTX[0-7]_LINE_PING_PONG_NUM_LINES) for that particular context is written into the destination address by the CSI2 DMA.
  - These interrupts are connected to the following interrupt and DMA lines:
    - MSS CR5 A/B
    - DSS DSP
    - DSS CM4
    - DSS_TPCC_B (CSI2A interrupts)

    - DSS_TPCC_C (CSI2B interrupts)
    - RCSS_TPCC_A
  - These context based interrupts are also connected to HWA and can be configured to be used as HWA triggers.
- Frame start interrupts (RCSS_CSI2A/B_SOF_INT0 , RCSS_CSI2A/B_SOF_INT1)
  - Can be independently configured to select any of the 8 CSI2 context based frame start interrupts using below MMR register
    - RCSS_CSI2A/B_CFG_SOF_INTR1_SEL / RCSS_CSI2A/B_CFG_SOF_INTR0_SEL
  - These interrupts are connected to the following interrupt and DMA lines
    - MSS CR5 A/B
    - DSS DSP
    - DSS CM4
    - DSS_TPCC_B(CSI2A interrupts)
    - DSS_TPCC_C(CSI2B interrupts)
    - RCSS_TPCC_A
  - These context based interrupts are also connected to HWA and can be configured to be used as HWA triggers.
- N Line wise Ping-pong mode
  - Legacy CSI2 IP supports only Frame based ping pong DMA trasfers. In AM273x, support is provided to support ping-pong switch at line level and also after “N”(N being programmable) number of lines.These can be enabled using below MMR registers
    - RCSS_CTRL: RCSS_CSI2A/B_CTX[0-7]_LINE_PING_PONG_ENABLE Enable line ping/pong feature instead of frame ping/pong
    - RCSS_CTRL: RCSS_CSI2A/B_CTX[0-7]_LINE_PING_PONG_NUM_LINES Number of lines after which the CSI2 DMA writes switch between ping and pong
  - At the start of a frame, the CSI2 DMA writes always starts from the PING start address for all contexts
- Parity for CSI2 memories
  - Byte-wise parity support is provided for FIFO RAM and CTX RAM
  - The parity enable for the RAMs are provided below
    - RCSS_CTRL:RCSS_CSI2A/B_PARITY_CTRL_FIFO_PARITY_EN
    - RCSS_CTRL: RCSS_CSI2A/B_PARITY_CTRL_CTX_PARITY_EN
  - The parity error status for the RAMs are available in below configuration registers
    - RCSS_CTRL: RCSS_CSI2A/B_PARITY_STATUS_FIFO_PARITY_ADDR
    - RCSS_CTRL: RCSS_CSI2A/B_PARITY_STATUS_FIFO_PARITY_ADDR

11.6.1.1.2 CSI2 PHY

11.6.1.1.2.1 CSI2 PHY Overview

Two MIPI D-PHY-compliant CSIRX PHY receivers act as a physical connection and configuration of clock/data lanes with external sensors. CSIRX PHY supports up to four configurations, depending on the required number of D-PHY data lane external sensors. The receivers are compatible with the *MIPI D-PHY Specification v0.92*.

The PHY is controlled and must be configured first from the control module for pad configuration. The differential data/clock lanes coming into the CSI2-A and CSI2-B CSIRX are explained in the CSI2 PHY control registers CSI2_PHY_CFG.

As mentioned previously, two PHYs are integrated in the device. Both the CSI2-A and CSI2-B CSIRX contain four data lanes, as shown in Figure 11-372.

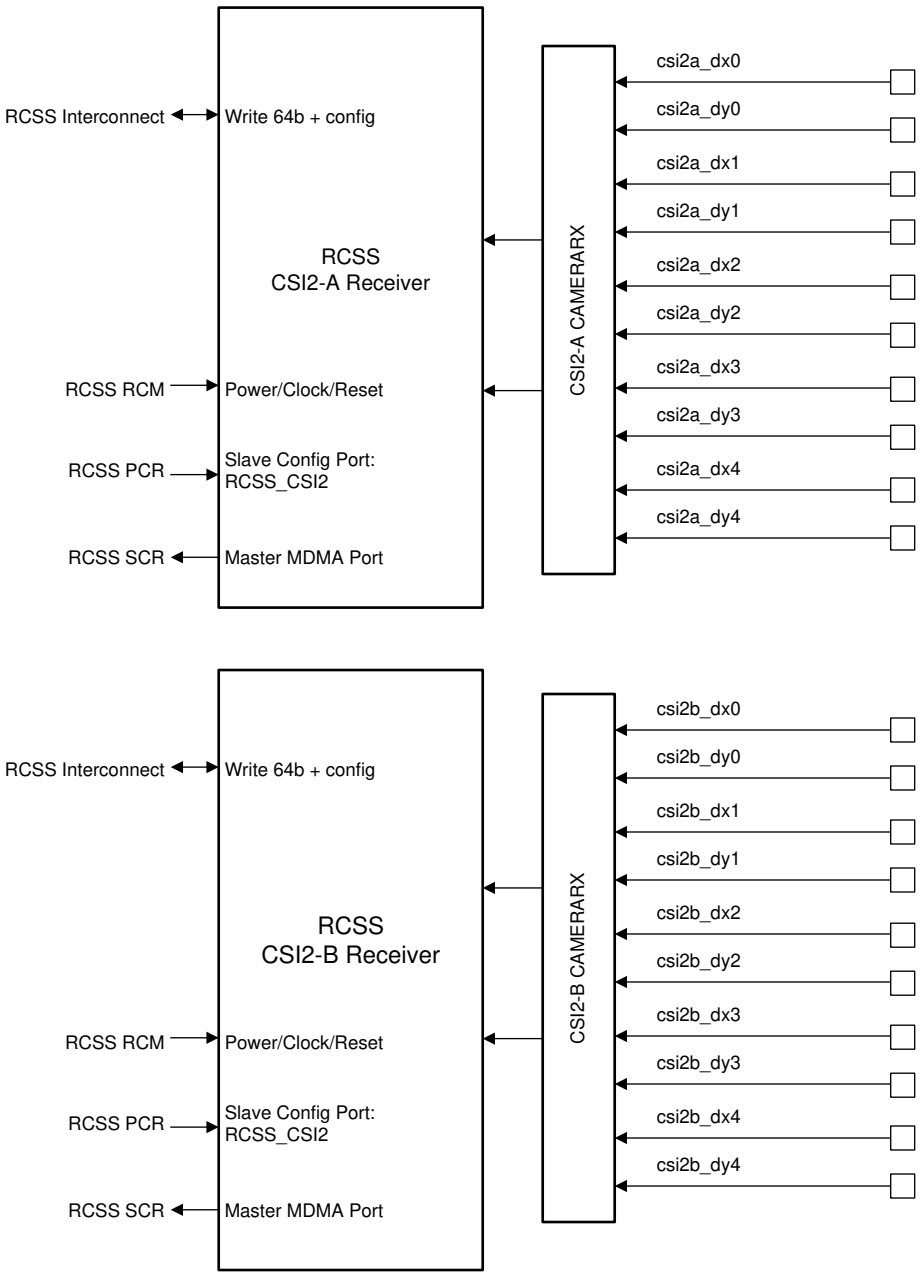

Figure 11-372. Interfaces CSI2-A PHY Diagram Four D-PHY Data Lane Configuration

Note

LANE 4 can be used only as a data lane, never as a clock lane. All other configurations are possible. Also, a speed restriction is present when lane 4 is used; then all data lanes perform at up to 824 Mbps instead of 1000 Mbps.

CSI2-A and CSI2-B CSIRX represent the overall PHY solution for connecting external sensors to feed the CSI interface. The MIPI D-PHY function can support up to four data lane modules and one clock lane module. Reverse direction escape mode is not supported. The lane module polarity and positions are configurable; that is, any lane module can be chosen as the clock lane module, and the DX/DY data pad for each lane module can be configured as DP or DN pins defined.

11.6.1.1.2.2 CSI2 PHY Functional Description

11.6.1.1.2.2.1 CSI2 PHY Functional Configuration

The CSI2 PHY converts the bitstream, divided into 1 to 4 serial data lanes, into a bitstream compatible with the CSI2 receiver and one clock lane.

The register logs complex I/O events of the following types:

- Line power-state change (all lanes in ultralow-power mode [ULPM], at least one lane exits ULPM, etc.)
- Error on one lane

The CSI2 receiver embeds two registers to configure/read some complex I/O parameters:

- The register detects clock miss with respect to the *MIPI D-PHY Specification v0.92* and control timing.
- The register reports completion of reset on the different parts of the module and configures the timing parameters.
- The registers contain the PWR_AUTO and PWR_CMD bit fields, which affect the power management of the two complex I/Os.

The complex I/O has three power modes: on, off, and ultralow power (ULP). These modes can reflect the ON or ULP states of the five differential lines if the CSI2_COMPLEXIO_CFG[24] PWR_AUTO bit is set to 1. If the PWR_AUTO bit is at reset value (0), the complex I/O power state is controlled by the CSI2_COMPLEXIO_CFG[28:27] PWR_CMD bit field, which directly defines the power state. Figure 11-373 shows the complex I/O power finite state-machine (FSM).

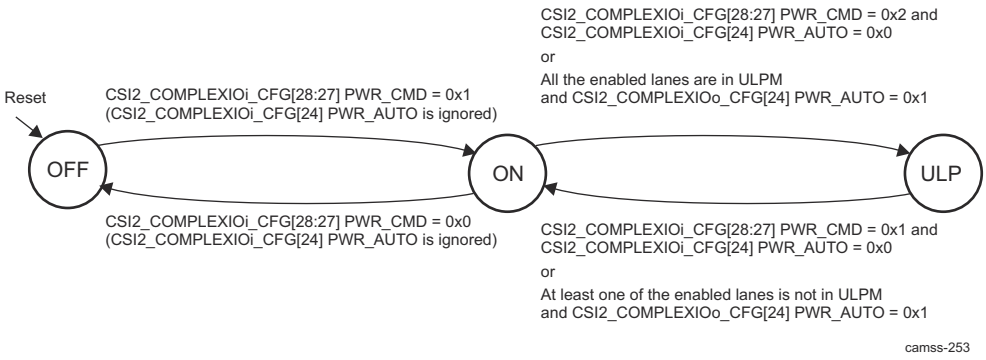

Figure 11-373. CSI2 Complex I/O Power FSM

Another register, , is used to control the power state of the complex I/O modules with regard to the differential line state. This register controls the mode of the two complex I/Os (RxMode and NoRxMode) and the delay between the differential lanes in STOP state and the complex I/O on NoRxMode. The CSI2_TIMING[15] FORCE_RX_MODE_IO1 bit sets the complex I/O in RxMode or NoRxMode (stopped mode). The FORCE_RX_MODE_IO bit is automatically reset to 0 by hardware when the counter ends and the FSM returns to NoRxMode. Three bits (CSI2_TIMING[14] STOP_STATE_X16_IO1, CSI2_TIMING[13] STOP_STATE_X4_IO1, and the CSI2_TIMING[12:0] STOP_STATE_COUNTER_IO1 bit field) configure the

delay between line stop mode and complex I/O stop mode. The delay represents the number of functional clock cycles and can be calculated as follows:

Total delay in clock cycle = CSI2_TIMING.STOP_STATE_COUNTER_IO x (1+CSI2_TIMING.STOP_STATE_X16_IO x 15) x (1+CSI2_TIMING.STOP_STATE_X4_IO x 3).

Table 11-1661 lists the possible values of the delay, in terms of the clock cycles, depending on the values of the STOP_STATE_X16_IO and STOP_STATE_X4_IO bits.

Table 11-1661. CSI2 Possible Time-Out Value for RxMode Counter

STOP_STATE_X16_IO	STOP_STATE_X4_IO	Possible Delay Value (in Functional Clock Cycles)
0x0	0x0	8191 (with step of 1)
0x0	0x1	32764 (with step of 4)
0x1	0x0	131056 (with step of 16)
0x1	0x1	524224 (with step of 64)

The FORCERXMODE signal is used at initialization time (complex I/O). Figure 11-374 describes the ForceRxMode and StopState FSM to assert and deassert the FORCERXMODE signal and to monitor STOPSTATE from the complex I/O.

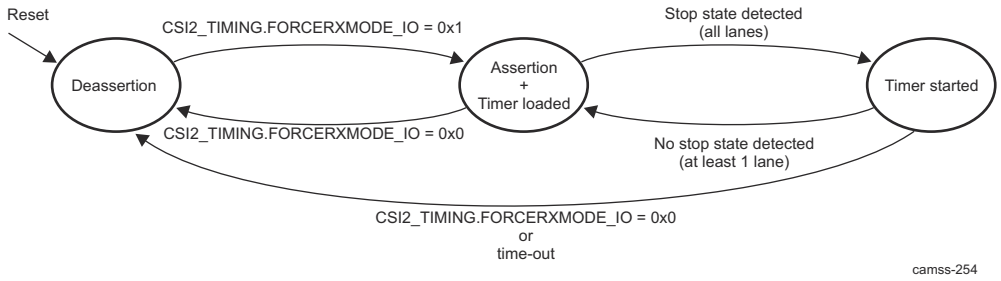

Figure 11-374. CSI2 RxMode and StopState FSM

11.6.1.1.2.2.2 CSI2 PHY and Link Initialization Sequence

The MIPI D-PHY initialization sequence is not implemented within CSIRX. The CSI2 receiver is expected to coordinate the PHY initialization. The controller must ensure that the PHY is held in RESET/WAIT for RX mode until the D-PHY transmitter is powered up and the link comes to the defined state. The controller can use the STOPSTATE and FORCERXMODE signals of CSIRX for this purpose. STOPSTATE indicates the line states, while FORCERXMODE forces the receiver state-machine into "wait for stop state." One possible initialization sequence is:

To fully initialize the CSIPHY, perform the following steps:

1. Configure all CSI2 receiver registers to be ready to receive signals/data from the CSIPHY:
   a. Configure all needed CSI2 registers:
      i. Set [18:16] DATA4_POSITION.
      ii. Set [14:12] DATA3_POSITION.
      iii. Set [10:8] DATA2_POSITION.
      iv. Set [6:4] DATA1_POSITION.
      v. Set [2:0] CLOCK_POSITION.
      vi.

> **CAUTION**
>
> This must be done before the CSIPHY is active.

2. CSIPHY and link initialization sequence:
   a. Deassert the CSIPHY reset.
      i. Set [30] RESET_CTRL to 0x1.

CAUTION

For the [29] RESET_DONE bit to be set to 0x1 (reset completed), the external sensor must to be active and sending the MIPI HS BYTECLK.

The following registers can be set only after deasserting the CSIPHY reset and before asserting the FORCERXMODE signal:

-
-
-

b. Assert the FORCERXMODE signal:
   i. Set [15] FORCE_RX_MODE_IO1 to 0x1.
c. Connect pulldown on link (DP/DN) by asserting the respective PIPD* signals (PIPD* = 0):

   For CSI2-A/B CSIRX pulldown on signals using the RCSS_CTRL: RCSS_CSI2A/B_LANE_CFG registers for each lane:

   -
   -

d. Power up the CSIPHY:
   i. Set [28:27] PWR_CMD to 0x1.
e. Check whether the state status reaches the ON state:
   - [26:25] PWR_STATUS = 0x1
f. Wait for STOPSTATE = 1 (for all enabled lane modules):
   i. The timer is set through the [14:0] bit field. The reset value can be kept.
   ii. Wait until [15] FORCE_RX_MODE_IO1 = 0x0. It is automatically put at 0 when all enabled lanes are in STOPSTATE and the timer is finished.
g. Release PIPD* (= 1).

   For CSI2-A/B CSIRX pullup on signals using the RCSS_CTRL: RCSS_CSI2A/B_LANE_CFG registers for each lane:

   -

3. The CSIPHY is initialized and ready/active in CSI2 mode.

11.6.1.1.2.2.3 CSI PHY Error Signals

In D-PHY mode, the CSIPHY supports the following error detection and signaling to the associated receiver:

- ERRSOTHS: Flags 1-bit errors in the HS start of transmission synchronization pattern. In this error scenario, the CSIPHY continues to receive the data and pass it to the receiver, but confidence in the data may be low, because of the 1-bit error seen in sync. This signal, if asserted, is high for one cycle of RXBYTECLKHS.
- ERRSOTSYNCHS: Flags multiple bit errors in the HS start of transmission synchronization pattern. In this case, the CSIPHY cannot achieve proper synchronization and does not pass the received data to the receiver. This signal, if asserted, is high for one cycle of RXBYTECLKHS.
- ERRCONTROL: Flags the control sequence error; that is, when the LP sequence observed on line is not recognized as a valid control sequence. This signal, if asserted, is high until the next change in the state of the LP line.
- ERRESC: Flags the escape entry error; that is, when the escape entry sequence is unrecognized. This signal, if asserted, is high until the next change in the state of the LP line.

11.6.1.1.3 CSI2

11.6.1.1.3.1 CSI2 Environment

11.6.1.1.3.1.1 CSI2 Protocol and Data Format

The CSI2 supports MIPI CSI2 multiple data type formats. This section describes MIPI CSI2 protocol and data formats. The CSI2 is compatible with the *MIPI CSI2 Specification v1.0-01-00 r0.03*. Table 11-1662 lists the MIPI CSI2 supported by CSI2 formats in addition to JPEG8. Shading in the primary and secondary MIPI CSI2-defined formats indicates special format extensions of the CSI2 receiver.

Table 11-1662 summarizes the pixel formats supported by the CSI2 receiver interface.

Table 11-1662. CSI2 Pixel Format Modes

CSI2_CTX_CTRL2_i[9:0] Format	CSI2 Data Format	Bits per Pixel (BPP)	Data Size Increases in Memory	2D Mode Availability	Comments

For more information about how the data formats are transmitted and how the data are stored in memory, see Section 11.6.1.1.3.1.1.4, *CSI2 Operating Modes*.

11.6.1.1.3.1.1.1 CSI2 Physical Layer

The CSI2-A/CSI2-B receivers are tightly connected to a PHY layer (for more information about the PHY, see Section 11.6.1.1.2, *CSI2 PHY*). Table 11-1663 lists the CSI2-A receiver I/O , and Table 11-1664 lists the CSI2-B receiver I/O. The CSI2_RECEIVER provides access to the complex I/O configuration from the CSI2_COMPLEXIO_CFG register.

Table 11-1663. CSI2-A I/O Description

Signal Name		I/O(1)	Description
csi2a_dx0	lane 0 (position 1)	I	Serial data/clock input
csi2a_dy0			
csi2a_dx1	lane 1 (position 2)	I	Serial data/clock input
csi2a_dy1			
csi2a_dx2	lane 2 (position 3)	I	Serial data/clock input
csi2a_dy2			
csi2a_dx3	lane 3 (position 4)	I	Serial data/clock input
csi2a_dy3			
csi2a_dx4	lane 4 (position 5)	I	Serial data input only
csi2a_dy4			

(1) I = Input

Table 11-1664. CSI2-B I/O Description

Signal Name		I/O(1)	Description
csi2b_dx0	lane 0 (position 1)	I	Serial data/clock input
csi2b_dy0			
csi2b_dx1	lane 1 (position 2)	I	Serial data/clock input
csi2b_dy1			
csi2b_dx2	lane 2 (position 3)	I	Serial data/clock input
csi2b_dy2			
csi2b_dx3	lane 3 (position 4)	I	Serial data/clock input
csi2b_dy3			
csi2b_dx4	lane 4 (position 5)	I	Serial data input only
csi2b_dy4			

Note

The serial lane can be used as clock lane or data lane (excluding lane 4 on the CSI2-A I/O). The MIPI CSI2 protocol requires one clock lane (others are data lane or unused lane).

Lanes support the two operating modes:

- HS mode: High-speed transmit mode
- Off mode: Lane is off.

11.6.1.1.3.1.1.2 CSI2 Lane Merger

The layer consists of lane merger logic to merge the incoming serial stream into a byte stream. The lane merger can merge up to four lanes (CSI2-A) into a single byte stream. The bits are sent with the LSB first. The order of the lanes at the CSI2-A, CSI2-B receiver core depends on the lane configuration. The merger is not used for a single lane.

The number of lanes and their configuration can be changed only in ULPM or when all data lanes are in off mode.

Figure 11-375 to Figure 11-378 show the byte position into each serial link for one to four data lane configurations. The byte stream always starts from lane 1. It finishes on one of the lanes, depending on the number of bytes to receive and the number of lanes.

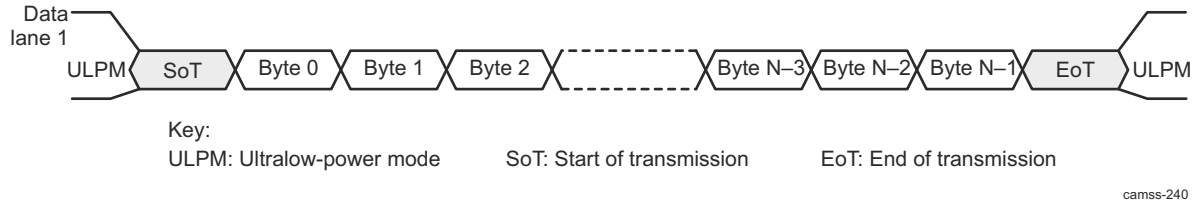

Figure 11-375. CSI2 One Data-Lane Configuration

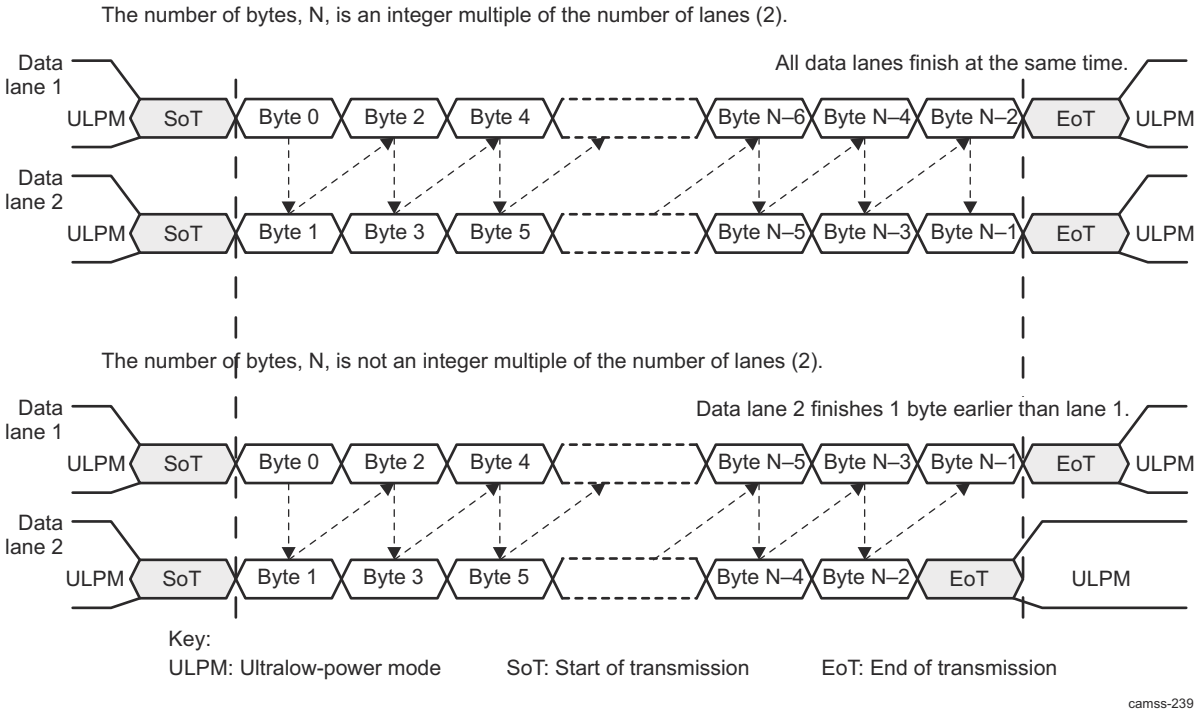

Figure 11-376. CSI2 Two Data-Lane Merger Configuration

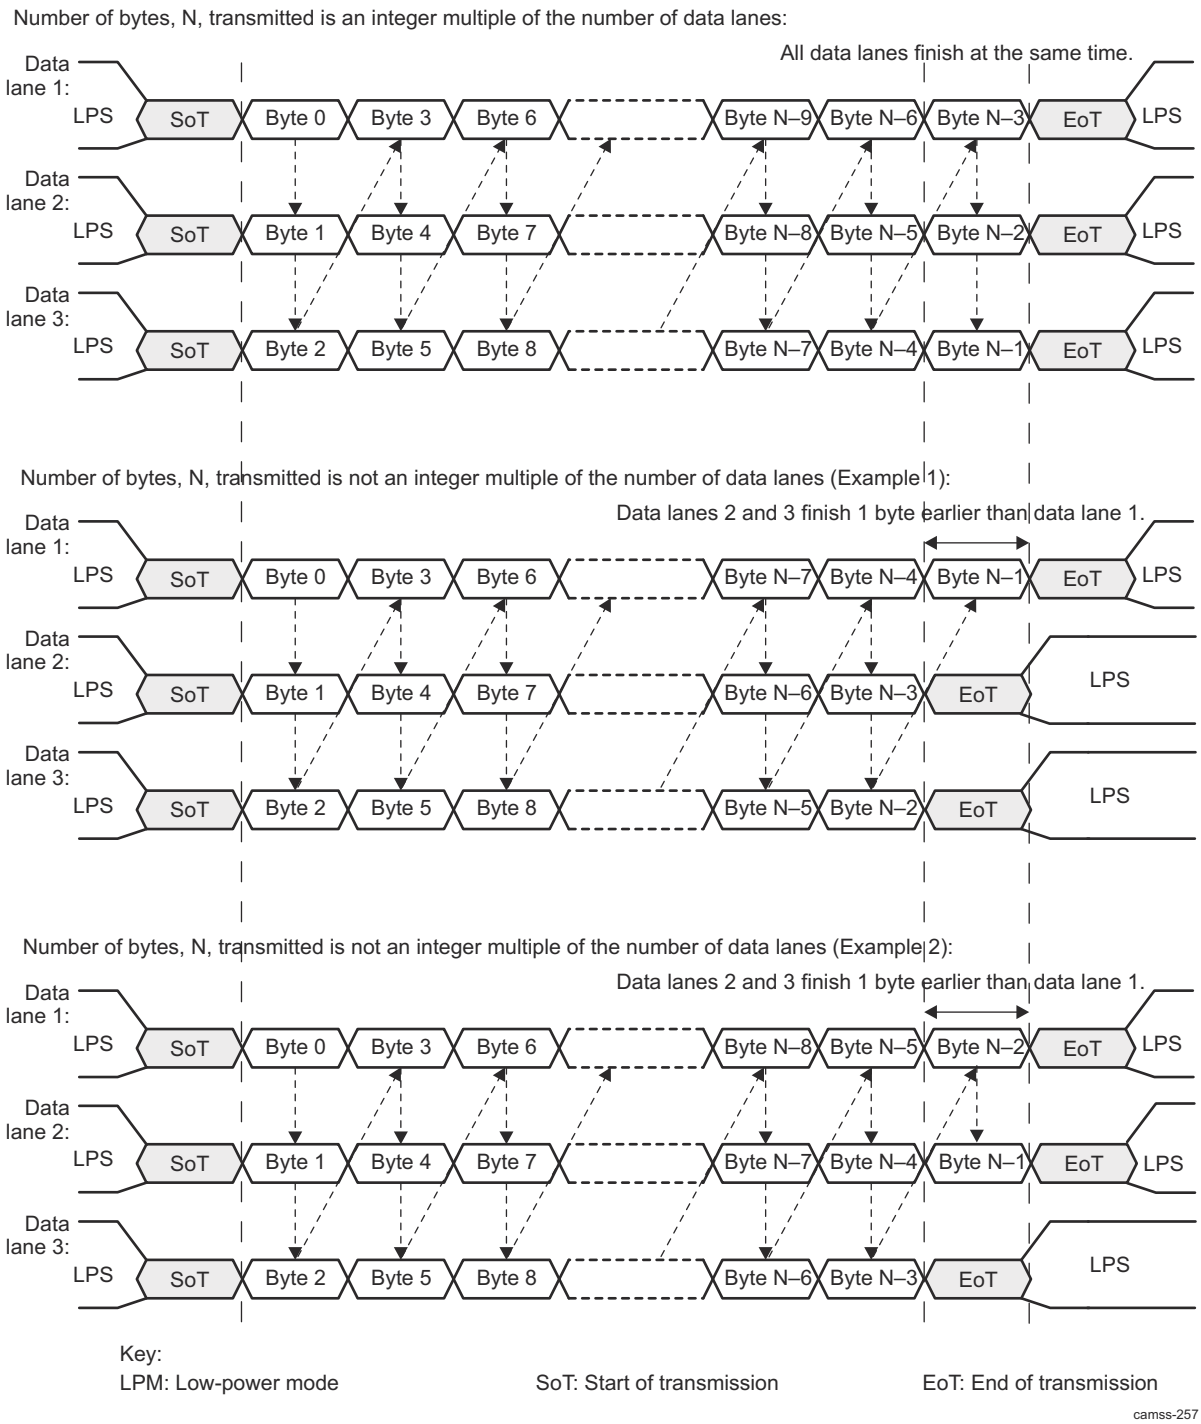

Figure 11-377. CSI2 Three Data-Lane Merger Configuration

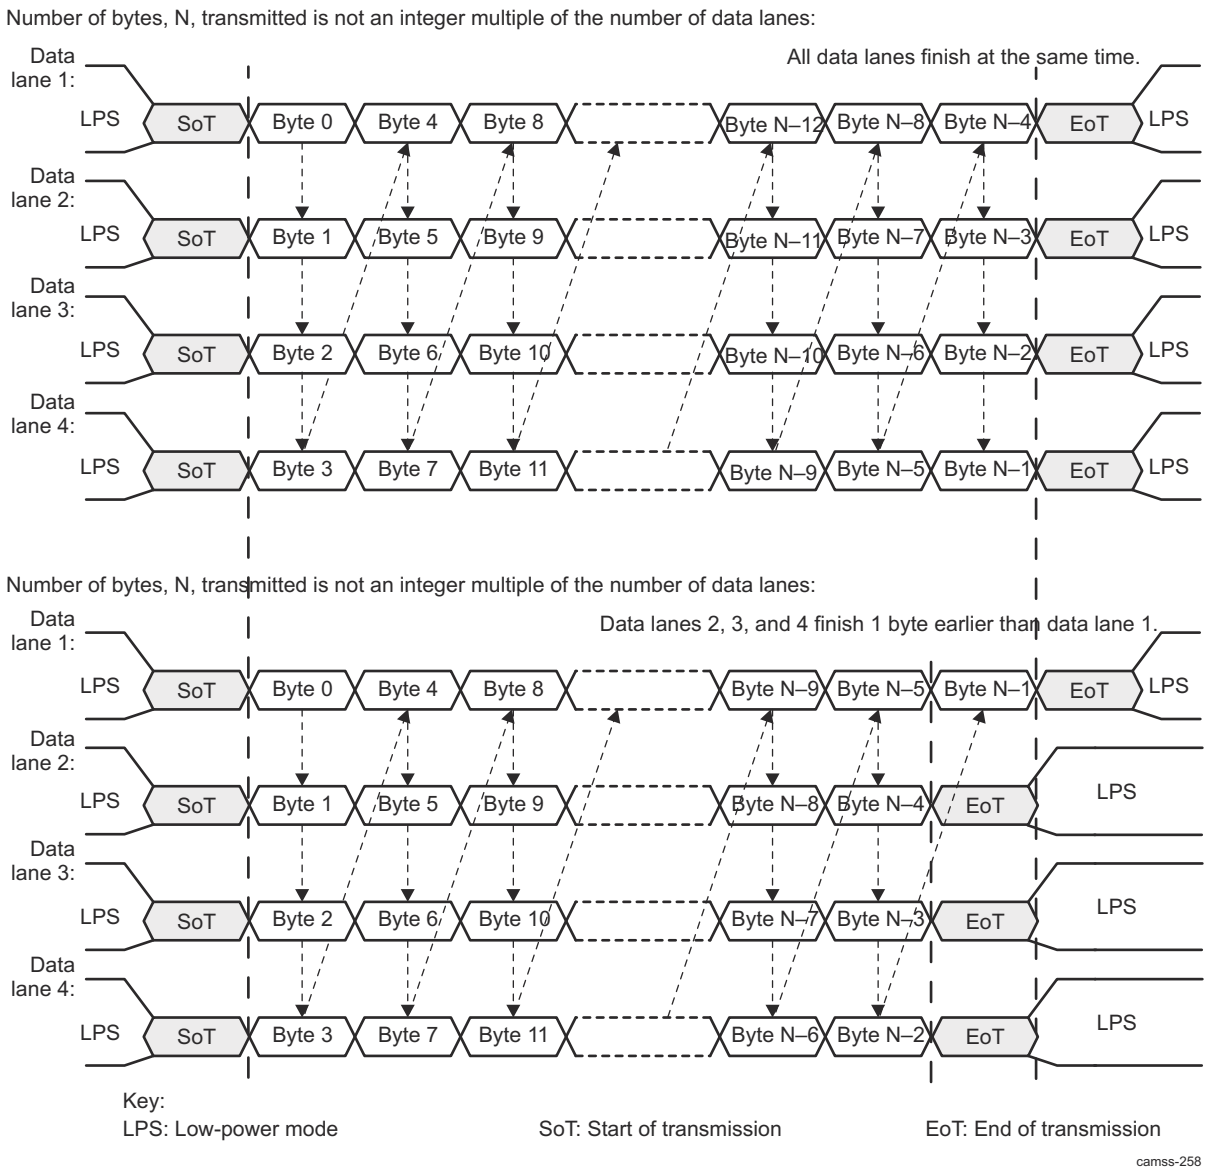

Figure 11-378. CSI2 Four Data-Lane Merger Configuration

11.6.1.1.3.1.1.3 CSI2 Protocol Layer

The low-level protocol (LLP) is a byte-oriented protocol from the lane merger layer. It supports short and long packet formats.

The CSI2 protocol layer defines how image-sensor data is transported onto the physical layer.

The feature set of the protocol layer implemented by the CSI2 receiver is:

- Transport of arbitrary data (payload-independent)
- 8-bit word size
- Support for up to four interleaved virtual channels on the same link
- Special packets for frame-start, frame-end, line-start, and line-end information
- Descriptor for the type, pixel depth, and format of application-specific payload data
- Error-correction code (ECC) for 1-bit error correction or 2-bit error detection in the header
- 16-bit checksum code for payload error detection

Figure 11-379 shows the CSI2 protocol layer with short and long packets.

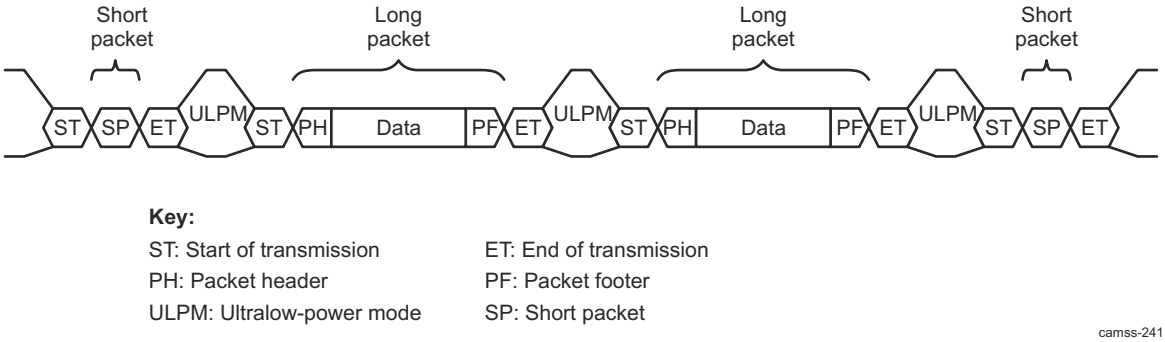

Figure 11-379. CSI2 Protocol Layer With Short and Long Packets

Two packets are always separated from each other with a sequence of ET, ULPM, and ST.

11.6.1.1.3.1.1.3.1 CSI2 Short Packet

A short packet is identified by data types 0x00 to 0x0F. A short packet can be used for frame or line synchronization or for generic data. Figure 11-380 shows the structure of a short packet.

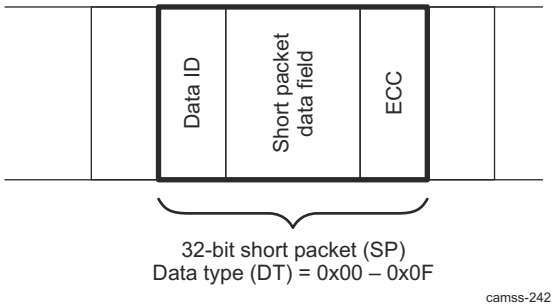

Figure 11-380. CSI2 Short Packet Structure

For frame-synchronization data types, the short packet data field is the frame number. For line-synchronization data types, the short packet data field is the line number. For generic short packet data types, the content of the short packet data field is user-defined.

The 16-bit frame number, when used, is always nonzero to distinguish it from the use case where the frame number is inoperative and remains set to 0. The behavior of the 16-bit frame number is one of the following:

- The frame number is always 0 and is inoperative.
- The frame number increments by 1 for every FS packet within the same virtual channel and is periodically reset to 1 (1, 2, 1, 2, 1, 2, 1, 2 or 1, 2, 3, 4, 1, 2, 3, 4).

For LSC and LEC synchronization packets, the short packet data field contains a 16-bit line number. This line number is the same for the LS and LE packets corresponding to a given line. Line numbers are logical line numbers and do not necessarily equal physical line numbers. The 16-bit line number, when used, is always nonzero to distinguish it from the use case where the line number is inoperative and remains set to 0.

The behavior of the 16-bit line number is one of the following:

- The line number is always 0 and is inoperative.
- The line number increments by 1 for every LS packet within the same virtual channel and the same data type. The line number is periodically reset to 1 for the first LS packet after an FS packet. The intended use is for progressive scan (noninterlaced) video data streams. The line number must be a nonzero value.
- The line number increments by the same arbitrary step value greater than 1 for every LS packet within the same virtual channel and the same data type. The line number is periodically reset to a nonzero arbitrary start value for the first LS packet after an FS packet. The arbitrary start value can be different between successive frames. The intended use is for interlaced video data streams.

The ECC byte allows single-bit errors to be corrected and 2-bit errors to be detected in the short packet.

Short packets apply to all contexts using the same virtual channel ID (up to eight contexts support eight dedicated configurations of virtual channel ID and data types). The data type associated with the context is not used to distinguish which context is used when receiving short packets.

11.6.1.1.3.1.1.3.2 CSI2 Long Packet

A long packet is identified by data types 0x10 to 0x37. A long packet consists of three elements:

- A 32-bit packet header (PH)
- An application-specific data payload with a variable number of 8-bit data words
- A 16-bit packet footer (PF)

The packet header is composed of three elements:

- An 8-bit data identifier
- A 16-bit word count field
- An 8-bit ECC

The packet footer has one element, a 16-bit checksum.

Figure 11-381 and Table 11-1665 show the structure of a long packet.

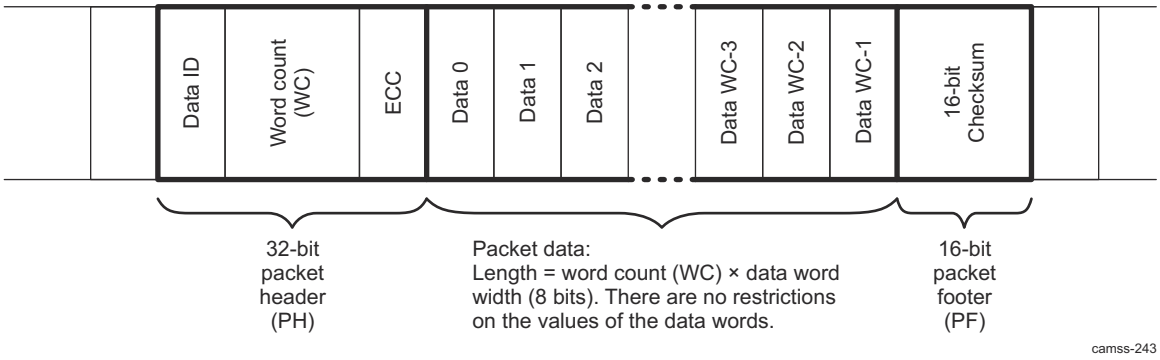

Figure 11-381. CSI2 Long Packet Structure

Table 11-1665. CSI2 Long Packet Structure Description

Packet Part	Field Name	Size (Bits)	Description
Header	Data ID	8	Contains the virtual channel identifier and the data-type information
	Word count	16	Number of data words in the packet data. A word is 8 bits.
	ECC	8	ECC for data ID and WC field. Allows 1-bit error recovery and 2-bit error detection.
Data	Data	WC-8	Application-specific payload (WC words of 8 bits)
Footer	Checksum	16	16-bit CRC for packet data

There are no restrictions on the size of the packet data, but each data format can impose additional restrictions on the length of the payload data (for example, a multiple of 4 bytes).

11.6.1.1.3.1.1.3.3 CSI2 Data Identifier

The data identifier byte contains the virtual channel (VC) value and the data-type (DT) value, as shown in Figure 11-382. The VC value is in the 2 MSBs of the data identifier byte. The DT value is in the 6 LSBs of the data identifier byte.

Figure 11-382 shows the data identifier structure.

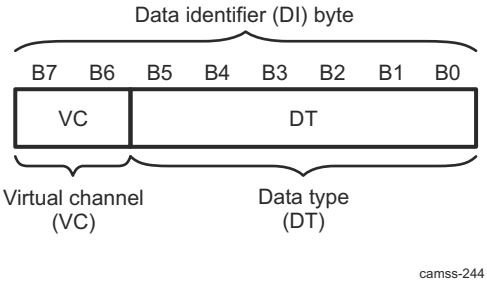

Figure 11-382. CSI2 Data Identifier Structure

Virtual Channel

The CSI2 protocol layer transports virtual channels. Virtual channels are built of frames. A frame can comprise embedded data and image-sensor data. Two contexts are used to send the two types of data separately. Each frame is identified by unique mandatory synchronization codes: frame start and frame end. Line start and line end synchronization codes are optional for the transmitter. A set of registers is associated with each context defined by the virtual channel ID and the data type. Figure 11-383 shows a virtual channel.

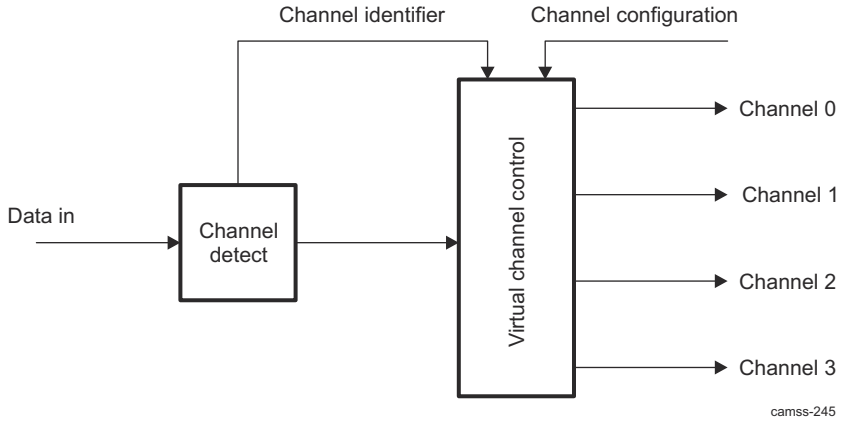

Figure 11-383. CSI2 Virtual Channel

Pixel Formats

11.6.1.1.3.1.1.3.4 CSI2 Synchronization Codes

Data reception from the image-sensor module uses four synchronization codes embedded in the serial bitstream:

- FSC: Identifies the start of a new frame
- LSC: Identifies the start of a new line; received for every line
- LEC: Identifies the end of a line; received for every line
- FEC: Identifies the end of the last line and the end of the current frame

Table 11-1666 summarizes the synchronization code values.

Table 11-1666. CSI2 Synchronization Codes

Synchronization Code	Value	Comments
FSC	0x0	Mandatory
FEC	0x1	Mandatory
LSC	0x2	Optional
LEC	0x3	Optional
Reserved	0x4 to 0x7	Not used

11.6.1.1.3.1.1.3.5 CSI2 Generic Short Packet Codes

When the synchronization code value is from 0x8 to 0xF, the short packet is called a generic short packet. Short packets are not processed by the camera interface hardware. A generic short packet is stored in a register without the ECC and an interrupt can be generated. Therefore, generic short packets must be handled by software.

11.6.1.1.3.1.1.3.6 CSI2 Generic Long Packet Codes

The code value 0x10 indicates null packets, which can be received at any time. They are discarded by the protocol engine.

The code value 0x11 indicates blanking packets, which can be received at any time. They are discarded by the protocol engine.

The code value 0x12 indicates embedded 8-bit nonimage data typically used for JPEG.

Code values from 0x13 to 0x17 are reserved.

11.6.1.1.3.1.1.3.7 CSI2 Frame Structure

Each frame consists of short packets to indicate SOF and EOF. Optional short packets for start of line and end of line can be sent by the image sensor.

Some information before and after the picture data can be sent as SOF and EOF information by the image sensor to the memory through the L3 port.

For each frame, the pixel data (arbitrary data or user-defined byte data) are valid only after an SOF short packet. If the data are invalid, they are discarded by the protocol engine.

A frame contains embedded data and image-sensor data. Figure 11-384 shows where the embedded data and image-sensor data are in the frame. The frame is scanned in raster order starting from the top-left corner, as shown in Figure 11-384 and Figure 11-385. The following definitions for a frame apply:

- Zero or more SOF status lines (SOF lines) can be embedded at the beginning of a CSI2 frame.
- The image embedded data is carried using separate data types and virtual channels (see Section 11.6.1.1.3.3.2.4, *CSI2 Virtual Channel and Context*).
- Zero or more EOF status lines (EOF lines) can be embedded at the end of a CSI2 frame.
- The SOF lines, pixel data, and EOF lines do not overlap.

The CSI2 receiver does not use the information in the status lines. However, it extracts it and stores it in memory for use by software.

Because the data types are different, the data is carried using separate data types called virtual channels. Those must be mapped to the adequate context. The CSI2 receiver uses a different context for embedded data and image-sensor data. See Section 11.6.1.1.3.3.2.4, *CSI2 Virtual Channel and Context*.

Embedded data is supported as a context by the CSI2 receiver; therefore, there is no specific hardware support for embedded data.

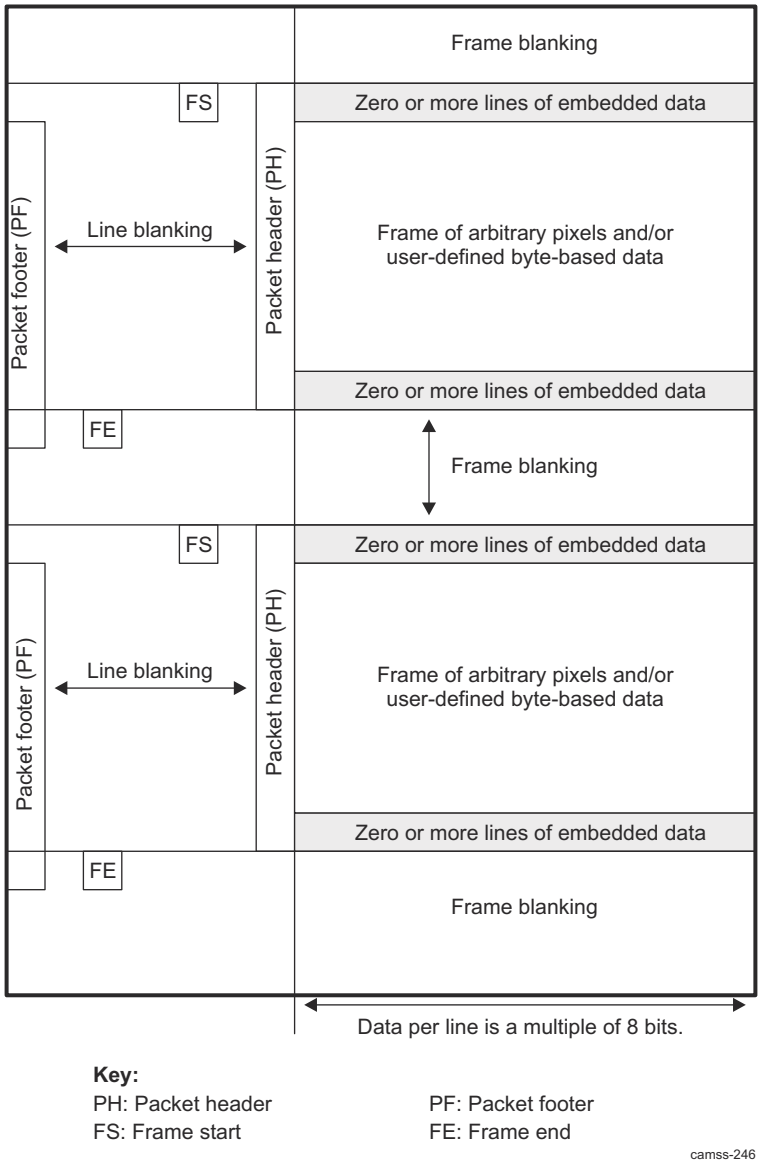

Figure 11-384. CSI2 General Frame Structure (Informative)

Figure 11-385 shows the frame structure of a YUV4:2:2 interlaced video frame without embedded data.

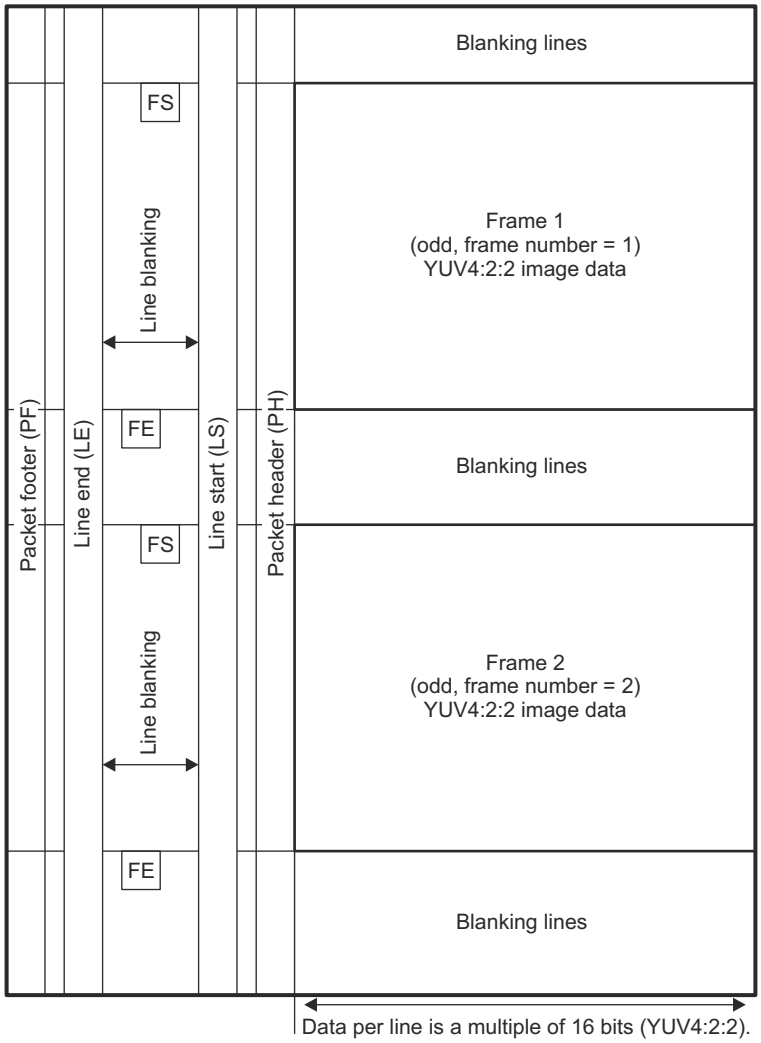

Figure 11-385. CSI2 Digital Interlaced Video Frame (Informative)

The period between the LEC and the new LSC is the line blanking period. The time between the FEC and the new FSC is the frame blanking period. The receiver works with the line blanking period set to 0. The image data is stored in memory by selecting one of the various operating modes. Section 11.6.1.1.3.1.1.4, *CSI2 Operating Modes*, explains storing image data frames into memory.

11.6.1.1.3.1.1.4 CSI2 Operating Modes

11.6.1.1.3.1.1.4.1 CSI2 YUV Operating Modes

11.6.1.1.3.1.1.4.1.1 CSI2 YUV4:2:0 8-Bit

YUV4:2:0 8-bit data can be stored to memory in little-endian and big-endian format. To set the endianness for YUV4:2:0 use the CSI2_CTRL[4] ENDIANNESS bit. The line length sent through the CSI2 physical protocol is a multiple of 16 bits for odd lines and 32 bits for even lines.

For correct pixel reconstruction, the line length must be a multiple of 32 bits and the number of lines must be even. Figure 11-386 shows the storage format for YUV4:2:0 8-bit data. It is shown as little endian. If the data format is big endian, the figure changes accordingly. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field to 0x18

to select YUV4:2:0 8-bit mode. Even and odd lines do not have the same length. Offset must be set accordingly with the CSI2_CTX_DAT_OFST_i[16:5] OFST bit field; for example, if the offset is 0, the data is written in a contiguous way (bit-to-bit of odd and even lines). If the data has an offset, set the destination offset between the first pixel of the previous line and the first pixel of the current line being written to memory.

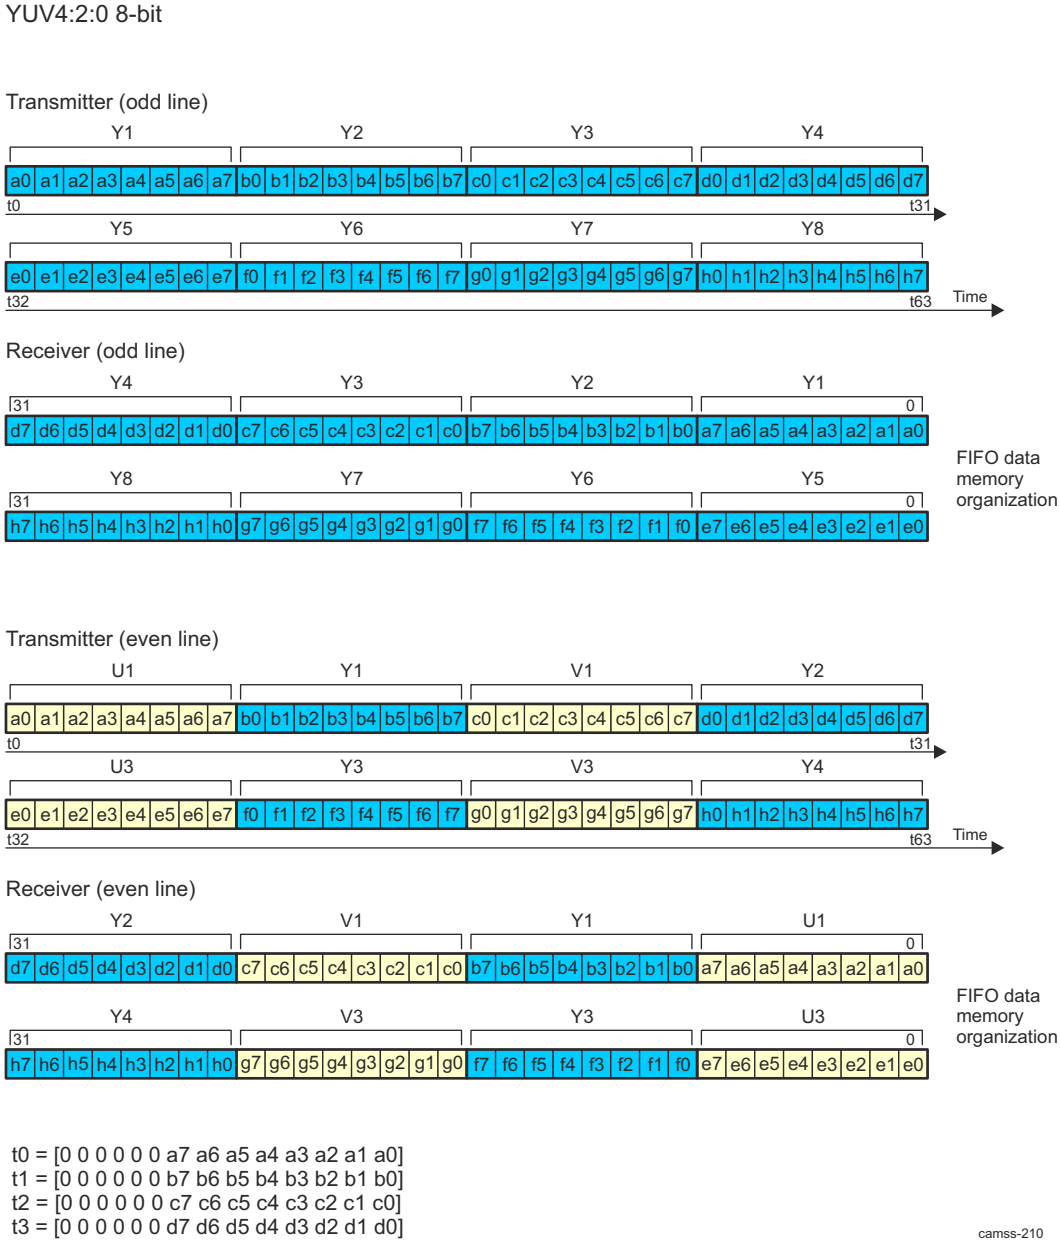

Figure 11-386. CSI2 YUV4:2:0 8-Bit

11.6.1.1.3.1.1.4.1.2 CSI2 YUV4:2:0 10-Bit

YUV4:2:0 10-bit data can be stored to memory in little-endian and big-endian format. The line length sent through the CSI2 physical protocol is a multiple of 40 bits for odd lines and 80 bits for even lines. Figure 11-387 shows the storage format for YUV4:2:0 10-bit data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field to 0x19 to select YUV4:2:0 10-bit mode. Even and odd lines do not have the same length. Offset must be set accordingly with the CSI2_CTX_DAT_OFST_i[16:5] OFST bit field.

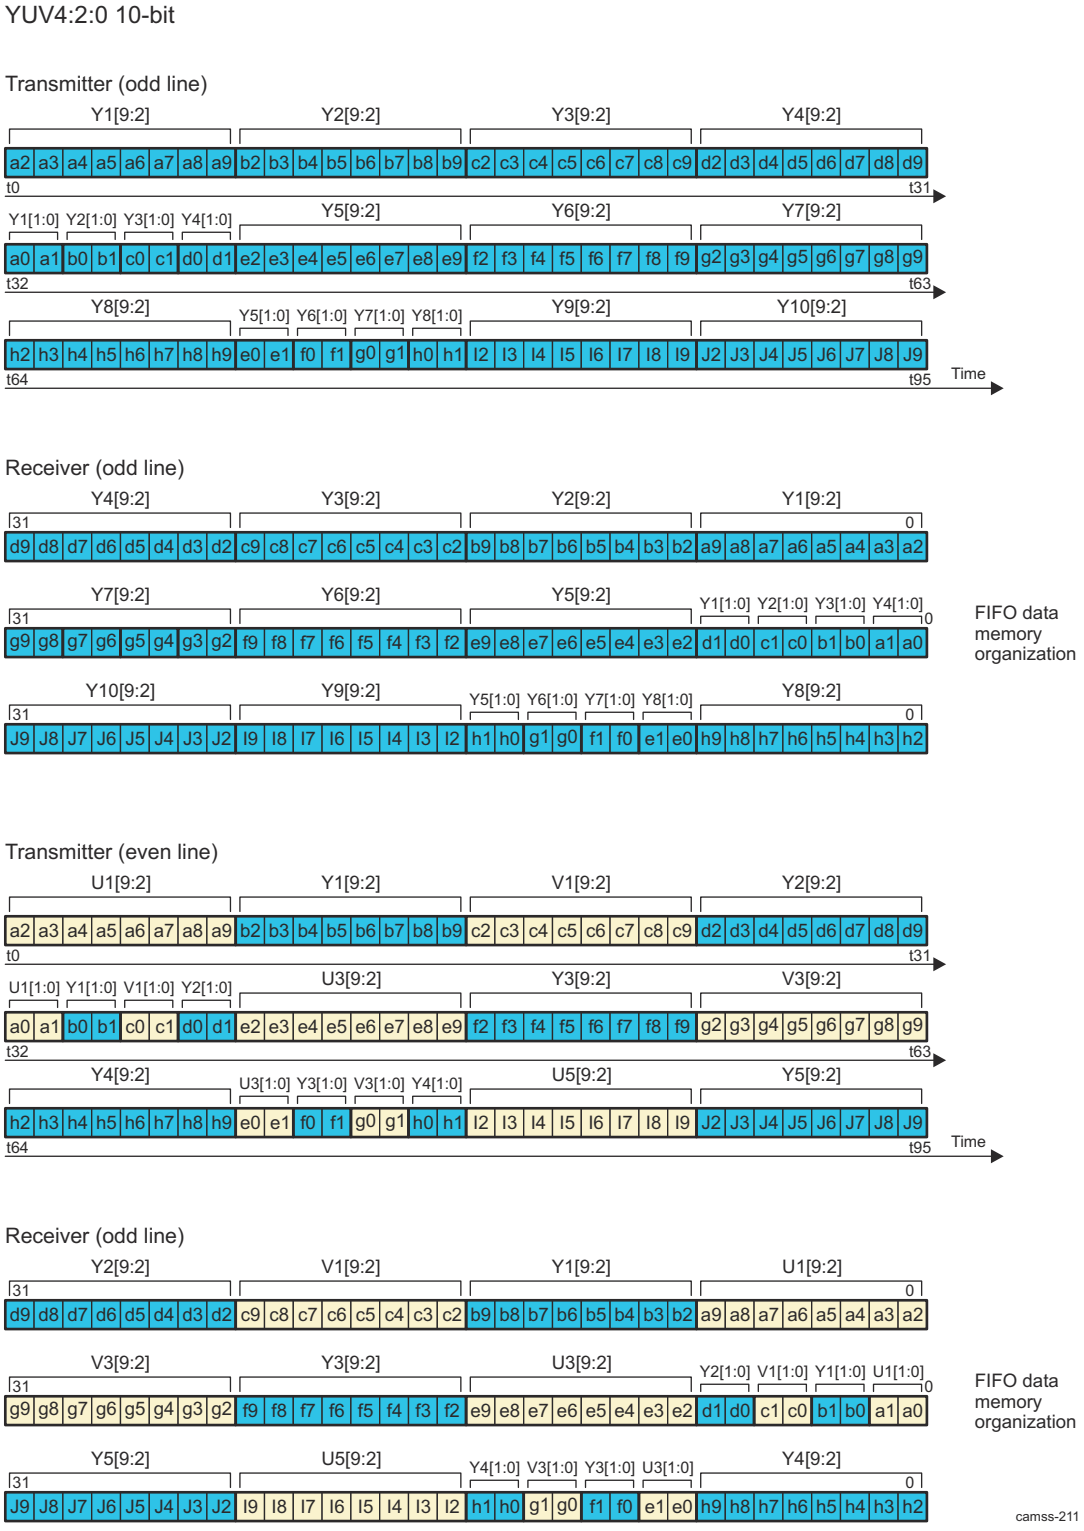

Figure 11-387. CSI2 YUV4:2:0 10-Bit

11.6.1.1.3.1.1.4.1.3 CSI2 YUV4:2:0 8-Bit Legacy

YUV4:2:0 8-bit legacy data can be stored to memory in little-endian and big-endian format. The line length sent through the CSI2 physical protocol is a multiple of 4 bytes. Figure 11-388 shows the storage format for YUV4:2:0

8-bit legacy data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field to 0x1A to select YUV4:2:0 8-bit legacy mode.

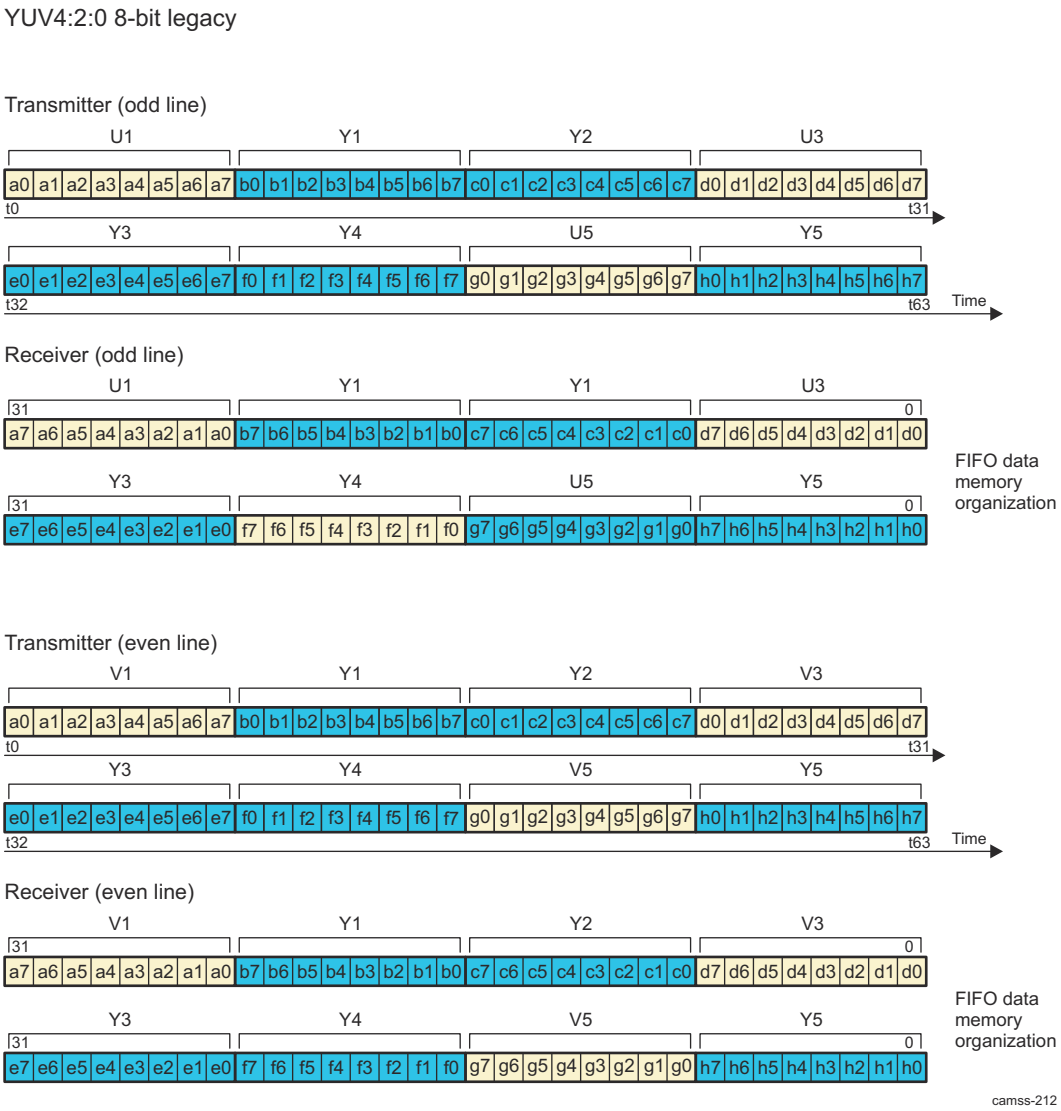

Figure 11-388. CSI2 YUV4:2:0 8-Bit Legacy

11.6.1.1.3.1.1.4.1.4 CSI2 YUV4:2:0 8-Bit + CSPS

YUV4:2:0 8-bit CSPS data can be stored to memory in little-endian and big-endian format. The line length sent through the CSI2 physical protocol is a multiple of 16 bits for odd lines and 32 bits for even lines.

For correct pixel reconstruction, the line length must be a multiple of 3 32 bits and the number of lines must be even. Figure 11-389 shows the storage format for YUV4:2:0 8-bit + CSPS data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field to 0x1C to select YUV4:2:0 8-bit + CSPS mode.

YUV4:2:0 8-bit + CSPS

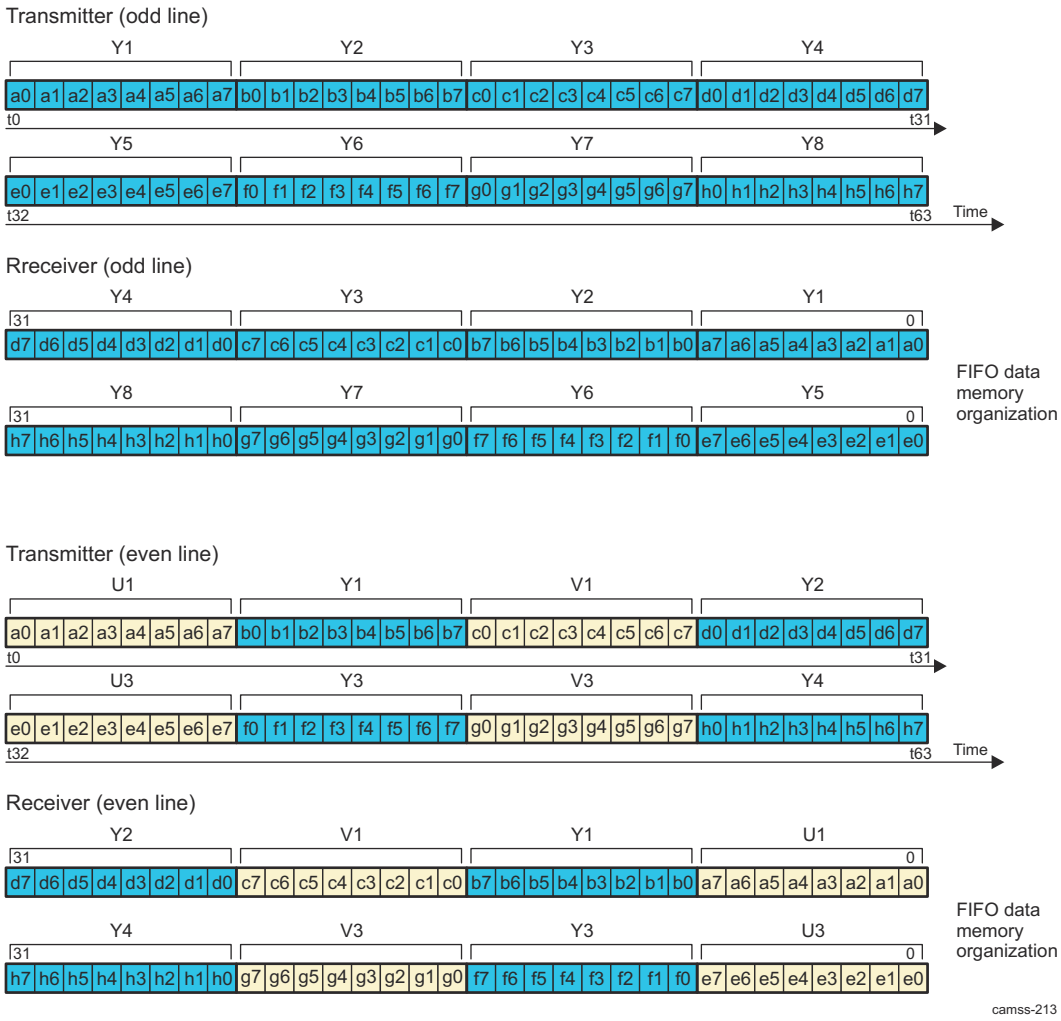

Figure 11-389. CSI2 YUV4:2:0 8-Bit + CSPS

11.6.1.1.3.1.1.4.1.5 CSI2 Byte Swap

The CSI2 receiver incorporates a byte-swapping function. Software can optionally enable byte-swapping of the payload data by setting the CSI2_CTx_CTRL1[31] BYTESWAP bit. This feature must be used only when the amount of payload data per packet is a multiple of 16 bits. The byte-swapping is performed before pixel reconstruction.

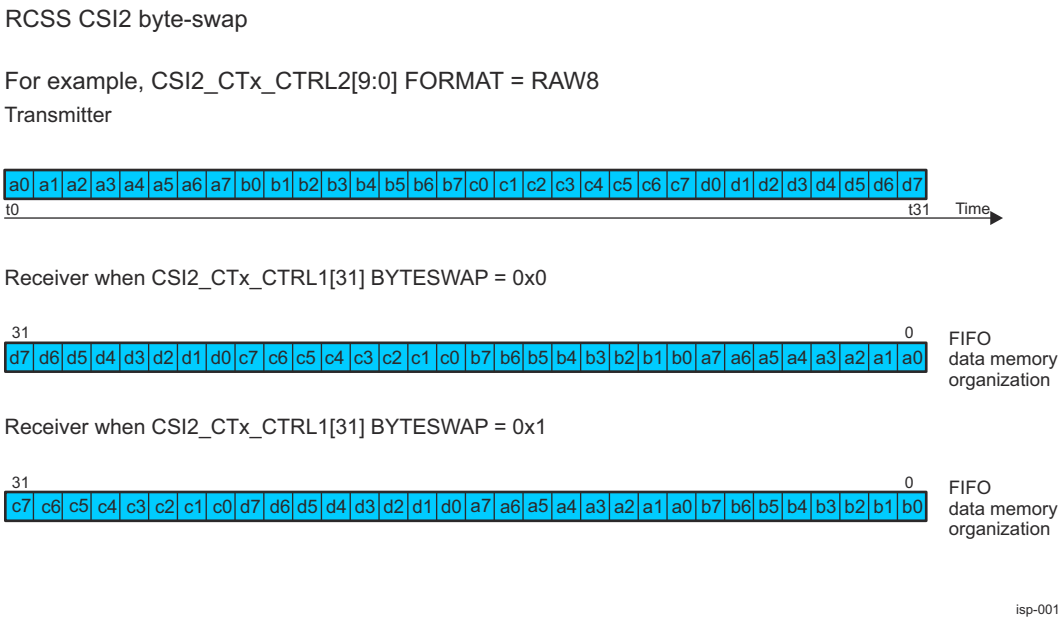

Figure 11-390. CSI2 Byte Swap

11.6.1.1.3.1.1.4.1.6 CSI2 YUV4:2:0 10-Bit + CSPS

YUV4:2:0 10-bit CSPS data can be stored to memory in little-endian and big-endian format. The line length sent through the CSI2 physical protocol is a multiple of 40 bits for odd lines and 80 bits for even lines.

For correct pixel reconstruction, the line length must be a multiple of 3 32 bits and the number of lines must be even. Figure 11-391 shows the storage format for YUV4:2:0 10-bit + CSPS data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field to 0x1D to select YUV4:2:0 10-bit + CSPS mode.

YUV4:2:0 10-bit + CSPS

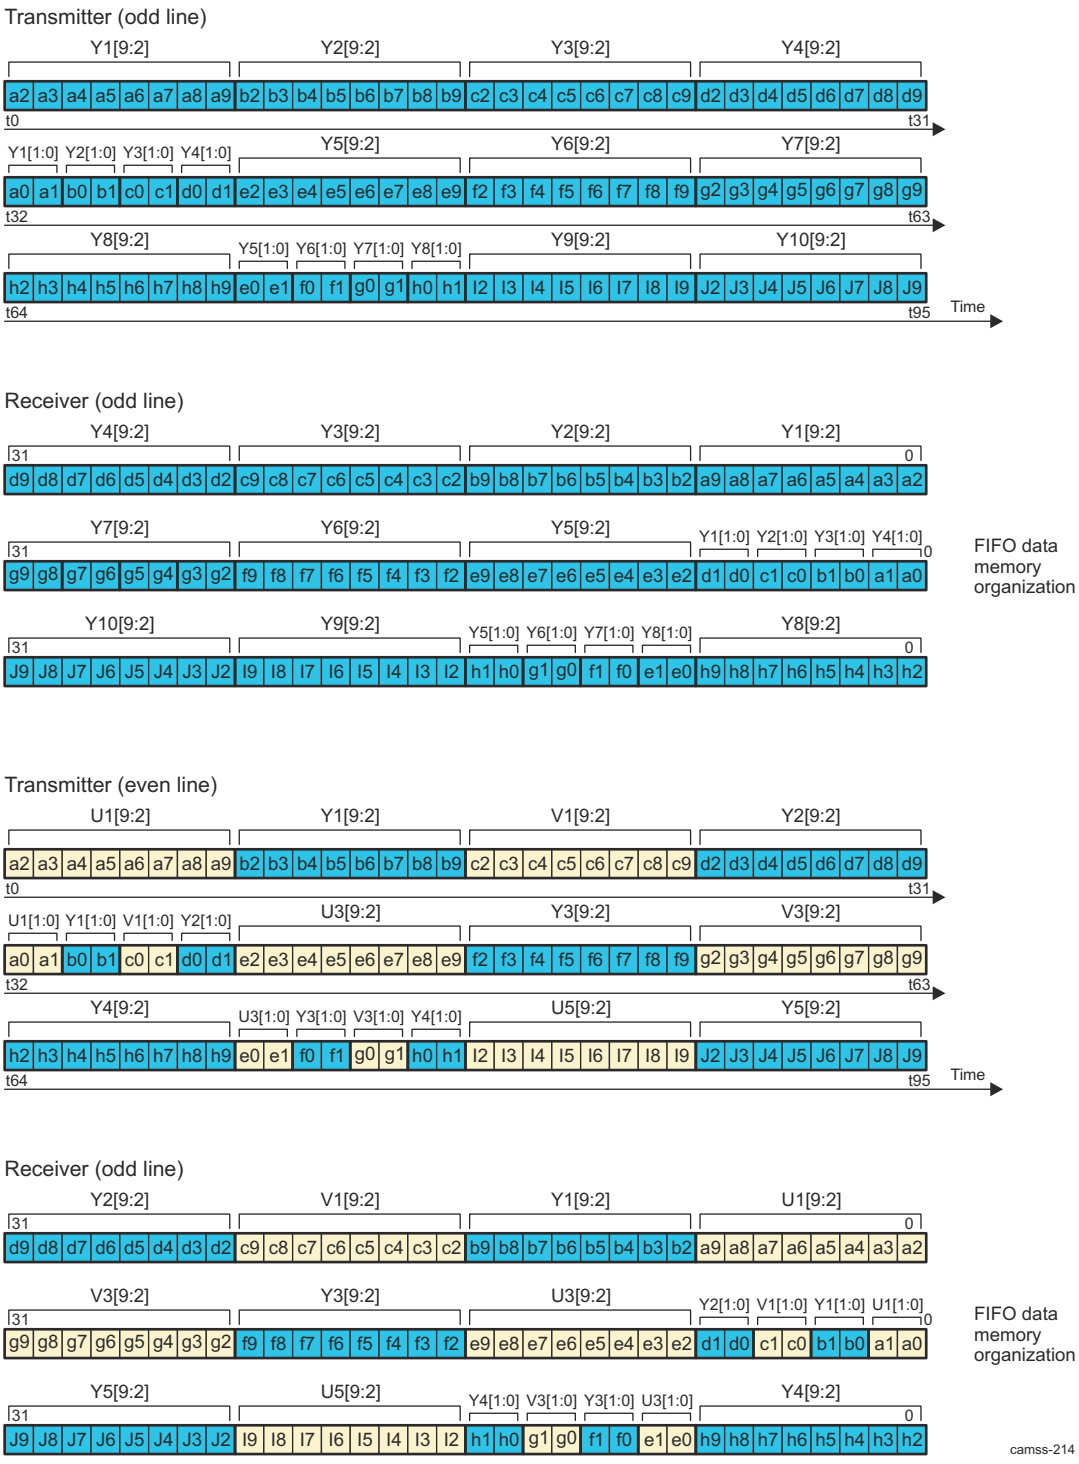

Figure 11-391. CSI2 YUV4:2:0 10-Bit + CSPS

11.6.1.1.3.1.1.4.1.7 CSI2 YUV4:2:2 8-Bit

YUV4:2:2 data can be stored to memory in little-endian and big-endian format. To set the endianness for YUV4:2:2 use the CSI2_CTRL[4] ENDIANNESS bit. The line length sent through the CSI2 physical

protocol is a multiple of 32 bits. Figure 11-392 shows the storage format for YUV4:2:2 8-bit data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field to 0x1E to select YUV4:2:2 8-bit mode.

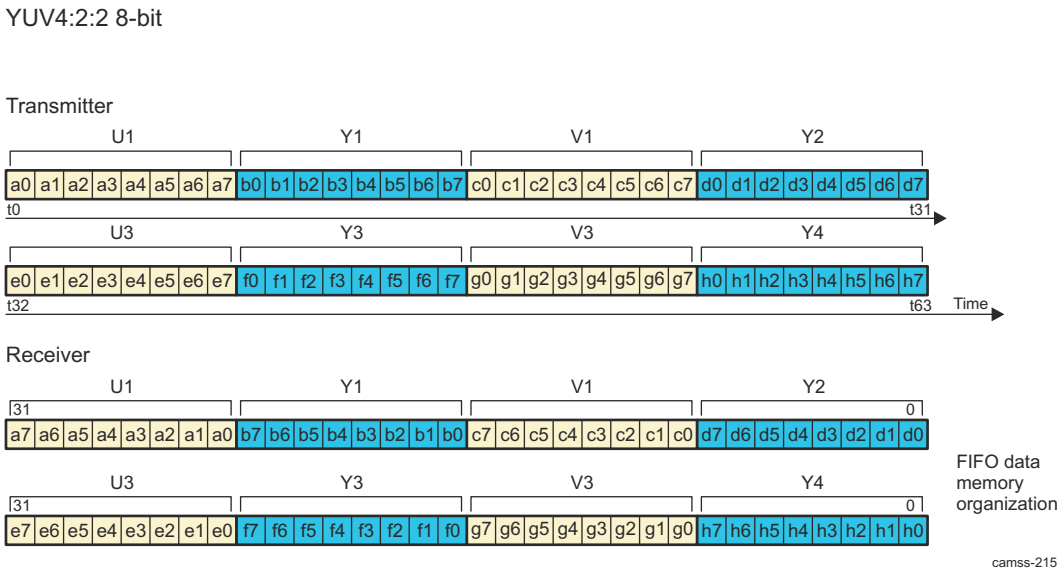

Figure 11-392. CSI2 YUV4:2:2 8-Bit

11.6.1.1.3.1.1.4.1.8 CSI2 YUV4:2:2 10-Bit

YUV4:2:2 data can be stored to memory in little-endian and big-endian format. The line length sent through the CSI2 physical protocol is a multiple of 40 bits. Figure 11-393 shows the storage format for YUV4:2:2 10-bit data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field to 0x1F to select YUV4:2:2 10-bit mode.

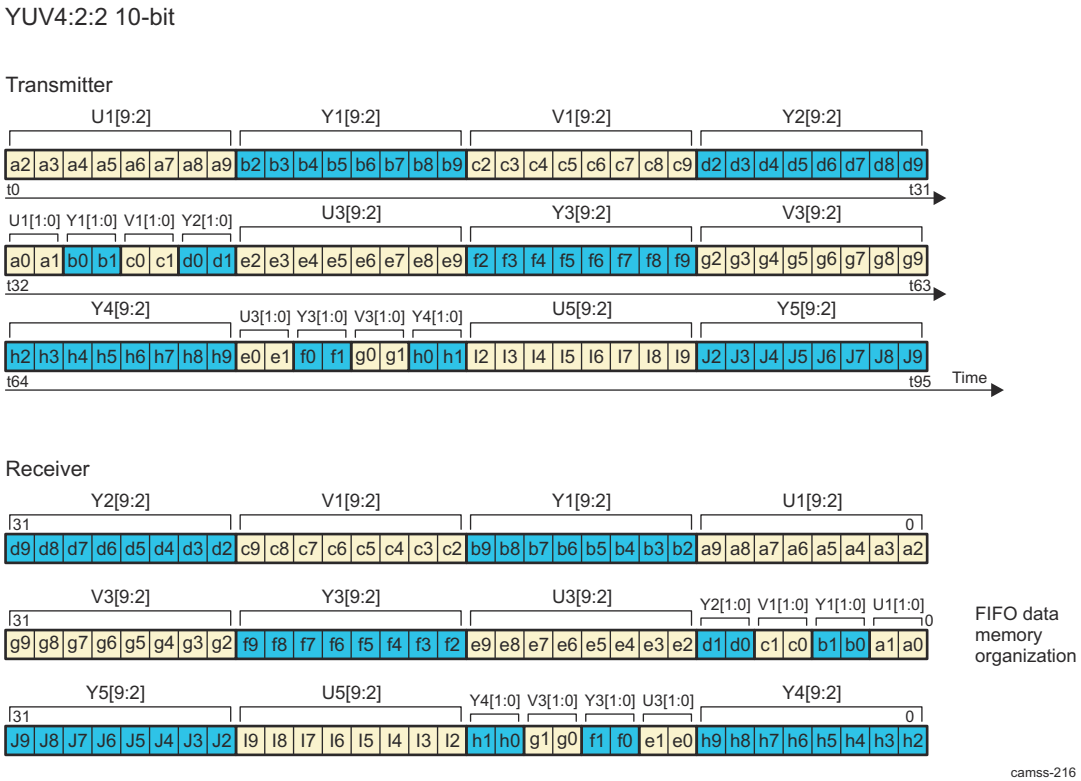

Figure 11-393. CSI2 YUV4:2:2 10-Bit

11.6.1.1.3.1.1.4.2 CSI2 RGB Operating Modes

11.6.1.1.3.1.1.4.2.1 CSI2 RGB565

RGB565 data is output to memory without data expansion. The line length sent through the CSI2 physical layer is always a multiple of 16 bits. Figure 11-394 shows the storage format for RGB565 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field to 0x22 to select RGB565 mode.

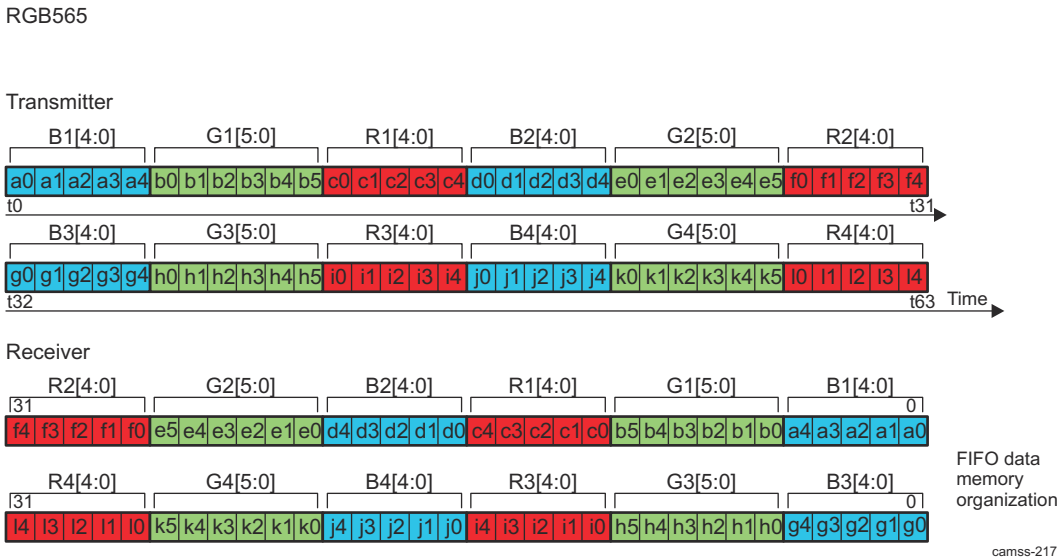

Figure 11-394. CSI2 RGB565

11.6.1.1.3.1.1.4.2.2 CSI2 RGB888

RGB888 data can be output to memory in two formats: with or without data expansion. If data expansion is used, the value of the 8 upper bits is programmable and can be set with an alpha value for computer graphics applications (the CSI2_CTX_CTRL3_i[29:16] ALPHA bit field). Figure 11-395 shows the storage format for RGB888 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field to 0x24 to select RGB888 mode.

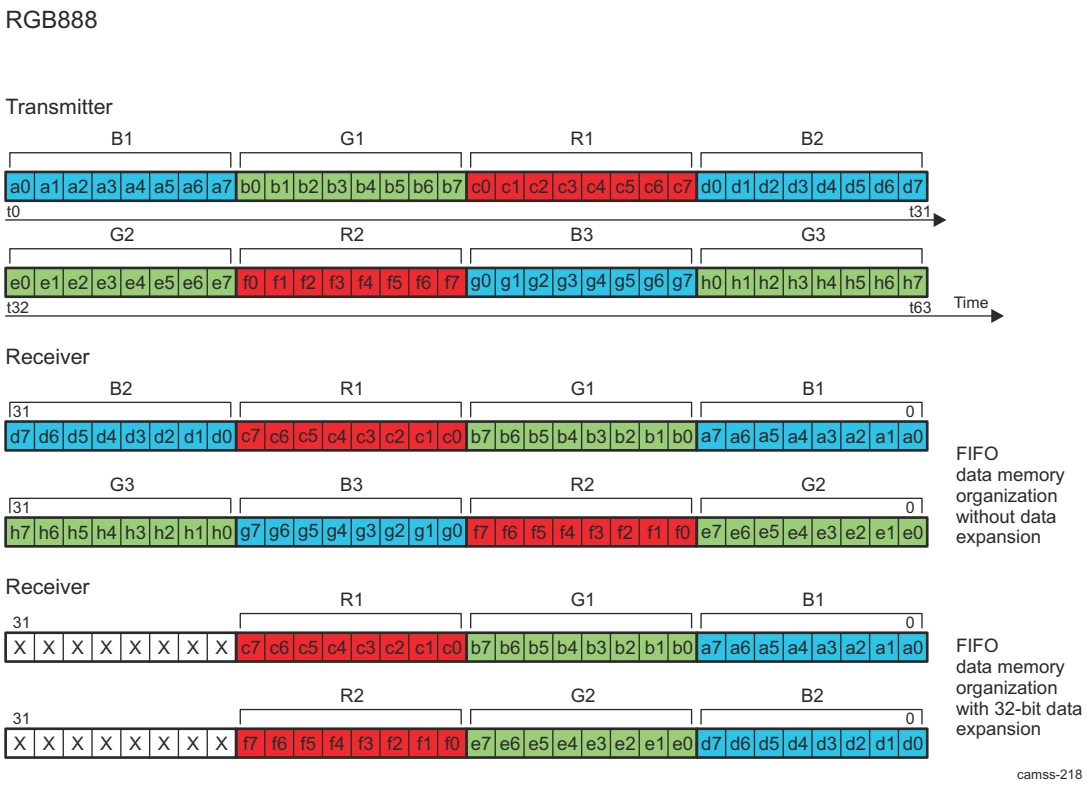

Figure 11-395. CSI2 RGB888

11.6.1.1.3.1.1.4.2.3 CSI2 RGB666

RGB666 data is always output to memory with data expansion. The value of the 14 upper bits is programmable and can be set with an alpha value for computer graphics applications (the CSI2_CTX_CTRL3_i[29:16] ALPHA bit field). The line length sent through the CSI2 physical protocol is a multiple of 8 bits. Furthermore, the line length is a multiple of 9 × 8 bits to finish the pixel reconstruction correctly. Figure 11-396 shows the storage format for RGB666 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field to 0x33 to select RGB666 mode.

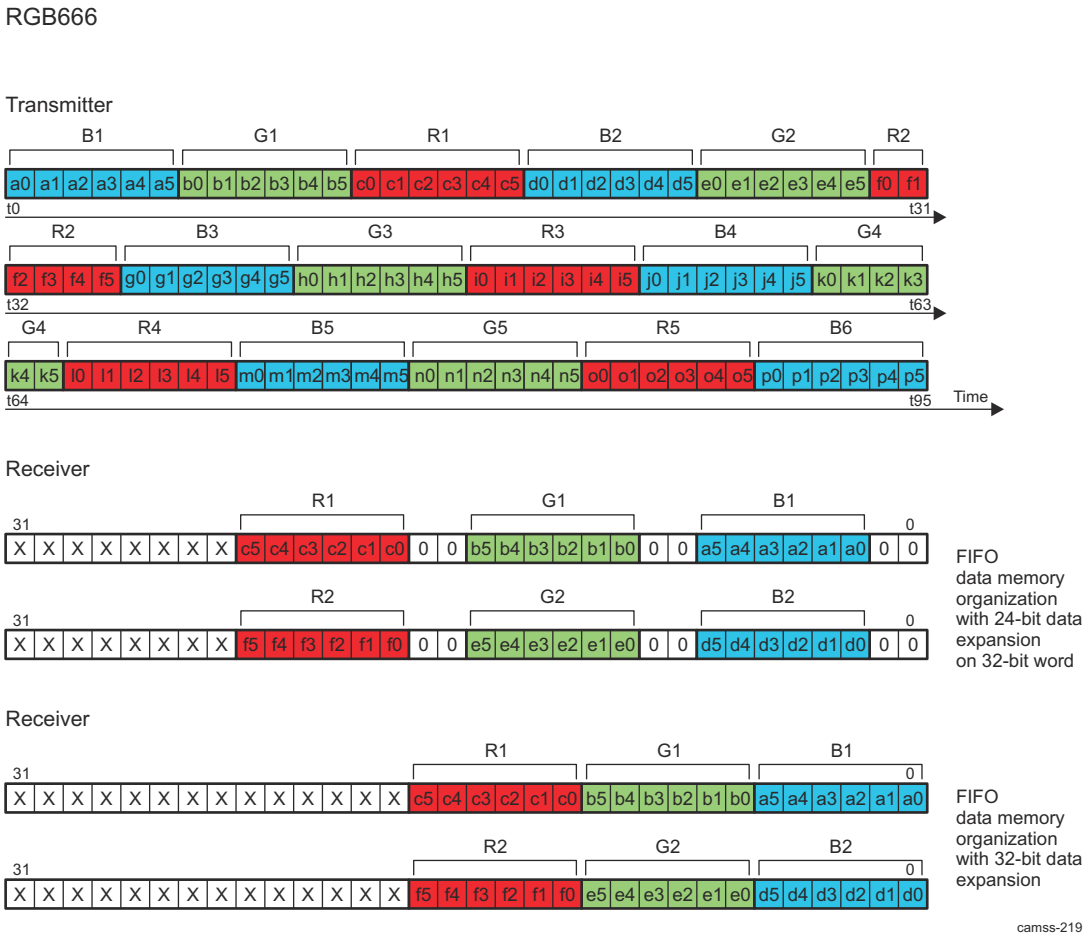

Figure 11-396. CSI2 RGB666

11.6.1.1.3.1.1.4.2.4 CSI2 RGB444

RGB444 data is output to memory with data expansion. When data expansion is used, the value of the 4 upper bits is programmable and can be set with an alpha value for computer graphics applications (the CSI2_CTX_CTRL3_i[29:16] ALPHA bit field). Figure 11-397 shows the storage format for RGB444 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field to 0xA0 to select RGB444 mode.

RGB444

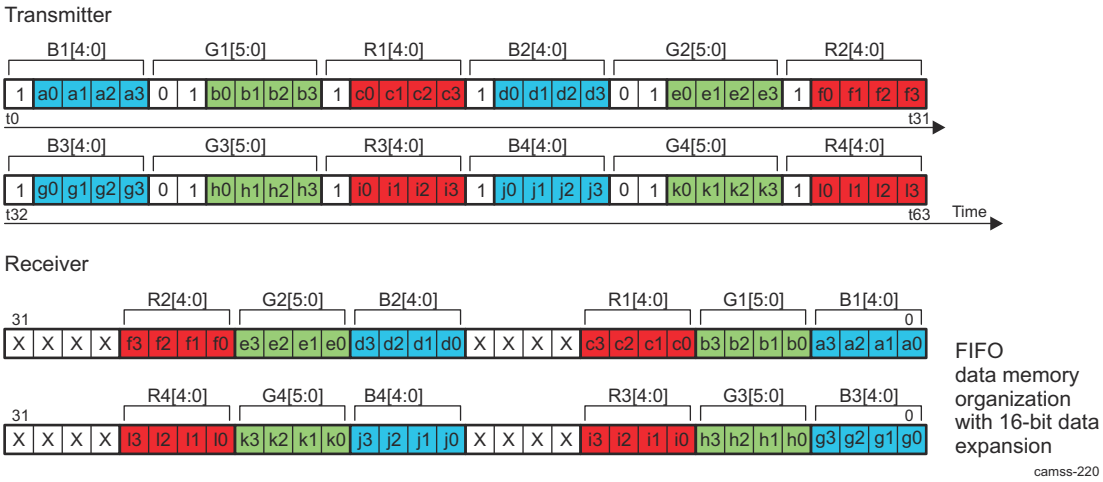

Figure 11-397. CSI2 RGB444

11.6.1.1.3.1.1.4.2.5 CSI2 RGB555

RGB555 data is output to memory with data expansion. Figure 11-398 shows the storage format for RGB555 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field to 0xA1 to select RGB555 mode.

RGB555

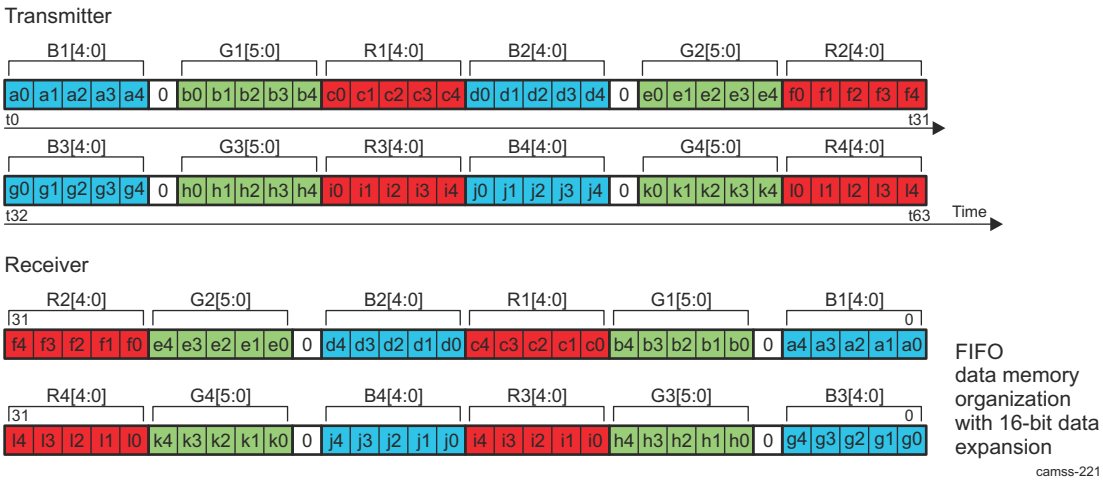

Figure 11-398. CSI2 RGB555

11.6.1.1.3.1.1.4.3 CSI2 RAW Bayer RGB Operating Modes

11.6.1.1.3.1.1.4.3.1 CSI2 RAW6

RAW6 data can be output to memory with or without data expansion. The line length sent through the CSI2 physical layer is a multiple of 8 bits (6-bit image data + 2-bit expansion). Furthermore, the line length is a multiple of 3 × 8 bits to complete the pixel reconstruction correctly (the lowest common multiple of 8 and 6 is 24, so 3 × 8 bits). Figure 11-399 shows the storage format for RAW6 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field as follows:

- To 0x28 to select RAW6 mode
- To 0x68 for RAW6 + 8-bit expansion

- To 0x2A8 for RAW6 + DPCM decompression to 10-bit expanded to 16-bit
- To 0x3A8 for RAW6 + DPCM decompression to 12-bit expanded to 16-bit

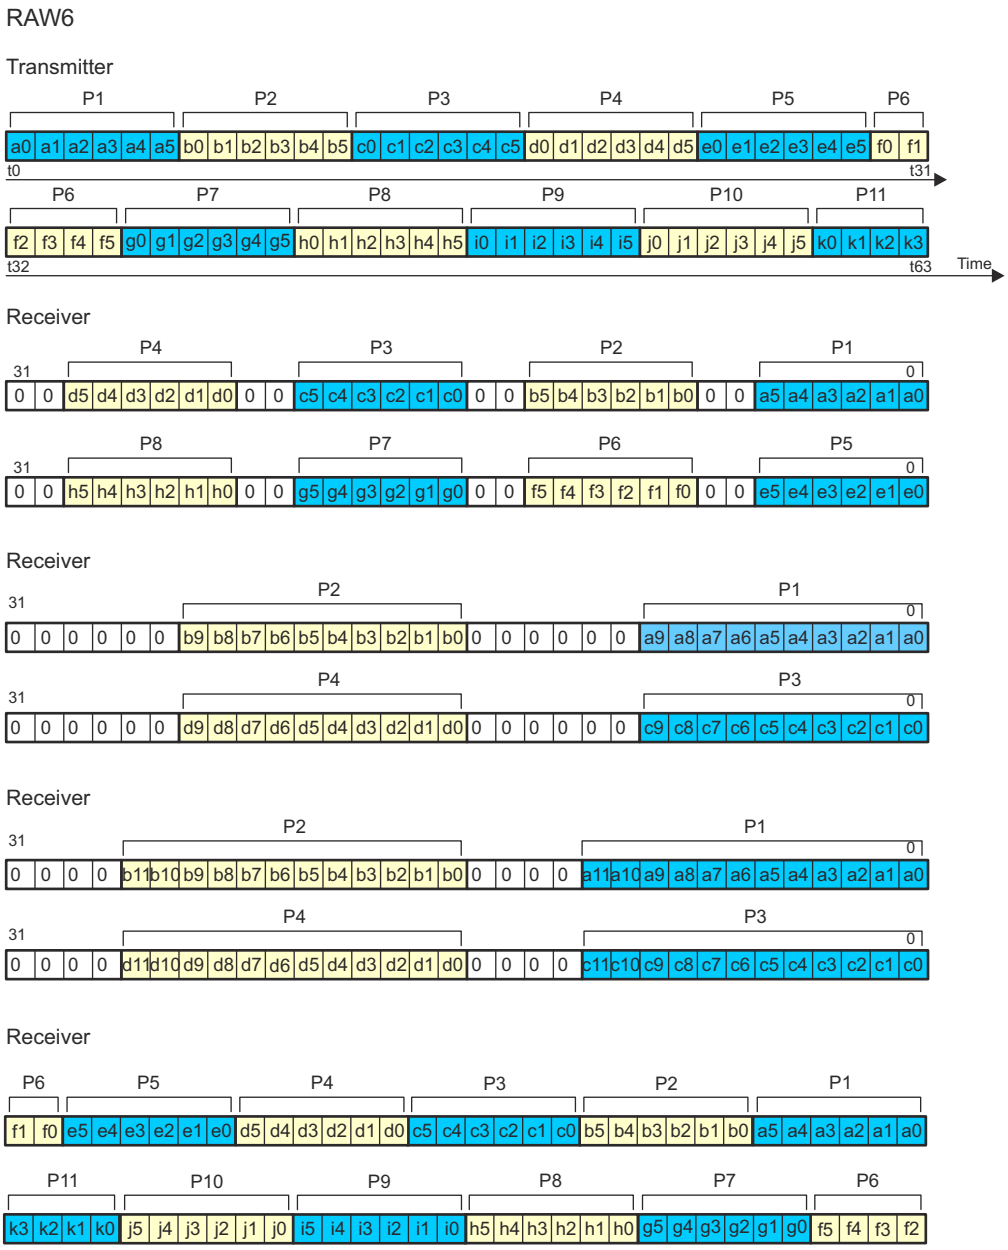

Figure 11-399. CSI2 RAW6

11.6.1.1.3.1.1.4.3.2 CSI2 RAW7

RAW7 data can be output to memory with or without data expansion. The line length sent through the CSI2 physical layer is a multiple of 8 bits. Furthermore, the line length is a multiple of 7 × 8 bits to complete the pixel reconstruction correctly (the lowest common multiple of 8 and 7 is 56, so 7 × 8 bits). Figure 11-400 shows the storage format for RAW7 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field as follows:

- To 0x29 to select RAW7 mode
- To 0x69 for RAW7 + 8-bit expansion
- To 0x229 for RAW7 + DPCM decompression to 10-bit expanded to 16-bit
- To 0x369 for RAW7 + DPCM decompression to 12-bit expanded to 16-bit

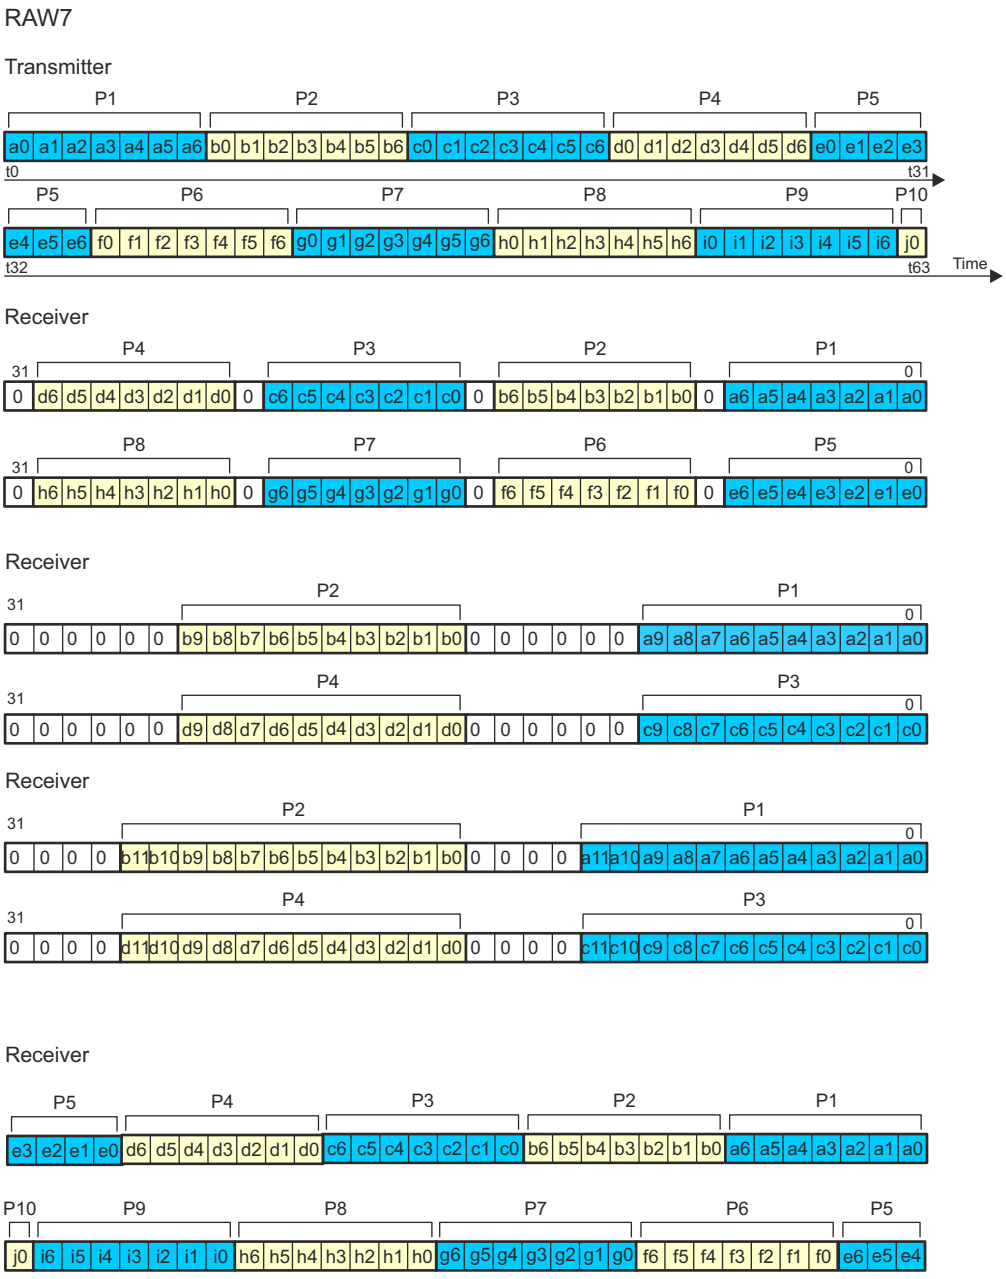

Figure 11-400. CSI2 RAW7

11.6.1.1.3.1.1.4.3.3 CSI2 RAW8

RAW8 data can be output to memory with or without data expansion. The line length sent through the CSI2 physical layer is always a multiple of 8 bits. Figure 11-401 shows the storage format for RAW8 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field as follows:

- To 0x2A to select RAW8 mode
- To 0x2AA for RAW8 + DPCM decompression to 10-bit expanded to 16-bit
- To 0x36A for RAW8 + DPCM decompression to 12-bit expanded to 16-bit

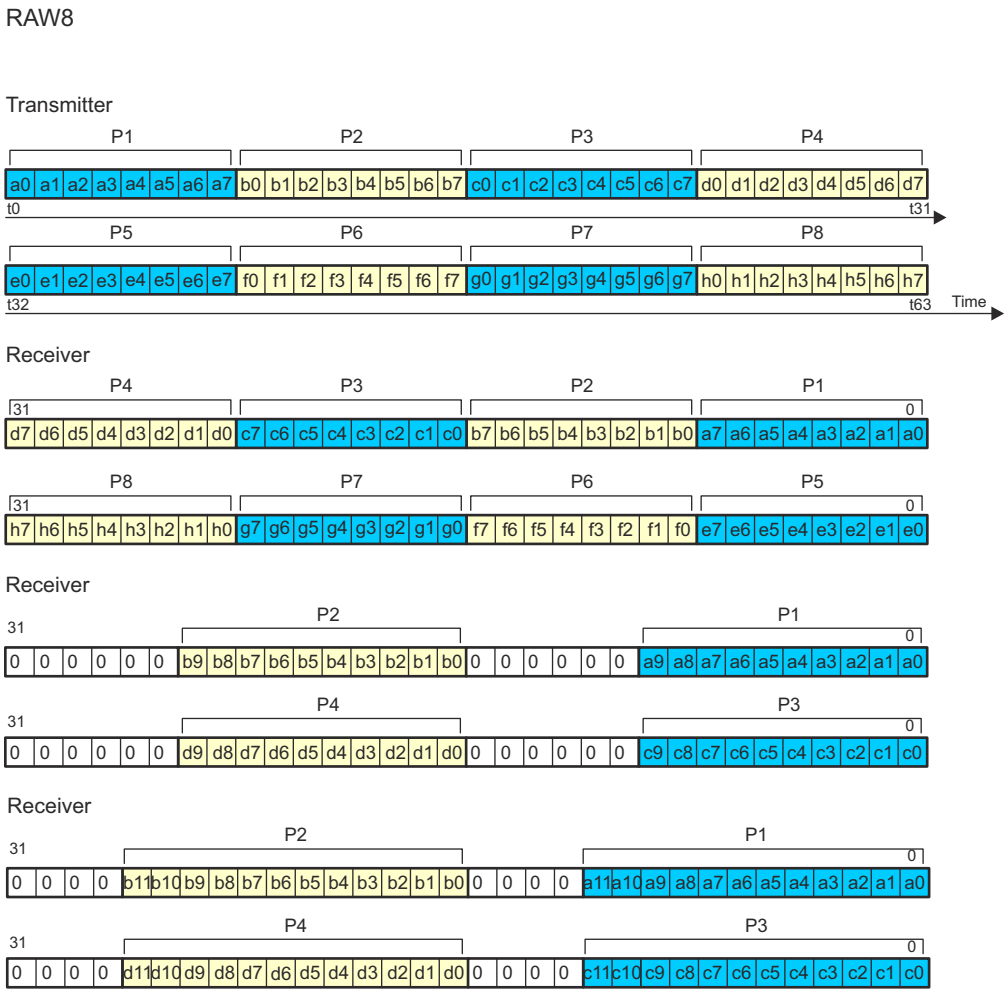

Figure 11-401. CSI2 RAW8

11.6.1.1.3.1.1.4.3.4 CSI2 RAW10

RAW10 data can be output memory in two formats: with or without data expansion. If data expansion is used, the 10-bit data are padded with 0s on a 16-bit word. The line length sent through the CSI2 physical layer is a multiple of 8 bits. Furthermore, the line length is a multiple of 5 × 8 bits to complete the pixel reconstruction correctly (the lowest common multiple of 8 and 10 is 40, so 5 × 8 bits). Figure 11-402 shows the storage format for RAW10 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field as follows:

- To 0x2B to select RAW10 mode
- To 0xAB for RAW10 + 16-bit expansion

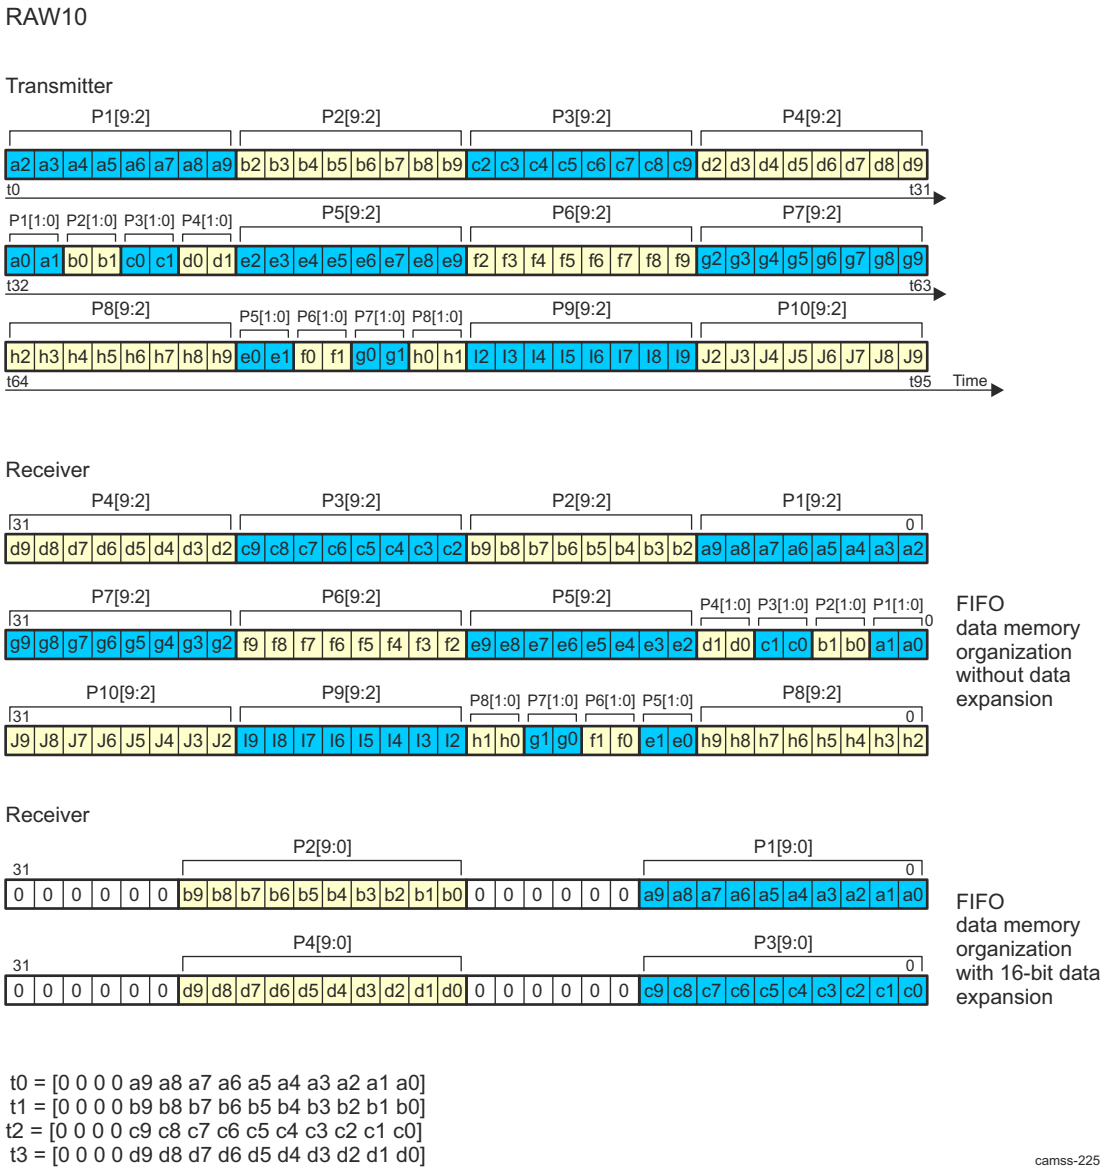

Figure 11-402. CSI2 RAW10

11.6.1.1.3.1.1.4.3.5 CSI2 RAW12

RAW12 data can be output to memory in two formats: with or without data expansion. If data expansion is used, the 12-bit data are padded with 0s on a 16-bit word. The line length sent through the CSI2 physical layer is a multiple of 8 bits. Furthermore, the line length is a multiple of 3 × 8 bits to complete the pixel reconstruction correctly (the lowest common multiple of 8 and 12 is 24, so 3 × 8 bits). Figure 11-403 shows the storage format for RAW12 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field as follows:

- To 0x2C to select RAW12 mode
- To 0xAC for RAW12 + 16-bit expansion

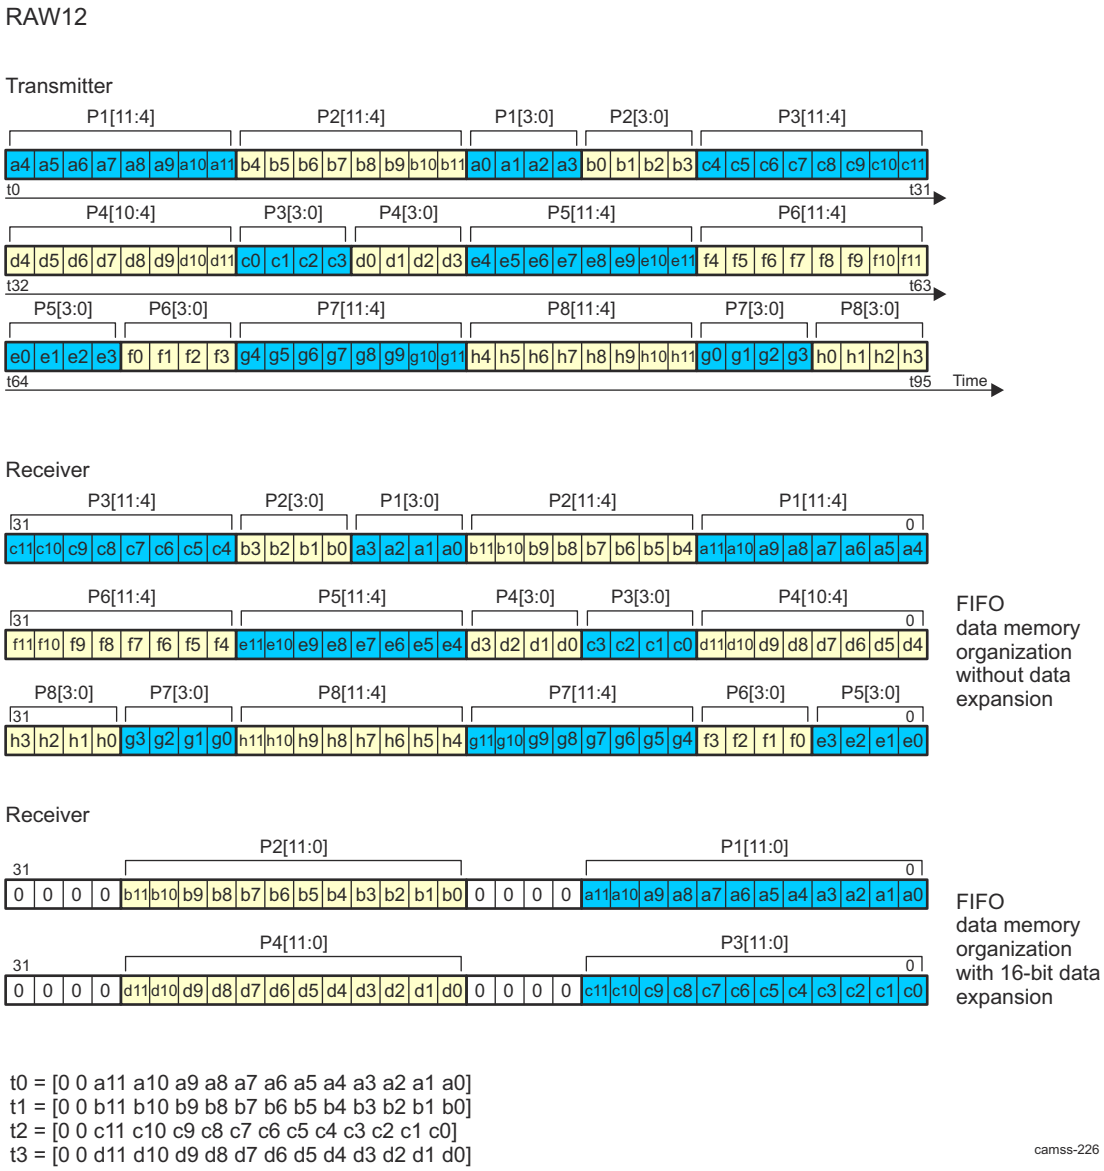

Figure 11-403. CSI2 RAW12

11.6.1.1.3.1.1.4.3.6 CSI2 RAW14

RAW14 data can be output to memory in two formats: with or without data expansion. If data expansion is used, the 14-bit data are padded with 0s on a 16-bit word. The line length sent through the CSI2 physical layer is a multiple of 8 bits. Furthermore, the line length is a multiple of 7 × 8 bits to complete the pixel reconstruction correctly (the lowest common multiple of 8 and 14 is 56, so 7 × 8 bits). Figure 11-404 shows the storage format for RAW14 data. Set the CSI2_CTX_CTRL2_i[9:0] FORMAT bit field as follows:

- To 0x2D to select RAW14 mode
- To 0xAD for RAW14 + 16-bit expansion

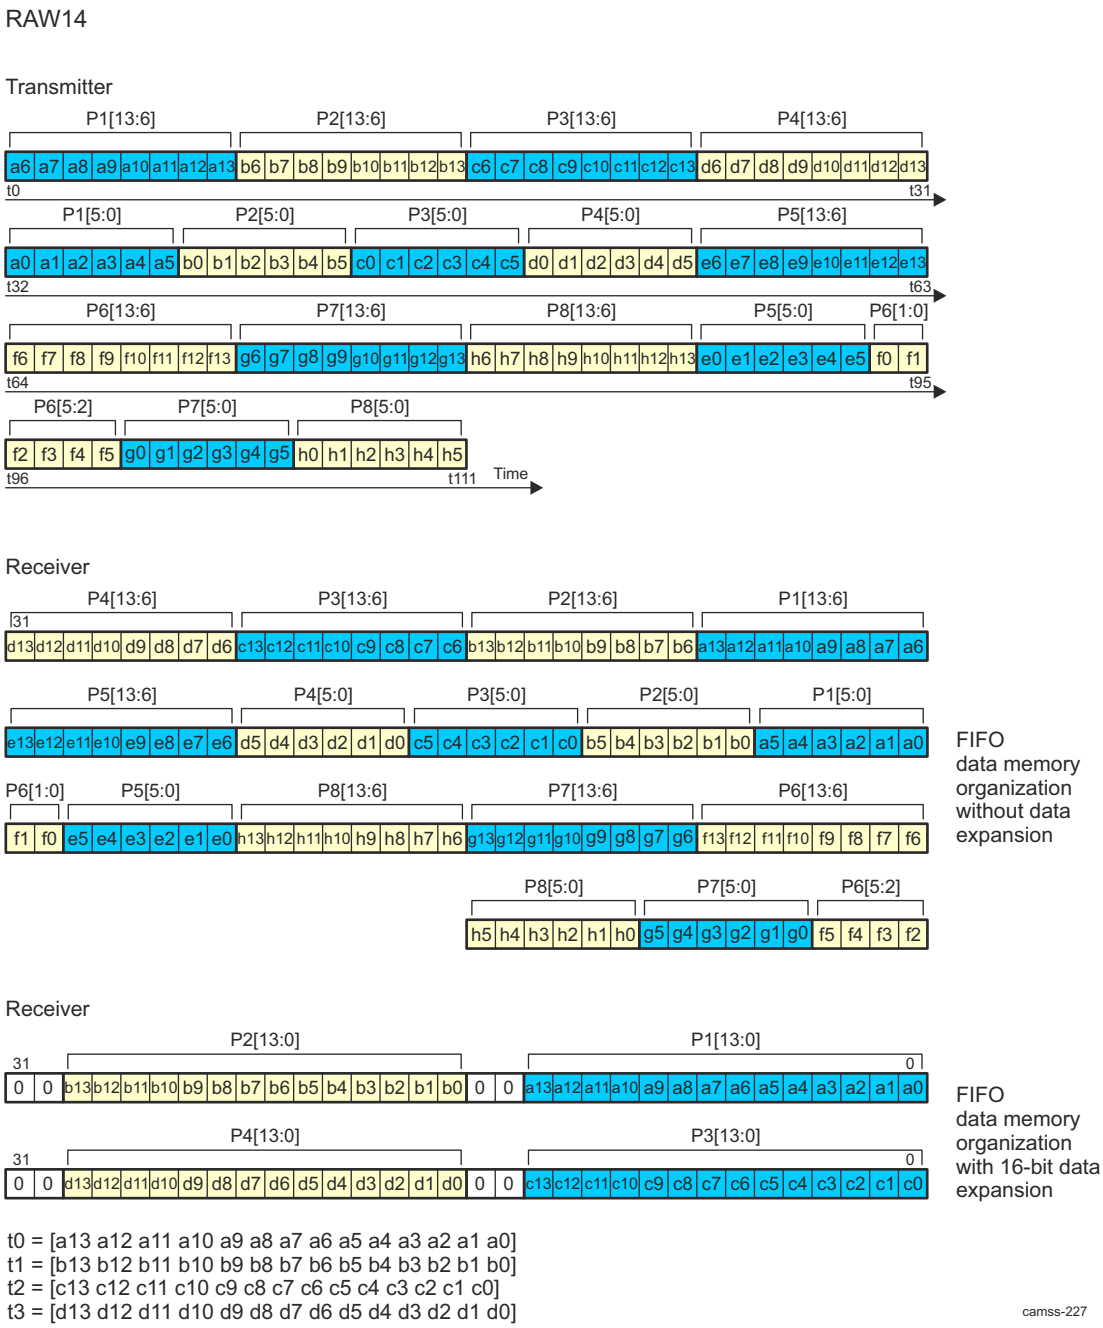

Figure 11-404. CSI2 RAW14

11.6.1.1.3.1.1.4.4 CSI2 JPEG8 Operating Modes

The size of a compressed stream can be known in advance. Figure 11-405 shows the format for storing JPEG8 data.

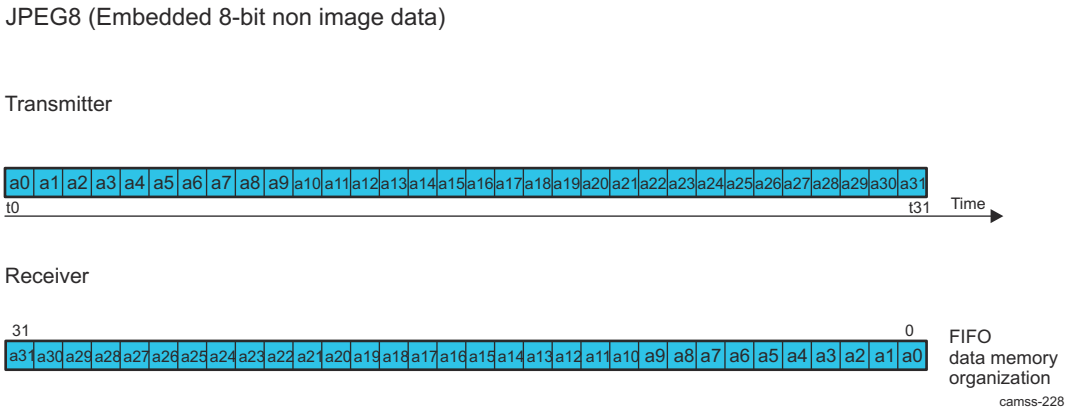

Figure 11-405. CSI2 JPEG8

11.6.1.1.3.1.1.4.5 CSI2 Generic Format

The CSI2 receiver supports a generic format to send data to memory. The generic mode is entered by setting the CSI2_CTX_CTRL1_i[30] GENERIC bit. The CSI2_CTX_CTRL2_i[9:0] FORMAT bit field defines how the data stream is decoded. When generic mode is enabled (GENERIC = 1), the MIPI data type code is ignored and data is decoded using the FORMAT bit. Whatever the MIPI data type code, it is ignored (the data stream is processed even if the FORMAT bit does not match the MIPI data type code.) When generic mode is not used (GENERIC = 0), the data stream is processed only when the MIPI data type code matches the FORMAT setting of the enabled context. If not matched, the data stream is not processed by the CSI2 engine. Only the virtual channel information is used to map a received data stream to a context. Software must ensure that a MIPI virtual channel used in generic mode is mapped only to a single context.

Figure 11-406 shows the CSI2 generic format.

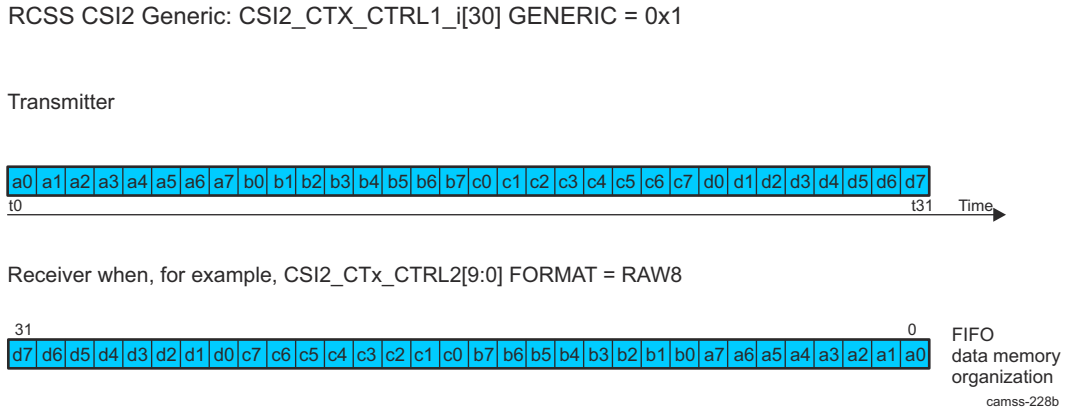

Figure 11-406. CSI2 Generic Format

11.6.1.1.3.1.1.4.6 CSI2 MIPI Format Supported Summary

Table 11-1667 summarizes the CSI2 MIPI-supported formats and their output category. By setting the CSI2_CTX_CTRL2_i register format, the CSI2 outputs certain types of pixel packet data.

Table 11-1667. CSI2 MIPI Format Supported by the Protocol Engine

MIPI			CSI2 Protocol Engine Support
Category	**Abbreviation**	**Register Setting Format Description**	**Configuration Value for CSI2_CTX_CTRL2_i[9:0] FORMAT**
Sync short packet data types(1)	Short packet sync code	Mandatory FSC	0x000
	Short packet sync code	Mandatory FEC	0x001

(1) To understand synchronization codes and short packets, see Section 11.6.1.1.3.3.2.3, *CSI2 Short Packet*.
(2) To understand synchronization codes and long packets, see Section 6.1.1.3.1.1.3.2, *CSI2 Long Packet*.

11.6.1.1.3.2 CSI2 Integration

Figure 11-407 is an overview of the integration of the CSI2-A/CSI2-B interface in the device. The figure is the top-level block diagram of the CSI2-A/CSI2-B receiver. The CSI2-A/CSI2-B receiver receives the serial data coming from a CSI2 compatible image sensor, converts it to parallel data, extracts the logical channels, detects and extracts the synchronization codes, reformats the data, and outputs it through the RCSS interconnect interface.

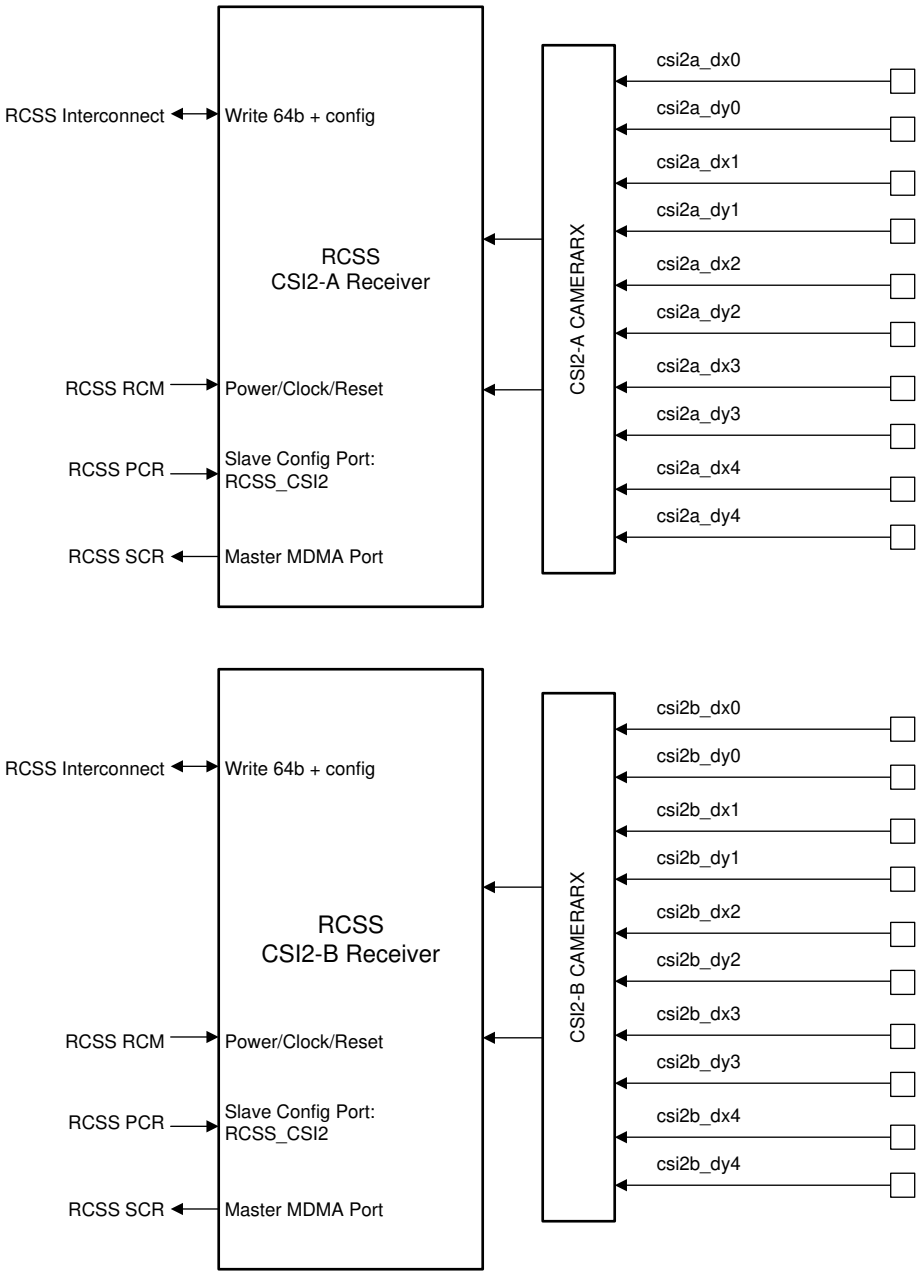

Figure 11-407. CSI2-A /CSI2-B Integration

The CSI2-A/CSI2-B receiver can send data directly to system memory using the master port.

For power domain, clocks, reset, and hardware requests, see Section 6.4.

11.6.1.1.3.3 CSI2 Functional Description

11.6.1.1.3.3.1 CSI2 Overview

Figure 11-408 is the CSI2-A/B receiver block diagram (it assumes there are four CSI2 image sensor data lines). The CSI2 receiver receives the byte data coming from a CSI2 D-PHY receiver (up to four data pairs), converts it to byte stream, detects and corrects errors, extracts the virtual channel ID, detects and extracts the synchronization codes, reformats the data, and outputs it through the RCSS interconnect interface.

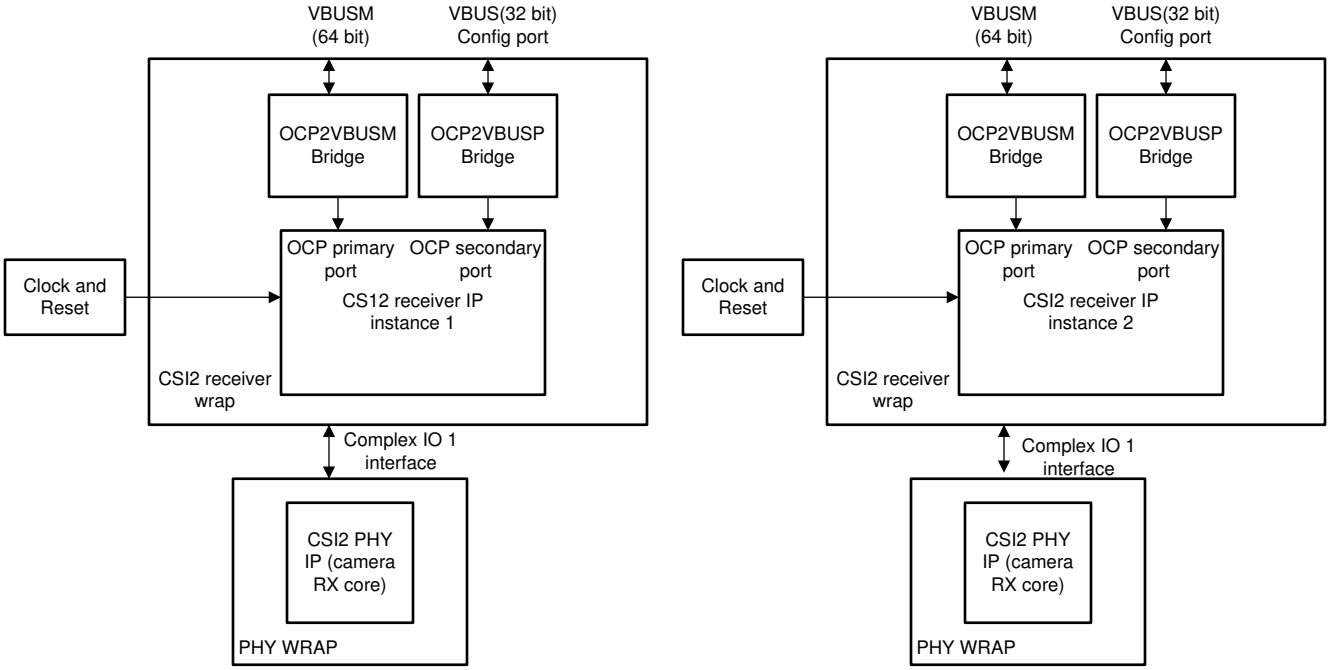

Figure 11-408. CSI2-A Receiver Block Diagram

11.6.1.1.3.3.2 CSI2 Functional Description

11.6.1.1.3.3.2.1 CSI2 Physical Layer Lane Configuration

The CSI2 serial interface is a unidirectional differential serial interface with data/clock for the physical layer.

The maximum CSI2 receiver data transfer capacity is 900 Mbps per data lane.

Data-clock signaling consists of two to five differential signal pairs: from one to four data lanes and one clock lane:

- The data signal carries the bit-serial data. The CSI2 transmitter in the image sensor sends the data in-quadrature with the dual-data rate (DDR) clock in HS mode; otherwise, the clock is extracted from the received data in LS mode. Data is transmitted byte-wise, LSB first. The CSI2 complex I/O receives the data and sends the byte stream to the CSI2 receiver.
- The clock signal carries the DDR clock signal.

Each physical lane can be a data or clock lane with a restriction to the fourth line, which can only be data (see Section 11.6.1.1.2.1, *CSI2 PHY Overview*). The clock/data lane must be configured before transmission to indicate the byte order, while merging the received bytes into a byte stream shows the reachable speed per data lane function of data lane numbers.

Lanes are configured through the CSI2_COMPLEXIO_CFG registers for CSI2-A and CSI2-B PHY, respectively. The [2:0] CLOCK_POSITION bit field and the [3] CLOCK_POL bit configure which lane transmits the clock and define its polarity. DATAl_POSITION and DATAl_POL configure the data lanes and their polarity, where l is the number of the data lane (l = 1 to 4). When the DATAl_POSITION field is set to 0, data lane l is not used.

CAUTION

Lane 4 (position 5) supports only data. The CLOCK_POSITION must not be set at position 5.

11.6.1.1.3.3.2.2 CSI2 ECC and Checksum Generation

The CSI2 receiver includes an ECC in the packet header and a checksum in the packet footer for long-packet transmission. These two fields can be used to detect and/or correct errors in the received packet.

11.6.1.1.3.3.2.2.1 CSI2 ECC

To detect and correct transmission errors of the header of short and long packets, an 8-bit ECC is included in the header of packets (short and long packet).

The ECC concerns all the fields for a short packet (data ID and short-packet data field) and the packet header for a long packet (data ID and word count). The ECC can only correct one error. Additional errors cannot be repaired, but they are flagged.

The CSI2 receiver ECC is compared against the CSI2 transmitter ECC embedded in the bitstream. If the ECC does not match, an interrupt is triggered to the host central processing unit (CPU).

For long and short packets, the correction is always done if there is only one error per packet header.

An ECC error with or without correction can be reported at two levels, depending on the type of packet. Table 11-1668 describes the field in which events are logged. Logging cannot be disabled, but users can set the corresponding bit in the and registers to prevent event generation at a higher level.

Table 11-1668. CSI2 ECC Event Logging

	Short Packet	Long Packet
With correction	Global CSI2_IRQSTATUS[12] ECC_CORRECTION_IRQ	Context CSI2_CTX_IRQENABLE_i[8] ECC_CORRECTION_IRQ
Without correction	Global CSI2_IRQSTATUS[11] ECC_NO_CORRECTION_IRQ	Global CSI2_IRQSTATUS[11] ECC_NO_CORRECTION_IRQ

The ECC check can be disabled (short and long packet) by setting the [2] ECC_EN bit to 0. Setting the bit to 1 enables the ECC check.

11.6.1.1.3.3.2.2.2 CSI2 Checksum

To detect errors in transmission of the payload of long packets, a 16-bit CRC checksum is computed on the payload of the long packets in the transmitter. This CRC is stored in the packet footer. A CRC is also computed in the CSI2 receiver. If the checksums do not match, an interrupt is triggered to the host CPU.

CRC errors are logged in the CS_IRQ field of the corresponding context register, . Logging cannot be disabled, but users can set the corresponding bit in the register to prevent event generation at a higher level.

The CRC can be disabled for a specific context by setting the [5] CS_EN bit to 0. Seeting the bit to 1 enables the CRC.

11.6.1.1.3.3.2.3 CSI2 Short Packet

There are two types of short packets in the CSI2 receiver:

- Synchronization short packet: Used by the protocol engine to synchronize frame and line (data ID from 0x0 to 0x7)
- Generic short packet: User-dependent; not treated by the protocol engine (data ID from 0x8 to 0xF)

When a generic short packet is received by the CSI2 receiver, the ECC check is performed if it is enabled. Then, the short packet is written in the [23:0] SHORT_PACKET bit field. The ECC field is deleted from the short packet. Figure 11-409 shows the SHORT_PACKET bit field format.

Figure 11-409. CSI2 SHORT_PACKET Bit Field Format

When a short packet is stored, an event is logged in the [13] SHORT_PACKET_IRQ bit. Logging cannot be disabled, but users can set the corresponding bit in the register to prevent event generation at a higher level.

The application reads the register before the next short packet with a code from 0x8 to 0xF. There is a single register for capturing the generic short packet, because no data type in it is associated with context.

11.6.1.1.3.3.2.4 CSI2 Virtual Channel and Context

The CSI2 protocol layer transports virtual channels. The virtual channels separate different data flows interleaved in the same data stream. Each virtual channel is identified by a unique channel identification number in the packet header. This channel identification number is encoded in the 2-bit code.

The CSI2 receiver monitors the channel identifier number and demultiplexes the interleaved data streams. The CSI2 receiver supports up to four concurrent virtual channels.

The CSI2 receiver supports eight contexts with their events to control the four possible virtual channels and the different data transmitted through them. A context is linked to a specific data type transported by a given virtual channel. The following bit fields permit configuration of a context:

- [12:11] VIRTUAL_ID: Configures the virtual ID linked to the current context
- [9:0] FORMAT: Configures the data format linked to the current context

Figure 11-410 shows the relationships between virtual channels and contexts.

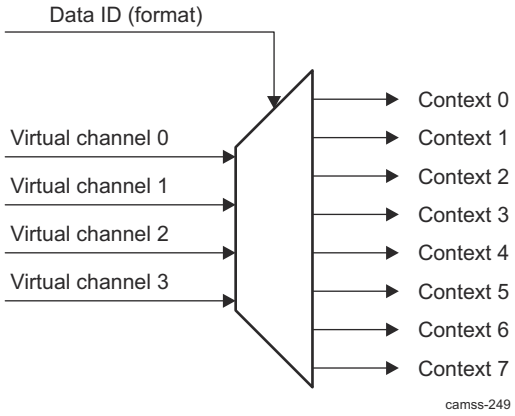

Figure 11-410. CSI2 Virtual Channel to Context

Each context consists of eight registers: six registers to control the corresponding context and two to log and enable events from the context. All registers in a context can be modified at any time; however, modifications apply only from the start of the following frame.

A context can be enabled independently by setting the [0] CTX_EN bit to 1; setting this bit to 0 disables the corresponding context.

When acquiring frames on a context, users can write the number of frames to capture in the [15:8] COUNT bit field. Acceptable values are 0 to 255; 0 stands for infinite capture (no count). After each frame is acquired, the count value is decremented by 1. When the count value reaches 0, the [6] FRAME_NUMBER_IRQ event is set and the CTX_EN bit is set to 0. To write a value in the COUNT bit field, the [4] COUNT_UNLOCK bit must be set to 1. If the value of the COUNT_UNLOCK bit is 0, a write in the COUNT bit field has no effect.

The CSI2_CTX_CTRL3_i[15:0] LINE_NUMBER bit field configures the generation of the [7] LINE_NUMBER_IRQ event. The [1] LINE_MODULO bit configures how the LINE_NUMBER event is generated:

- 0: The event is generated one time by frame.
- 1: The event is generated modulo LINE_NUMBER (the event can be generated more than once in a frame).

During a frame capture, the [31:16] FRAME_NUMBER bit field shows the number that identifies the frame received.

11.6.1.1.3.3.2.5 CSI2 DMA Engine

The CSI2 receiver integrates its own DMA engine with dedicated FIFO.

Global DMA configuration is common to the eight channels and is defined in the register. Configuration of the ping-pong address and the offset between lines is specific for a given context; therefore, each context has its own DMA configuration registers.

The DMA engine supports:

- 1D addressing mode (no address line offset, CSI2_CTX_DAT_OFST_i = 0)
- 2D addressing mode (address line offset different than 0, CSI2_CTX_DAT_OFST_i != 0)

The burst size is defined in the [6:5] BURST_SIZE bit field and the [16] BURST_SIZE_EXPAND bit. The DMA uses the burst size or smaller sizes down to single open-core protocol (OCP) writes depending on the alignment at the end of lines. The DMA engine can handle burst requests. When the burst requests can be used, as soon as one burst of data is present in the FIFO, the DMA engine initiates a burst write.

Note

Unless there are specific requirements, CSI2 (also applies to all other initiators) must be configured to use only a burst size of 128 bytes and nonposted writes.

When single requests must be used, as soon as one element (the size depends on the data type and the post-processing: DPCM, EXT, etc.) is present in the FIFO, the DMA engine initiates a single write.

Interleave mode is dedicated by the CSI2 receiver only when the line numbers are received (short packets). The line number is used to calculate the start address of the line.

The DMA starts to write in memory using the [31:5] ADDR bit field for the first frame to be transferred, and then uses the [31:5] ADDR bit field and the ping address alternately. Thus, the first frame uses the ping address, the second frame uses the pong address, the third frame uses the ping address, and so on.

The [3] PING_PONG status bit indicates whether the ping address () or the pong address () was used to store the pixel data of the last frame. After reset or after a 0-to-1 edge transition in the [0] IF_EN bit, the pixel data is written in the ping buffer and the [3] PING_PONG bit = PONG. When the number of FECs received equals the value programmed in the [23:16] FEC_NUMBER bit field, the pixel data are written in the pong buffer and [3] PING_PONG = PING. [3] PING_PONG toggles after the [23:16] FEC_NUMBER FEC sync code with the virtual channel ID defined is received in the [12:11] VIRTUAL_ID bit field.

The [23:16] FEC_NUMBER bit field must be set as follows:

- In progressive mode, set to 1.
- In interlaced mode, set to the number of interlaced frames to recreate a progressive image in the PING_PONG buffer.

11.6.1.1.3.3.2.5.1 CSI2 Progressive Frame to Progressive Storage

After each line, a new start line address is computed, depending on the value of the [31:5] OFST bit field:

- If OFST = 0, the new line starts immediately after the last pixel (data are written contiguously in memory).
- Otherwise, the value of OFST sets the offset between the first pixel of the previous line and the first pixel of the current line in memory.

For the ping frame:

```
@Line0 = CSI2_CTX_DAT_PING_ADDR_i@Line1 = @Line0 + CSI2_CTX_DAT_OFST_i@Line2 = @Line1 +
CSI2_CTX_DAT_OFST_i
```

For the pong frame:

```
@Line0 = CSI2_CTX_DAT_PONG_ADDR_i@Line1 = @Line0 + CSI2_CTX_DAT_OFST_i@Line2 = @Line1 +
CSI2_CTX_DAT_OFST_i
```

11.6.1.1.3.3.2.5.2 CSI2 Interlaced Frame to Progressive Storage

The mode is functional only when the line numbers are transmitted. It is automatically enabled without setting.

For the ping frame:

```
@LineX = CSI2_CTX_DAT_PING_ADDR_i + CSI2_CTX_DAT_OFST_i * Line_Number
```

For the pong frame:

```
@LineX = CSI2_CTX_DAT_PONG_ADDR_i + CSI2_CTX_DAT_OFST_i * Line_Number
```

Figure 11-411 shows how data are stored in memory regarding the DMA configuration.

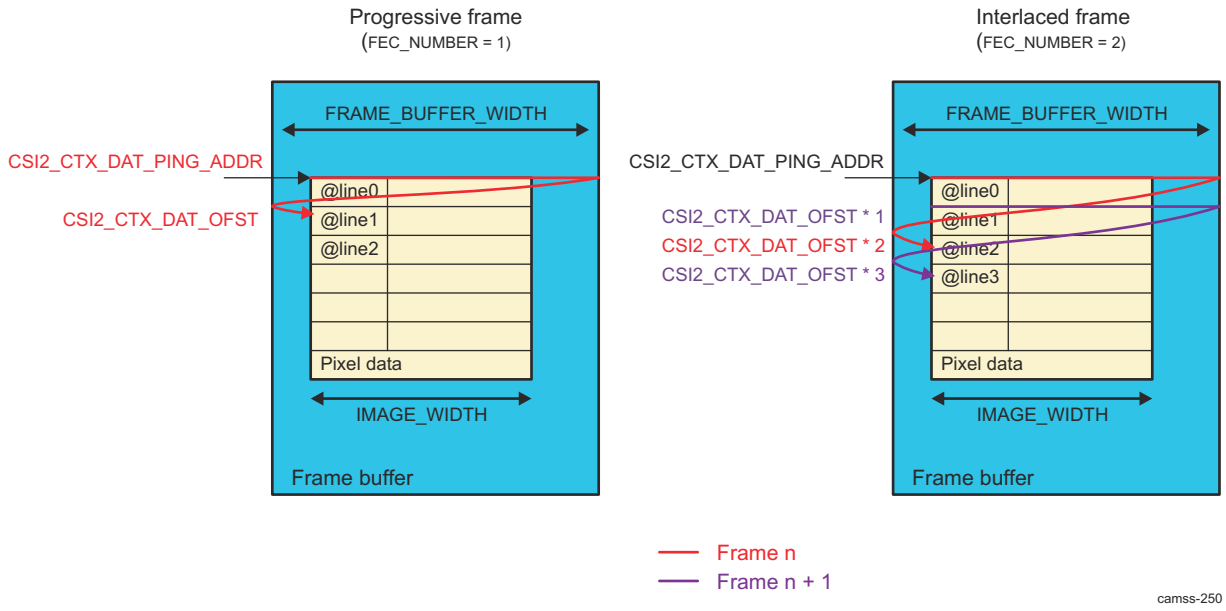

Figure 11-411. CSI2 Data Destination Setting in Progressive and Interlaced Mode

The burst size is defined in the CSI2_CTRL[6:5] BURST_SIZE bit field for bursts up to 16 × 64 bits or the CSI2_CTRL[16] BURST_SIZE_EXPAND bit for 16 × 128-bit bursts. It can be changed only while the CSI2_CTRL[0] IF_EN bit is reset to 0. The recommended value is the CSI2_CTRL[16] BURST_SIZE_EXPAND bit set to 1, which defines a burst of 16 × 64 bits (the maximum value); otherwise, by default it is set to 8 × 64 bits. When the BURST_SIZE_EXPAND bit is set, the BURST_SIZE setting has no effect. The DMA uses nonposted writes by default. The CSI2_CTRL[13] NON_POSTED_WRITE bit must be set to 1 to match DMA default configuration. It can be changed only while the CSI2_CTRL[0] IF_EN bit is reset to 0.

11.6.1.1.3.3.2.6 CSI2 MFLAG Mechanism and Arbitration

The MFLAG mechanism allows a dynamic increase of the priority of CSI2 real-time traffic, when required, based on the fullness of the CSI2 DMA read and write buffers. Programmable buffer thresholds indicate when the

local MFLAG signal is generated. The MFLAG signal is then provided to the L3 interconnect for granting or prioritizing OCP requests. The out band CSI2 MFLAG signal is asynchronous to any on-going OCP transaction. The threshold corresponds to the fullness of DMA buffer, and is defined by the following threshold parameters:

- High threshold – When the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes high (asserted). The value is set in the [22:20] MFLAG_LEVH register.
- Low threshold – When the corresponding pipeline buffer reaches the programmed value, the associated local MFLAG signal goes low (deasserted). The value is set in the [19:17] MFLAG_LEVL register.

11.6.1.1.3.3.2.7 CSI2 Transcoding

Image transcoding is used mainly to reduce memory footprint and bandwidth when:

- The sensor does not support DPCM compression. In fact, A-Law and DPCM compressed pixels occupy only 6, 7, or 8 BPP of storage.
- Digital zoom is used
  - Data that is not going to be used by further processing does not need to the stored in system memory.
  - Pixels cannot be accessed from random locations in a DPCM-compressed frame. Transcoding avoids memory-to-memory processing of unused pixels.

Figure 11-412 shows the logical representation of the image transcoding operation.

- Data is extracted from the CSI2 stream by the protocol engine.
- It is DPCM decompressed if necessary. That is the case when the received stream is DPCM-compressed and transcoding has been enabled using the [27:24] TRANSCODE bit field.
- Internal data are aligned on MSB when they enter the cropping stage. For example:
  - 4 LSBs are 0s when RAW10 data are handled.
  - 2 LSBs are 0s when RAW12 data are handled.

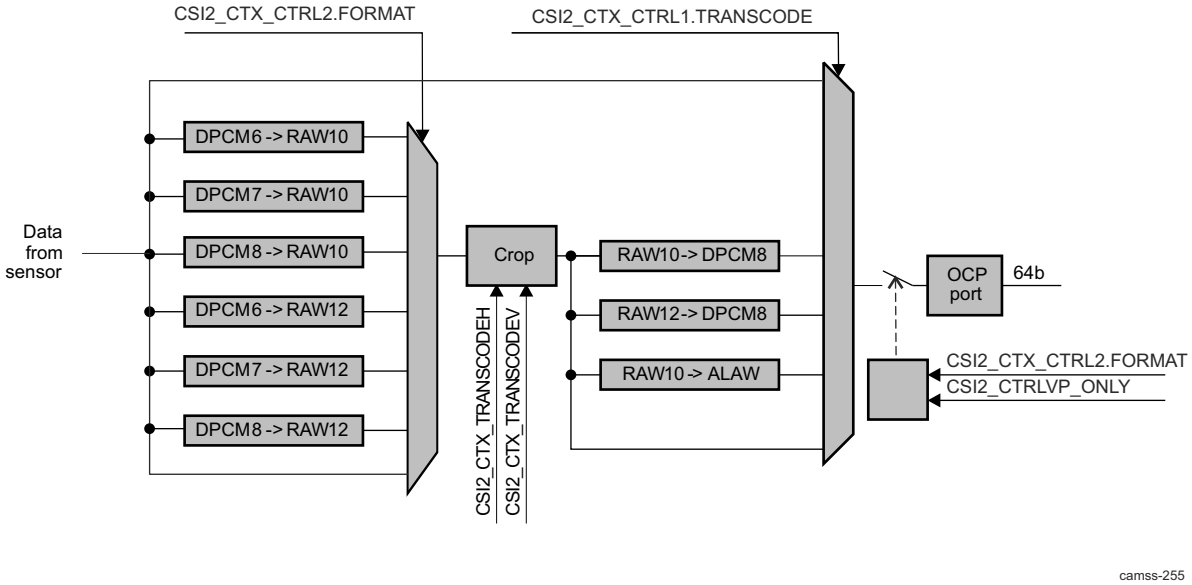

Figure 11-412. CSI2 Frame Processing

Table 11-1669 shows the input format provided to the cropping engine for a given pixel format provided by the sensor. Formats not listed in the table are not supported for transcoding. The FORMAT and Corresponding Setting Value column corresponds to the value set in the [9:0] FORMAT register.

Table 11-1669. CSI2 Supported Transcoding Input Formats

CSI2_CTX_CTRL2_i[9:0] FORMAT and Corresponding Setting Value		Cropping Engine Input Format	DPCM Decomposition Enabled	Video Port Enabled
0x028	RAW6	RAW6		
0x068	RAW6 + EXP8			
0x029	RAW7	RAW7		
0x069	RAW7 + EXP8			
0x02A	RAW8	RAW8		
0x02B	RAW10	RAW10		
0x0AB	RAW10 + EXP16			
0x229	RAW7 + DPCM10 + EXP16		Yes	
0x2A8	RAW6 + DPCM10 + EXP16		Yes	
0x2AA	RAW8 + DPCM10 + EXP16		Yes	
0x2Cn	USER_DEFINED_BYTE_DATA + DPCM10 + EXP16		Yes	
0x02C	RAW12	RAW12		
0x0AC	RAW12 + EXP16			
0x35A	RAW8 DPCM12 + EXP16		Yes	
0x1Cn	USER_DEFINED_BYTE_DATA + DPCM12 + EXP16		Yes	
0x3A8	RAW6 + DPCM12 + EXP16		Yes	
0x369	RAW7 + DPCM12 + EXP16		Yes	
0x02D	RAW14	RAW14		
0x0AD	RAW14 + EXP16			

Image cropping parameters are controlled by software. Figure 11-413 shows the cropping operation.

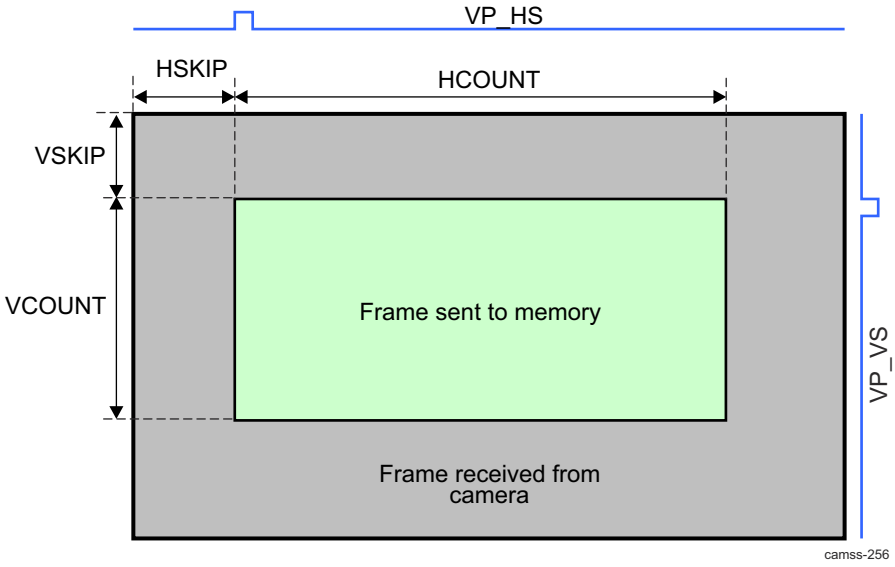

Figure 11-413. CSI2 Frame Cropping

CAUTION

Hardware does not check for validity of the settings. The following rules must be respected:

- [12:0] HSKIP + CSI2_CTX_TRANSCODEH_i[28:16] HCOUNT <= image width
- [12:0] VSKIP + CSI2_CTX_TRANSCODEV_i[28:16] VCOUNT <= image height

Furthermore, the [28:16] HCOUNT bit field must comply with the following alignment constraints; otherwise, undefined behavior occurs. Table 11-1670 shows the transcode alignment constraints

Table 11-1670. CSI2 Transcode Alignment Constraints

CSI2_CTX_CTRLi[27:24] TRANSCODE Value	Transcode	HCOUNT Must Be Multiple of
0x0	Disabled	1
0x1	DPCM10 RAW8	1
0x2	DPCM12 RAW8	1
0x3	ALAW10 RAW8	1
0x4	RAW8	1
0x5	RAW10 + EXP16	1
0x6	RAW10	4
0x7	RAW12 + EXP16	1
0x8	RAW12	2
0x9	RAW10 + EXP16	4

The CSI2_CTX_CTRL1_i[28] HSCALE configuration register enables horizontal downscaling of RAW data. It reduces the horizontal size and pixel clock by a factor of 2. The scaler uses a 2-tap horizontal filter operating on samples of the same color plane. The coefficients are: [1/2 ; 0 ; 1/2]

Figure 11-414 shows the scaler operation.

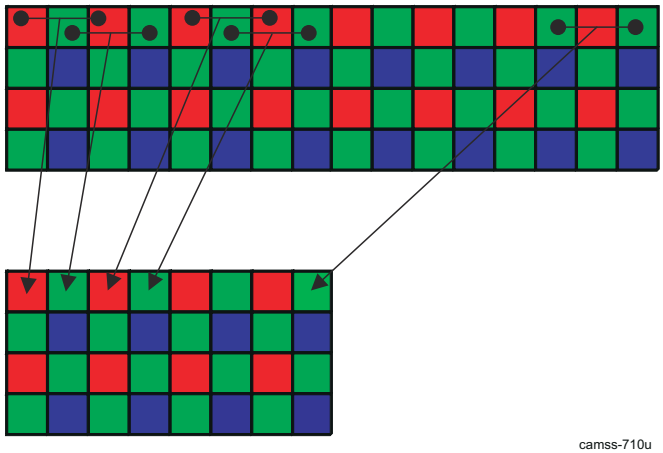

Figure 11-414. CSI2 Horizontal Scaler

When data goes to the interface port, HCOUNT/2 must comply with the constraints from Table 11-1670 (for example, for RAW10, HCOUNT must be a multiple of 8).

Table 11-1671 lists possible combinations of input and output formats supported by the transcoding engine. The Transcode column corresponds to the CSI2_CTX_CTRL1_i[27:24] TRANSCODE bit field of a context.

Table 11-1671. CSI2-Supported Transcoding Output Formats

Cropping Engine Output	Transcode		Supported	Cropping Engine Output	Transcode		Supported
RAW6	0	Disabled	Yes	RAW10	0	Disabled	Yes
	1	DPCM10 RAW8			1	DPCM10 RAW8	Yes
	2	DPCM12 RAW8			2	DPCM12 RAW8	
	3	ALAW10 RAW8			3	ALAW10 RAW8	Yes
	4	RAW8			4	RAW8	
	5	RAW10 + EXP16			5	RAW10 + EXP16	Yes
	6	RAW10			6	RAW10	Yes
	7	RAW12 + EXP16			7	RAW12 + EXP16	
	8	RAW12			8	RAW12	
	9	RAW14			9	RAW14	
RAW7	0	Disabled	Yes	RAW12	0	Disabled	Yes
	1	DPCM10 RAW8			1	DPCM10 RAW8	
	2	DPCM12 RAW8			2	DPCM12 RAW8	Yes
	3	ALAW10 RAW8			3	ALAW10 RAW8	
	4	RAW8			4	RAW8	
	5	RAW10 + EXP16			5	RAW10 + EXP16	
	6	RAW10			6	RAW10	
	7	RAW12 + EXP16			7	RAW12 + EXP16	Yes
	8	RAW12			8	RAW12	Yes
	9	RAW14			9	RAW14	
RAW8	0	Disabled	Yes	RAW14	0	Disabled	Yes
	1	DPCM10 RAW8			1	DPCM10 RAW8	
	2	DPCM12 RAW8			2	DPCM12 RAW8	
	3	ALAW10 RAW8			3	ALAW10 RAW8	
	4	RAW8	Yes		4	RAW8	
	5	RAW10 + EXP16			5	RAW10 + EXP16	
	6	RAW10			6	RAW10	
	7	RAW12 + EXP16			7	RAW12 + EXP16	
	8	RAW12			8	RAW12	
	9	RAW14			9	RAW14	Yes

RAW pixels are packed into 64-bit words sent to the OCP master port, as defined in:

- Section 1.1.3.1.1.4.3.3, *CSI2 RAW8*
- Section 1.1.3.1.1.4.3.4, *CSI2 RAW10*
- Section 1.1.3.1.1.4.3.5, *CSI2 RAW12*
- Section 1.1.3.1.1.4.3.6, *CSI2 RAW14*

For RAW10 and RAW12, software can choose among packed and nonpacked storage. A-Law and DPCM-compressed pixels are stored as RAW8 data: each RAW8 container holds a compressed data point.

Enabling of the OCP is controlled by the [9:0] FORMAT bit field and the [11] VP_ONLY_EN and CSI2_CTX_CTRL1_i[2] VP_FORCE bits.

To enable transcoding, software configures the context normally and also configures the framing using the and registers. Software defines the after transcoding with the CSI2_CTX_CTRL1_i[27:24] TRANSCODE bit field.

11.6.1.1.3.3.2.8 CSI2 EndOfFrame and EndOfLine (EOF and EOL) Pulses

The CSI2 receiver generates two signals to qualify the last pixel of a frame and the last pixel of a line to the TCTRL. It is active during or after the adequate interface bridge transaction and becomes inactive before the first transaction of the next line. Software can enable/disable generation of those signals for each context using the [7] EOF_EN and [6] EOL_EN bits.

11.6.1.1.3.3.2.9 CSI2 Data Decompression

The data compression technique used is DPCM and PCM.

To select the DPCM decompression predictor for the CSI2 Interface, set the [10] DPCM_PRED bit to 1 for simple predictor or to 0 for advanced predictor.

11.6.1.1.3.4 CSI2 Programming Model

11.6.1.1.3.4.1 CSI2 Programming Reset Management

The CSI2 receiver accepts a general software reset, propagated throughout the hierarchy. This reset can be done to initialize the CSI2 receiver and the complex I/O (A or B) and has the same effect as a hardware reset. Figure 11-415 shows how to reset CSI2 globally.

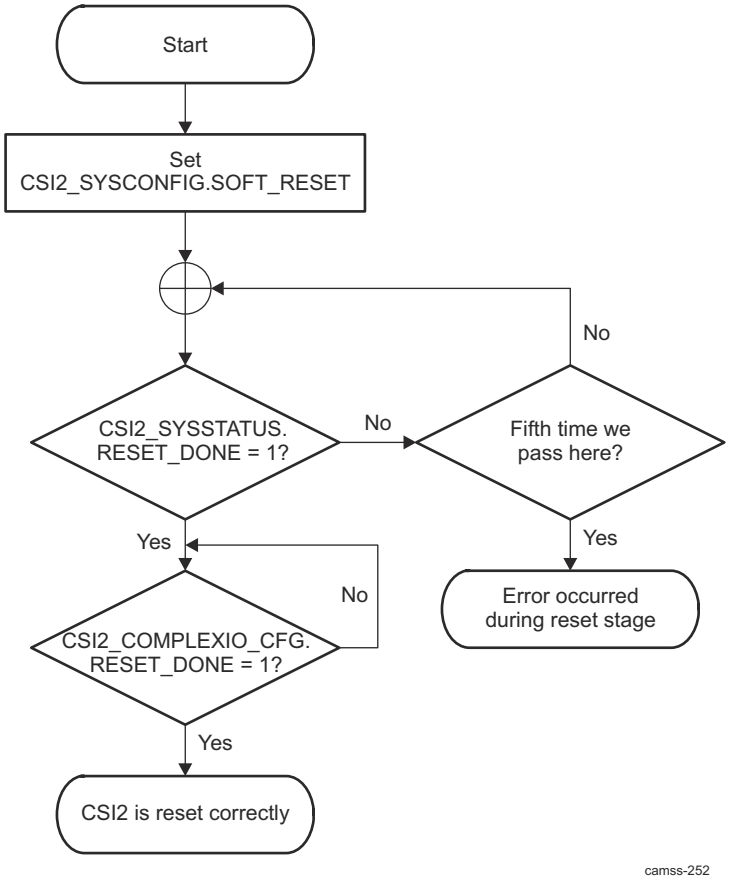

Figure 11-415. CSI2 Receiver Global Reset Flow Chart

Note

Before setting the software reset bit to 1 in the CSI2_SYSCONFIG register, the user must have access to a CSI2 receiver register.

Note

The CSI2_COMPLEXIO_CFG[29] RESET_DONE bit is set to 1 only after the initialization of the CSI2 receiver, CSI2 complex I/O, and external camera completes.

11.6.1.1.3.4.2 CSI2 Programming Enable Video/Picture Acquisition

Before using the receiver, a CSIPHY initialization in CSI2 mode must be made for CSI2-A CSIRX, which is associated with the CSI2 receiver. See Section 11.6.1.1.2.2.2, *CSI2 PHY and Link Initialization Sequence*. To start a video/picture acquisition, perform the steps listed in Table 11-1672.

Table 11-1672. CSI2 Global Initialization

Step	Register/Bit Field/Programming Model	Value
Reset the CSI2 receiver.	See Section 11.6.1.1.3.4.1, *Reset Management.*	
Configure the module power management. The module tries to enter smart-standby mode during the vertical blanking period. The CSI2_SYSCONFIG[0] AUTO_IDLE bit keeps its reset value; by default, an automatic port clock gating strategy is applied based on port interface activity.	CSI2_SYSCONFIG[13:12] MSTANDBY_MODE	0x2
Configure the interrupt generation as required. To enable context and/or complex I/O event reporting, enable the corresponding bit field in the CSI2_IRQENABLE register. If the enable bit is at 0, logging is still effective if an event occurs, but is not reported to a higher level.	CSI2_IRQENABLE and CSI2_IRQENABLE	
Configure the complex I/O interrupt generation as required. If the enable bit is at 0, logging is still effective if an event occurs, but is not reported to a higher level.	CSI2_COMPLEXIO_IRQSTATUS and CSI2_COMPLEXIO_IRQENABLE)	
Start complex I/O: Set the CSI2_COMPLEXIO_CFG[28:27] PWR_CMD bit field to 0x1 to pass the complex I/O to the ON state, and then check that the state status reaches the ON state (CSI2_COMPLEXIO_CFG[26:25] PWR_STATUS = 0x1) (for complex I/O A).	CSI2_COMPLEXIO_CFG[28:27] PWR_CMD	0x1
Configure the complex I/O: • The complex I/O is fully functional with CSI2_COMPLEX_CFG set at its reset value. • CSI2_COMPLEX_CFG must be changed according to the data rate being used.	CSI2_COMPLEXIO_CFG	
Set RXMODE and STOPSTATE FSM to RXMODE state. Users can also configure the delay for the FSM to return from RXMODE to NORXMODE when all lines reach STOPSTATE.	CSI2_TIMING[15] FORCE_RX_MODE_IO1	0x1
Activate ECC correction and error detection on short packets and packet headers. The ECC check corrects the packet if there is one error and generates an error if there is more than one error (unrecoverable error).	CSI2_CTRL[2] ECC_EN	0x1
Start the CSI2 receiver.	CSI2_CTRL[0] IF_EN	0x1
Configure the different contexts to be used.		
Link the context to a virtual channel and a data type.	See Section 11.6.1.1.3.4.6, *Linking a Context to a Virtual Channel and a Data Type.*	
Set the FEC_NUMBER bit field to 0x1 for a progressive video and to 0x2 for an interlaced video. For more information, see Section 11.6.1.1.3.3.2.5, *DMA Engine.*	CSI2_CTX_CTRL1_i[26:23] FEC_NUMBER	0x1 or 0x2
Capture an infinite number of frames (until the interface or the context is disabled).	CSI2_CTX_CTRL1_i[15:8] COUNT and CSI2_CTX_CTRL1_i[4] COUNT_UNLOCK	0x0

Table 11-1672. CSI2 Global Initialization (continued)

Step	Register/Bit Field/Programming Model	Value
Enable the CRC checksum on long packet payload. This allows detection of errors, but cannot correct errors like the ECC for header and short packet. On error detection, an event is triggered (the CSI2_CTX_IRQSTATUS_i[5] CS_IRQ bit).	CSI2_CTX_CTRL1_i[5] CS_EN	
Configure the DMA engine for the current channel: Configure the ping and pong addresses.	CSI2_CTX_DAT_PING_ADDR_i[31:5] ADDR and CSI2_CTX_DAT_PING_ADDR_i[31:5] ADDR	
Set the CSI2_CTx_DAT_OFST_i[15:5] OFST bit field to 0x0 so consecutive lines are stored consecutively in memory (image width and frame-buffer width are equal).	CSI2_CTX_DAT_OFST_i[15:5] OFST	
Keep the ALPHA setting at its reset value (0x0) for RGB padding.	CSI2_CTX_CTRL3_i[29:16] ALPHA	
Enable the contexts.	CSI2_CTX_CTRL1_i[0] CTX_EN	0x1

11.6.1.1.3.4.3 CSI2 Programming Disable Video/Picture Acquisition

There are two ways to end picture acquisition:

- Disable the corresponding context by setting the [0] CTX_EN bit to 0. This stops the acquisition for the current context. Other enabled contexts are still capturing frames and writing them in memory.
- Disable the CSI2 receiver interface by setting the [0] IF_EN bit to 0. This can have an immediate effect if the [3] FRAME bit is set to 0, or it can be effective after all the enabled contexts receive the FEC if the [3] FRAME bit is set to 1.

11.6.1.1.3.4.4 CSI2 Programming Capture a Finite Number of Frames

The CSI2 receiver can be configured to capture a finite number of frames. To configure the CSI2 receiver in this mode, perform the steps listed in Table 11-1673.

Table 11-1673. CSI2 Capture a Finite Number of Frames

Step	Bit Field	Value
Enable a write to the COUNT bit field.	CSI2_CTX_CTRL1_i[4] COUNT_UNLOCK	0x1
Set the bit field to the number of frames the CSI2 receiver must capture.	CSI2_CTX_CTRL1_i[15:8] COUNT	Valid values are 0 to 255; 0 is infinite capture and 1 to 255 defines the number of frames to capture.
Disable a write to the COUNT bit field.	CSI2_CTX_CTRL1_i[4] COUNT_UNLOCK	0x0

During frame capture, the COUNT bit field is decremented by 1 at each frame capture. Software reads the COUNT bit field to know how many frames must still be captured.

The COUNT bit can be updated during capture if the COUNT_UNLOCK bit is set to 1.

11.6.1.1.3.4.5 CSI2 Programming a Periodic Event During Frame Acquisition

The CSI2 receiver can generate a periodic event. This line number is defined in the [15:0] LINE_NUMBER bit field. The event can be generated once or multiple times per frame, depending on the value of the [1] LINE_MODULO bit:

- If the LINE_MODULO bit = 0, the event is generated when the line number corresponding to the LINE_NUMBER bit field is received.
- If the LINE_MODULO bit = 1, the event is generated when the line number received corresponds to a multiple of the LINE_NUMBER value (LINE_NUMBER is used as a modulo).

11.6.1.1.3.4.6 CSI2 Programming a Context to a Virtual Channel and a Data Type

The CSI2 receiver supports eight contexts and the CSI2 protocol defines four virtual channels. Therefore, a CSI2 receiver context can be associated with a virtual channel and a data type. Virtual channels are defined by a 2-bit field. Valid data types for the CSI2 receiver with their associated values are described in the [9:0] FORMAT bit field.

For each context, a register defines with which channel and data type the context is associated:

- The VIRTUAL_ID bit field defines the associated virtual ID transported by the CSI2 protocol from the camera sensor.
- The FORMAT bit field defines the associated data type. The data type is a combination of the data type transported by the CSI2 protocol and the type of storage in memory. A given data type (RGB888) can be stored in memory in different ways (RGB888 or RGB888 + EXP32). Therefore, the FORMAT bit field also defines how DMA stores data in memory.
- **CSI2_CTXn_DAT_PING_ADDR** and **CSI2_CTX0_DAT_PONG_ADDR** need to be set in order to store the received data (ping or pong manner) from CSI2RX. Same set of registers would be used during HIL mode to write data to device's internal memory.

For example, for the current context to capture a frame from virtual channel 2 and data type RAW12 with data expansion (RAW12 + EXP16), write the value 0x10AC (0x2 11 + 0xAC) in the 16 LSBs of the register.

11.6.1.1.3.4.7 CSI2 Programming Progressive and Interleaved Frame Configuration

The CSI2 receiver can treat progressive and interlaced frames. There is no progressive or interleaved mode, but the [23:16] FEC_NUMBER bit field controls the number of FECs before swapping to the other (ping or pong) buffer. Therefore, two modes are possible:

- FEC_NUMBER = 1: This is equivalent to progressive mode. After a FEC on the context, the current buffer is switched (ping to pong or pong to ping). The image in the memory buffer consists of one transmitted frame.
- FEC_NUMBER = 2: The current buffer is switched (ping to pong or pong to ping) after the FEC_NUMBER FEC is received for the context. The image in the memory buffer consists of the FEC_NUMBER transmitted frame.

For more information about how data is stored in memory through the DMA, see Section 11.6.1.1.3.3.2.5, *DMA Engine*.

Note

If FEC_NUMBER 1, the camera sensor must send the line number information with the current line. Otherwise, the CSI2 receiver cannot calculate each line address.

11.6.1.1.3.4.8 CSI2 Programming Debug Mode

Table 11-1674 lists the procedure to enable debug mode.

Table 11-1674. CSI2 Enable Debug Mode

Step	Bit	Value
Enable debug mode.	CSI2_CTRL[7] DBG_EN	0x1

- During debug mode the input does not come from the CSI2 receiver interface but from the CSI2_DBG_H and CSI2_DBG_P registers. The full CSI2 receiver function can be debugged in debug mode. Full 32-bit values must always be written to the CSI2_DBG_H register. The CSI2_CTRL[0] IF_EN bit has no affect during debug mode. To reset the FIFO in case of overflow, the CSI2_CTRL[7] DBG_EN bit must be reset to 0, and the interface must be enabled by setting the CSI2_CTRL[0] IF_EN bit to 0x1.
- The CSI2_DBG_H register is used to provide short packet and long packet headers.
- The CSI2_DBG_P register is used to provide long packet payload.

The following examples apply to the CSI2_DBG_H register:

- The sync codes for virtual channel 0 are written as CSI2_DBG_H = 0xFF00 0000 or 0xFF00 0001, or 0xFF00 0002 or 0xFF00 0003. To send the RAW12 pixels 0x673, 0x452, 0x01d, 0xefc, 0xab0, 0x891, 0x326, 0x547, write CSI2_DBG_H = 0x0123 4567, followed by CSI2_DBG_H = 0x89abcdef, and CSI2_DBG_H = 0x7654 3210.

11.6.1.1.3.5 CSI2 Register Manual

11.6.1.1.3.5.1 CSI2 Instance Summary

Table 11-1675 summarizes the CSI2 instance.

Table 11-1675. CSI2 Instance Summary

Module Name	Base Address	Size
RCSS_CSI2A	0x05080000	392 bytes
RCSS_CSI2B	0x050A0000	392 bytes

11.6.1.1.3.5.2 RCSS_CSI2 Registers

Table 11-1676 lists the memory-mapped registers for the RCSS_CSI2 registers. All register offset addresses not listed in Table 11-1676 should be considered as reserved locations and the register contents should not be modified.

Reset or Default Value		
-n		Value after reset or the default value

11.6.1.1.3.5.2.1 CSI2_REVISION Register (Offset = 0h) [Reset = 00000030h]

CSI2_REVISION is shown in Table 11-1678.

Return to the Summary Table.

MODULE REVISION This register contains the IP revision code in binary coded digital. For example we have: 0x01 = revision 0.1 and 0x21 = revision 2.1

Table 11-1678. CSI2_REVISION Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RES1	R	0h	RESERVE FIELD
7-0	REV	R	30h	IP revision [7:4] Major revision [3:0] Minor revision

11.6.1.1.3.5.2.2 CSI2_SYSCONFIG Register (Offset = 10h) [Reset = 00000001h]

CSI2_SYSCONFIG is shown in Table 11-1679.

Return to the Summary Table.

SYSTEM CONFIGURATION REGISTER This register is the OCP-socket system configuration register.

Table 11-1679. CSI2_SYSCONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-14	RES2	R	0h	RESERVE FIELD
13-12	MSTANDBY_MODE	R/W	0h	RESERVE FIELD
11-2	RES3	R	0h	RESERVE FIELD
1	SOFT_RESET	R/W	0h	Software reset. Set the bit to 1 to trigger a module reset. The bit is automatically reset by the hw. During reads return 0. 0: Normal mode. 1: The module is reset
0	AUTO_IDLE	R/W	1h	Internal OCP gating strategy 0: OCP clock is free-running. 1: Automatic OCP clock gating strategy is applied based on the OCP interface activity.

11.6.1.1.3.5.2.3 CSI2_SYSSTATUS Register (Offset = 14h) [Reset = 00000001h]

CSI2_SYSSTATUS is shown in Table 11-1680.

Return to the Summary Table.

SYSTEM STATUS REGISTER This register provides status information about the module excluding the interrupt status register.

Table 11-1680. CSI2_SYSSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RES4	R	0h	RESERVE FIELD
0	RESET_DONE	R	1h	Internal reset monitoring Read 0x1: Reset completed. Read 0x0: Internal module reset is on going.

11.6.1.1.3.5.2.4 CSI2_IRQSTATUS Register (Offset = 18h) [Reset = 00000000h]

CSI2_IRQSTATUS is shown in Table 11-1681.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - All contexts This register associates one bit for each context in order to determine which context has generated the interrupt. The context shall be enabled for events to be generated on that context. If the

Table 11-1681. CSI2_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	RES5	R	0h	RESERVE FIELD
14	OCP_ERR_IRQ	R/W	0h	OCP Error Interrupt 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. (RW W1toClr)
13	SHORT_PACKET_IRQ	R/W	0h	Short packet reception status (other than synch events: Line Start, Line End, Frame Start, and Frame End: data type between 0x8 and x0F only shall be considered). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. (RW W1toClr)
12	ECC_CORRECTION_IRQ	R/W	0h	ECC has been used to do the correction of the only 1-bit error status (short packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
11	ECC_NO_CORRECTION_IRQ	R/W	0h	ECC error status (short and long packets). No correction of the header because of more than 1-bit error. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
10	COMPLEXIO2_ERR_IRQ	R	0h	RESERVE FIELD
9	COMPLEXIO1_ERR_IRQ	R	0h	Error signaling from Complex IO #1: status of the PHY errors received from the complex IO #1 (events are defined in CSI2_COMPLEXIO1_IRQSTATUS for the 1st complex IO). Read 0: READS: Event is false. Read 1: READS: Event is true (pending).
8	FIFO_OVF_IRQ	R/W	0h	FIFO overflow error status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
7	CONTEXT7	R	0h	Context 7 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).
6	CONTEXT6	R	0h	Context 6 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).
5	CONTEXT5	R	0h	Context 5 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).

Table 11-1681. CSI2_IRQSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	CONTEXT4	R	0h	Context 4 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).
3	CONTEXT3	R	0h	Context 3 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).
2	CONTEXT2	R	0h	Context 2 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).
1	CONTEXT1	R	0h	Context 1 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).
0	CONTEXT0	R	0h	Context 0 Read 0: READS: Event is false. Read 1: READS: Event is true (pending).

11.6.1.1.3.5.2.5 CSI2_IRQENABLE Register (Offset = 1Ch) [Reset = 00000000h]

CSI2_IRQENABLE is shown in Table 11-1682.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - All contexts This register associates one bit for each context in order to enable/disable each context individually.

Table 11-1682. CSI2_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	RES6	R	0h	RESERVE FIELD
14	OCP_ERR_IRQ	R/W	0h	OCP Error Interrupt 0: Event is masked 1: Event generates an interrupt when it occurs
13	SHORT_PACKET_IRQ	R/W	0h	Short packet reception (other than synch events: Line Start, Line End, Frame Start, and Frame End: data type between 0x8 and x0F only shall be considered). 0: Event is masked 1: Event generates an interrupt when it occurs
12	ECC_CORRECTION_IRQ	R/W	0h	ECC has been used to correct the only 1-bit error (short packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
11	ECC_NO_CORRECTION_IRQ	R/W	0h	ECC error (short and long packets). No correction of the header because of more than 1-bit error. 0: Event is masked 1: Event generates an interrupt when it occurs
10	COMPLEXIO2_ERR_IRQ	R/W	0h	RESERVED
9	COMPLEXIO1_ERR_IRQ	R/W	0h	Error signaling from Complex IO # 1: the interrupt is triggered when any error is received from the complex IO #1 (events are defined in CSI2_COMPLEXIO1_IRQSTATUS for the 1st complex IO). 0: Event is masked 1: Event generates an interrupt when it occurs
8	FIFO_OVF_IRQ	R/W	0h	FIFO overflow enable 0: Event is masked 1: Event generates an interrupt when it occurs
7	CONTEXT7	R/W	0h	Context 7 0: Event is masked 1: Event generates an interrupt when it occurs
6	CONTEXT6	R/W	0h	Context 6 0: Event is masked 1: Event generates an interrupt when it occurs
5	CONTEXT5	R/W	0h	Context 5 0: Event is masked 1: Event generates an interrupt when it occurs
4	CONTEXT4	R/W	0h	Context 4 0: Event is masked 1: Event generates an interrupt when it occurs
3	CONTEXT3	R/W	0h	Context 3 0: Event is masked 1: Event generates an interrupt when it occurs
2	CONTEXT2	R/W	0h	Context 2 0: Event is masked 1: Event generates an interrupt when it occurs
1	CONTEXT1	R/W	0h	Context 1 0: Event is masked 1: Event generates an interrupt when it occurs

Table 11-1682. CSI2_IRQENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	CONTEXT0	R/W	0h	Context 0 0: Event is masked 1: Event generates an interrupt when it occurs

11.6.1.1.3.5.2.6 CSI2_CTRL Register (Offset = 40h) [Reset = 00000000h]

CSI2_CTRL is shown in Table 11-1683.

Return to the Summary Table.

GLOBAL CONTROL REGISTER This register controls the CSI2 RECEIVER module. This register shall not be modified dynamically (except IF_EN bit field).

Table 11-1683. CSI2_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	RES7	R	0h	RESERVE FIELD
22-20	MFLAG_LEVH	R/W	0h	RESERVE FIELD
19-17	MFLAG_LEVL	R/W	0h	RESERVE FIELD
16	BURST_SIZE_EXPAND	R/W	0h	Sets the DMA burst size on the L3 interconnect. 0: Use the burst size defined in the BURST_SIZE register 1: Allow generation of 16x 64-bit bursts
15	VP_CLK_EN	R/W	0h	RESERVE FIELD
14	STREAMING	R/W	0h	Streaming mode 0: Disable 1: Enable
13	NON_POSTED_WRITE	R/W	0h	Not Posted Writes 0: Disable 1: Enable
12	RES8	R	0h	RESERVE FIELD
11	VP_ONLY_EN	R/W	0h	RESERVE FIELD
10	STREAMING_32_BIT	R/W	0h	Indicates if 64-bit or 32-bit streaming burst is used. Valid only if CSI2_CTRL.STREAMING=1 0: 64-bit streaming burst is used byte enable pattern is 0xFF 1: 32-bit streaming burst is used byte enable pattern is 0x0F
9-8	VP_OUT_CTRL	R/W	0h	RESERVE FIELD
7	DBG_EN	R/W	0h	Enables the debug mode. 0: Disable 1: Enable
6-5	BURST_SIZE	R/W	0h	Sets the DMA burst size on the L3 interconnect. 0x 0: 1x64 OCP writes 0x 1: 2x64 OCP writes 0x 2: 4x64 OCP writes 0x 3: 8x64 OCP writes
4	ENDIANNESS	R/W	0h	Select endianness for YUV422 8 bit and YUV420 legacy formats. 0: Use native MIPI CSI2 endianness: Little endian for all formats except for YUV422 8b and YUV420 Legacy which a big endian. 1: Store all pixel formats little endian.
3	FRAME	R/W	0h	Set the modality in which IF_EN works. 0: If IF_EN = 0 the interface is disabled immediately. 1: If IF_EN = 1 the interface is disabled after all FEC sync code have been received for the active contexts.
2	ECC_EN	R/W	0h	Enables the Error Correction Code check for the received header (short and long packets for all virtual channel ids). 0: Disabled 1: Enabled
1	SECURE	R/W	0h	RESERVE FIELD

Table 11-1683. CSI2_CTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	IF_EN	R/W	0h	Enables the physical interface to the module. 0: The interface is disabled. If FRAME = 0, it is disabled immediately. If FRAME = 1, it is disabled when each context has received the FEC sync code. 1: The interface is enabled immediately, the data acquisition starts on the next FSC sync code. Writing '1' to this register when the current value is '0' has the effect to clear the output FIFO. The pixel data of the following frame will be written in the PING buffer, i.e., the CSI2_CTX_CTRL.PING_PONG bits are reset to '0' as well.

11.6.1.1.3.5.2.7 CSI2_DBG_H Register (Offset = 44h) [Reset = 00000000h]

CSI2_DBG_H is shown in Table 11-1684.

Return to the Summary Table.

DEBUG REGISTER (Header) This register provides a way to debug the CSI2 RECEIVER module with no image sensor connected to the module. The debug mode is enabled by CSI2_CTRL.DBG_EN. Only full 32-bit values shall be written. The register is

Table 11-1684. CSI2_DBG_H Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	DBG	W	0h	32-bit input value.

11.6.1.1.3.5.2.8 CSI2_GNQ Register (Offset = 48h) [Reset = 0000001Bh]

CSI2_GNQ is shown in Table 11-1685.

Return to the Summary Table.

GENERIC PARAMETER REGISTER This register provide a way to read the generic parameters used in the design.

Table 11-1685. CSI2_GNQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RES9	R	0h	RESERVE FIELD
5-2	FIFODEPTH	R	6h	Output FIFO size in multiple of 68 bits. Read 0x2: 8x 68 bits Read 0x3: 16x 68 bits Read 0x4: 32x 68 bits Read 0x5: 64x 68 bits Read 0x6: 128 x 68 bits Read 0x7: 256 x 68 bits
1-0	NBCONTEXTS	R	3h	Number of contexts supported by the module. Read 0x0: 1 Context Read 0x1: 2 Contexts Read 0x2: 4 Contexts Read 0x3: 8 Contexts

11.6.1.1.3.5.2.9 CSI2_COMPLEXIO_CFG2 Register (Offset = 4Ch) [Reset = 00000000h]

CSI2_COMPLEXIO_CFG2 is shown in Table 11-1686.

Return to the Summary Table.

COMPLEX IO CONFIGURATION REGISTER for the complex IO #2 This register contains the lane configuration for the order and position of the lanes (clock and data) and the polarity order for the control of the PHY differential signals in addit

Table 11-1686. CSI2_COMPLEXIO_CFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RES10	R	0h	RESERVE FIELD
30	RESET_CTRL	R/W	0h	RESERVE FIELD
29	RESET_DONE	R	0h	RESERVE FIELD
28-27	PWR_CMD	R/W	0h	RESERVE FIELD
26-25	PWR_STATUS	R	0h	RESERVE FIELD
24	PWR_AUTO	R/W	0h	RESERVE FIELD
23-20	RES11	R	0h	RESERVE FIELD
19	DATA4_POL	R/W	0h	RESERVE FIELD
18-16	DATA4_POSITION	R/W	0h	RESERVE FIELD
15	DATA3_POL	R/W	0h	RESERVE FIELD
14-12	DATA3_POSITION	R/W	0h	RESERVE FIELD
11	DATA2_POL	R/W	0h	RESERVE FIELD
10-8	DATA2_POSITION	R/W	0h	RESERVE FIELD
7	DATA1_POL	R/W	0h	RESERVE FIELD
6-4	DATA1_POSITION	R/W	0h	RESERVE FIELD
3	CLOCK_POL	R/W	0h	RESERVE FIELD
2-0	CLOCK_POSITION	R/W	0h	RESERVE FIELD

11.6.1.1.3.5.2.10 CSI2_COMPLEXIO_CFG1 Register (Offset = 50h) [Reset = 00000000h]

CSI2_COMPLEXIO_CFG1 is shown in Table 11-1687.

Return to the Summary Table.

COMPLEXIO CONFIGURATION REGISTER for the complex IO #1 This register contains the lane configuration for the order and position of the lanes (clock and data) and the polarity order for the control of the PHY differential signals in additi

Table 11-1687. CSI2_COMPLEXIO_CFG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RES12	R	0h	RESERVE FIELD
30	RESET_CTRL	R/W	0h	Controls the reset of the complex IO 0: Complex IO reset active. 1: Complex IO reset de-asserted.
29	RESET_DONE	R	0h	Internal reset monitoring of the power domain using the PPI byte clock from the complex io Read 0: Internal module reset is on going. Read 1: Reset completed.
28-27	PWR_CMD	R/W	0h	Command for power control of the complex io 0x 0: Command to change to OFF state 0x 1: Command to change to ON state 0x 2: Command to change to Ultra Low Power state
26-25	PWR_STATUS	R	0h	Status of the power control of the complex io Read 0x0: Complex IO in OFF state Read 0x1: Complex IO in ON state Read 0x2: Complex IO in Ultra Low Power state
24	PWR_AUTO	R/W	0h	Automatic switch between ULP and ON states based on ULPM signals from complex iO 0: Disable 1: Enable
23-20	RES13	R	0h	RESERVE FIELD
19	DATA4_POL	R/W	0h	+/- differential pin order of DATA lane 4. 0: +/- pin order 1: -/+ pin order
18-16	DATA4_POSITION	R/W	0h	Position and order of the DATA lane 4. The values 6 and 7 are reserved. 0x 0: Not used/connected 0x 1: Data lane 4 is at the position 1. 0x 2: Data lane 4 is at the position 2. 0x 3: Data lane 4 is at the position 3. 0x 4: Data lane 4 is at the position 4. 0x 5: Data lane 4 is at the position 5.
15	DATA3_POL	R/W	0h	+/- differential pin order of DATA lane 3. 0: +/- pin order 1: -/+ pin order

Table 11-1687. CSI2_COMPLEXIO_CFG1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14-12	DATA3_POSITION	R/W	0h	Position and order of the DATA lane 3. The values 6 and 7 are reserved. 0x 0: Not used/connected 0x 1: Data lane 3 is at the position 1. 0x 2: Data lane 3 is at the position 2. 0x 3: Data lane 3 is at the position 3. 0x 4: Data lane 3 is at the position 4. 0x 5: Data lane 3 is at the position 5.
11	DATA2_POL	R/W	0h	+/- differential pin order of DATA lane 2. 0: +/- pin order 1: -/+ pin order
10-8	DATA2_POSITION	R/W	0h	Position and order of the DATA lane 2. The values 6 and 7 are reserved. 0x 0: Not used/connected 0x 1: Data lane 2 is at the position 1. 0x 2: Data lane 2 is at the position 2. 0x 3: Data lane 2 is at the position 3. 0x 4: Data lane 2 is at the position 4. 0x 5: Data lane 2 is at the position 5.
7	DATA1_POL	R/W	0h	+/- differential pin order of DATA lane 1. 0: +/- pin order 1: -/+ pin order
6-4	DATA1_POSITION	R/W	0h	Position and order of the DATA lane 1. 0, 6 and 7 are reserved. The data lane 1 is always present. 0x 1: Data lane 1 is at the position 1. 0x 2: Data lane 1 is at the position 2. 0x 3: Data lane 1 is at the position 3. 0x 4: Data lane 1 is at the position 4. 0x 5: Data lane 1 is at the position 5.
3	CLOCK_POL	R/W	0h	+/- differential pin order of CLOCK lane. 0: +/- pin order 1: -/+ pin order
2-0	CLOCK_POSITION	R/W	0h	Position and order of the CLOCK lane. 0, 6 and 7 are reserved. The clock lane is always present. 0x 1: Clock lane is at the position 1. 0x 2: Clock lane is at the position 2. 0x 3: Clock lane is at the position 3. 0x 4: Clock lane is at the position 4. 0x 5: Clock lane is at the position 5.

11.6.1.1.3.5.2.11 CSI2_COMPLEXIO1_IRQSTATUS Register (Offset = 54h) [Reset = 00000000h]

CSI2_COMPLEXIO1_IRQSTATUS is shown in Table 11-1688.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - All errors from complex IO #1

Table 11-1688. CSI2_COMPLEXIO1_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RES14	R	0h	RESERVE FIELD
26	STATEALLULPMEXIT	R/W	0h	At least one of the active lanes has exit the ULPM 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
25	STATEALLULPMENTER	R/W	0h	All active lanes are entering in ULPM. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
24	STATEULPM5	R/W	0h	Lane #5 in Ultra Low Power Mode 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
23	STATEULPM4	R/W	0h	Lane #4 in Ultra Low Power Mode 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
22	STATEULPM3	R/W	0h	Lane #3 in Ultra Low Power Mode 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

11.6.1.1.3.5.2.13 CSI2_SHORT_PACKET Register (Offset = 5Ch) [Reset = 00000000h]

CSI2_SHORT_PACKET is shown in Table 11-1690.

Return to the Summary Table.

SHORT PACKET INFORMATION - This register sets the 24-bit DATA_ID + Short Packet Data Field when the data type is between 0x8 and x0F

Table 11-1690. CSI2_SHORT_PACKET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RES16	R	0h	RESERVE FIELD
23-0	SHORT_PACKET	R	0h	Short Packet information: DATA ID + DATA FIELD

11.6.1.1.3.5.2.14 CSI2_COMPLEXIO1_IRQENABLE Register (Offset = 60h) [Reset = 00000000h]

CSI2_COMPLEXIO1_IRQENABLE is shown in Table 11-1691.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - All errors from complex IO #1

Table 11-1691. CSI2_COMPLEXIO1_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RES17	R	0h	RESERVE FIELD
26	STATEALLULPMEXIT	R/W	0h	At least one of the active lanes has exit the ULPM 0: Event is masked 1: Event generates an interrupt when it occurs
25	STATEALLULPMENTER	R/W	0h	All active lanes are entering in ULPM. 0: Event is masked 1: Event generates an interrupt when it occurs
24	STATEULPM5	R/W	0h	Lane #5 in Ultra Low Power Mode 0: Event is masked 1: Event generates an interrupt when it occurs
23	STATEULPM4	R/W	0h	Lane #4 in Ultra Low Power Mode 0: Event is masked 1: Event generates an interrupt when it occurs
22	STATEULPM3	R/W	0h	Lane #3 in Ultra Low Power Mode 0: Event is masked 1: Event generates an interrupt when it occurs
21	STATEULPM2	R/W	0h	Lane #2 in Ultra Low Power Mode 0: Event is masked 1: Event generates an interrupt when it occurs
20	STATEULPM1	R/W	0h	Lane #1 in Ultra Low Power Mode 0: Event is masked 1: Event generates an interrupt when it occurs
19	ERRCONTROL5	R/W	0h	Control error for lane #5 0: Event is masked 1: Event generates an interrupt when it occurs
18	ERRCONTROL4	R/W	0h	Control error for lane #4 0: Event is masked 1: Event generates an interrupt when it occurs
17	ERRCONTROL3	R/W	0h	Control error for lane #3 0: Event is masked 1: Event generates an interrupt when it occurs
16	ERRCONTROL2	R/W	0h	Control error for lane #2 0: Event is masked 1: Event generates an interrupt when it occurs
15	ERRCONTROL1	R/W	0h	Control error for lane #1 0: Event is masked 1: Event generates an interrupt when it occurs
14	ERRESC5	R/W	0h	Escape entry error for lane #5 0: Event is masked 1: Event generates an interrupt when it occurs
13	ERRESC4	R/W	0h	Escape entry error for lane #4 0: Event is masked 1: Event generates an interrupt when it occurs
12	ERRESC3	R/W	0h	Escape entry error for lane #3 0: Event is masked 1: Event generates an interrupt when it occurs
11	ERRESC2	R/W	0h	Escape entry error for lane #2 0: Event is masked 1: Event generates an interrupt when it occurs

Table 11-1691. CSI2_COMPLEXIO1_IRQENABLE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	ERRESC1	R/W	0h	Escape entry error for lane #1 0: Event is masked 1: Event generates an interrupt when it occurs
9	ERRSOTSYNCHS5	R/W	0h	Start of transmission sync error for lane #5 0: Event is masked 1: Event generates an interrupt when it occurs
8	ERRSOTSYNCHS4	R/W	0h	Start of transmission sync error for lane #4 0: Event is masked 1: Event generates an interrupt when it occurs
7	ERRSOTSYNCHS3	R/W	0h	Start of transmission sync error for lane #3 0: Event is masked 1: Event generates an interrupt when it occurs
6	ERRSOTSYNCHS2	R/W	0h	Start of transmission sync error for lane #2 0: Event is masked 1: Event generates an interrupt when it occurs
5	ERRSOTSYNCHS1	R/W	0h	Start of transmission sync error for lane #1 0: Event is masked 1: Event generates an interrupt when it occurs
4	ERRSOTHS5	R/W	0h	Start of transmission error for lane #5 0: Event is masked 1: Event generates an interrupt when it occurs
3	ERRSOTHS4	R/W	0h	Start of transmission error for lane #4 0: Event is masked 1: Event generates an interrupt when it occurs
2	ERRSOTHS3	R/W	0h	Start of transmission error for lane #3 0: Event is masked 1: Event generates an interrupt when it occurs
1	ERRSOTHS2	R/W	0h	Start of transmission error for lane #2 0: Event is masked 1: Event generates an interrupt when it occurs
0	ERRSOTHS1	R/W	0h	Start of transmission error for lane #1 0: Event is masked 1: Event generates an interrupt when it occurs

11.6.1.1.3.5.2.15 CSI2_COMPLEXIO2_IRQENABLE Register (Offset = 64h) [Reset = 00000000h]

CSI2_COMPLEXIO2_IRQENABLE is shown in Table 11-1692.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - All errors from complex IO #2

11.6.1.1.3.5.2.16 CSI2_DBG_P Register (Offset = 68h) [Reset = 00000000h]

CSI2_DBG_P is shown in Table 11-1693.

Return to the Summary Table.

DEBUG REGISTER (Payload) This register provides a way to debug the CSI2 RECEIVER module with no image sensor connected to the module. The debug mode is enabled by CSI2_CTRL.DBG_EN. Only full 32-bit values shall be written. The register is

Table 11-1693. CSI2_DBG_P Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	DBG	W	0h	32-bit input value.

11.6.1.1.3.5.2.17 CSI2_TIMING Register (Offset = 6Ch) [Reset = 7FFF7FFFh]

CSI2_TIMING is shown in Table 11-1694.

Return to the Summary Table.

TIMING REGISTER This register controls the CSI2 RECEIVER module. This register shall not be modified while CSI2_CTRL.IF_EN is set to '1'. It is used to indicate the number of L3 cycles for the Stop State monitoring.

Table 11-1694. CSI2_TIMING Register Field Descriptions

Bit	Field	Type	Reset	Description
31	FORCE_RX_MODE_IO2	R/W	0h	RESERVE FIELD
30	STOP_STATE_X16_IO2	R/W	1h	RESERVE FIELD
29	STOP_STATE_X4_IO2	R/W	1h	RESERVE FIELD
28-16	STOP_STATE_COUNTER_IO2	R/W	1FFFh	RESERVE FIELD
15	FORCE_RX_MODE_IO1	R/W	0h	Control of ForceRxMode signal 0: De-assertion of ForceRxMode. The HW reset the bit at the end of the Force RX Mode assertion. The SW can reset the bit in order to stop the assertion of the ForceRXMode signal prior to the completion of the period. 1: Assertion of ForceRxMode
14	STOP_STATE_X16_IO1	R/W	1h	Multiplication factor for the number of L3 cycles defined in STOP_STATE_COUNTER bit-field 0: The number of L3 cycles defined in STOP_STATE _COUNTER is multiplied by 1x 1: The number of L3 cycles defined in STOP_STATE _COUNTER is multiplied by 16x
13	STOP_STATE_X4_IO1	R/W	1h	Multiplication factor for the number of L3 cycles defined in STOP_STATE_COUNTER bit-field 0: The number of L3 cycles defined in STOP_STATE _COUNTER is multiplied by 1x 1: The number of L3 cycles defined in STOP_STATE _COUNTER is multiplied by 4x
12-0	STOP_STATE_COUNTER_IO1	R/W	1FFFh	Stop State counter for monitoring. It indicates the number of L3 to monitor for Stop State before de-asserting ForceRxMode (Complex IO #1). The value is from 0 to 8191.

11.6.1.1.3.5.2.18 CSI2_CTX0_CTRL1 Register (Offset = 70h) [Reset = 00010008h]

CSI2_CTX0_CTRL1 is shown in Table 11-1695.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1695. CSI2_CTX0_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 2: Outputs DPCM compressed RAW12 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 3: Outputs ALAW compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data. 0x 4: Outputs uncompressed RAW8 data. Data in memory is organized as regular RAW8 data 0x 5: Outputs uncompressed RAW10 data. Data in memory is organized as regular RAW10+EXP16 data 0x 6: Outputs uncompressed RAW10 data. Data in memory is organized as regular packed RAW10 data 0x 7: Outputs uncompressed RAW12 data. Data in memory is organized as regular RAW12+EXP16 data 0x 8: Outputs uncompressed RAW12 data. Data in memory is organized as regular packed RAW12 data 0x 9: Outputs uncompressed RAW14 data.
23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 11-1695. CSI2_CTX0_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

11.6.1.1.3.5.2.19 CSI2_CTX0_CTRL2 Register (Offset = 74h) [Reset = 00000000h]

CSI2_CTX0_CTRL2 is shown in Table 11-1696.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 11-1696. CSI2_CTX0_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)
12-11	VIRTUAL_ID	R/W	0h	Virtual channel ID 0x 0: Virtual Channel ID 0 0x 1: Virtual Channel ID 1 0x 2: Virtual Channel ID 2 0x 3: Virtual Channel ID 3
10	DPCM_PRED	R/W	0h	Selects the DPCM predictor. 0: The advanced predictor is used. Not supported for 10 – 8 – 10 algorithm. Performance limited to 1 pixel/cycle. 1: The simple predictor is used.

11.6.1.1.3.5.2.20 CSI2_CTX0_DAT_OFST Register (Offset = 78h) [Reset = 00000000h]

CSI2_CTX0_DAT_OFST is shown in Table 11-1697.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 11-1697. CSI2_CTX0_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ (2^{17}-1)
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.21 CSI2_CTX0_DAT_PING_ADDR Register (Offset = 7Ch) [Reset = 00000000h]

CSI2_CTX0_DAT_PING_ADDR is shown in Table 11-1698.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 11-1698. CSI2_CTX0_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.22 CSI2_CTX0_DAT_PONG_ADDR Register (Offset = 80h) [Reset = 00000000h]

CSI2_CTX0_DAT_PONG_ADDR is shown in Table 11-1699.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 11-1699. CSI2_CTX0_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.23 CSI2_CTX0_IRQENABLE Register (Offset = 84h) [Reset = 00000000h]

CSI2_CTX0_IRQENABLE is shown in Table 11-1700.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 11-1700. CSI2_CTX0_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

11.6.1.1.3.5.2.24 CSI2_CTX0_IRQSTATUS Register (Offset = 88h) [Reset = 00000000h]

CSI2_CTX0_IRQSTATUS is shown in Table 11-1701.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 11-1701. CSI2_CTX0_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

11.6.1.1.3.5.2.25 CSI2_CTX0_CTRL3 Register (Offset = 8Ch) [Reset = 00000000h]

CSI2_CTX0_CTRL3 is shown in Table 11-1702.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1702. CSI2_CTX0_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

11.6.1.1.3.5.2.26 CSI2_CTX1_CTRL1 Register (Offset = 90h) [Reset = 00010008h]

CSI2_CTX1_CTRL1 is shown in Table 11-1703.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1703. CSI2_CTX1_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 2: Outputs DPCM compressed RAW12 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 3: Outputs ALAW compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data. 0x 4: Outputs uncompressed RAW8 data. Data in memory is organized as regular RAW8 data 0x 5: Outputs uncompressed RAW10 data. Data in memory is organized as regular RAW10+EXP16 data 0x 6: Outputs uncompressed RAW10 data. Data in memory is organized as regular packed RAW10 data 0x 7: Outputs uncompressed RAW12 data. Data in memory is organized as regular RAW12+EXP16 data 0x 8: Outputs uncompressed RAW12 data. Data in memory is organized as regular packed RAW12 data 0x 9: Outputs uncompressed RAW14 data.
23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 11-1703. CSI2_CTX1_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

11.6.1.1.3.5.2.27 CSI2_CTX1_CTRL2 Register (Offset = 94h) [Reset = 00000000h]

CSI2_CTX1_CTRL2 is shown in Table 11-1704.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 11-1704. CSI2_CTX1_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)
12-11	VIRTUAL_ID	R/W	0h	Virtual channel ID 0x 0: Virtual Channel ID 0 0x 1: Virtual Channel ID 1 0x 2: Virtual Channel ID 2 0x 3: Virtual Channel ID 3
10	DPCM_PRED	R/W	0h	Selects the DPCM predictor. 0: The advanced predictor is used. Not supported for 10 – 8 – 10 algorithm. Performance limited to 1 pixel/cycle. 1: The simple predictor is used.

Table 11-1704. CSI2_CTX1_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-0	FORMAT	R/W	0h	Data format selection. 0x 000: OTHERS (except NULL and BLANKING packets) 0x 012: Embedded 8-bit non-image data (e.g. JPEG) 0x 018: YUV420 8bit 0x 019: YUV420 10bit 0x01A: YUV420 8bit legacy 0x01C: YUV420 8bit + CSPS 0x01D: YUV420 10bit + CSPS 0x01E: YUV422 8bit 0x01F: YUV422 10bit 0x 022: RGB565 0x 024: RGB888 0x 028: RAW6 0x 029: RAW7 0x02A: RAW8 0x02B: RAW10 0x02C: RAW12 0x02D: RAW14 0x 033: RGB666 + EXP32_24 0x 040: USER_DEFINED_8_BIT_DATA_TYPE_1 0x 041: USER_DEFINED_8_BIT_DATA_TYPE_2 0x 042: USER_DEFINED_8_BIT_DATA_TYPE_3 0x 043: USER_DEFINED_8_BIT_DATA_TYPE_4 0x 044: USER_DEFINED_8_BIT_DATA_TYPE_5 0x 045: USER_DEFINED_8_BIT_DATA_TYPE_6 0x 046: USER_DEFINED_8_BIT_DATA_TYPE_7 0x 047: USER_DEFINED_8_BIT_DATA_TYPE_8 0x 068: RAW6 + EXP8 0x 069: RAW7 + EXP8 0x 080: USER_DEFINED_8_BIT_DATA_TYPE_1 + EXP8 0x 081: USER_DEFINED_8_BIT_DATA_TYPE_2 + EXP8 0x 082: USER_DEFINED_8_BIT_DATA_TYPE_3 + EXP8 0x 083: USER_DEFINED_8_BIT_DATA_TYPE_4 + EXP8 0x 084: USER_DEFINED_8_BIT_DATA_TYPE_5 + EXP8 0x 085: USER_DEFINED_8_BIT_DATA_TYPE_6 + EXP8 0x 086: USER_DEFINED_8_BIT_DATA_TYPE_7 + EXP8 0x 087: USER_DEFINED_8_BIT_DATA_TYPE_8 + EXP8 0x09E: YUV422 8bit + VP 0x0A 0: RGB444 + EXP16 0x0A 1: RGB555 + EXP16 0x0AB: RAW10 + EXP16 0x0AC: RAW12 + EXP16 0x0AD: RAW14 + EXP16 0x0DE: Same as YUV422 8bit + VP but data is send as 16-bit wide words to video port. 11.6.1.1.3.5.2.28 CSI2_CTX1_DAT_OFST Register (Offset = 98h) [Reset = 00000000h]

CSI2_CTX1_DAT_OFST is shown in Table 11-1705.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 11-1705. CSI2_CTX1_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ (2^{17}-1)
4-0	RESERVED	R	0h	

11.6.1.1.3.5.2.29 CSI2_CTX1_DAT_PING_ADDR Register (Offset = 9Ch) [Reset = 00000000h]

CSI2_CTX1_DAT_PING_ADDR is shown in Table 11-1706.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 11-1706. CSI2_CTX1_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.30 CSI2_CTX1_DAT_PONG_ADDR Register (Offset = A0h) [Reset = 00000000h]

CSI2_CTX1_DAT_PONG_ADDR is shown in Table 11-1707.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 11-1707. CSI2_CTX1_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.31 CSI2_CTX1_IRQENABLE Register (Offset = A4h) [Reset = 00000000h]

CSI2_CTX1_IRQENABLE is shown in Table 11-1708.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 11-1708. CSI2_CTX1_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

11.6.1.1.3.5.2.32 CSI2_CTX1_IRQSTATUS Register (Offset = A8h) [Reset = 00000000h]

CSI2_CTX1_IRQSTATUS is shown in Table 11-1709.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 11-1709. CSI2_CTX1_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

11.6.1.1.3.5.2.33 CSI2_CTX1_CTRL3 Register (Offset = ACh) [Reset = 00000000h]

CSI2_CTX1_CTRL3 is shown in Table 11-1710.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1710. CSI2_CTX1_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

11.6.1.1.3.5.2.34 CSI2_CTX2_CTRL1 Register (Offset = B0h) [Reset = 00010008h]

CSI2_CTX2_CTRL1 is shown in Table 11-1711.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1711. CSI2_CTX2_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 2: Outputs DPCM compressed RAW12 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 3: Outputs ALAW compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data. 0x 4: Outputs uncompressed RAW8 data. Data in memory is organized as regular RAW8 data 0x 5: Outputs uncompressed RAW10 data. Data in memory is organized as regular RAW10+EXP16 data 0x 6: Outputs uncompressed RAW10 data. Data in memory is organized as regular packed RAW10 data 0x 7: Outputs uncompressed RAW12 data. Data in memory is organized as regular RAW12+EXP16 data 0x 8: Outputs uncompressed RAW12 data. Data in memory is organized as regular packed RAW12 data 0x 9: Outputs uncompressed RAW14 data.
23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 11-1711. CSI2_CTX2_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

11.6.1.1.3.5.2.35 CSI2_CTX2_CTRL2 Register (Offset = B4h) [Reset = 00000000h]

CSI2_CTX2_CTRL2 is shown in Table 11-1712.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 11-1712. CSI2_CTX2_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)
12-11	VIRTUAL_ID	R/W	0h	Virtual channel ID 0x 0: Virtual Channel ID 0 0x 1: Virtual Channel ID 1 0x 2: Virtual Channel ID 2 0x 3: Virtual Channel ID 3
10	DPCM_PRED	R/W	0h	Selects the DPCM predictor. 0: The advanced predictor is used. Not supported for 10 – 8 – 10 algorithm. Performance limited to 1 pixel/cycle. 1: The simple predictor is used.

11.6.1.1.3.5.2.36 CSI2_CTX2_DAT_OFST Register (Offset = B8h) [Reset = 00000000h]

CSI2_CTX2_DAT_OFST is shown in Table 11-1713.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 11-1713. CSI2_CTX2_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ (2^{17}-1)
4-0	RESERVED	R	0h	

11.6.1.1.3.5.2.37 CSI2_CTX2_DAT_PING_ADDR Register (Offset = BCh) [Reset = 00000000h]

CSI2_CTX2_DAT_PING_ADDR is shown in Table 11-1714.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 11-1714. CSI2_CTX2_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.38 CSI2_CTX2_DAT_PONG_ADDR Register (Offset = C0h) [Reset = 00000000h]

CSI2_CTX2_DAT_PONG_ADDR is shown in Table 11-1715.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 11-1715. CSI2_CTX2_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.39 CSI2_CTX2_IRQENABLE Register (Offset = C4h) [Reset = 00000000h]

CSI2_CTX2_IRQENABLE is shown in Table 11-1716.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 11-1716. CSI2_CTX2_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

11.6.1.1.3.5.2.40 CSI2_CTX2_IRQSTATUS Register (Offset = C8h) [Reset = 00000000h]

CSI2_CTX2_IRQSTATUS is shown in Table 11-1717.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 11-1717. CSI2_CTX2_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

11.6.1.1.3.5.2.41 CSI2_CTX2_CTRL3 Register (Offset = CCh) [Reset = 00000000h]

CSI2_CTX2_CTRL3 is shown in Table 11-1718.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1718. CSI2_CTX2_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

11.6.1.1.3.5.2.42 CSI2_CTX3_CTRL1 Register (Offset = D0h) [Reset = 00010008h]

CSI2_CTX3_CTRL1 is shown in Table 11-1719.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1719. CSI2_CTX3_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. 11.6.1.1.3.5.2.44 CSI2_CTX3_DAT_OFST Register (Offset = D8h) [Reset = 00000000h]

CSI2_CTX3_DAT_OFST is shown in Table 11-1721.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 11-1721. CSI2_CTX3_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ (2^{17}-1)
4-0	RESERVED	R	0h	

11.6.1.1.3.5.2.45 CSI2_CTX3_DAT_PING_ADDR Register (Offset = DCh) [Reset = 00000000h]

CSI2_CTX3_DAT_PING_ADDR is shown in Table 11-1722.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 11-1722. CSI2_CTX3_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.46 CSI2_CTX3_DAT_PONG_ADDR Register (Offset = E0h) [Reset = 00000000h]

CSI2_CTX3_DAT_PONG_ADDR is shown in Table 11-1723.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 11-1723. CSI2_CTX3_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.47 CSI2_CTX3_IRQENABLE Register (Offset = E4h) [Reset = 00000000h]

CSI2_CTX3_IRQENABLE is shown in Table 11-1724.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 11-1724. CSI2_CTX3_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

11.6.1.1.3.5.2.48 CSI2_CTX3_IRQSTATUS Register (Offset = E8h) [Reset = 00000000h]

CSI2_CTX3_IRQSTATUS is shown in Table 11-1725.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 11-1725. CSI2_CTX3_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

11.6.1.1.3.5.2.49 CSI2_CTX3_CTRL3 Register (Offset = ECh) [Reset = 00000000h]

CSI2_CTX3_CTRL3 is shown in Table 11-1726.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1726. CSI2_CTX3_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

11.6.1.1.3.5.2.50 CSI2_CTX4_CTRL1 Register (Offset = F0h) [Reset = 00010008h]

CSI2_CTX4_CTRL1 is shown in Table 11-1727.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1727. CSI2_CTX4_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 2: Outputs DPCM compressed RAW12 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 3: Outputs ALAW compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data. 0x 4: Outputs uncompressed RAW8 data. Data in memory is organized as regular RAW8 data 0x 5: Outputs uncompressed RAW10 data. Data in memory is organized as regular RAW10+EXP16 data 0x 6: Outputs uncompressed RAW10 data. Data in memory is organized as regular packed RAW10 data 0x 7: Outputs uncompressed RAW12 data. Data in memory is organized as regular RAW12+EXP16 data 0x 8: Outputs uncompressed RAW12 data. Data in memory is organized as regular packed RAW12 data 0x 9: Outputs uncompressed RAW14 data.
23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 11-1727. CSI2_CTX4_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

11.6.1.1.3.5.2.51 CSI2_CTX4_CTRL2 Register (Offset = F4h) [Reset = 00000000h]

CSI2_CTX4_CTRL2 is shown in Table 11-1728.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 11-1728. CSI2_CTX4_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)
12-11	VIRTUAL_ID	R/W	0h	Virtual channel ID 0x 0: Virtual Channel ID 0 0x 1: Virtual Channel ID 1 0x 2: Virtual Channel ID 2 0x 3: Virtual Channel ID 3
10	DPCM_PRED	R/W	0h	Selects the DPCM predictor. 0: The advanced predictor is used. Not supported for 10 – 8 – 10 algorithm. Performance limited to 1 pixel/cycle. 1: The simple predictor is used.

				0: USER_DEFINED_8_BIT_DATA_TYPE_1 + DPCM10 + EXP16 0x2C 1: USER_DEFINED_8_BIT_DATA_TYPE_2 + DPCM10 + EXP16 0x2C 2: USER_DEFINED_8_BIT_DATA_TYPE_3 + DPCM10 + EXP16 0x2C 3: USER_DEFINED_8_BIT_DATA_TYPE_4 + DPCM10 + EXP16 0x2C 4: USER_DEFINED_8_BIT_DATA_TYPE_5 + DPCM10 + EXP16 0x2C 5: USER_DEFINED_8_BIT_DATA_TYPE_6 + DPCM10 + EXP16 0x2C 6: USER_DEFINED_8_BIT_DATA_TYPE_7 + DPCM10 + EXP16 0x2C 7: USER_DEFINED_8_BIT_DATA_TYPE_8 + DPCM10 + EXP16 0x 329: RAW7 + DPCM10 + VP 0x32A: RAW8 + DPCM10 + VP 0x 340: USER_DEFINED_8_BIT_DATA_TYPE_1 + DPCM10 + VP 0x 341: USER_DEFINED_8_BIT_DATA_TYPE_2 + DPCM10 + VP 0x 342: USER_DEFINED_8_BIT_DATA_TYPE_3 + DPCM10 + VP 0x 343: USER_DEFINED_8_BIT_DATA_TYPE_4 + DPCM10 + VP 0x 344: USER_DEFINED_8_BIT_DATA_TYPE_5 + DPCM10 + VP 0x 345: USER_DEFINED_8_BIT_DATA_TYPE_6 + DPCM10 + VP 0x 346: USER_DEFINED_8_BIT_DATA_TYPE_7 + DPCM10 + VP 0x 347: USER_DEFINED_8_BIT_DATA_TYPE_8 + DPCM10 + VP 0x 368: RAW6 DPCM12 + VP 0x 369: RAW7 DPCM12 + EXP16 0x36A: RAW8 DPCM12 + EXP16 0x3A 8: RAW6 DPCM12 + EXP16 0x3A 9: RAW7 DPCM12 + VP 0x3AA: RAW8 DPCM12 + VP

11.6.1.1.3.5.2.52 CSI2_CTX4_DAT_OFST Register (Offset = F8h) [Reset = 00000000h]

CSI2_CTX4_DAT_OFST is shown in Table 11-1729.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 11-1729. CSI2_CTX4_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ (2^{17}-1)
4-0	RESERVED	R	0h	

11.6.1.1.3.5.2.53 CSI2_CTX4_DAT_PING_ADDR Register (Offset = FCh) [Reset = 00000000h]

CSI2_CTX4_DAT_PING_ADDR is shown in Table 11-1730.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 11-1730. CSI2_CTX4_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.54 CSI2_CTX4_DAT_PONG_ADDR Register (Offset = 100h) [Reset = 00000000h]

CSI2_CTX4_DAT_PONG_ADDR is shown in Table 11-1731.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 11-1731. CSI2_CTX4_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.55 CSI2_CTX4_IRQENABLE Register (Offset = 104h) [Reset = 00000000h]

CSI2_CTX4_IRQENABLE is shown in Table 11-1732.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 11-1732. CSI2_CTX4_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

11.6.1.1.3.5.2.56 CSI2_CTX4_IRQSTATUS Register (Offset = 108h) [Reset = 00000000h]

CSI2_CTX4_IRQSTATUS is shown in Table 11-1733.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 11-1733. CSI2_CTX4_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

11.6.1.1.3.5.2.57 CSI2_CTX4_CTRL3 Register (Offset = 10Ch) [Reset = 00000000h]

CSI2_CTX4_CTRL3 is shown in Table 11-1734.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1734. CSI2_CTX4_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

11.6.1.1.3.5.2.58 CSI2_CTX5_CTRL1 Register (Offset = 110h) [Reset = 00010008h]

CSI2_CTX5_CTRL1 is shown in Table 11-1735.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1735. CSI2_CTX5_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 2: Outputs DPCM compressed RAW12 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 3: Outputs ALAW compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data. 0x 4: Outputs uncompressed RAW8 data. Data in memory is organized as regular RAW8 data 0x 5: Outputs uncompressed RAW10 data. Data in memory is organized as regular RAW10+EXP16 data 0x 6: Outputs uncompressed RAW10 data. Data in memory is organized as regular packed RAW10 data 0x 7: Outputs uncompressed RAW12 data. Data in memory is organized as regular RAW12+EXP16 data 0x 8: Outputs uncompressed RAW12 data. Data in memory is organized as regular packed RAW12 data 0x 9: Outputs uncompressed RAW14 data.
23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 11-1735. CSI2_CTX5_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

11.6.1.1.3.5.2.59 CSI2_CTX5_CTRL2 Register (Offset = 114h) [Reset = 00000000h]

CSI2_CTX5_CTRL2 is shown in Table 11-1736.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 11-1736. CSI2_CTX5_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)
12-11	VIRTUAL_ID	R/W	0h	Virtual channel ID 0x 0: Virtual Channel ID 0 0x 1: Virtual Channel ID 1 0x 2: Virtual Channel ID 2 0x 3: Virtual Channel ID 3
10	DPCM_PRED	R/W	0h	Selects the DPCM predictor. 0: The advanced predictor is used. Not supported for 10 – 8 – 10 algorithm. Performance limited to 1 pixel/cycle. 1: The simple predictor is used.

Table 11-1736. CSI2_CTX5_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-0	FORMAT	R/W	0h	Data format selection. 0x 000: OTHERS (except NULL and BLANKING packets) 0x 012: Embedded 8-bit non-image data (e.g. JPEG) 0x 018: YUV420 8bit 0x 019: YUV420 10bit 0x01A: YUV420 8bit legacy 0x01C: YUV420 8bit + CSPS 0x01D: YUV420 10bit + CSPS 0x01E: YUV422 8bit 0x01F: YUV422 10bit 0x 022: RGB565 0x 024: RGB888 0x 028: RAW6 0x 029: RAW7 0x02A: RAW8 0x02B: RAW10 0x02C: RAW12 0x02D: RAW14 0x 033: RGB666 + EXP32_24 0x 040: USER_DEFINED_8_BIT_DATA_TYPE_1 0x 041: USER_DEFINED_8_BIT_DATA_TYPE_2 0x 042: USER_DEFINED_8_BIT_DATA_TYPE_3 0x 043: USER_DEFINED_8_BIT_DATA_TYPE_4 0x 044: USER_DEFINED_8_BIT_DATA_TYPE_5 0x 045: USER_DEFINED_8_BIT_DATA_TYPE_6 0x 046: USER_DEFINED_8_BIT_DATA_TYPE_7 0x 047: USER_DEFINED_8_BIT_DATA_TYPE_8 0x 068: RAW6 + EXP8 0x 069: RAW7 + EXP8 0x 080: USER_DEFINED_8_BIT_DATA_TYPE_1 + EXP8 0x 081: USER_DEFINED_8_BIT_DATA_TYPE_2 + EXP8 0x 082: USER_DEFINED_8_BIT_DATA_TYPE_3 + EXP8 0x 083: USER_DEFINED_8_BIT_DATA_TYPE_4 + EXP8 0x 084: USER_DEFINED_8_BIT_DATA_TYPE_5 + EXP8 0x 085: USER_DEFINED_8_BIT_DATA_TYPE_6 + EXP8 0x 086: USER_DEFINED_8_BIT_DATA_TYPE_7 + EXP8 0x 087: USER_DEFINED_8_BIT_DATA_TYPE_8 + EXP8 0x09E: YUV422 8bit + VP 0x0A 0: RGB444 + EXP16 0x0A 1: RGB555 + EXP16 0x0AB: RAW10 + EXP16 0x0AC: RAW12 + EXP16 0x0AD: RAW14 + EXP16 0x0DE: Same as YUV422 8bit + VP but data is send as 16-bit wide words to video port. 11.6.1.1.3.5.2.60 CSI2_CTX5_DAT_OFST Register (Offset = 118h) [Reset = 00000000h]

CSI2_CTX5_DAT_OFST is shown in Table 11-1737.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 11-1737. CSI2_CTX5_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ (2^{17}-1)
4-0	RESERVED	R	0h	

11.6.1.1.3.5.2.61 CSI2_CTX5_DAT_PING_ADDR Register (Offset = 11Ch) [Reset = 00000000h]

CSI2_CTX5_DAT_PING_ADDR is shown in Table 11-1738.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 11-1738. CSI2_CTX5_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.62 CSI2_CTX5_DAT_PONG_ADDR Register (Offset = 120h) [Reset = 00000000h]

CSI2_CTX5_DAT_PONG_ADDR is shown in Table 11-1739.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 11-1739. CSI2_CTX5_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.63 CSI2_CTX5_IRQENABLE Register (Offset = 124h) [Reset = 00000000h]

CSI2_CTX5_IRQENABLE is shown in Table 11-1740.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 11-1740. CSI2_CTX5_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

11.6.1.1.3.5.2.64 CSI2_CTX5_IRQSTATUS Register (Offset = 128h) [Reset = 00000000h]

CSI2_CTX5_IRQSTATUS is shown in Table 11-1741.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 11-1741. CSI2_CTX5_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

11.6.1.1.3.5.2.65 CSI2_CTX5_CTRL3 Register (Offset = 12Ch) [Reset = 00000000h]

CSI2_CTX5_CTRL3 is shown in Table 11-1742.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1742. CSI2_CTX5_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

11.6.1.1.3.5.2.66 CSI2_CTX6_CTRL1 Register (Offset = 130h) [Reset = 00010008h]

CSI2_CTX6_CTRL1 is shown in Table 11-1743.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1743. CSI2_CTX6_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.
29	RES19	R	0h	RESERVE FIELD
28	HSCALE	R/W	0h	Enable horizontal downscaling by a factor of two. Applies to RAW data when transcoding is enabled. Must be disabled when transcoding is disabled. 0: Disable 1: Enable
27-24	TRANSCODE	R/W	0h	Enables image transcoding. When this features is enabled: - the data format from the camera is defined by the FORMAT register - the format after transcode is defined by the TRANSCODE register. The memory storage / video port formats is defined by the TRANSCODE register 0x 0: Feature disabled. 0x 1: Outputs DPCM compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 2: Outputs DPCM compressed RAW12 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data 0x 3: Outputs ALAW compressed RAW10 data. After compression, pixels are coded on 8 bits. Data in memory is organized as regular RAW8 data. 0x 4: Outputs uncompressed RAW8 data. Data in memory is organized as regular RAW8 data 0x 5: Outputs uncompressed RAW10 data. Data in memory is organized as regular RAW10+EXP16 data 0x 6: Outputs uncompressed RAW10 data. Data in memory is organized as regular packed RAW10 data 0x 7: Outputs uncompressed RAW12 data. Data in memory is organized as regular RAW12+EXP16 data 0x 8: Outputs uncompressed RAW12 data. Data in memory is organized as regular packed RAW12 data 0x 9: Outputs uncompressed RAW14 data.
23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 11-1743. CSI2_CTX6_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

11.6.1.1.3.5.2.67 CSI2_CTX6_CTRL2 Register (Offset = 134h) [Reset = 00000000h]

CSI2_CTX6_CTRL2 is shown in Table 11-1744.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 11-1744. CSI2_CTX6_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)
12-11	VIRTUAL_ID	R/W	0h	Virtual channel ID 0x 0: Virtual Channel ID 0 0x 1: Virtual Channel ID 1 0x 2: Virtual Channel ID 2 0x 3: Virtual Channel ID 3
10	DPCM_PRED	R/W	0h	Selects the DPCM predictor. 0: The advanced predictor is used. Not supported for 10 – 8 – 10 algorithm. Performance limited to 1 pixel/cycle. 1: The simple predictor is used.

Table 11-1744. CSI2_CTX6_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-0	FORMAT	R/W	0h	Data format selection. 0x 000: OTHERS (except NULL and BLANKING packets) 0x 012: Embedded 8-bit non-image data (e.g. JPEG) 0x 018: YUV420 8bit 0x 019: YUV420 10bit 0x01A: YUV420 8bit legacy 0x01C: YUV420 8bit + CSPS 0x01D: YUV420 10bit + CSPS 0x01E: YUV422 8bit 0x01F: YUV422 10bit 0x 022: RGB565 0x 024: RGB888 0x 028: RAW6 0x 029: RAW7 0x02A: RAW8 0x02B: RAW10 0x02C: RAW12 0x02D: RAW14 0x 033: RGB666 + EXP32_24 0x 040: USER_DEFINED_8_BIT_DATA_TYPE_1 0x 041: USER_DEFINED_8_BIT_DATA_TYPE_2 0x 042: USER_DEFINED_8_BIT_DATA_TYPE_3 0x 043: USER_DEFINED_8_BIT_DATA_TYPE_4 0x 044: USER_DEFINED_8_BIT_DATA_TYPE_5 0x 045: USER_DEFINED_8_BIT_DATA_TYPE_6 0x 046: USER_DEFINED_8_BIT_DATA_TYPE_7 0x 047: USER_DEFINED_8_BIT_DATA_TYPE_8 0x 068: RAW6 + EXP8 0x 069: RAW7 + EXP8 0x 080: USER_DEFINED_8_BIT_DATA_TYPE_1 + EXP8 0x 081: USER_DEFINED_8_BIT_DATA_TYPE_2 + EXP8 0x 082: USER_DEFINED_8_BIT_DATA_TYPE_3 + EXP8 0x 083: USER_DEFINED_8_BIT_DATA_TYPE_4 + EXP8 0x 084: USER_DEFINED_8_BIT_DATA_TYPE_5 + EXP8 0x 085: USER_DEFINED_8_BIT_DATA_TYPE_6 + EXP8 0x 086: USER_DEFINED_8_BIT_DATA_TYPE_7 + EXP8 0x 087: USER_DEFINED_8_BIT_DATA_TYPE_8 + EXP8 0x09E: YUV422 8bit + VP 0x0A 0: RGB444 + EXP16 0x0A 1: RGB555 + EXP16 0x0AB: RAW10 + EXP16 0x0AC: RAW12 + EXP16 0x0AD: RAW14 + EXP16 0x0DE: Same as YUV422 8bit + VP but data is send as 16-bit wide words to video port. 11.6.1.1.3.5.2.68 CSI2_CTX6_DAT_OFST Register (Offset = 138h) [Reset = 00000000h]

CSI2_CTX6_DAT_OFST is shown in Table 11-1745.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 11-1745. CSI2_CTX6_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ (2^{17}-1)
4-0	RESERVED	R	0h	

11.6.1.1.3.5.2.69 CSI2_CTX6_DAT_PING_ADDR Register (Offset = 13Ch) [Reset = 00000000h]

CSI2_CTX6_DAT_PING_ADDR is shown in Table 11-1746.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 11-1746. CSI2_CTX6_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.70 CSI2_CTX6_DAT_PONG_ADDR Register (Offset = 140h) [Reset = 00000000h]

CSI2_CTX6_DAT_PONG_ADDR is shown in Table 11-1747.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 11-1747. CSI2_CTX6_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.71 CSI2_CTX6_IRQENABLE Register (Offset = 144h) [Reset = 00000000h]

CSI2_CTX6_IRQENABLE is shown in Table 11-1748.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 11-1748. CSI2_CTX6_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

11.6.1.1.3.5.2.72 CSI2_CTX6_IRQSTATUS Register (Offset = 148h) [Reset = 00000000h]

CSI2_CTX6_IRQSTATUS is shown in Table 11-1749.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 11-1749. CSI2_CTX6_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

11.6.1.1.3.5.2.73 CSI2_CTX6_CTRL3 Register (Offset = 14Ch) [Reset = 00000000h]

CSI2_CTX6_CTRL3 is shown in Table 11-1750.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1750. CSI2_CTX6_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

11.6.1.1.3.5.2.74 CSI2_CTX7_CTRL1 Register (Offset = 150h) [Reset = 00010008h]

CSI2_CTX7_CTRL1 is shown in Table 11-1751.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1751. CSI2_CTX7_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BYTESWAP	R/W	0h	Allows swapping bytes two by two in the payload data. It doesn't affect - short packets - long packet header or footers - CRC calculation The purpose is to by swap data send to the OCP port and/or video port 0: Disabled 1: Enabled
30	GENERIC	R/W	0h	Enables the generic mode. 0: Disabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is used. 1: Enabled. Data is received according to CSI2_CTX_CTRL1.FORMAT and the long packet code transmitted in the MIPI stream is ignored.

Data in memory is organized as regular RAW8 data. 0x 4: Outputs uncompressed RAW8 data. Data in memory is organized as regular RAW8 data 0x 5: Outputs uncompressed RAW10 data. Data in memory is organized as regular RAW10+EXP16 data 0x 6: Outputs uncompressed RAW10 data. Data in memory is organized as regular packed RAW10 data 0x 7: Outputs uncompressed RAW12 data. Data in memory is organized as regular RAW12+EXP16 data 0x 8: Outputs uncompressed RAW12 data. Data in memory is organized as regular packed RAW12 data 0x 9: Outputs uncompressed RAW14 data.
23-16	FEC_NUMBER	R/W	1h	Number of FEC to receive between using swap of CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR for the calculation of the address in memory. (shall be used only in interlace mode, otherwise set to '1')

Table 11-1751. CSI2_CTX7_CTRL1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15-8	COUNT	R/W	0h	Sets the number of frame to acquire. Once the frame acquisition starts, the COUNT value is decremented after every frame. When COUNT reaches 0, the FRAME_NUMBER_IRQ interrupt is triggered and CTX_EN is set to '0'. Writes to this bit field are controlled by the COUNT_UNLOCK bit. During the same OCP write access , the bit-field COUNT_UNLOCK shall be written in addition to COUNT bit-field in order to change the COUNT value. COUNT can be overwritten dynamically with a new count value." 0: Infinite number of frames (no count). 1: 1 frame to acquire ... 255: 255 frames to acquire.
7	EOF_EN	R/W	0h	Indicates if the end of frame signal shall be asserted at the end of the frame Read 0: The end of frame signal is not asserted at the end of each frame. Read 1: The end of frame signal is asserted at the end of each frame.
6	EOL_EN	R/W	0h	Indicates if the end of line signal shall be asserted at the end of the line. Read 0: The end of line signal is not asserted at the end of each frame. Read 1: The end of line signal is asserted at the end of each frame.
5	CS_EN	R/W	0h	Enables the checksum check for the received payload (long packet only). 0: Disabled 1: Enabled
4	COUNT_UNLOCK	W	0h	Unlock writes to the COUNT bit field. Write 0: COUNT bit field is locked. Writes have no effect Write 1: COUNT bit field is unlocked. Writes are possible.
3	PING_PONG	R	1h	Indicates whether the PING or PONG destination address (CSI2_CTX_DAT_PING_ADDR or CSI2_CTX_DAT_PONG_ADDR) was used to write the last frame. This bit field toggles after every FEC_NUMBER FEC sync code received for the current context. Read 0: PING buffer Read 1: PONG buffer
2	VP_FORCE	R/W	0h	RESERVE FIELD
1	LINE_MODULO	R/W	0h	Line modulo configuration 0: CSI2_CTX_CTRL3.LINE_NUMBER is used once per frame for the generation of the LINE_NUMBER_IRQ. 1: CSI2_CTX_CTRL3.LINE_NUMBER is used as a modulo number for the generation of the LINE_NUMBER_IRQ (multiple times the interrupt can be generated for each frame)
0	CTX_EN	R/W	0h	Enables the Context 0: Disabled 1: Enabled

11.6.1.1.3.5.2.75 CSI2_CTX7_CTRL2 Register (Offset = 154h) [Reset = 00000000h]

CSI2_CTX7_CTRL2 is shown in Table 11-1752.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code (except for VIRTUAL_ID and FORMAT fields). The change of VIRTUIAL_ID and FORMAT ha

Table 11-1752. CSI2_CTX7_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	FRAME	R	0h	Frame number. The CSI-2 protocol engine extracts the frame number from the SOF short packet sent by the camera.
15	RES20	R	0h	RESERVE FIELD
14-13	USER_DEF_MAPPING	R/W	0h	Selects the pixel format of USER_DEFINED in FORMAT 0x 0: RAW6 0x 1: RAW7 0x 2: RAW8 (not valid if FORMAT is USER_DEFINED_8_BIT_DATA_TYPE_x_EXP8 with x from 1 to 8)
12-11	VIRTUAL_ID	R/W	0h	Virtual channel ID 0x 0: Virtual Channel ID 0 0x 1: Virtual Channel ID 1 0x 2: Virtual Channel ID 2 0x 3: Virtual Channel ID 3
10	DPCM_PRED	R/W	0h	Selects the DPCM predictor. 0: The advanced predictor is used. Not supported for 10 – 8 – 10 algorithm. Performance limited to 1 pixel/cycle. 1: The simple predictor is used.

Table 11-1752. CSI2_CTX7_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9-0	FORMAT	R/W	0h	Data format selection. 0x 000: OTHERS (except NULL and BLANKING packets) 0x 012: Embedded 8-bit non-image data (e.g. JPEG) 0x 018: YUV420 8bit 0x 019: YUV420 10bit 0x01A: YUV420 8bit legacy 0x01C: YUV420 8bit + CSPS 0x01D: YUV420 10bit + CSPS 0x01E: YUV422 8bit 0x01F: YUV422 10bit 0x 022: RGB565 0x 024: RGB888 0x 028: RAW6 0x 029: RAW7 0x02A: RAW8 0x02B: RAW10 0x02C: RAW12 0x02D: RAW14 0x 033: RGB666 + EXP32_24 0x 040: USER_DEFINED_8_BIT_DATA_TYPE_1 0x 041: USER_DEFINED_8_BIT_DATA_TYPE_2 0x 042: USER_DEFINED_8_BIT_DATA_TYPE_3 0x 043: USER_DEFINED_8_BIT_DATA_TYPE_4 0x 044: USER_DEFINED_8_BIT_DATA_TYPE_5 0x 045: USER_DEFINED_8_BIT_DATA_TYPE_6 0x 046: USER_DEFINED_8_BIT_DATA_TYPE_7 0x 047: USER_DEFINED_8_BIT_DATA_TYPE_8 0x 068: RAW6 + EXP8 0x 069: RAW7 + EXP8 0x 080: USER_DEFINED_8_BIT_DATA_TYPE_1 + EXP8 0x 081: USER_DEFINED_8_BIT_DATA_TYPE_2 + EXP8 0x 082: USER_DEFINED_8_BIT_DATA_TYPE_3 + EXP8 0x 083: USER_DEFINED_8_BIT_DATA_TYPE_4 + EXP8 0x 084: USER_DEFINED_8_BIT_DATA_TYPE_5 + EXP8 0x 085: USER_DEFINED_8_BIT_DATA_TYPE_6 + EXP8 0x 086: USER_DEFINED_8_BIT_DATA_TYPE_7 + EXP8 0x 087: USER_DEFINED_8_BIT_DATA_TYPE_8 + EXP8 0x09E: YUV422 8bit + VP 0x0A 0: RGB444 + EXP16 0x0A 1: RGB555 + EXP16 0x0AB: RAW10 + EXP16 0x0AC: RAW12 + EXP16 0x0AD: RAW14 + EXP16 0x0DE: Same as YUV422 8bit + VP but data is send as 16-bit wide words to video port. 11.6.1.1.3.5.2.76 CSI2_CTX7_DAT_OFST Register (Offset = 158h) [Reset = 00000000h]

CSI2_CTX7_DAT_OFST is shown in Table 11-1753.

Return to the Summary Table.

DATA MEM ADDRESS OFFSET REGISTER - Context This register sets the offset which is applied on the destination address after each line is written to memory. This register applies for both CSI2_CTX_DAT_PING_ADDR and CSI2_CTX_DAT_PONG_ADDR.

Table 11-1753. CSI2_CTX7_DAT_OFST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RES21	R	0h	RESERVE FIELD
16-5	OFST	R/W	0h	Line offset programmed in bytes (signed value 2's complement). If OFST = 0, the data is written contiguously in memory. Otherwise, OFST sets the destination offset between the first pixel of the previous line and the first pixel of the current line. Valid range: -2^{17} ~ (2^{17}-1)
4-0	RESERVED	R	0h	

11.6.1.1.3.5.2.77 CSI2_CTX7_DAT_PING_ADDR Register (Offset = 15Ch) [Reset = 00000000h]

CSI2_CTX7_DAT_PING_ADDR is shown in Table 11-1754.

Return to the Summary Table.

DATA MEM PING ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PING address. Double buffering is enabled when the addresses

Table 11-1754. CSI2_CTX7_DAT_PING_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.78 CSI2_CTX7_DAT_PONG_ADDR Register (Offset = 160h) [Reset = 00000000h]

CSI2_CTX7_DAT_PONG_ADDR is shown in Table 11-1755.

Return to the Summary Table.

DATA MEM PONG ADDRESS REGISTER - Context This register sets the 32-bit memory address where the pixel data are stored. The destination is double buffered: this register sets the PONG address. Double buffering is enabled when the addresses

Table 11-1755. CSI2_CTX7_DAT_PONG_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	ADDR	R/W	0h	27 most significant bits of the 32-bit address.
4-0	RES	R	0h	RESERVE FIELD

11.6.1.1.3.5.2.79 CSI2_CTX7_IRQENABLE Register (Offset = 164h) [Reset = 00000000h]

CSI2_CTX7_IRQENABLE is shown in Table 11-1756.

Return to the Summary Table.

INTERRUPT ENABLE REGISTER - Context This register regroups all the events related to Context.

Table 11-1756. CSI2_CTX7_IRQENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES22	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to correct the only 1-bit error (long packet only). 0: Event is masked 1: Event generates an interrupt when it occurs
7	LINE_NUMBER_IRQ	R/W	0h	Context - Line number is reached. 0: Event is masked 1: Event generates an interrupt when it occurs
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached. 0: Event is masked 1: Event generates an interrupt when it occurs
5	CS_IRQ	R/W	0h	Context - Check-Sum of the payload mismatch detection 0: Event is masked 1: Event generates an interrupt when it occurs
4	RES23	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
2	LS_IRQ	R/W	0h	Context - Line start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection. 0: Event is masked 1: Event generates an interrupt when it occurs

11.6.1.1.3.5.2.80 CSI2_CTX7_IRQSTATUS Register (Offset = 168h) [Reset = 00000000h]

CSI2_CTX7_IRQSTATUS is shown in Table 11-1757.

Return to the Summary Table.

INTERRUPT STATUS REGISTER - Context This register regroups all the events related to Context.

Table 11-1757. CSI2_CTX7_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RES24	R	0h	RESERVE FIELD
8	ECC_CORRECTION_IRQ	R/W	0h	Context - ECC has been used to do the correction of the only 1-bit error status (long packet only). 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
7	LINE_NUMBER_IRQ	R/W	0h	Contexc - Line number reached status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
6	FRAME_NUMBER_IRQ	R/W	0h	Context - Frame counter reached status 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
5	CS_IRQ	R/W	0h	Context - Check-Sum mismatch status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
4	RES25	R	0h	RESERVE FIELD
3	LE_IRQ	R/W	0h	Context - Line end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. . - (RW W1toClr)
2	LS_IRQ	R/W	0h	Context - Line start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
1	FE_IRQ	R/W	0h	Context - Frame end sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)
0	FS_IRQ	R/W	0h	Context - Frame start sync code detection status. 0: READS: Event is false. WRITES: Status bit unchanged. 1: READS: Event is true (pending). WRITES: Status bit is reset. - (RW W1toClr)

11.6.1.1.3.5.2.81 CSI2_CTX7_CTRL3 Register (Offset = 16Ch) [Reset = 00000000h]

CSI2_CTX7_CTRL3 is shown in Table 11-1758.

Return to the Summary Table.

CONTROL REGISTER - Context This register controls the Context. This register is shadowed: modifications are taken into account after the next FSC sync code.

Table 11-1758. CSI2_CTX7_CTRL3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R	0h	Reserved
29-16	ALPHA	R/W	0h	When TRANSCODE=0 Alpha value for RGB888, RGB666 and RBG444. When TRANSCODE=1 and BYS=1 Image width, in pixels, acquired from the BYS port.
15-0	LINE_NUMBER	R/W	0h	Line number for the interrupt generation

11.6.1.1.3.5.2.82 CSI2_PHY_CFG_REG0 Register (Offset = 170h) [Reset = 00000427h]

CSI2_PHY_CFG_REG0 is shown in Table 11-1759.

Return to the Summary Table.

Table 11-1759. CSI2_PHY_CFG_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	HS_CLK_CONFIG	R/W	0h	Disable clock missing detector
23-16	RESERVED	R	0h	RESERVED
15-8	THS_TERM	R/W	4h	Ths-term timing parameter in multiples of DDR clock. Effective time for enabling of termination= synchronizer delay + timer delay + LPRX delay + combinational routing delay ~ (1-2)* DDRCLK + THS-TERM + ~ (1-15) ns Programmed value = ceil(12.5 / DDR clock period) –1
7-0	THS_SETTLE	R/W	27h	THS-SETTLE timing parameter in multiples on DDR clock frequency. Effective Ths-settle seen on line (starting to look for sync pattern) = synchronizer delay + timer delay + LPRX delay + combinational routing delay – pipeline delay in HS data path. ~ (1-2)* DDRCLK + THS-SETTLE + ~ (1-15) ns -1*DDRCLK Programmed value = ceil(90 ns / DDR clock period) + 3

11.6.1.1.3.5.2.83 CSI2_PHY_CFG_REG1 Register (Offset = 174h) [Reset = 0002E10Eh]

CSI2_PHY_CFG_REG1 is shown in Table 11-1760.

Return to the Summary Table.

Table 11-1760. CSI2_PHY_CFG_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RSVD2	R/W	0h	Reserved
29	RESETDONECTRLCLK	R	0h	RESETDONECTRLCLK
28	RESETDONERXBYTECLK	R	0h	RESETDONERXBYTECLK
27-26	RSVD1	R/W	0h	Reserved
25	CLK_MISS_DET	R	0h	1: Error in clock missing detector 0: Clock missing detector successful.
24-18	TCLK_TERM	R/W	0h	TCLK_TERM timing parameter in multiples of CTRLCLK Effective time for enabling of termination = synchronizer delay + timer delay + LPRX delay + combinational routing delay ~ (1–2)* CTRLCLK + TCLK_TERM + ~ (1–15) ns Programmed value = ceil(9.5 / CTRLCLK period) – 1
17-10	D_PHY_HS_SYNC_PAT	R/W	B8h	DPHY mode HS sync pattern in byte order (reverse of RW 0xB8 received order) D-PHY mode sync pattern. Default : “10111000”
9-8	CTRLCLK_DIV_FACT	R/W	1h	Divide factor for CTRLCLK for CLKMISS detector
7-0	TCLK_SETTLE	R/W	Eh	TCLK_SETTLE timing parameter in multiples of CTRLCLK Clock Effective TCLK_SETTLE = synchronizer delay + timer delay + LPRX delay + combinational routing delay ~(1–2)* CTRLCLK + Tclk-settle + ~ (1 –15) ns Programmed value = max[3, ceil(155 ns/CTRLCLK period) –1]

11.6.1.1.3.5.2.84 CSI2_PHY_CFG_REG2 Register (Offset = 178h) [Reset = 000000FFh]

CSI2_PHY_CFG_REG2 is shown in Table 11-1761.

Return to the Summary Table.

Table 11-1761. CSI2_PHY_CFG_REG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RXTRIGGERESC0	R/W	0h	Mapping of Trigger escape entry command to PPI output RXTRIGGERESC0
29-28	RXTRIGGERESC1	R/W	0h	Mapping of Trigger escape entry command to PPI output RXTRIGGERESC1
27-26	RXTRIGGERESC2	R/W	0h	Mapping of Trigger escape entry command to PPI output RXTRIGGERESC2.
25-24	RXTRIGGERESC3	R/W	0h	Mapping of Trigger escape entry command to PPI output RXTRIGGERESC3
23-0	CCP2_SYNC_PAT	R/W	FFh	CCP2 mode sync pattern in byte order (reverse of received order)

11.6.1.1.3.5.2.85 CSI2_PHY_CFG_REG3 Register (Offset = 17Ch) [Reset = 00000000h]

CSI2_PHY_CFG_REG3 is shown in Table 11-1762.

Return to the Summary Table.

11.7 Timer Modules

11.7.1 Real-Time Interrupt (RTI) and Watchdog Module

This chapter describes the functionality of the real-time interrupt (RTI) module. The RTI is designed as an operating system timer to support a real time operating system (RTOS).

Note

This chapter describes a superset implementation of the RTI module that includes features and functionality related to DMA and Timebase control. These features are dependent on the device-specific feature content. Consult your device-specific datasheet to determine the applicability of these features to your device being used.

11.7.1.1 Overview

The real-time interrupt (RTI) module provides timer functionality for operating systems and for benchmarking code. The RTI module can incorporate several counters that define the time bases needed for scheduling in the operating system.

The timers also allow you to benchmark certain areas of code by reading the values of the counters at the beginning and the end of the desired code range and calculating the difference between the values.

11.7.1.1.1 Features

The RTI module has the following features:

- Two independent 64 bit counter blocks
- Windowed Watchdog Timer (WWDT) Feature
- Four configurable compares for generating operating system ticks or DMA requests. Each event can be driven by either counter block 0 or counter block 1.
- Fast enabling/disabling of events
- Two time stamp (capture) functions for system or peripheral interrupts, one for each counter block
- Digital windowed watchdog

The RTI does not support the following features:

- External clock supervising circuit to switch to internal prescale counter 0, if external clock source fails to increment in a predefined window.
- Capture events to capture timestamps through recording of timer status.
- Two time-stamp (capture) functions for system or peripheral interrupts, one for each counter block.
- Analog Watchdog via external RC Network to prevent for runaway code.

11.7.1.1.2 Industry Standard Compliance Statement

This module is specifically designed to fulfill the requirements for OSEK (**O**ffene **S**ysteme und deren **S**chnittstellen für die **E**lektronik im **K**raftfahrzeug, or Open Systems and the Corresponding Interfaces for Automotive Electronics) as well as OSEK/time-compliant operating systems, but is not limited to it.

11.7.1.2 Module Operation

Figure 11-416 illustrates the high level block diagram of the RTI module.

The RTI module has two independent counter blocks for generating different timebases: counter block 0 and counter block 1. The two counter blocks provide the same basic functionality.

A compare unit compares the counters with programmable values and generates four independent interrupt or DMA requests on compare matches. Each of the compare registers can be programmed to be compared to either counter block 0 or counter block 1.

The following sections describe the individual functions in more detail.

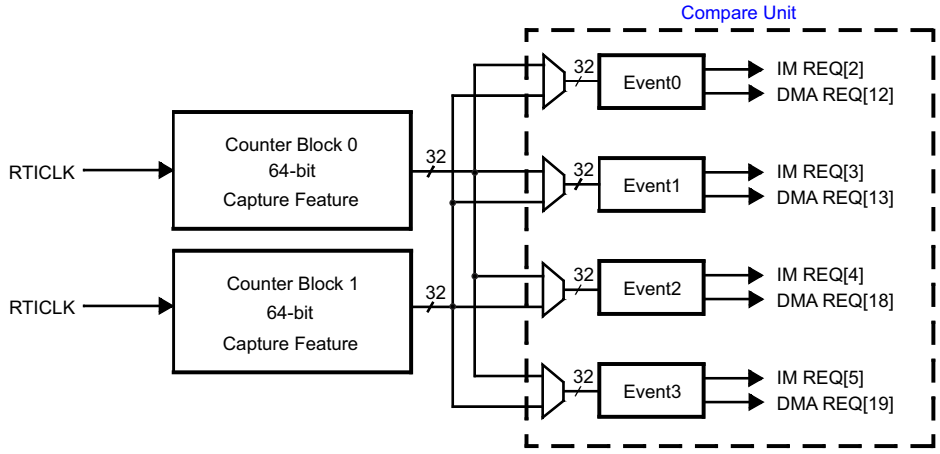

Figure 11-416. RTI Block Diagram

Note

During deep sleep entry, there is a need to disable the WDT warm reset propagation.

The WDT does **not** provide coverage in deep sleep mode. Thus, proper care must be taken by the application to ensure the WDT is not enabled when entering this mode. TOP_PRCM:RST_WDT_RESET_EN[0] must be set to 0.

11.7.1.2.1 Counter Operation

Each counter block consists of the following (see Figure 11-417):

- One 32-bit prescale counter , also called Up Counter (RTIUC0 or RTIUC1)
- One 32-bit free running counter (RTIFRC0 or RTIFRC1)

The RTIUC0/1 is driven by the RTICLK and counts up until the compare value in the compare up counter register (RTICPUC0 or RTICPUC1) is reached. When the compare matches, RTIFRC0/1 is incremented and RTIUC0/1 is reset to 0. If RTIFRC0/1 overflows, an interrupt is generated to the interrupt manager (NVIC/IM). The overflow interrupt is not intended to generate the timebase for the operating system. See Section 11.7.1.2.2 for the timebase generation. The up counter together with the compare up counter value prescale the RTI clock. The resulting formula for the frequency of the free running counter (RTIFRC0/1) is:

$$f_{RTIFRCx} = \begin{cases} \dfrac{f_{RTICLK}}{RTICPUCx + 1} & \text{when RTICPUCx} \neq 0 \\ \dfrac{f_{RTICLK}}{2^{32}+1} & \text{when RTICPUCx} = 0 \end{cases} \quad (9)$$

Note

Setting RTICPUCx equal to zero is not recommended. Doing so will hold the Up Counter at zero for two RTICLK cycles after it overflows from 0xFFFFFFFF to zero.

The counter values can be determined by reading the respective counter registers or by generating a hardware event which captures the counter value into the respective capture register. Both functions are described in the following sections.

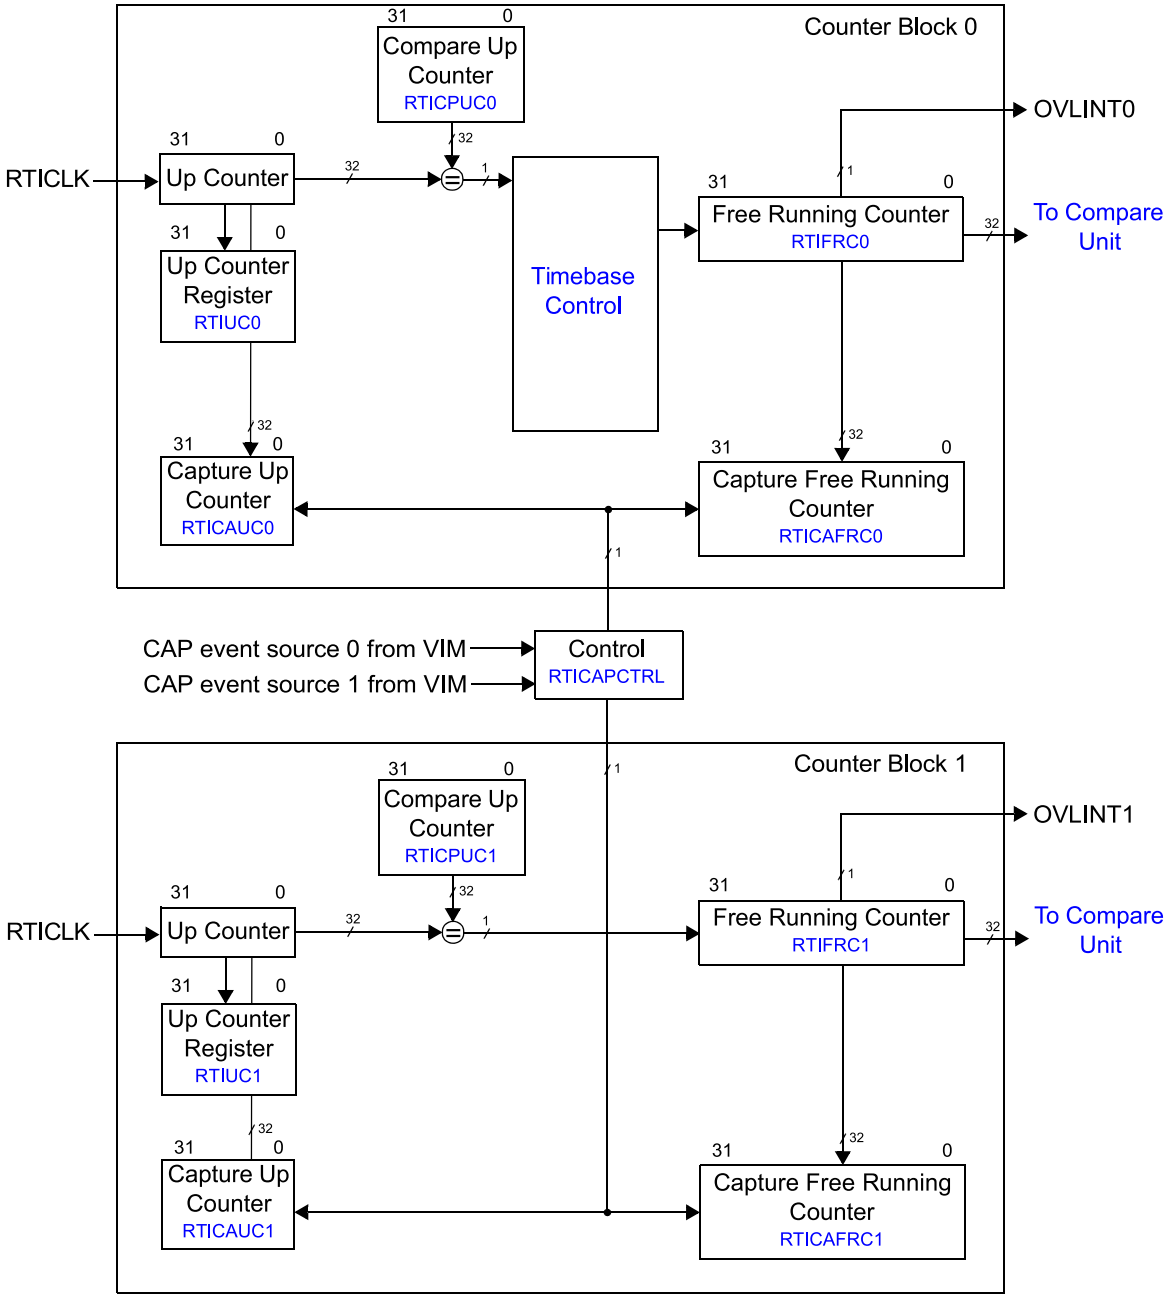

Figure 11-417. Counter Block Diagram

11.7.1.2.1.1 Counter and Capture Read Consistency

Portions of the device internal databus are 32-bits wide. If the application wants to read the 64-bit counters or the 64-bit capture values, a certain order of 32-bit read operations needs to be followed. This is to prevent one counter incrementing in between the two separate read operations to both counters.

Reading the Counters

The free running counter (RTIFRCx) must be read first. This priority will ensure that in the cycle when the CPU reads RTIFRCx, the up counter value is stored in its counter register (RTIUCx). The second read has to access the up counter register (RTIUCx), which then holds the value which corresponds to the number of RTICLK cycles that have elapsed at the time reading the free running counter register (RTIFRCx).

Note

The up counters are implemented as shadow registers. Reading RTIUCx without having read RTIFRCx first will return always the same value. RTIUCx will only be updated when RTIFRCx is read.

Reading the Capture Values

The free running counter capture register (RTICAFRCx) must be read first. This priority will ensure that in the cycle when the CPU reads RTICAFRCx, the up counter value is stored in its counter register (RTICAUCx). The second read has to access the up counter register (RTICAUCx), which then holds the value captured at the time when reading the capture free running counter register (RTICAFRCx).

Note

The capture up counter registers are implemented as shadow registers. Reading RTICAUCx without having read RTICAFRCx first will return always the same value. RTICAUCx will only be updated when RTICAFRCx is read.

11.7.1.2.1.2 Capture Feature

Both counter blocks also provide a capture feature on external events. Two capture sources can trigger the capture event. The source triggering the block is configurable (RTICAPCTRL). The sources originate from the Interrupt Manager (NVIC/IM) and allow the generation of capture events when a peripheral modules has generated an interrupt. Any of the peripheral interrupts can be selected as the capture event in the NVIC/IM.

When an event is detected, RTIUCx and RTIFRCx are stored in the capture up counter (RTICAUCx) and capture free running counter (RTICAFRCx) registers. The read order of the captured values must be the same as the read order of the actual counters (see Section 11.7.1.2.1.1).

11.7.1.2.2 Interrupt/DMA Requests

There are four compare registers (RTICOMPy) to generate interrupt requests to the NVIC/IM or DMA requests to the DMA controller. The interrupts can be used to generate different timebases for the operating system. Each of the compare registers can be configured to be compared to either RTIFRC0 or RTIFRC1. When the counter value matches the compare value, an interrupt is generated. To allow periodic interrupts, a certain value can be added to the compare value in RTICOMPy automatically. This value is stored in the update compare register (RTIUDCPy) and will be added after a compare is matched. The period of the generated interrupt/DMA request can be calculated with:

$$t_{COMPx} = t_{RTICLK} \times (RTICPUCy + 1) \times RTIUDCPy$$

if RTICPUCy ≠ 0,

$$t_{COMPx} = t_{RTICLK} \times (2^{32}+1) \times RTIUDCPy$$

if RTIUDCPy = 0,

$$t_{COMPx} = t_{RTICLK} \times (RTICPUCy + 1) \times 2^{32} \quad (10)$$

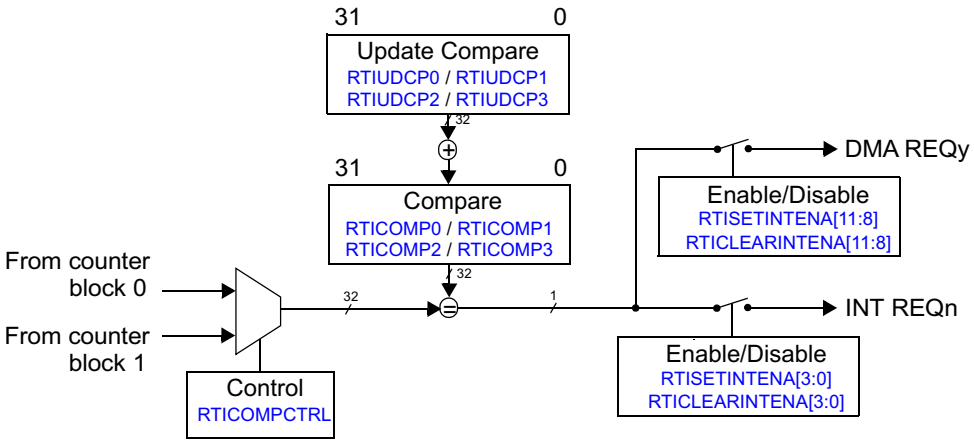

Figure 11-418. Compare Unit Block Diagram (shows only 1 of 4 blocks for simplification)

Another interrupt that can be generated is the overflow interrupt (OVLINTx) in case the RTIFRCx counter overflows.

The interrupts/DMA requests can be enabled in the RTISETINTENA register and disabled in the RTICLEARINTENA register. The RTIINTFLAG register shows the pending interrupts.

11.7.1.2.3 RTI Clocking

The counter blocks are clocked with RTICLK.

A clock supervision for the NTUx clocking scheme is implemented to avoid missing operating system ticks.

11.7.1.2.4 Digital Watchdog (DWD)

The digital watchdog (DWD) is an optional safety diagnostic which can detect a runaway CPU and generate either a reset or NMI (non-maskable interrupt) response. It generates resets or NMIs after a programmable period, and generates a reset if no correct key sequence was written to the RTIWDKEY register. Figure 11-419 illustrates the DWD.

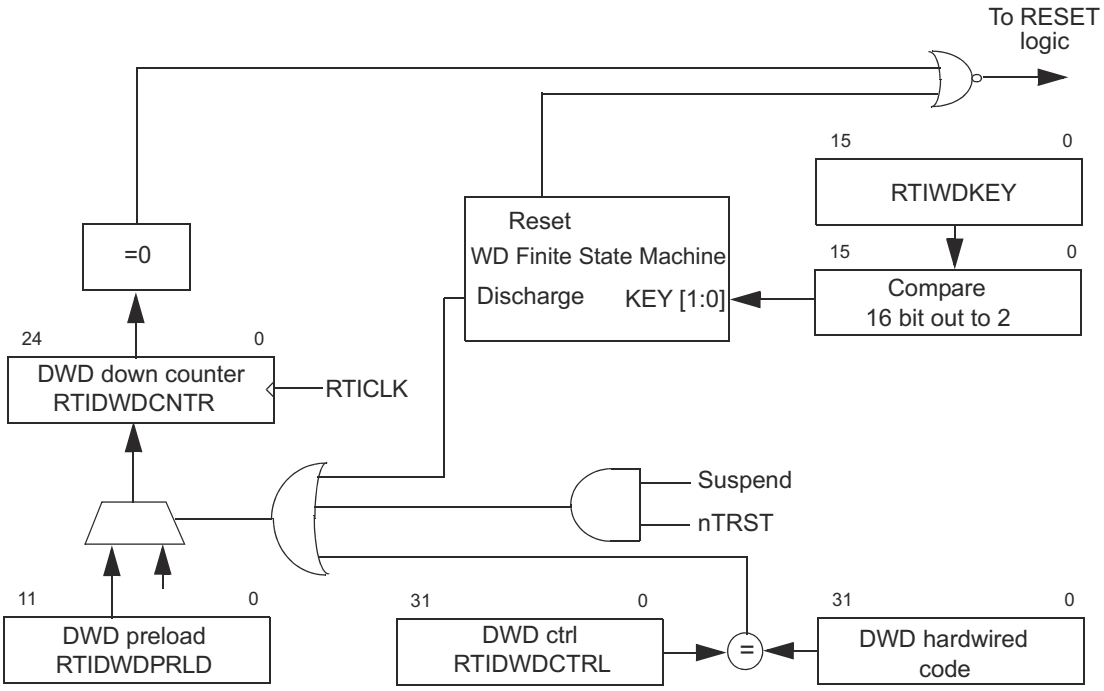

Figure 11-419. Digital Watchdog

11.7.1.2.4.1 Digital Watchdog (DWD)

The DWD is disabled by default. If it should be used, it must be enabled by writing a 32-bit value to the RTIDWDCTRL register.

Note

Once the DWD is enabled, it cannot be disabled except by system reset or power on reset.

If the correct key sequence is written to the RTIWDKEY register (0xE51A followed by 0xA35C), the 25-bit DWD down counter is reloaded with the left justified 12-bit preload value stored in RTIDWDPRLD. If an incorrect value is written, a watchdog reset will occur immediately. Also a reset or NMI will be generated when the DWD down counter is decremented to 0.

While the device is in suspend mode (halting debug mode), the DWD down counter keeps the value it had when entering suspend mode.

The DWD down counter will be decremented with the RTICLK frequency.

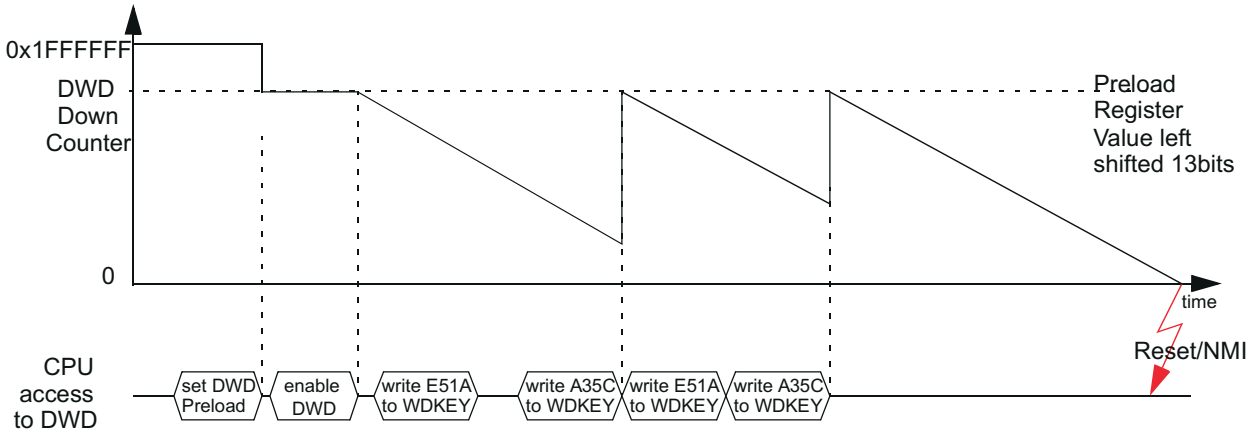

Figure 11-420. DWD Operation

The expiration time of the DWD down counter can be determined with the following equation:

$texp = (DWDPRLD + 1) \times 2^{13}/RTICLK$

where

DWDPRLD = 0...4095

Note

Care should be taken to ensure that the CPU write to the watchdog register is made allowing time for the write to propagate to the RTI.

11.7.1.2.4.2 Digital Windowed Watchdog (DWWD)

In addition to the time-out boundary configurable via the digital watchdog discussed in Section 11.7.1.2.4.1, for enhanced safety metrics it is desirable to check for a watchdog "pet" within a time window rather than using a single time threshold. This is enabled by the digital windowed watchdog (DWWD) feature.

- Functional Behavior

The DWWD opens a configurable time window in which the watchdog must be serviced. Any attempt to service the watchdog outside this time window, or a failure to service the watchdog in this time window, will cause

the watchdog to generate either a reset to the CPU. This is controlled by configuring the RTIWWDRXNCTRL register. As with the DWD, the DWWD is disabled after power on reset. When the DWWD is configured to generate a non-maskable interrupt on a window violation, the watchdog counter continues to count down. The NMI handler needs to clear the watchdog violation status flag(s) and then service the watchdog by writing the correct sequence in the watchdog key register. This service will cause the watchdog counter to get reloaded from the preload value and start counting down. If the NMI handler does not service the watchdog in time, it could count down all the way to zero and wrap around. If the NMI Handler does not service the watchdog in time, the NMI gets generated continuously, each time the counter counts to '0'.

The DWWD uses the Digital Watchdog (DWD) preload register (RTIDWDPRLD) setting to define the end-time of the window. The start-time of the window is defined by a window size configuration register(RTIWWDSIZECTRL).

The default window size is set to 100%, which corresponds to the DWD functionality of a time-out-only watchdog. The window size can be selected (through register RTIWWDSIZECTRL) from among 100%, 50%, 25%, 12.5%, 6.25% and 3.125% as shown in Figure 11-421. The window with the respective size will be opened before the end of the DWD expiration. The user has to serve the watchdog in the window. Otherwise, a reset or NMI will generate. Figure 11-422 shows an DWWD operation example (25% window).

- Configuration of DWWD

The DWWD preload value (same as DWD preload) can only be configured when the DWWD counter is disabled. The window size and watchdog reaction to a violation can be configured even after the watchdog has been enabled. Any changes to the window size and watchdog reaction configurations will only take effect after the next servicing of the DWWD. This feature can be utilized to dynamically set windows of different sizes based on task execution time, adding a program sequence element to the diagnostic which can improve fault coverage.

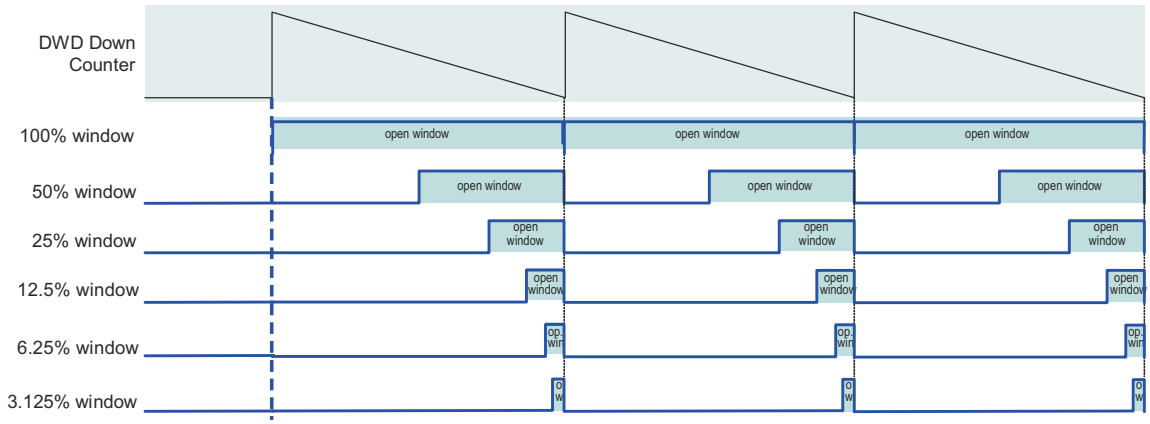

Figure 11-421. Digital Windowed Watchdog Timing Example

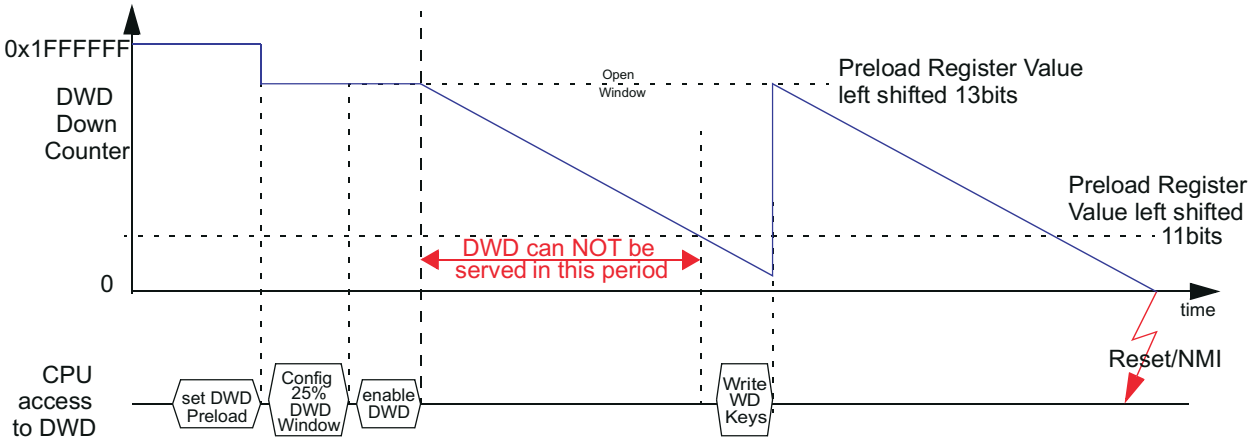

Figure 11-422. Digital Windowed Watchdog Operation Example (25% Window)

11.7.1.2.5 Halting Debug Mode Behaviour

Once the system enters halting debug mode, the behavior of the RTI depends on the COS (continue on suspend) bit. If the bit is cleared and halting debug mode is active, all counters will stop operation. If the bit is set to one, all counters will be clocked normally and the RTI will work like in normal mode. However, if the external timebase (NTU) is used and the system is in halting debug mode, the timebase control circuit will switch to internal timebase once it detects the missing NTU signal of the suspended communication controller. This will be signaled with an TBINT interrupt so that software can resynchronize after the device exits halting debug mode.

11.7.1.3 MSS_RTI Registers

Table 11-1782 lists the memory-mapped registers for the MSS_RTI registers. All register offset addresses not listed in Table 11-1782 should be considered as reserved locations and the register contents should not be modified.

Table 11-1782. MSS_RTI Registers

Offset	Acronym	Register Name	Section
0h	RTIGCTRL	RTIGCTRL	Go
4h	RTITBCTRL	RTITBCTRL	Go
8h	RTICAPCTRL	RTICAPCTRL	Go
Ch	RTICOMPCTRL	RTICOMPCTRL	Go
10h	RTIFRC0	RTIFRC0	Go
14h	RTIUC0	RTIUC0	Go
18h	RTICPUC0	RTICPUC0	Go
20h	RTICAFRC0	RTICAFRC0	Go
24h	RTICAUC0	RTICAUC0	Go
30h	RTIFRC1	RTIFRC1	Go
34h	RTIUC1	RTIUC1	Go
38h	RTICPUC1	RTICPUC1	Go
40h	RTICAFRC1	RTICAFRC1	Go
44h	RTICAUC1	RTICAUC1	Go
50h	RTICOMP0	RTICOMP0	Go
54h	RTIUDCP0	RTIUDCP0	Go
58h	RTICOMP1	RTICOMP1	Go
5Ch	RTIUDCP1	RTIUDCP1	Go
60h	RTICOMP2	RTICOMP2	Go
64h	RTIUDCP2	RTIUDCP2	Go
68h	RTICOMP3	RTICOMP3	Go
6Ch	RTIUDCP3	RTIUDCP3	Go
70h	RTITBLCOMP	RTITBLCOMP	Go
74h	RTITBHCOMP	RTITBHCOMP	Go
80h	RTISETINT	RTISETINT	Go
84h	RTICLEARINT	RTICLEARINT	Go
88h	RTIINTFLAG	RTIINTFLAG	Go
90h	RTIDWDCTRL	RTIDWDCTRL	Go
94h	RTIDWDPRLD	RTIDWDPRLD	Go
98h	RTIWDSTATUS	RTIWDSTATUS	Go
9Ch	RTIWDKEY	RTIWDKEY	Go
A0h	RTIDWDCNTR	RTIDWDCNTR	Go
A4h	RTIWWDRXNCTRL	RTIWWDRXNCTRL	Go
A8h	RTIWWDSIZECTRL	RTIWWDSIZECTRL	Go
ACh	RTIINTCLRENABLE	RTIINTCLRENABLE	Go
B0h	RTICOMP0CLR	RTICOMP0CLR	Go
B4h	RTICOMP1CLR	RTICOMP1CLR	Go
B8h	RTICOMP2CLR	RTICOMP2CLR	Go
BCh	RTICOMP3CLR	RTICOMP3CLR	Go

Complex bit access types are encoded to fit into small table cells. Table 11-1783 shows the codes that are used for access types in this section.

Table 11-1783. MSS_RTI Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

11.7.1.3.1 RTIGCTRL Register (Offset = 0h) [Reset = 00000000h]

RTIGCTRL is shown in Table 11-1784.

Return to the Summary Table.

Global Control Register starts / stops the counters

Table 11-1784. RTIGCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
19-16	NTUSEL	R/W	0h	NTUSEL: Select NTU signal. These bits determine which NTU input signal is used as external timebase. There are up to four inputs supported with four valid selection combinations. Any invalid selection value written to the NTUSEL bit-field will result in a TIED LOW being used as the NTU signal. The NTU signal will also be TIED LOW in case of a single-bit flip as it will result in an invalid combination of NTUSEL. User and privilege mode (read): 0000 = NTU0 0101 = NTU1 1010 = NTU2 1111 = NTU3 other = tied to ‘0’ Privilege mode (write): 0000 = NTU0 0101 = NTU1 1010 = NTU2 1111 = NTU3 other = tied to ‘0’
15	COS	R/W	0h	COS: Continue On Suspend. This bit determines if both counters are stopped when the device goes into debug mode or if they continue counting. User and privilege mode (read): 0 = counters are stopped while in debug mode 1 = counters are running while in debug mode Privilege mode (write): 0 = stop counters in debug mode 1 = continue counting in debug mode
14-2	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
1	CNT1EN	R/W	0h	CNT1EN: Counter 1 Enable. The CNT1EN bit starts and stops the operation of counter block 1 (UC1 and FRC1). User and privilege mode (read): 0 = counters are stopped 1 = counters are running Privilege mode (write): 0 = stop counters 1 = start counters Gives the absolute 32 bit destination address (physical).
0	CNT0EN	R/W	0h	CNT0EN: Counter 0 Enable.The CNT0EN bit starts and stops the operation of counter block 0 (UC0 and FRC0). User and privilege mode (read): 0 = counters are stopped 1 = counters are running Privilege mode (write): 0 = stop counters 1 = start counters Gives the absolute 32 bits source address (physical).

11.7.1.3.2 RTITBCTRL Register (Offset = 4h) [Reset = 00000000h]

RTITBCTRL is shown in Table 11-1785.

Return to the Summary Table.

Timebase Control selection which source triggers free running counter 0

Table 11-1785. RTITBCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	0h	Reserved
1	INC	R/W	0h	INC: Increment Free Running Counter 0. This bit determines wether the Free Running Counter 0 is automatically incremented if a failing clock on the NTUx signal is detected. User and privilege mode (read): 0 = FRC0 will not be incremented 1 = FRC0 will be incremented Privilege mode (write): 0 = Do not increment FRC0 on failing external clock 1 = Increment FRC0 on failing external clock
0	TBEXT	R/W	0h	TBEXT: Timebase External. The Timebase External bit selects whether the Free Running Counter 0 is clocked by the internal Up Counter 0 or from the external signal NTUx. Since setting the TBEXT bit to 1 resets Up Counter 0, Free Running Counter 0 will not be incremented in this occurence. The only source which is able to increment Free Running Counter 0 is NTUx. When the Timebase Supervisor circuit detects a missing clockedge, then the TBEXT bit is reset. The selection if the external signal should be used, can only be done by software. User and privilege mode (read): 0 = UC0 clocks FRC0 1 = NTUx clocks FRC0 Privilege mode (write): 0 = MUX is switched to internal UC0 clocking scheme 1 = MUX is switched to external NTUx clocking scheme

11.7.1.3.3 RTICAPCTRL Register (Offset = 8h) [Reset = 00000000h]

RTICAPCTRL is shown in Table 11-1786.

Return to the Summary Table.

Capture Control controls the capture source for the counters

Table 11-1786. RTICAPCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
1	CAPCNTR1	R/W	0h	CAPCNTR 1: Capture Counter 1. This bit determines, which external interrupt source triggers a capture event of both UC1 and FRC1. User and privilege mode (read): 0 = capture event is triggered by Capture Event Source 0 1 = capture event is triggered by Capture Event Source 1 Privilege mode (write): 0 = enable capture event triggered by Capture Event Source 0 1 = enable capture event triggered by Capture Event Source 1
0	CAPCNTR0	R/W	0h	CAPCNTR 0: Capture Counter 0. This bit determines, which external interrupt source triggers a capture event of both UC0 and FRC0. User and privilege mode (read): 0 = capture event is triggered by Capture Event Source 0 1 = capture event is triggered by Capture Event Source 1 Privilege mode (write): 0 = enable capture event triggered by Capture Event Source 0 1 = enable capture event triggered by Capture Event Source 1 11 indexed 10 reserved 01 post-increment 00 constant

11.7.1.3.4 RTICOMPCTRL Register (Offset = Ch) [Reset = 00000000h]

RTICOMPCTRL is shown in Table 11-1787.

Return to the Summary Table.

Compare Control controls the source for the compare registers

Table 11-1787. RTICOMPCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-13	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
12	COMP3SEL	R/W	0h	COMPSEL 3: Compare Select 3. This bit determines the counter with which the compare value hold in compare register 3 is compared. User and privilege mode (read): 0 = value will be compared with FRC 0 1 = value will be compared with FRC 1 Privilege mode (write): 0 = enable compare with FRC 0 1 = enable compare with FRC 1
11-9	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
8	COMP2SEL	R/W	0h	COMPSEL 2: Compare Select 2. This bit determines the counter with which the compare value hold in compare register 2 is compared. User and privilege mode (read): 0 = value will be compared with FRC 0 1 = value will be compared with FRC 1 Privilege mode (write): 0 = enable compare with FRC 0 1 = enable compare with FRC 1
7-5	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
4	COMP1SEL	R/W	0h	COMPSEL 1: Compare Select 1. This bit determines the counter with which the compare value hold in compare register 1 is compared. User and privilege mode (read): 0 = value will be compared with FRC 0 1 = value will be compared with FRC 1 Privilege mode (write): 0 = enable compare with FRC 0 1 = enable compare with FRC 1
3-1	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
0	COMP0SEL	R/W	0h	COMPSEL 0: Compare Select 0. This bit determines the counter with which the compare value hold in compare register 0 is compared. User and privilege mode (read): 0 = value will be compared with FRC 0 1 = value will be compared with FRC 1 Privilege mode (write): 0 = enable compare with FRC 0 1 = enable compare with FRC 1

11.7.1.3.5 RTIFRC0 Register (Offset = 10h) [Reset = 00000000h]

RTIFRC0 is shown in Table 11-1788.

Return to the Summary Table.

Free Running Counter 0 current value of free running counter 0

Table 11-1788. RTIFRC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	FRC0	R/W	0h	FRC0: Free Running Counter 0. This registers holds the current value of the Free Running Counter 0 and will be updated continuously. User and privilege mode (read): current value of the counter Privilege mode (write): The counter can be preset by writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC0 and RTIFRC0.

11.7.1.3.6 RTIUC0 Register (Offset = 14h) [Reset = 00000000h]

RTIUC0 is shown in Table 11-1789.

Return to the Summary Table.

Up Counter 0 current value of prescale counter 0

Table 11-1789. RTIUC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	UC0	R/W	0h	UC0: Up Counter 0. This registers holds the current value of the Up Counter 0 and prescales the RTI clock. It will be only updated by a previous read of Free Running Counter 0. This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 0 and Free Running Counter 0. User and privilege mode (read): value of the counter when the Free Running Counter 0 was read Privilege mode (write): the counter can be preset by writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC0 and RTIFRC0. Note: Preset value concern If the preset value is bigger than the compare value stored in register RTICPUC0 then it can take a long time until a compare matches, since RTIUC0 has to count up until it overflows.

11.7.1.3.7 RTICPUC0 Register (Offset = 18h) [Reset = 00000000h]

RTICPUC0 is shown in Table 11-1790.

Return to the Summary Table.

Compare Up Counter 0 compare value compared with prescale counter 0

Table 11-1790. RTICPUC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPUC0	R/W	0h	This registers holds the compare value, which is compared with the Up Counter 0. When the compare matches, Free Running counter 0 is incremented. The Up Counter is set to zero when the counter value matches the CPUC0 value. The value set in this prescales the RTI clock. If CPUC 0 = 0: then, frequency = RTICLK/ (2^{32}) If CPUC0 ≠ 0: then , frequency = RTICLK/(CPUC0 + 1) User and privilege mode (read): current compare value Privilege mode (write when TBEXT = 0): the compare value is updated Privilege mode (write when TBEXT = 1): the compare value is not changed

11.7.1.3.8 RTICAFRC0 Register (Offset = 20h) [Reset = 00000000h]

RTICAFRC0 is shown in Table 11-1791.

Return to the Summary Table.

Capture Free Running Counter 0 current value of free running counter 0 on external event

Table 11-1791. RTICAFRC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CAFRC0	R/W	0h	CAFRC0: Capture Free Running Counter 0. This registers captures the current value of the Free Running Counter 0 when a event occurs, controlled by the external capture control block. User and privilege mode (read): value of Free Running Counter 0 on a capture event

11.7.1.3.9 RTICAUC0 Register (Offset = 24h) [Reset = 00000000h]

RTICAUC0 is shown in Table 11-1792.

Return to the Summary Table.

Capture Up Counter 0 current value of prescale counter 0 on external event

Table 11-1792. RTICAUC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CAUC0	R/W	0h	CAUC0: Capture Up Counter 0. This registers captures the current value of the Up Counter 0 when a event occurs, controlled by the external capture control block. The read sequence has to be the same as with Up Counter 0 and Free Running Counter 0. So the RTICAFRC0 register has to be read first, before the RTICAUC0 register is read. This sequence ensures that the value of the RTICAUC0 register is the corresponding value to the RTICAFRC0 register, even if another capture event happens in between the two reads. User and privilege mode (read): value of Up Counter 0 on a capture event

11.7.1.3.10 RTIFRC1 Register (Offset = 30h) [Reset = 00000000h]

RTIFRC1 is shown in Table 11-1793.

Return to the Summary Table.

Free Running Counter 1 current value of free running counter 1

Table 11-1793. RTIFRC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	FRC1	R/W	0h	FRC1: Free Running Counter 1. This registers holds the current value of the Free Running Counter 1 and will be updated continuously. User and privilege mode (read): current value of the counter Privilege mode (write): The counter can be preset by writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC1 and RTIFRC1.

11.7.1.3.11 RTIUC1 Register (Offset = 34h) [Reset = 00000000h]

RTIUC1 is shown in Table 11-1794.

Return to the Summary Table.

Up Counter 1 current value of prescale counter 1

Table 11-1794. RTIUC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	UC1	R/W	0h	UC1: Up Counter 1. This registers holds the current value of the Up Counter 1 and prescales the RTI clock. It will be only updated by a previous read of Free Running Counter 1. This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 1 and Free Running Counter 1. User and privilege mode (read): value of the counter when the Free Running Counter 1 was read Privilege mode (write): the counter can be preset by writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC1 and RTIFRC1. Note: Preset value concern If the preset value is bigger than the compare value stored in register RTICPUC1 then it can take a long time until a compare matches, since RTIUC1 has to count up until it overflows.

11.7.1.3.12 RTICPUC1 Register (Offset = 38h) [Reset = 00000000h]

RTICPUC1 is shown in Table 11-1795.

Return to the Summary Table.

Compare Up Counter 1 compare value compared with prescale counter 1

Table 11-1795. RTICPUC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPUC1	R/W	0h	This registers holds the compare value, which is compared with the Up Counter 1. When the compare matches, Free Running Counter 1 is incremented. The Up Counter is set to zero when the counter value matches the CPUC1 value. The value set in this prescales the RTI clock. If CPUC 1 = 0: then, frequency = RTICLK/ (2^{32}) If CPUC1 ≠ 0: then , frequency = RTICLK/(CPUC1 + 1) User and privilege mode (read): current compare value Privilege mode (write when TBEXT = 0): the compare value is updated Privilege mode (write when TBEXT = 1): the compare value is not changed

11.7.1.3.13 RTICAFRC1 Register (Offset = 40h) [Reset = 00000000h]

RTICAFRC1 is shown in Table 11-1796.

Return to the Summary Table.

Capture Free Running Counter 1 current value of free running counter 1 on external event

Table 11-1796. RTICAFRC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CAFRC1	R/W	0h	CAFRC1: Capture Free Running Counter 1. This registers captures the current value of the Free Running Counter 1 when a event occurs, controlled by the external capture control block. User and privilege mode (read): value of Free Running Counter 1 on a capture event

11.7.1.3.14 RTICAUC1 Register (Offset = 44h) [Reset = 00000000h]

RTICAUC1 is shown in Table 11-1797.

Return to the Summary Table.

Capture Up Counter 1 current value of prescale counter 1 on external event

Table 11-1797. RTICAUC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CAUC1	R/W	0h	CAUC1: Capture Up Counter 1. This registers captures the current value of the Up Counter 1 when a event occurs, controlled by the external capture control block. The read sequence has to be the same as with Up Counter 1 and Free Running Counter 1. So the RTICAFRC1 register has to be read first, before the RTICAUC1 register is read. This sequence ensures that the value of the RTICAUC1 register is the corresponding value to the RTICAFRC1 register, even if another capture event happens in between the two reads. User and privilege mode (read): value of Up Counter 1 on a capture event

11.7.1.3.15 RTICOMP0 Register (Offset = 50h) [Reset = 00000000h]

RTICOMP0 is shown in Table 11-1798.

Return to the Summary Table.

Compare 0 compare value to be compared with the counters

Table 11-1798. RTICOMP0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP0	R/W	0h	COMP0: Compare 0. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, an interrupt is flagged. With this register it is also possible to initiate a DMA request. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

11.7.1.3.16 RTIUDCP0 Register (Offset = 54h) [Reset = 00000000h]

RTIUDCP0 is shown in Table 11-1799.

Return to the Summary Table.

Update Compare 0 value to be added to the compare register 0 value on compare match

Table 11-1799. RTIUDCP0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	UDCP0	R/W	0h	UDCP0: Update Compare 0 Register. This registers holds a value, which is added to the value in the compare 0 register each time a compare matches. This gives the possibility to generate periodic interrupts without software intervention. User and privilege mode (read): value to be added to the compare 0 register on the next compare match Privilege mode (write): new update value

11.7.1.3.17 RTICOMP1 Register (Offset = 58h) [Reset = 00000000h]

RTICOMP1 is shown in Table 11-1800.

Return to the Summary Table.

Compare 1 compare value to be compared with the counters

Table 11-1800. RTICOMP1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP1	R/W	0h	COMP1: compare1. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, an interrupt is flagged. With this register it is also possible to initiate a DMA request. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

11.7.1.3.18 RTIUDCP1 Register (Offset = 5Ch) [Reset = 00000000h]

RTIUDCP1 is shown in Table 11-1801.

Return to the Summary Table.

Update Compare 1 value to be added to the compare register 1 value on compare match

Table 11-1801. RTIUDCP1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	UDCP1	R/W	0h	UDCP1: Update compare1 Register. This registers holds a value, which is added to the value in the compare1 register each time a compare matches. This gives the possibility to generate periodic interrupts without software intervention. User and privilege mode (read): value to be added to the compare1 register on the next compare match Privilege mode (write): new update value

11.7.1.3.19 RTICOMP2 Register (Offset = 60h) [Reset = 00000000h]

RTICOMP2 is shown in Table 11-1802.

Return to the Summary Table.

Compare 2 compare value to be compared with the counters

Table 11-1802. RTICOMP2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP2	R/W	0h	COMP2: compare 2. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, an interrupt is flagged. With this register it is also possible to initiate a DMA request. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

11.7.1.3.20 RTIUDCP2 Register (Offset = 64h) [Reset = 00000000h]

RTIUDCP2 is shown in Table 11-1803.

Return to the Summary Table.

Update Compare 2 value to be added to the compare register 2 value on compare match

Table 11-1803. RTIUDCP2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	UDCP2	R/W	0h	UDCP2: Update compare 2 Register. This registers holds a value, which is added to the value in the compare 2 register each time a compare matches. This gives the possibility to generate periodic interrupts without software intervention. User and privilege mode (read): value to be added to the compare 2 register on the next compare match Privilege mode (write): new update value

11.7.1.3.21 RTICOMP3 Register (Offset = 68h) [Reset = 00000000h]

RTICOMP3 is shown in Table 11-1804.

Return to the Summary Table.

Compare 3 compare value to be compared with the counters

Table 11-1804. RTICOMP3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP3	R/W	0h	COMP3: compare 3. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, an interrupt is flagged. With this register it is also possible to initiate a DMA request. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

11.7.1.3.22 RTIUDCP3 Register (Offset = 6Ch) [Reset = 00000000h]

RTIUDCP3 is shown in Table 11-1805.

Return to the Summary Table.

Update Compare 3 value to be added to the compare register 3 value on compare match

Table 11-1805. RTIUDCP3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	UDCP3	R/W	0h	UDCP3: Update compare 3 Register. This registers holds a value, which is added to the value in the compare 3 register each time a compare matches. This gives the possibility to generate periodic interrupts without software intervention. User and privilege mode (read): value to be added to the compare 3 register on the next compare match Privilege mode (write): new update value

11.7.1.3.23 RTITBLCOMP Register (Offset = 70h) [Reset = 00000000h]

RTITBLCOMP is shown in Table 11-1806.

Return to the Summary Table.

Timebase Low Compare compare value to activate edge detection circuit

Table 11-1806. RTITBLCOMP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TBLCOMP	R/W	0h	TBLCOMP: Timebase Low Compare Value. This value determines when the edge detection circuit starts monitoring the NTUx signal. It will be compared with Up Counter 0. User and privilege mode (read): current compare value Privilege mode (write when TBEXT = 0): the compare value is updated Privilege mode (write when TBEXT = 1): the compare value is not changed Note: Reset behavior A reset does not generate a compare match.

11.7.1.3.24 RTITBHCOMP Register (Offset = 74h) [Reset = 00000000h]

RTITBHCOMP is shown in Table 11-1807.

Return to the Summary Table.

Timebase High Compare compare value to deactivate edge detection circuit

Table 11-1807. RTITBHCOMP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TBHCOMP	R/W	0h	TBHCOMP: Timebase High Compare Value. This value determines when the edge detection circuit will stop monitoring the NTUx signal. It will be compared with Up Counter 0. RTITBHCOMP has to be less than RTICPUC0, since RTIUC0 will be reset when RTICPUC0 is reached. Example: The NTUx edge detection circuit should be active +/- 10 RTICLK cycles around RTICPUC0. RTICPUC 0 = 0x00000050 RTITBLCOMP = 0x000046 RTITBHCOMP = 0x00000009 User and privilege mode (read): current compare value Privilege mode (write when TBEXT = 0): the compare value is updated Privilege mode (write when TBEXT = 1): the compare value is not changed Note: Reset behavior A reset does not generate a compare match.

11.7.1.3.25 RTISETINT Register (Offset = 80h) [Reset = 00000000h]

RTISETINT is shown in Table 11-1808.

Return to the Summary Table.

Set Interrupt Enable sets interrupt enable bits int RTIINTCTRL without having to do a read-modify-write operation

Table 11-1808. RTISETINT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
18	SETOVL1INT	R/W	0h	SETOVL1INT: Set Free Running Counter 1 Overflow Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
17	SETOVL0INT	R/W	0h	SETOVL0INT: Set Free Running Counter 0 Overflow Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
16	SETTBINT	R/W	0h	SETTBINT: Set Timebase Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
15-12	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
11	SETDMA3	R/W	0h	SETDMA 3: Set Compare DMA Request 3. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request
10	SETDMA2	R/W	0h	SETDMA 2: Set Compare DMA Request 2. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request
9	SETDMA1	R/W	0h	SETDMA 1: Set Compare DMA Request 1. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request
8	SETDMA0	R/W	0h	SETDMA 0: Set Compare DMA Request 0. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request
7-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect

Table 11-1808. RTISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	SETINT3	R/W	0h	SETINT 3: Set Compare Interrupt 3. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged
2	SETINT2	R/W	0h	SETINT 2: Set Compare Interrupt 2. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
1	SETINT1	R/W	0h	SETINT 1: Set Compare Interrupt 1. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
0	SETINT0	R/W	0h	SETINT 0: Set Compare Interrupt 0. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt

11.7.1.3.26 RTICLEARINT Register (Offset = 84h) [Reset = 00000000h]

RTICLEARINT is shown in Table 11-1809.

Return to the Summary Table.

Clear Interrupt Enable clears interrupt enable bits int RTIINTCTRL without having to do a read-modify-write operation

Table 11-1809. RTICLEARINT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
18	CLEAROVL1INT	R/W	0h	CLEAROVL1INT: CLEAR Free Running Counter 1 Overflow Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
17	CLEAROVL0INT	R/W	0h	CLEAROVL0INT: CLEAR Free Running Counter 0 Overflow Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
16	CLEARTBINT	R/W	0h	CLEARTBINT: CLEAR Timebase Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
15-12	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
11	CLEARDMA3	R/W	0h	CLEARDMA 3: CLEAR Compare DMA Request 3. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request
10	CLEARDMA2	R/W	0h	CLEARDMA 2: CLEAR Compare DMA Request 2. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request
9	CLEARDMA1	R/W	0h	CLEARDMA 1: CLEAR Compare DMA Request 1. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request
8	CLEARDMA0	R/W	0h	CLEARDMA 0: CLEAR Compare DMA Request 0. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request

Table 11-1809. RTICLEARINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
3	CLEARINT3	R/W	0h	CLEARINT 3: CLEAR Compare Interrupt 3. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
2	CLEARINT2	R/W	0h	CLEARINT 2: CLEAR Compare Interrupt 2. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
1	CLEARINT1	R/W	0h	CLEARINT 1: CLEAR Compare Interrupt 1. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
0	CLEARINT0	R/W	0h	CLEARINT 0: CLEAR Compare Interrupt 0. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt

11.7.1.3.27 RTIINTFLAG Register (Offset = 88h) [Reset = 00000000h]

RTIINTFLAG is shown in Table 11-1810.

Return to the Summary Table.

Interrupt Flags interrupt pending bits

Table 11-1810. RTIINTFLAG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
18	OVL1INT	R/W	0h	OVL1INT: Free Running Counter 1 Overflow Interrupt Flag. User and privilege mode (read): determines if an interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
17	OVL0INT	R/W	0h	OVL0INT: Free Running Counter 0 Overflow Interrupt Flag. User and privilege mode (read): determines if an interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
16	TBINT	R/W	0h	User and privilege mode (read): this flag is set when the TBEXT bit is cleared by detection of a missing external clockedge. It will not be set by clearing TBEXT by software. determines if an interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
15-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
3	INT3	R/W	0h	INT 3: Interrupt Flag 3. User and privilege mode (read): determines if a interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
2	INT2	R/W	0h	INT 2: Interrupt Flag 2. User and privilege mode (read): determines if a interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
1	INT1	R/W	0h	INT 1: Interrupt Flag 1. User and privilege mode (read): determines if a interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
0	INT0	R/W	0h	INT 0: Interrupt Flag 0. User and privilege mode (read): determines if a interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0

11.7.1.3.28 RTIDWDCTRL Register (Offset = 90h) [Reset = 00000000h]

RTIDWDCTRL is shown in Table 11-1811.

Return to the Summary Table.

Digital Watchdog Control Enables the Digital Watchdog

Table 11-1811. RTIDWDCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	DWDCTRL	R/W	0h	DWDCTRL: Digital Watchdog Control. User and priviledge mode (read): 0x5312ACED = DWD counter is disabled. This is the default value. 0xA98559DA = DWD counter is enabled Any other value = DWD counter state is unchanged (enabled or disabled) Priviledge mode (write): 0xA98559DA = DWD counter is enabled Any other value = State of DWD counter is unchanged (stays enabled or disabled) Note: One-Write Functionality of DWDCTRL Register The RTIDWDCTRL register implements a one-write functionality, such that the application cannot write to this registermore than once. Writing the default value will not enable the watchdog as described above. Writing the enable value will start the watchdog counters. A write to RTIDWDCTRL will only be enabled after a system reset again.

11.7.1.3.29 RTIDWDPRLD Register (Offset = 94h) [Reset = 00000000h]

RTIDWDPRLD is shown in Table 11-1812.

Return to the Summary Table.

Digital Watchdog Preload sets the experation time of the Digital Watchdog

Table 11-1812. RTIDWDPRLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
11-0	DWDPRLD	R/W	0h	DWDPRLD: Digital Watchdog Preload Value. User and priviledge mode (read): A read from this register in any CPU mode returns the current preload value. Priviledge mode (write): If the DWD is always enabled after reset is released: The DWD starts counting down from the reset value of the counter, that is, 0x002DFFFF. The application can configure the DWD preload register any time before this down counter expires. When the application services the DWD, the preload register contents are copied left-justified into the DWD down counter and it starts counting down from that value. If the DWD is implemented such that the down counter is enabled by software: The DWD preload register can be configured only when the DWD is disabled. Therefore, the application can only configure the DWD preload register before it enables the DWD down counter. The expiration time of the DWD Down Counter can be determined with following equation: texp = (RTIDWDPRLD+1) x 2^{13} / RTICLK1 where: RTIDWDPRLD = 0...4095

11.7.1.3.30 RTIWDSTATUS Register (Offset = 98h) [Reset = 00000000h]

RTIWDSTATUS is shown in Table 11-1813.

Return to the Summary Table.

Watchdog Status reflects the status of Analog and Digital Watchdog

Table 11-1813. RTIWDSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
5	DWWD_ST	R/W	0h	DWWD ST: Windowed Watchdog Status. This bit denotes whether the time-window defined by the windowed watchdog configuration has been violated, or if a wrong key or key sequence was written to service the watchdog. User and priviledge mode (read): 0 = no time-window violation has occurred. 1 = a time-window violation has occurred. The watchdog will generate either a system reset or a non-maskable interrupt to the CPU in this case. Priviledge mode (write): 0 = leaves the current value unchanged. 1 = clears the bit to 0. This will also clear all other status flags in the RTIWDSTATUS register except for the AWD ST flag. Clearing of the status flags will deassert the non-maskable interrupt generated due to violation of the DWWD.
4	ENDTIMEVIOL	R/W	0h	END TIME VIOL: Windowed Watchdog End Time Violation Status. This bit denotes whether the end-time defined by the windowed watchdog configuration has been violated. This bit is effectively a copy of the DWD ST status flag. User and priviledge mode (read): 0 = no end-time window violation has occurred. 1 = the end-time defined by the windowed watchdog configuration has been violated. Priviledge mode (write): 0 = leaves the current value unchanged. 1 = clears the bit to 0.
3	STARTTIMEVIOL	R/W	0h	START TIME VIOL: Windowed Watchdog Start Time Violation Status. This bit denotes whether the start-time defined by the windowed watchdog configuration has been violated. This indicates that the WWD was serviced before the service window was opened. User and priviledge mode (read): 0 = no start-time window violation has occurred. 1 = the start-time defined by the windowed watchdog configuration has been violated. Priviledge mode (write): 0 = leaves the current value unchanged. 1 = clears the bit to 0.
2	KEYST	R/W	0h	KEYST: Watchdog KeyStatus. This bit denotes a reset generated by a wrong key or a wrong key-sequence written to the RTIWDKEY register. User and priviledge mode (read): 0 = no wrong key or key-sequence written 1 = wrong key or key-sequence written to RTIWDKEY register Priviledge mode (write): 0 = leaves the current value unchanged 1 = clears the bit to 0

Table 11-1813. RTIWDSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	DWDST	R/W	0h	DWDST: Digital Watchdog Status. This bit is effectively a copy of the END TIME VIOL status flag and is maintained for compatibility reasons. User and priviledge mode (read): 0 = DWD timeout period not expired 1 = DWD timeout period has expired Priviledge mode (write): 0 = leaves the current value unchanged 1 = clears the bit to 0
0	AWDST	R/W	0h	AWDST: Analog Watchdog Status. User and priviledge mode (read): 0 = AWD pin 0 –> 1 threshold not exceeded 1 = AWD pin 0 –> 1 threshold exceeded Priviledge mode (write): 0 = leaves the current value unchanged 1 = clears the bit to 0

11.7.1.3.31 RTIWDKEY Register (Offset = 9Ch) [Reset = 00000000h]

RTIWDKEY is shown in Table 11-1814.

Return to the Summary Table.

Watchdog Key correct written key values discharge the external capacitor

Table 11-1814. RTIWDKEY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
15-0	WDKEY	R/W	0h	WDKEY: Watchdog Key. User and privilege mode reads are indeterminate. Privilege mode (write): A write of 0xE51A followed by 0xA35C in two separate write operations defines the Key Sequence and discharges the watchdog capacitor. This also causes the upper 12 bits of the DWD down counter to be reloaded with the contents of the DWD preload register and the lower 13 bits to become all 1's. Writing any other value causes a digital watchdog reset, as shown in Table 1-3. Note: Register write access time precaution The user has to take into account that the write to the register takes 3 VCLK cycle. This needs to be considered for the AWD/DWD expiration calculation.

11.7.1.3.32 RTIDWDCNTR Register (Offset = A0h) [Reset = 00000000h]

RTIDWDCNTR is shown in Table 11-1815.

Return to the Summary Table.

Digital Watchdog Down Counter current value of DWD down counter

Table 11-1815. RTIDWDCNTR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
24-0	DWDCNTR	R/W	0h	DWDCNTR: Digital Watchdog Down Counter. The value of the DWDCNTR after a system reset is 0x002D_FFFF. When the DWD is enabled and the DWD counter starts counting down from this value with an RTICLK1 time base of 3MHz, a watchdog reset will be generated in 1 second. User and privilege mode (read): Reads return the current counter value. Privilege mode (write): Writes don't have an effect.

11.7.1.3.33 RTIWWDRXNCTRL Register (Offset = A4h) [Reset = 00000000h]

RTIWWDRXNCTRL is shown in Table 11-1816.

Return to the Summary Table.

Windowed Watchdog Reaction Control configures the windowed watchdog to either generate a non-maskable interrupt to the CPU or to generate a system reset

Table 11-1816. RTIWWDRXNCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
3-0	WWDRXN	R/W	0h	WWDRXN: Digital Windowed Watchdog Reaction. User and privilege mode (read), privileged mode (write): 0x 5 = This is the default value. The windowed watchdog will cause a reset if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. 0xA = The windowed watchdog will generate a non-maskable interrupt to the CPU if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. Writing any other value will cause a system reset if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. Note: Configuration of DWWD Reaction The DWWD reaction can be selected by the application even when the DWWD counter is already enabled. If a change to the WWDRXN is made before the watchdog service window is opened, then the change in the configuration takes effect immediately. If a change to the WWDRXN is made when the watchdog service window is already open, then the change in configuration takes effect only after the watchdog is serviced.

11.7.1.3.34 RTIWWDSIZECTRL Register (Offset = A8h) [Reset = 00000000h]

RTIWWDSIZECTRL is shown in Table 11-1817.

Return to the Summary Table.

Windowed Watchdog Size Control configures the size of the window for the digital windowed watchdog

Table 11-1817. RTIWWDSIZECTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	WWDSIZE	R/W	0h	WWDSIZE: Digital Windowed Watchdog Window Size. User and privilege mode (read), privileged mode (write): Value written to WWDSIZE Window Size 0x00000005 100% (Functionality same as the time-out digital watchdog.) 0x00000050 50% 0x00000500 25% 0x00005000 12.5% 0x00050000 6.25% 0x00500000 3.125% Any other value 3.125% Note: Incorrect value being written to watchdog window size control register If an incorerct value is written to the WWDSIZE field, or if a system disturbance causes the WWDSIZE field to have a value other than 0x5, 0x50, 0x500, 0x5000, 0x50000, or 0x500000, then the window size will be configured to be 3.125%. This increases the chances of getting a reset due to the windowed watchdog, which enables the system to handle the cause for the incorrect configuration. Note: Configuration of DWWD Window Size The DWWD window size can be selected by the application even when the DWWD counter is already enabled. If a change to the WWDSIZE is made before the watchdog service window is opened, then the change in the configuration takes effect immediately. If a change to the WWDSIZE is made when the watchdog service window is already open, then

11.7.1.3.35 RTIINTCLRENABLE Register (Offset = ACh) [Reset = 00000000h]

RTIINTCLRENABLE is shown in Table 11-1818.

Return to the Summary Table.

RTI Compare Interrupt Clear Enable enable the auto clear functionality for each of the compare interrupts

Table 11-1818. RTIINTCLRENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
27-24	INTCLRENABLE3	R/W	0h	INTCLRENABLE3. Enables the auto-clear functionality on the compare 3 interrupt. User and Privileged mode (read): 0x 5 = Auto-clear for compare 3 interrupt is disabled. Any other value = Auto-clear for compare 3 interrupt is enabled. Privileged mode (write): 0x 5 = Disables the auto-clear functionality on the compare 3 interrupt. Any other value = Enables the auto-clear functionality on the compare 3 interrupt.
23-20	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
19-16	INTCLRENABLE2	R/W	0h	INTCLRENABLE2. Enables the auto-clear functionality on the compare 2 interrupt. User and Privileged mode (read): 0x 5 = Auto-clear for compare 2 interrupt is disabled. Any other value = Auto-clear for compare 2 interrupt is enabled. Privileged mode (write): 0x 5 = Disables the auto-clear functionality on the compare 2 interrupt. Any other value = Enables the auto-clear functionality on the compare 2 interrupt.
15-12	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
11-8	INTCLRENABLE1	R/W	0h	INTCLRENABLE1. Enables the auto-clear functionality on the compare 1 interrupt. User and Privileged mode (read): 0x 5 = Auto-clear for compare 1 interrupt is disabled. Any other value = Auto-clear for compare 1 interrupt is enabled. Privileged mode (write): 0x 5 = Disables the auto-clear functionality on the compare 1 interrupt. Any other value = Enables the auto-clear functionality on the compare 1 interrupt.
7-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
3-0	INTCLRENABLE0	R/W	0h	INTCLRENABLE0. Enables the auto-clear functionality on the compare 0 interrupt. User and Privileged mode (read): 0x 5 = Auto-clear for compare 0 interrupt is disabled. Any other value = Auto-clear for compare 0 interrupt is enabled. Privileged mode (write): 0x 5 = Disables the auto-clear functionality on the compare 0 interrupt. Any other value = Enables the auto-clear functionality on the compare 0 interrupt.

11.7.1.3.36 RTICOMP0CLR Register (Offset = B0h) [Reset = 00000000h]

RTICOMP0CLR is shown in Table 11-1819.

Return to the Summary Table.

Compare 0 Clear compare value to be compared with the counter to clear the compare0 interrupt line

Table 11-1819. RTICOMP0CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP0CLR	R/W	0h	COMP0CLR: Compare 0 Clear. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, the compare 0 interrupt or DMA request line is cleared. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

11.7.1.3.37 RTICOMP1CLR Register (Offset = B4h) [Reset = 00000000h]

RTICOMP1CLR is shown in Table 11-1820.

Return to the Summary Table.

Compare 1 Clear compare value to be compared with the counter to clear the compare1 interrupt line

Table 11-1820. RTICOMP1CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP1CLR	R/W	0h	COMP1CLR: Compare 1 Clear. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, the Compare 1 interrupt or DMA request line is cleared. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

11.7.1.3.38 RTICOMP2CLR Register (Offset = B8h) [Reset = 00000000h]

RTICOMP2CLR is shown in Table 11-1821.

Return to the Summary Table.

Compare 2 Clear compare value to be compared with the counter to clear the compare2 interrupt line

Table 11-1821. RTICOMP2CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP2CLR	R/W	0h	COMP2CLR: Compare 2 Clear. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, the Compare 2 interrupt or DMA request line is cleared. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

11.7.1.3.39 RTICOMP3CLR Register (Offset = BCh) [Reset = 00000000h]

RTICOMP3CLR is shown in Table 11-1822.

Return to the Summary Table.

Compare 3 Clear compare value to be compared with the counter to clear the compare3 interrupt line

Table 11-1822. RTICOMP3CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COMP3CLR	R/W	0h	COMP3CLR: Compare 3 Clear. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, the Compare 3 interrupt or DMA request line is cleared. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

11.8 Internal Diagnostics Modules

11.8.1 Data Modification Module (DMM)

A Data Modification Module (DMM) gives the ability to write external data into the device memory.

This chapter describes the functionality of the Data Modification Module (DMM), which provides the capability to modify data in the entire 4 GB address space of the device from an external peripheral, with minimal interruption of the application. A DMM gives the ability to write external data into the device memory. For HIL (playback), DMM can be used in I/O Mode and CSI mode (trace only mode).

11.8.1.1 Overview

11.8.1.1.1 Features

The DMM module has the following features:

- Acts as a bus master, thus enabling direct writes to the 4GB address space without CPU intervention
- Writes to memory locations specified in the received packet (leverages packets defined by trace mode of the RAM trace port (RTP) module
- Writes received data to consecutive addresses, which are specified by the DMM module (leverages packets defined by direct data mode of RTP module)
- Configurable port width (1, 2, 4, 8, 16 pins)
- Up to 65 Mbit/s pin data rate
- Unused pins configurable as GIO pins

11.8.1.1.2 Block Diagram

Figure 11-423 shows the block diagram for the DMM.

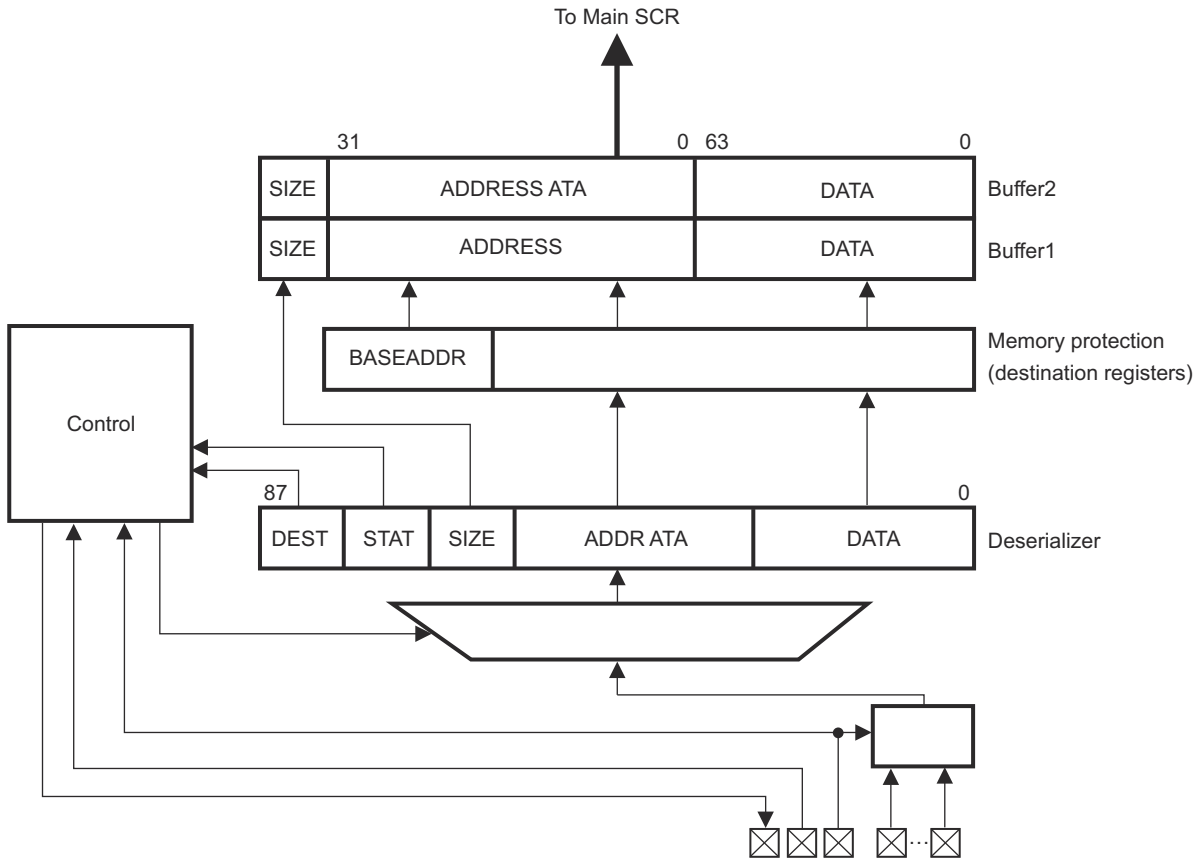

Figure 11-423. DMM Block Diagram

11.8.1.2 Module Operation

The DMM receives data over the DMM pins from external systems and writes the received data directly to the base address programmed in the module plus offset address given in the packet or into a buffer specified by start address and length. It leverages the protocol defined by the RAM Trace Port (RTP) module to have a common interface definition for external systems. It can also be used to connect an RTP and DMM module together for fast processor intercommunication.

The DMM module provides two modes of operation:

- **Trace Mode:** In this mode, the DMM writes the received data directly to an address that is calculated from the base address programmed into the destination register (DEST0REG1 Register (Offset = 2Ch) [Reset = 00000000h] ; DEST0REG2 Register (Offset = 34h) [Reset = 00000000h]) plus the offset address contained in the received packet. An interrupt can be generated when data is written the lowest address of a programmed region. This capability enables the sender to raise an interrupt at the receiver while sending specific information.
- **Direct Data Mode:** In this mode, the DMM writes the received data into an address range of the 4GB address space. The buffer start address (DDMDEST Register (Offset = 1Ch) [Reset = 00000000h]) and blocksize (DDMBL Register (Offset = 20h) [Reset = 00000000h]) is programmable in the DMM module. When the buffer reaches its end address, the buffer pointer wraps around and points to the beginning of the buffer again. The EO_BUFF flag (INTFLAG Register (Offset = 10h) [Reset = 00000000h]) will be set and if enabled, an interrupt will be generated to indicate a buffer-full condition. Another interrupt, can be configured to indicate different buffer fill levels. This can be accomplished by programming a certain fill level into the DMMINTPT register (INTPT Register (Offset = 28h) [Reset = 00000000h]). The PROG_BUFF flag (INTFLAG Register (Offset = 10h) [Reset = 00000000h]) indicates that this level has been reached.

Data will be captured by the input buffer and moved to the appropriate bit field in the deseralizer. When the deseralizer is completely full, the data will be moved to the output buffer register. A two-level buffer is implemented to avoid overflow conditions if the internal bus is occupied by other transactions. In addition the $\overline{\text{DMMENA}}$ signal can be used to signal the external hardware that an overflow might occur if more data is sent. The automatic generation of the $\overline{\text{DMMENA}}$ signal can be configured by setting the ENAFUNC bit (DMMPC0 Register (Offset = 6Ch) [Reset = 00000000h]). While the $\overline{\text{DMMENA}}$ signal is active, the DMM module will not receive any new data.

The DMM is a bus master and forwards the received data to the bus system. The write operation will be minimally intrusive to the program flow, because the CPU/DMA access will only be blocked if the CPU/DMA accesses the same resource as the DMM.

To prevent an external system from overwriting critical data in the memory while configured in Trace Mode, a memory protection mechanism is implemented via a programmable start address and block size of a region. A maximum of four destinations with two regions each are supported.

For proper operation, at least DMMCLK, DMMSYNC and DMMDATA[0] need to be programmed in functional mode (DMMPC0 Register (Offset = 6Ch) [Reset = 00000000h]). If a large amount of data should be transmitted in a short time, more data pins should be used in functional mode. The module supports 1, 2, 4, 8, or 16-pin configurations.

The module can be configured to handle a free running clock provided on DMMCLK (GLBCTRL Register (Offset = 0h) [Reset = 00000005h]). Clock pulses between two DMMSYNC pulses that exceed the number of valid clock pulses for a packet will be ignored.

11.8.1.2.1 Data Format

Below is a description of the packet and frame format.

11.8.1.2.1.1 Clocking Scheme

The DMM supports both continuous and noncontinuous clocking. The clock received on DMMCLK in the continuous clocking scheme is a free-running clock. In noncontinuous clocking scheme, the clock will stop after each packet and will start with the reception of a DMMSYNC signal.

11.8.1.2.1.2 Trace Mode Packet

Figure 11-424 illustrates the trace mode packet format. One packet consists of 2 bits (DEST) denoting the destination in which the data is stored, 2 status bits (STAT), the 2-bit SIZE of the data, the 18-bit address of where the data should be written to, and a variable data field.

The DEST bits (Table 11-1823) will be used to determine which destination register applies to the transmitted data and the received address determines if the packet falls into a valid region of the destination area. If the address is valid, the base address, programmed in one of the destination registers (DEST1REG1 Register (Offset = 3Ch) [Reset = 00000000h] ; DEST1REG2 Register (Offset = 44h) [Reset = 00000000h]) of this particular region will be applied to create the complete 32-bit address for the destination. The DMM module only takes action on a "11" setting of the STAT bits (Table 11-1824). This signals that an overflow in the transmitting hardware module has occurred. If this is the case the SRC_OVF flag (INTFLAG Register (Offset = 10h) [Reset = 00000000h]) will be set and the received data will be written to the address specified in the packet. The size information of the data transmitted in the packet is denoted in the SIZE bits (Table 11-1825) of the packet. Depending on the SIZE information, the module expects to receive only this amount of data.

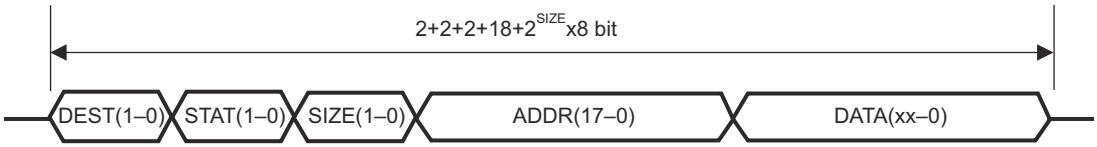

Figure 11-424. Trace Mode Packet Format

Table 11-1823 through Table 11-1825 illustrate the encoding of packet format in trace mode.

Table 11-1823. Encoding of Destination Bits in Trace Mode Packet Format

DEST[1:0]	Destination
00	Dest 0
01	Dest 1
10	Dest 2
11	Dest 3

Table 11-1824. Encoding of Status Bits in Trace Mode Packet Format

STAT[1:0]	Status
00	don't care
01	don't care
10	don't care
11	overflow

Table 11-1825. Encoding of Write Size in Packet Format

SIZE[1:0]	Write Size
00	8 bit
01	16 bit
10	32 bit
11	64 bit

11.8.1.2.1.3 Direct Data Mode Packet

Figure 11-425 illustrates the direct data mode packet format.

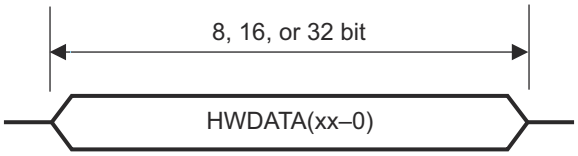

Figure 11-425. Direct Data Mode Packet Format

The packet consists only of data bits and no header information. It can be 8-, 16- or 32-bit wide. A variable packet width is not supported because the DMM module will check the number of incoming bits (DMMCLK cycles) for error detection. The DMM will write the received data to the destination once the programmed number of bits has been received.

If the programmed word width does not correspond to the received data, the following actions will be taken:

- If the received data is greater than the programmed width, only the configured number of bits are transferred into the RAM buffer, the additional bits are discarded.
- If the received number of bits is smaller than the programmed width, no data will be written to the buffer, because a new DMMSYNC signal has been received before the expected number of bits.

11.8.1.2.2 Data Port

The packet will be received in several subpackets, depending on the width of the external data bus (DMMDATA[y:0]) and the amount of data to be transmitted. Table 11-1826 illustrates the number of clock cycles required for a complete packet.

Table 11-1826. Number of Clock Cycles per Packet

Port Width/ Pins	Write Size in Bits			
	8	16	32	64
1	32	40	56	88
2	16	20	28	44
4	8	10	14	22
8	4	5	7	11
16	2	3	4	6

The user can program the port width in the DMMPC0 register (DMMPC0 Register (Offset = 6Ch) [Reset = 00000000h]). This feature allows pins that are not used for DMM functionality to be used as GIO pins. Only the pins shown in Table 11-1827 can be used for a desired port width.

Table 11-1827. Pins Used for Data Communication

Port Width	Pins Used
1	DMMDATA[0]
2	DMMDATA[1:0]
4	DMMDATA[3:0]
8	DMMDATA[7:0]
16	DMMDATA[15:0]

Note

If pins other than the ones specified in Table 11-1827 are programmed as functional pins for a desired port width, the received data will be corrupted and will not be transferred to the deserializer.

Note

If DMMCLK or DMMSYNC are programmed as nonfunctional pins, functional operation will not occur.

11.8.1.2.2.1 Signal Description

DMMSYNC	This signal has to be provided by external hardware. It signals the start of a new packet. It has to be active (high) for one full DMMCLK cycle, starting with the rising edge of DMMCLK. If the DMMSYNC pulse is longer than a single DMMCLK cycle and two falling edges of DMMCLK see a high pulse on DMMSYNC, the module will treat the second DMMSYNC pulse as the start of a packet and will flag a PACKET_ERR_INT (INTFLAG Register (Offset = 10h) [Reset = 00000000h]).
DMMCLK	The clock is externally generated and can be suspended between two packets. For this feature, CONTCLK must be set to 0 (GLBCTRL Register (Offset = 0h) [Reset = 00000005h]). If the clock is not stopped between two packets, CONTCLK must be set to 1. Data will be latched on the falling edge of the DMMCLK signal.
$\overline{\text{DMMENA}}$	This signal is pulled high if no new data should be received via the data pins, because of a potential overflow situation.
DMMDATA[15:0]	These pins receive the packet information transmitted by the external hardware. Data is latched on the falling edge of DMMCLK.

Figure 11-426 shows an example of multiple packets received during trace mode, in noncontinuous clock configuration.

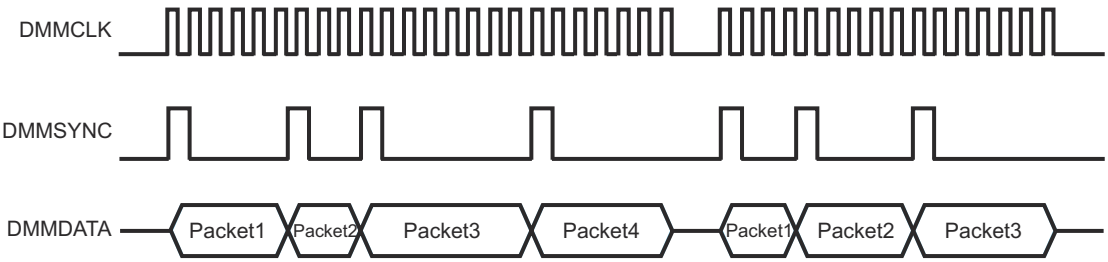

Figure 11-426. Packet Sync Signal Example

Figure 11-427 shows an example of a 4-bit data port with 8-bit receive data (A5h) to be written into DEST1 (address 0001 2345h) on a trace mode packet.

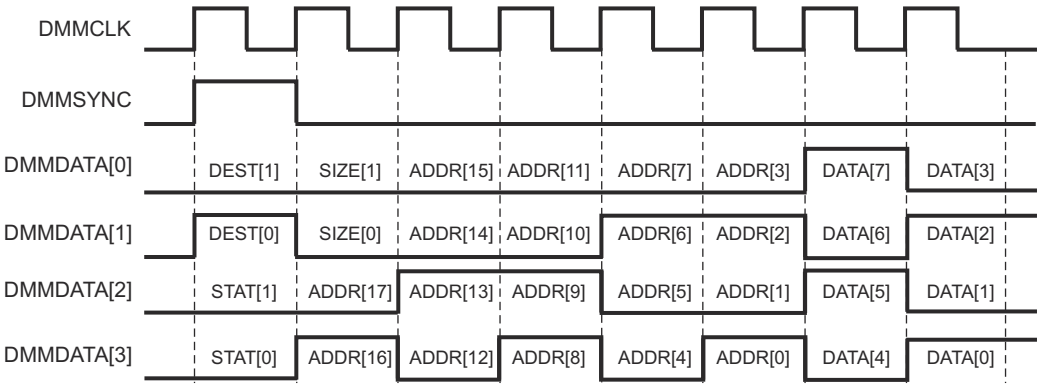

Figure 11-427. Example Single Packet Transmission

11.8.1.2.3 Error Handling

The module will generate two different kind of errors. Once an error condition is recognized, an interrupt will be generated if enabled.

11.8.1.2.3.1 Overflow Error

This error is signaled when the module has received new data before the previous data was written to the destination address. If the internal buffers are full, the $\overline{\text{DMMENA}}$ signal will go high. If the sending module does not evaluate the $\overline{\text{DMMENA}}$ signal and keeps on sending new frames, the data that was previously received

might be overwritten, thus resulting in setting the BUFF_OVF flag (INTFLAG Register (Offset = 10h) [Reset = 00000000h]).

11.8.1.2.3.2 Packet Error

Noncontinuous Clock Mode

The size of the incoming packet is defined by the SIZE information of a trace mode packet or the programmed size of a direct data mode packet. If too many or less than the number of bits are received before the next sync signal, the PACKET_ERR_INT flag will be set (INTFLAG Register (Offset = 10h) [Reset = 00000000h]). In case of receiving a DMMCLK signal without a corresponding DMMSYNC signal, a packet error will also be generated.

Continuous Clock Mode

If less than the expected number of bits are received, the PACKET_ERR_INT flag will be set (INTFLAG Register (Offset = 10h) [Reset = 00000000h]) when the next DMMSYNC signal is received. Packets with more than the expected number of bits cannot be detected.

The check for packet error is done only after the detection of the first DMMSYNC signal after the DMM is turned on or comes out of suspend mode (with COS = 0; GLBCTRL Register Field Descriptions), that is, before the reception of first DMMSYNC, the toggling of DMMCLK would be ignored.

11.8.1.2.3.3 Bus Error

If an error occurs on the microcontroller internal bus system while transferring the data from the DMM to the destination, the BUSERROR flag will be set.

11.8.1.2.4 Interrupts

The module provides different interrupts. These can be programmed to different interrupt levels independently using DMMINTLVL (INTLVL Register (Offset = Ch) [Reset = 00000000h]).

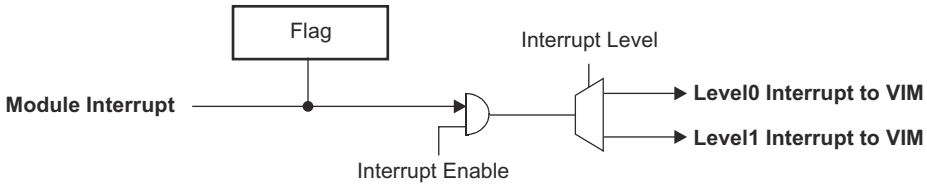

Figure 11-428. Interrupt Structure

Interrupts can be divided into error interrupts and functional interrupts. The error handling is described in Section 11.8.1.2.3. Functional interrupts depend on the mode (Trace Mode, Direct Data Mode) the DMM module is used in.

Trace Mode: An interrupt can be enabled whenever an access to the lowest address of a defined region is performed. This address is the starting address programmed in the DMMDESTxREGy register. An interrupt for each of the region can be generated by setting the individual interrupt enable bits.

Direct Data Mode: There are two interrupts that can be individually controlled. One is generated when the buffer pointer reaches the end of the defined buffer and wraps around (EO_BUFF; INTSET Register (Offset = 4h) [Reset = 00000000h]). The other one is generated when the buffer pointer matches the programmed interrupt threshold (PROG_BUFF; INTSET Register (Offset = 4h) [Reset = 00000000h]). The buffer pointer points to the next address to be written, therefor there are (interrupt threshold - 1) values stored in the buffer. The interrupt threshold can be programmed in the DMMINTPT register (INTPT Register (Offset = 28h) [Reset = 00000000h]).

11.8.1.3 MSS_DMM Registers

Table 11-1828 lists the memory-mapped registers for the MSS_DMM registers. All register offset addresses not listed in Table 11-1828 should be considered as reserved locations and the register contents should not be modified.

Table 11-1828. MSS_DMM Registers

Offset	Acronym	Register Name	Section
0h	GLBCTRL	DMM Global Control Register	Go
4h	INTSET	DMM Interrupt Set Register	Go
8h	INTCLR	DMM Interrupt Clear Register	Go

8Ch	DMMPC8	DMM Pin Control 8	Go

Complex bit access types are encoded to fit into small table cells. Table 11-1829 shows the codes that are used for access types in this section.

Table 11-1829. MSS_DMM Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

11.8.1.3.1 GLBCTRL Register (Offset = 0h) [Reset = 00000005h]

GLBCTRL is shown in Table 11-1830.

Return to the Summary Table.

Sets the global configuration of the module

Table 11-1830. GLBCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	RESERVED	R	0h	Reserved
24	BUSY	R/W	0h	BUSY User and privilege mode (read): 0 = the DMM does not currently receive data and has no data in its internal buffers, which need to be transfered. 1 = the module is currently receiving data, or has data in its internal buffers Privilege mode (write): Writes have no effect
23-19	RESERVED	R	0h	Reserved
18	CONTCLK	R/W	0h	CONTCLK. Continous RTPCLK output User and privilege mode (read): 0 = RTPCLK will be suspended between two packets 1 = free running RTPCLK Privilege mode (write): 0 = suspend RTPCLK between packets 1 = enable free running clock between packets
17	COS	R/W	0h	COS. Continue On Suspend Influences behaviour of module while in suspend mode. In all cases the corresponding interrupt will be set. User and privilege mode (read): 0 = before entering suspend mode, the ongoing reception (if started 1 HCLK cycle before SUSPEND goes high) of a packet will be finished and the value will be written to the destination. 2 HCLK cycles after SUSPEND goes low, the reception of packets is enabled again. 1 = continue receiving packets and update destination, while in suspend mode Privilege mode (write): 0 = disable data reception while in suspend mode 1 = enable data reception while in suspend mode
16	RESET	R/W	0h	RESET This bit resets the statemachine and the registers to its reset value, except the RESET bit itself. It has to be cleared by writing to it. User and privilege mode (read): 0 = no reset of DMM module 1 = reset of DMM module Privilege mode (write): 0 = no reset of DMM module 1 = reset DMM module to its reset state
15-11	RESERVED	R	0h	Reserved
10-9	DDM_WIDTH	R/W	0h	DDM_WIDTH: Packet Width in Direct Data Mode User and privilege mode read and write operation: Bit Encoding Transfer Size 00 8 bit 01 16 bit 10 32 bit 11 Reserved
8	TM_DMM	R/W	0h	TM_DMM: Packet Format If this bit is set, the DMM module assumes to receive packets by the Direct Data Mode. User and privilege mode (read): 0 = the DMM module assumes packets in Trace Mode definition 1 = the DMM module assumes packets in Direct Data Mode definition Privilege mode (write): 0 = enable Trace Mode 1 = enable Direct Data Mode
7-4	RESERVED	R	0h	Reserved

Table 11-1830. GLBCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3-0	ONOFF	R/W	5h	ON/OFF User and privilege mode (read): 1010 = the DMM module receives data and writes it to the buffer all other = the DMM module does not receive data Privilege mode (write): 1010 = enable receive/write operations. Packets will be received 1 HCLK cycle after enabling the module all other = disable receive/write operations. Packets in reception will be finished. NOTE: It is recommended to write 0101 to avoid having a soft error inadvertently enabling the module. NOTE: Registers which affect the operation of the module, should be only programmed when the BUSY bit is 0 and the ON/OFF bits are not 1010. NOTE: If the module was turned off (ON/OFF != 1010) and then turned on (ON/OFF = 1010) again, it is recommended to perform a reset (RESET = 1) of the module before switching it on. This avoids that the state machine is held in an unrecoverable state.

11.8.1.3.2 INTSET Register (Offset = 4h) [Reset = 00000000h]

INTSET is shown in Table 11-1831.

Return to the Summary Table.

Enables interrupts

Table 11-1831. INTSET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	RESERVED	R/W	0h	Reserved
17	PROG_BUFF	R/W	0h	PROG_BUFF: Programmable Buffer Interrupt Set This enables the interrupt generation in case the buffer pointer equals the programmed value in the DMMINTPT register. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
16	EO_BUFF	R/W	0h	EO_BUFF: End of Buffer Interrupt Set This enables the interrupt generation in case data was written to the last entry in the buffer and the pointer wrapped around. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
15	DEST3REG2	R/W	0h	DEST3REG 2: Destination 3 Region 2 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 3 Region 2. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
14	DEST3REG1	R/W	0h	DEST3REG 1: Destination 3 Region 1 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 3 Region 1. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
13	DEST2REG2	R/W	0h	DEST2REG 2: Destination 2 Region 2 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 2 Region 2. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
12	DEST2REG1	R/W	0h	DEST2REG 1: Destination 2 Region 1 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 2 Region 1. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)

Table 11-1831. INTSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	DEST1REG2	R/W	0h	DEST1REG 2: Destination 1 Region 2 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 1 Region 2. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
10	DEST1REG1	R/W	0h	DEST1REG 1: Destination 1 Region 1 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 1 Region 1. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
9	DEST0REG2	R/W	0h	DEST0REG 2: Destination 0 Region 2 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 0 Region 2. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
8	DEST0REG1	R/W	0h	DEST0REG 1: Destination 0 Region 1 Interrupt Set This enables the interrupt generation in case data was accessed at the startaddress of Destination 0 Region 1. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
7	BUSERROR	R/W	0h	BUSERROR: BMM Bus Error Response User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated on BMM HRESP = Error Privilege mode (write): 0 = no influence on bit 1 = enable interrupt when BMM HRESP = Error
6	BUFF_OVF	R/W	0h	BUFF_OVF: Write Buffer Overflow Interrupt Set This enables the interrupt generation in case new data is received, while the previous data is still in the deserializer. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
5	SRC_OVF	R/W	0h	SRC_OVF: Source Overflow Interrupt Set This enables the interrupt generation in case a overflow was denoted in the STAT bits of the received packet. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)

Table 11-1831. INTSET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	DEST3_ERRENA	R/W	0h	DEST3_ERRENA: Destination 3 Error Interrupt Set This enables the interrupt generation in case data should be written into a address not specified by DMMDEST3REG1/DMMDEST3BL1 or DMMDEST3REG2/DMMDEST3BL2. If both blocksizes are programmed to 0 or a reserved value, the interrupt will also be generated. The write in this case will not take place. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt
3	DEST2_ERRENA	R/W	0h	DEST2_ERRENA: Destination 2 Error Interrupt Set This enables the interrupt generation in case data should be written into a address not specified by DMMDEST2REG1/DMMDEST2BL1 or DMMDEST2REG2/DMMDEST2BL2. If both blocksizes are programmed to 0 or a reserved value, the interrupt will also be generated. The write in this case will not take place. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
2	DEST1_ERRENA	R/W	0h	DEST1_ERRENA: Destination 1 Error Interrupt Set This enables the interrupt generation in case data should be written into a address not specified by DMMDEST1REG1/DMMDEST1BL1 or DMMDEST1REG2/DMMDEST1BL2. If both blocksizes are programmed to 0 or a reserved value, the interrupt will also be generated. The write in this case will not take place. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
1	DEST0_ERRENA	R/W	0h	DEST0_ERRENA: Destination 0 Error Interrupt Set This enables the interrupt generation in case data should be written into a address not specified by DMMDEST0REG1/DMMDEST0BL1 or DMMDEST0REG2/DMMDEST0BL2. If both blocksizes are programmed to 0 or a reserved value, the interrupt will also be generated. The write in this case will not take place. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)
0	PACKET_ERR_INT	R/W	0h	PACKET_ERR_INT: Packet Error Interrupt Set This enables the interrupt generation in case of an error condition. Either the number of bits received on a Trace Mode packet doesn't correspond to the size specified in the SIZE field or the number of bits received on a Direct Data Mode packet doesn't equal the number of programmed bits in DMMGLBCTRL [10:9]. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated in case of an overflow or packet error. Privilege mode (write): 0 = no influence on bit 1 = enable interrupt (sets corresponding bit in DMMINTCLR)

11.8.1.3.3 INTCLR Register (Offset = 8h) [Reset = 00000000h]

INTCLR is shown in Table 11-1832.

Return to the Summary Table.

Disables interrupts

Table 11-1832. INTCLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	RESERVED	R	0h	Reserved
17	PROG_BUFF	R/W	0h	PROG_BUFF: Programmable Buffer Interrupt Clear This disables the interrupt generation in case the buffer pointer equals the programmed value in the DMMINTPT register. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)
16	EO_BUFF	R/W	0h	EO_BUFF: End of Buffer Interrupt Clear This disables the interrupt generation in case data was written to the last entry in the buffer and the pointer wrapped around. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)
15	DEST3REG2	R/W	0h	DEST3REG 2: Destination 3 Region 2 Interrupt Clear This disables the interrupt generation in case data was accessed at the startaddress of Destination 3 Region 2. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)
14	DEST3REG1	R/W	0h	DEST3REG 1: Destination 3 Region 1 Interrupt Clear This disables the interrupt generation in case data was accessed at the startaddress of Destination 3 Region 1. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)
13	DEST2REG2	R/W	0h	DEST2REG 2: Destination 2 Region 2 Interrupt Clear This disables the interrupt generation in case data was accessed at the startaddress of Destination 2 Region 2. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)
12	DEST2REG1	R/W	0h	DEST2REG 1: Destination 2 Region 1 Interrupt Clear This disables the interrupt generation in case data was accessed at the startaddress of Destination 2 Region 1. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)

Table 11-1832. INTCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	DEST1REG2	R/W	0h	DEST1REG 2: Destination 1 Region 2 Interrupt Clear This disables the interrupt generation in case data was accessed at the startaddress of Destination 1 Region 2. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)
10	DEST1REG1	R/W	0h	DEST1REG 1: Destination 1 Region 1 Interrupt Clear This disables the interrupt generation in case data was accessed at the startaddress of Destination 1 Region 1. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)
9	DEST0REG2	R/W	0h	DEST0REG 2: Destination 0 Region 2 Interrupt Clear This disables the interrupt generation in case data was accessed at the startaddress of Destination 0 Region 2. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)
8	DEST0REG1	R/W	0h	DEST0REG 1: Destination 0 Region 1 Interrupt Clear This disables the interrupt generation in case data was accessed at the startaddress of Destination 0 Region 1. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)
7	BUSERROR	R/W	0h	BUSERROR: BMM Bus Error Response User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated on BMM HRESP = Error Privilege mode (write): 0 = no influence on bit 1 = disable interrupt on BMM HRESP = Error
6	BUFF_OVF	R/W	0h	BUFF_OVF: Write Buffer Overflow Interrupt Clear This disables the interrupt generation in case new data is received, while the previous data is still in the deserializer.. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)
5	SRC_OVF	R/W	0h	SRC_OVF: Source Overflow Interrupt Clear This disables the interrupt generation in case a overflow was denoted in the STAT bits of the received packet. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)

Table 11-1832. INTCLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	DEST3_ERRENA	R/W	0h	DEST3_ERRENA: Destination 3 Error Interrupt Clear This disables the interrupt generation in case data should be written into a address not specified by DMMDEST3REG1/DMMDEST3BL1 or DMMDEST3REG2/DMMDEST3BL2. If both blocksizes are programmed to 0 or a reserved value, the interrupt will also be generated. The write in this case will not take place. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)
3	DEST2_ERRENA	R/W	0h	DEST2_ERRENA: Destination 2 Error Interrupt Clear This disables the interrupt generation in case data should be written into a address not specified by DMMDEST2REG1/DMMDEST2BL1 or DMMDEST2REG2/DMMDEST2BL2. If both blocksizes are programmed to 0 or a reserved value, the interrupt will also be generated. The write in this case will not take place. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)
2	DEST1_ERRENA	R/W	0h	DEST1_ERRENA: Destination 1 Error Interrupt Clear This disables the interrupt generation in case data should be written into a address not specified by DMMDEST1REG1/DMMDEST1BL1 or DMMDEST1REG2/DMMDEST1BL2. If both blocksizes are programmed to 0 or a reserved value, the interrupt will also be generated. The write in this case will not take place. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)
1	DEST0_ERRENA	R/W	0h	DEST0_ERRENA: Destination 0 Error Interrupt Clear This disables the interrupt generation in case data should be written into a address not specified by DMMDEST0REG1/DMMDEST0BL1 or DMMDEST0REG2/DMMDEST0BL2. If both blocksizes are programmed to 0 or a reserved value, the interrupt will also be generated. The write in this case will not take place. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)
0	PACKET_ERR_INT	R/W	0h	PACKET_ERR_INT: Packet Error Interrupt Clear This disables the interrupt generation in case of an error condition. Either the number of bits received on a Trace Mode packet doesn't correspond to the size specified in the SIZE field or the number of bits received on a Direct Data Mode packet doesn't equal the number of programmed bits in DMMGLBCTRL [10:9]. User and privilege mode (read): 0 = no interrupt will be generated 1 = an interrupt will be generated in case of an overflow or packet error. Privilege mode (write): 0 = no influence on bit 1 = disable interrupt (clears corresponding bit in DMMINTSET)

11.8.1.3.4 INTLVL Register (Offset = Ch) [Reset = 00000000h]

INTLVL is shown in Table 11-1833.

Return to the Summary Table.

Selects high or low priority interrupt level

Table 11-1833. INTLVL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	RESERVED	R	0h	Reserved

11.8.1.3.6 OFF1 Register (Offset = 14h) [Reset = 00000000h]

OFF1 is shown in Table 11-1835.

Return to the Summary Table.

Interrupt offset for high priority level

Table 11-1835. OFF1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R	0h	Reserved
4-0	OFFSET	R	0h	OFFSET User and privilege mode (read): Bit Encoding Interrupt 00000 Phantom 00001 Packet Error 00010 Destination 0 Error 00011 Destination 1 Error 00100 Destination 2 Error 00101 Destination 3 Error 00110 Source Overflow 00111 Buffer Overflow 01000 Bus Error 01001 Destination 0 Region 1 01010 Destination 0 Region 2 01011 Destination 1 Region 1 01100 Destination 1 Region 2 01101 Destination 2 Region 1 01110 Destination 2 Region 2 01111 Destination 3 Region 1 10000 Destination 3 Region 2 10001 End of Buffer 10010 Programmable Buffer 10011 - 11111 Reserved Reading the offset will clear the corresponding flag in DMMINTFLAG. Privilege and user mode (write): writes have no effect

11.8.1.3.7 OFF2 Register (Offset = 18h) [Reset = 00000000h]

OFF2 is shown in Table 11-1836.

Return to the Summary Table.

Interrupt offset for low priority level

Table 11-1836. OFF2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R	0h	Reserved
4-0	OFFSET	R	0h	OFFSET User and privilege mode (read): Bit Encoding Interrupt 00000 Phantom 00001 Packet Error 00010 Destination 0 Error 00011 Destination 1 Error 00100 Destination 2 Error 00101 Destination 3 Error 00110 Source Overflow 00111 Buffer Overflow 01000 Bus Error 01001 Destination 0 Region 1 01010 Destination 0 Region 2 01011 Destination 1 Region 1 01100 Destination 1 Region 2 01101 Destination 2 Region 1 01110 Destination 2 Region 2 01111 Destination 3 Region 1 10000 Destination 3 Region 2 10001 End of Buffer 10010 Programmable Buffer 10011 - 11111 Reserved Reading the offset will clear the corresponding flag in DMMINTFLAG. Privilege and user mode (write): writes have no effect

11.8.1.3.8 DDMDEST Register (Offset = 1Ch) [Reset = 00000000h]

DDMDEST is shown in Table 11-1837.

Return to the Summary Table.

Configuration of Buffer for Direct Data Mode

Table 11-1837. DDMDEST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	STARTADDR	R/W	0h	STARTADDR[31:0] These bits define the starting address of the buffer. The starting address has to be a multiple of the blocksize chosen in DMMDDMBL. User and privilege mode (read): current start address Privilege mode (write): sets start address to value written

11.8.1.3.9 DDMBL Register (Offset = 20h) [Reset = 00000000h]

DDMBL is shown in Table 11-1838.

Return to the Summary Table.

Defines the blocksize for the buffer in Direct Data Mode

Table 11-1838. DDMBL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	BLOCKSIZE	R/W	0h	BLOCKSIZE These bits define the length of the buffer region. If all bits are 0, the region is disabled and no data will be stored. User and privilege mode (read): current start address Privilege mode (write): BLOCKSIZE [3:0] Region Size (in byte) 0000 0 0001 32 0010 64 0011 128 0100 256 0101 512 0110 1k 0111 2k 1000 4k 1001 8k 1010 16k 1011 32k 1100 Reserved 1101 Reserved 1110 Reserved 1111 Reserved

11.8.1.3.10 DDMPT Register (Offset = 24h) [Reset = 00000000h]

DDMPT is shown in Table 11-1839.

Return to the Summary Table.

Pointer to the last written entry in the buffer

Table 11-1839. DDMPT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	RESERVED	R	0h	Reserved
14-0	POINTER	R	0h	POINTER These bits hold the pointer to the next entry to be written in the buffer. The pointer points to the byte aligned address. If in 16-bit DDM mode, bit 0 will be discarded. If in 32-bit DDM mode, bit 0 and 1 will be discarded. User and privilege mode (read): next pointer entry Privilege mode (write): writes have no effect

11.8.1.3.11 INTPT Register (Offset = 28h) [Reset = 00000000h]

INTPT is shown in Table 11-1840.

Return to the Summary Table.

Programmable Interrupt Pointer

Table 11-1840. INTPT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-15	RESERVED	R	0h	Reserved
14-0	INTPT	R/W	0h	INTPT: Interrupt Pointer When the buffer pointer (DMMDDMPT) matches the programmed value in DMMINTPT and the PROG_BUF interrupt is set, a interrupt is generated. User and privilege mode (read): current interrupt pointer Privilege mode (write): new interrupt pointer

11.8.1.3.12 DEST0REG1 Register (Offset = 2Ch) [Reset = 00000000h]

DEST0REG1 is shown in Table 11-1841.

Return to the Summary Table.

Defines Region 1 for Destination 0

Table 11-1841. DEST0REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	BASEADDR	R/W	0h	BASEADDR [31:18] These bits define the base address of the 256kB region where the buffer is located. User and privilege mode (read): current start address Privilege mode (write): sets base address to value written
17-0	BLOCKADDR	R/W	0h	BLOCKADDR [17:0] These bits define the starting address of the buffer in the 256kB page. The starting address has to be a multiple of the blocksize chosen in DMMDEST0BL1. User and privilege mode (read): current start address Privilege mode (write): sets start address to value written

11.8.1.3.13 DEST0BL1 Register (Offset = 30h) [Reset = 00000000h]

DEST0BL1 is shown in Table 11-1842.

Return to the Summary Table.

Defines the blocksize for the buffer for Destination 0 Region 1

Table 11-1842. DEST0BL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	BLOCKSIZE	R/W	0h	BLOCKSIZE These bits define the length of the buffer region. If all bits are 0, the region is disabled and no data will be stored. User and privilege mode (read): current block size Privilege mode (write): BLOCKSIZE [3:0] Region Size (in byte) 0000 0k 0001 1k 0010 2k 0011 4k 0100 8k 0101 16k 0110 32k 0111 64k 1000 128k 1001 256k 1010 Reserved 1011 Reserved 1100 Reserved 1101 Reserved 1110 Reserved 1111 Reserved

11.8.1.3.14 DEST0REG2 Register (Offset = 34h) [Reset = 00000000h]

DEST0REG2 is shown in Table 11-1843.

Return to the Summary Table.

Defines Region 2 for Destination 0

Table 11-1843. DEST0REG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	BASEADDR	R/W	0h	BASEADDR [31:18] These bits define the base address of the 256kB region where the buffer is located. User and privilege mode (read): current start address Privilege mode (write): sets base address to value written
17-0	BLOCKADDR	R/W	0h	BLOCKADDR [17:0] These bits define the starting address of the buffer in the 256kB page. The starting address has to be a multiple of the blocksize chosen in DMMDEST0BL2. User and privilege mode (read): current start address Privilege mode (write): sets start address to value written

11.8.1.3.15 DEST0BL2 Register (Offset = 38h) [Reset = 00000000h]

DEST0BL2 is shown in Table 11-1844.

Return to the Summary Table.

Defines the blocksize for the buffer for Destination 0 Region 2

Table 11-1844. DEST0BL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	BLOCKSIZE	R/W	0h	BLOCKSIZE These bits define the length of the buffer region. If all bits are 0, the region is disabled and no data will be stored. User and privilege mode (read): current block size Privilege mode (write): BLOCKSIZE [3:0] Region Size (in byte) 0000 0k 0001 1k 0010 2k 0011 4k 0100 8k 0101 16k 0110 32k 0111 64k 1000 128k 1001 256k 1010 Reserved 1011 Reserved 1100 Reserved 1101 Reserved 1110 Reserved 1111 Reserved

11.8.1.3.16 DEST1REG1 Register (Offset = 3Ch) [Reset = 00000000h]

DEST1REG1 is shown in Table 11-1845.

Return to the Summary Table.

Defines Region 1 for Destination1

Table 11-1845. DEST1REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	BASEADDR	R/W	0h	BASEADDR [31:18] These bits define the base address of the 256kB region where the buffer is located. User and privilege mode (read): current start address Privilege mode (write): sets base address to value written
17-0	BLOCKADDR	R/W	0h	BLOCKADDR [17:0] These bits define the starting address of the buffer in the 256kB page. The starting address has to be a multiple of the blocksize chosen in DMMDEST1BL1. User and privilege mode (read): current start address Privilege mode (write): sets start address to value written

11.8.1.3.17 DEST1BL1 Register (Offset = 40h) [Reset = 00000000h]

DEST1BL1 is shown in Table 11-1846.

Return to the Summary Table.

Defines the blocksize for the buffer for Destination 1 Region 1

Table 11-1846. DEST1BL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	BLOCKSIZE	R/W	0h	BLOCKSIZE These bits define the length of the buffer region. If all bits are 0, the region is disabled and no data will be stored. User and privilege mode (read): current block size Privilege mode (write): BLOCKSIZE [3:0] Region Size (in byte) 0000 0k 0001 1k 0010 2k 0011 4k 0100 8k 0101 16k 0110 32k 0111 64k 1000 128k 1001 256k 1010 Reserved 1011 Reserved 1100 Reserved 1101 Reserved 1110 Reserved 1111 Reserved

11.8.1.3.18 DEST1REG2 Register (Offset = 44h) [Reset = 00000000h]

DEST1REG2 is shown in Table 11-1847.

Return to the Summary Table.

Defines Region 2 for Destination 1

Table 11-1847. DEST1REG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	BASEADDR	R/W	0h	BASEADDR [31:18] These bits define the base address of the 256kB region where the buffer is located. User and privilege mode (read): current start address Privilege mode (write): sets base address to value written
17-0	BLOCKADDR	R/W	0h	BLOCKADDR [17:0] These bits define the starting address of the buffer in the 256kB page. The starting address has to be a multiple of the blocksize chosen in DMMDEST1BL2. User and privilege mode (read): current start address Privilege mode (write): sets start address to value written

11.8.1.3.19 DEST1BL2 Register (Offset = 48h) [Reset = 00000000h]

DEST1BL2 is shown in Table 11-1848.

Return to the Summary Table.

Defines the blocksize for the buffer for Destination 1 Region 2

Table 11-1848. DEST1BL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	BLOCKSIZE	R/W	0h	BLOCKSIZE These bits define the length of the buffer region. If all bits are 0, the region is disabled and no data will be stored. User and privilege mode (read): current block size Privilege mode (write): BLOCKSIZE [3:0] Region Size (in byte) 0000 0k 0001 1k 0010 2k 0011 4k 0100 8k 0101 16k 0110 32k 0111 64k 1000 128k 1001 256k 1010 Reserved 1011 Reserved 1100 Reserved 1101 Reserved 1110 Reserved 1111 Reserved

11.8.1.3.20 DEST2REG1 Register (Offset = 4Ch) [Reset = 00000000h]

DEST2REG1 is shown in Table 11-1849.

Return to the Summary Table.

Defines Region 1 for Destination 2

Table 11-1849. DEST2REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	BASEADDR	R/W	0h	BASEADDR [31:18] These bits define the base address of the 256kB region where the buffer is located. User and privilege mode (read): current start address Privilege mode (write): sets base address to value written
17-0	BLOCKADDR	R/W	0h	BLOCKADDR [17:0] These bits define the starting address of the buffer in the 256kB page. The starting address has to be a multiple of the blocksize chosen in DMMDEST2BL1. User and privilege mode (read): current start address Privilege mode (write): sets start address to value written

11.8.1.3.21 DEST2BL1 Register (Offset = 50h) [Reset = 00000000h]

DEST2BL1 is shown in Table 11-1850.

Return to the Summary Table.

Defines the blocksize for the buffer for Destination 2 Region 1

Table 11-1850. DEST2BL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	BLOCKSIZE	R/W	0h	BLOCKSIZE These bits define the length of the buffer region. If all bits are 0, the region is disabled and no data will be stored. 11.8.1.3.28 DMMPC0 Register (Offset = 6Ch) [Reset = 00000000h]

DMMPC0 is shown in Table 11-1857.

Return to the Summary Table.

Defines functional or GIO mode of pins

Table 11-1857. DMMPC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R	0h	Reserved
18	ENAFUNC	R/W	0h	ENAFUNC: Functional mode of DMMENA pin This bit defines whether the pin is used in functional mode or in GIO mode User and privilege mode (read): 0 = Pin is used in GIO mode 1 = Pin is used in Functional mode Privilege mode (write): 0 = Pin is used in GIO mode 1 = Pin is used in Functional mode
17-2	DATAxFUNC	R/W	0h	DATAxFUNC: Functional mode of DMMDATA[x] pin This bit defines whether the pin is used in functional mode or in GIO mode User and privilege mode (read): 0 = Pin is used in GIO mode 1 = Pin is used in FunctionaPrivilege mode (write): 0 = Pin is used in GIO mode 1 = Pin is used in Functional model mode
1	CLKFUNC	R/W	0h	CLKFUNC: Functional mode of DMMCLK pin This bit defines whether the pin is used in functional mode or in GIO mode User and privilege mode (read): 0 = Pin is used in GIO mode 1 = Pin is used in Functional mode Privilege mode (write): 0 = Pin is used in GIO mode 1 = Pin is used in Functional mode
0	SYNCFUNC	R/W	0h	SYNCFUNC: Functional mode of DMMSYNC pin This bit defines whether the pin is used in functional mode or in GIO mode User and privilege mode (read): 0 = Pin is used in GIO mode 1 = Pin is used in Functional mode Privilege mode (write): 0 = Pin is used in GIO mode 1 = Pin is used in Functional mode

11.8.1.3.29 DMMPC1 Register (Offset = 70h) [Reset = 00000000h]

DMMPC1 is shown in Table 11-1858.

Return to the Summary Table.

Defines direction of pins

Table 11-1858. DMMPC1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R	0h	Reserved
18	ENADIR	R/W	0h	ENADIR: Direction of DMMENA pin This bit defines whether the pin is used as input or output in GIO mode User and privilege mode (read): 0 = Pin is used as input 1 = Pin is used as output Privilege mode (write): 0 = Pin is set to input 1 = Pin is set to output
17-2	DATAxDIR	R/W	0h	DATAxDIR: Direction of DMMDATA[x] pin This bit defines whether the pin is used as input or output in GIO mode User and privilege mode (read): 0 = Pin is used as input 1 = Pin is used as output Privilege mode (write): 0 = Pin is set to input 1 = Pin is set to output
1	CLKDIR	R/W	0h	CLKDIR: Direction of DMMCLK pin This bit defines whether the pin is used as input or output in GIO mode User and privilege mode (read): 0 = Pin is used as input 1 = Pin is used as output Privilege mode (write): 0 = Pin is set to input 1 = Pin is set to output
0	SYNCDIR	R/W	0h	SYNCDIR: Direction of DMMSYNC pin This bit defines whether the pin is used as input or output in GIO mode User and privilege mode (read): 0 = Pin is used as input 1 = Pin is used as output Privilege mode (write): 0 = Pin is set to input 1 = Pin is set to output

11.8.1.3.30 DMMPC2 Register (Offset = 74h) [Reset = 00000000h]

DMMPC2 is shown in Table 11-1859.

Return to the Summary Table.

Input level of pins

Table 11-1859. DMMPC2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R	0h	Reserved
18	ENAIN	R/W	0h	ENAIN: DMMENA input This bit reflects the state of the pin in all modes User and privilege mode (read): 0 = Logic low (input voltage is VIL or lower) 1 = Logic high (input voltage is VIH or higher) Privilege mode (write): Writes to this bit have no effect.
17-2	DATAxIN	R/W	0h	DATAxIN: DMMDATA[x] input This bit reflects the state of the pin in all modes User and privilege mode (read): 0 = Logic low (input voltage is VIL or lower) 1 = Logic high (input voltage is VIH or higher) Privilege mode (write): Writes to this bit have no effect
1	CLKIN	R/W	0h	CLKIN: DMMCLK input This bit reflects the state of the pin in all modes User and privilege mode (read): 0 = Logic low (input voltage is VIL or lower) 1 = Logic high (input voltage is VIH or higher) Privilege mode (write): Writes to this bit have no effect
0	SYNCIN	R/W	0h	SYNCIN: DMMSYNC input This bit reflects the state of the pin in all modes User and privilege mode (read): 0 = Logic low (input voltage is VIL or lower) 1 = Logic high (input voltage is VIH or higher) Privilege mode (write): Writes to this bit have no effect.

11.8.1.3.31 DMMPC3 Register (Offset = 78h) [Reset = 00000000h]

DMMPC3 is shown in Table 11-1860.

Return to the Summary Table.

Sets pins to high or low

Table 11-1860. DMMPC3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R	0h	Reserved
18	ENAOUT	R/W	0h	ENAOUT: Output state of DMMENA pin This bit sets the pin to logic low or high level User and privilege mode (read): 0 = Logic low (output voltage is VOL or lower) 1 = Logic high (output voltage is VOH or higher) Privilege mode (write): 0 = Logic low (output voltage is set to VOL or lower) 1 = Logic high (output voltage is set to VOH or higher)
17-2	DATAxOUT	R/W	0h	DATAxOUT: Output state of DMMDATA[x] pin This bit sets the pin to logic low or high level User and privilege mode (read): 0 = Logic low (output voltage is VOL or lower) 1 = Logic high (output voltage is VOH or higher) Privilege mode (write): 0 = Logic low (output voltage is set to VOL or lower) 1 = Logic high (output voltage is set to VOH or higher)
1	CLKOUT	R/W	0h	CLKOUT: Output state of DMMCLK pin This bit sets the pin to logic low or high level User and privilege mode (read): 0 = Logic low (output voltage is VOL or lower) 1 = Logic high (output voltage is VOH or higher) Privilege mode (write): 0 = Logic low (output voltage is set to VOL or lower) 1 = Logic high (output voltage is set to VOH or higher)
0	SYNCOUT	R/W	0h	SYNCOUT: Output state of DMMSYNC pin This bit sets the pin to logic low or high level User and privilege mode (read): 0 = Logic low (output voltage is VOL or lower) 1 = Logic high (output voltage is VOH or higher) Privilege mode (write): 0 = Logic low (output voltage is set to VOL or lower) 1 = Logic high (output voltage is set to VOH or higher)

11.8.1.3.32 DMMPC4 Register (Offset = 7Ch) [Reset = 00000000h]

DMMPC4 is shown in Table 11-1861.

Return to the Summary Table.

Sets pins to high

Table 11-1861. DMMPC4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R	0h	Reserved
18	ENASET	R/W	0h	ENASET: Sets output state of DMMENA pin to logic high Value in the ENASET bit sets the data output control register bit to 1 regardless of the current value in the ENAOUT bit User and privilege mode (read): 0 = Logic low (output voltage is VOL or lower) 1 = Logic high (output voltage is VOH or higher) Privilege mode (write): 0 = leaves the pin unchanged 1 = Sets the pin to Logic high (output voltage is set to VOH or higher)
17-2	DATAxSET	R/W	0h	DATAxSET: Sets output state of DMMDATA[x] pin to logic high Value in the DATAxSET bit sets the data output control register bit to 1 regardless of the current value in the DATAxOUT bit User and privilege mode (read): 0 = Logic low (output voltage is VOL or lower) 1 = Logic high (output voltage is VOH or higher) Privilege mode (write): 0 = leaves the pin unchanged 1 = Sets the pin to Logic high (output voltage is set to VOH or higher)
1	CLKSET	R/W	0h	CLKSET: Sets output state of DMMCLK pin to logic high Value in the CLKSET bit sets the data output control register bit to 1 regardless of the current value in the CLKOUT bit User and privilege mode (read): 0 = Logic low (output voltage is VOL or lower) 1 = Logic high (output voltage is VOH or higher) Privilege mode (write): 0 = leaves the pin unchanged 1 = Sets the pin to Logic high (output voltage is set to VOH or higher)
0	SYNCSET	R/W	0h	SYNCSET: Sets output state of DMMSYNC pin logic high Value in the SYNCSET bit sets the data output control register bit to 1 regardless of the current value in the SYNCOUT bit User and privilege mode (read): 0 = Logic low (output voltage is VOL or lower) 1 = Logic high (output voltage is VOH or higher) Privilege mode (write): 0 = leaves the pin unchanged 1 = Sets the pin to Logic high (output voltage is set to VOH or higher)

11.8.1.3.33 DMMPC5 Register (Offset = 80h) [Reset = 00000000h]

DMMPC5 is shown in Table 11-1862.

Return to the Summary Table.

Sets pins to low

Table 11-1862. DMMPC5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R	0h	Reserved
18	ENACLR	R/W	0h	ENACLR: Sets output state of DMMENA pin to logic low Value in the ENACLR bit clears the data output control register bit to 0 regardless of the current value in the ENAOUT bit User and privilege mode (read): 0 = Logic low (output voltage is VOL or lower) 1 = Logic high (output voltage is VOH or higher) Privilege mode (write): 0 = leaves the pin unchanged 1 = clears the pin to logic low (output voltage is set to VOL or lower)
17-2	DATAxCLR	R/W	0h	DATAxCLR: Sets output state of DMMDATA[x] pin to logic low Value in the DATAxCLR bit clears the data output control register bit to 0 regardless of the current value in the DATAxOUT bit User and privilege mode (read): 0 = Logic low (output voltage is VOL or lower) 1 = Logic high (output voltage is VOH or higher) Privilege mode (write): 0 = leaves the pin unchanged 1 = clears the pin to logic low (output voltage is set to VOL or lower)
1	CLKCLR	R/W	0h	CLKCLR: Sets output state of DMMCLK pin to logic low Value in the CLKCLR bit clears the data output control register bit to 0 regardless of the current value in the DATAxOUT bit User and privilege mode (read): 0 = Logic low (output voltage is VOL or lower) 1 = Logic high (output voltage is VOH or higher) Privilege mode (write): 0 = leaves the pin unchanged 1 = clears the pin to logic low (output voltage is set to VOL or lower)
0	SYNCCLR	R/W	0h	SYNCCLR: Sets output state of DMMSYNC pin to logic low Value in the SYNCCLR bit clears the data output control register bit to 0 regardless of the current value in the DATAxOUT bit User and privilege mode (read): 0 = Logic low (output voltage is VOL or lower) 1 = Logic high (output voltage is VOH or higher) Privilege mode (write): 0 = leaves the pin unchanged 1 = clears the pin to logic low (output voltage is set to VOL or lower)

11.8.1.3.34 DMMPC6 Register (Offset = 84h) [Reset = 00000000h]

DMMPC6 is shown in Table 11-1863.

Return to the Summary Table.

Configures open drain functionality of pin

Table 11-1863. DMMPC6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R	0h	Reserved
18	ENAPDR	R/W	0h	ENAPDR: Open Drain enable Enables open drain functionality on pin if pin is configured as GIO output (DMMPC0.x=0 DMMPC1.x=1). If pin is configured as functional pin (DMMPC0.x=1), the open drain functionality is disabled. User and privilege mode (read): 0 = pin behaves as normal push/pull pin 1 = pin operates in open drain mode Privilege mode (write): 0 = configures pin as push/pull 1 = configures pin as open drain

11.8.2 Core Clock Comparator (CCC)

11.8.2.1 Description

Core Clock Comparator (CCC) supports single-shot and continuous mode of operation, such as DCC. In continuous mode, the programmed values are reloaded after every successful comparison.

The module accepts 7 clock inputs for clock 0 and clock 1. One of these input clocks is selected to counter 0 and counter 1. Counter 0 is a down counter and is preloaded with a value before enabling the module. Counter 1 is an up counter which operates on Clock 1.

At the expiry of counter 0, value in the counter 1 is compared against the programmed expected value of the counter. After a successful comparison, a Done signal is asserted in single-shot mode, whereas in continuous mode, counter 0 is reloaded for the next comparison. Margin value programmed provides the tolerance for the comparison. An error signal is asserted when the counter 1 value differs from the expected value beyond the tolerance range.

When an error occurs, the module stops comparison in both single-shot and continuous mode.

There is a timeout counter functioning on Clock 1. A timeout value must be loaded into the timeout counter before enabling the module. If the timeout counter expires before the expiry of counter 0, an error condition is

indicated. In continuous mode, after the successful comparison, the timeout value is also reloaded along with Counter 0.

11.8.2.2 Block Diagram

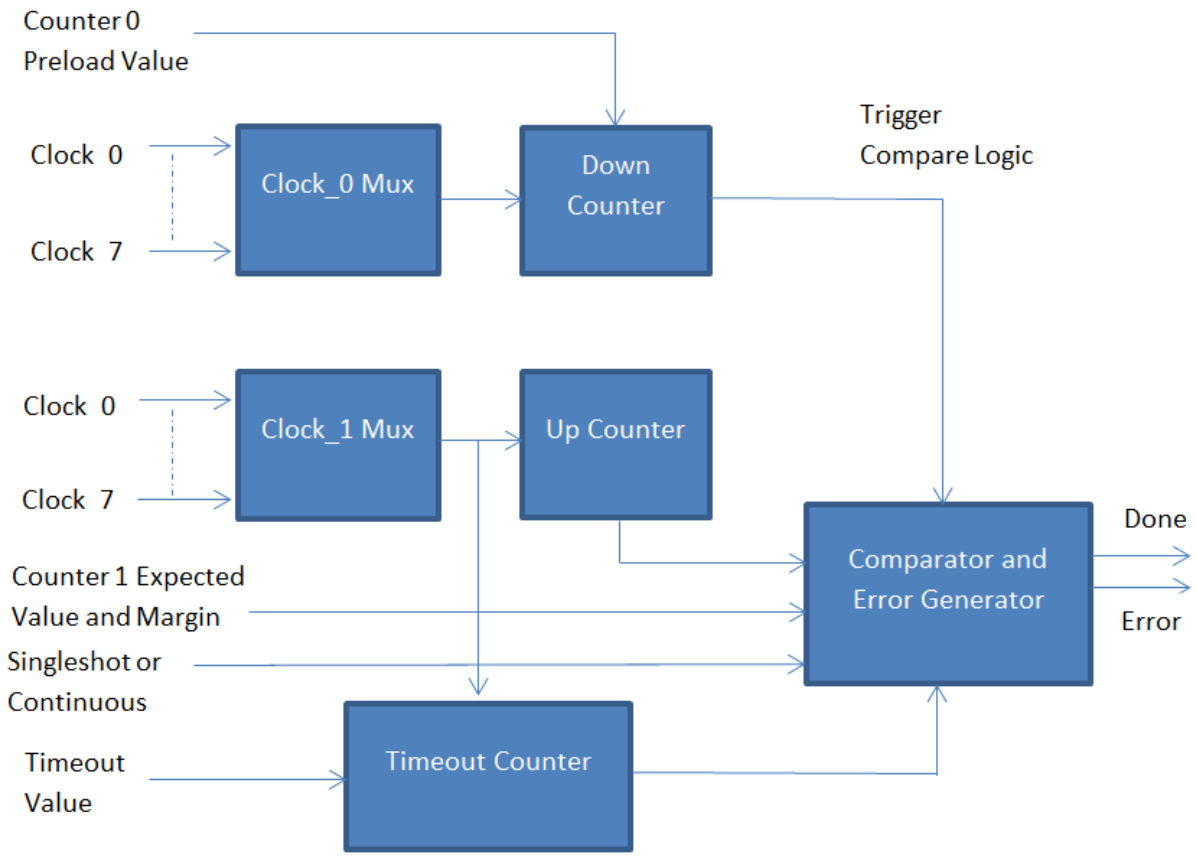

Figure 11-429. CCC Block Diagram

11.8.2.3 Perform Clock Comparison

The following are the steps to perform clock comparison.

1. Select Clock 0.
2. Select Clock 1.
3. Load value for down counting in counter 0.
4. Load expected value of counter 1.
5. Load Margin value for tolerance.
6. Set singleshot or continuous mode.
7. Load timeout value.
8. Enable Module.
9. Wait for Done or Error indication.

11.8.2.4 I/O Table

Table 11-1866. I/O Table

Signal	Input/Output	Description
async_rst_n	Input	Module Reset
vbusp_clk	Input	Clock

Table 11-1866. I/O Table (continued)

Signal	Input/Output	Description
clock0_src	Input	Input clocks for Counter 0
clock1_src	Input	Input clocks for Counter 1
clock0_sel	Input	Clock Selector for Counter 0
clock1_sel	Input	Clock Selector for Counter 1
count0_expiry_val	Input	Preload Value for Counter 0
count1_expected_val	Input	Expected value of Counter 1
disable_clk_output	Input	Cutoff clocks for the module
enable_module	Input	Enable for Clock comparator
margin_count	Input	Tolerance value for Comparator
singleshot_mode	Input	0->Continuous mode, 1-> Singleshot mode
count1_val_out	Output	Counter 1 value
counter_error	Output	Error Indicator
counter_done	Output	Successful comparison Indicator
mod_status	Output	Internal Status Indicator
async_error_indicator	Output	Error indicator without the synchronizer
timeout_err_count	Input	Preload value for Timeout Counter
atpg_reset_bypass	Input	DFT reset
atpg_clk	Input	DFT clock
icg_te	Input	Control for ICG
atpg_clk_bypass	Input	Control for ATPG clock

11.8.2.5 Recommended Programmation

- Clock source 1 must be faster than Clock source 0 for successful comparison of clocks.
- The timeout value must always be loaded for successful comparison. The timeout value must be greater than the duration of the comparison operation.

11.8.3 Dual Clock Comparator (DCC)

This section describes the dual-clock comparator (DCC) module.

11.8.3.1 Introduction

The primary purpose of a DCC module is to measure the frequency of a clock signal using a second known clock signal as a reference. Specifically, DCC is designed to detect drifts from the expected clock frequency. This capability can be used to ensure the correct frequency range for several different device clock sources, thereby enhancing the system safety metrics.

11.8.3.1.1 Main Features

The main features of each of the DCC modules are:

- Allows application to ensure that a fixed ratio is maintained between frequencies of two clock signals
- Supports the definition of a programmable tolerance window in terms of number of reference clock cycles
- Supports continuous monitoring without requiring application intervention
- Also supports a single-sequence mode for spot measurements
- Allows selection of clock source for each of the counters resulting in several specific use cases

11.8.3.1.2 Block Diagram

Figure 11-430 illustrates the main concept of the DCC module.

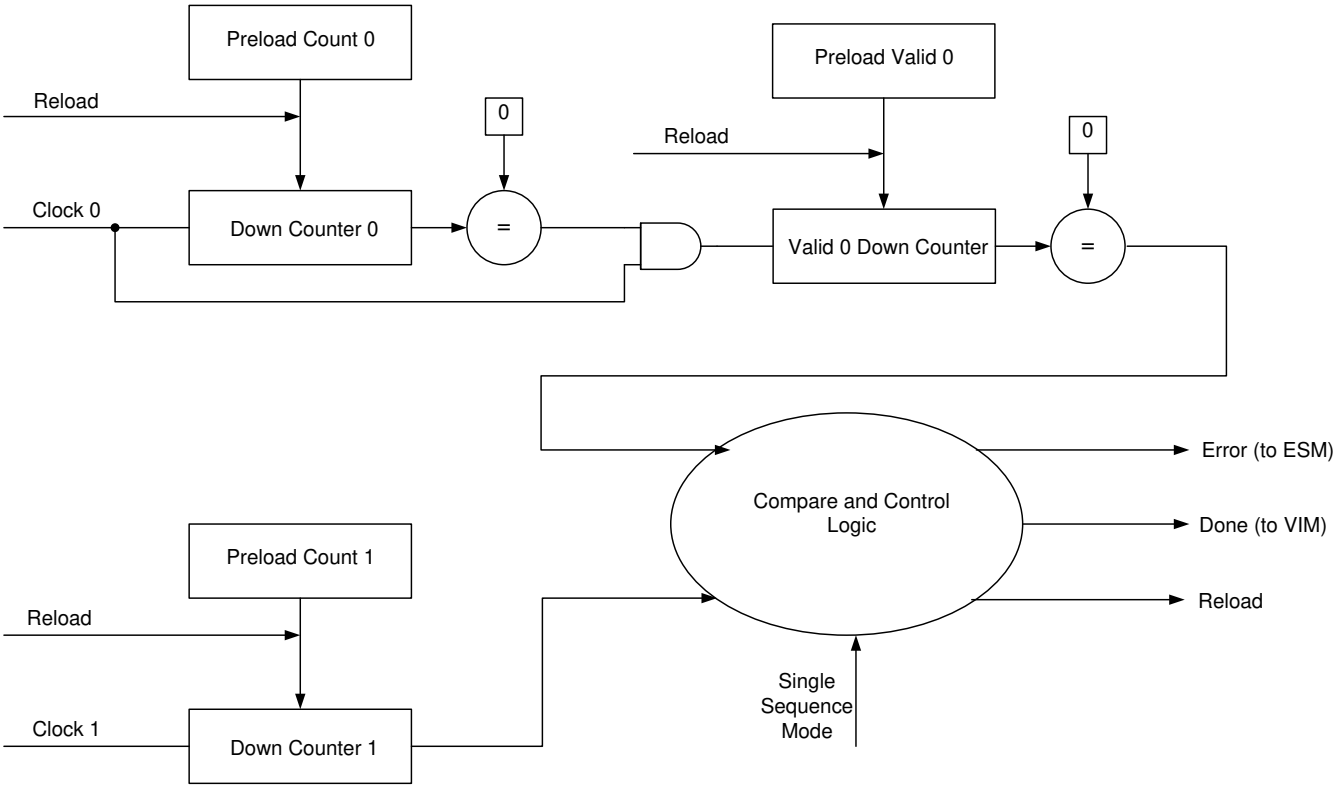

Figure 11-430. Block Diagram

11.8.3.2 Module Operation

As shown in Figure 11-430, the DCC contains two counters – counter0 and counter1, which are driven by two signals – clock0 and clock1. The application programs the seed values for both these counters. The application also configures the tolerance window time by configuring the valid counter for clock0.

Counter0 and counter1 both start counting simultaneously once the DCC is enabled. When counter0 counts down to zero, this automatically triggers the count down of the tolerance window counter (valid0).

The DCC module can be used in two different operating modes:

11.8.3.2.1 Continuous Monitoring Mode

In this mode, the DCC is used by the application to ensure that two clock signals maintain the correct frequency ratio. Suppose the application wants to ensure that the PLL output signal (clock source # 1) always maintains a fixed frequency relationship with the main oscillator (clock source # 0).

- In this case, the application can use the main oscillator as the clock0 signal (for counter0 and valid0) and the PLL output as the clock1 (for counter1).
- The seed values of counter0, valid0 and counter1 are selected such that if the actual frequencies of clock0 and clock1 are equal to their expected frequencies, then the counter1 will reach zero either at the same time as counter0 or during the count down of the valid0 counter.
- If the counter1 reaches zero during the count down of the valid0 counter, then all the counters (counter0, valid0, counter1) are reloaded with their initial seed values once valid0 has also counted down to zero.
- This sequence of counting down and checking then continues as long as there is no error, or until the DCC module is disabled.
- The counters also all get reloaded if the application resets and restarts the DCC module.

Error Conditions:

An error condition is generated by any one of the following:

1. Counter1 counts down to 0 before Counter0 reaches 0. This means that clock1 is faster than expected, or clock0 is slower than expected. It includes the case when clock0 is stuck at 1 or 0.
2. Counter1 does not reach 0 even when Counter0 and Valid0 have both reached 0. This means that clock1 is slower than expected. It includes the case when clock1 is stuck at 1 or 0.

Any error freezes the counters from counting. An application may then read out the counter values to help determine what caused the error.

11.8.3.2.1.1 Error Conditions

While operating in continuous mode, the counters get reloaded with the seed values and continue counting down under the following conditions:

- The module is reset or restarted by the application, OR
- Counter0, Valid 0 and Counter1 all reach 0 without any error

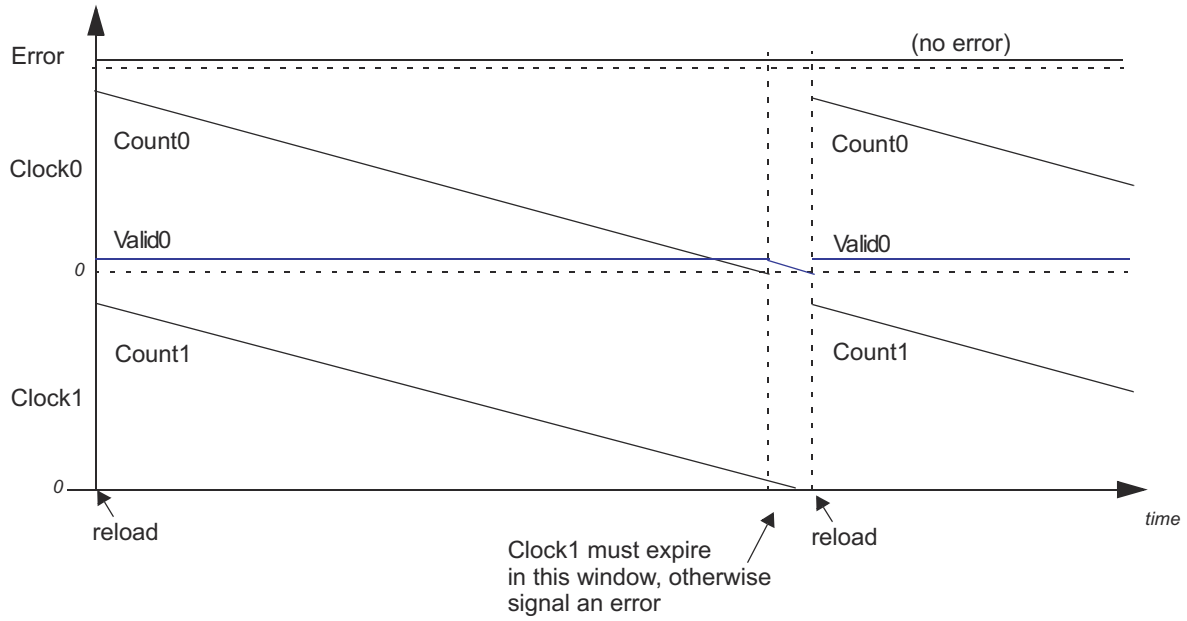

Figure 11-431. Counter Relationship

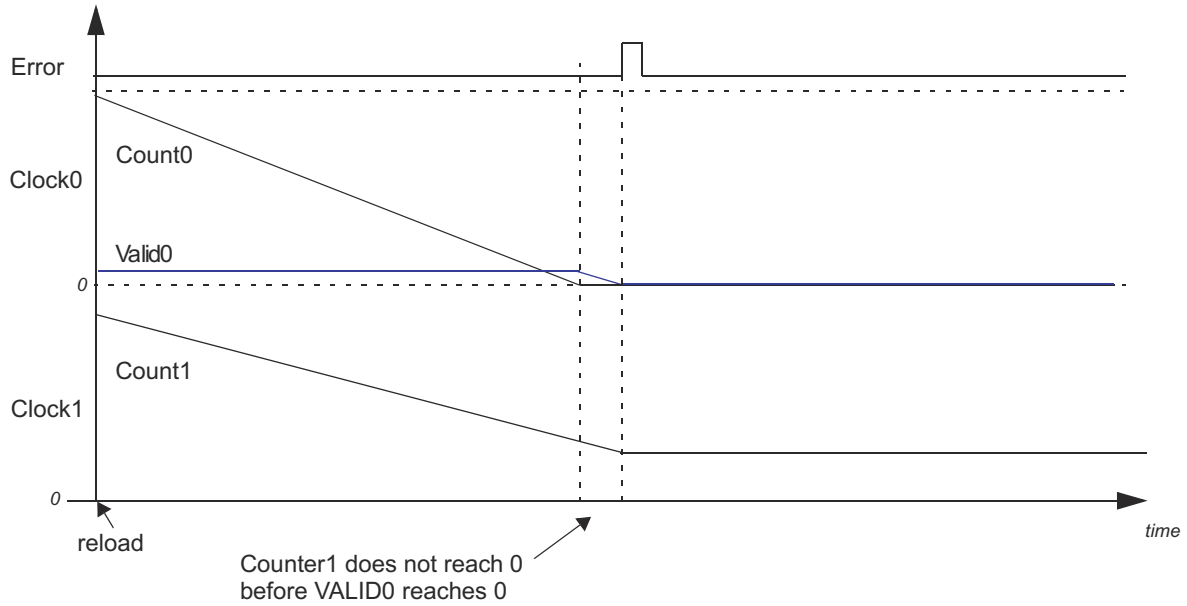

Figure 11-432. Clock1 Slower Than Clock0 - Results in an Error and Stops Counting

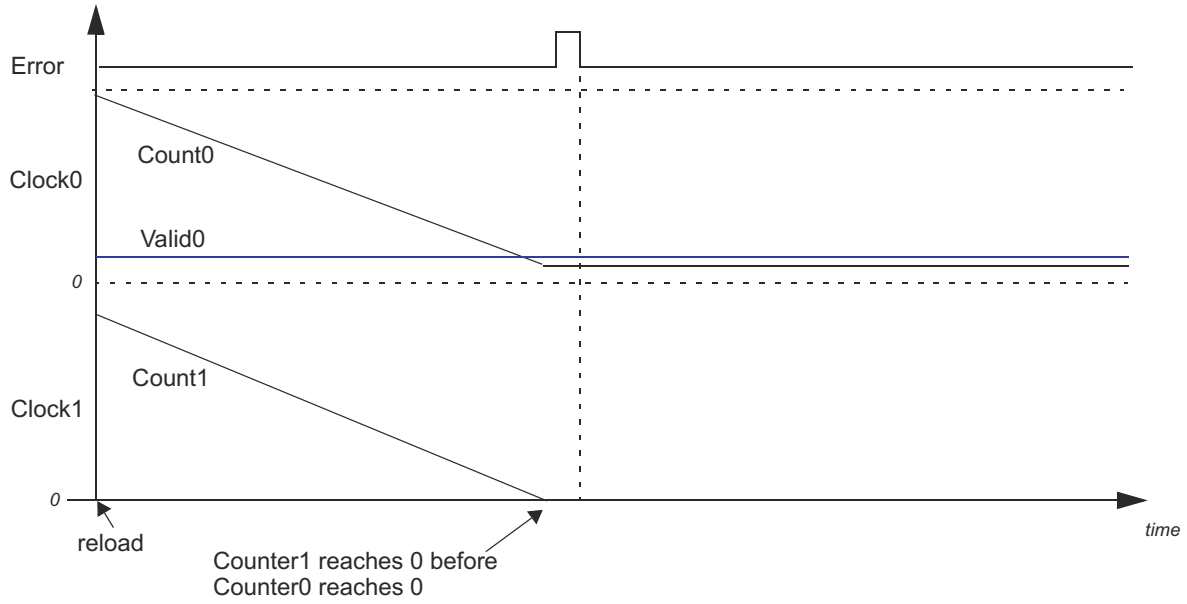

Figure 11-433. Clock1 Faster Than Clock0 - Results in an Error and Stops Counting

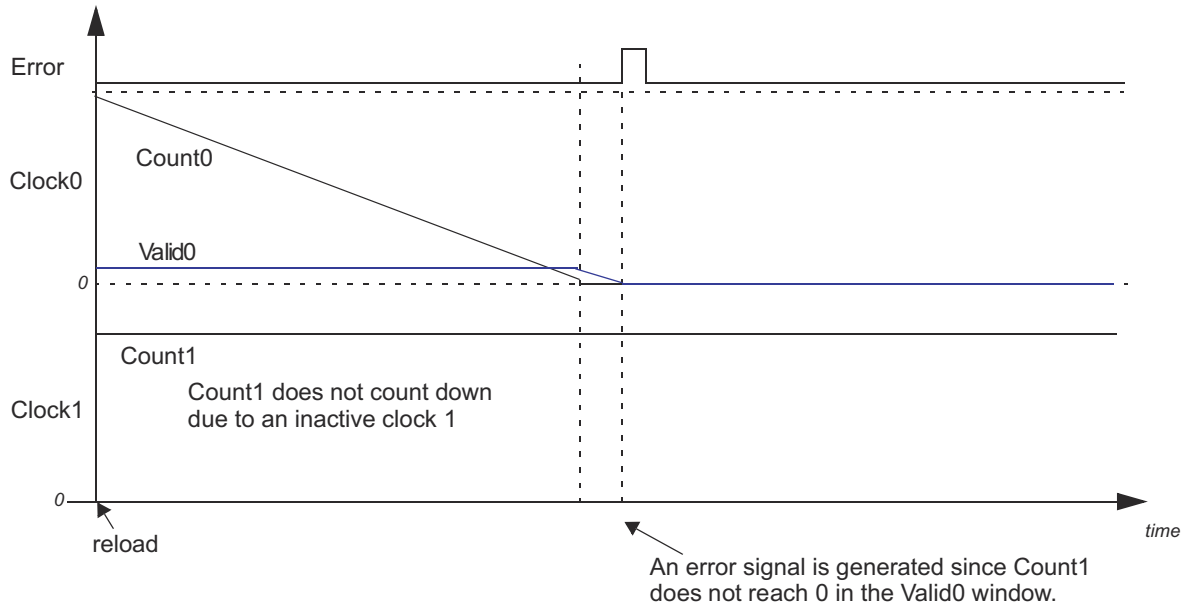

Figure 11-434. Clock1 Not Present - Results in an Error and Stops Counting

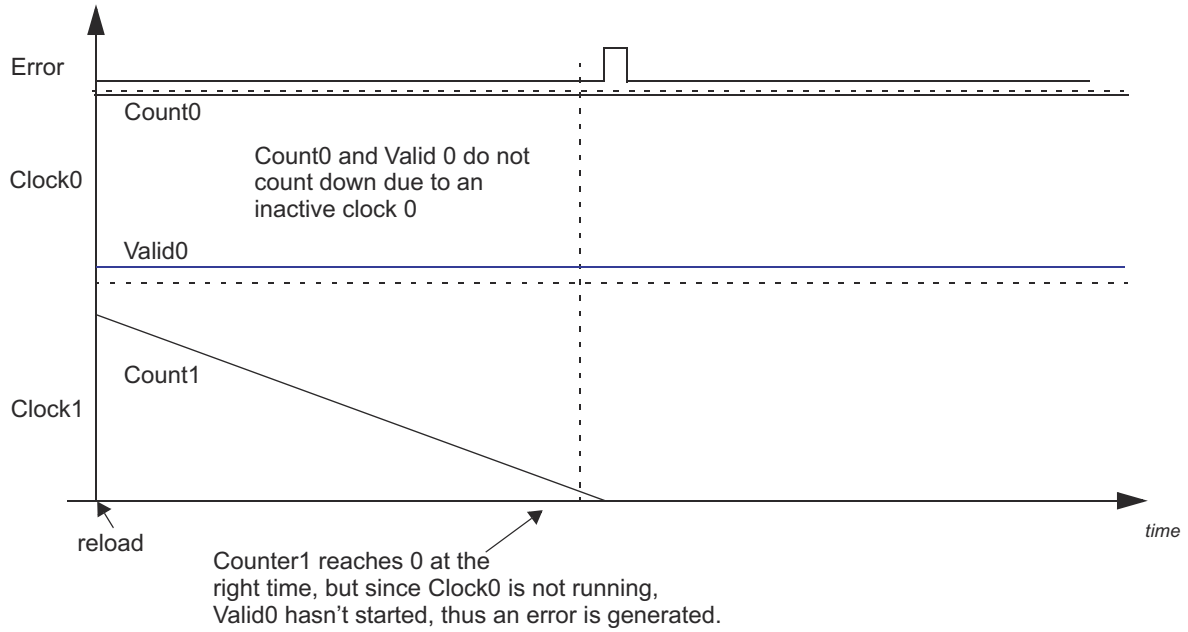

Figure 11-435. Clock0 Not Present - Results in an Error and Stops Counting

11.8.3.2.2 Single-Shot Measurement Mode

The DCC module can be programmed to count down one time by enabling the single-shot mode. In this mode, the DCC stops operating when the down counter0 and the valid counter0 reach 0. Alternatively, the DCC can be programmed to stop counting when the down counter1 reaches 0.

At the end of one sequence of counting down in this single-shot mode, the DCC gets disabled automatically, which prevents further counting. This mode is typically used for spot measurements of the frequency of a signal. This frequency could be an unknown for the application before the measurement.

Example Usage of Single-Shot Measurement Mode: Trimming the High-Frequency Low-Power Oscillator

A practical example of the usage of the spot measurement mode is in trimming the HF LPO (clock source # 5) using the main oscillator as a reference. This measurement sequence would proceed as follows:

- The application sets up the seed values for counter0 and valid0 for the duration of the measurement. Suppose the main oscillator frequency is 10 MHz and the intended duration of the measurement is 500 µs. The application needs to configure a seed value of 5000.
- These 5000 counts need to be divided between the counter0 and the valid0 counters. The minimum value for the valid0 seed is 4, so the application can configure counter0 seed value as 4996 and the valid0 seed value as 4.
- Suppose the HF LPO frequency is truly unknown. In this case the application can choose the maximum allowed seed value for counter1. This increases the probability of counter0 and valid0 counting down while the counter1 has still not fully counted down to zero. The maximum allowed seed value for counter1 is 1048575.
- Once the DCC is enabled, the counters counter0 and counter1 both start counting down from their seed values.
- When counter0 reaches zero, it automatically triggers the valid0 counter.
- When valid0 reaches zero, if counter1 is not zero as well, an ERROR status flag is set and a "DCC error" is sent to the ESM. Counter1 is also frozen so that it stops counting down any further. The application can enable an interrupt to be generated from the ESM whenever this DCC error is indicated. Refer the device datasheet to identify the ESM group and channel where the DCC error is connected.
- The DCC error interrupt service routine can then check the value of counter1 when the error was generated. Suppose that the counter1 now reads 1044575. This means that counter1 has counted 1048575 - 1044575,

or 4000 cycles within the 500-µs measurement period. This means that the average frequency of the HF LPO over this 500-µs period was 4000 cycles / 500 µs, or 8 MHz.
- The application then needs to clear the ERROR status flag and restart the DCC module so that it is ready for the next spot measurement.

If there is no error generated at the end of the sequence, then the DONE status flag is set and a DONE interrupt is generated. The application must clear the DONE flag before restarting the DCC.

The conditions that cause a DCC error are identical between the continuous monitoring mode and the single-shot measurement mode.

Error Conditions:

An error condition is generated by any one of the following:
1. Counter1 counts down to 0 before Counter0 reaches 0. This means that clock1 is faster than expected, or clock0 is slower than expected. It includes the case when clock0 is stuck at 1 or 0.
2. Counter1 does not reach 0 even when Counter0 and Valid0 have both reached 0. This means that clock1 is slower than expected. It includes the case when clock1 is stuck at 1 or 0.

Any error freezes the counters from counting. An application may then read out the counter values to help determine what caused the error.

Freezing Counters when Counter1 Reaches Zero:

The DCC module also allows the counters to be frozen when the counter1 reaches zero. This allows one of the clock sources for counter1 to be used as a reference for measuring one of the clock sources for counter0. The error conditions are the same as those where (counter0=0 and valid0=0) define the condition when the DCC counters are frozen. That is, an error is indicated if coutner0 and valid0 become zero while counter1 is still non-zero. In this case, however, the application would typically set up the seed values such that the counter1 will become zero before counter0. Essentially the measurement period is defined by the seed value of the counter1. Note that this is also an error condition, and the interrupt service routine can use the measurement period and the actual cycles counted by counter1 to determine the frequency of the clock0 signal.

11.8.3.3 MSS DCC Integration

4-DCC modules have been instantiated in the SOC as part of MSS. Clocks to the module are mentioned in the following sections.

DSS_CLKSRC7_CLK	Counter 1 Clock Source	PLL_PER_HSDIV0_CLKOUT1	0x7

Refer to the interrupt and DMA tables for mapping of the IPs interrupts and DMA requests.

11.8.3.5 Clock Source Selection for Counter0 and Counter1

Refer the device datasheet to identify the available options for selecting the clock sources for both counters of the DCC module. Some microcontrollers may include multiple instances of the DCC module. This will also be identified in the device datasheet.

The selection of the clock sources for counter0 and coutner1 is done by a combination of the KEY, CNT0 CLKSRC and CNT1 CLKSRC control fields of the CNT0CLKSRC and CNT1CLKSRC registers.

11.8.3.6 DCC Registers

Table 11-1873 lists the DCC memory-mapped registers. All register offset addresses not listed in Table 11-1873 should be considered as reserved locations and the register contents should not be modified.

Table 11-1873. DCC Registers

Offset	Acronym	Register Name	Section
0h	DCCGCTRL	DCCGCTRL	Section 12.8.3.6.1

Complex bit access types are encoded to fit into small table cells. Table 11-1874 shows the codes that are used for access types in this section.

Table 11-1874. DCC Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

11.8.3.6.1 DCCGCTRL Register (Offset = 0h) [reset = 5555h]

DCCGCTRL is shown in Figure 11-436 and described in Table 11-1875.

Return to Summary Table.

Starts / stops the counters clears the error signal

11.8.4 ECC_AGGREGATOR

This section describes the common ECC aggregator functionality.

11.8.4.1 ECC Aggregator Overview

To increase functional safety and system reliability the memories (for example, FIFOs, queues, SRAMs and others) in many device modules and subsystems are protected by error correcting code (ECC). This is accomplished through an ECC aggregator and ECC wrapper. The ECC aggregator is connected to these memories (hereinafter ECC RAMs) and involved in the ECC process. Each memory is surrounded by an ECC wrapper which performs the ECC detection and correction. The wrapper communicates via serial interface with the aggregator which has memory mapped configuration interface

11.8.4.2 Integration Details

In TPR1x design, there are five ECC aggregators.

- MSS_ECC_AGG_R5A
- MSS_ECC_AGG_R5B
- MSS_ECC_AGG_MSS
- DSS_ECC_AGG
- HSM_ECC_AGGR (details will be available in HSM document)

This aggregator is used to fault inject all memory ecc_controllers and aggregate the errors to generate a single error to ESM.

11.8.4.3 ECC Aggregator Features

The ECC aggregator has the following features:

- Reduces memory software errors via single error correction (SEC) and double error detection (DED)
- Provides a mechanism to control and monitor the ECC protected memories in a module or subsystem
- SEC and DED over the system interconnect data bus and parity and redundancy for the system interconnect command and address buses
- Generates an interrupt for correctable error

- Generates an interrupt for non-correctable error
- Supports inject only mode for diagnostic purposes
- Supports software readable status for single and double-bit ECC errors and associated information such as row address where error has occurred and data bits that have been flipped
- An ECC endpoint can be ECC RAM component.
- Detects single bit error via parity checking on:
  1. Memory mapped configuration interface FIFO
  2. Serial interface FIFO
- Single bit error detection via parity checking results in a non-correctable error interrupt
- Supports timeout mechanism on transactions over the ECC serial interface. Timeout occurrence results in a non-correctable error interrupt.
- Certain control bits have redundancy and if a bit flips an interrupt is generated

11.8.4.4 ECC Aggregator Integration

This section describes ECC aggregator integration in the device, including information about clocks, resets, and hardware requests.

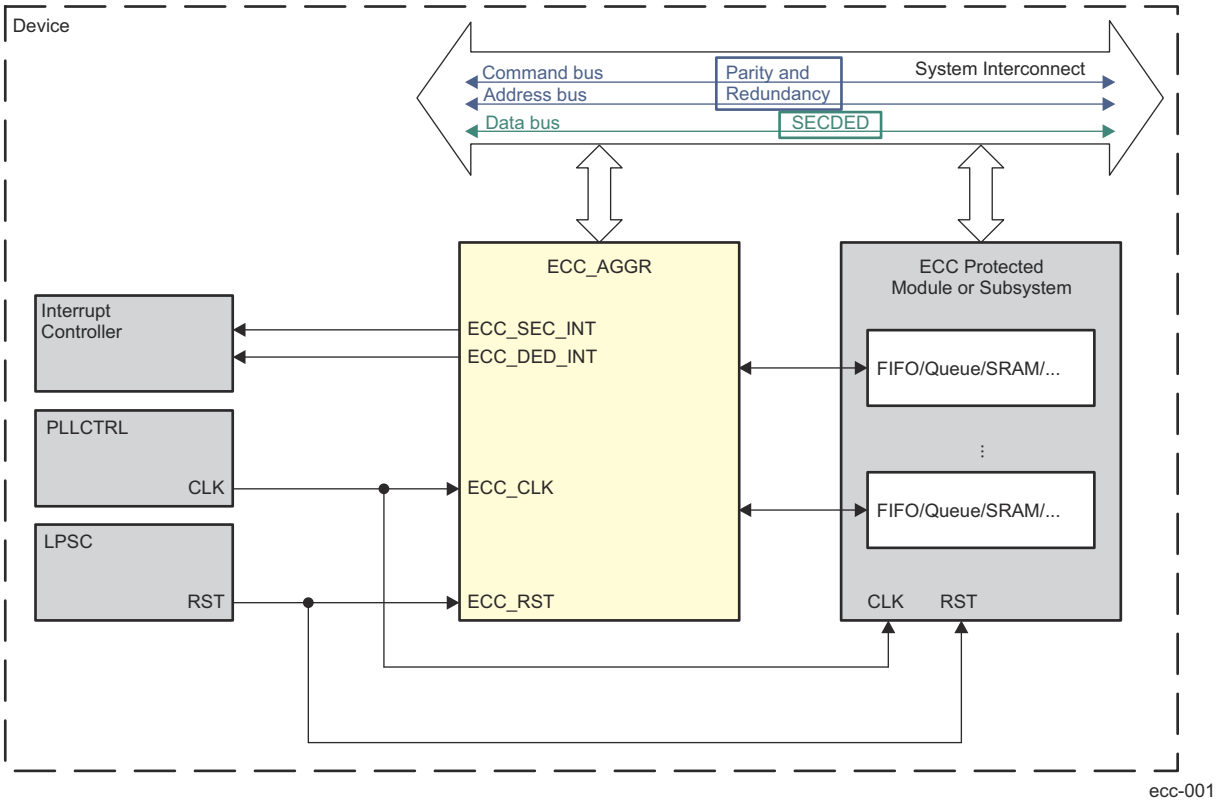

Figure 11-447. ECC Aggregator Integration

Table 11-1886. ECC Aggregator Clocks and Resets

ECC_AGGR	ECC_RST	Same as corresponding module or subsystem	Same as corresponding module or subsystem	ECC aggregator reset

Table 11-1887. ECC Aggregator Hardware Requests

Interrupt Requests					
Module Instance	Module Interrupt Signal	Destination Interrupt Input	Description	Description	Type
ECC_AGGR	ECC_SEC_INT	See	See	Interrupt for correctable error(SEC)	Leve
	ECC_DED_INT	See	See	Interrupt for non-correctable error (DED, parity, redundancy, timeout)	LEVEL
DMA Events					
Module Instance	Module DMA Input	Destination DMA Event Input	Destination	Description	Type
ECC_AGGR	-	-	-	-	-

Note

For more information on the interrupts, see Section 11.8.4.9.

For more information on the interconnects, see .

For more information on the power, reset and clock management, see the corresponding sections in .

For more information on the device interrupt controllers, see *Interrupt Controllers*.

11.8.4.5 ECC Aggregator Function Description

This section describes the architecture and functional details of the ECC aggregator.

11.8.4.5.1 ECC Aggregator Block Diagram

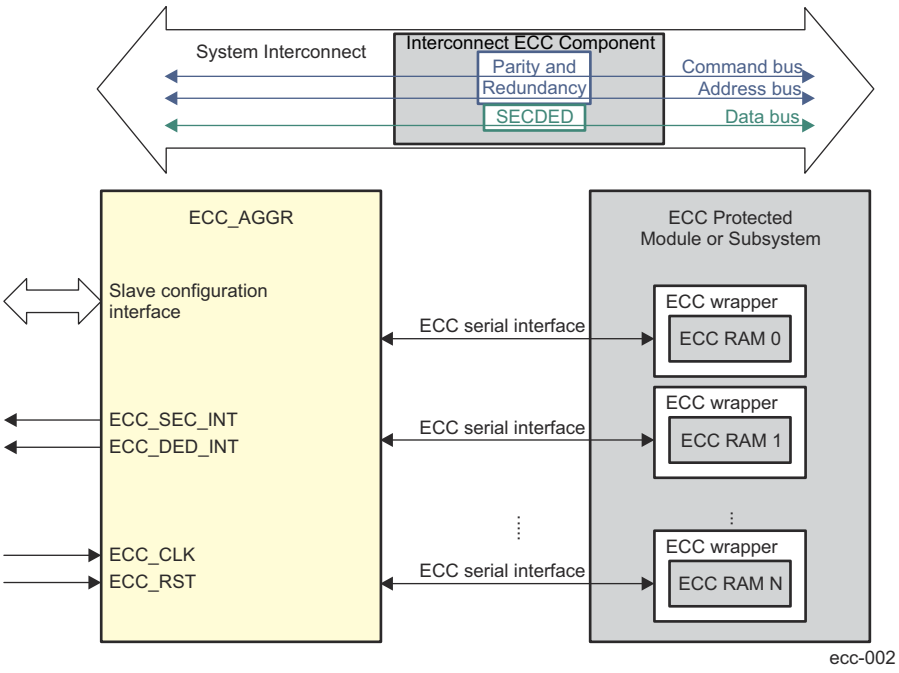

Figure 11-448. ECC Aggregator Block Diagram

The ECC aggregator is connected to one or more ECC endpoints each of which has assigned a unique ID used when the endpoint is accessed for status information or configuration. The ECC aggregator provides software

access to all ECC related registers through its memory mapped slave configuration interface while the serial interface is used to communicate with the ECC endpoints. Upon detection of single or double-bit error the corresponding interrupt line is asserted.

11.8.4.6 ECC Aggregator Register Groups

The ECC aggregator has ECC control, status and interrupt registers for each ECC endpoint in a module or subsystem. These registers are memory mapped and occupy 1 KB address space although part of it may contain reserved locations. The registers are split in the following types:

- **Global registers**. They are common to all ECC endpoints associated with the ECC aggregator and include the ECC_VECTOR and ECC_REV registers. Each ECC endpoint has assigned a unique ID.

  When this ID is written to the ECC_VECTOR[10-0] ECC_VECTOR field the corresponding endpoint is selected either for control or for status reading.
- **ECC control and status registers**. These registers are specific to each ECC endpoint and reside in the range from address offset 0x10 to 0x28, if the endpoint is ECC RAM or from 0x10 to 0x24, if the endpoint is interconnect ECC component. They are memory mapped but are accessed through the ECC serial interface. They are also selected by the ECC endpoint ID written to the ECC_VECTOR[10-0] ECC_VECTOR field. Because of latency on the serial interface the ECC control and status registers are read by performing special sequence as described in Section 12.9.4.3.3. These registers have also different functionality for both types of endpoints - ECC RAM and interconnect ECC component.
- **Interrupt registers**. They include interrupt status, interrupt enable, interrupt disable, and EOI registers.

11.8.4.7 Read Access to the ECC Control and Status Registers

Read accesses to the ECC control and status registers for each ECC endpoint represent read operations over the ECC serial interface and are triggered by performing the following sequence:

1. Software writes the following in the ECC_VECTOR register:
   - The ECC endpoint ID in the ECC_VECTOR[10-0] ECC_VECTOR field to select particular ECC endpoint.
   - The register read address in the ECC_VECTOR[23-16] RD_SVBUS_ADDRESS field to select which register has to be read through the ECC serial interface.
   - A value of 0x1 in the ECC_VECTOR[15] RD_SVBUS bit to trigger read operation through the ECC serial interface.
2. Software polls the ECC_VECTOR[24] RD_SVBUS_DONE bit to check if it is 0x1. This indicates that the read operation on the ECC serial interface has completed.
3. Software reads the data from the register previously selected by the ECC_VECTOR[23-16]RD_SVBUS_ADDRESS field.

11.8.4.8 Serial Write Operation

Write operations over the ECC serial interface are performed as follows:

1. Software specifies the ECC endpoint ID in the ECC_VECTOR[10-0] ECC_VECTOR field. The ECC_VECTOR[23-16] RD_SVBUS_ADDRESS field is a don't care but the ECC_VECTOR[15] RD_SVBUS bit must be set to 0x0.
2. Software performs regular write operation to the desired address. If the ECC endpoint ID has already been specified, step 1 can be skipped. Unlike serial read operations it is not necessary to always specify the endpoint ID before performing serial write operation.

The following is an example for serial write operation:

1. Write 0x0000 0008 to the ECC_VECTOR register.
2. Write 0x0000 000F to the ECC_CTRL register. This sends write request with data 0x0000 000F to the ECC_CTRL register associated with ECC RAM with ID = 8.

11.8.4.9 Interrupts

The ECC aggregator generates the following interrupts:

- Correctable interrupt (ECC_SEC_INT) where hardware can correct the error but notifies the system in case of SEC.

- Non-correctable interrupt (ECC_DED_INT) where hardware cannot correct the error in cases of DED, parity check, redundancy check or timeout occurrence.

The following is the sequence for servicing interrupts:

- Software enables the interrupts for an ECC endpoint by writing 0x1 to the corresponding bit of the following interrupt enable registers:
  - ECC_SEC_ENABLE_SET_REG0 for the correctable interrupt
  - ECC_DED_ENABLE_SET_REG0 for the noncorrectable interrupt
- On receiving an interrupt, software checks which ECC endpoint has caused the error by reading the following interrupt status registers:
  - ECC_SEC_STATUS_REG0 for the correctable interrupt ECC_DED_STATUS_REG0 for the non-correctable interrupt
- Software performs serial read operations as described in Section 12.9.4.3.3 to read the following status registers that contain details about the error:
  - If the endpoint is ECC RAM:
    - ECC_ERR_STAT1
    - ECC_ERR_STAT2
    - ECC_ERR_STAT3
- If the endpoint is interconnect ECC component:
  - ECC_CBASS_ERR_STAT1
  - ECC_CBASS_ERR_STAT2
- After the interrupt has been serviced, depending on the error type, software should clear the corresponding status bits in the ECC_ERR_STAT1 and ECC_ERR_STAT3 registers or in the ECC_CBASS_ERR_STAT1 register. Software has to poll these registers to guarantee that status bits are cleared as there is no other indication for write completion over the ECC serial interface.

The value of the *_PEND_CLR fields in the ECC_CBASS_ERR_STAT1 register must be read and then written back to decrement the count of each field back to 0x0. A further error capture into the ECC_CBASS_ERR_STAT1 register does not occur unless all its fields are 0x0. The decrement value should not be larger than the read value. If a field in the ECC_CBASS_ERR_STAT1 register should not be modified, write a value of 0x0 to that field.

- Software writes 0x1 to the corresponding end of interrupt register to clear the interrupt:
  - ECC_SEC_EOI_REG for the correctable interrupt
  - ECC_DED_EOI_REG for the non-correctable interrupt

11.8.4.10 Inject Only Mode

There are modules that already perform the ECC generation and checking as part of their data path. In this case, the ECC wrapper may be configured in inject only mode, if needed. In this mode the ECC wrapper does not perform ECC detection and correction. The inject only mode allows users to inject single or double-bit errors so that the module logic can be tested for diagnostic purposes.

Note

There is no software control to enable inject only mode. It is configured via tie-off value. Inject only and ECC modes are mutually exclusive.

The interconnect ECC component also supports error injection mode. There is error injection logic for testing of the error checking logic (checkers). The injection logic can be configured to inject either single or double bit error and what data pattern to be used for injection (ECC_CBASS_CTRL[11-8] ECC_PATTERN). The ECC_CBASS_ERR_CTRL1 and ECC_CBASS_ERR_CTRL2 registers should be written first to setup the injection. Then, either the ECC_CBASS_CTRL[3] FORCE_SE or the ECC_CBASS_CTRL[4] FORCE_DE bit must be set to 0x1 to start the injection. Both bits must not be set at the same time. If the injection should continue in incrementing mode, then the ECC_CBASS_CTRL[5] FORCE_N_BIT bit should be set to 0x1. Once the FORCE_N_BIT is set, then each successive injection can simply write the ECC_CBASS_CTRL register

to set the FORCE_SE or FORCE_DE again. Reading 0x0 from either the FORCE_SE or the FORCE_DE bit indicates that the injection has completed, as these bits automatically clear when the checker indicates that it has performed the injection. The time for an injection to complete is not guaranteed, so some delay is needed between successive injections.

11.8.4.11 Errors

Each aggregator generates two errors which drive the ESM.

- <modulename>_SERR module names are mentioned in the below section
- <modulename>_SERR module names are mentioned in the below section

Group1 and Group2 mappings are found the ESM interrupt sections.

11.8.4.12 Aggregator Mapping to Memory Instances

11.8.6 Error Signaling Module (ESM)

This section provides the details of the error signaling module (ESM) that aggregates device errors and provides internal and external error response based on error severity.

11.8.6.1 Overview

The Error Signaling Module (ESM) collects and reports the various error conditions on the microcontroller. The error condition is categorized based on a severity level. Error response is then generated based on the category of the error. Possible error responses include a low priority interrupt, high priority interrupt, and an external pin action.

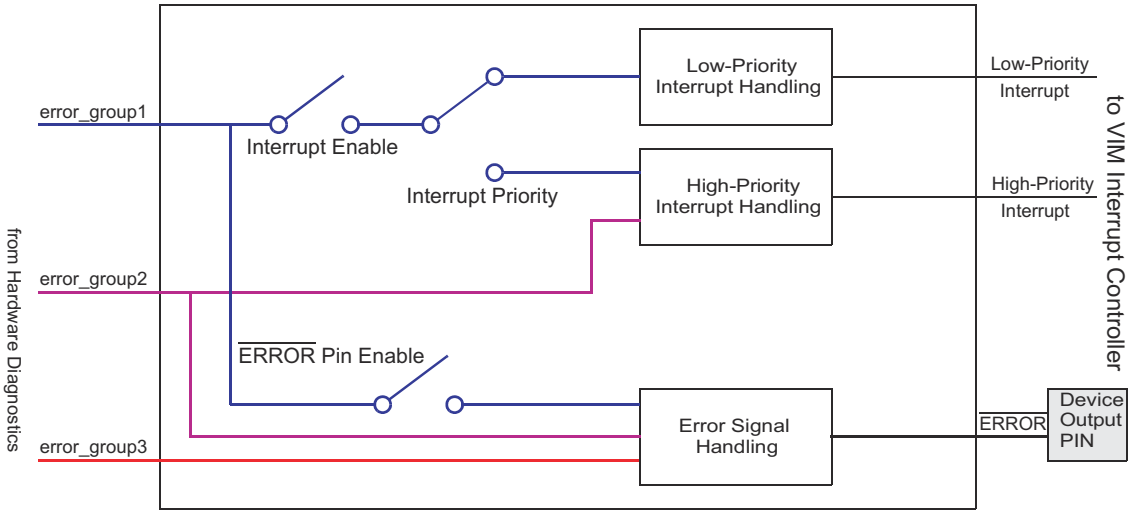
11.8.6.2 Feature List

- Up to 192 error channels (MSS/DSS) are supported, divided into 3 different groups:
  - 128 Group1 (low severity) channels with configurable interrupt generation and configurable $\overline{\text{ERROR}}$ pin behavior
  - 32 Group2 (high severity) channels with predefined interrupt generation and predefined $\overline{\text{ERROR}}$ pin behavior
  - 32 Group3 (high severity) channels with no interrupt generation and predefined $\overline{\text{ERROR}}$ pin behavior. These channels have no interrupt response as they are reserved for CPU based diagnostics that generate aborts directly to the CPU.
- Dedicated device $\overline{\text{ERROR}}$ pin to signal an external observer
- Configurable timebase for $\overline{\text{ERROR}}$ pin output
- Error forcing capability for latent fault testing

11.8.6.3 Block Diagram

As shown in Figure 11-537, the ESM channels are divided into three groups. Group1 channels are considered to be low severity. Group1 errors have a configurable interrupt response and configurable $\overline{\text{ERROR}}$ pin behavior. Note that the ESM Status Register 1 (ESMSR1) for error group 1 gets updated, regardless if the interrupt enable is active or not. Group2 channels are $\overline{\text{ERROR}}$ high severity. Group2 errors always generate a high priority interrupt and an output on the $\overline{\text{ERROR}}$ pin. Group3 errors are reserved for high severity errors generated by diagnostics which have already generated a CPU abort response. Because an abort response is generated, there is no need to generate an interrupt response. Group3 errors always generate an $\overline{\text{ERROR}}$ pin output.

The ESM interrupt and $\overline{\text{ERROR}}$ pin behavior are also summarized in Table 11-1984.



Note that the ESM Status Register 1 (ESMSR1) for error_group1 gets updated, regardless if the interrupt enable is active or not.

Figure 11-537. Block Diagram

Table 11-1984. ESM Interrupt and $\overline{\text{ERROR}}$ Pin Behavior

Error Group	Interrupt Generated	Interrupt Priority	$\overline{\text{ERROR}}$ Pin Response Generated
1	configurable interrupt	configurable priority	configurable output generation
2	interrupt generated	high priority	output generated
3	no interrupt	NA	output generated

Figure 11-538 and Figure 11-539 show the interrupt response handling and $\overline{\text{ERROR}}$ pin response handling with register configuration. The total active time of the $\overline{\text{ERROR}}$ pin is controlled by the Low-Time Counter Preload register (LTCP) and the key register (ESMEPSR) as shown in Figure 11-539. See for details.

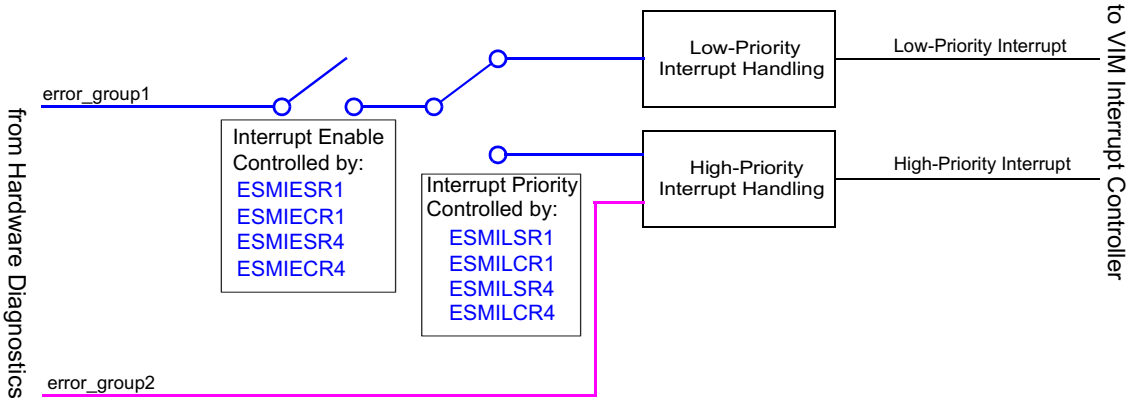


Figure 11-538. Interrupt Response Handling

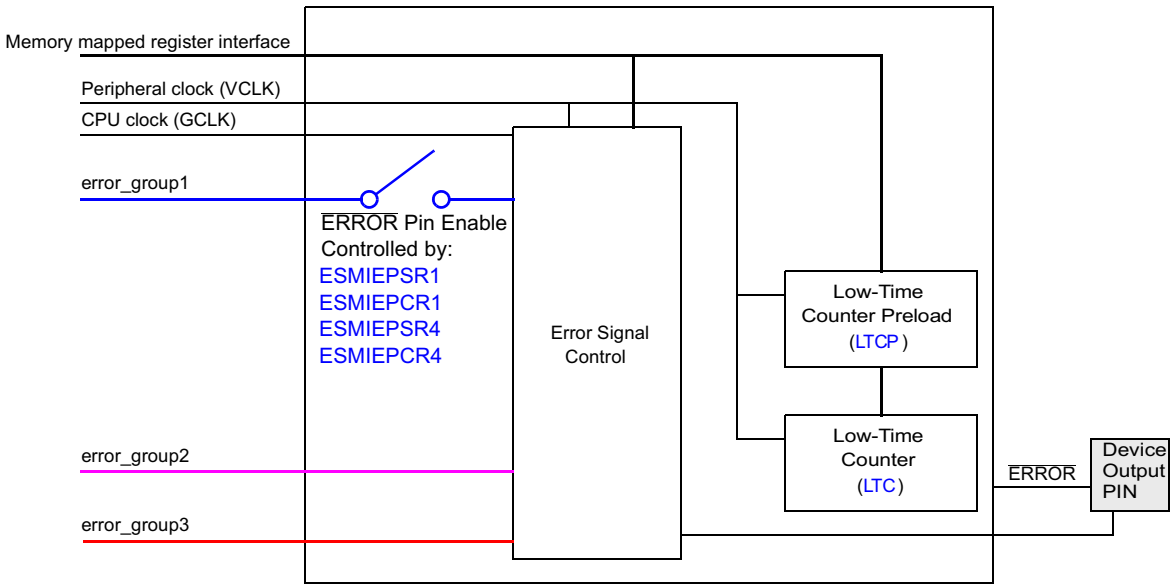

Figure 11-539. $\overline{\text{ERROR}}$ Pin Response Handling

11.8.6.4 Integration Details

TPR1x has 3 instances of the ESM module.

	Parameters

Instance	Max Group 1	Max Group 2	Max Group 3
MSS_ESM	128	32	32
DSS_ESM	128	32	32
HSM_ESM	Refer HSM Design Specification		

Refer to Section 11.8.4.9 for the ESM Interrupt map.

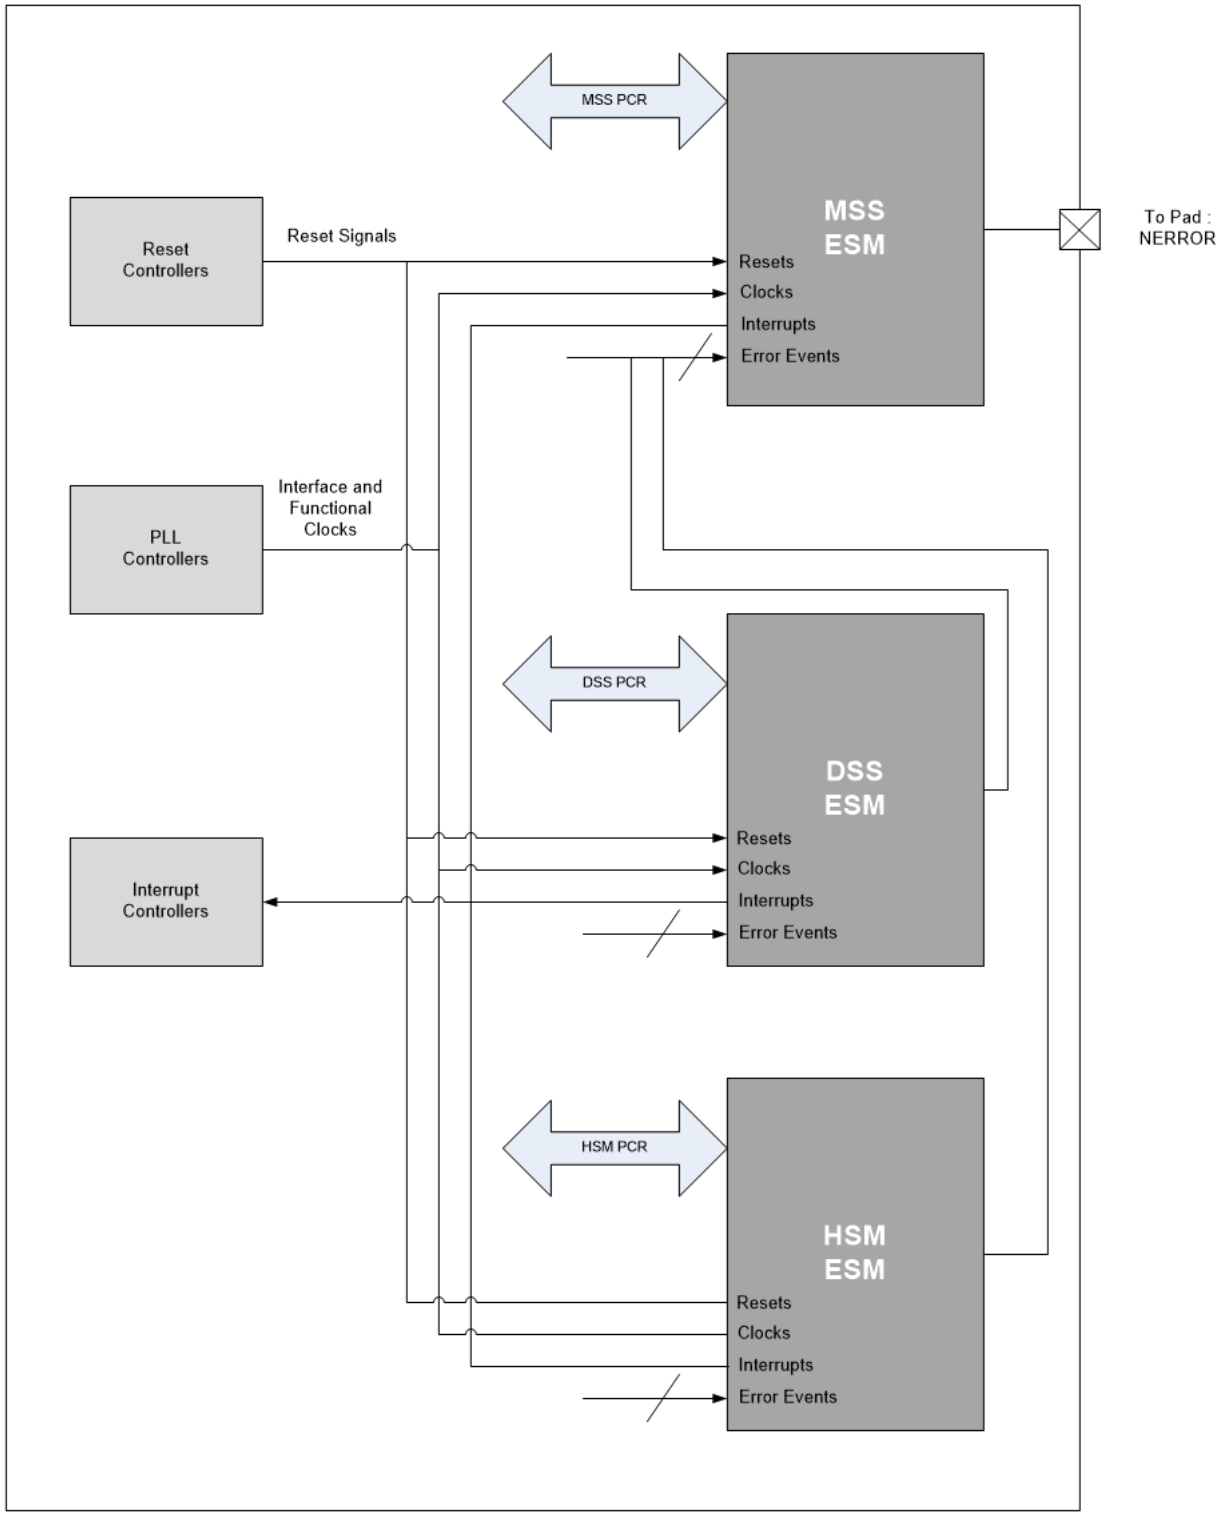

Figure 11-540. ESM Block Diagram

11.8.6.5 Module Operation

This device has 40 error channels (APPSS), divided into 2 different error groups. Please refer to the device datasheet for ESM channel assignment details.

The ESM module has error flags for each error channel. The error status registers ESMSR1, ESMSR4, ESMSR2, ESMSR3 provide status information on a pending error of Group1 (Channel 0-31), Group1 (Channel 32-63), Group1 (Channel 64-95), Group2, and Group3, respectively. The ESMEPSR register provides the current $\overline{\text{ERROR}}$ status. The module also provides a status shadow register, ESMSSR2, which maintains the error flags of Group2 until power-on reset ($\overline{\text{PORRST}}$) is asserted. See for details of their behavior during power on reset and warm reset.

Once an error occurs, the ESM module will set the corresponding error flags. In addition, it can trigger an interrupt, $\overline{\text{ERROR}}$ pin outputs low depending on the ESM settings. Once the $\overline{\text{ERROR}}$ pin outputs low, a power on reset or a write of 0x5 to ESMEKR is required to release the ESM error pin back to normal state. The application can read the error status registers (ESMSR1, ESMSR4, ESMSR7, ESMSR2, and ESMSR3) to debug the error. If an $\overline{\text{RST}}$ is triggered or the error interrupt has been served, the error flag of Group2 should be read from ESMSSR2 because the error flag in ESMSR2 will be cleared by $\overline{\text{RST}}$.

The functionality of the $\overline{\text{ERROR}}$ pin can be tested by forcing an error.

11.8.6.5.1 Reset Behavior

Power on reset:

- $\overline{\text{ERROR}}$ pin behavior

  When nPORRST is active, the $\overline{\text{ERROR}}$ pin is in a high impedance state (output drivers disabled).
- Register behavior

  After $\overline{\text{PORRST}}$, all registers in ESM module will be re-initialized to the default value. All the error status registers are cleared to zero.

Warm reset ($\overline{\text{RST}}$):

- $\overline{\text{ERROR}}$ pin behavior

  During $\overline{\text{RST}}$, the $\overline{\text{ERROR}}$ pin is in “output active” state with pull-down disabled. The $\overline{\text{ERROR}}$ pin remains unchanged after $\overline{\text{RST}}$.
- Register behavior

  After $\overline{\text{RST}}$, ESMSR1, ESMSR4, ESMSR7, ESMSSR2, ESMSR3 and ESMEPSR register values remains un-changed. Since $\overline{\text{RST}}$ does not clear the critical failure registers, the user can read those registers to debug the failures after $\overline{\text{RST}}$ pin goes back to high.

After $\overline{\text{RST}}$, if one of the flags in ESMSR1, ESMSR4 and ESMSR7 is set, the interrupt service routine will be called once the corresponding interrupt is enabled.

-

Note

ESMSR2 is cleared after $\overline{\text{RST}}$. The flag in ESMSR2 gets cleared when reading the appropriate vector in the ESMIOFFHR offset register. Reading ESMIOFFHR will not clear the ESMSR1, ESMSR4, ESMSR7 and the shadow register ESMSSR2. Reading ESMIOFFLR will also not clear the ESMSR1, ESMSR4 and ESMSR7.

11.8.6.5.2 $\overline{\text{ERROR}}$ Pin Timing

The $\overline{\text{ERROR}}$ pin is an active low function. The state of the pin is also readable from $\overline{\text{ERROR}}$ Pin Status Register (ESMEPSR). A warm reset ($\overline{\text{RST}}$) does not affect the state of the pin. The pin is in a high-impedance state during power-on reset. Once the ESM module drives the $\overline{\text{ERROR}}$ pin low, it remains in this state for the time specified by the Low-Time Counter Preload register (LTCPR). Based on the time period of the peripheral clock (VCLK), the total active time of the $\overline{\text{ERROR}}$ pin can be calculated as:

$$t_{\overline{ERROR}\_low} = t_{VCLK} \times (LTCP + 1) \tag{11}$$

Once this period expires, the $\overline{\text{ERROR}}$ pin is set to high in case the reset of the $\overline{\text{ERROR}}$ pin was requested. This request is done by writing an appropriate key (0x5) to the key register (ESMEKR) during the $\overline{\text{ERROR}}$ pin low time. Here are a few examples:

Example 1: ESM detects a failure and drives the $\overline{\text{ERROR}}$ pin low. No $\overline{\text{ERROR}}$ pin reset is requested. The $\overline{\text{ERROR}}$ pin continues outputting low until power on reset occurs.

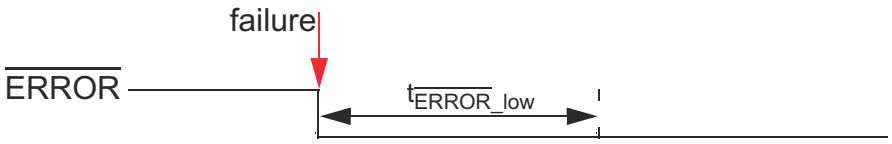

Figure 11-541. $\overline{\text{ERROR}}$ Pin Timing - Example 1

Example 2: ESM detects a failure and drives the $\overline{\text{ERROR}}$ pin low. An $\overline{\text{ERROR}}$ pin reset request is received before t $_{\overline{\text{ERROR}}\_low}$ expires. In this case, the $\overline{\text{ERROR}}$ pin is set to high immediately after t $_{\overline{\text{ERROR}}\_low}$ expires.

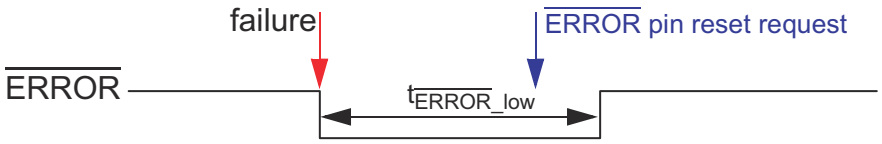

Figure 11-542. $\overline{\text{ERROR}}$ Pin Timing - Example 2

Example 3: ESM detects a failure and drives the $\overline{\text{ERROR}}$ pin low. An $\overline{\text{ERROR}}$ pin reset request is received after t $_{\overline{\text{ERROR}}\_low}$ expires. In this case, the $\overline{\text{ERROR}}$ pin is set to high immediately after $\overline{\text{ERROR}}$ pin reset request is received.

Figure 11-543. $\overline{\text{ERROR}}$ Pin Timing - Example 3

Example 4: ESM detects a failure and drives the $\overline{\text{ERROR}}$ pin low. Another failure occurs within the time the pin stays low. In this case, the low time counter will be reset when the other failure occurs. In other words, $t_{\overline{\text{ERROR}}\_low}$ should be counted from whenever the most recent failure occurs.

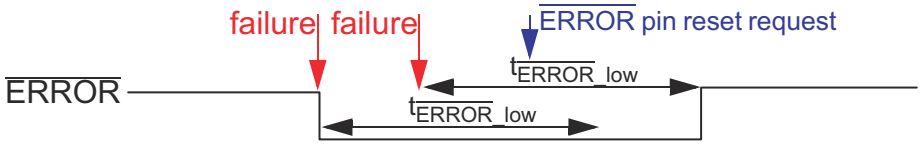

Figure 11-544. $\overline{\text{ERROR}}$ Pin Timing - Example 4

Example 5: The reset of the $\overline{\text{ERROR}}$ pin was requested by the software even before the failure occurs. In this case, the $\overline{\text{ERROR}}$ pin is set to high immediately after $t_{\overline{\text{ERROR}}\_low}$ expires. This case is not recommended and should be avoided by the application.

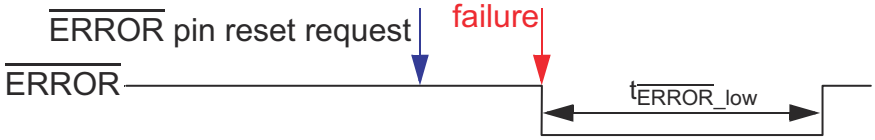

Figure 11-545. $\overline{\text{ERROR}}$ Pin Timing - Example 5

11.8.6.5.3 Forcing an Error Condition

The error response generation mechanism is testable by software by forcing an error condition. This allows testing the $\overline{\text{ERROR}}$ pin functionality. By writing a dedicated key to the error forcing key register (ESMEKR), the $\overline{\text{ERROR}}$ pin is set to low for the specified time. The following steps describe how to force an error condition:

1. Check $\overline{\text{ERROR}}$ Pin Status Register (ESMEPSR). This register must be 1 to switch into the error forcing mode. The ESM module cannot be switched into the error forcing mode if a failure has already been detected in functional mode. The application command to switch to error forcing mode is ignored.
2. Write “1010b” to the error forcing key register (ESMEKR). After that, the $\overline{\text{ERROR}}$ pin should output low (error force mode). Once the application puts the ESM module in the error forcing mode, the $\overline{\text{ERROR}}$ pin cannot indicate the normal error functionality. If a failure occurs during this time, it gets still latched and the LTC is reset and stopped. The error output pin is already driven low on account of the error forcing mode. When the ESM is forced back to normal functional mode, the LTC becomes active and forces the $\overline{\text{ERROR}}$ pin low until the expiration of the LTC.
3. Write “0000” to the error forcing key register (ESMEKR) back to the active normal mode. If there are no errors detected while the ESM module is in the error forcing mode, the $\overline{\text{ERROR}}$ pin goes high immediately after exiting the error forcing mode.

11.8.6.6 Recommended Programming Procedure

During the initialization stage, the application code should follow the recommendations in Figure 11-546 to initialize the ESM.

Once an error occurs, it can trigger an interrupt, $\overline{\text{ERROR}}$ pin outputs low depending on the ESM settings. Once the $\overline{\text{ERROR}}$ pin outputs low, a power on reset or a write of 0x5 to ESMEKR is required to release the ESM back to normal state. The application can read the error status registers (ESMSR1, ESMSR4, ESMSR7, ESMSR2, and ESMSR3) to debug the error. If an $\overline{\text{RST}}$ is triggered or the error interrupt has been served, the error flag of Group2 should be read from ESMSSR2 because the error flag in ESMSR2 will be cleared by $\overline{\text{RST}}$.

11.8.7 Cyclic Redudancy Check (CRC)

This section describes the cyclic redundancy check (CRC) controller module. Presently two CRC modules have been instantiated in the TRP1x one for MSS and another for DSS.

11.8.7.1 Overview

The CRC controller is a module that is used to perform CRC (Cyclic Redundancy Check) to verify the integrity of memory system. A signature representing the contents of the memory is obtained when the contents of the memory are read into CRC controller. The responsibility of CRC controller is to calculate the signature for a set of data and then compare the calculated signature value against a pre-determined good signature value. CRC controller supports two channels to perform CRC calculation on multiple memories in parallel and can be used on any memory system.

11.8.7.2 Features

The CRC controller offers:

- Two channels to perform background signature verification on any memory sub-system.
- Data compression on 8, 16, 32, and 64-bit data size.
- Maximum-length PSA (Parallel Signature Analysis) register constructed based on 64-bit primitive polynomial.
- Each channel has a CRC Value Register that contains the pre-determined CRC value.
- Use timed base event trigger from timer to initiate DMA data transfer.
- Programmable 20-bit pattern counter per channel to count the number of data patterns for compression.
- Three modes of operation. Auto, Semi-CPU and Full-CPU.
- For each channel, CRC can be performed either by CRC Controller or by CPU.
- Automatically perform signature verification without CPU intervention in AUTO mode.
- Generate interrupt to CPU in Semi-CPU mode to allow CPU to perform signature verification itself.
- Generate CRC fail interrupt in AUTO mode if signature verification fails.
- Generate Timeout interrupt if CRC is not performed within the time limit.
- Generate DMA request per channel to initiate CRC value transfer.

11.8.7.3 Block Diagram

Figure 11-577 shows a block diagram of the CRC controller.

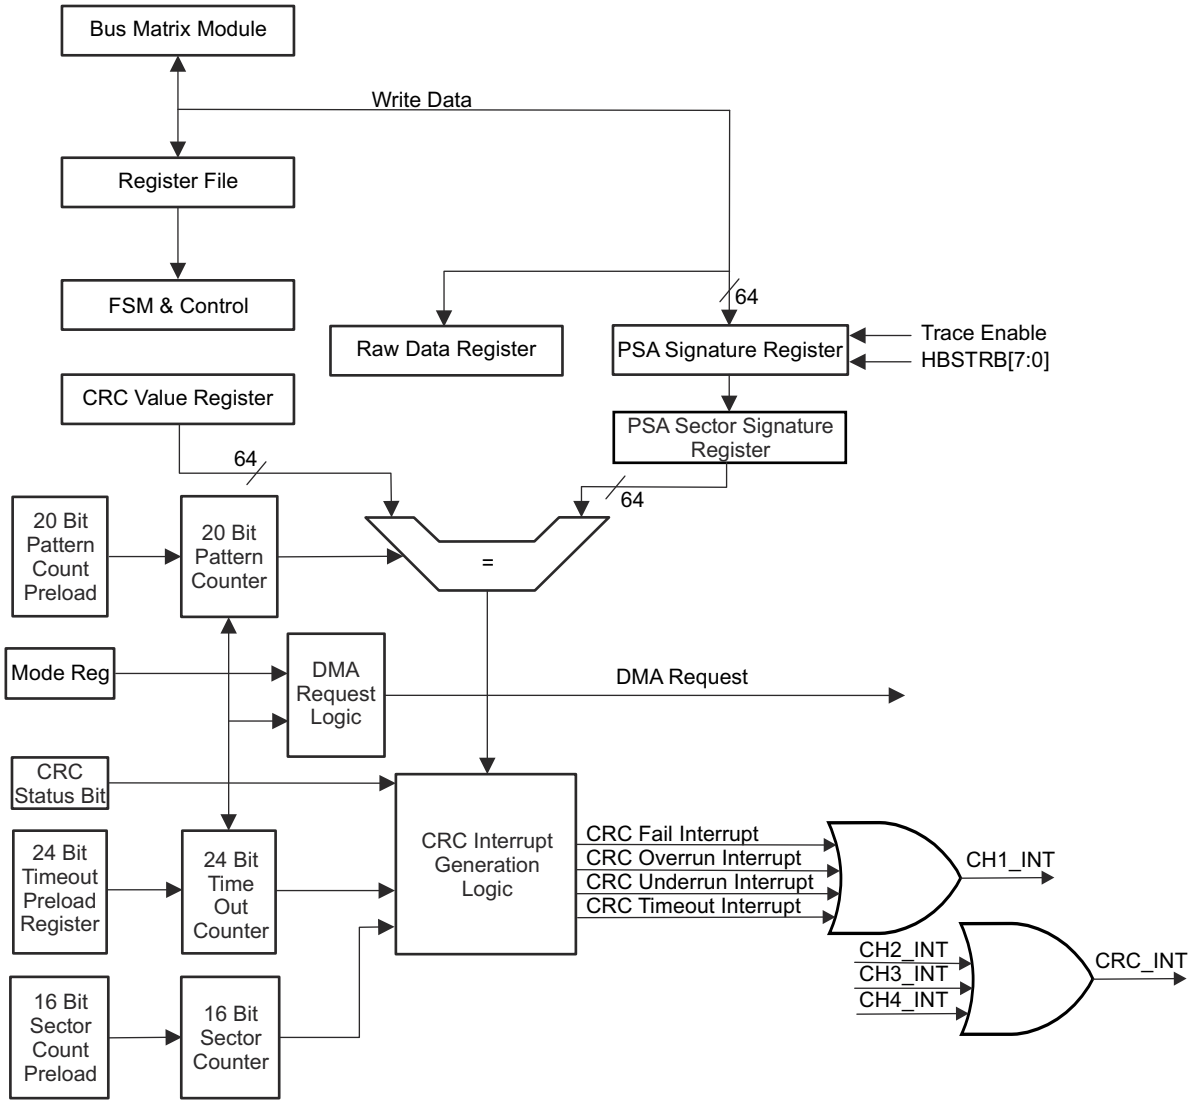

Figure 11-577. CRC Controller Block Diagram For One Channel

11.8.7.4 Module Operation

11.8.7.4.1 General Operation

There are two channels in CRC controller, and for each channel there is a memory-mapped PSA (Parallel Signature Analysis) Signature Register and a memory-mapped CRC (Cyclic Redundancy Check) Value Register. A memory can be organized into multiple sectors with each sector consisting of multiple data patterns. A data pattern can be 8-, 16-, 32-, or 64-bit data. CRC module performs the signature calculation and compares the signature to a pre-determined value. The PSA Signature Register compresses an incoming data pattern into a signature when it is written. When one sector of data patterns are written into PSA Signature Register, a final signature corresponding to the sector is obtained. CRC Value Register stores the pre-determined signature corresponding to one sector of data patterns. The calculated signature and the pre-determined signature are then compared to each other for signature verification. To minimize CPU's involvement, data patterns transfer can be carried out at the background of CPU using DMA controller. DMA is setup to transfer data from memory from which the contents to be verified to the memory mapped PSA Signature Register. When DMA transfers data to the memory mapped PSA Signature Register, a signature is generated. A programmable 20-bit data pattern counter is used for each channel to define the number of data patterns to calculate for each sector. Signature verification can be performed automatically by CRC controller in AUTO mode or by CPU itself in Semi-CPU or Full-CPU mode. In AUTO mode, a self sustained CRC signature calculation can be achieved without any CPU intervention.

11.8.7.4.2 CRC Modes of Operation

CRC Controller can operate in AUTO, Semi-CPU, and Full-CPU modes.

11.8.7.4.2.1 AUTO Mode

In AUTO mode, CRC Controller in conjunction with DMA controller can perform CRC without CPU intervention. A sustained transfer of data to both the PSA Signature Register and CRC Value Register are performed in the background of CPU. When a mismatch is detected, an interrupt is generated to CPU. A 16-bit current sector ID register is provided to identify which sector causes a CRC failure.

11.8.7.4.2.2 Semi-CPU Mode

In Semi-CPU mode, DMA controller is also utilized to perform data patterns transfer to PSA Signature Register. Instead of performing signature verification automatically, the CRC controller generates an compression complete interrupt to CPU after each sector is compressed. Upon responding to the interrupt the CPU performs the signature verification by reading the calculated signature stored at the PSA Sector Signature Register, and compares it to a pre-determined CRC value.

11.8.7.4.2.3 Full CPU Mode

In Full-CPU mode, the CPU does the data patterns transfer and signature verification all by itself. When CPU has enough throughput, it can perform data patterns transfer by reading data from the memory system to the PSA Signature Register. After certain number of data patterns are compressed, the CPU can read from the PSA Signature Register and compare the calculated signature to the pre-determined CRC signature value. In Full-CPU mode, neither interrupt nor DMA request is generated. All counters are also disabled.

11.8.7.4.3 PSA Signature Register

The 64-bit PSA Signature Register is based on the primitive polynomial (as in the following equation) to produce the maximum length LFSR (Linear Feedback Shift Register), as shown in Figure 11-578.

$$f(x) = x^{64} + x^4 + x^3 + x + 1 \quad (12)$$

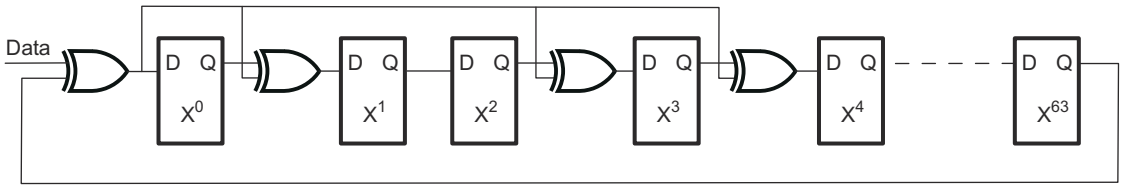

Figure 11-578. Linear Feedback Shift Register (LFSR)

The serial implementation of LFSF has a limitation that, it requires ‘n’ clock cycles to calculate the CRC values for an ‘n’ bit data stream. The idea is to produce the same CRC value operating on a multi-bit data stream, as would occur if the CRC were computed one bit at a time over the whole data stream. The algorithm involves looping to simulate the shifting, and concatenating strings to build the equations after ‘n’ shift.

The parallel CRC calculation based on the polynomial can be illustrated in the following HDL code:

```
for i in 63 to 0 loop
   NEXT_CRC_VAL(0) := CRC_VAL(63) xor DATA(i);
     for j in 1 to 63 loop
       case j is
          when 1|3|4 =>
               NEXT_CRC_VAL(j) :=
                   CRC_VAL(j - 1) xor CRC_VAL(63) xor DATA(i);
          when others =>
               NEXT_CRC_VAL(j) := CRC_VAL(j - 1);
       end case;
     end loop;
   CRC_VAL := NEXT_CRC_VAL;
end loop;
```

Note

1) The inner loop is to calculate the next value of each shift register bit after one cycle

2) The outer loop is to simulate 64 cycles of shifting. The equation for each shift register bit is thus built before it is compressed into the shift register.

3) MSB of the DATA is shifted in first

There is one PSA Signature Register per CRC channel. PSA Signature Register can be both read and written. When it is written, it can either compress the data or just capture the data depending on the state of CHx_MODE bits. If CHx_MODE=Data Capture, a seed value can be planted in the PSA Signature Register without compression. Other modes other than Data Capture will result with the data compressed by PSA Signature Register when it is written. Each channel can be planted with different seed value before compression starts. When PSA Signature Register is read, it gives the calculated signature.

CRC Controller should be used in conjunction with the on chip DMA controller to produce optimal system performance. The incoming data pattern to PSA Signature Register is typically initiated by the DMA controller. When DMA is properly setup, it would read data from the pre-determined memory system and write them to the memory mapped PSA Signature Register. Each time PSA Signature Register is written a signature is generated.

CPU itself can also perform data transfer by reading from the memory system and perform write operation to PSA Signature Register if CPU has enough throughput to handle data patterns transfer.

After system reset and when AUTO mode is enabled, CRC Controller automatically generates a DMA request to request the pre-determined CRC value corresponding to the first sector of memory to be checked.

In AUTO mode, when one sector of data patterns is compressed, the signature stored at the PSA Signature Register is first copied to the PSA Sector Signature Register and PSA Signature Register is then cleared out to all zeros. An automatic signature verification is then performed by comparing the signature stored at the PSA Sector Signature Register to the CRC Value Register. After the comparison the CRC Controller can generate a DMA request. Upon receiving the DMA request the DMA controller will update the CRC Value Register by transferring the next pre-determined signature value associated with the next sector of memory system. If the signature verification fails then CRC Controller can generate a CRC fail interrupt.

In Full-CPU mode, no DMA request and interrupt are generated at all. The number of data patterns to be compressed is determined by CPU itself. Full-CPU mode is useful when DMA controller is not available to perform background data patterns transfer. The OS can periodically generate a software interrupt to CPU and use CPU to accomplish data transfer and signature verification.

CRC Controller supports doubleword, word, half word and byte access to the PSA Signature Register. During a non-doubleword write access, all unwritten byte lanes are padded with zero’s before compression. Note that comparison between PSA Sector Signature Register and CRC Value Register is always in 64 bit because a compressed value is always expressed in 64 bit.

There is a software reset per channel for PSA Signature Register. When set, the PSA Signature Register is reset to all zeros.

PSA Signature Register is reset to zero under the following conditions:

- System reset
- PSA Software reset
- One sector of data patterns are compressed

11.8.7.4.4 PSA Sector Signature Register

After one sector of data is compressed, the final resulting signature calculated by PSA Signature Register is transferred to the PSA Sector Signature Register. PSA Signature Register is a read only register. During Semi-CPU mode, the host CPU should read from the PSA Sector Signature Register instead of reading from PSA Signature Register for signature verification to avoid data coherency issue. The PSA Signature Register can be updated with new signature before the host CPU is able to retrieve it.

In Semi-CPU mode, no DMA request is generated. When one sector of data patterns is compressed, CRC controller first generates a compression complete interrupt. Responding to the interrupt, CPU will in the ISR read the PSA Sector Signature Register and compare it to the known good signature or write the signature value to another memory location to build a signature file. In Semi-CPU mode, CPU must perform the signature verification in a manner to prevent any overrun condition. The overrun condition occurs when the compression complete interrupt is generated after one sector of data patterns is compressed and CPU has not read from the PSA Sector Signature Register to perform necessary signature verification before PSA Sector Signature Register is overridden with a new value. An overrun interrupt can be enable to generate when overrun condition occurs. During Semi-CPU mode, the host CPU should read from the PSA Sector Signature Register instead of reading from PSA Signature Register for signature verification to avoid data coherency issue. The PSA Signature Register can be updated with new signature before the host CPU is able to retrieve it.

11.8.7.4.5 CRC Value Register

Associated with each channel there is a CRC Value Register. The CRC Value Register stores the pre-determined CRC value. After one sector of data patterns is compressed by PSA Signature Register, CRC Controller can automatically compare the resulting signature stored at the PSA Sector Signature Register with the pre-determined value stored at the CRC Value Register if AUTO mode is enabled. If the signature verification fails, CRC Controller can be enabled to generate an CRC fail interrupt. When the channel is set up for Semi-CPU mode, CRC controller first generates a compression complete interrupt to CPU. Upon servicing the interrupt, CPU will then read the PSA Sector Signature Register and then read the corresponding CRC value stored at another location and compare them. CPU should not read from the CRC Value Register during Semi-CPU or Full-CPU mode because the CRC Value Register is not updated during these two modes.

In AUTO mode, for first sector's signature, DMA request is generated when mode is programmed to AUTO. For subsequent sectors, DMA request is generated after each sector is compressed. Responding to the DMA request, DMA controller reloads the CRC Value Register for the next sector of memory system to be checked.

When CRC Value Register is updated with a new CRC value, an internal flag is set to indicate that CRC Value Register contains the most current value. This flag is cleared when CRC comparison is performed. Each time at the end of the final data pattern compression of a sector, CRC Controller first checks to see if the corresponding CRC Value Register has the most current CRC value stored in it by polling the flag. If the flag is set then the CRC comparison can be performed. If the flag is not set then it means the CRC Value Register contains stale information. A CRC underrun interrupt is generated. When an underrun condition is detected, signature verification is not performed.

CRC Controller supports doubleword, word, half word and byte access to the CRC Value Register. As noted before comparison between PSA Sector Signature Register and CRC Value Register during AUTO mode is carried out in 64 bit.

11.8.7.4.6 Raw Data Register

The raw or un-compressed data written to the PSA Signature Register is also saved in the Raw Data Register. This register is read only.

11.8.7.4.7 Example DMA Controller Setup

DMA controller needs to be setup properly in either either AUTO or Semi-CPU mode as DMA controller is used to transfer data patterns. Hardware or a combination of hardware and software DMA triggering are supported.

11.8.7.4.7.1 AUTO Mode Using Hardware Timer Trigger

There are two DMA channels associated with each CRC channel when in AUTO mode. One DMA channel is setup to transfer data patterns from the source memory to the PSA Signature Register. The second DMA channel is setup to transfer the pre-determined signature to the CRC Value Register. The trigger source for the first DMA channel can be either by hardware or by software. As illustrated in Figure 11-579 a timer can be used to trigger a DMA request to initiate transfer from the source memory system to PSA Signature Register. In AUTO mode, CRC Controller also generates DMA request after one sector of data patterns is compressed to initiate transfer of the next CRC value corresponding to the next sector of memory. Thus a new CRC value is always updated in the CRC Value Register by DMA synchronized to each sector of memory.

A block of memory system is usually divided into many sectors. All sectors are the same size. The sector size is programmed in the CRC_PCOUNT_REGx and the number of sectors in one block is programmed in the CRC_SCOUNT_REGx of the respective channel. CRC_PCOUNT_REGx multiplies CRC_SCOUNT_REGx and multiplies transfer size of each data pattern should give the total block size in number of bytes.

The total size of the memory system to be examined is also programmed in the respective transfer count register inside DMA module. The DMA transfer count register is divided into two parts. They are element count and frame count. Note that an HW DMA request can be programmed to trigger either one frame or one entire block transfer. In Figure 11-579, an HW DMA request from a timer is used as a trigger source to initiate DMA transfer. If all two CRC channels are active in AUTO mode then a total of two DMA requests would be generated by CRC Controller.

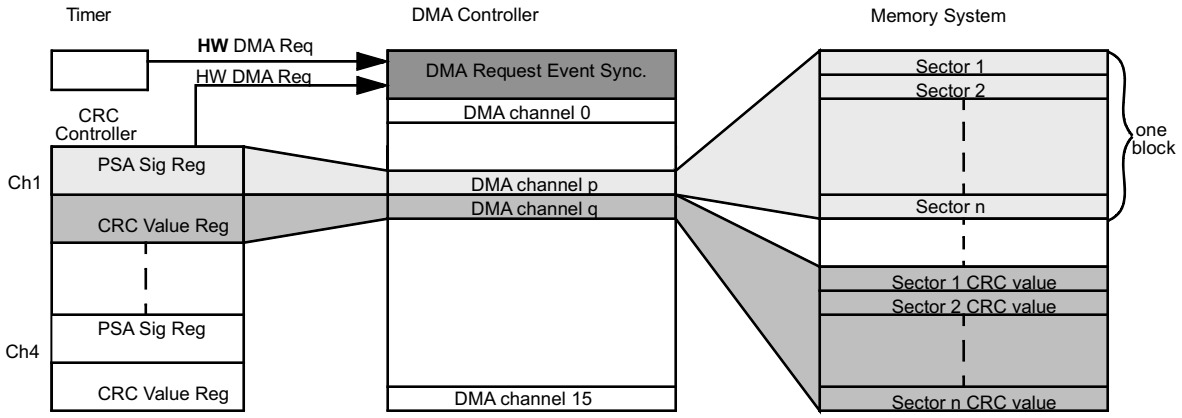

Figure 11-579. AUTO Mode Using Hardware Timer Trigger

11.8.7.4.7.2 AUTO Mode Using Software Trigger

The data patterns transfer can also be initiated by software. CPU can generate a software DMA request to activate the DMA channel to transfer data patterns from source memory system to the PSA Signature Register. To generate a software DMA request CPU needs to set the corresponding DMA channel in the DMA software trigger register. Note that just one software DMA request from CPU is enough to complete the entire data patterns transfer for all sectors. See Figure 11-580 for an illustration.

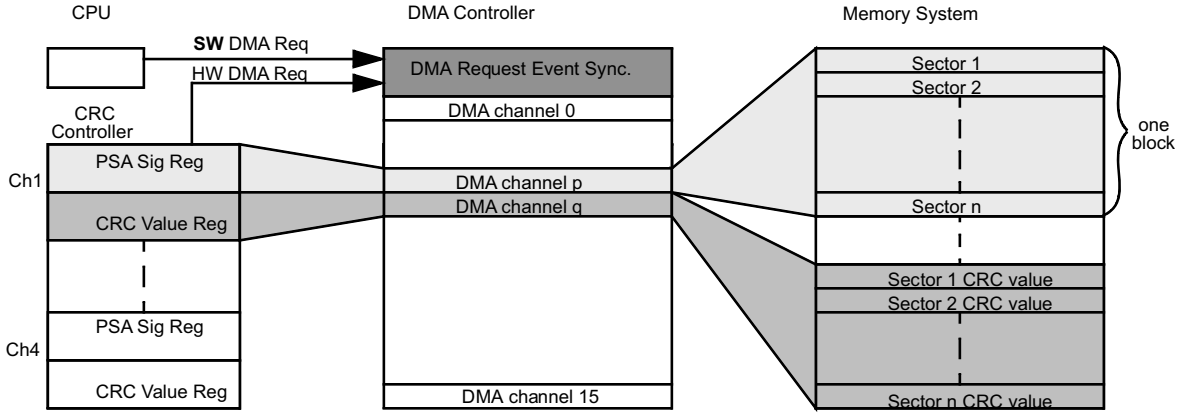

Figure 11-580. AUTO Mode With Software CPU Trigger

11.8.7.4.7.3 Semi-CPU Mode Using Hardware Timer Trigger

During semi-CPU mode, no DMA request is generated by CRC controller. Therefore, no DMA channel is allocated to update CRC Value Register. CPU should not read from CRC Value Register in semi-CPU mode as it contains stale value. Note that no signature verification is performed at all during this mode. Similar to AUTO mode, either by hardware or by software DMA request can be used as a trigger for data patterns transfer. Figure 11-581 illustrates the DMA setup using semi-CPU mode with hardware timer trigger.

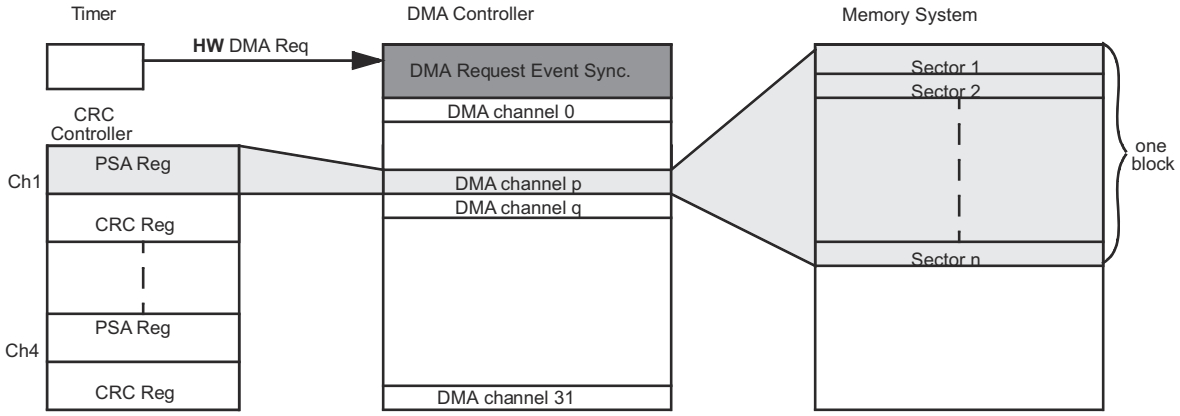

Figure 11-581. Semi-CPU Mode With Hardware Timer Trigger

Table 11-2020. CRC Modes in Which DMA Request and Counter Logic are Active or Inactive

Mode	DMA Request	Pattern Counter	Sector Counter	Timeout Counter
AUTO	Active	Active	Active	Active
Semi-CPU	Inactive	Active	Active	Active
Full-CPU	Inactive	Inactive	Inactive	Inactive

11.8.7.4.8 Pattern Count Register

There is a 20-bit data pattern counter for every CRC channel. The data pattern counter is a down counter and can be pre-loaded with a programmable value stored in the Pattern Count Register. When the data pattern counter reaches zero, a compression complete interrupt is generated in Semi-CPU mode and an automatic signature verification is performed in AUTO mode. In AUTO only, DMA request is generated to trigger the DMA controller to update the CRC Value Register.

Note

The data pattern count should be divisible by the total transfer count as programmed in DMA controller. The total transfer count is the product of element count and frame count.

11.8.7.4.9 Sector Count Register/Current Sector Register

Each channel contains a 16 bit sector counter. The sector count register stores the number of sectors. Sector counter is a free running counter and is incremented by one each time when one sector of data patterns is compressed. When the signature verification fails, the current value stored in the sector counter is saved into current sector register. If signature verification fails, CPU can read from the current sector register to identify the sector which causes the CRC mismatch. To aid and facilitate the CPU in determining the cause of a CRC failure, it is advisable to use the following equation during CRC and DMA setup:

CRC Pattern Count × CRC Sector Count = DMA Element Count × DMA Frame Count

The current sector register is frozen from being updated until both the current sector register is read and CRC fail status bit is cleared by CPU. If CPU does not respond to the CRC failure in a timely manner before another sector produces a signature verification failure, the current sector register is not updated with the new sector number. An overrun interrupt is generate instead. If current sector register is already frozen with an erroneous sector and emulation is entered with SUSPEND signal goes to high then the register still remains frozen even it is read.

In Semi-CPU mode, the current sector register is used to indicate the sector for which the compression complete has last happened.

The current sector register is reset when the PSA software reset is enabled.

Note

Both data pattern count and sector count registers must be greater than or equal to one for the counters to count. After reset, pattern count and sector count registers default to zero and the associated counters are inactive.

11.8.7.4.10 Interrupt

The CRC controller generates several types of interrupts per channel. Associated with each interrupt, there is an interrupt enable bit. No interrupt is generated in Full-CPU mode.

- Compression complete interrupt
- CRC fail interrupt
- Overrun interrupt
- Underrun interrupt
- Timeout interrupt

Table 11-2021. Modes in Which Interrupt Condition Can Occur

	AUTO	Semi-CPU	Full-CPU
Compression Complete	no	yes	no
CRC Fail	yes	no	no
Overrun	yes	yes	no
Underrun	yes	no	no
Timeout	yes	yes	no

11.8.7.4.10.1 Compression Complete Interrupt

Compression complete interrupt is generated in Semi-CPU mode only. When the data pattern counter reaches zero, the compression complete flag is set and the interrupt is generated.

11.8.7.4.10.2 CRC Fail Interrupt

CRC fail interrupt is generated in AUTO mode only. When the signature verification fails, the CRC fail flag is set,. CPU should take action to address the fail condition and clear the CRC fail flag after it resolves the CRC mismatch.

11.8.7.4.10.3 Overrun Interrupt

Overrun interrupt is generated in either AUTO or Semi-CPU mode. During AUTO mode, if a CRC fail is detected then the current sector number is recorded in the current sector register. If CRC fail status bit is not cleared and current sector register is not read by the host CPU before another CRC fail is detected for another sector then an overrun interrupt is generated. During Semi-CPU mode, when the data pattern counter finishes counting, it generates a compression complete interrupt. At the same time the signature is copied into the PSA Sector Signature Register. If the host CPU does not read the signature from PSA Sector Signature Register before it is updated again with a new signature value then an overrun interrupt is generated.

11.8.7.4.10.4 Underrun Interrupt

Underrun interrupt only occurs in AUTO mode. The interrupt is generated when the CRC Value Register is not updated with the corresponding signature when the data pattern counter finishes counting. During AUTO mode, CRC Controller generates DMA request to update CRC Value Register in synchronization to the corresponding sector of the memory. Signature verification is also performed if underrun condition is detected. And CRC fail interrupt is generated at the same time as the underrun interrupt.

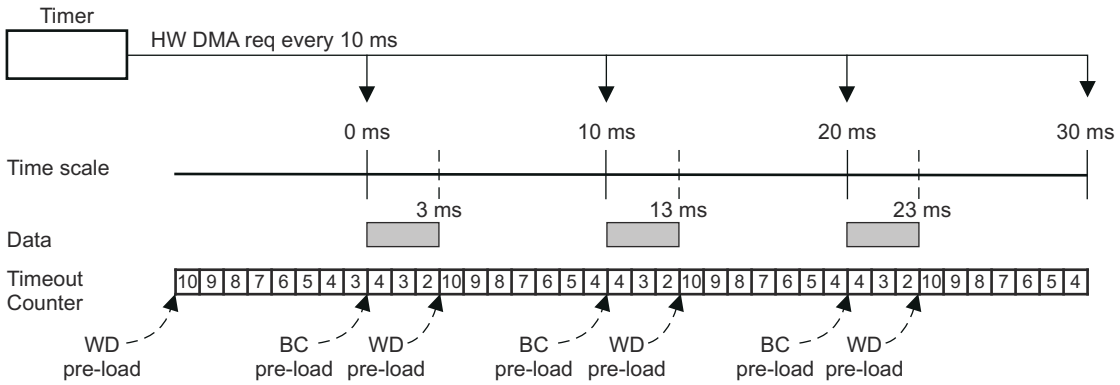
11.8.7.4.10.5 Timeout Interrupt

To ensure that the memory system is examined within a pre-defined time frame and no loss of incoming data there is a 24 bit timeout counter per CRC channel. The 24 bit timeout down counter can be pre-loaded with two different pre-load values, watchdog timeout pre-load value (CRC_WDTOPLDx) and block complete timeout pre-load value (CRC_BCTOPLDx). The timeout counter is clocked by a prescaler clock which is permanently running at division 64 of HCLK clock.

First pattern of data must be transferred by the DMA before the timeout counter expires, Watchdog timeout pre-load register (CRC_WDTOPLDx) is used as timeout counter. Block complete timeout pre-load register (CRC_BCTOPLDx) is used to check if one complete block of data patterns are compressed within a specific time frame. The timeout counter is first pre-loaded with CRC_WDTOPLDx after either AUTO or Semi-CPU mode is selected and starts to down count. If the timeout counter expires before DMA transfers any data pattern to PSA Signature Register then a timeout interrupt is generated. An incoming data pattern before the timeout counter expires will automatically pre-load the timeout counter with CRC_BCTOPLDx the block complete timeout pre-load value.

Block complete timeout pre-load value is used to check it one block of data patterns are compressed within a given time limit. If the timeout counter pre-loaded with CRC_BCTOPLDx value expires before one block of data patterns are compressed a timeout interrupt is generated. When one block (pattern count x sector count) of data patterns are compressed before the counter has expired, the counter is pre-loaded with CRC_WDTOPLDx value again. If the timeout counter is pre-loaded with zero then the counter is disable and no timeout interrupt is generated.

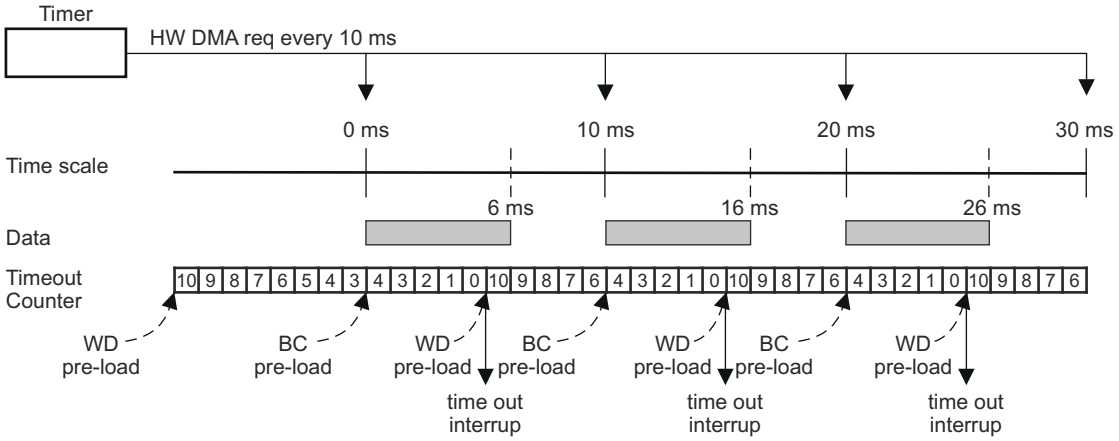
In Figure 11-582, a timer generates DMA request every 10ms to trigger one block (pattern count x sector count) transfer. Since we want to make sure that DMA does start to transfer a block every 10 ms we would set the first pre-load value to 10ms in CRC_WDTOPLDx. We also want to make sure that one block of data patterns are compressed within 4ms. With such a requirement, we would set the second pre-load value to 4ms in CRC_BCTOPLDx register.



WD pre-load = watchdog timeout pre-load (CRC_WDTOPLDx)
BC pre-load = block complete timeout pre-load (CRC_BCTOPLDx)

Note: No timeout interrupt is generated in this example since each block of data patterns are compressed in 3 ms and DMA does initiate a block transfer every 10 ms.

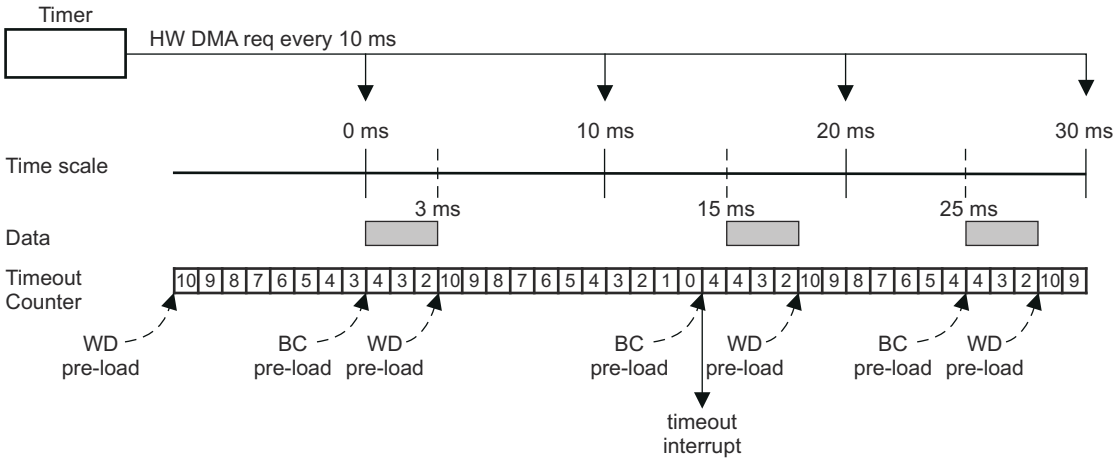
Figure 11-582. Timeout Example 1



WD pre-load = watchdog timeout pre-load (CRC_WDTOPLDx)
BC pre-load = block complete timeout pre-load (CRC_BCTOPLDx)

Note: Timeout interrupt is generated in this example since each block of data patterns are compressed in 6 ms and this is out of the 4ms time frame.

Figure 11-583. Timeout Example 2



WD pre-load = watchdog timeout pre-load (CRC_WDTOPLDx)
BC pre-load = block complete timeout pre-load (CRC_BCTOPLDx)

Note: Timeout interrupt is generated in this example since DMA can not transfer the second block of data within 10ms time limit and the reason may be that DMA is set up in fixed priority scheme and DMA is serving other higher priority channels at the time before it can service the timer request.

Figure 11-584. Timeout Example 3

11.8.7.4.10.6 Interrupt Offset Register

CRC Controller only generates one interrupt request to interrupt manager. A interrupt offset register is provided to indicate the source of the pending interrupt with highest priority. Table 11-2022 shows the offset interrupt vector address of each interrupt condition in an ascending order of priority.

Table 11-2022. Interrupt Offset Mapping

Offset Value	Interrupt Condition
0	Phantom
1h	Ch1 CRC Fail
2h	Ch2 CRC Fail
3h-8h	Reserved
9h	Ch1 Compression Complete
Ah	Ch2 Compression Complete
Bh-10h	Reserved
11h	Ch1 Overrun
12h	Ch2 Overrun
13h-18h	Reserved
19h	Ch1 Underrun
1Ah	Ch2 Underrun
1Bh-20h	Reserved
21h	Ch1 Timeout
22h	Ch2 Timeout
23h-24h	Reserved

11.8.7.4.10.7 Error Handling

When an interrupt is generated, host CPU should take appropriate actions to identify the source of error and restart the respective channel in DMA and CRC module. To restart a CRC channel, the user should perform the following steps in the ISR:

1. Write to software reset bit in CRC_CTRL register to reset the respective PSA Signature Register.
2. Reset the CHx_MODE bits to 00 in CRC_CTRL register as Data capture mode.
3. Set the CHx_MODE bits in CRC_CTRL register to desired new mode again.
4. Release software reset.

The host CPU should use byte write to restart each individual channel.

11.8.7.4.11 Power Down Mode

CRC module can be put into power down mode when the power down control bit PWDN is set. The module wakes up when the PWDN bit is cleared.

11.8.7.4.12 Emulation

A read access from a register in functional mode can sometimes trigger a certain internal event to follow. For example, reading an interrupt offset register triggers an event to clear the corresponding interrupt status flag. During emulation when SUSPEND signal is high, a read access from any register should only return the register contents to the bus and should not trigger or mask any event as it would have in functional mode. This is to prevent debugger from reading the interrupt offset register during refreshing screen and cause the corresponding interrupt status flag to get cleared. Timeout counters are stopped to generate timeout interrupts in emulation mode. No Peripheral Controller bus error should be generated if reading from the unimplemented locations.

11.8.7.4.13 Peripheral Bus Interface

CRC is a Peripheral target module. The register interface is similar to other peripheral modules. CRC supports following features:

- Different sizes of burst operation.
- Aligned and unaligned accesses.
- Abort is generated for any illegal address accesses.

11.8.7.5 Example

This section illustrates several of the ways in which the CRC Controller can be utilized to perform CRC.

11.8.7.5.1 Example: Auto Mode Using Time Based Event Triggering

A large memory area with 2Mbyte (256k doubleword) is to be checked in the background of CPU. CRC is to be performed every 1K byte (128 doubleword). Therefore there should be 2048 pre-recorded CRC values. For illustration purpose, we map channel 1 CRC Value Register to DMA channel 1 and channel 1 PSA Signature Register to DMA channel 2. Assume all DMA transfers are carried out in 64-bit transfer size.

11.8.7.5.1.1 DMA Setup

- Set up DMA channel 1 with the starting address from which the pre-determined CRC values are stored. Set up the destination address to the memory mapped channel 1 CRC Value Register. Put the source address at post increment addressing mode and put the destination address at constant addressing mode. Use ***hardware*** DMA request for channel 1 to trigger a ***frame*** transfer.
- Set up DMA channel 2 with the source address from which the contents of memory to be verified. Set up the destination address to the memory mapped channel 1 PSA Signature Register. Program the element transfer count to 128 and the frame transfer count to 2048. Put the source address at post increment addressing mode and put the destination address at constant address mode. Use ***hardware*** DMA request for channel 2 to trigger an entire ***block*** transfer.

11.8.7.5.1.2 Timer Setup

The timer can be any general purpose timer which is capable of generating a time-based DMA request.

- Set up timer to generate DMA request associated with DMA channel 2. For example, an OS can set up the timer to generate a DMA request every 10ms.

11.8.7.5.1.3 CRC Setup

- Program the pattern count to 128.
- Program the sector count to 2048.
- Enable AUTO mode and all interrupts.

After AUTO mode is selected, CRC Controller automatically generates a DMA request on channel 1. Around the same time the timer module also generates a DMA request on DMA channel 2. When the first incoming data pattern arrives at the PSA Signature Register, the CRC Controller will compress it. After some time, the DMA controller would update the CRC Value Register with a pre-determined value matching the calculated signature for the first sector of 128 64 bit data patterns. After one sector of data patterns are compressed, the CRC Controller generate a CRC fail interrupt if signature stored at the PSA Sector Signature Register does not match the CRC Value Register. CRC Controller generates a DMA request on DMA channel 1 when one sector of data patterns are compressed. This routine will continue until the entire 2Mbyte are consumed. If the timeout counter reached zero before the entire 2Mbytes are compressed a timeout interrupt is generated. After 2MBytes are transferred, the DMA can generate an interrupt to CPU. The entire operation will continue again when DMA responds to the DMA request from both the timer and CRC Controller. The CRC is performed totally without any CPU intervention.

11.8.7.5.2 Example: Auto Mode Without Using Time Based Triggering

A small but highly secured memory area with 1kbytes is to be checked in the background of CPU. CRC is to be performed every 1Kbytes. Therefore there is only one pre-recorded CRC value. For illustration purpose, we map channel 1 CRC Value Register to DMA channel 1 and channel 1 PSA Signature Register to DMA channel 2. Assume all transfers carried out by DMA are in 64 bit transfer size.

11.8.7.5.2.1 DMA Setup

- Set up DMA channel 1 with the source address from which the pre-determined CRC value is stored. Set up the destination address to the memory mapped channel 1 CRC Value Register. Put the source address at constant addressing mode and put the destination address at constant addressing mode. Use ***hardware*** DMA request for channel 1.
- Set up DMA channel 2 with the source address from which the memory area to be verified. Set up the destination address to the memory mapped channel 1 PSA Signature Register. Program the element transfer count to 128 and the frame transfer count to 1. Put the source address at post increment addressing mode and put the destination address at constant address mode. Generate a ***software*** DMA request on channel 2 after CRC has completed its setup. Enable autoinitiation for DMA channel 2.

11.8.7.5.2.2 CRC Setup

- Program the pattern count to 128.
- Program the sector count to 1.
- Leaving the timeout count register with the reset value of zero means no timeout interrupt is generated.
- Enable AUTO mode and all interrupts.

After AUTO mode is selected, the CRC Controller automatically generates a DMA request on channel 1. At the same time the CPU generates a ***software*** DMA request on DMA channel 2. When the first incoming data pattern arrives at the PSA Signature Register, the CRC Controller will compress it. After some time, the DMA controller would update the CRC Value Register with a pre-determined value matching the calculated signature for the first sector of 128 64 bit data patterns. After one sector of data patterns are compressed, the CRC Controller generates a CRC fail interrupt if signature stored at the PSA Sector Signature Register does not match the CRC Value Register. CRC Controller generates a DMA request on DMA channel 1 again after one sector is compressed. After 1kbytes are transferred, the DMA can generate an interrupt to CPU. Responding to the DMA interrupt CPU can restart the CRC routine by generating a software DMA request onto channel 2 again.

11.8.7.5.3 Example: Semi-CPU Mode

If DMA controller is available in a system, the CRC module can also operate in semi-CPU mode. This means that CPU can still make use of the DMA to perform data patterns transfer to CRC controller in the background. The difference between semi-CPU mode and AUTO mode is that CRC controller does not automatically perform

the signature verification. CRC controllers generates a compression complete interrupt to CPU when the one sector of data patterns are compressed. CPU needs to perform the signature verification itself.

A memory area with 2Mbyte is to be verified with the help of the CPU. CRC operation is to be performed every 1K byte. Since there are 2Mbyte (256k doublewords) of memory to be check and we want to perform a CRC every 1Kbyte (128 doublewords) and therefore there should be 2048 pre-recorded CRC values. In Semi-CPU mode, the CRC Value Register is not updated and contains indeterminate data.

11.8.7.5.3.1 DMA Setup

Set up DMA channel 1 with the source address from which the memory area to be verified are mapped. Set up the destination address to the memory mapped channel 1 PSA Signature Register. Put the starting address at post increment addressing mode and put the destination address at constant address mode. Use hardware DMA request to trigger an entire block transfer for channel 1. Disable autoinitiation for DMA channel 1.

11.8.7.5.3.2 Timer Setup

The timer can be any general purpose timer which is capable of generating a time based DMA request.

Set up timer to generate DMA request associated with DMA channel 1. For example, an OS can set up the timer to generate a DMA request every 10ms.

11.8.7.5.3.3 CRC Setup

- Program the pattern count to 128.
- Program the sector count to 2048.
- Enable Semi-CPU mode and enable all interrupts.

The timer module first generates a DMA request on DMA channel 1 when it is enabled. When the first incoming data pattern arrives at the PSA Signature Register, the CRC controller will compress it. After one sector of data patterns are compressed, the CRC controller generate a compression complete interrupt. Upon responding to the interrupt the CPU would read from the PSA Sector Signature Register. It is up to the CPU on how to deal with the PSA value just read. It can compare it to a known signature value or it can write it to another memory location to build a signature file or even transfer the signature out of the device via SCI or SPI. This routine will continue until the entire 2Mbyte are consumed. The latency of the interrupt response from CPU can cause overrun condition. If CPU does not read from PSA Sector Signature Register before the PSA value is overridden with the signature of the next sector of memory, an overrun interrupt will be generated by CRC controller.

11.8.7.5.4 Example: Full-CPU Mode

In a system without the availability of DMA controller, the CRC routine can be operated by CPU provided the CPU has enough throughput. CPU needs to read from the memory area from which CRC is to be performed.

A memory area with 2Mbyte is to be checked with the help of the CPU. CRC verification is to be performed every 1K byte. In CPU mode, the CRC Value Register is not updated and contains indeterminate data.

11.8.7.5.4.1 CRC Setup

- All control registers can be left in their reset state. Only enable Full-CPU mode.

CPU itself reads from the memory and write the data to the PSA Signature Register inside CRC Controller. When the first incoming data pattern arrives at the PSA Signature Register, the CRC Controller will compress it. After ***2MBytes*** data patterns are compressed, CPU can read from the PSA Signature Register. It is up to the CPU on how to deal with the PSA signature value just read. It can compare it to a known signature value stored at another memory location.

11.8.7.6 MSS_MCRC Registers

Table 11-2023 lists the PCR_generated_memory_map registers. All register offset addresses not listed in Table 11-2023 should be considered as reserved locations and the register contents should not be modified.

Table 11-2034. CRC_CURSEC_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-0	CRC_CURSEC1	R/W	0h	Channel 1 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erro- neous sector number.

11.8.7.6.12 CRC_WDTOPLD1 Register (Offset = 4Ch) [reset = 0h]

CRC_WDTOPLD1 is shown in Figure 11-596 and described in Table 11-2035.

Return to the Table 11-2023.

Table 11-2047. CRC_CURSEC_REG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-0	CRC_CURSEC2	R/W	0h	Channel 2 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erro- neous sector number.

11.8.7.6.25 CRC_WDTOPLD2 Register (Offset = 8Ch) [reset = 0h]

CRC_WDTOPLD2 is shown in Figure 11-609 and described in Table 11-2048.

11.8.8 Safety Modules

11.8.8.1 Core Clock Comparator (CCC)

11.8.8.1.1 Description

Core Clock Comparator (CCC) supports single-shot and continuous mode of operation, such as DCC. In continuous mode, the programmed values are reloaded after every successful comparison.

The module accepts 7 clock inputs for clock 0 and clock 1. One of these input clocks is selected to counter 0 and counter 1. Counter 0 is a down counter and is preloaded with a value before enabling the module. Counter 1 is an up counter which operates on Clock 1.

At the expiry of counter 0, value in the counter 1 is compared against the programmed expected value of the counter. After a successful comparison, a Done signal is asserted in single-shot mode, whereas in continuous mode, counter 0 is reloaded for the next comparison. Margin value programmed provides the tolerance for the comparison. An error signal is asserted when the counter 1 value differs from the expected value beyond the tolerance range.

When an error occurs, the module stops comparison in both single-shot and continuous mode.

There is a timeout counter functioning on Clock 1. A timeout value must be loaded into the timeout counter before enabling the module. If the timeout counter expires before the expiry of counter 0, an error condition is indicated. In continuous mode, after the successful comparison, the timeout value is also reloaded along with Counter 0.

11.8.8.1.2 Block Diagram

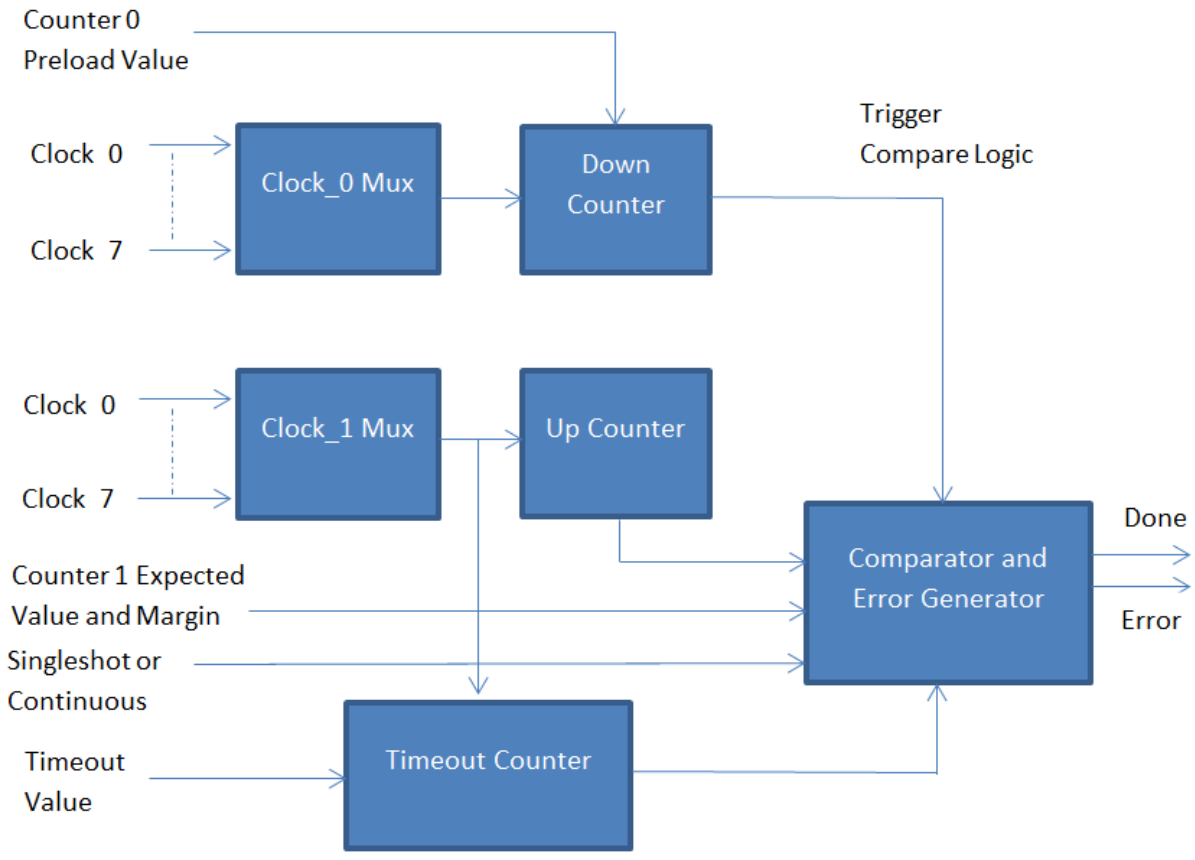

Figure 11-647. CCC Block Diagram

11.8.8.1.3 Perform Clock Comparison

The following are the steps to perform clock comparison.

1. Select Clock 0.
2. Select Clock 1.
3. Load value for down counting in counter 0.
4. Load expected value of counter 1.
5. Load Margin value for tolerance.
6. Set singleshot or continuous mode.
7. Load timeout value.
8. Enable Module.
9. Wait for Done or Error indication.

11.8.8.1.4 I/O Table

Table 11-2086. I/O Table

Signal	Input/Output	Description
async_rst_n	Input	Module Reset
vbusp_clk	Input	Clock
clock0_src	Input	Input clocks for Counter 0
clock1_src	Input	Input clocks for Counter 1
clock0_sel	Input	Clock Selector for Counter 0
clock1_sel	Input	Clock Selector for Counter 1
count0_expiry_val	Input	Preload Value for Counter 0
count1_expected_val	Input	Expected value of Counter 1
disable_clk_output	Input	Cutoff clocks for the module
enable_module	Input	Enable for Clock comparator
margin_count	Input	Tolerance value for Comparator
singleshot_mode	Input	0->Continuous mode, 1-> Singleshot mode
count1_val_out	Output	Counter 1 value
counter_error	Output	Error Indicator
counter_done	Output	Successful comparison Indicator
mod_status	Output	Internal Status Indicator
async_error_indicator	Output	Error indicator without the synchronizer
timeout_err_count	Input	Preload value for Timeout Counter
atpg_reset_bypass	Input	DFT reset
atpg_clk	Input	DFT clock
icg_te	Input	Control for ICG
atpg_clk_bypass	Input	Control for ATPG clock

11.8.8.1.5 Recommended Programmation

- Clock source 1 must be faster than Clock source 0 for successful comparison of clocks.
- The timeout value must always be loaded for successful comparison. The timeout value must be greater than the duration of the comparison operation.

11.8.8.2 Dual Clock Comparator (DCC)

This section describes the dual-clock comparator (DCC) module.

11.8.8.2.1 Introduction

The primary purpose of a DCC module is to measure the frequency of a clock signal using a second known clock signal as a reference. Specifically, DCC is designed to detect drifts from the expected clock frequency. This capability can be used to ensure the correct frequency range for several different device clock sources, thereby enhancing the system safety metrics.

11.8.8.2.1.1 Main Features

The main features of each of the DCC modules are:

- Allows application to ensure that a fixed ratio is maintained between frequencies of two clock signals
- Supports the definition of a programmable tolerance window in terms of number of reference clock cycles
- Supports continuous monitoring without requiring application intervention
- Also supports a single-sequence mode for spot measurements
- Allows selection of clock source for each of the counters resulting in several specific use cases

11.8.8.2.1.2 Block Diagram

Figure 11-648 illustrates the main concept of the DCC module.

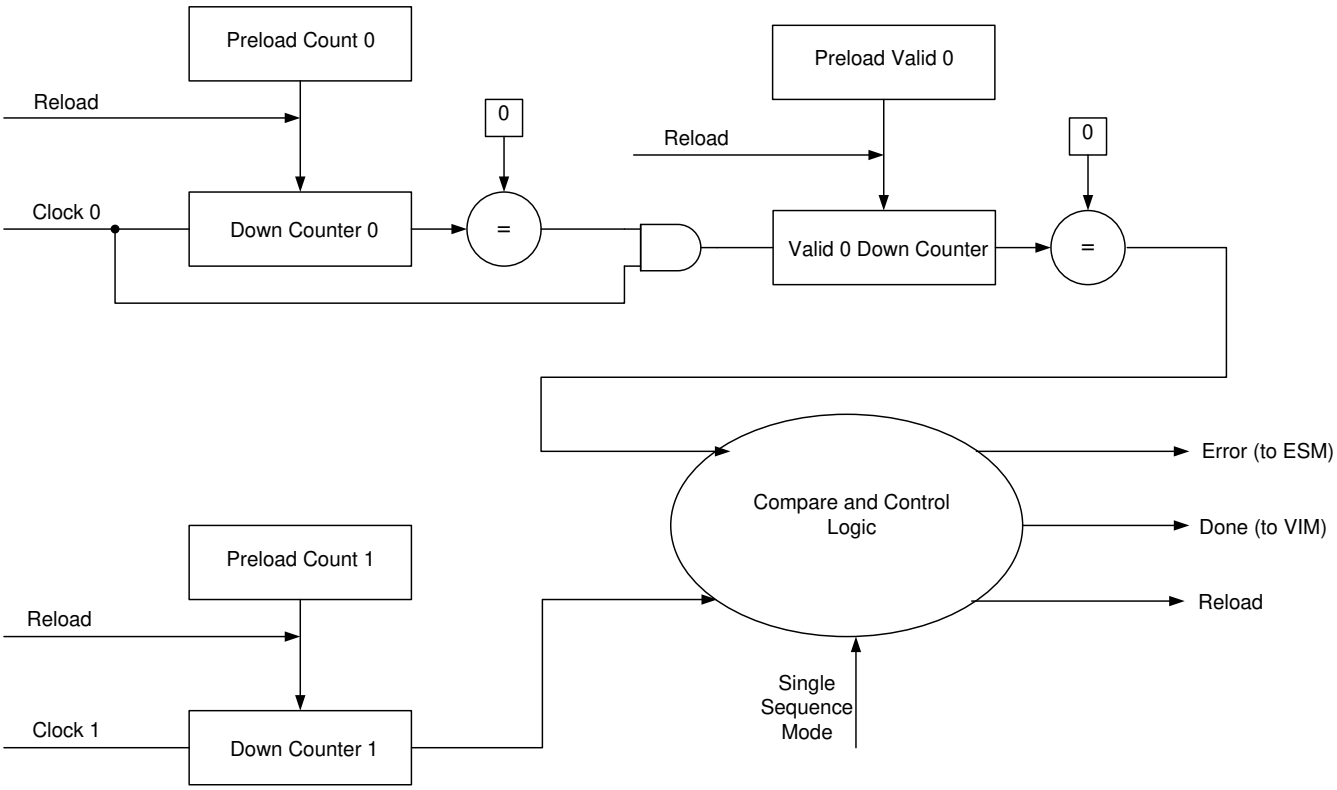

Figure 11-648. Block Diagram

11.8.8.2.2 Module Operation

As shown in Figure 11-430, the DCC contains two counters – counter0 and counter1, which are driven by two signals – clock0 and clock1. The application programs the seed values for both these counters. The application also configures the tolerance window time by configuring the valid counter for clock0.

Counter0 and counter1 both start counting simultaneously once the DCC is enabled. When counter0 counts down to zero, this automatically triggers the count down of the tolerance window counter (valid0).

The DCC module can be used in two different operating modes:

11.8.8.2.2.1 Continuous Monitoring Mode

In this mode, the DCC is used by the application to ensure that two clock signals maintain the correct frequency ratio. Suppose the application wants to ensure that the PLL output signal (clock source # 1) always maintains a fixed frequency relationship with the main oscillator (clock source # 0).

- In this case, the application can use the main oscillator as the clock0 signal (for counter0 and valid0) and the PLL output as the clock1 (for counter1).
- The seed values of counter0, valid0 and counter1 are selected such that if the actual frequencies of clock0 and clock1 are equal to their expected frequencies, then the counter1 will reach zero either at the same time as counter0 or during the count down of the valid0 counter.
- If the counter1 reaches zero during the count down of the valid0 counter, then all the counters (counter0, valid0, counter1) are reloaded with their initial seed values once valid0 has also counted down to zero.
- This sequence of counting down and checking then continues as long as there is no error, or until the DCC module is disabled.
- The counters also all get reloaded if the application resets and restarts the DCC module.

Error Conditions:

An error condition is generated by any one of the following:

1. Counter1 counts down to 0 before Counter0 reaches 0. This means that clock1 is faster than expected, or clock0 is slower than expected. It includes the case when clock0 is stuck at 1 or 0.
2. Counter1 does not reach 0 even when Counter0 and Valid0 have both reached 0. This means that clock1 is slower than expected. It includes the case when clock1 is stuck at 1 or 0.

Any error freezes the counters from counting. An application may then read out the counter values to help determine what caused the error.

11.8.8.2.2.1.1 Error Conditions

While operating in continuous mode, the counters get reloaded with the seed values and continue counting down under the following conditions:

- The module is reset or restarted by the application, OR
- Counter0, Valid 0 and Counter1 all reach 0 without any error

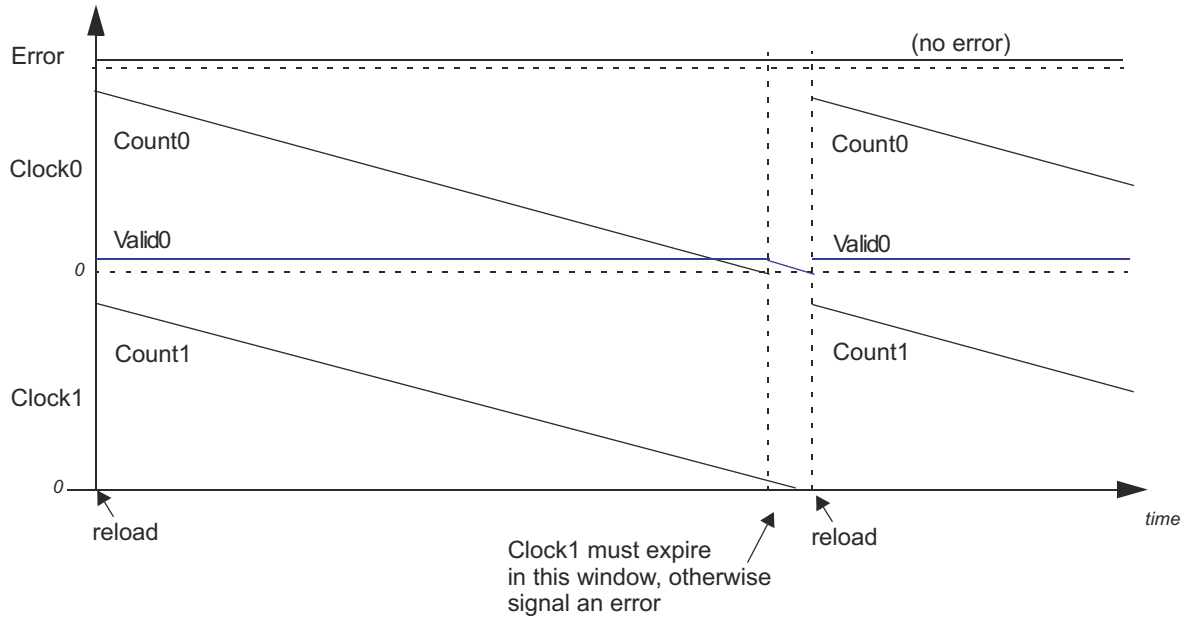

Figure 11-649. Counter Relationship

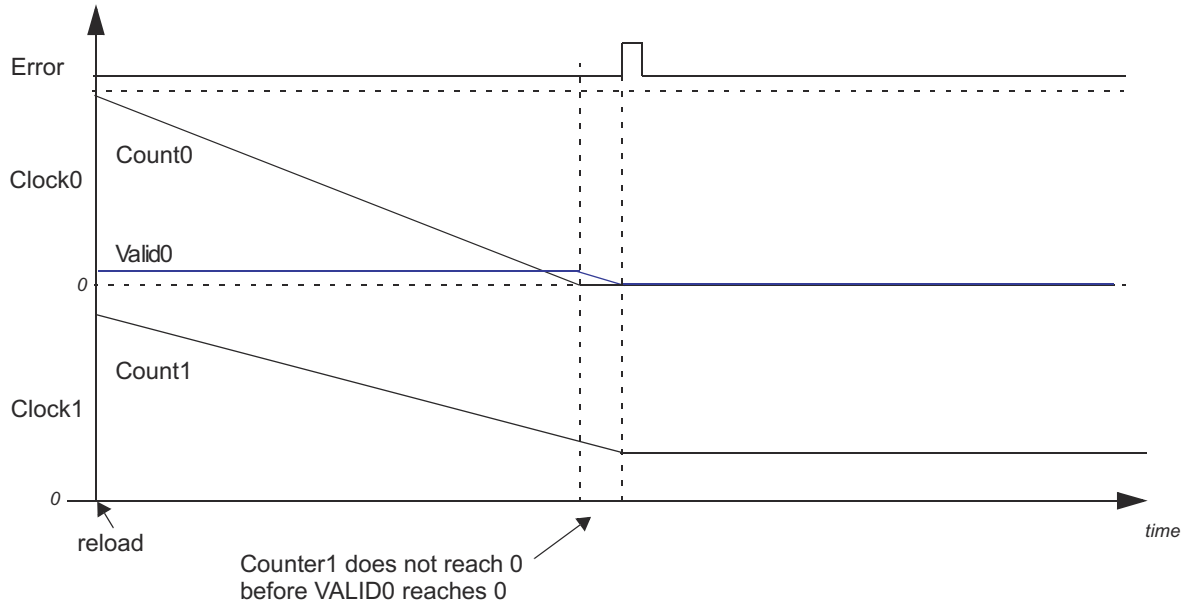

Figure 11-650. Clock1 Slower Than Clock0 - Results in an Error and Stops Counting

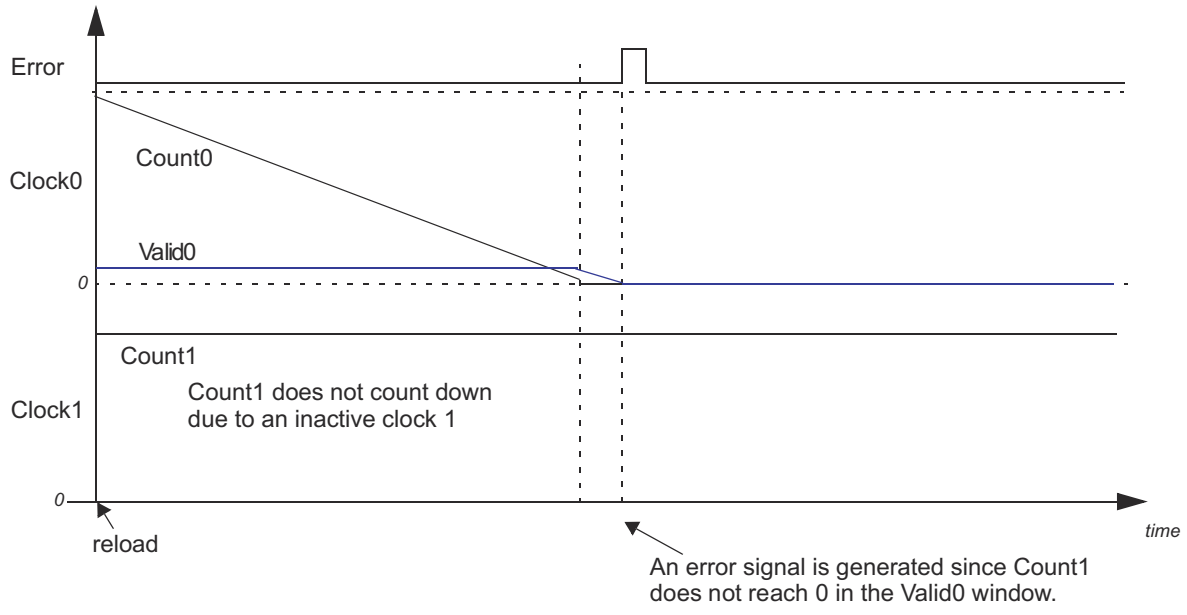

Figure 11-652. Clock1 Not Present - Results in an Error and Stops Counting

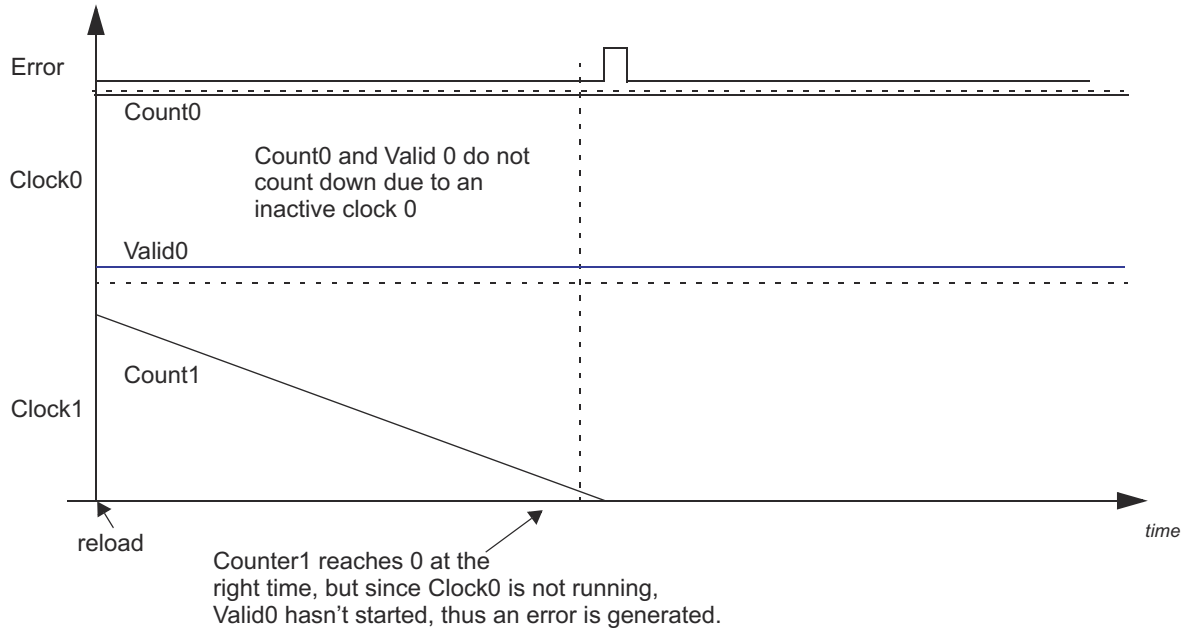

Figure 11-653. Clock0 Not Present - Results in an Error and Stops Counting

11.8.8.2.2.2 Single-Shot Measurement Mode

The DCC module can be programmed to count down one time by enabling the single-shot mode. In this mode, the DCC stops operating when the down counter0 and the valid counter0 reach 0. Alternatively, the DCC can be programmed to stop counting when the down counter1 reaches 0.

At the end of one sequence of counting down in this single-shot mode, the DCC gets disabled automatically, which prevents further counting. This mode is typically used for spot measurements of the frequency of a signal. This frequency could be an unknown for the application before the measurement.

Example Usage of Single-Shot Measurement Mode: Trimming the High-Frequency Low-Power Oscillator

A practical example of the usage of the spot measurement mode is in trimming the HF LPO (clock source # 5) using the main oscillator as a reference. This measurement sequence would proceed as follows:

- The application sets up the seed values for counter0 and valid0 for the duration of the measurement. Suppose the main oscillator frequency is 10 MHz and the intended duration of the measurement is 500 µs. The application needs to configure a seed value of 5000.
- These 5000 counts need to be divided between the counter0 and the valid0 counters. The minimum value for the valid0 seed is 4, so the application can configure counter0 seed value as 4996 and the valid0 seed value as 4.
- Suppose the HF LPO frequency is truly unknown. In this case the application can choose the maximum allowed seed value for counter1. This increases the probability of counter0 and valid0 counting down while the counter1 has still not fully counted down to zero. The maximum allowed seed value for counter1 is 1048575.
- Once the DCC is enabled, the counters counter0 and counter1 both start counting down from their seed values.
- When counter0 reaches zero, it automatically triggers the valid0 counter.
- When valid0 reaches zero, if counter1 is not zero as well, an ERROR status flag is set and a "DCC error" is sent to the ESM. Counter1 is also frozen so that it stops counting down any further. The application can enable an interrupt to be generated from the ESM whenever this DCC error is indicated. Refer the device datasheet to identify the ESM group and channel where the DCC error is connected.
- The DCC error interrupt service routine can then check the value of counter1 when the error was generated. Suppose that the counter1 now reads 1044575. This means that counter1 has counted 1048575 - 1044575,

or 4000 cycles within the 500-µs measurement period. This means that the average frequency of the HF LPO over this 500-µs period was 4000 cycles / 500 µs, or 8 MHz.
- The application then needs to clear the ERROR status flag and restart the DCC module so that it is ready for the next spot measurement.

If there is no error generated at the end of the sequence, then the DONE status flag is set and a DONE interrupt is generated. The application must clear the DONE flag before restarting the DCC.

The conditions that cause a DCC error are identical between the continuous monitoring mode and the single-shot measurement mode.

Error Conditions:

An error condition is generated by any one of the following:
1. Counter1 counts down to 0 before Counter0 reaches 0. This means that clock1 is faster than expected, or clock0 is slower than expected. It includes the case when clock0 is stuck at 1 or 0.
2. Counter1 does not reach 0 even when Counter0 and Valid0 have both reached 0. This means that clock1 is slower than expected. It includes the case when clock1 is stuck at 1 or 0.

Any error freezes the counters from counting. An application may then read out the counter values to help determine what caused the error.

Freezing Counters when Counter1 Reaches Zero:

The DCC module also allows the counters to be frozen when the counter1 reaches zero. This allows one of the clock sources for counter1 to be used as a reference for measuring one of the clock sources for counter0. The error conditions are the same as those where (counter0=0 and valid0=0) define the condition when the DCC counters are frozen. That is, an error is indicated if coutner0 and valid0 become zero while counter1 is still non-zero. In this case, however, the application would typically set up the seed values such that the counter1 will become zero before counter0. Essentially the measurement period is defined by the seed value of the counter1. Note that this is also an error condition, and the interrupt service routine can use the measurement period and the actual cycles counted by counter1 to determine the frequency of the clock0 signal.

11.8.8.2.3 MSS DCC Integration

4-DCC modules have been instantiated in the SOC as part of MSS. Clocks to the module are mentioned in the following sections.

11.8.8.2.3.1 Input Clock sources

Refer to the interrupt and DMA tables for mapping of the IPs interrupts and DMA requests.

11.8.8.2.5 Clock Source Selection for Counter0 and Counter1

Refer the device datasheet to identify the available options for selecting the clock sources for both counters of the DCC module. Some microcontrollers may include multiple instances of the DCC module. This will also be identified in the device datasheet.

The selection of the clock sources for counter0 and coutner1 is done by a combination of the KEY, CNT0 CLKSRC and CNT1 CLKSRC control fields of the CNT0CLKSRC and CNT1CLKSRC registers.

11.8.8.2.6 DCC Registers

Table 11-2093 lists the DCC memory-mapped registers. All register offset addresses not listed in Table 11-2093 should be considered as reserved locations and the register contents should not be modified.

Table 11-2093. DCC Registers

Offset	Acronym	Register Name	Section
0h	DCCGCTRL	DCCGCTRL	Section 12.8.8.2.6.1

Complex bit access types are encoded to fit into small table cells. Table 11-2094 shows the codes that are used for access types in this section.

Table 11-2094. DCC Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

11.8.8.2.6.1 DCCGCTRL Register (Offset = 0h) [reset = 5555h]

DCCGCTRL is shown in Figure 11-654 and described in Table 11-2095.

Return to Summary Table.

Starts / stops the counters clears the error signal

11.8.8.3 ECC_AGGREGATOR

This section describes the common ECC aggregator functionality.

11.8.8.3.1 ECC Aggregator Overview

To increase functional safety and system reliability the memories (for example, FIFOs, queues, SRAMs and others) in many device modules and subsystems are protected by error correcting code (ECC). This is accomplished through an ECC aggregator and ECC wrapper. The ECC aggregator is connected to these memories (hereinafter ECC RAMs) and involved in the ECC process. Each memory is surrounded by an ECC wrapper which performs the ECC detection and correction. The wrapper communicates via serial interface with the aggregator which has memory mapped configuration interface

11.8.8.3.2 Integration Details

In TPR1x design, there are five ECC aggregators.

- MSS_ECC_AGG_R5A
- MSS_ECC_AGG_R5B
- MSS_ECC_AGG_MSS
- DSS_ECC_AGG
- HSM_ECC_AGGR (details will be available in HSM document)

This aggregator is used to fault inject all memory ecc_controllers and aggregate the errors to generate a single error to ESM.

11.8.8.3.3 ECC Aggregator Features

The ECC aggregator has the following features:

- Reduces memory software errors via single error correction (SEC) and double error detection (DED)
- Provides a mechanism to control and monitor the ECC protected memories in a module or subsystem
- SEC and DED over the system interconnect data bus and parity and redundancy for the system interconnect command and address buses
- Generates an interrupt for correctable error

- Generates an interrupt for non-correctable error
- Supports inject only mode for diagnostic purposes
- Supports software readable status for single and double-bit ECC errors and associated information such as row address where error has occurred and data bits that have been flipped
- An ECC endpoint can be ECC RAM component.
- Detects single bit error via parity checking on:
  1. Memory mapped configuration interface FIFO
  2. Serial interface FIFO
- Single bit error detection via parity checking results in a non-correctable error interrupt
- Supports timeout mechanism on transactions over the ECC serial interface. Timeout occurrence results in a non-correctable error interrupt.
- Certain control bits have redundancy and if a bit flips an interrupt is generated

11.8.8.3.4 ECC Aggregator Integration

This section describes ECC aggregator integration in the device, including information about clocks, resets, and hardware requests.

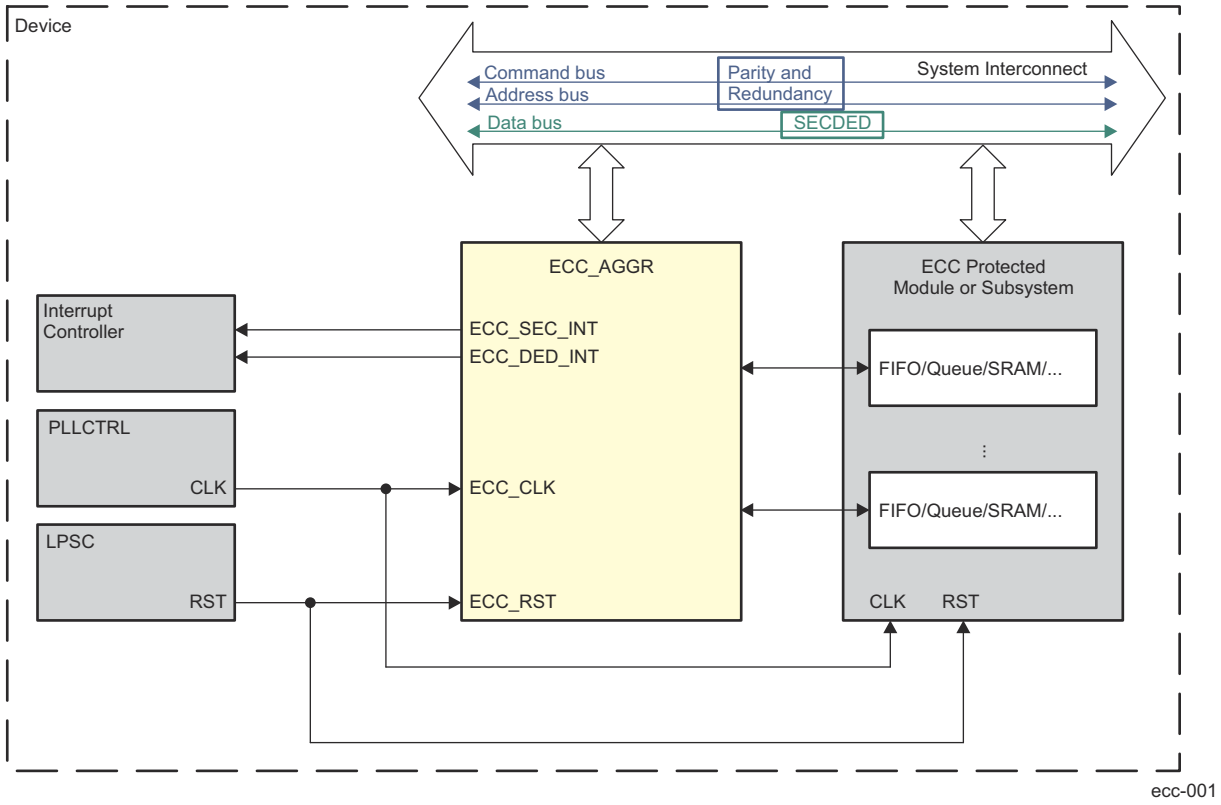

Figure 11-665. ECC Aggregator Integration

Table 11-2106. ECC Aggregator Clocks and Resets

Clock				
Module Instance	Module Clock Input	Source Clock Signal	Source	Description
ECC_AGGR	ECC_CLK	Same as corresponding module or subsystem	Same as corresponding module or subsystem	ECC aggregator clock
Resets				
Module Instance	Module Reset Input	Source Reset Signal	Source	Description
ECC_AGGR	ECC_RST	Same as corresponding module or subsystem	Same as corresponding module or subsystem	ECC aggregator reset

Table 11-2107. ECC Aggregator Hardware Requests

Interrupt Requests					
Module Instance	Module Interrupt Signal	Destination Interrupt Input	Description	Description	Type
ECC_AGGR	ECC_SEC_INT	See	See	Interrupt for correctable error(SEC)	Leve
	ECC_DED_INT	See	See	Interrupt for non-correctable error (DED, parity, redundancy, timeout)	LEVEL
DMA Events					
Module Instance	Module DMA Input	Destination DMA Event Input	Destination	Description	Type
ECC_AGGR	-	-	-	-	-

Note

For more information on the interrupts, see Section 11.8.4.9.

For more information on the interconnects, see .

For more information on the power, reset and clock management, see the corresponding sections in .

For more information on the device interrupt controllers, see *Interrupt Controllers*.

11.8.8.3.5 ECC Aggregator Function Description

This section describes the architecture and functional details of the ECC aggregator.

11.8.8.3.5.1 ECC Aggregator Block Diagram

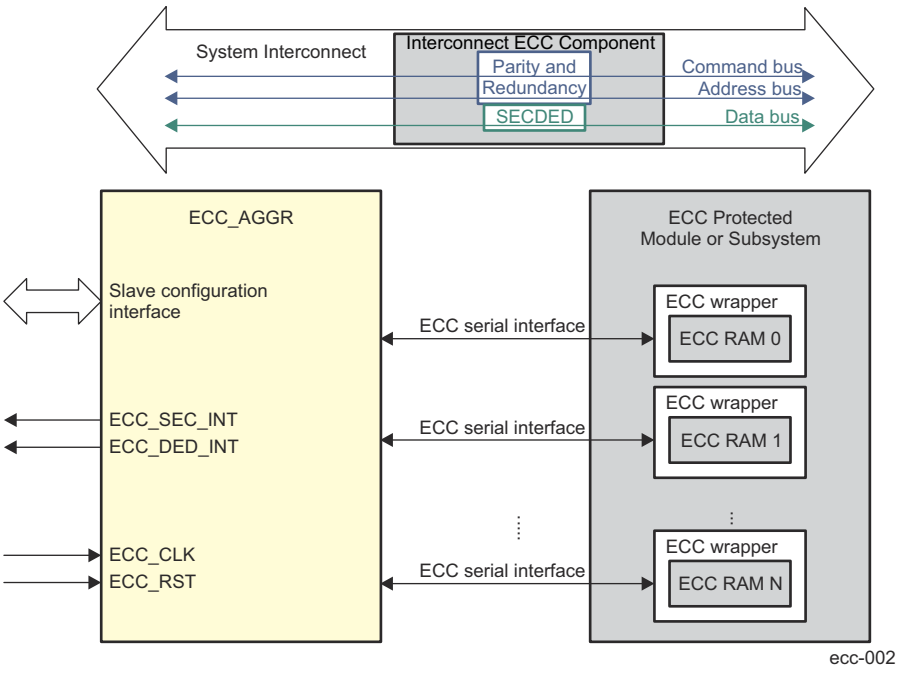

Figure 11-666. ECC Aggregator Block Diagram

The ECC aggregator is connected to one or more ECC endpoints each of which has assigned a unique ID used when the endpoint is accessed for status information or configuration. The ECC aggregator provides software

access to all ECC related registers through its memory mapped slave configuration interface while the serial interface is used to communicate with the ECC endpoints. Upon detection of single or double-bit error the corresponding interrupt line is asserted.

11.8.8.3.6 ECC Aggregator Register Groups

The ECC aggregator has ECC control, status and interrupt registers for each ECC endpoint in a module or subsystem. These registers are memory mapped and occupy 1 KB address space although part of it may contain reserved locations. The registers are split in the following types:

- **Global registers**. They are common to all ECC endpoints associated with the ECC aggregator and include the ECC_VECTOR and ECC_REV registers. Each ECC endpoint has assigned a unique ID.

  When this ID is written to the ECC_VECTOR[10-0] ECC_VECTOR field the corresponding endpoint is selected either for control or for status reading.
- **ECC control and status registers**. These registers are specific to each ECC endpoint and reside in the range from address offset 0x10 to 0x28, if the endpoint is ECC RAM or from 0x10 to 0x24, if the endpoint is interconnect ECC component. They are memory mapped but are accessed through the ECC serial interface. They are also selected by the ECC endpoint ID written to the ECC_VECTOR[10-0] ECC_VECTOR field. Because of latency on the serial interface the ECC control and status registers are read by performing special sequence as described in Section 12.9.4.3.3. These registers have also different functionality for both types of endpoints - ECC RAM and interconnect ECC component.
- **Interrupt registers**. They include interrupt status, interrupt enable, interrupt disable, and EOI registers.

11.8.8.3.7 Read Access to the ECC Control and Status Registers

Read accesses to the ECC control and status registers for each ECC endpoint represent read operations over the ECC serial interface and are triggered by performing the following sequence:

1. Software writes the following in the ECC_VECTOR register:
   - The ECC endpoint ID in the ECC_VECTOR[10-0] ECC_VECTOR field to select particular ECC endpoint.
   - The register read address in the ECC_VECTOR[23-16] RD_SVBUS_ADDRESS field to select which register has to be read through the ECC serial interface.
   - A value of 0x1 in the ECC_VECTOR[15] RD_SVBUS bit to trigger read operation through the ECC serial interface.
2. Software polls the ECC_VECTOR[24] RD_SVBUS_DONE bit to check if it is 0x1. This indicates that the read operation on the ECC serial interface has completed.
3. Software reads the data from the register previously selected by the ECC_VECTOR[23-16]RD_SVBUS_ADDRESS field.

11.8.8.3.8 Serial Write Operation

Write operations over the ECC serial interface are performed as follows:

1. Software specifies the ECC endpoint ID in the ECC_VECTOR[10-0] ECC_VECTOR field. The ECC_VECTOR[23-16] RD_SVBUS_ADDRESS field is a don't care but the ECC_VECTOR[15] RD_SVBUS bit must be set to 0x0.
2. Software performs regular write operation to the desired address. If the ECC endpoint ID has already been specified, step 1 can be skipped. Unlike serial read operations it is not necessary to always specify the endpoint ID before performing serial write operation.

The following is an example for serial write operation:

1. Write 0x0000 0008 to the ECC_VECTOR register.
2. Write 0x0000 000F to the ECC_CTRL register. This sends write request with data 0x0000 000F to the ECC_CTRL register associated with ECC RAM with ID = 8.

11.8.8.3.9 Interrupts

The ECC aggregator generates the following interrupts:

- Correctable interrupt (ECC_SEC_INT) where hardware can correct the error but notifies the system in case of SEC.

- Non-correctable interrupt (ECC_DED_INT) where hardware cannot correct the error in cases of DED, parity check, redundancy check or timeout occurrence.

The following is the sequence for servicing interrupts:

- Software enables the interrupts for an ECC endpoint by writing 0x1 to the corresponding bit of the following interrupt enable registers:
  - ECC_SEC_ENABLE_SET_REG0 for the correctable interrupt
  - ECC_DED_ENABLE_SET_REG0 for the noncorrectable interrupt
- On receiving an interrupt, software checks which ECC endpoint has caused the error by reading the following interrupt status registers:
  - ECC_SEC_STATUS_REG0 for the correctable interrupt ECC_DED_STATUS_REG0 for the non-correctable interrupt
- Software performs serial read operations as described in Section 12.9.4.3.3 to read the following status registers that contain details about the error:
  - If the endpoint is ECC RAM:
    - ECC_ERR_STAT1
    - ECC_ERR_STAT2
    - ECC_ERR_STAT3
- If the endpoint is interconnect ECC component:
  - ECC_CBASS_ERR_STAT1
  - ECC_CBASS_ERR_STAT2
- After the interrupt has been serviced, depending on the error type, software should clear the corresponding status bits in the ECC_ERR_STAT1 and ECC_ERR_STAT3 registers or in the ECC_CBASS_ERR_STAT1 register. Software has to poll these registers to guarantee that status bits are cleared as there is no other indication for write completion over the ECC serial interface.

The value of the *_PEND_CLR fields in the ECC_CBASS_ERR_STAT1 register must be read and then written back to decrement the count of each field back to 0x0. A further error capture into the ECC_CBASS_ERR_STAT1 register does not occur unless all its fields are 0x0. The decrement value should not be larger than the read value. If a field in the ECC_CBASS_ERR_STAT1 register should not be modified, write a value of 0x0 to that field.

- Software writes 0x1 to the corresponding end of interrupt register to clear the interrupt:
  - ECC_SEC_EOI_REG for the correctable interrupt
  - ECC_DED_EOI_REG for the non-correctable interrupt

11.8.8.3.10 Inject Only Mode

There are modules that already perform the ECC generation and checking as part of their data path. In this case, the ECC wrapper may be configured in inject only mode, if needed. In this mode the ECC wrapper does not perform ECC detection and correction. The inject only mode allows users to inject single or double-bit errors so that the module logic can be tested for diagnostic purposes.

Note

There is no software control to enable inject only mode. It is configured via tie-off value. Inject only and ECC modes are mutually exclusive.

The interconnect ECC component also supports error injection mode. There is error injection logic for testing of the error checking logic (checkers). The injection logic can be configured to inject either single or double bit error and what data pattern to be used for injection (ECC_CBASS_CTRL[11-8] ECC_PATTERN). The ECC_CBASS_ERR_CTRL1 and ECC_CBASS_ERR_CTRL2 registers should be written first to setup the injection. Then, either the ECC_CBASS_CTRL[3] FORCE_SE or the ECC_CBASS_CTRL[4] FORCE_DE bit must be set to 0x1 to start the injection. Both bits must not be set at the same time. If the injection should continue in incrementing mode, then the ECC_CBASS_CTRL[5] FORCE_N_BIT bit should be set to 0x1. Once the FORCE_N_BIT is set, then each successive injection can simply write the ECC_CBASS_CTRL register

to set the FORCE_SE or FORCE_DE again. Reading 0x0 from either the FORCE_SE or the FORCE_DE bit indicates that the injection has completed, as these bits automatically clear when the checker indicates that it has performed the injection. The time for an injection to complete is not guaranteed, so some delay is needed between successive injections.

11.8.8.3.11 Errors

Each aggregator generates two errors which drive the ESM.

- <modulename>_SERR module names are mentioned in the below section
- <modulename>_SERR module names are mentioned in the below section

Group1 and Group2 mappings are found the ESM interrupt sections.

5-0	revmin	R	2h	Minor version

11.8.8.4.1.5 ctrl Register (Offset = 14h) [Reset = X]

ctrl is shown in Table 11-2118.

Return to the Summary Table.

ECC Control Register

Table 11-2118. ctrl Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RESERVED	R/W	X	
8	check_svbus_timeout	R/W	1h	check for svbus timeout errors
7	check_parity	R/W	1h	check for parity errors
6	error_once	R/W	0h	Force Error only once
5	force_n_row	R/W	0h	Force Error on any RAM read
4	force_ded	R/W	0h	Force Double Bit Error
3	force_sec	R/W	0h	Force Single Bit Error
2	enable_rmw	R/W	1h	Enable rmw
1	ecc_check	R/W	1h	Enable ECC check
0	ecc_enable	R/W	1h	Enable ECC

11.8.8.4.1.6 err_ctrl1 Register (Offset = 18h) [Reset = 00000000h]

err_ctrl1 is shown in Table 11-2119.

Return to the Summary Table.

ECC Error Control1 Register

Table 11-2119. err_ctrl1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ecc_row	R/W	0h	Row address where single or double-bit error needs to be applied. This is ignored if force_n_row is set

11.8.8.4.1.7 err_ctrl2 Register (Offset = 1Ch) [Reset = 00000000h]

err_ctrl2 is shown in Table 11-2120.

Return to the Summary Table.

ECC Error Control2 Register

Table 11-2120. err_ctrl2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	ecc_bit2	R/W	0h	Data bit that needs to be flipped if double bit error needs to be forced
15-0	ecc_bit1	R/W	0h	Data bit that needs to be flipped when force_sec is set

11.8.8.4.1.8 err_stat1 Register (Offset = 20h) [Reset = 00000000h]

err_stat1 is shown in Table 11-2121.

Return to the Summary Table.

ECC Error Status1 Register

Table 11-2121. err_stat1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	ecc_bit1	R	0h	Data bit that corresponds to the single-bit error
15	clr_ctrl_reg_err	R/W1C	0h	Clear control reg error Error Status, you must also re write the contorl ergister itself to clear this
14-13	clr_parity_err	R/Wdecr	0h	Clear parity Error Status
12	clr_ecc_other	R/W1C	0h	Clear other Error Status
11-10	clr_ecc_ded	R/Wdecr	0h	Clear Double Bit Error Status
9-8	clr_ecc_sec	R/Wdecr	0h	Clear Single Bit Error Status
7	ctr_reg_err	R/W1S	0h	control register error pending, Level interrupt
6-5	parity_err	R/W1S	0h	Level parity error Error Status
4	ecc_other	R/W1S	0h	successive single-bit errors have occurred while a writeback is still pending, Level interrupt
3-2	ecc_ded	R/Wincr	0h	Level Double Bit Error Status
1-0	ecc_sec	R/Wincr	0h	Level Single Bit Error Status

11.8.8.4.1.9 err_stat2 Register (Offset = 24h) [Reset = 00000000h]

err_stat2 is shown in Table 11-2122.

Return to the Summary Table.

ECC Error Status2 Register

Table 11-2122. err_stat2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ecc_row	R	0h	Row address where the single or double-bit error has occurred

11.8.8.4.1.10 err_stat3 Register (Offset = 28h) [Reset = X]

err_stat3 is shown in Table 11-2123.

Return to the Summary Table.

ECC Error Status3 Register

Table 11-2123. err_stat3 Register Field Descriptions

11.8.8.5 Error Signaling Module (ESM)

This section provides the details of the error signaling module (ESM) that aggregates device errors and provides internal and external error response based on error severity.

11.8.8.5.1 Overview

The Error Signaling Module (ESM) collects and reports the various error conditions on the microcontroller. The error condition is categorized based on a severity level. Error response is then generated based on the category of the error. Possible error responses include a low priority interrupt, high priority interrupt, and an external pin action.

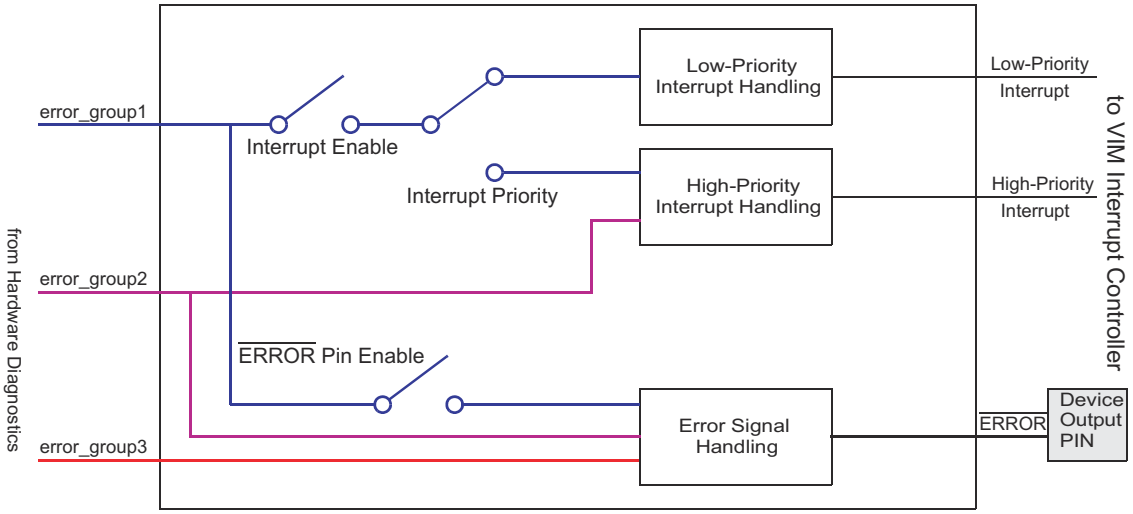
11.8.8.5.2 Feature List

- Up to 192 error channels (MSS/DSS) are supported, divided into 3 different groups:
  - 128 Group1 (low severity) channels with configurable interrupt generation and configurable $\overline{\text{ERROR}}$ pin behavior
  - 32 Group2 (high severity) channels with predefined interrupt generation and predefined $\overline{\text{ERROR}}$ pin behavior
  - 32 Group3 (high severity) channels with no interrupt generation and predefined $\overline{\text{ERROR}}$ pin behavior. These channels have no interrupt response as they are reserved for CPU based diagnostics that generate aborts directly to the CPU.
- Dedicated device $\overline{\text{ERROR}}$ pin to signal an external observer
- Configurable timebase for $\overline{\text{ERROR}}$ pin output
- Error forcing capability for latent fault testing

11.8.8.5.3 Block Diagram

As shown in Figure 11-733, the ESM channels are divided into three groups. Group1 channels are considered to be low severity. Group1 errors have a configurable interrupt response and configurable $\overline{\text{ERROR}}$ pin behavior. Note that the ESM Status Register 1 (ESMSR1) for error group 1 gets updated, regardless if the interrupt enable is active or not. Group2 channels are $\overline{\text{ERROR}}$ high severity. Group2 errors always generate a high priority interrupt and an output on the $\overline{\text{ERROR}}$ pin. Group3 errors are reserved for high severity errors generated by diagnostics which have already generated a CPU abort response. Because an abort response is generated, there is no need to generate an interrupt response. Group3 errors always generate an $\overline{\text{ERROR}}$ pin output.

The ESM interrupt and $\overline{\text{ERROR}}$ pin behavior are also summarized in Table 11-2205.



Note that the ESM Status Register 1 (ESMSR1) for error_group1 gets updated, regardless if the interrupt enable is active or not.

Figure 11-733. Block Diagram

Table 11-2205. ESM Interrupt and $\overline{\text{ERROR}}$ Pin Behavior

Error Group	Interrupt Generated	Interrupt Priority	$\overline{\text{ERROR}}$ Pin Response Generated
1	configurable interrupt	configurable priority	configurable output generation
2	interrupt generated	high priority	output generated
3	no interrupt	NA	output generated

Figure 11-734 and Figure 11-735 show the interrupt response handling and $\overline{\text{ERROR}}$ pin response handling with register configuration. The total active time of the $\overline{\text{ERROR}}$ pin is controlled by the Low-Time Counter Preload register (LTCP) and the key register (ESMEPSR) as shown in Figure 11-735. See for details.

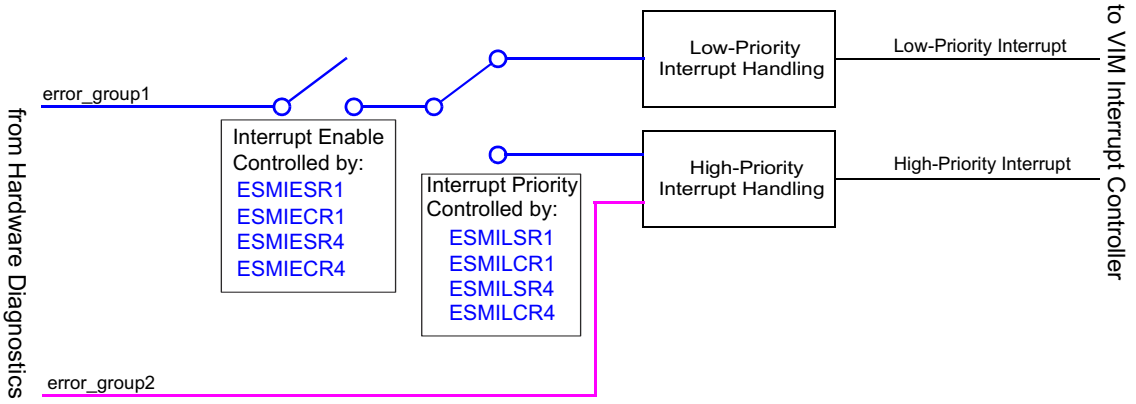


Figure 11-734. Interrupt Response Handling

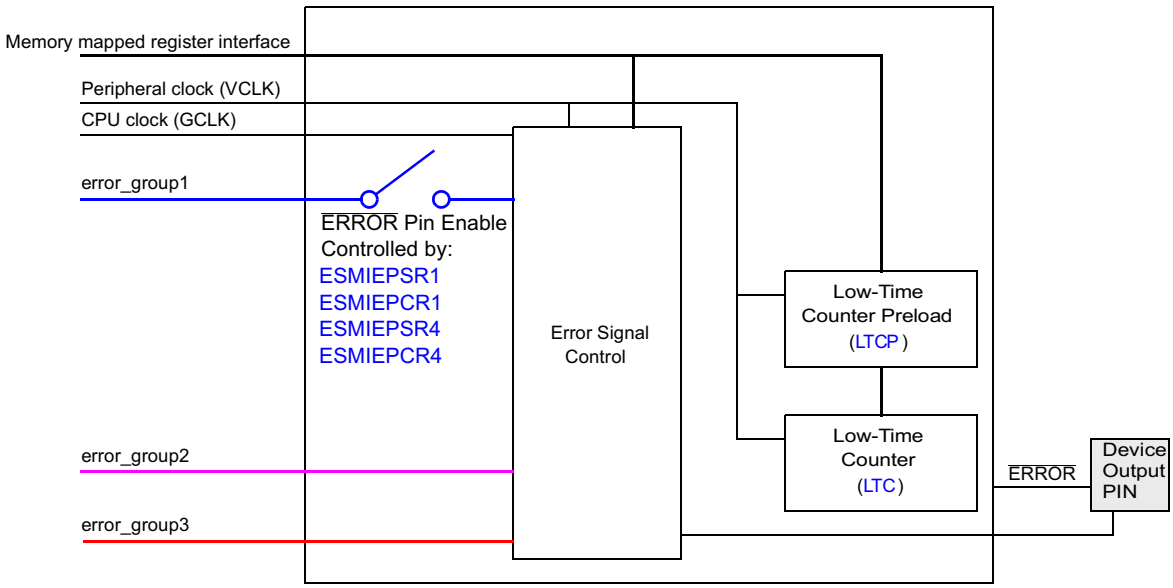

Figure 11-735. $\overline{\text{ERROR}}$ Pin Response Handling

11.8.8.5.4 Integration Details

TPR1x has 3 instances of the ESM module.

	Parameters

Instance	Max Group 1	Max Group 2	Max Group 3
MSS_ESM	128	32	32
DSS_ESM	128	32	32
HSM_ESM	Refer HSM Design Specification		

Refer to Section 11.8.4.9 for the ESM Interrupt map.

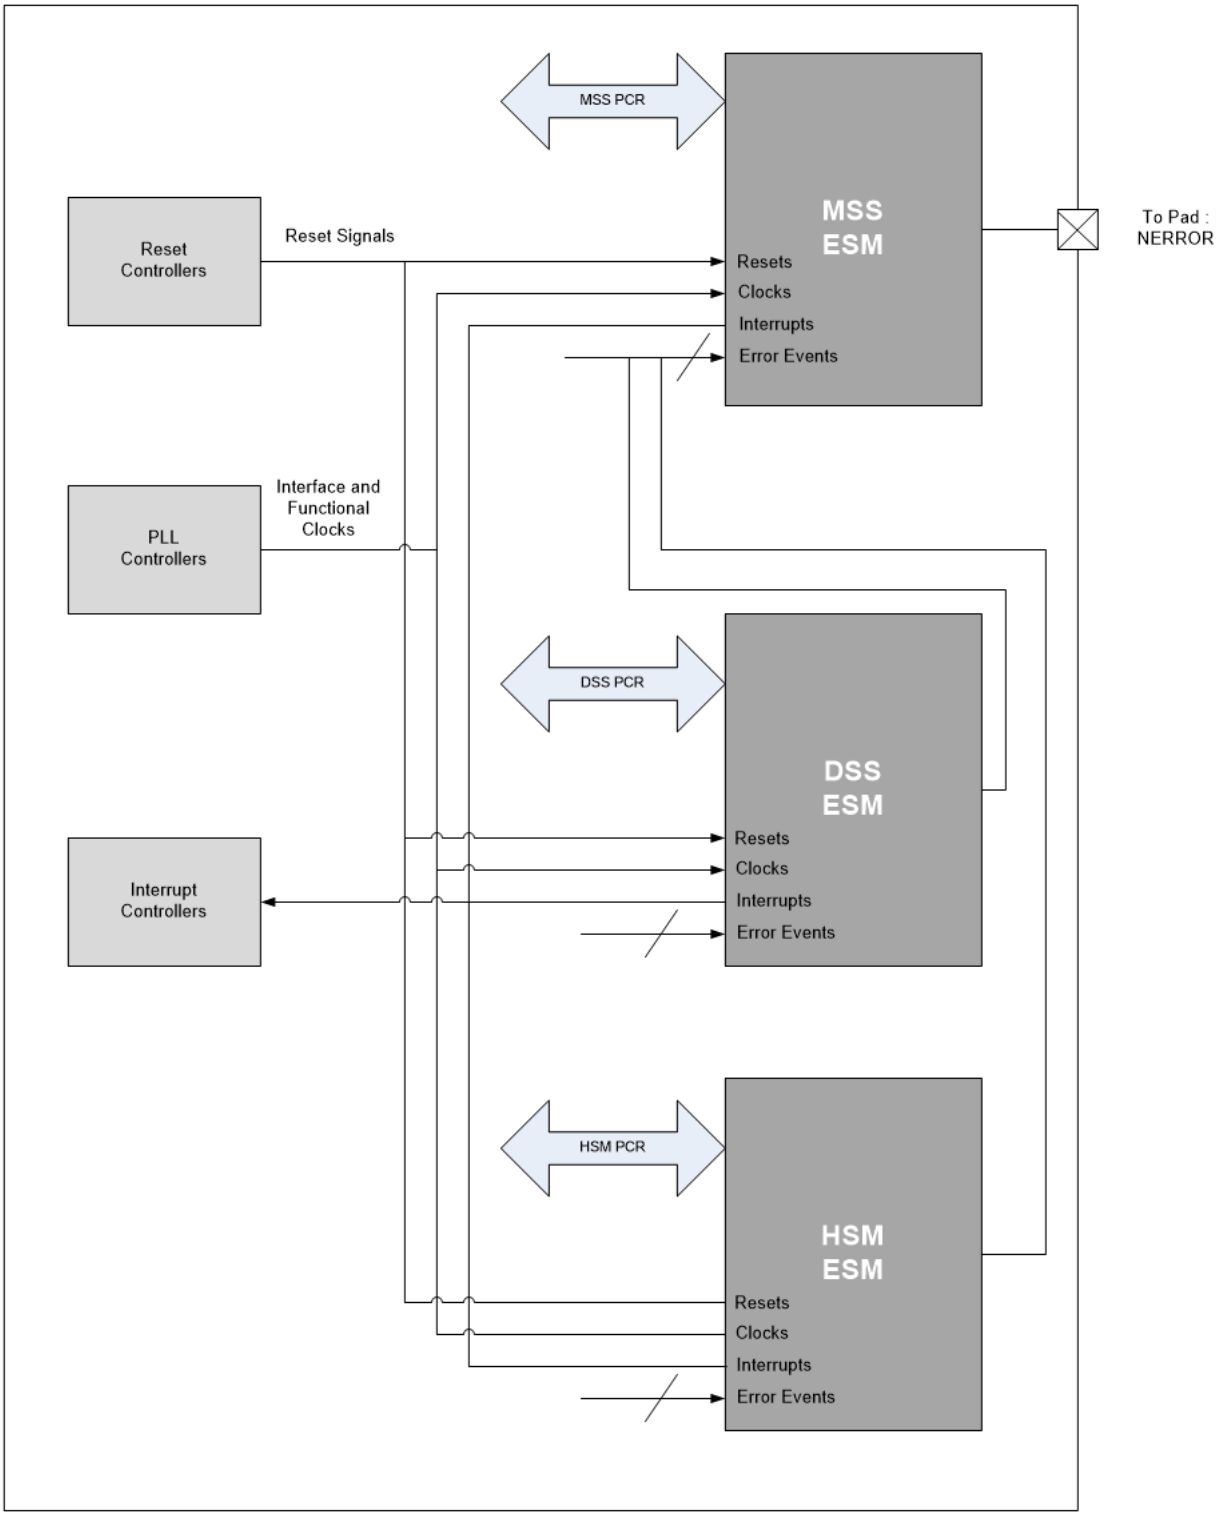

Figure 11-736. ESM Block Diagram

11.8.8.5.5 Module Operation

This device has 40 error channels (APPSS), divided into 2 different error groups. Please refer to the device datasheet for ESM channel assignment details.

The ESM module has error flags for each error channel. The error status registers ESMSR1, ESMSR4, ESMSR2, ESMSR3 provide status information on a pending error of Group1 (Channel 0-31), Group1 (Channel 32-63), Group1 (Channel 64-95), Group2, and Group3, respectively. The ESMEPSR register provides the current $\overline{\text{ERROR}}$ status. The module also provides a status shadow register, ESMSSR2, which maintains the error flags of Group2 until power-on reset ($\overline{\text{PORRST}}$) is asserted. See for details of their behavior during power on reset and warm reset.

Once an error occurs, the ESM module will set the corresponding error flags. In addition, it can trigger an interrupt, $\overline{\text{ERROR}}$ pin outputs low depending on the ESM settings. Once the $\overline{\text{ERROR}}$ pin outputs low, a power on reset or a write of 0x5 to ESMEKR is required to release the ESM error pin back to normal state. The application can read the error status registers (ESMSR1, ESMSR4, ESMSR7, ESMSR2, and ESMSR3) to debug the error. If an $\overline{\text{RST}}$ is triggered or the error interrupt has been served, the error flag of Group2 should be read from ESMSSR2 because the error flag in ESMSR2 will be cleared by $\overline{\text{RST}}$.

The functionality of the $\overline{\text{ERROR}}$ pin can be tested by forcing an error.

11.8.8.5.5.1 Reset Behavior

Power on reset:

- $\overline{\text{ERROR}}$ pin behavior

  When nPORRST is active, the $\overline{\text{ERROR}}$ pin is in a high impedance state (output drivers disabled).
- Register behavior

  After $\overline{\text{PORRST}}$, all registers in ESM module will be re-initialized to the default value. All the error status registers are cleared to zero.

Warm reset ($\overline{\text{RST}}$):

- $\overline{\text{ERROR}}$ pin behavior

  During $\overline{\text{RST}}$, the $\overline{\text{ERROR}}$ pin is in “output active” state with pull-down disabled. The $\overline{\text{ERROR}}$ pin remains unchanged after $\overline{\text{RST}}$.
- Register behavior

  After $\overline{\text{RST}}$, ESMSR1, ESMSR4, ESMSR7, ESMSSR2, ESMSR3 and ESMEPSR register values remains un-changed. Since $\overline{\text{RST}}$ does not clear the critical failure registers, the user can read those registers to debug the failures after $\overline{\text{RST}}$ pin goes back to high.

After $\overline{\text{RST}}$, if one of the flags in ESMSR1, ESMSR4 and ESMSR7 is set, the interrupt service routine will be called once the corresponding interrupt is enabled.

-

Note

ESMSR2 is cleared after $\overline{\text{RST}}$. The flag in ESMSR2 gets cleared when reading the appropriate vector in the ESMIOFFHR offset register. Reading ESMIOFFHR will not clear the ESMSR1, ESMSR4, ESMSR7 and the shadow register ESMSSR2. Reading ESMIOFFLR will also not clear the ESMSR1, ESMSR4 and ESMSR7.

11.8.8.5.5.2 $\overline{\text{ERROR}}$ Pin Timing

The $\overline{\text{ERROR}}$ pin is an active low function. The state of the pin is also readable from $\overline{\text{ERROR}}$ Pin Status Register (ESMEPSR). A warm reset ($\overline{\text{RST}}$) does not affect the state of the pin. The pin is in a high-impedance state during power-on reset. Once the ESM module drives the $\overline{\text{ERROR}}$ pin low, it remains in this state for the time specified by the Low-Time Counter Preload register (LTCPR). Based on the time period of the peripheral clock (VCLK), the total active time of the $\overline{\text{ERROR}}$ pin can be calculated as:

$$t_{\overline{ERROR}\_low} = t_{VCLK} \times (LTCP + 1) \quad (13)$$

Once this period expires, the $\overline{\text{ERROR}}$ pin is set to high in case the reset of the $\overline{\text{ERROR}}$ pin was requested. This request is done by writing an appropriate key (0x5) to the key register (ESMEKR) during the $\overline{\text{ERROR}}$ pin low time. Here are a few examples:

Example 1: ESM detects a failure and drives the $\overline{\text{ERROR}}$ pin low. No $\overline{\text{ERROR}}$ pin reset is requested. The $\overline{\text{ERROR}}$ pin continues outputting low until power on reset occurs.

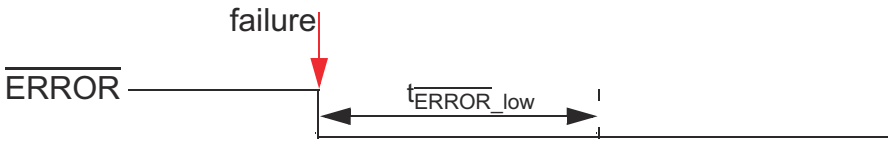

Figure 11-737. $\overline{\text{ERROR}}$ Pin Timing - Example 1

Example 2: ESM detects a failure and drives the $\overline{\text{ERROR}}$ pin low. An $\overline{\text{ERROR}}$ pin reset request is received before t $\overline{\text{ERROR}}$ _low expires. In this case, the $\overline{\text{ERROR}}$ pin is set to high immediately after t $\overline{\text{ERROR}}$ _low expires.

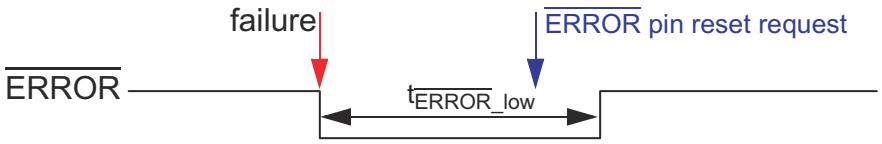

Figure 11-738. $\overline{\text{ERROR}}$ Pin Timing - Example 2

Example 3: ESM detects a failure and drives the $\overline{\text{ERROR}}$ pin low. An $\overline{\text{ERROR}}$ pin reset request is received after t $\overline{\text{ERROR}}$ _low expires. In this case, the $\overline{\text{ERROR}}$ pin is set to high immediately after $\overline{\text{ERROR}}$ pin reset request is received.

Figure 11-739. $\overline{\text{ERROR}}$ Pin Timing - Example 3

Example 4: ESM detects a failure and drives the $\overline{\text{ERROR}}$ pin low. Another failure occurs within the time the pin stays low. In this case, the low time counter will be reset when the other failure occurs. In other words, $t_{\overline{\text{ERROR}}\_low}$ should be counted from whenever the most recent failure occurs.

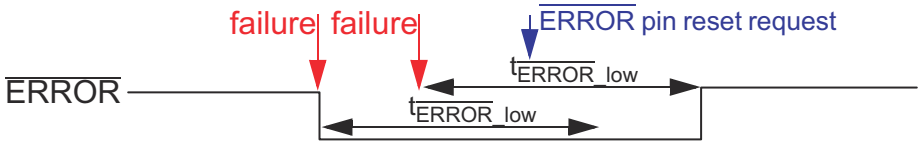

Figure 11-740. $\overline{\text{ERROR}}$ Pin Timing - Example 4

Example 5: The reset of the $\overline{\text{ERROR}}$ pin was requested by the software even before the failure occurs. In this case, the $\overline{\text{ERROR}}$ pin is set to high immediately after $t_{\overline{\text{ERROR}}\_low}$ expires. This case is not recommended and should be avoided by the application.

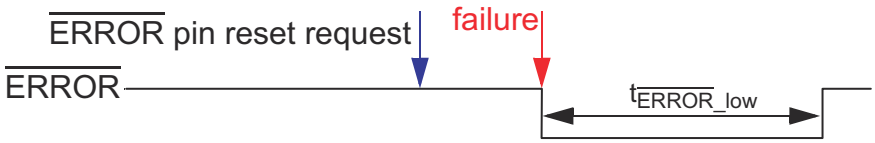

Figure 11-741. $\overline{\text{ERROR}}$ Pin Timing - Example 5

11.8.8.5.5.3 Forcing an Error Condition

The error response generation mechanism is testable by software by forcing an error condition. This allows testing the $\overline{\text{ERROR}}$ pin functionality. By writing a dedicated key to the error forcing key register (ESMEKR), the $\overline{\text{ERROR}}$ pin is set to low for the specified time. The following steps describe how to force an error condition:

1. Check $\overline{\text{ERROR}}$ Pin Status Register (ESMEPSR). This register must be 1 to switch into the error forcing mode. The ESM module cannot be switched into the error forcing mode if a failure has already been detected in functional mode. The application command to switch to error forcing mode is ignored.
2. Write “1010b” to the error forcing key register (ESMEKR). After that, the $\overline{\text{ERROR}}$ pin should output low (error force mode). Once the application puts the ESM module in the error forcing mode, the $\overline{\text{ERROR}}$ pin cannot indicate the normal error functionality. If a failure occurs during this time, it gets still latched and the LTC is reset and stopped. The error output pin is already driven low on account of the error forcing mode. When the ESM is forced back to normal functional mode, the LTC becomes active and forces the $\overline{\text{ERROR}}$ pin low until the expiration of the LTC.
3. Write “0000” to the error forcing key register (ESMEKR) back to the active normal mode. If there are no errors detected while the ESM module is in the error forcing mode, the $\overline{\text{ERROR}}$ pin goes high immediately after exiting the error forcing mode.

11.8.8.5.6 Recommended Programming Procedure

During the initialization stage, the application code should follow the recommendations in Figure 11-742 to initialize the ESM.

Once an error occurs, it can trigger an interrupt, $\overline{\text{ERROR}}$ pin outputs low depending on the ESM settings. Once the $\overline{\text{ERROR}}$ pin outputs low, a power on reset or a write of 0x5 to ESMEKR is required to release the ESM back to normal state. The application can read the error status registers (ESMSR1, ESMSR4, ESMSR7, ESMSR2, and ESMSR3) to debug the error. If an $\overline{\text{RST}}$ is triggered or the error interrupt has been served, the error flag of Group2 should be read from ESMSSR2 because the error flag in ESMSR2 will be cleared by $\overline{\text{RST}}$.

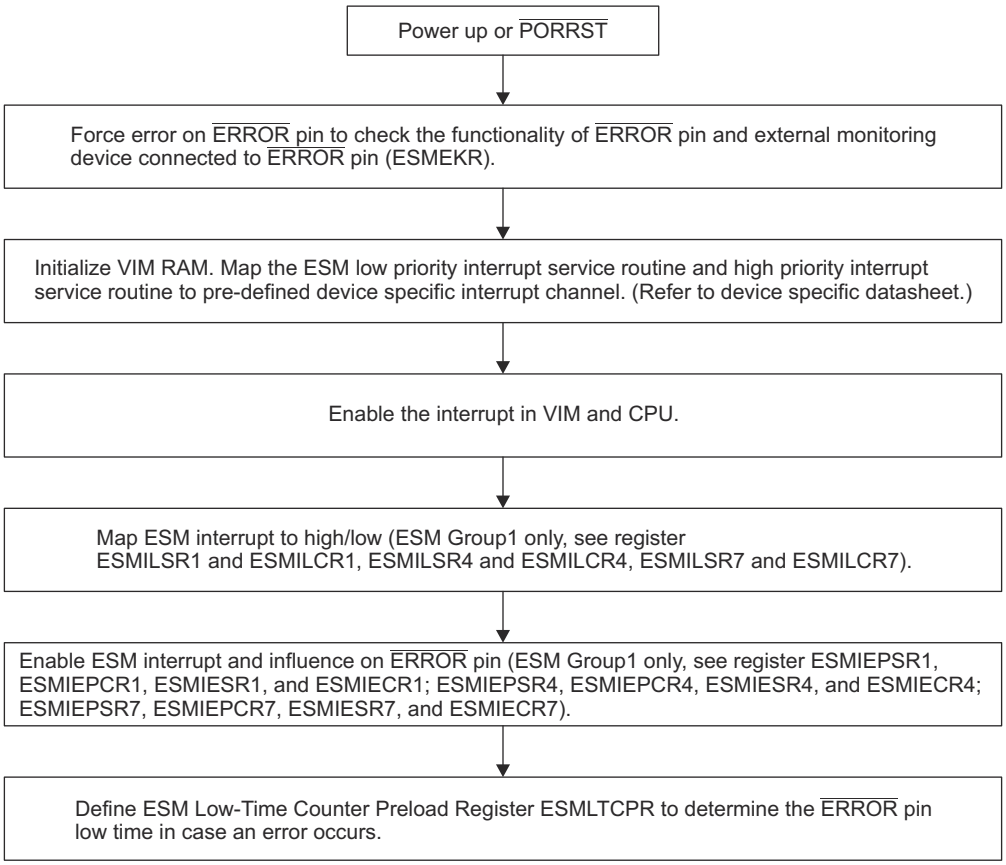

Figure 11-742. ESM Initialization

11.8.8.5.7 MSS_ESM Registers

Table 11-2206 lists the memory-mapped registers for the MSS_ESM. To determine the base address, refer to the device-specific memory map. The address locations not listed are reserved.

11.8.8.6 Cyclic Redudancy Check (CRC)

This section describes the cyclic redundancy check (CRC) controller module. Presently two CRC modules have been instantiated in the TRP1x one for MSS and another for DSS.

11.8.8.6.1 Overview

The CRC controller is a module that is used to perform CRC (Cyclic Redundancy Check) to verify the integrity of memory system. A signature representing the contents of the memory is obtained when the contents of the memory are read into CRC controller. The responsibility of CRC controller is to calculate the signature for a set of data and then compare the calculated signature value against a pre-determined good signature value. CRC controller supports two channels to perform CRC calculation on multiple memories in parallel and can be used on any memory system.

11.8.8.6.2 Features

The CRC controller offers:

- Two channels to perform background signature verification on any memory sub-system.
- Data compression on 8, 16, 32, and 64-bit data size.
- Maximum-length PSA (Parallel Signature Analysis) register constructed based on 64-bit primitive polynomial.
- Each channel has a CRC Value Register that contains the pre-determined CRC value.
- Use timed base event trigger from timer to initiate DMA data transfer.
- Programmable 20-bit pattern counter per channel to count the number of data patterns for compression.
- Three modes of operation. Auto, Semi-CPU and Full-CPU.
- For each channel, CRC can be performed either by CRC Controller or by CPU.
- Automatically perform signature verification without CPU intervention in AUTO mode.
- Generate interrupt to CPU in Semi-CPU mode to allow CPU to perform signature verification itself.
- Generate CRC fail interrupt in AUTO mode if signature verification fails.
- Generate Timeout interrupt if CRC is not performed within the time limit.
- Generate DMA request per channel to initiate CRC value transfer.

11.8.8.6.3 Block Diagram

Figure 11-773 shows a block diagram of the CRC controller.

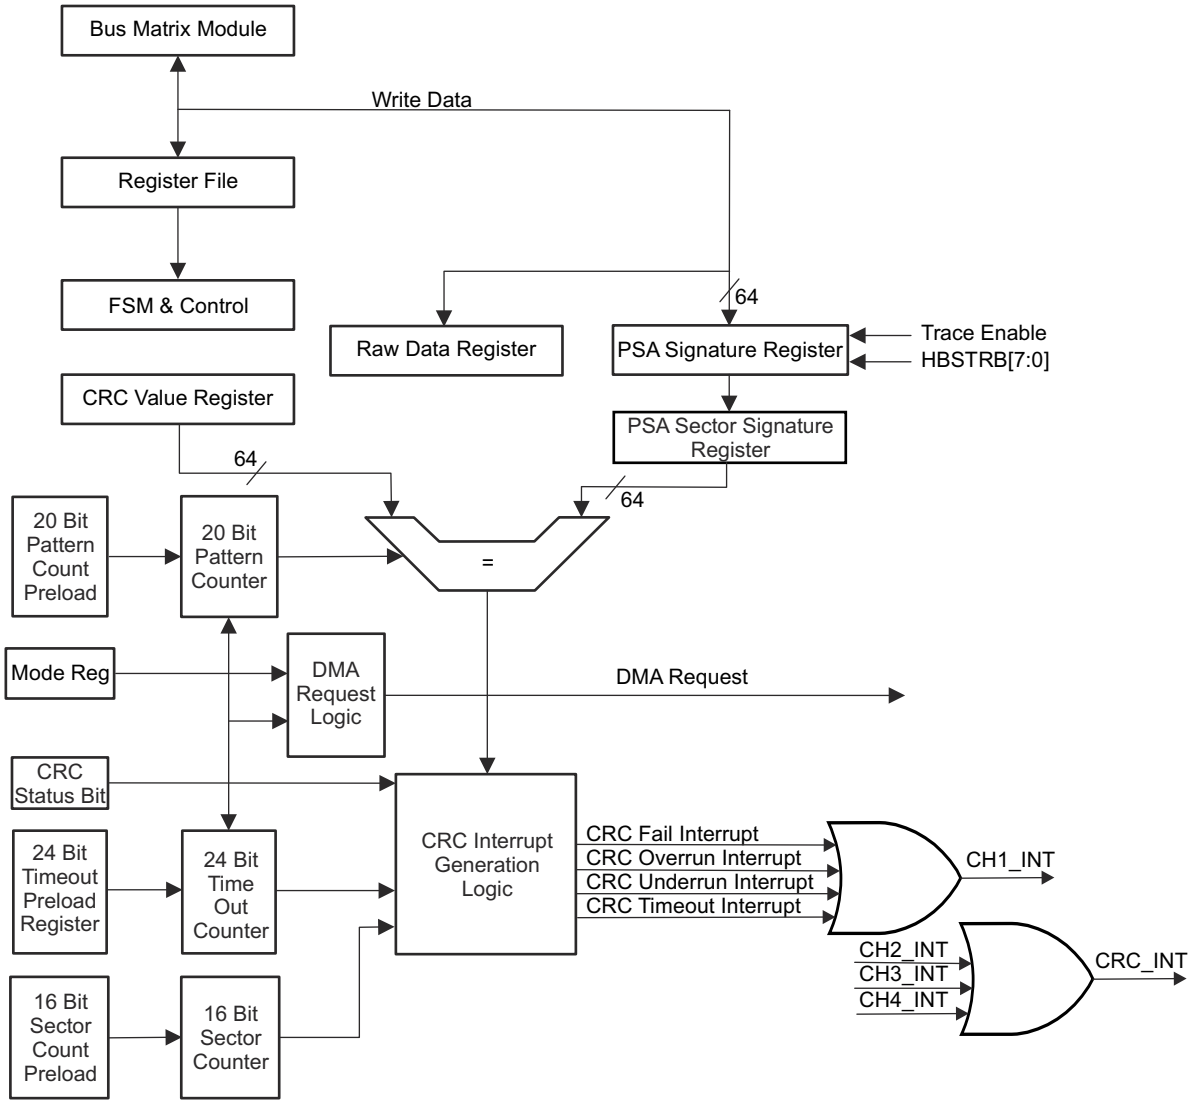

Figure 11-773. CRC Controller Block Diagram For One Channel

11.8.8.6.4 Module Operation

11.8.8.6.4.1 General Operation

There are two channels in CRC controller, and for each channel there is a memory-mapped PSA (Parallel Signature Analysis) Signature Register and a memory-mapped CRC (Cyclic Redundancy Check) Value Register. A memory can be organized into multiple sectors with each sector consisting of multiple data patterns. A data pattern can be 8-, 16-, 32-, or 64-bit data. CRC module performs the signature calculation and compares the signature to a pre-determined value. The PSA Signature Register compresses an incoming data pattern into a signature when it is written. When one sector of data patterns are written into PSA Signature Register, a final signature corresponding to the sector is obtained. CRC Value Register stores the pre-determined signature corresponding to one sector of data patterns. The calculated signature and the pre-determined signature are then compared to each other for signature verification. To minimize CPU's involvement, data patterns transfer can be carried out at the background of CPU using DMA controller. DMA is setup to transfer data from memory from which the contents to be verified to the memory mapped PSA Signature Register. When DMA transfers data to the memory mapped PSA Signature Register, a signature is generated. A programmable 20-bit data pattern counter is used for each channel to define the number of data patterns to calculate for each sector. Signature verification can be performed automatically by CRC controller in AUTO mode or by CPU itself in Semi-CPU or Full-CPU mode. In AUTO mode, a self sustained CRC signature calculation can be achieved without any CPU intervention.

11.8.8.6.4.2 CRC Modes of Operation

CRC Controller can operate in AUTO, Semi-CPU, and Full-CPU modes.

11.8.8.6.4.2.1 AUTO Mode

In AUTO mode, CRC Controller in conjunction with DMA controller can perform CRC without CPU intervention. A sustained transfer of data to both the PSA Signature Register and CRC Value Register are performed in the background of CPU. When a mismatch is detected, an interrupt is generated to CPU. A 16-bit current sector ID register is provided to identify which sector causes a CRC failure.

11.8.8.6.4.2.2 Semi-CPU Mode

In Semi-CPU mode, DMA controller is also utilized to perform data patterns transfer to PSA Signature Register. Instead of performing signature verification automatically, the CRC controller generates an compression complete interrupt to CPU after each sector is compressed. Upon responding to the interrupt the CPU performs the signature verification by reading the calculated signature stored at the PSA Sector Signature Register, and compares it to a pre-determined CRC value.

11.8.8.6.4.2.3 Full CPU Mode

In Full-CPU mode, the CPU does the data patterns transfer and signature verification all by itself. When CPU has enough throughput, it can perform data patterns transfer by reading data from the memory system to the PSA Signature Register. After certain number of data patterns are compressed, the CPU can read from the PSA Signature Register and compare the calculated signature to the pre-determined CRC signature value. In Full-CPU mode, neither interrupt nor DMA request is generated. All counters are also disabled.

11.8.8.6.4.3 PSA Signature Register

The 64-bit PSA Signature Register is based on the primitive polynomial (as in the following equation) to produce the maximum length LFSR (Linear Feedback Shift Register), as shown in Figure 11-774.

$$f(x) = x^{64} + x^4 + x^3 + x + 1 \quad (14)$$

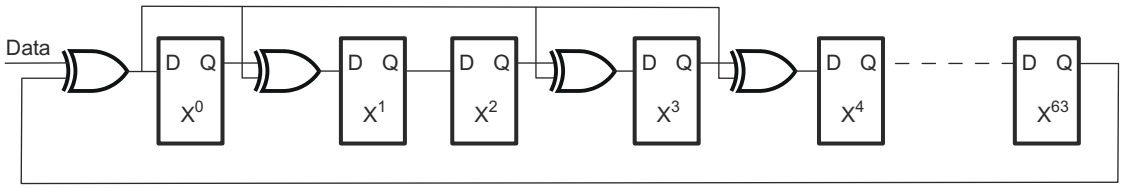

Figure 11-774. Linear Feedback Shift Register (LFSR)

The serial implementation of LFSF has a limitation that, it requires ‘n’ clock cycles to calculate the CRC values for an ‘n’ bit data stream. The idea is to produce the same CRC value operating on a multi-bit data stream, as would occur if the CRC were computed one bit at a time over the whole data stream. The algorithm involves looping to simulate the shifting, and concatenating strings to build the equations after ‘n’ shift.

The parallel CRC calculation based on the polynomial can be illustrated in the following HDL code:

```
for i in 63 to 0 loop
   NEXT_CRC_VAL(0) := CRC_VAL(63) xor DATA(i);
     for j in 1 to 63 loop
       case j is
          when 1|3|4 =>
               NEXT_CRC_VAL(j) :=
                   CRC_VAL(j - 1) xor CRC_VAL(63) xor DATA(i);
          when others =>
               NEXT_CRC_VAL(j) := CRC_VAL(j - 1);
       end case;
     end loop;
   CRC_VAL := NEXT_CRC_VAL;
end loop;
```

Note

1) The inner loop is to calculate the next value of each shift register bit after one cycle

2) The outer loop is to simulate 64 cycles of shifting. The equation for each shift register bit is thus built before it is compressed into the shift register.

3) MSB of the DATA is shifted in first

There is one PSA Signature Register per CRC channel. PSA Signature Register can be both read and written. When it is written, it can either compress the data or just capture the data depending on the state of CHx_MODE bits. If CHx_MODE=Data Capture, a seed value can be planted in the PSA Signature Register without compression. Other modes other than Data Capture will result with the data compressed by PSA Signature Register when it is written. Each channel can be planted with different seed value before compression starts. When PSA Signature Register is read, it gives the calculated signature.

CRC Controller should be used in conjunction with the on chip DMA controller to produce optimal system performance. The incoming data pattern to PSA Signature Register is typically initiated by the DMA controller. When DMA is properly setup, it would read data from the pre-determined memory system and write them to the memory mapped PSA Signature Register. Each time PSA Signature Register is written a signature is generated.

CPU itself can also perform data transfer by reading from the memory system and perform write operation to PSA Signature Register if CPU has enough throughput to handle data patterns transfer.

After system reset and when AUTO mode is enabled, CRC Controller automatically generates a DMA request to request the pre-determined CRC value corresponding to the first sector of memory to be checked.

In AUTO mode, when one sector of data patterns is compressed, the signature stored at the PSA Signature Register is first copied to the PSA Sector Signature Register and PSA Signature Register is then cleared out to all zeros. An automatic signature verification is then performed by comparing the signature stored at the PSA Sector Signature Register to the CRC Value Register. After the comparison the CRC Controller can generate a DMA request. Upon receiving the DMA request the DMA controller will update the CRC Value Register by transferring the next pre-determined signature value associated with the next sector of memory system. If the signature verification fails then CRC Controller can generate a CRC fail interrupt.

In Full-CPU mode, no DMA request and interrupt are generated at all. The number of data patterns to be compressed is determined by CPU itself. Full-CPU mode is useful when DMA controller is not available to perform background data patterns transfer. The OS can periodically generate a software interrupt to CPU and use CPU to accomplish data transfer and signature verification.

CRC Controller supports doubleword, word, half word and byte access to the PSA Signature Register. During a non-doubleword write access, all unwritten byte lanes are padded with zero’s before compression. Note that comparison between PSA Sector Signature Register and CRC Value Register is always in 64 bit because a compressed value is always expressed in 64 bit.

There is a software reset per channel for PSA Signature Register. When set, the PSA Signature Register is reset to all zeros.

PSA Signature Register is reset to zero under the following conditions:

- System reset
- PSA Software reset
- One sector of data patterns are compressed

11.8.8.6.4.4 PSA Sector Signature Register

After one sector of data is compressed, the final resulting signature calculated by PSA Signature Register is transferred to the PSA Sector Signature Register. PSA Signature Register is a read only register. During Semi-CPU mode, the host CPU should read from the PSA Sector Signature Register instead of reading from PSA Signature Register for signature verification to avoid data coherency issue. The PSA Signature Register can be updated with new signature before the host CPU is able to retrieve it.

In Semi-CPU mode, no DMA request is generated. When one sector of data patterns is compressed, CRC controller first generates a compression complete interrupt. Responding to the interrupt, CPU will in the ISR read the PSA Sector Signature Register and compare it to the known good signature or write the signature value to another memory location to build a signature file. In Semi-CPU mode, CPU must perform the signature verification in a manner to prevent any overrun condition. The overrun condition occurs when the compression complete interrupt is generated after one sector of data patterns is compressed and CPU has not read from the PSA Sector Signature Register to perform necessary signature verification before PSA Sector Signature Register is overridden with a new value. An overrun interrupt can be enable to generate when overrun condition occurs. During Semi-CPU mode, the host CPU should read from the PSA Sector Signature Register instead of reading from PSA Signature Register for signature verification to avoid data coherency issue. The PSA Signature Register can be updated with new signature before the host CPU is able to retrieve it.

11.8.8.6.4.5 CRC Value Register

Associated with each channel there is a CRC Value Register. The CRC Value Register stores the pre-determined CRC value. After one sector of data patterns is compressed by PSA Signature Register, CRC Controller can automatically compare the resulting signature stored at the PSA Sector Signature Register with the pre-determined value stored at the CRC Value Register if AUTO mode is enabled. If the signature verification fails, CRC Controller can be enabled to generate an CRC fail interrupt. When the channel is set up for Semi-CPU mode, CRC controller first generates a compression complete interrupt to CPU. Upon servicing the interrupt, CPU will then read the PSA Sector Signature Register and then read the corresponding CRC value stored at another location and compare them. CPU should not read from the CRC Value Register during Semi-CPU or Full-CPU mode because the CRC Value Register is not updated during these two modes.

In AUTO mode, for first sector's signature, DMA request is generated when mode is programmed to AUTO. For subsequent sectors, DMA request is generated after each sector is compressed. Responding to the DMA request, DMA controller reloads the CRC Value Register for the next sector of memory system to be checked.

When CRC Value Register is updated with a new CRC value, an internal flag is set to indicate that CRC Value Register contains the most current value. This flag is cleared when CRC comparison is performed. Each time at the end of the final data pattern compression of a sector, CRC Controller first checks to see if the corresponding CRC Value Register has the most current CRC value stored in it by polling the flag. If the flag is set then the CRC comparison can be performed. If the flag is not set then it means the CRC Value Register contains stale information. A CRC underrun interrupt is generated. When an underrun condition is detected, signature verification is not performed.

CRC Controller supports doubleword, word, half word and byte access to the CRC Value Register. As noted before comparison between PSA Sector Signature Register and CRC Value Register during AUTO mode is carried out in 64 bit.

11.8.8.6.4.6 Raw Data Register

The raw or un-compressed data written to the PSA Signature Register is also saved in the Raw Data Register. This register is read only.

11.8.8.6.4.7 Example DMA Controller Setup

DMA controller needs to be setup properly in either either AUTO or Semi-CPU mode as DMA controller is used to transfer data patterns. Hardware or a combination of hardware and software DMA triggering are supported.

11.8.8.6.4.7.1 AUTO Mode Using Hardware Timer Trigger

There are two DMA channels associated with each CRC channel when in AUTO mode. One DMA channel is setup to transfer data patterns from the source memory to the PSA Signature Register. The second DMA channel is setup to transfer the pre-determined signature to the CRC Value Register. The trigger source for the first DMA channel can be either by hardware or by software. As illustrated in Figure 11-775 a timer can be used to trigger a DMA request to initiate transfer from the source memory system to PSA Signature Register. In AUTO mode, CRC Controller also generates DMA request after one sector of data patterns is compressed to initiate transfer of the next CRC value corresponding to the next sector of memory. Thus a new CRC value is always updated in the CRC Value Register by DMA synchronized to each sector of memory.

A block of memory system is usually divided into many sectors. All sectors are the same size. The sector size is programmed in the CRC_PCOUNT_REGx and the number of sectors in one block is programmed in the CRC_SCOUNT_REGx of the respective channel. CRC_PCOUNT_REGx multiplies CRC_SCOUNT_REGx and multiplies transfer size of each data pattern should give the total block size in number of bytes.

The total size of the memory system to be examined is also programmed in the respective transfer count register inside DMA module. The DMA transfer count register is divided into two parts. They are element count and frame count. Note that an HW DMA request can be programmed to trigger either one frame or one entire block transfer. In Figure 11-775, an HW DMA request from a timer is used as a trigger source to initiate DMA transfer. If all two CRC channels are active in AUTO mode then a total of two DMA requests would be generated by CRC Controller.

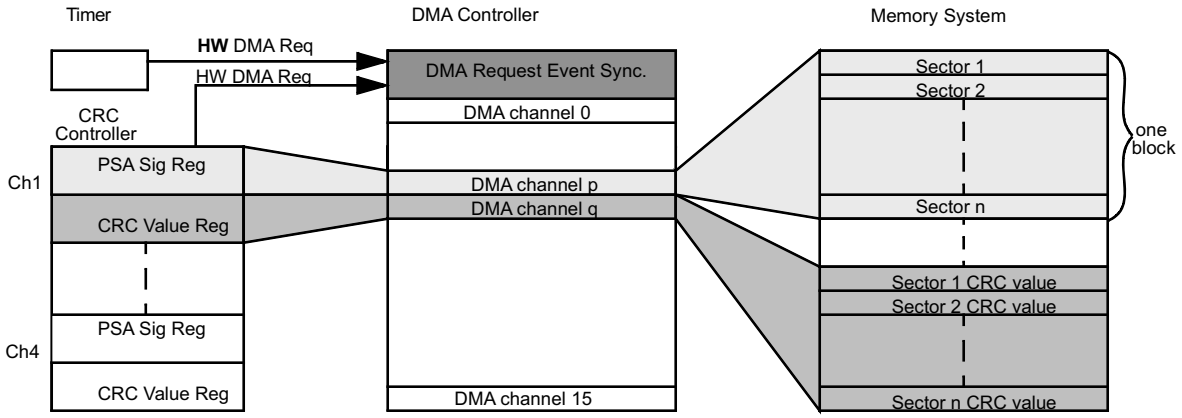

Figure 11-775. AUTO Mode Using Hardware Timer Trigger

11.8.8.6.4.7.2 AUTO Mode Using Software Trigger

The data patterns transfer can also be initiated by software. CPU can generate a software DMA request to activate the DMA channel to transfer data patterns from source memory system to the PSA Signature Register. To generate a software DMA request CPU needs to set the corresponding DMA channel in the DMA software trigger register. Note that just one software DMA request from CPU is enough to complete the entire data patterns transfer for all sectors. See Figure 11-776 for an illustration.

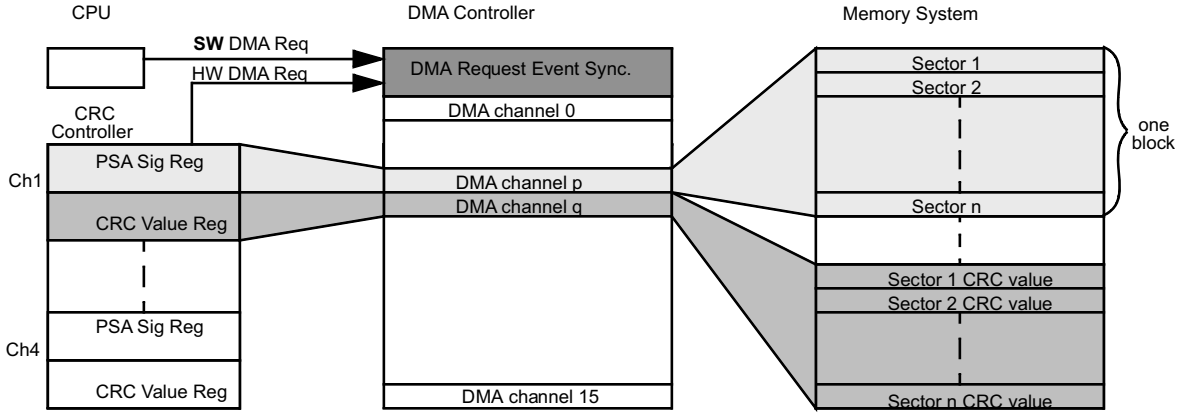

Figure 11-776. AUTO Mode With Software CPU Trigger

11.8.8.6.4.7.3 Semi-CPU Mode Using Hardware Timer Trigger

During semi-CPU mode, no DMA request is generated by CRC controller. Therefore, no DMA channel is allocated to update CRC Value Register. CPU should not read from CRC Value Register in semi-CPU mode as it contains stale value. Note that no signature verification is performed at all during this mode. Similar to AUTO mode, either by hardware or by software DMA request can be used as a trigger for data patterns transfer. Figure 11-777 illustrates the DMA setup using semi-CPU mode with hardware timer trigger.

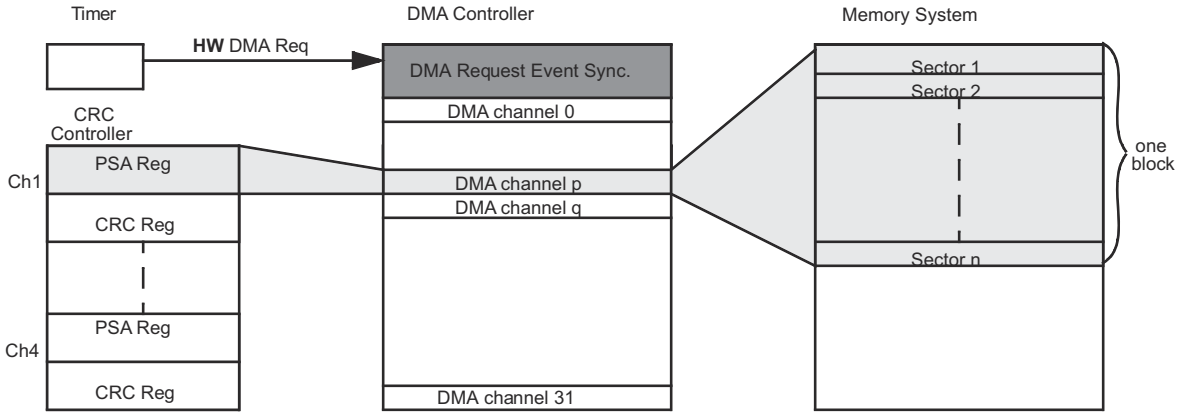

Figure 11-777. Semi-CPU Mode With Hardware Timer Trigger

Table 11-2238. CRC Modes in Which DMA Request and Counter Logic are Active or Inactive

Mode	DMA Request	Pattern Counter	Sector Counter	Timeout Counter
AUTO	Active	Active	Active	Active
Semi-CPU	Inactive	Active	Active	Active
Full-CPU	Inactive	Inactive	Inactive	Inactive

11.8.8.6.4.8 Pattern Count Register

There is a 20-bit data pattern counter for every CRC channel. The data pattern counter is a down counter and can be pre-loaded with a programmable value stored in the Pattern Count Register. When the data pattern counter reaches zero, a compression complete interrupt is generated in Semi-CPU mode and an automatic signature verification is performed in AUTO mode. In AUTO only, DMA request is generated to trigger the DMA controller to update the CRC Value Register.

Note

The data pattern count should be divisible by the total transfer count as programmed in DMA controller. The total transfer count is the product of element count and frame count.

11.8.8.6.4.9 Sector Count Register/Current Sector Register

Each channel contains a 16 bit sector counter. The sector count register stores the number of sectors. Sector counter is a free running counter and is incremented by one each time when one sector of data patterns is compressed. When the signature verification fails, the current value stored in the sector counter is saved into current sector register. If signature verification fails, CPU can read from the current sector register to identify the sector which causes the CRC mismatch. To aid and facilitate the CPU in determining the cause of a CRC failure, it is advisable to use the following equation during CRC and DMA setup:

CRC Pattern Count × CRC Sector Count = DMA Element Count × DMA Frame Count

The current sector register is frozen from being updated until both the current sector register is read and CRC fail status bit is cleared by CPU. If CPU does not respond to the CRC failure in a timely manner before another sector produces a signature verification failure, the current sector register is not updated with the new sector number. An overrun interrupt is generate instead. If current sector register is already frozen with an erroneous sector and emulation is entered with SUSPEND signal goes to high then the register still remains frozen even it is read.

In Semi-CPU mode, the current sector register is used to indicate the sector for which the compression complete has last happened.

The current sector register is reset when the PSA software reset is enabled.

Note

Both data pattern count and sector count registers must be greater than or equal to one for the counters to count. After reset, pattern count and sector count registers default to zero and the associated counters are inactive.

11.8.8.6.4.10 Interrupt

The CRC controller generates several types of interrupts per channel. Associated with each interrupt, there is an interrupt enable bit. No interrupt is generated in Full-CPU mode.

- Compression complete interrupt
- CRC fail interrupt
- Overrun interrupt
- Underrun interrupt
- Timeout interrupt

Table 11-2239. Modes in Which Interrupt Condition Can Occur

	AUTO	Semi-CPU	Full-CPU
Compression Complete	no	yes	no
CRC Fail	yes	no	no
Overrun	yes	yes	no
Underrun	yes	no	no
Timeout	yes	yes	no

11.8.8.6.4.10.1 Compression Complete Interrupt

Compression complete interrupt is generated in Semi-CPU mode only. When the data pattern counter reaches zero, the compression complete flag is set and the interrupt is generated.

11.8.8.6.4.10.2 CRC Fail Interrupt

CRC fail interrupt is generated in AUTO mode only. When the signature verification fails, the CRC fail flag is set,. CPU should take action to address the fail condition and clear the CRC fail flag after it resolves the CRC mismatch.

11.8.8.6.4.10.3 Overrun Interrupt

Overrun interrupt is generated in either AUTO or Semi-CPU mode. During AUTO mode, if a CRC fail is detected then the current sector number is recorded in the current sector register. If CRC fail status bit is not cleared and current sector register is not read by the host CPU before another CRC fail is detected for another sector then an overrun interrupt is generated. During Semi-CPU mode, when the data pattern counter finishes counting, it generates a compression complete interrupt. At the same time the signature is copied into the PSA Sector Signature Register. If the host CPU does not read the signature from PSA Sector Signature Register before it is updated again with a new signature value then an overrun interrupt is generated.

11.8.8.6.4.10.4 Underrun Interrupt

Underrun interrupt only occurs in AUTO mode. The interrupt is generated when the CRC Value Register is not updated with the corresponding signature when the data pattern counter finishes counting. During AUTO mode, CRC Controller generates DMA request to update CRC Value Register in synchronization to the corresponding sector of the memory. Signature verification is also performed if underrun condition is detected. And CRC fail interrupt is generated at the same time as the underrun interrupt.

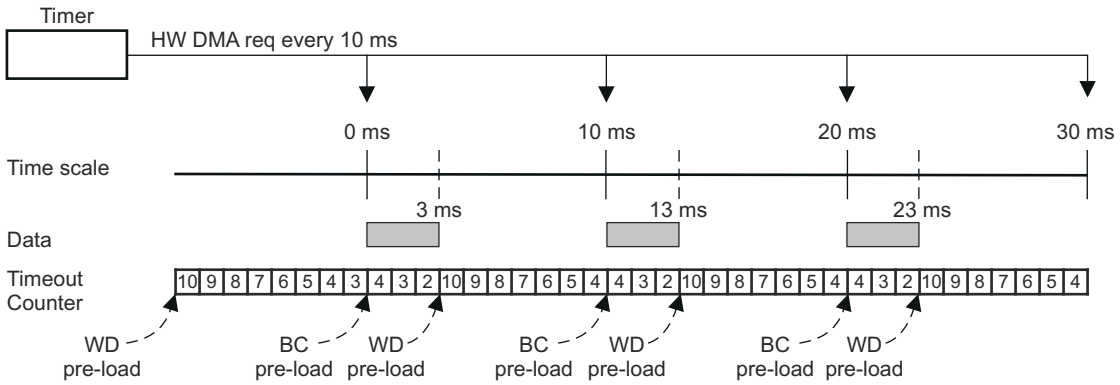
11.8.8.6.4.10.5 Timeout Interrupt

To ensure that the memory system is examined within a pre-defined time frame and no loss of incoming data there is a 24 bit timeout counter per CRC channel. The 24 bit timeout down counter can be pre-loaded with two different pre-load values, watchdog timeout pre-load value (CRC_WDTOPLDx) and block complete timeout pre-load value (CRC_BCTOPLDx). The timeout counter is clocked by a prescaler clock which is permanently running at division 64 of HCLK clock.

First pattern of data must be transferred by the DMA before the timeout counter expires, Watchdog timeout pre-load register (CRC_WDTOPLDx) is used as timeout counter. Block complete timeout pre-load register (CRC_BCTOPLDx) is used to check if one complete block of data patterns are compressed within a specific time frame. The timeout counter is first pre-loaded with CRC_WDTOPLDx after either AUTO or Semi-CPU mode is selected and starts to down count. If the timeout counter expires before DMA transfers any data pattern to PSA Signature Register then a timeout interrupt is generated. An incoming data pattern before the timeout counter expires will automatically pre-load the timeout counter with CRC_BCTOPLDx the block complete timeout pre-load value.

Block complete timeout pre-load value is used to check it one block of data patterns are compressed within a given time limit. If the timeout counter pre-loaded with CRC_BCTOPLDx value expires before one block of data patterns are compressed a timeout interrupt is generated. When one block (pattern count x sector count) of data patterns are compressed before the counter has expired, the counter is pre-loaded with CRC_WDTOPLDx value again. If the timeout counter is pre-loaded with zero then the counter is disable and no timeout interrupt is generated.

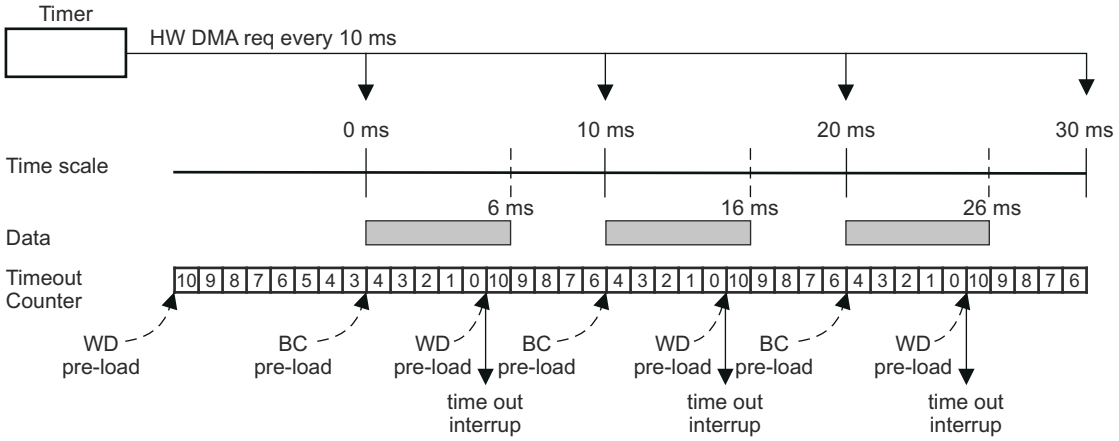
In Figure 11-778, a timer generates DMA request every 10ms to trigger one block (pattern count x sector count) transfer. Since we want to make sure that DMA does start to transfer a block every 10 ms we would set the first pre-load value to 10ms in CRC_WDTOPLDx. We also want to make sure that one block of data patterns are compressed within 4ms. With such a requirement, we would set the second pre-load value to 4ms in CRC_BCTOPLDx register.



WD pre-load = watchdog timeout pre-load (CRC_WDTOPLDx)
BC pre-load = block complete timeout pre-load (CRC_BCTOPLDx)

Note: No timeout interrupt is generated in this example since each block of data patterns are compressed in 3 ms and DMA does initiate a block transfer every 10 ms.

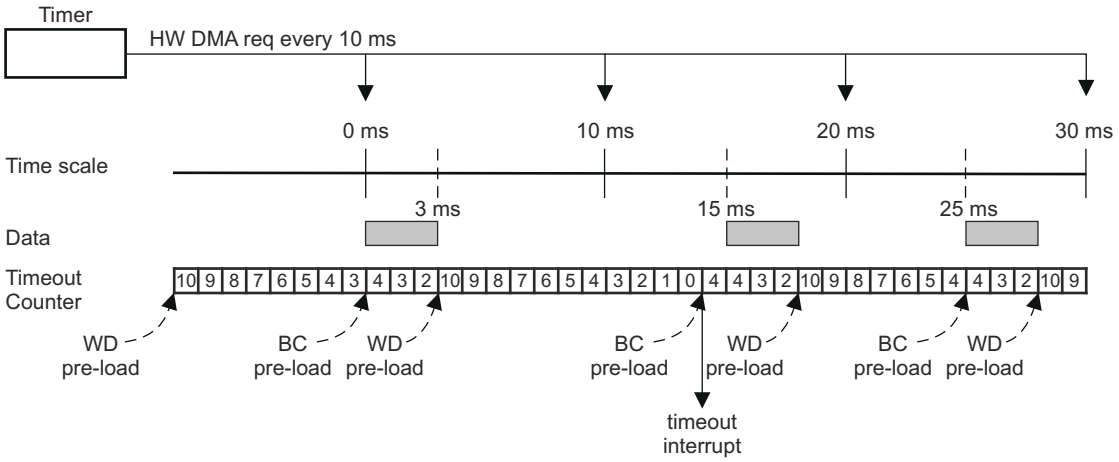
Figure 11-778. Timeout Example 1



WD pre-load = watchdog timeout pre-load (CRC_WDTOPLDx)
BC pre-load = block complete timeout pre-load (CRC_BCTOPLDx)

Note: Timeout interrupt is generated in this example since each block of data patterns are compressed in 6 ms and this is out of the 4ms time frame.

Figure 11-779. Timeout Example 2



WD pre-load = watchdog timeout pre-load (CRC_WDTOPLDx)
BC pre-load = block complete timeout pre-load (CRC_BCTOPLDx)

Note: Timeout interrupt is generated in this example since DMA can not transfer the second block of data within 10ms time limit and the reason may be that DMA is set up in fixed priority scheme and DMA is serving other higher priority channels at the time before it can service the timer request.

Figure 11-780. Timeout Example 3

11.8.8.6.4.10.6 Interrupt Offset Register

CRC Controller only generates one interrupt request to interrupt manager. A interrupt offset register is provided to indicate the source of the pending interrupt with highest priority. Table 11-2240 shows the offset interrupt vector address of each interrupt condition in an ascending order of priority.

Table 11-2240. Interrupt Offset Mapping

Offset Value	Interrupt Condition
0	Phantom
1h	Ch1 CRC Fail
2h	Ch2 CRC Fail
3h-8h	Reserved
9h	Ch1 Compression Complete
Ah	Ch2 Compression Complete
Bh-10h	Reserved
11h	Ch1 Overrun
12h	Ch2 Overrun
13h-18h	Reserved
19h	Ch1 Underrun
1Ah	Ch2 Underrun
1Bh-20h	Reserved
21h	Ch1 Timeout
22h	Ch2 Timeout
23h-24h	Reserved

11.8.8.6.4.10.7 Error Handling

When an interrupt is generated, host CPU should take appropriate actions to identify the source of error and restart the respective channel in DMA and CRC module. To restart a CRC channel, the user should perform the following steps in the ISR:

1. Write to software reset bit in CRC_CTRL register to reset the respective PSA Signature Register.
2. Reset the CHx_MODE bits to 00 in CRC_CTRL register as Data capture mode.
3. Set the CHx_MODE bits in CRC_CTRL register to desired new mode again.
4. Release software reset.

The host CPU should use byte write to restart each individual channel.

11.8.8.6.4.11 Power Down Mode

CRC module can be put into power down mode when the power down control bit PWDN is set. The module wakes up when the PWDN bit is cleared.

11.8.8.6.4.12 Emulation

A read access from a register in functional mode can sometimes trigger a certain internal event to follow. For example, reading an interrupt offset register triggers an event to clear the corresponding interrupt status flag. During emulation when SUSPEND signal is high, a read access from any register should only return the register contents to the bus and should not trigger or mask any event as it would have in functional mode. This is to prevent debugger from reading the interrupt offset register during refreshing screen and cause the corresponding interrupt status flag to get cleared. Timeout counters are stopped to generate timeout interrupts in emulation mode. No Peripheral Controller bus error should be generated if reading from the unimplemented locations.

11.8.8.6.4.13 Peripheral Bus Interface

CRC is a Peripheral target module. The register interface is similar to other peripheral modules. CRC supports following features:

- Different sizes of burst operation.
- Aligned and unaligned accesses.
- Abort is generated for any illegal address accesses.

11.8.8.6.5 Example

This section illustrates several of the ways in which the CRC Controller can be utilized to perform CRC.

11.8.8.6.5.1 Example: Auto Mode Using Time Based Event Triggering

A large memory area with 2Mbyte (256k doubleword) is to be checked in the background of CPU. CRC is to be performed every 1K byte (128 doubleword). Therefore there should be 2048 pre-recorded CRC values. For illustration purpose, we map channel 1 CRC Value Register to DMA channel 1 and channel 1 PSA Signature Register to DMA channel 2. Assume all DMA transfers are carried out in 64-bit transfer size.

11.8.8.6.5.1.1 DMA Setup

- Set up DMA channel 1 with the starting address from which the pre-determined CRC values are stored. Set up the destination address to the memory mapped channel 1 CRC Value Register. Put the source address at post increment addressing mode and put the destination address at constant addressing mode. Use ***hardware*** DMA request for channel 1 to trigger a ***frame*** transfer.
- Set up DMA channel 2 with the source address from which the contents of memory to be verified. Set up the destination address to the memory mapped channel 1 PSA Signature Register. Program the element transfer count to 128 and the frame transfer count to 2048. Put the source address at post increment addressing mode and put the destination address at constant address mode. Use ***hardware*** DMA request for channel 2 to trigger an entire ***block*** transfer.

11.8.8.6.5.1.2 Timer Setup

The timer can be any general purpose timer which is capable of generating a time-based DMA request.

- Set up timer to generate DMA request associated with DMA channel 2. For example, an OS can set up the timer to generate a DMA request every 10ms.

11.8.8.6.5.1.3 CRC Setup

- Program the pattern count to 128.
- Program the sector count to 2048.
- Enable AUTO mode and all interrupts.

After AUTO mode is selected, CRC Controller automatically generates a DMA request on channel 1. Around the same time the timer module also generates a DMA request on DMA channel 2. When the first incoming data pattern arrives at the PSA Signature Register, the CRC Controller will compress it. After some time, the DMA controller would update the CRC Value Register with a pre-determined value matching the calculated signature for the first sector of 128 64 bit data patterns. After one sector of data patterns are compressed, the CRC Controller generate a CRC fail interrupt if signature stored at the PSA Sector Signature Register does not match the CRC Value Register. CRC Controller generates a DMA request on DMA channel 1 when one sector of data patterns are compressed. This routine will continue until the entire 2Mbyte are consumed. If the timeout counter reached zero before the entire 2Mbytes are compressed a timeout interrupt is generated. After 2MBytes are transferred, the DMA can generate an interrupt to CPU. The entire operation will continue again when DMA responds to the DMA request from both the timer and CRC Controller. The CRC is performed totally without any CPU intervention.

11.8.8.6.5.2 Example: Auto Mode Without Using Time Based Triggering

A small but highly secured memory area with 1kbytes is to be checked in the background of CPU. CRC is to be performed every 1Kbytes. Therefore there is only one pre-recorded CRC value. For illustration purpose, we map channel 1 CRC Value Register to DMA channel 1 and channel 1 PSA Signature Register to DMA channel 2. Assume all transfers carried out by DMA are in 64 bit transfer size.

11.8.8.6.5.2.1 DMA Setup

- Set up DMA channel 1 with the source address from which the pre-determined CRC value is stored. Set up the destination address to the memory mapped channel 1 CRC Value Register. Put the source address at constant addressing mode and put the destination address at constant addressing mode. Use ***hardware*** DMA request for channel 1.
- Set up DMA channel 2 with the source address from which the memory area to be verified. Set up the destination address to the memory mapped channel 1 PSA Signature Register. Program the element transfer count to 128 and the frame transfer count to 1. Put the source address at post increment addressing mode and put the destination address at constant address mode. Generate a ***software*** DMA request on channel 2 after CRC has completed its setup. Enable autoinitiation for DMA channel 2.

11.8.8.6.5.2.2 CRC Setup

- Program the pattern count to 128.
- Program the sector count to 1.
- Leaving the timeout count register with the reset value of zero means no timeout interrupt is generated.
- Enable AUTO mode and all interrupts.

After AUTO mode is selected, the CRC Controller automatically generates a DMA request on channel 1. At the same time the CPU generates a ***software*** DMA request on DMA channel 2. When the first incoming data pattern arrives at the PSA Signature Register, the CRC Controller will compress it. After some time, the DMA controller would update the CRC Value Register with a pre-determined value matching the calculated signature for the first sector of 128 64 bit data patterns. After one sector of data patterns are compressed, the CRC Controller generates a CRC fail interrupt if signature stored at the PSA Sector Signature Register does not match the CRC Value Register. CRC Controller generates a DMA request on DMA channel 1 again after one sector is compressed. After 1kbytes are transferred, the DMA can generate an interrupt to CPU. Responding to the DMA interrupt CPU can restart the CRC routine by generating a software DMA request onto channel 2 again.

11.8.8.6.5.3 Example: Semi-CPU Mode

If DMA controller is available in a system, the CRC module can also operate in semi-CPU mode. This means that CPU can still make use of the DMA to perform data patterns transfer to CRC controller in the background. The difference between semi-CPU mode and AUTO mode is that CRC controller does not automatically perform

the signature verification. CRC controllers generates a compression complete interrupt to CPU when the one sector of data patterns are compressed. CPU needs to perform the signature verification itself.

A memory area with 2Mbyte is to be verified with the help of the CPU. CRC operation is to be performed every 1K byte. Since there are 2Mbyte (256k doublewords) of memory to be check and we want to perform a CRC every 1Kbyte (128 doublewords) and therefore there should be 2048 pre-recorded CRC values. In Semi-CPU mode, the CRC Value Register is not updated and contains indeterminate data.

11.8.8.6.5.3.1 DMA Setup

Set up DMA channel 1 with the source address from which the memory area to be verified are mapped. Set up the destination address to the memory mapped channel 1 PSA Signature Register. Put the starting address at post increment addressing mode and put the destination address at constant address mode. Use hardware DMA request to trigger an entire block transfer for channel 1. Disable autoinitiation for DMA channel 1.

11.8.8.6.5.3.2 Timer Setup

The timer can be any general purpose timer which is capable of generating a time based DMA request.

Set up timer to generate DMA request associated with DMA channel 1. For example, an OS can set up the timer to generate a DMA request every 10ms.

11.8.8.6.5.3.3 CRC Setup

- Program the pattern count to 128.
- Program the sector count to 2048.
- Enable Semi-CPU mode and enable all interrupts.

The timer module first generates a DMA request on DMA channel 1 when it is enabled. When the first incoming data pattern arrives at the PSA Signature Register, the CRC controller will compress it. After one sector of data patterns are compressed, the CRC controller generate a compression complete interrupt. Upon responding to the interrupt the CPU would read from the PSA Sector Signature Register. It is up to the CPU on how to deal with the PSA value just read. It can compare it to a known signature value or it can write it to another memory location to build a signature file or even transfer the signature out of the device via SCI or SPI. This routine will continue until the entire 2Mbyte are consumed. The latency of the interrupt response from CPU can cause overrun condition. If CPU does not read from PSA Sector Signature Register before the PSA value is overridden with the signature of the next sector of memory, an overrun interrupt will be generated by CRC controller.

11.8.8.6.5.4 Example: Full-CPU Mode

In a system without the availability of DMA controller, the CRC routine can be operated by CPU provided the CPU has enough throughput. CPU needs to read from the memory area from which CRC is to be performed.

A memory area with 2Mbyte is to be checked with the help of the CPU. CRC verification is to be performed every 1K byte. In CPU mode, the CRC Value Register is not updated and contains indeterminate data.

11.8.8.6.5.4.1 CRC Setup

- All control registers can be left in their reset state. Only enable Full-CPU mode.

CPU itself reads from the memory and write the data to the PSA Signature Register inside CRC Controller. When the first incoming data pattern arrives at the PSA Signature Register, the CRC Controller will compress it. After ***2MBytes*** data patterns are compressed, CPU can read from the PSA Signature Register. It is up to the CPU on how to deal with the PSA signature value just read. It can compare it to a known signature value stored at another memory location.

11.8.8.6.6 MSS_MCRC Registers

Table 11-2241 lists the PCR_generated_memory_map registers. All register offset addresses not listed in Table 11-2241 should be considered as reserved locations and the register contents should not be modified.

11.8.8.7.2 STC Overview

The enhanced Self-Test Controller (STC) is used to test logic cores based on the On-Product Multiple Input Signature Register (OPMISR) scan compression architecture.

Software-based self-test programs for the cores are available, but offer less test coverage. Due to the complexity of the soft cores, the coverage required can be difficult to achieve and will result in a larger program size.

For these complex cores, on-chip logic BIST support for the self-test is preferred.

The main features of the STC include:

- Implements the OPMISR controller, along with the on-chip self-test controller for the synthesizable module logic, which enables high test coverage.
- The self-test controller facilitates complete isolation of the logical segment under the test from the rest of the system during the self-test run. Configure critical control signals in the initiator and target ports of the logical segment under the test to a safe state.
- The self-tested CPU core initiator bus transaction signals are configured to be in idle mode during the self-test run.

- Time-out counter for the self-test run as a fail-safe feature.
- Can capture power reduction using dead cycles before and after the capture pulse.
- Coverage improvements technique – ROM inverse access mode. In this, the patterns are read in a reverse order from ROM and applied to the UUT. Pattern randomization due to this approach results in coverage improvement, without an increase in the number of patterns. Corresponding INV_MISR is also stored in the ROM.

A self test segment corresponds to a portion of discreet safety-critical logic which can be tested in isolation from the rest of the system by the self test controller and OPMISR logic.

11.8.8.7.2.1 OPMISR Concept

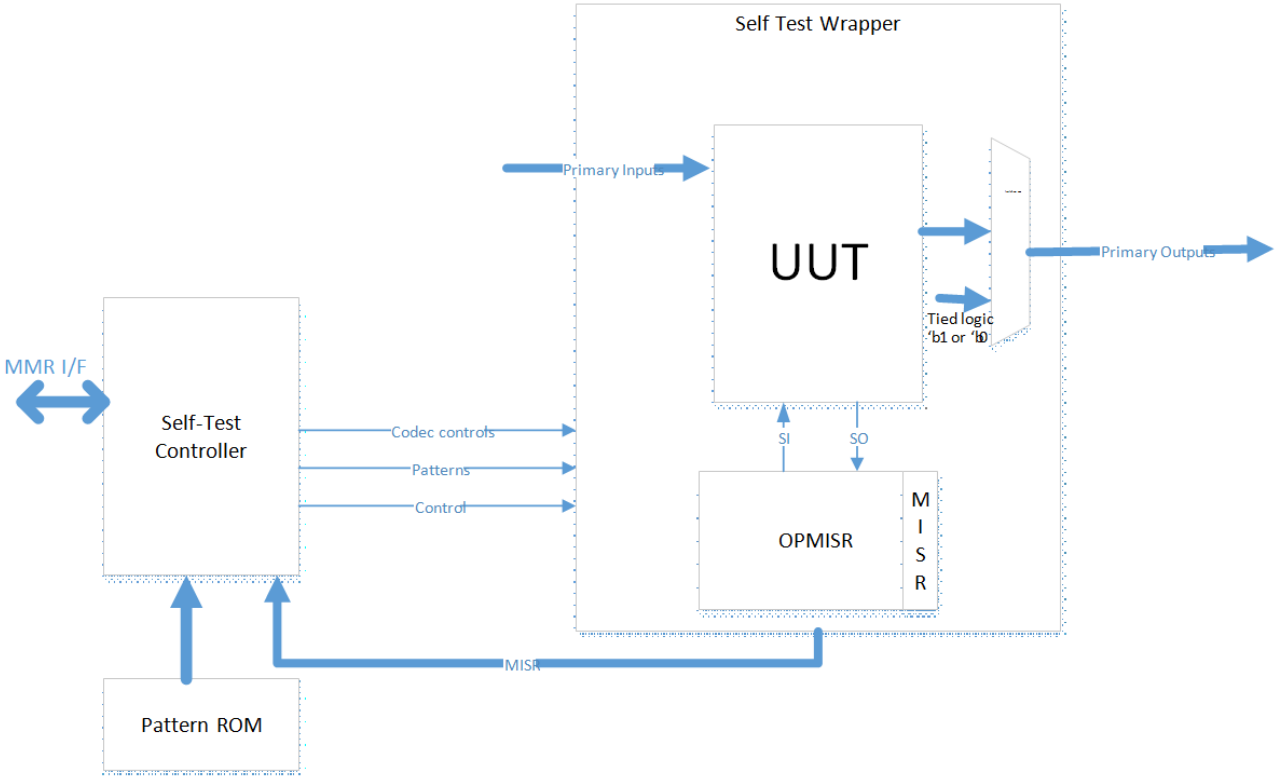

Figure 11-843. OPMISR Conceptual Diagram

The On-Product Multiple-Input Signature Register (OPMISR) is a methodology which moves the test pattern generation on-chip. Logic BIST is implemented on functional partitions (BIST'ed COREs) that are speed-critical and have high gate count. A conceptual diagram of OPMISR implementation is shown in Figure 11-843.

The MISR test structure modifies the typical fullscan scan chain such that each scan data input internally drives many chains. These chains feed to the inserted MISR structure. The chain's values are captured into the MISR during shift, generating a resulting signature that can be shifted out.

A given Unit Under Test (UUT) is scan-inserted, and the scan chains are hooked to the OPMISR logic. The self-test wrapper created around the UUT and the OPMISR logic includes the isolation muxes for the output ports of the core, to ensure that the core and UUT are isolated from the rest of the system during the self-test.

11.8.8.7.3 Block Diagram

The STC module is composed of following blocks:

- ROM interface

- FSM and sequence control
- Register file
- STC bypass / ATE interface
- Peripheral bus interface (VBUSP interface)

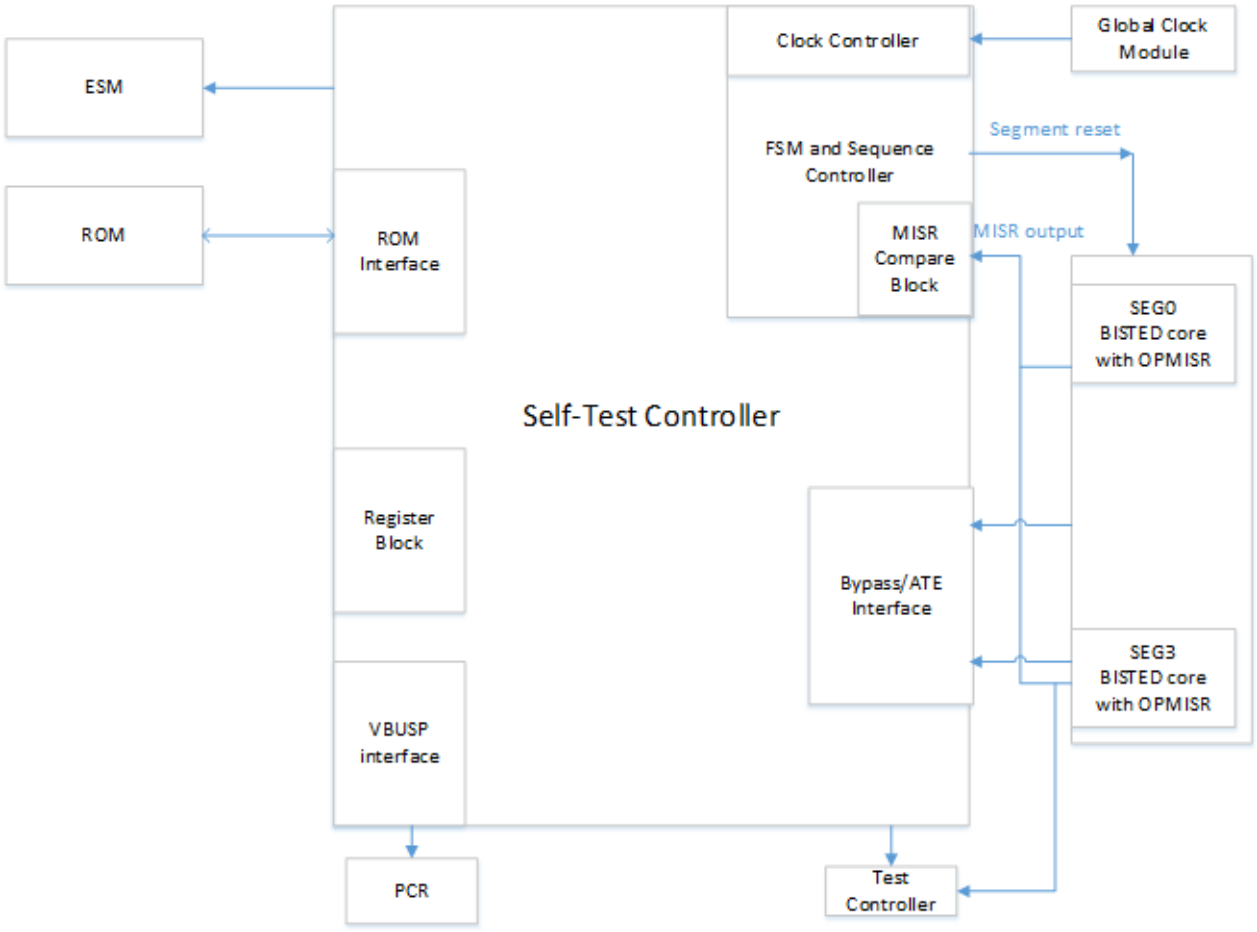

Figure 11-844. Block Diagram for STC With Multiple Segments

11.8.8.7.4 Module Description

11.8.8.7.4.1 ROM Interface

This block handles the ROM address and control signal generation to read the self-test microcode from the ROM. The test microcode, patterns, and golden signature value for each interval is stored in ROM.

Detailed information of the ROM microcode is available at ROM.

11.8.8.7.4.2 FSM and Sequence Control

This block generates the signals and data to OPMISR controller based on the test type and scan chain depth. The sequence of operation per interval is defined in Section 11.8.8.7.4.6.

11.8.8.7.4.2.1 Clock Control

The CLOCK CNTRL sub-block handles the clock selection and clock generation for ROM, OPMISR controller, and BIST'ed CORE clocks.

11.8.8.7.4.2.2 MISR Compare Block

At the end of the each self-test interval, an 896-bit MISR value from the OPMISR controller is shifted into NSTC. This is compared with the MISR_GOLDEN value, which is copied into a buffered register before the start of the interval. The result is updated into the status registers.

11.8.8.7.4.3 Register Block

This block implements the user-programmable control registers that determine when to start a self test, at what clock frequency the scan test should be performed, which segment to be selected for the test, how many pattern intervals to be completed before stopping, and so forth.

The register block also captures various status information of the self test for the user.

11.8.8.7.4.4 STC Bypass / ATE Interface

This is a production test interface. This section bypasses the self-test FSM. The OPMISR signal interface is brought out directly to the module ports, and these are accessible to the ATE (tester) at the device level using the test controller module. The intent of the block is to provide capability for fault isolation for parts failing the logic self test run.

This block receives two sets of signals; one from the device test controller, and another similar set from the self-test FSM (test sequencer). The bypass indicator signal is used to select one of the two sets of signals to be routed to the OPMISR controller.

11.8.8.7.4.5 VBUSP Interface

The control and the status registers of the STC module can be accessed through the VBUSP interface. During application programming, configuration registers are programmed through the peripheral interface, to enable and run the self-test controller.

The ROM contains the data to be processed by STC for the self-test run. This includes the control fields such as Segment ID, Pattern Count, and Golden MISR value for the STC, and the pattern scan data for the OPMISR controller.

The ROM space is divided into chunks, with each chunk containing the data corresponding to one OPMISR interval. The size required for an interval varies depending on the number patterns packed into the interval and the length of internal scan chains required.

Because each interval requires 64 rows of ROM for storing control and Golden MISR values, minimizing the number of intervals by packing more patterns into each interval provides the best ROM size. This works best if

the self-test must be run only as a part of the boot-up sequence. However, if the self-test is performed during application IDLE time, the number of patterns that can be packed into each interval will be dictated by the IDLE time available for the self-test, because an interval is the smallest granularity of a self-test run.

Details of the ROM image micro-code fields are given in the following sections.

11.8.8.7.4.7.1 TR_T: Transition Delay Methodology Type

This specifies the transition delay methodology for the current transition delay interval.

0	Launch-on-System-Clock

11.8.8.7.4.7.2 FT: Fault Model for the BIST Run

This specifies the fault model for the current interval of the test.

0	Stuck-at

11.8.8.7.4.7.3 SEG_ID[1:0]

This indicates which logical segment is selected for the associated interval during the self-test run.

SEG_SEL[1:0]	Segment Under Test
00	Segment 0
01	Segment 1
10	Segment 2
11	Segment 3

11.8.8.7.4.7.4 Pattern Count (patt_count[9:0])

This specifies the number of scan data patterns within a self-test interval. The pattern counts can vary from a minimum of 2 to a maximum of 1024.

patt_count[9:0]	Patterns per Interval
00_0000_0000	Not a valid interval [defaults to 2 patterns per interval]
00_0000_0001	2 patterns per interval
00_0000_0010	3 patterns per interval
...	...
11_1111_1110	1023 patterns per interval
11_1111_1111	1024 patterns per interval

11.8.8.7.4.7.5 MISR_GOLDEN[895:0]: Golden Signature Data Bits

This part of ROM contains the golden signature data of the current interval. This value is used to compare with the actual MISR value, when ST_GCR1.ROM_ACCESS_INV=0 and ST_GCR1.LP_SCAN_MODE=0, to generate the pass/fail information of the interval.

11.8.8.7.4.7.6 LP_MISR_GOLDEN[895:0]: Low Power Mode Golden Signature Data Bits

This part of ROM contains the LP golden signature data of the current interval. This value is used to compare with the actual MISR value, when STCGCR1.ROM_ACCESS_INV=0 and STCGCR1.LP_SCAN_MODE=1, to generate the pass/fail information of the interval.

11.8.8.7.4.7.7 INV_MISR_GOLDEN[895:0]: Inverse Mode Golden Signature Data Bits

This part of ROM contains the inverse mode golden signature data of the current interval. This value is used to compare with the actual MISR value, when STCGCR1.ROM_ACCESS_INV=1 and STCGCR1.LP_SCAN_MODE=0, to generate the pass/fail information of the interval.

11.8.8.7.4.7.8 LP_INV_MISR_GOLDEN[895:0]: Low Power Inverse Mode Golden Signature Data Bits

This part of ROM contains the low-power inverse mode golden signature data of the current interval. This value is used to compare with the actual MISR value, when STCGCR1.ROM_ACCESS_INV=1 and STCGCR1.LP_SCAN_MODE=1, to generate the pass/fail information of the interval.

11.8.8.7.4.7.9 Pn_SDm[7:0] (n - no. of patterns, m - scan chain length): OP-MISR Scan Data

This part of the ROM contains the scan data corresponding to each pattern. Each interval can have n number of scan patterns, as defined in the patt_count field. The number of 7bits of scan data in a pattern is equal to the length of the scan chain formed inside the UUT.

11.8.8.7.5 STC Registers

Table 11-2306 lists the memory-mapped registers for the STC registers. All register offset addresses not listed in Table 11-2306 should be considered as reserved locations and the register contents should not be modified.

Complex bit access types are encoded to fit into small table cells. Table 11-2307 shows the codes that are used for access types in this section.

Table 11-2307. STC Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

11.8.8.7.5.1 STCGCR0 Register (Offset = 0h) [Reset = 00000000h]

STCGCR0 is shown in Table 11-2308.

Return to the Summary Table.

Self test Global control Reg0. *NOT BYTE ACCESSIBLE

Table 11-2308. STCGCR0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	INTCOUNT_B16	R/W	0h	Number of intervals of the self test run (RWP - Read, Priviledge Mode Write only) Count of intervals that need to be covered for a specific selftest run. The selftest controller sends out “complete” indication once it runs all of the intervals programmed in this field. INTCOUNT_B 16= 0 is an invalid configuration for a selftest.
15-11	NU0	R	0h	Reserved bits
10-8	CAP_IDLE_CYCLE	R/W	0h	Idle cycles before and after capture clock (RWP - Read, Priviledge Mode Write only) Idle Cycles before and after capture clock. This value is used to insert that many idle cycles in the Capture phase. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
7-5	SCANEN_HIGH_CAP_IDLE_CYCLE	R/W	0h	Idle cycles before and after capture clock (RWP - Read, Priviledge Mode Write only). *NOT BYTE ACCESSIBLE Idle Cycles between scan_en going high to func_clk_en generation and scan_en going high to misr_log_en generation. This value is used to insert that many idle cycles in the shift clock (scan_en going high to func_clk_en generation) and misr_log_clk (scan_en going high to misr_log_en generation) generation. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
4-2	NU1	R	0h	Reserved bits
1-0	RS_CNT_B1	R/W	0h	Restart/Continue or preload (RWP - Read, Priviledge Mode Write only) This bit specifies the selftest controller whether to continue the run from next interval onwards, restart from ROM address 0 or preload from a prescribed interval. This bit gets reset after the completion of selftest run. 00 = Continue NSTC run from previous interval 01 = Restart NSTC run from ROM address 0 1X = Start from segment number specified in STC_SEGPLR register

11.8.8.7.5.2 STCGCR1 Register (Offset = 4h) [Reset = 00000000h]

STCGCR1 is shown in Table 11-2309.

Return to the Summary Table.

Self test Global control Reg1

Table 11-2309. STCGCR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	NU2	R	0h	Reserved bits
11-8	SEG0_CORE_SEL	R/W	0h	Selects the Segment 0 CORE for self test (RWP - Read, Priviledge Mode Write only) Select the Segment 0 CORE for Self -Test 0001 = Select CORE for selftest Other = CORE not selected.
7	NU3	R	0h	Reserved bits
6	CODEC_SPREAD_MODE	R/W	0h	Codec Spread Mode control signal (RWP - Read, Priviledge Mode Write only) This bit is used to configure the codec in spread / X-OR mode. 1 = Spread mode 0 = XOR mode
5	LP_SCAN_MODE	R/W	0h	LP scan mode (RWP - Read, Priviledge Mode Write only) This bit is used to decide the scan configuration: 1 = Operates in Low Power Scan Mode. 0 = Operates in Normal Scan Mode.
4	ROM_ACCESS_INV	R/W	0h	Rom access inversion mode (RWP - Read, Priviledge Mode Write only) - NOT SUPPORTED
3-0	ST_ENA_B4	R/W	0h	Self test enable key (RWP - Read, Priviledge Mode Write only) 1010 = Self test run enabled All values other than 1010 = Self test run disabled

11.8.8.7.5.3 STCTPR Register (Offset = 8h) [Reset = 00000000h]

STCTPR is shown in Table 11-2310.

Return to the Summary Table.

Time out counter preload register

Table 11-2310. STCTPR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TO_PRELOAD	R/W	0h	Self test time out preload (RWP - Read, Priviledge Mode Write only) This register contains the total number of STC clock cycles it will take before a self-test timeout error will be triggered after the initiation of the self-test run. This is a fail safe feature to avoid system hang-up situation on account of any run away self test issues. This register should be loaded with a meaningful count value for this feature to be effective. This register value (preload count value) gets loaded into the self test timeout down counter whenever a self test run is initiated (ST_ENA is enabled). and gets disabled on completion of a self test run.

11.8.8.7.5.4 STC_CADDR Register (Offset = Ch) [Reset = 00000000h]

STC_CADDR is shown in Table 11-2311.

Return to the Summary Table.

Current Address register for CORE1

Table 11-2311. STC_CADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ADDR	R	0h	Current ROM Address for CORE1 This register reflects the current ROM address (for micro code load) accessed during selftest for CORE1 in of case segment0 and all the remaining segmentsn where n = 1 to 3).

11.8.8.7.5.5 STCCICR Register (Offset = 10h) [Reset = 00000000h]

STCCICR is shown in Table 11-2312.

Return to the Summary Table.

Current Interval count register

Table 11-2312. STCCICR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	CORE2_ICOUNT	R	0h	Specifies the last interval number for CORE2 This specifies the Last executed Interval number for CORE2 of Segment0 if self test is being executed for secondary core as well. This field is applicable only for Segment 0.
15-0	CORE1_ICOUNT	R	0h	Specifies the last interval number for CORE1 This specifies the Last executed Interval number of a self-test run.

11.8.8.7.5.6 STCGSTAT Register (Offset = 14h) [Reset = 00000000h]

STCGSTAT is shown in Table 11-2313.

Return to the Summary Table.

Global Status Register

Table 11-2313. STCGSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	NU4	R	0h	Reserved bits
11-8	ST_ACTIVE	R	0h	Tells whether self test is currently active or not. 1010 = Self test is active Others = SelfTest is not active Once the self-test completes and ST_ENA_B 4 key is cleared, this field will reflect the inactive value.
7-2	NU5	R	0h	Reserved bits
1	TEST_FAIL	R	0h	Test_fail flag (RCP - Read, Clear on Writing in Priviledge Mode) 0 = Self test run has not failed 1 = SelfTest run has failed. Write Clear.
0	TEST_DONE	R	0h	Test_done_flag (RCP - Read, Clear on Writing in Priviledge Mode) 0 = Not completed 1 = SelfTest run Completed

11.8.8.7.5.7 STCFSTAT Register (Offset = 18h) [Reset = 00000000h]

STCFSTAT is shown in Table 11-2314.

Return to the Summary Table.

Fail Status Register

Table 11-2314. STCFSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	NU6	R	0h	Reserved bits
4-3	FSEG_ID	R	0h	Failed Segment ID (RCP - Read, Clear on Writing in Priviledge Mode) This field captures the Segment number for which any of the failures like TO_ER_B 1, CPU 1_FAIL_B 1 and CPU 2_FAIL_B 1 occur. 00 = Failure on Segment 0 01 = Failure on Segment 1 10 = Failure on Segment 2 11 = Failure on Segment 3
2	TO_ER_B1	R	0h	Tells whether self test failed because of time out error (RCP - Read, Clear on Writing in Priviledge Mode) 0 = No time out error occurred 1 = SelfTest run failed due to a timeout error
1	CPU2_FAIL_B1	R	0h	Tells whether MISR mismatch happenned in CORE 2 when in Segment 0 mode (RCP - Read, Clear on Writing in Priviledge Mode) 0 = No MISR mismatch for CORE 2 1 = Self test run failed due to MISR mismatch for CORE 2
0	CPU1_FAIL_B1	R	0h	Tells whether MISR mismatch happenned in CORE 1 (RCP - Read, Clear on Writing in Priviledge Mode) Applicable to all segments. 0 = No MISR mismatch for CORE 1 1 = Self test run failed due to MISR mismatch for CORE 1

11.8.8.7.5.8 STCSCSCR Register (Offset = 1Ch) [Reset = 00000000h]

STCSCSCR is shown in Table 11-2315.

Return to the Summary Table.

Signature compare Self Check Register

Table 11-2315. STCSCSCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	NU7	R	0h	Reserved bits
4	FAULT_INS_B1	R/W	0h	Fault Insertion bit (RWP - Read, Priviledge Mode Write only) 0 = No fault insertion. 1 = Inserts fault in the logic unedr test which will make signature compare fail. This feature is used as diagnostic check of the STC IP.
3-0	SELF_CHECK_KEY_B4	R/W	0h	Signature compare logic self check key enable/disable (RWP - Read, Priviledge Mode Write only) 1010 = Signature compare logic Self Check is enabled All values other than 1010 = Signature compare logic Self Check is disabled

11.8.8.7.5.9 STC_CADDR2 Register (Offset = 20h) [Reset = 00000000h]

STC_CADDR2 is shown in Table 11-2316.

Return to the Summary Table.

Current Address register for CORE2

Table 11-2316. STC_CADDR2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ADDR	R	0h	Current ROM Address for CORE2 This register reflects the current ROM address(for micro code load) accessed during selftest for CORE2 in of case segment0.

11.8.8.7.5.10 STC_CLKDIV Register (Offset = 24h) [Reset = 00000000h]

STC_CLKDIV is shown in Table 11-2317.

Return to the Summary Table.

Clock Divider Register

Table 11-2317. STC_CLKDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	NU8	R	0h	Reserved bits
26-24	CLKDIV0	R/W	0h	Clock division for Seg0 (RWP - Read, Priviledge Mode Write only) *NOT SUPPORTED X = Division ratio is X+1 for Segment 0
23-19	NU9	R	0h	Reserved bits
18-16	CLKDIV1	R/W	0h	Clock division for Seg1 (RWP - Read, Priviledge Mode Write only) *NOT SUPPORTED X = Division ratio is X+1 for Segment 1
15-11	NU10	R	0h	Reserved bits
10-8	CLKDIV2	R/W	0h	Clock division for Seg2 (RWP - Read, Priviledge Mode Write only) *NOT SUPPORTED X = Division ratio is X+1 for Segment 2
7-3	NU11	R	0h	Reserved bits
2-0	CLKDIV3	R/W	0h	Clock division for Seg3 (RWP - Read, Priviledge Mode Write only) *NOT SUPPORTED X = Division ratio is X+1 for Segment 3

11.8.8.7.5.11 STC_SEGPLR Register (Offset = 28h) [Reset = 00000000h]

STC_SEGPLR is shown in Table 11-2318.

Return to the Summary Table.

Segment 1st interval Preload Register

Table 11-2318. STC_SEGPLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	NU12	R	0h	Reserved bits
1-0	SEGID_PLOAD	R/W	0h	Segment number for which preload is to be started (RWP - Read, Priviledge Mode Write only) This specifies the segment for which the address of its First interval will be pre-loaded into the NSTC ROM address counter. The 1st address of each segment are defined in SEGx_START_ADDR register.The address of the 1st interval of the selected segment is loaded into the NSTC ROM address counter when the RS_CNT_B 1 bits of STC_GCR 0 are set to 1X 00 = Preload the address of the 1st interval of segment 0. 01 = Preload the address of the 1st interval of segment 1. 10 = Preload the address of the 1st interval of segment 2. 11 = Preload the address of the 1st interval of segment 3.

11.8.8.7.5.12 SEG0_START_ADDR Register (Offset = 2Ch) [Reset = 00000000h]

SEG0_START_ADDR is shown in Table 11-2319.

Return to the Summary Table.

ROM Start address for Segment0

Table 11-2319. SEG0_START_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	NU13	R	0h	Reserved bits
19-0	SEG_START_ADDR	R/W	0h	Segment 0 Start Address (RWP - Read, Priviledge Mode Write only) This register holds the ROM address for the start of first interval of the segment. When STC_GCR0.RS_CNT_B1 field is set to (1x) “PRELOAD” option, this register is used to determine the ROM start address for the Segment selected in ST_SEGPLR register. Valid number of bits depends on RTL paramerter ADDR

11.8.8.7.5.13 SEG1_START_ADDR Register (Offset = 30h) [Reset = 00000000h]

SEG1_START_ADDR is shown in Table 11-2320.

Return to the Summary Table.

ROM Start address for Segment1

Table 11-2320. SEG1_START_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	NU14	R	0h	Reserved bits
19-0	SEG_START_ADDR	R/W	0h	Segment 1 Start Address (RWP - Read, Priviledge Mode Write only) This register holds the ROM address for the start of first interval of the segment. When STC_GCR0.RS_CNT_B1 field is set to (1x) “PRELOAD” option, this register is used to determine the ROM start address for the Segment selected in ST_SEGPLR register. Valid number of bits depends on RTL paramerter ADDR. This register is present only when RTL parameter NUM_SEG = 1.

11.8.8.7.5.14 SEG2_START_ADDR Register (Offset = 34h) [Reset = 00000000h]

SEG2_START_ADDR is shown in Table 11-2321.

Return to the Summary Table.

ROM Start address for Segment2

Table 11-2321. SEG2_START_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	NU15	R	0h	Reserved bits
19-0	SEG_START_ADDR	R/W	0h	Segment 2 Start Address (RWP - Read, Priviledge Mode Write only) This register holds the ROM address for the start of first interval of the segment. When STC_GCR0.RS_CNT_B1 field is set to (1x) “PRELOAD” option, this register is used to determine the ROM start address for the Segment selected in ST_SEGPLR register. Valid number of bits depends on RTL paramerter ADDR. This register is present only when RTL parameter NUM_SEG = 2.

11.8.8.7.5.15 SEG3_START_ADDR Register (Offset = 38h) [Reset = 00000000h]

SEG3_START_ADDR is shown in Table 11-2322.

Return to the Summary Table.

ROM Start address for Segment3

Table 11-2322. SEG3_START_ADDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	NU16	R	0h	Reserved bits
19-0	SEG_START_ADDR	R/W	0h	Segment 3 Start Address (RWP - Read, Priviledge Mode Write only) This register holds the ROM address for the start of first interval of the segment. When STC_GCR0.RS_CNT_B1 field is set to (1x) “PRELOAD” option, this register is used to determine the ROM start address for the Segment selected in ST_SEGPLR register. Valid number of bits depends on RTL paramerter ADDR. This register is present only when RTL parameter NUM_SEG = 3.

11.8.8.7.5.16 CORE1_CURMISR_0 Register (Offset = 3Ch) [Reset = 00000000h]

CORE1_CURMISR_0 is shown in Table 11-2323.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2323. CORE1_CURMISR_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR0	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.17 CORE1_CURMISR_1 Register (Offset = 40h) [Reset = 00000000h]

CORE1_CURMISR_1 is shown in Table 11-2324.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2324. CORE1_CURMISR_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR1	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.18 CORE1_CURMISR_2 Register (Offset = 44h) [Reset = 00000000h]

CORE1_CURMISR_2 is shown in Table 11-2325.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2325. CORE1_CURMISR_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR2	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.19 CORE1_CURMISR_3 Register (Offset = 48h) [Reset = 00000000h]

CORE1_CURMISR_3 is shown in Table 11-2326.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2326. CORE1_CURMISR_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR3	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.20 CORE1_CURMISR_4 Register (Offset = 4Ch) [Reset = 00000000h]

CORE1_CURMISR_4 is shown in Table 11-2327.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2327. CORE1_CURMISR_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR4	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.21 CORE1_CURMISR_5 Register (Offset = 50h) [Reset = 00000000h]

CORE1_CURMISR_5 is shown in Table 11-2328.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2328. CORE1_CURMISR_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR5	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.22 CORE1_CURMISR_6 Register (Offset = 54h) [Reset = 00000000h]

CORE1_CURMISR_6 is shown in Table 11-2329.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2329. CORE1_CURMISR_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR6	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.23 CORE1_CURMISR_7 Register (Offset = 58h) [Reset = 00000000h]

CORE1_CURMISR_7 is shown in Table 11-2330.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2330. CORE1_CURMISR_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR7	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.24 CORE1_CURMISR_8 Register (Offset = 5Ch) [Reset = 00000000h]

CORE1_CURMISR_8 is shown in Table 11-2331.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2331. CORE1_CURMISR_8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR8	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.25 CORE1_CURMISR_9 Register (Offset = 60h) [Reset = 00000000h]

CORE1_CURMISR_9 is shown in Table 11-2332.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2332. CORE1_CURMISR_9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR9	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.26 CORE1_CURMISR_10 Register (Offset = 64h) [Reset = 00000000h]

CORE1_CURMISR_10 is shown in Table 11-2333.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2333. CORE1_CURMISR_10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR10	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.27 CORE1_CURMISR_11 Register (Offset = 68h) [Reset = 00000000h]

CORE1_CURMISR_11 is shown in Table 11-2334.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2334. CORE1_CURMISR_11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR11	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.28 CORE1_CURMISR_12 Register (Offset = 6Ch) [Reset = 00000000h]

CORE1_CURMISR_12 is shown in Table 11-2335.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2335. CORE1_CURMISR_12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR12	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.29 CORE1_CURMISR_13 Register (Offset = 70h) [Reset = 00000000h]

CORE1_CURMISR_13 is shown in Table 11-2336.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2336. CORE1_CURMISR_13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR13	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.30 CORE1_CURMISR_14 Register (Offset = 74h) [Reset = 00000000h]

CORE1_CURMISR_14 is shown in Table 11-2337.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2337. CORE1_CURMISR_14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR14	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.31 CORE1_CURMISR_15 Register (Offset = 78h) [Reset = 00000000h]

CORE1_CURMISR_15 is shown in Table 11-2338.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2338. CORE1_CURMISR_15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR15	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.32 CORE1_CURMISR_16 Register (Offset = 7Ch) [Reset = 00000000h]

CORE1_CURMISR_16 is shown in Table 11-2339.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2339. CORE1_CURMISR_16 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR16	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.33 CORE1_CURMISR_17 Register (Offset = 80h) [Reset = 00000000h]

CORE1_CURMISR_17 is shown in Table 11-2340.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2340. CORE1_CURMISR_17 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR17	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.34 CORE1_CURMISR_18 Register (Offset = 84h) [Reset = 00000000h]

CORE1_CURMISR_18 is shown in Table 11-2341.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2341. CORE1_CURMISR_18 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR18	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.35 CORE1_CURMISR_19 Register (Offset = 88h) [Reset = 00000000h]

CORE1_CURMISR_19 is shown in Table 11-2342.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2342. CORE1_CURMISR_19 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR19	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.36 CORE1_CURMISR_20 Register (Offset = 8Ch) [Reset = 00000000h]

CORE1_CURMISR_20 is shown in Table 11-2343.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2343. CORE1_CURMISR_20 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR20	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.37 CORE1_CURMISR_21 Register (Offset = 90h) [Reset = 00000000h]

CORE1_CURMISR_21 is shown in Table 11-2344.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2344. CORE1_CURMISR_21 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR21	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.38 CORE1_CURMISR_22 Register (Offset = 94h) [Reset = 00000000h]

CORE1_CURMISR_22 is shown in Table 11-2345.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2345. CORE1_CURMISR_22 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR22	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.39 CORE1_CURMISR_23 Register (Offset = 98h) [Reset = 00000000h]

CORE1_CURMISR_23 is shown in Table 11-2346.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2346. CORE1_CURMISR_23 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR23	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.40 CORE1_CURMISR_24 Register (Offset = 9Ch) [Reset = 00000000h]

CORE1_CURMISR_24 is shown in Table 11-2347.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2347. CORE1_CURMISR_24 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR24	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.41 CORE1_CURMISR_25 Register (Offset = A0h) [Reset = 00000000h]

CORE1_CURMISR_25 is shown in Table 11-2348.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2348. CORE1_CURMISR_25 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR25	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.42 CORE1_CURMISR_26 Register (Offset = A4h) [Reset = 00000000h]

CORE1_CURMISR_26 is shown in Table 11-2349.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2349. CORE1_CURMISR_26 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR26	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.43 CORE1_CURMISR_27 Register (Offset = A8h) [Reset = 00000000h]

CORE1_CURMISR_27 is shown in Table 11-2350.

Return to the Summary Table.

Holds the MISR signature for CORE1

Table 11-2350. CORE1_CURMISR_27 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C1MISR27	R	0h	MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.44 CORE2_CURMISR_0 Register (Offset = ACh) [Reset = 00000000h]

CORE2_CURMISR_0 is shown in Table 11-2351.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2351. CORE2_CURMISR_0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR0	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.45 CORE2_CURMISR_1 Register (Offset = B0h) [Reset = 00000000h]

CORE2_CURMISR_1 is shown in Table 11-2352.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2352. CORE2_CURMISR_1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR1	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.46 CORE2_CURMISR_2 Register (Offset = B4h) [Reset = 00000000h]

CORE2_CURMISR_2 is shown in Table 11-2353.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2353. CORE2_CURMISR_2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR2	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.47 CORE2_CURMISR_3 Register (Offset = B8h) [Reset = 00000000h]

CORE2_CURMISR_3 is shown in Table 11-2354.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2354. CORE2_CURMISR_3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR3	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.48 CORE2_CURMISR_4 Register (Offset = BCh) [Reset = 00000000h]

CORE2_CURMISR_4 is shown in Table 11-2355.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2355. CORE2_CURMISR_4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR4	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.49 CORE2_CURMISR_5 Register (Offset = C0h) [Reset = 00000000h]

CORE2_CURMISR_5 is shown in Table 11-2356.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2356. CORE2_CURMISR_5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR5	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.50 CORE2_CURMISR_6 Register (Offset = C4h) [Reset = 00000000h]

CORE2_CURMISR_6 is shown in Table 11-2357.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2357. CORE2_CURMISR_6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR6	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.51 CORE2_CURMISR_7 Register (Offset = C8h) [Reset = 00000000h]

CORE2_CURMISR_7 is shown in Table 11-2358.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2358. CORE2_CURMISR_7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR7	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.52 CORE2_CURMISR_8 Register (Offset = CCh) [Reset = 00000000h]

CORE2_CURMISR_8 is shown in Table 11-2359.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2359. CORE2_CURMISR_8 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR8	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.53 CORE2_CURMISR_9 Register (Offset = D0h) [Reset = 00000000h]

CORE2_CURMISR_9 is shown in Table 11-2360.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2360. CORE2_CURMISR_9 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR9	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.54 CORE2_CURMISR_10 Register (Offset = D4h) [Reset = 00000000h]

CORE2_CURMISR_10 is shown in Table 11-2361.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2361. CORE2_CURMISR_10 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR10	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.55 CORE2_CURMISR_11 Register (Offset = D8h) [Reset = 00000000h]

CORE2_CURMISR_11 is shown in Table 11-2362.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2362. CORE2_CURMISR_11 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR11	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.56 CORE2_CURMISR_12 Register (Offset = DCh) [Reset = 00000000h]

CORE2_CURMISR_12 is shown in Table 11-2363.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2363. CORE2_CURMISR_12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR12	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.57 CORE2_CURMISR_13 Register (Offset = E0h) [Reset = 00000000h]

CORE2_CURMISR_13 is shown in Table 11-2364.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2364. CORE2_CURMISR_13 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR13	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.58 CORE2_CURMISR_14 Register (Offset = E4h) [Reset = 00000000h]

CORE2_CURMISR_14 is shown in Table 11-2365.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2365. CORE2_CURMISR_14 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR14	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.59 CORE2_CURMISR_15 Register (Offset = E8h) [Reset = 00000000h]

CORE2_CURMISR_15 is shown in Table 11-2366.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2366. CORE2_CURMISR_15 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR15	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.60 CORE2_CURMISR_16 Register (Offset = ECh) [Reset = 00000000h]

CORE2_CURMISR_16 is shown in Table 11-2367.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2367. CORE2_CURMISR_16 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR16	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.61 CORE2_CURMISR_17 Register (Offset = F0h) [Reset = 00000000h]

CORE2_CURMISR_17 is shown in Table 11-2368.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2368. CORE2_CURMISR_17 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR17	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.62 CORE2_CURMISR_18 Register (Offset = F4h) [Reset = 00000000h]

CORE2_CURMISR_18 is shown in Table 11-2369.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2369. CORE2_CURMISR_18 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR18	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.63 CORE2_CURMISR_19 Register (Offset = F8h) [Reset = 00000000h]

CORE2_CURMISR_19 is shown in Table 11-2370.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2370. CORE2_CURMISR_19 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR19	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.64 CORE2_CURMISR_20 Register (Offset = FCh) [Reset = 00000000h]

CORE2_CURMISR_20 is shown in Table 11-2371.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2371. CORE2_CURMISR_20 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR20	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.65 CORE2_CURMISR_21 Register (Offset = 100h) [Reset = 00000000h]

CORE2_CURMISR_21 is shown in Table 11-2372.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2372. CORE2_CURMISR_21 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR21	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.66 CORE2_CURMISR_22 Register (Offset = 104h) [Reset = 00000000h]

CORE2_CURMISR_22 is shown in Table 11-2373.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2373. CORE2_CURMISR_22 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR22	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.67 CORE2_CURMISR_23 Register (Offset = 108h) [Reset = 00000000h]

CORE2_CURMISR_23 is shown in Table 11-2374.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2374. CORE2_CURMISR_23 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR23	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.68 CORE2_CURMISR_24 Register (Offset = 10Ch) [Reset = 00000000h]

CORE2_CURMISR_24 is shown in Table 11-2375.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2375. CORE2_CURMISR_24 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR24	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.69 CORE2_CURMISR_25 Register (Offset = 110h) [Reset = 00000000h]

CORE2_CURMISR_25 is shown in Table 11-2376.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2376. CORE2_CURMISR_25 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR25	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.70 CORE2_CURMISR_26 Register (Offset = 114h) [Reset = 00000000h]

CORE2_CURMISR_26 is shown in Table 11-2377.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2377. CORE2_CURMISR_26 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR26	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.7.5.71 CORE2_CURMISR_27 Register (Offset = 118h) [Reset = 00000000h]

CORE2_CURMISR_27 is shown in Table 11-2378.

Return to the Summary Table.

Holds the MISR signature for CORE2

Table 11-2378. CORE2_CURMISR_27 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	C2MISR27	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

11.8.8.8 Programmable Built-In Self-Test (PBIST)

This section describes the programmable built-in self-test (PBIST) controller module used for testing the on-chip memories.

11.8.8.8.1 Overview

The PBIST (Programmable Built-In Self-Test) controller architecture provides a run-time-programmable memory BIST engine for varying levels of coverage across many embedded memory instances.

Name	Frame Address (Hex) Start	Frame Address (Hex) End	Size	Description
TOP_PBIST	0x02F7_9400	0x02F7_95CC	464Bytes	PBIST module configuration registers. This IP covers memory test for all memories excluding DSP L1P, L1D and associated TAG memories
DSS_DSP_PBIST	0x06F7_9000	0x06F7_91CC	464Bytes	PBIST module configuration registers. This IP covers memory test for all memories excluding DSP L1P, L1D and associated TAG memories

11.8.8.8.1.1 PBIST vs. Application Software-Based Testing

The PBIST architecture consists of a small coprocessor with a dedicated instruction set targeted specifically toward testing memories. This coprocessor executes test routines stored in the PBIST ROM and runs them on multiple on-chip memory instances. The on-chip memory configuration information is also stored in the PBIST ROM.

The PBIST Controller architecture offers significant advantages over tests running on the main processor (application software-based testing):

- Embedded CPUs have a long access path to memories outside the tightly-couple memory sub-system, while the PBIST controller has a dedicated path to the memories specifically for the self-test
- Embedded CPUs are designed for their targeted use and are often not easily programmed for memory test algorithms.
- The memory test algorithm code on embedded CPUs is typically significantly larger than that needed for PBIST.
- The embedded CPU is significantly larger than the PBIST controller.

11.8.8.8.1.2 PBIST Block Diagram

Figure 11-847 illustrates the basic PBIST blocks and its wrapper logic for the device.

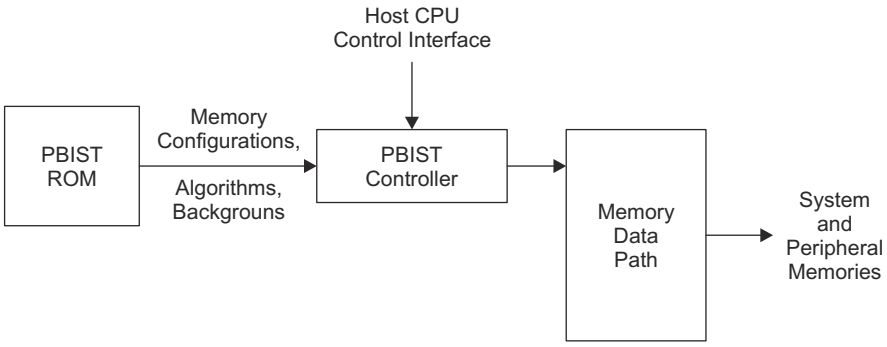

Figure 11-847. PBIST Block Diagram

11.8.8.8.1.2.1 On-chip ROM

The on-chip ROM contains the information regarding the algorithms and memories to be tested.

11.8.8.8.1.2.2 Host Processor Interface to the PBIST Controller Registers

The CPU can select the algorithm and RAM groups for the memories' self-test from the onchip ROM based on the application requirements. Once the self-test has executed, the CPU can query the PBIST controller registers to identify any memories that failed the self-test and to then take appropriate next steps as required by the application's author.

11.8.8.8.1.2.3 Memory Data Path

This is the read and write data path logic between different system and peripheral memories tightly coupled to the PBIST memory interface. The PBIST controller executes each selected algorithm on each valid memory group sequentially until all the algorithms are executed.

Note

NOTE: Not all algorithms are designed to run on all RAM groups. If an algorithm is selected to run on an incompatible memory, this will result in a failure. Refer to and for RAM grouping and algorithm information.

11.8.8.8.2 RAM/ROM Grouping and Algorithm

11.8.8.8.2.1 RAM Algorithm: March13N

This section provides a brief description for some of the test algorithms used for memory self-test.

•

• **March13N**:

– March13N is the baseline test algorithm for SRAM testing. It provides the highest overall coverage.

The other algorithms provide additional coverage of otherwise missed boundary conditions of the SRAM operation.

– The concept behind the general march algorithm is to indicate:

- The bits around the bit cell do not affect the bit cell.
- The bit cell can be written and read as both a 1 and a 0.

– The basic operation of the march is to initialize the array to a know pattern, then march a different pattern through the memory.

– Type of faults detected by this algorithm:

- Address decoder faults
- Stuck-At faults
- Coupled faults
- State coupling faults
- Parametric faults
- Write recovery faults
- Read/write logic faults

11.8.8.8.2.2 Read/write logic faults

The triple read reads the array, all the way through, three times while summing the reads to compare the sums for all three read formats. The algorithm checks if there is enough margin in both the erasure and programmation to operate at full speed with the CPU. This can be addressed with the XOR Read (Memory Contents XOR Memory Address). An error in the XOR Read indicates that the interaction between adjacent bit cells, being a different polarity, may be causing speed issues when the CPU exercises worstcase instruction sequencing. Each

read can be performed on any memory block, and an associated checksum is calculated to determine PASS or FAIL.

Type of faults detected by this algorithm:

- Address decoder faults
- Stuck-At faults
- Coupled faults
- State coupling faults
- Parametric faults
- Read logic faults

11.8.8.8.2.3

Note

March13N is the most recommended algorithm for the memory self-test

Chapter 12

On-chip Debug

The debug subsystem contains one MCUDebugss at its core that allows the JTAG interface access to device components. The debug subsystem is designed to provide the following debug features:

- JTAG debug access to debug resources, mapped through an ARM SWJ-DP and TI ICEPickM scan module
- System memory access without halting the processor
- Trace for C66x DSP
- ETM-based trace for ARM R5F
- Cross trigger to halt and restart MSS and DSP, based on events such as watchdog, timers, DMA, and time-stamp events
- Capability to read the device ID

12.1 AM273x On Chip Debug Architecture

12.1.1 On Chip DebugOverview

On Chip Debug (also known as OneMCU DebugSS) is used in the AM273x platform. An overview of the interconnectivity of the debug ports and trace ports are shown in Figure 12-1.

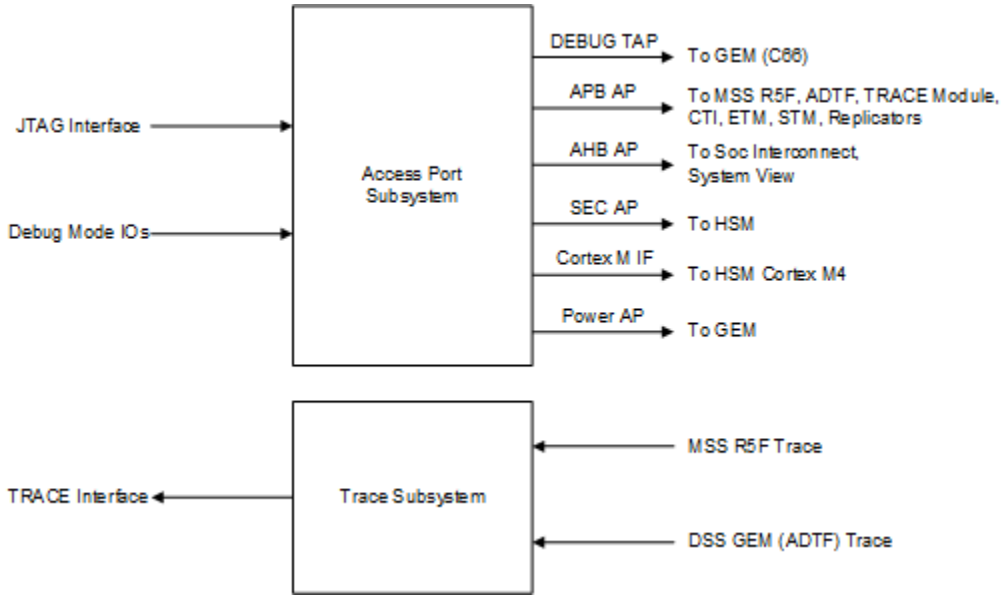

Figure 12-1. Debug SS Overview

12.1.2

The On Chip Debugarchitecture and the connectivity of the various debug components are shown in Figure 12-2.

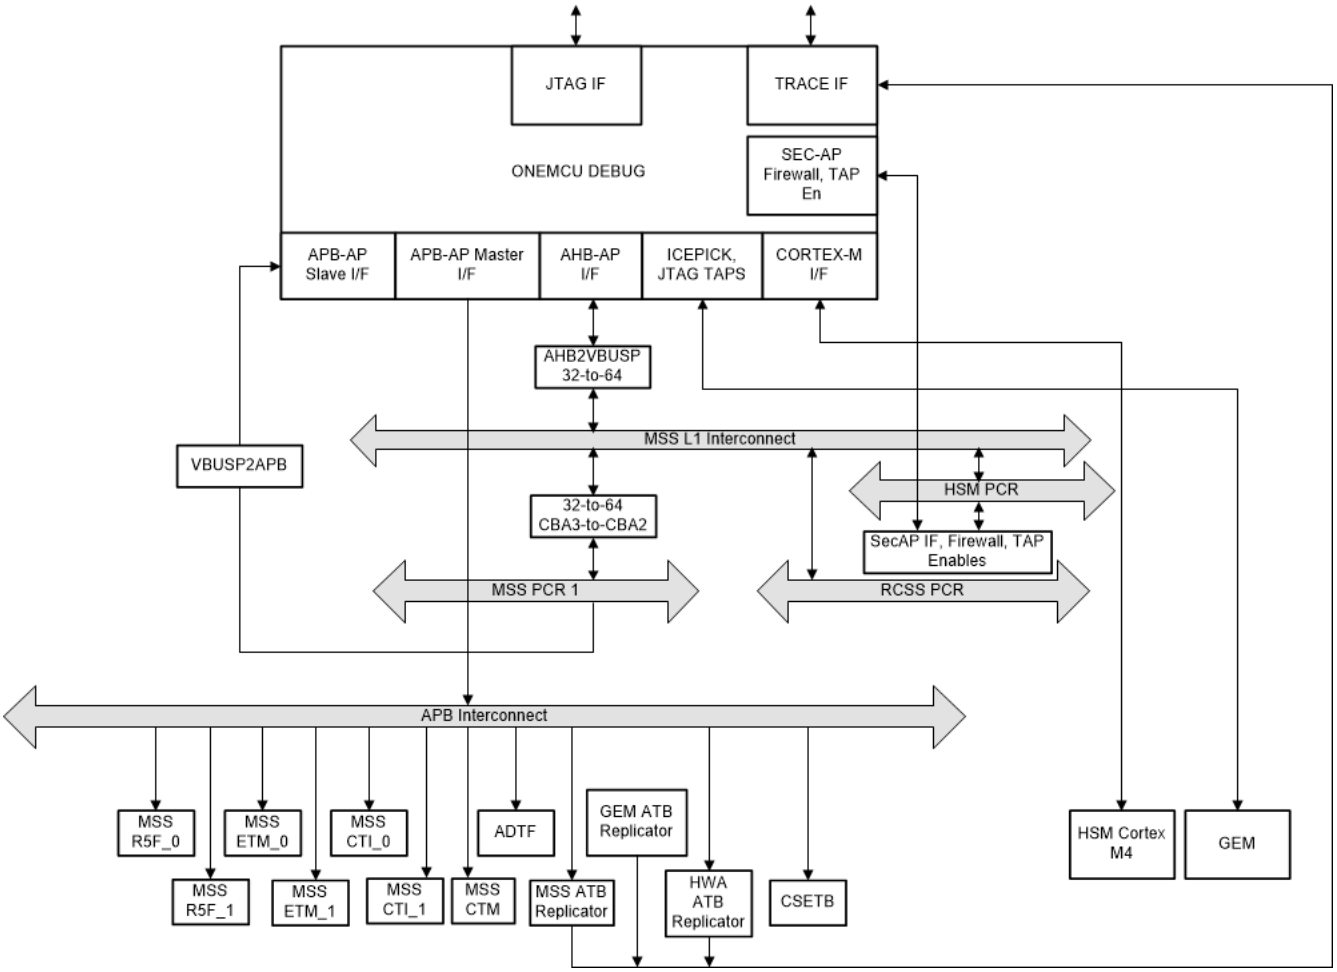

Figure 12-2. AM273x On Chip Debug Architecture

12.1.3 On Chip Debug Subsystem Address Map

The memory map view for RS232 and DAP AHB is the same as MSS CortexR5. Table 12-1 shows the APB Port Address Map for the AM273x.

Table 12-1. Debug Subsystem Address Map

APB Port	Block Name	Start Address Offset	End Address Offset
APB EXTERNAL PORT 0	C66x ADTF	0x00010000	0x00010FFF
APB EXTERNAL PORT 0	C66x ATB REPLICATOR	0x00011000	0x00011FFF
APB EXTERNAL PORT 0	MSS CR5 ATB REPLICATOR	0x00012000	0x00012FFF
APB EXTERNAL PORT 0	CSETB	0x00013000	0x00013FFF
APB EXTERNAL PORT 0	HSM CM4 REPLICATOR	0x00015000	0x00015FFF
APB EXTERNAL PORT 0	MDO INFRA CS-STM	0x00016000	0x00016FFF
APB EXTERNAL PORT 0	MDO INFRA CS-TPIU	0x00017000	0x00017FFF
APB EXTERNAL PORT 0	HSM CM4 CTI	0x00018000	0x00018FFF
APB EXTERNAL PORT 1	MSS CR5 ROM Table	0x00020000	0x00020FFF

APB EXTERNAL PORT 2	MSS CR5 C0 CTI	0x00038000	0x00038FFF
APB EXTERNAL PORT 2	MSS CR5 C1 CTI	0x00039000	0x00039FFF

Table 12-1. Debug Subsystem Address Map (continued)

APB Port	Block Name	Start Address Offset	End Address Offset
APB EXTERNAL PORT 2	MSS CR5 C0 ETM	0x0003C000	0x0003CFFF
APB EXTERNAL PORT 2	MSS CR5 C1 ETM	0x0003D000	0x0003DFFF

12.1.4 Trace Subsystem

12.1.4.1 Trace Infrastructure

The trace infrastructure is shown in Figure 12-3. Trace data from the MSS CR5 cores, C66x DSP core, and HSM Cortex M4 cores may be routed to the external trace lines over the TPIU-Trace interface. Alternately, there is an 8KB trace memory to store the configured (filtered) trace data onto the memory.

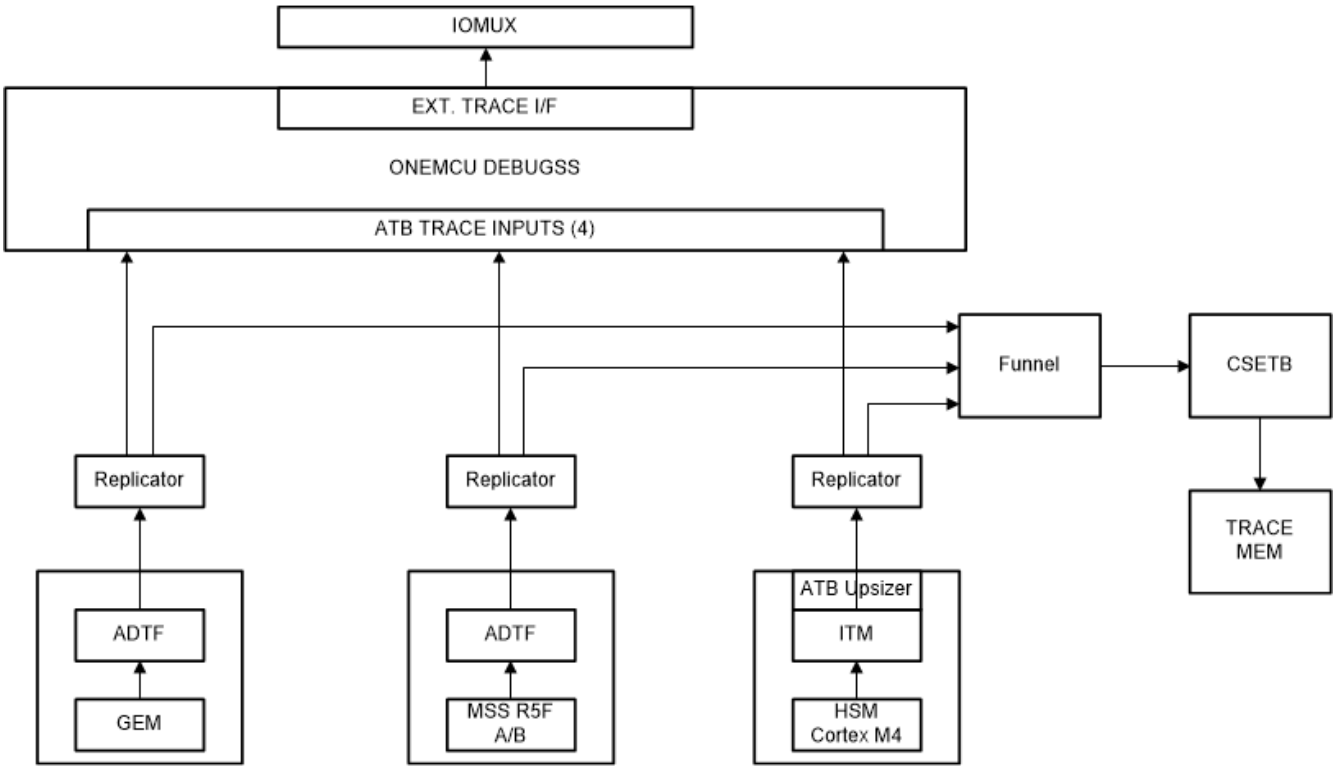

Figure 12-3. Trace Infrastructure

The CortexM4 ITM output requries an 8-bit to 32-bit ATB upsizer in the path to convert the signals to be compatible as input to the upstream layers/modules.

The maximum support frequency for the external interface trace clock is 125 MHz.

12.1.4.2 Cross Triggering

12.1.4.2.1 Cross Triggering Infrastructure

The cross triggering infrastructure is shown in Figure 12-4. The host processors involved in the cross triggering sequence are:

- MSS Cortex R5F cores, ETB
- C66x DSP cores, ADTF
- Host as suspend peripherals
  - HWA Accelerator

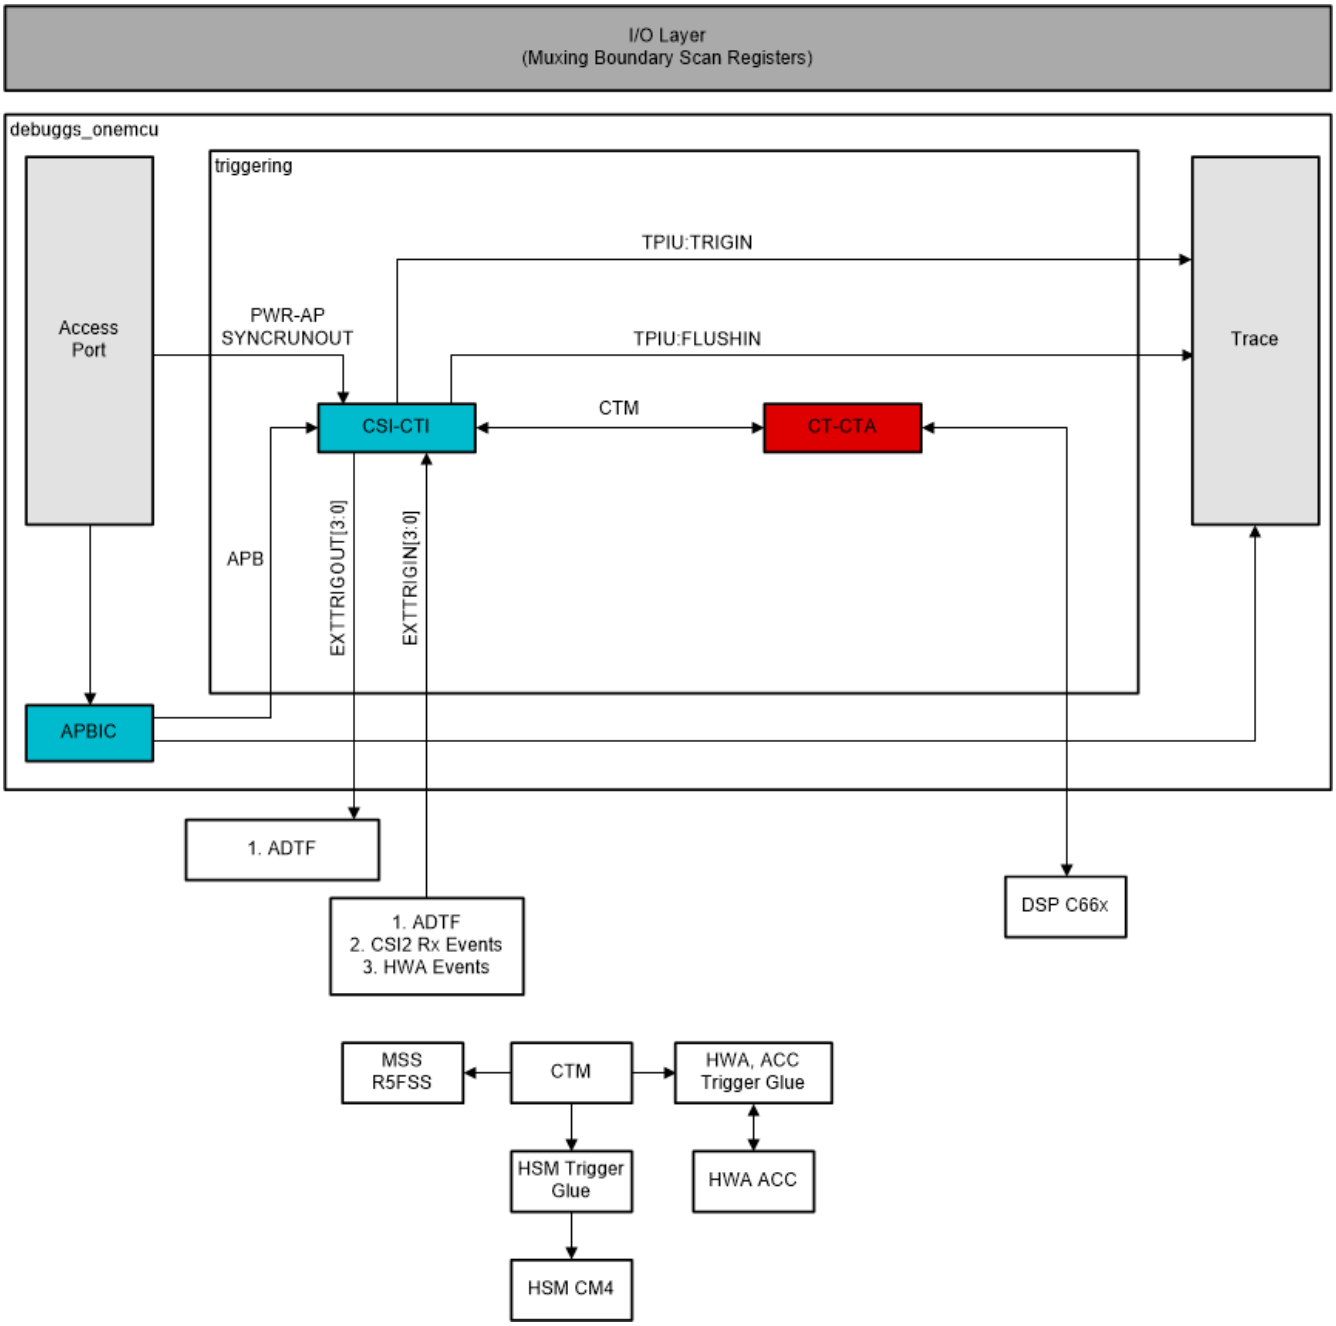

Figure 12-4. Cross Triggering Infrastructure

[0]	TPIU:TRIGIN	Internal TPIU

12.1.5 Suspend Peripherals

The device supports a suspend feature, which provides a way to stop a "closely coupled" hardware process running on a peripheral-IP when the host processor enters a debug state. The suspend mechanism is important for debug to ensure that peripheral-IPs operate in a lock-step manner with a host controller processor.

Table 12-8. Suspend Peripherals

Subsystems Peripherals	CPU Suspend	Peripherals	Peripheral Control Register
MSS Peripherals	MSS CR5 Cores	MSS_ CPSW	MSS_CTRL:DBG_ACK_CTL0_CPSW
		MSS_MCANA	MSS_CTRL:DBG_ACK_CTL1_DCAN
		MSS_MCANB	MSS_CTRL:DBG_ACK_CTL1_DCAN
		MSS_WDT	MSS_CTRL:DBG_ACK_CTL1_WDT
		MSS_RTIA	MSS_CTRL:DBG_ACK_CTL1_RTI
		MSS_RTIB	MSS_CTRL:DBG_ACK_CTL1_RTI
		MSS_RTIC	MSS_CTRL:DBG_ACK_CTL1_RTI
		MSS_MCRC	MSS_CTRL:DBG_ACK_CTL1_MCRC
		MSS_I2C	MSS_CTRL:DBG_ACK_CTL1_I2C
		MSS_SCIA	MSS_CTRL:DBG_ACK_CTL1_SCIA
		MSS_SCIB	MSS_CTRL:DBG_ACK_CTL1_SCIB

Table 12-8. Suspend Peripherals (continued)

Subsystems Peripherals	CPU Suspend	Peripherals	Peripheral Control Register

		RCSS_I2CB	RCSS_CTRL:: DBG_ACK_CTL0_RCSS_I2CB
		RCSS_ECAP	RCSS_CTRL:: DBG_ACK_CTL0_RCSS_ECAP

Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from April 13, 2023 to May 20, 2024 (from Revision C (April 2023) to Revision D (May 2024)) Page

- Adding a Read This First which includes useful links and trademarks are listed there 9
- QSPI max frequency chnaged to 80 MHz..... 10
- Changed digital temp. accuracy to +/- 5C..... 10
- Memory Map: Updated sizes, address, and layout for clarity 13
- Added a few rows about lock step and dual core modes..... 13
- DSP: Updated TCM and L3 end addresses in Memory Map..... 18
- RCSS: Updated TCM and L3 end addresses in Memory Map..... 23
- Added flash app note details in the boot rom section..... 33
- SOP: Added row about SBL in Functional Mode Pin Settings..... 34
- Reset: Added a list of items not affected by WARM Reset..... 1295
- Removing line 'Each processor has two sets of mailbox memory space and registers, and each set is designated per other processor to communicate.'..... 1719
- Updated the mailbox messaging scheme..... 1720
- [EDMA - Third Party Transfer Controller] updated interconnect naming to L3_VBUSM. Fixed typos (distant->destination register). Updated read/write data bus to 64 bits in TPTC Block Diagram and in note below diagram..... 1760
- [Types of EDMA Controller Transfers] changed 3rd dimension count definition space naming from register to PaRAM memory..... 1762
- [Channel Source Address (SRC)] updated addressing mode to FIFO for SAM..... 1768
- [Channel Destination Address (DST)] updated addressing mode to FIFO for DAM..... 1768
- [Count for 1st Dimension (ACNT)] updated ACNT valid values to range of 1 to 65535/..... 1768
- [Active Memory Protection] removed Example Access Denied register table, Example Access Allowed table since they are also in the RA..... 1796
- [Block Move Example] changed 'greater than 64K bytes' to 'greater than or equal to'..... 1807
- [Setting Up an EDMA Transfer] edited note under step 2 to reference step 1-d-ii instead of 1-b-ii..... 1812
- [EDMA Debug Checklist] filtered McASP example in Table 11-23 for AM273x only..... 1821
- GIO: Added additional naming conventions that GPIO can go by..... 2064
- I2C: Added list of I2C instance names..... 2159
- UART: Added new instance of UART and re-arrange sections by instances..... 2204
- GPADC: updated external I/O channel instances and link to to useful software information..... 2409
- Removed instructions PARAM related configurations..... 2409
- CPSW: Add bullet point about the CBS feature..... 2450
- Aurora: Updated pin naming..... 3550
- ePWM: Updated ePWM naming in text. Added warning about legacy names used in images 3650
- ePWM: Removed outdated terms for pinmux..... 3650
- McASP: Added note on McASP instance name..... 3922
- Made edits to the fist para for DWD..... 4238
- Made edits to DWD module operation..... 4240
- Made edits to DWWD module operation. 4240

- MCRC: Add bit details relating to Semi-CPU mode..... 4543
- MCRC: Add bit details relating to Semi-CPU mode..... 4802
- STC General Description: Removed unsupported features (Interval Testing).....4872
