Chapter 10

# Quad Serial Peripheral Interface (QSPI)

---

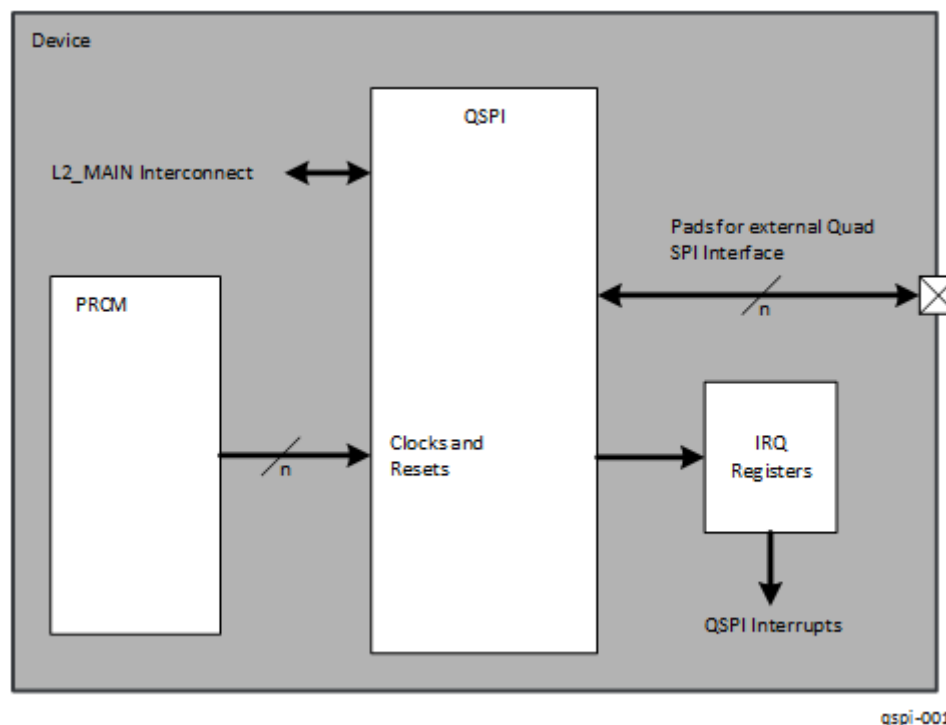

10.1 Quad Serial Peripheral Interface Overview.....	3366
10.2 QSPI Environment.....	3367
10.3 QSPI Functional Description.....	3368
10.4 QSPI Registers.....	3377

## 10.1 Quad Serial Peripheral Interface Overview

The quad serial peripheral interface (QSPI) module is a kind of SPI module that allows single, dual, or quad read access to external SPI devices. This module has a memory mapped register interface, which provides a direct interface for accessing data from external SPI devices and thus simplifying software requirements. The QSPI works as a controller only.

The one QSPI in the device is primarily intended for fast booting from quad-SPI flash memories. [Figure 10-1](#) shows the QSPI module overview.

**Figure 10-1. QSPI Overview**

The QSPI supports the following features:

- General SPI features:
  - Programmable clock divider
  - Max four pin interface
  - Programmable length (from 1 to 128 bits) of the words transferred
  - Programmable number (from 1 to 4096) of the words transferred
  - 1 external chip-select signal
  - Support for 1 pin Write. Dual or quad writes are not supported
  - Support for 1-, 2-, or 4-pin SPI interface
  - Optional interrupt generation on word or frame (number of words) completion
  - Programmable delay between chip select activation and output data from 0 to 3 QSPI clock cycles
  - Programmable signal polarities
  - Programmable active clock edge
  - Software-controllable interface allowing for any type of SPI transfer
  - Control through L2\_MAIN configuration port
- Serial flash interface (SFI) features:
  - Serial flash read/write interface
  - Additional registers for defining read and write commands to the external serial flash device
  - External flash support of up to 8 MB

- Fast read support, where fast read requires dummy bytes after address bytes; 0 to 3 dummy bytes can be configured.
- Dual read support
- Quad read support
- Little-endian support (only for memory mapped registers used to configure QSPI controller and not SPI content accesses)
- Linear increment addressing mode only

The QSPI supports only dual and quad reads. Dual or quad writes are not supported. In addition, there is no "pass through" mode supported where the data present on the QSPI input is sent to its output.

### Note

The QSPI module does not support cache line wrap mode.

## 10.2 QSPI Environment

Figure 10-2 shows a typical connection of the QSPI module to the external quad-SPI flash memory.

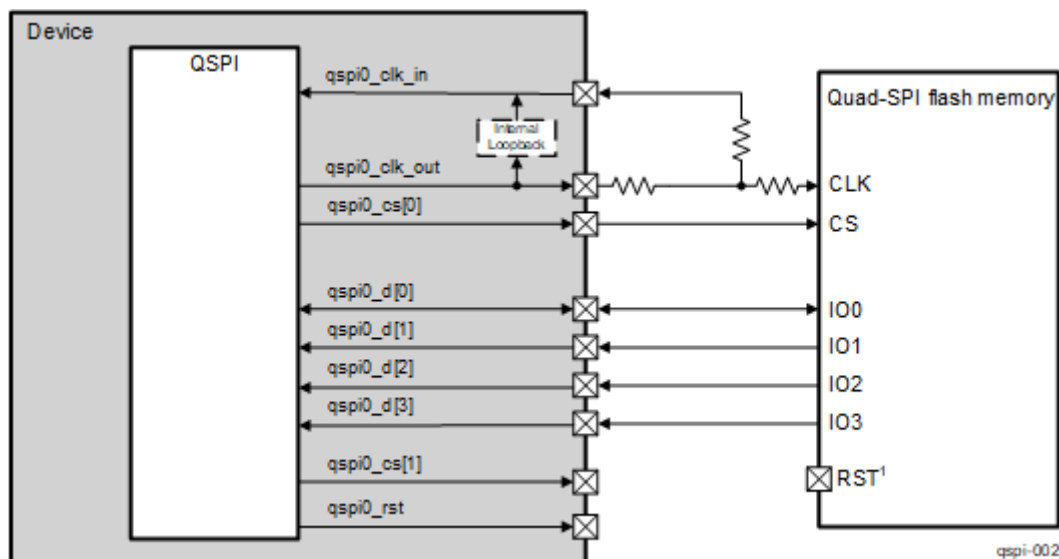

Figure 10-2. QSPI Connected to an External Quad-SPI Flash Memory

1. External flash memories that are larger than 128 Mb require an external reset pin for correct operation after SoC PORz reset. This reset must be triggered upon board reset to ensure the flash is in the correct state upon boot.

Table 10-1 lists and describes the QSPI I/O signals.

Table 10-1. QSPI I/O Signals

QSPI Signal/Pad name	I/O <sup>(1)</sup>	Description					
		3-pin <sup>(2)</sup> SPI Read (Single Read)	3-pin <sup>(2)</sup> SPI Write (Single Write)	4-pin <sup>(2)</sup> SPI Read (Single Read)	4-pin <sup>(2)</sup> SPI Write (Single Write)	4-pin <sup>(2)</sup> SPI Read (Dual Read)	6-pin <sup>(2)</sup> SPI Read (Quad Read)
qspi0_d[0]	IO	Used as SPI data input	Used as SPI data output	Not used	Used as SPI data output	Used as SPI data input 0	Used as SPI data input 0

qspi0_d[3]	I	Not used	Not used	Not used	Not used	Not used	Used as SPI data input 3

**Table 10-1. QSPI I/O Signals (continued)**

QSPI Signal/Pad name	I/O <sup>(1)</sup>	Description					
		3-pin <sup>(2)</sup> SPI Read (Single Read)	3-pin <sup>(2)</sup> SPI Write (Single Write)	4-pin <sup>(2)</sup> SPI Read (Single Read)	4-pin <sup>(2)</sup> SPI Write (Single Write)	4-pin <sup>(2)</sup> SPI Read (Dual Read)	6-pin <sup>(2)</sup> SPI Read (Quad Read)
qspi0_sclk	O	Clock for the external SPI device					
qspi0_cs[0]	O	External SPI device chip-select 0					
qspi0_rtclock	I	The qspi0_sclk output must be connected to the qspi0_rtclock input, and is used for controlling the timing of the read return data when the QSPI module operates in Mode 0. In case Mode 3 is used, there is no need to connect the qspi0_sclk to the qspi0_rtclock.					

(1) I = Input; O = Output

(2) This is the pin count at the SPI flash memory side. The pin count at the device side is increased by one because of the qspi0\_rtclock signal. References to the pin count throughout this chapter consider the pin count at the SPI flash memory side.

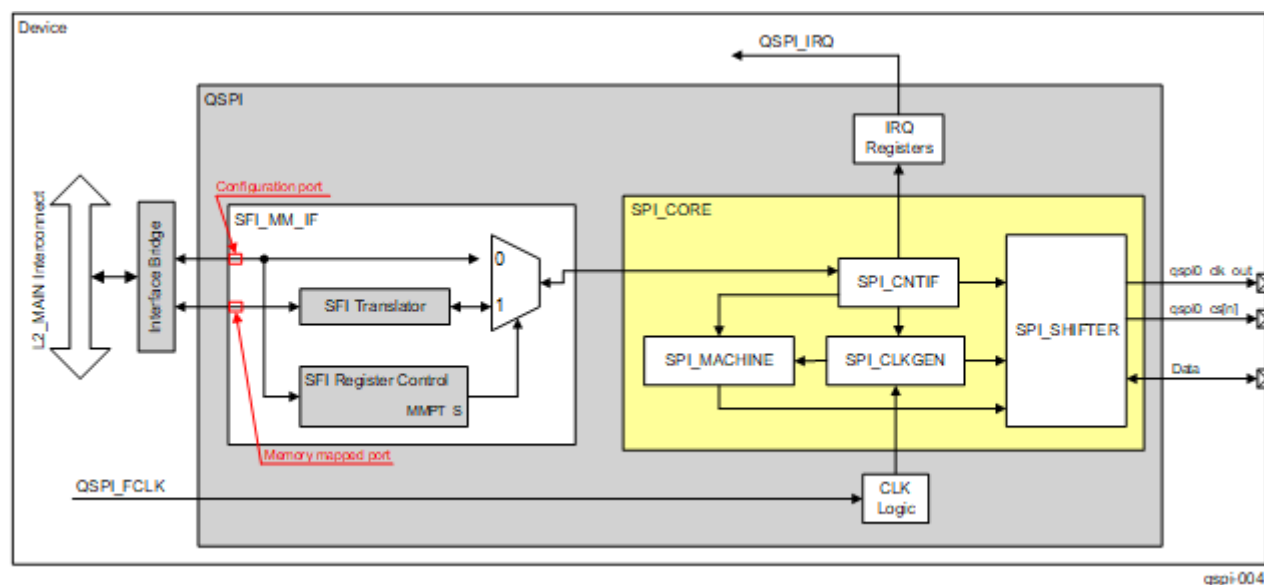

### Note

To ensure proper timing, precise layout and routing requirements must be followed. For layout and routing requirements for all QSPI signals, see section “PCB Guidelines” of the device Data Manual.

## 10.3 QSPI Functional Description

### 10.3.1 QSPI Block Diagram

Initial device boot from external SPI flash memory can be accomplished through the QSPI module. The interface is a simple 4-wire SPI used for control or data transfers. The QSPI also supports a 3-wire SPI protocol where the qspi0\_d[0] signal is used as a bidirectional for reads and writes. In addition, a 6-wire mode can be used to support quad read devices. Figure 10-3 shows the QSPI block diagram.

**Figure 10-3. QSPI Block Diagram**

The QSPI is composed of two blocks. The first one is the SFI memory-mapped interface (SFI\_MM\_IF) and the second one is the SPI core (SPI\_CORE). The SFI\_MM\_IF block is associated only with SPI flash memories and is used for specifying typical for the SPI flash memories settings (read or write command, number of address and dummy bytes, and so on) unlike the SPI\_CORE block, which is associated with the SPI interface itself and is used to configure typical SPI settings (chip-select polarity, serial clock inactive state, SPI clock mode, length of the words transferred, and so on).

The SFI\_MM\_IF comprises the following two subblocks:

- SFI register control
- SFI translator

The SPI\_CORE comprises the following four subblocks:

- SPI control interface (SPI\_CNTIF)
- SPI clock generator (SPI\_CLKGEN)
- SPI control state machine (SPI\_MACHINE)
- SPI data shifter (SPI\_SHIFTER)

In addition, an interface bridge connects the two ports (configuration port and memory-mapped port) of the SFI\_MM\_IF block to the L2\_MAIN interconnect. There are no software controls associated with this interface bridge.

The QSPI supports long transfers through a frame-style sequence. In its generic SPI use mode, a word can be defined up to 128 bits and multiple words can be transferred during a single access. For each word, a device initiator must read or write the new data and then tell the QSPI to continue the current operation. Using this sequence, a maximum of 4096 128-bit words can be transferred in a single SPI read or write operation. This allows great flexibility when connecting the QSPI to various types of devices.

As opposed to the generic SPI use mode, the communication with serial flash-type devices requires sending a byte command, followed by sending bytes of data. Commands can be sent through the SPI\_CORE block to communicate with a serial flash device; however, it is easier to do this using the SFI\_MM\_IF block because it is intended to ease the communication with serial flash devices. If the SPI\_CORE is used to communicate with a serial flash device, software must load the command into the SPI data transfer register with additional configuration fields, perform the byte transfer, then place the data to be sent (or configure for receive) along with additional configuration fields, and perform that transfer. Reads and writes to serial flash devices are more specific. First, the read or write command byte is sent, followed by 1 to 4 bytes of address (corresponding to the address to read/write), then followed by the data write/receive phase. Data is always sent byte oriented. When the address is loaded, data can be continuously read or written, and the address will automatically increment to each byte address internally to the serial flash device.

#### Note

The SFI\_MM\_IF block only allows reading and writing to an externally connected SPI flash device. The SFI\_MM\_IF block does not allow reads or writes to internal configuration and status registers of the SPI flash device. These registers must be accessed through the features of the SPI\_CORE block.

#### 10.3.1.1 SFI Register Control

The SFI register control block consists of the following five configuration registers:

- QSPI\_SPI\_SETUP0\_REG
- QSPI\_SPI\_SETUP1\_REG
- QSPI\_SPI\_SETUP2\_REG
- QSPI\_SPI\_SETUP3\_REG
- QSPI\_SPI\_SWITCH\_REG

The first four registers let the user define the following:

- Byte command for a serial flash read specified by the QSPI\_SPI\_SETUP<sub>i</sub>\_REG[7:0] RCMD bit field
- Byte command for a serial flash write specified by the QSPI\_SPI\_SETUP<sub>i</sub>\_REG[23:16] WCMD bit field
- Number of address bytes required for the particular type of serial flash specified by the QSPI\_SPI\_SETUP<sub>i</sub>\_REG[9:8] NUM\_A\_BYTES bit field
- Number of "dummy bytes" that may be needed to support the fast read mode function of some serial flash devices. The QSPI\_SPI\_SETUP<sub>i</sub>\_REG[11:10] NUM\_D\_BYTES bit field specifies the number of "dummy bits." In addition, the QSPI\_SPI\_SETUP<sub>i</sub>\_REG[28:24] NUM\_D\_BITS bit field can also specify the number of "dummy bits."

- Whether the read command is single (normal), dual, or quad read mode command. This is specified by the QSPI\_SPI\_SETUP<sub>i</sub>\_REG[13:12] READ\_TYPE bit field.
- *i* is equal to 0, 1, 2 and 3 and means that the QSPI\_SPI\_SETUP<sub>i</sub>\_REG registers are associated with each of the four supported chip-selects [that is, four supported output SPI flash devices])

The QSPI\_SPI\_SWITCH\_REG register acts as a static switch which allows the configuration port (shown in Figure 10-3) to connect directly to the SPI\_CORE block, or allows the memory-mapped port (also shown in Figure 10-3) to connect to the SPI\_CORE block. This is done using the QSPI\_SPI\_SWITCH\_REG[0] MMPT\_S bit.

In addition, the QSPI\_SPI\_SWITCH\_REG[1] MM\_INT\_EN bit is used to enable or disable the word complete interrupt during operations using the memory-mapped port.

### 10.3.1.2 SFI Translator

The SFI translator block represents an FSM which, based on the configuration information loaded into the SFI register control block, converts each input read/write sequence into an SPI\_CORE configuration sequence for access to the external serial flash memory.

A read sequence is converted into the following actions:

1. SPI chip-select goes active.
2. Read command byte is issued.
3. 1 to 4 address bytes, which correspond to the first address supplied, are issued.
4. 0 to 3 dummy bytes are issued, if “fast read” is supported.
5. Data bytes are read from the external SPI flash memory.
6. SPI chip-select goes inactive.

For linear addressing mode, action 5 is repeated until the byte count to be transferred reaches zero.

A write sequence is identical to a read sequence, except that a write sequence does not use dummy bytes.

Another important aspect with regard to writes is that a serial flash memory location can only be written to if the bits are erased in advance. Erased means the bits are set to 1. This means that writing only changes 1 contents to 0. It is not possible with this write to change the contents of a bit from 0 to 1. An erase command must be performed to do this operation. Erase commands cannot be executed on single byte locations. Depending on device types, there are page, block, and chip erase commands. To perform an erase command, the particular command must be sent over the SPI bus, and an internal register of the serial flash device must then be polled to determine when the erase completes. The erases must be done through the configuration port by software before performing any writes through the memory-mapped port. This means that writes are passed through to the serial flash device, but if the memory locations being modified are not properly erased before the write, the contents may not result in what was sent.

#### Note

The input to the SFI Memory Mapped Protocol Translator is 23 address lines. Therefore, the SFI mode of operation supports external flash size of up to 8MB

### 10.3.1.3 SPI Control Interface

The SPI control interface contains configuration registers used to configure the SPI core functionality of the QSPI. This block maintains all configuration settings for the SPI core (that is, settings specific for the SPI interface itself but not for the SPI flash memories).

The registers defined for this block are:

- The QSPI\_PID register, which is read only and contains QSPI revision associated information
- The QSPI\_SPI\_CLOCK\_CNTRL\_REG register, which is used to control external SPI clock (qspi0\_sclk)
- The QSPI\_SPI\_DC\_REG register used to define the SPI clock mode and chip-select polarity for the four external SPI devices

- The QSPI\_SPI\_CMD\_REG register used to control the operation of the SPI command. This register is also used to configure and transfer data.
  - Four data registers used for reading the data received and for writing the data to be transferred. These registers are:
    - QSPI\_SPI\_DATA\_REG
    - QSPI\_SPI\_DATA\_REG\_1
    - QSPI\_SPI\_DATA\_REG\_2
    - QSPI\_SPI\_DATA\_REG\_3
- These four registers compose a 128-bit shift register.
- The QSPI\_SPI\_STATUS\_REG register, which contains status information

All of these registers can only be written if the QSPI is not busy. This means that they can be written if the QSPI\_SPI\_STATUS\_REG[0] BUSY bit is 0x0. The QSPI becomes busy when a write to the QSPI\_SPI\_CMD\_REG[18:16] CMD bit field is performed. Writing to this bit field starts an SPI transaction and sets the QSPI\_SPI\_STATUS\_REG[0] BUSY bit to 0x1. The CMD bit field can be written again when the BUSY bit is 0x0. In addition, the start of the SPI transaction is synchronized to the qspi0\_sclk clock and clearing of the BUSY bit is synchronized to the QSPI\_FCLK clock.

The register group QSPI\_SPI\_DATA\_REG\_3, QSPI\_SPI\_DATA\_REG\_2, QSPI\_SPI\_DATA\_REG\_1 and QSPI\_SPI\_DATA\_REG is treated as a single 128-bit word for shifting data in and out. The QSPI\_SPI\_DATA\_REG\_3 register is used for the most significant bits and the QSPI\_SPI\_DATA\_REG is used for the least significant bits. This applies for both reads and writes. For example, after reading a 128-bit word (WLEN = 0x7F) the most significant bit of the data read, that is bit 127, will be located at QSPI\_SPI\_DATA\_REG\_3[31] position and the least significant bit, that is bit 0 of the data read, will be located at the QSPI\_SPI\_DATA\_REG[0] position.

The data written to this register group should be right justified so that a data pre-shifting is not required. The QSPI\_SPI\_CMD\_REG[25:19] WLEN bit field determines the location of the most significant bit and the bit position that will be shifted out first during a write. In order to shift out byte data the WLEN bit field should be set to 0x7 and the data byte should be written to the lower byte of the QSPI\_SPI\_DATA\_REG register. By setting the word length to 0x7 the QSPI\_SPI\_DATA\_REG register will look like a pseudo 8-bit shift register. When the user wants to write 40-bit long word the WLEN bit field should be set to 0x27, the 32 least significant bits of data should be written to the QSPI\_SPI\_DATA\_REG and the rest 8 most significant bits of data should be written to the lower byte of the QSPI\_SPI\_DATA\_REG\_1 register. By setting WLEN to 0x27 these two registers will look like a pseudo 40-bit shift register. When the word length is greater than 64 bits the QSPI\_SPI\_DATA\_REG\_2 register is also used and the previously described logic applies. The QSPI\_SPI\_DATA\_REG\_3 register is used together with the other three data registers when the word length is greater than 96 bits.

When dual or quad read mode is used the number of the words transferred must be even. This number is configured through the QSPI\_SPI\_CMD\_REG[11:0] FLEN bit field.

#### Note

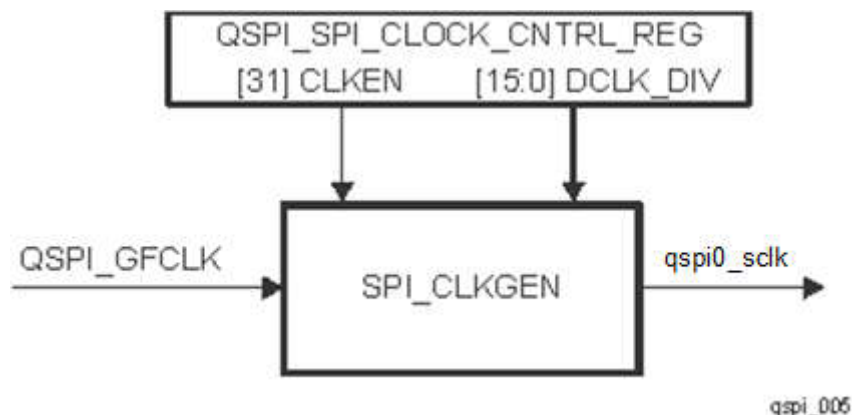

The QSPI module does not support a "pass through" mode where the data present on qspi0\_d[1] is sent to qspi0\_d[0], when 4-pin non-dual read mode is used. This means that setting the QSPI\_SPI\_CMD\_REG[18:16] CMD bit field to 0x1 causes the QSPI only to read from an external device using the qspi0\_d[1] pad as an input and if a write to the same external device is desired, the CMD bit field should be set to 0x2, which causes the qspi0\_d[0] pad to be used as an output.

#### 10.3.1.4 SPI Clock Generator

The SPI clock generator uses the QSPI\_FCLK clock as an input, and generates the qspi0\_sclk, which is a divided version of the QSPI\_FCLK clock. The divide ratio is a 16-bit value configured through the QSPI\_SPI\_CLOCK\_CNTRL\_REG[15:0] DCLK\_DIV bit field and thus provides a division factor in a range from 1 to 65536. The QSPI\_FCLK clock is divided by the DCLK\_DIV value + 1 to provide the qspi0\_sclk clock. When DCLK\_DIV = 0x0 the QSPI\_FCLK clock equals the DCLK clock. The value in the DCLK\_DIV bit field

applies only when the QSPI\_SPI\_CLOCK\_CNTRL\_REG[31] CLKEN bit is set to 0x1. Figure 10-4 shows the SPI\_CLKGEN block.

If the CLKEN bit is 0x0 the command specified in the QSPI\_SPI\_CMD\_REG[18:16] CMD bit field is not executed and the QSPI\_SPI\_STATUS\_REG[0] BUSY bit is not set. The command is executed only if the CLKEN bit is 0x1 before write to the CMD bit field.

**Figure 10-4. SPI\_CLKGEN Block**

### 10.3.1.5 SPI Control State-Machine

The SPI control state-machine (SPI\_MACHINE) manages the operation of the SPI\_CORE block. SPI\_MACHINE takes control and configuration information from the registers in the SPI\_CNTIF block as input and provides control information to the SPI data shifter. This information is used to control the SPI data port. The SPI\_MACHINE also generates status information, which is sent back to the SPI\_CNTIF block.

Writing a valid value to the QSPI\_SPI\_CMD\_REG[18:16] CMD bit field sets immediately the QSPI\_SPI\_STATUS\_REG[0] BUSY bit to 0x1, activates the corresponding qspi0\_cs[n] (n = 0 to 1) and starts the SPI data transaction. The BUSY bit is cleared automatically when QSPI\_SPI\_CMD\_REG[25:19] WLEN number of bits are shifted in or out. If the value of the QSPI\_SPI\_STATUS\_REG[27:16] WDCNT bit field is different than 0x0 and WLEN number of bits are shifted already, the SPI\_MACHINE waits until another write to the CMD bit field is performed. If the command written to the CMD bit field is valid, then this increments the value of the WDCNT bit field from 0x0 and starts shifting data in or out again. This is repeated until the WDCNT bit field reaches the frame length (QSPI\_SPI\_CMD\_REG[11:0] FLEN), that is, all words of the frame are shifted or till earlier frame termination occurs. While the SPI\_MACHINE is waiting for write to the CMD bit field the corresponding qspi0\_cs[n] (n = 0 to 1) remains active and the BUSY flag is set to 0x0. In addition, the bit length for each word can be changed during a frame from 1 to 128 bits using the QSPI\_SPI\_CMD\_REG[25:19] WLEN bit field.

The SPI\_MACHINE also provides a mechanism to terminate the frame earlier. This is done by writing an invalid command to the CMD bit field. An invalid command corresponds to the 0x0 and 0x4 (reserved) values of the CMD bit field. Writing one of these values when the the WDCNT bit field is not equal to 0x0 and when the BUSY flag is 0x0 terminates the frame earlier.

The corresponding qspi0\_cs[n] (n = 0 to 1) becomes inactive when all words are shifted or when the frame terminates earlier.

### 10.3.1.6 SPI Data Shifter

The SPI data shifter handles the capture and generation of the SPI interface signals. Based on control signals from the SPI\_MACHINE and SPI\_CNTIF blocks, data is shifted in or out on falling or rising edge of qspi0\_sclk clock depending on the SPI clock mode selected. Table 10-2 lists the four defined clock modes of operation for the QSPI.

**Table 10-2. SPI Clock Modes Definition**

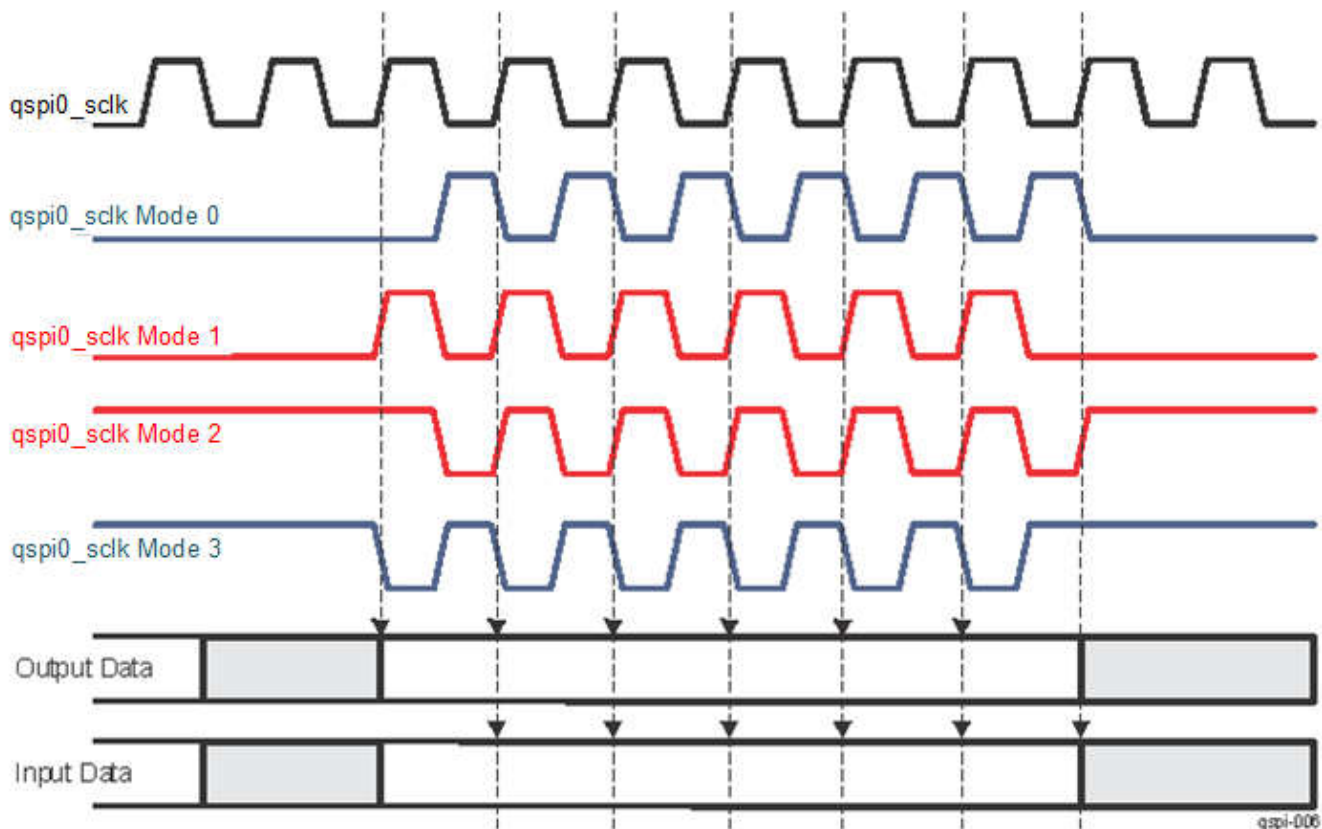

Mode	Settings in the QSPI_SPI_DC_REG Register		Description
	Value of the CKP bits	Value of the CKPH bits	
0	0	0	Data input captured on falling edge of qspi0_sclk clock. Data output generated on falling edge of qspi0_sclk clock
1	0	1	Data input captured on rising edge of qspi0_sclk clock. Data output generated on rising edge of qspi0_sclk clock
2	1	0	Data input captured on rising edge of qspi0_sclk clock. Data output generated on rising edge of qspi0_sclk clock
3	1	1	Data input captured on falling edge of qspi0_sclk clock. Data output generated on falling edge of qspi0_sclk clock

**Note**

Mode 1 and Mode 2 are not supported and should not be used.

The CKPi and CKPHi (i = 0 to 3) bits of the QSPI\_SPI\_DC\_REG register control the clock modes. Each of these 4 bits corresponds to an output chip select.

Figure 10-5 shows all four clock modes. In addition, through the DDi (i = 0 to 3) bits of the QSPI\_SPI\_DC\_REG register the data can be delayed from one to three qspi0\_sclk clock cycles after the corresponding qspi0\_cs[n] (n = 0 to 1) goes active. The active state of each chip-select can also be controlled through the CSPi (i = 0 to 3) bits of the QSPI\_SPI\_DC\_REG register.

**Figure 10-5. SPI Clock Modes**

### 10.3.2 QSPI Clock Configuration

The QSPI complies with the PRCM peripheral-idle protocol. The QSPI\_FCLK clock is gated based on the values loaded in the QSPI\_SYSCONFIG[3:2] IDLE\_MODE bit field. Three modes are supported:

- Force-idle: The QSPI\_FCLK clock is gated unconditionally by the QSPI.
- No-idle: The QSPI\_FCLK clock is never gated by the QSPI.
- Smart-idle: The QSPI\_FCLK clock is gated by the QSPI, depending on its internal requirements.

### 10.3.3 QSPI Interrupt Requests

Figure 10-6 shows a logical representation of the QSPI interrupt generation scheme.

**Figure 10-6. Logical Representation of the QSPI Interrupt Generation Scheme**

QSPI\_SPI\_STATUS\_REG[1] WC and QSPI\_SPI\_STATUS\_REG[2] FC are status bits indicating whether word or frame transfer is complete. Setting the corresponding interrupt enable bit (WIRQ or FIRQ) in the QSPI\_SPI\_CMD\_REG register allows these events (WC and FC) to generate an interrupt. The WC and FC bits are reset every time the user writes to the QSPI\_SPI\_CMD\_REG register or reads the QSPI\_SPI\_STATUS\_REG register. This is done to keep control parameters from changing the interface protocol signals while a transfer is in progress. Additionally, the QSPI\_SPI\_SWITCH\_REG[1] MM\_INT\_EN bit is used to enable or disable the word complete interrupt during operations using the memory-mapped port.

When the QSPI\_SPI\_CMD\_REG[14] WIRQ and QSPI\_SPI\_CMD\_REG[15] FIRQ bits are set to 0x1 the following applies:

- The QSPI activates its interrupt line only if the interrupts are enabled by setting to 0x1 the corresponding bits in the QSPI\_INTR\_ENABLE\_SET\_REG register. These interrupts can be disabled by setting the corresponding bits in the QSPI\_INTR\_ENABLE\_CLEAR\_REG register to 0x1.
- After an interrupt has been serviced, software must clear the corresponding status flag. This is done by setting the corresponding bit in the QSPI\_INTR\_STATUS\_ENABLED\_CLEAR register to 0x1, which

also clears the corresponding bit in the QSPI\_INTR\_STATUS\_RAW\_SET register. The status flags in the QSPI\_INTR\_STATUS\_RAW\_SET register are set even if the corresponding interrupt is disabled unlike those in the QSPI\_INTR\_STATUS\_ENABLED\_CLEAR register, which are set only if the corresponding interrupt is enabled.

- The QSPI also generates an interrupt if a certain bit in the QSPI\_INTR\_STATUS\_RAW\_SET register is set to 0x1 and the corresponding interrupt is enabled through the QSPI\_INTR\_ENABLE\_SET\_REG register. This feature is useful during user software debugging. In addition, even if interrupts are not enabled a corresponding raw flag in the QSPI\_INTR\_STATUS\_RAW\_SET register is set to 0x1 when an IRQ condition occurs.
- Even if interrupts are not enabled, a certain status bit in the QSPI\_INTR\_STATUS\_RAW\_SET register can also be cleared by setting to 0x1 the corresponding bit in the QSPI\_INTR\_STATUS\_ENABLED\_CLEAR register.

It must be considered that the previously described scenario applies if the QSPI\_SPI\_CMD\_REG[14] WIRQ and QSPI\_SPI\_CMD\_REG[15] FIRQ bits are set to 0x1.

#### Note

The QSPI\_IRQ interrupt line is activated only if at least one of the following conditions is met:

- The word complete interrupt is enabled:
  - during operations using the memory-mapped port by setting to 0x1 both the QSPI\_SPI\_SWITCH\_REG[1] MM\_INT\_EN and QSPI\_INTR\_ENABLE\_SET\_REG[1] WIRQ\_ENA\_SET bits.
  - during operations using the configuration port by setting to 0x1 both the QSPI\_SPI\_CMD\_REG[14] WIRQ and QSPI\_INTR\_ENABLE\_SET\_REG[1] WIRQ\_ENA\_SET bits.
- The frame complete interrupt is enabled setting to 0x1 both the QSPI\_SPI\_CMD\_REG[15] FIRQ and QSPI\_INTR\_ENABLE\_SET\_REG[0] FIRQ\_ENA\_SET bits.

The QSPI\_IRQ interrupt line is also activated when both the conditions are met.

Table 10-3 lists the event flags and the corresponding mask bits of the sources which can cause interrupts.

**Table 10-3. QSPI Events**

Event Flag	Event Mask	Description
QSPI_INTR_STATUS_RAW_SET[1] WIRQ_RAW QSPI_INTR_STATUS_ENABLED_CLEAR[1] WIRQ_ENA QSPI_SPI_STATUS_REG[1] WC	QSPI_INTR_ENABLE_SET_REG[1] WIRQ_ENA_SET QSPI_INTR_ENABLE_CLEAR_REG[1] WIRQ_ENA_CLR QSPI_SPI_CMD_REG[14] WIRQ	Word complete interrupt event. Asserted each time after a word is transferred or received.
QSPI_INTR_STATUS_RAW_SET[0] FIRQ_RAW QSPI_INTR_STATUS_ENABLED_CLEAR[0] FIRQ_ENA QSPI_SPI_STATUS_REG[2] FC	QSPI_INTR_ENABLE_SET_REG[0] FIRQ_ENA_SET QSPI_INTR_ENABLE_CLEAR_REG[0] FIRQ_ENA_CLR QSPI_SPI_CMD_REG[15] FIRQ	Frame complete interrupt event. Asserted each time after a frame is transferred or received.

#### Note

QSPI\_IRQ can also be used to trigger DMA events

### 10.3.4 QSPI Memory Regions

Two memory regions are associated with the QSPI. The first memory region is dedicated to the configuration port. Using this memory region, all internal registers can be programmed and serial transfers made from the supported external SPI devices. The L2\_MAIN start address at which the configuration port is available is

0x4820 0000. The second memory region is associated mainly with the memory-mapped port and is used for communication directly with one of the two supported external SPI devices. The memory region for device 1 starts at 0x6000 0000 and the memory region for device 2 starts at 0x6200 0000

It is important to keep in mind that the configuration port provides an access to all the QSPI registers listed in the register summary. These are configuration registers and also four data registers. The configuration registers are used to configure typical SPI and serial flash memory settings and the four data registers are used for read and write operations. When communicating with an external SPI device (but not an SPI flash memory) the SPI\_CORE module should be used and the data exchanged is available through these four data registers, which can be accessed only through the configuration port.

## 10.4 QSPI Registers

### 10.4.1 QSPI Register Summary

## Chapter 11

# Enhanced Direct Memory Access (EDMA)

---

This section describes the Enhanced Direct Memory Access (EDMA) controller. For features applicable to the EDMA instances in the device, see the device-specific Integration section. The primary purpose of the EDMA controller is to service data transfers programmed between two memory-mapped follower endpoints on the device. The EDMA controller consists of two principle blocks:

- EDMA channel controllers: EDMA\_TPCC
- EDMA transfer controllers: EDMA\_TPTC

Devices can have multiple instances of EDMA channel controllers, each associated with multiple EDMA transfer controllers.

The EDMA channel controller serves as the user interface for the EDMA controller. The EDMA\_TPCC includes parameter RAM (PaRAM), channel control registers, and interrupt control registers. The EDMA\_TPCC serves to prioritize incoming software requests or events from peripherals, and submits transfer requests (TR) to the EDMA transfer controller.

The EDMA transfer controllers are responsible for data movement. The transfer request packets (TRP) submitted by the EDMA\_TPCC contain the transfer context, based on which the transfer controller issues read/write commands to the source and destination addresses programmed for a given transfer.

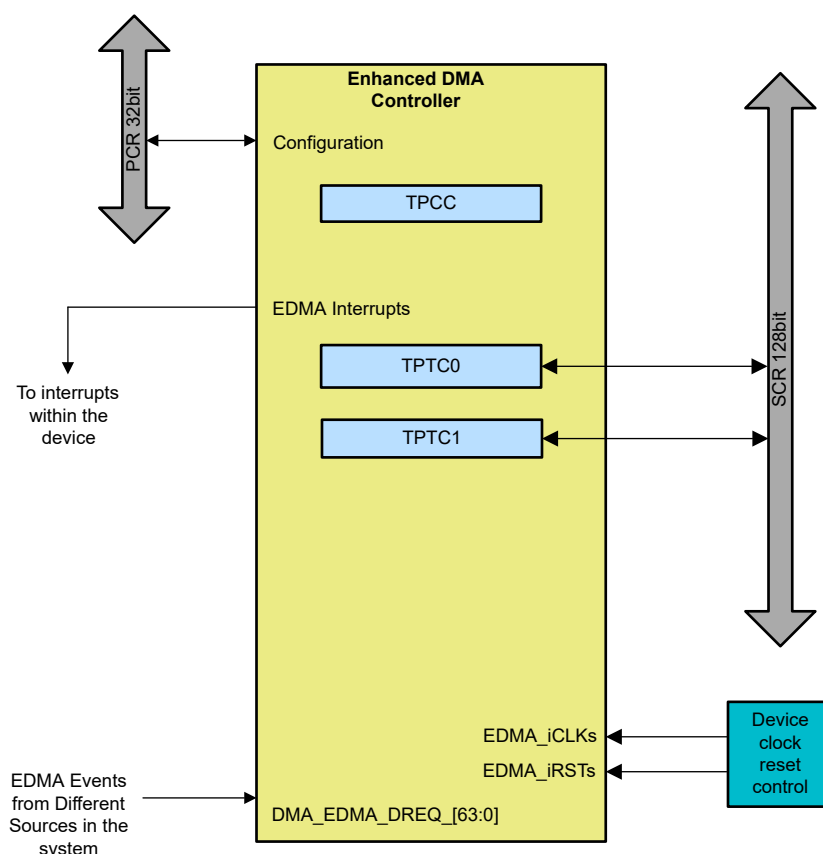

### 11.1 EDMA Module Overview

The enhanced direct memory access module, also called EDMA, performs high-performance data transfers between two target endpoints, memories and peripheral devices without microprocessor unit (MPU) or digital signal processor (DSP) support during transfer. EDMA transfer is programmed through a logical EDMA channel, which allows the transfer to be optimally tailored to the requirements of the application.

The EDMA controller is based on two major principal blocks:

- EDMA third-party channel controller (EDMA\_TPCC)
- EDMA third-party transfer controller (EDMA\_TPTC)

[Figure 11-1](#) shows an overview of the EDMA module.

**Figure 11-1. EDMA Module Overview**

For EDMA instances available on the device, see the device-specific integration section.

The **TPCC** is a high flexible channel controller that serves as both a user interface and an event interface for the EDMA controller. The EDMA\_TPCC serves to prioritize incoming software requests or events from peripherals, and submits transfer requests (TRs) to the transfer controller.

The **TPTC** performs read and write transfers by EDMA ports to the target peripherals, as programmed in the Active and Pending set of the registers. The transfer controllers are responsible for data movement, and issue read/write commands to the source and destination addresses programmed for a given transfer in the EDMA\_TPCC.

### 11.1.1 EDMA Features

This section shows generic EDMA features. For features applicable to the EDMA instances in the device, see the device-specific Integration section.

The EDMA\_TPCC channel controller has the following features:

- Fully orthogonal transfer description:
  - Three transfer dimensions
  - A-synchronized transfers: one dimension serviced per event
  - AB-synchronized transfers: two dimensions serviced per event
  - Independent indexes on source and destination
  - Chaining feature allowing a 3-D transfer based on a single event.
- Flexible transfer definition:
  - Increment or FIFO transfer addressing modes

- Linking mechanism allows automatic PaRAM set update
- Chaining allows multiple transfers to execute with one event
- Interrupt generation for the following:
  - Transfer completion
  - Error conditions
- Debug visibility:
  - Queue water marking/threshold
  - Error and status recording to facilitate debug
- 64 DMA request channels:
  - Event synchronization
  - Manual synchronization (CPUs write to event set registers EDMA\_TPCC\_ESR and EDMA\_TPCC\_ESRH).
  - Chain synchronization (completion of one transfer triggers another transfer).
- Eight QDMA channels:
  - QDMA channels trigger automatically upon writing to a parameter RAM (PaRAM) set entry.
  - Support for programmable QDMA channel to PaRAM mapping.
- Each PaRAM set can be used for a DMA channel, QDMA channel, or link set.
- Multiple transfer controllers/event queues.
- 16 event entries per event queue.

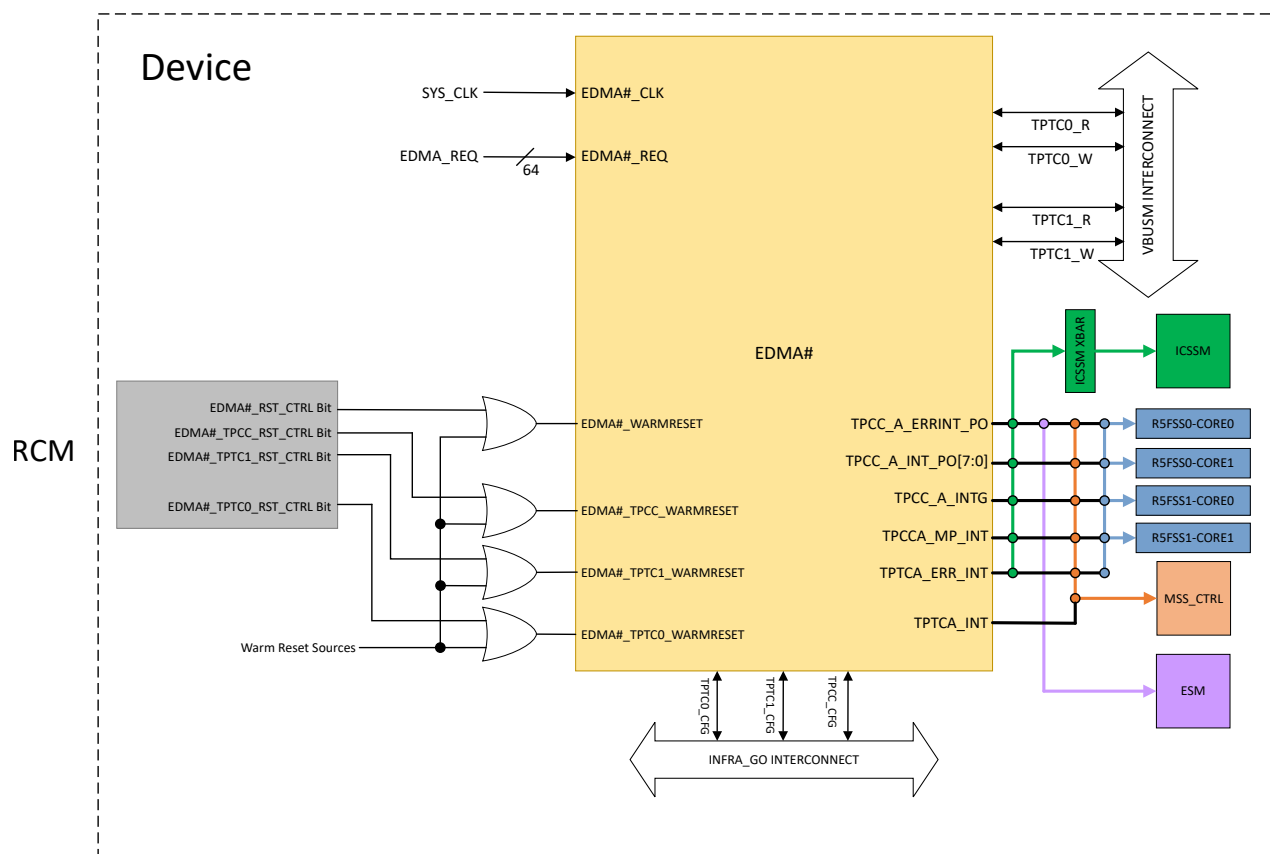

The **EDMA\_TPTC** transfer controller has the following features:

- 64-bit wide read and write ports per TC
- Supports two-dimensional transfers with independent indexes on source and destination (EDMA\_TPCC manages the third dimension)
- Support for increment or constant addressing mode transfers
- Interrupt and error support
- Memory-Mapped Register (MMR) bit fields are fixed position in 32-bit MMR regardless of endianness

## 11.2 EDMA Integration

This section describes modules integration in the device, including information about clocks, resets, and hardware requests.

## 11.2.1 EDMA Integration

**Figure 11-2. EDMA Integration Block Diagram**

### Note

For more information on the interconnects, see the [System Interconnect](#) chapter.

For more information on power, reset, and clock management, see the corresponding sections within the [Device Configuration](#) chapter.

For more information on the device interrupt controllers, see the [Interrupt Controllers](#) chapter.

## 11.2.2 EDMA Integration in MSS

The MSS has 2 TPCCs and 3 TPTCs, as shown in [Figure 11-3](#).

**Figure 11-3. MSS EDMA Wrapper**

Table 11-1 and Table 11-2 list the configuration for the TPCCs and TPTCs in the MSS.

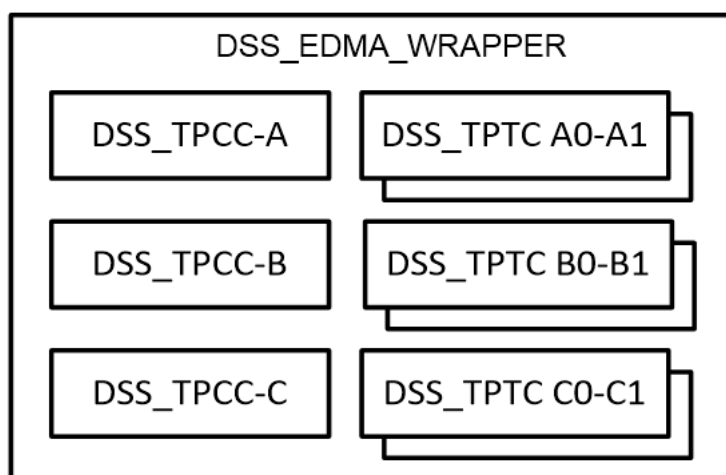

**Table 11-1. MSS TPCC Configuration**

Parameters	TPCC_A	TPCC_B
DMA Ch	64	64
Param Entires	128	128
QDMA Ch	8	8
Event queues	2	2
Mem Protection	Yes	Yes
Channel Mapping	Yes	Yes
Num TCs	2	1
Num Int Ch	NA	NA
Num Regions	NA	NA

**Table 11-2. MSS TPTC Configuration**

Parameters	TPTCA0-A1-B0
FIFO Size	512
TR Pipe Depth	2
Bus Width	8
Read Cmd Num	8
Write Cmd Num	8
RAM ECC	1

### 11.2.3 EDMA Integration in DSS

**Figure 11-4. DSS EDMA Wrapper Block Diagram**

The DSS has 3 TPCCs and 6 TPTCs.

[Table 11-3](#) and [Table 11-4](#) list the configuration for the TPCCs and TPTCs in the DSS.

**Table 11-3. DSS TPCC Configuration**

Parameters	TPCC_A	TPCC_B	TPCC_C
DMA Ch	64	64	64
Param Entires	128	128	256
QDMA Ch	8	8	8
Event queues	2	2	6
Mem Protection	Yes	Yes	Yes
Channel Mapping	Yes	Yes	Yes
Num TCs	2	2	2 (6)
Num Int Ch	NA	NA	NA
Num Regions	NA	NA	NA

**Table 11-4. DSS TPTC Configuration**

Parameters	TPTC_A[0-1]-B[0-1]-C[0-1]	TPTC_C[2-5]
FIFO Size	512	128
TR Pipe Depth	2	2
Bus Width	16	16
Read Cmd Num	8	8
Write Cmd Num	8	8

### 11.2.4 EDMA Functional Interrupt Aggregator

The following EDMA interrupts are aggregated and sent to the processor:

- TPCC Completion Interrupt
- TPCC Completion Region Interrupts
- TPTCs Completion Interrupt

[Table 11-5](#) lists the associated interrupt and registers for each TPCC instance. This section refers to TPCC and TPTC related interrupts, so refer to EDMA XBAR INTRTR0 for EDMA XBAR interrupts.

**Table 11-5. TPCC Interrupt Aggregators**

TPCC	Interrupt	Registers Space
MSS_TPCC_A	MSS_TPCC_A_INTAGG	MSS_CTRL::MSS_TPCC_A_INTAGG_MASK MSS_CTRL::MSS_TPCC_A_INTAGG_STATUS MSS_CTRL::MSS_TPCC_A_INTAGG_STATUS_RAW
MSS_TPCC_B	MSS_TPCC_B_INTAGG	MSS_CTRL::MSS_TPCC_B_INTAGG_MASK MSS_CTRL::MSS_TPCC_B_INTAGG_STATUS MSS_CTRL::MSS_TPCC_B_INTAGG_STATUS_RAW
DSS_TPCC_A	DSS_TPCC_A_INTAGG	DSS_CTRL::DSS_TPCC_A_INTAGG_MASK DSS_CTRL::DSS_TPCC_A_INTAGG_STATUS DSS_CTRL::DSS_TPCC_A_INTAGG_STATUS_RAW
DSS_TPCC_B	DSS_TPCC_B_INTAGG	DSS_CTRL::DSS_TPCC_B_INTAGG_MASK DSS_CTRL::DSS_TPCC_B_INTAGG_STATUS DSS_CTRL::DSS_TPCC_B_INTAGG_STATUS_RAW
DSS_TPCC_C	DSS_TPCC_C_INTAGG	DSS_CTRL::DSS_TPCC_C_INTAGG_MASK DSS_CTRL::DSS_TPCC_C_INTAGG_STATUS DSS_CTRL::DSS_TPCC_C_INTAGG_STATUS_RAW
RSS_TPCC_A	RSS_TPCC_A_INTAGG	RSS_CTRL::RSS_TPCC_A_INTAGG_MASK RSS_CTRL::RSS_TPCC_A_INTAGG_STATUS RSS_CTRL::RSS_TPCC_A_INTAGG_STATUS_RAW
HSM_TPCC_A	HSM_TPCC_A_INTAGG	HSM_CTRL::HSM_TPCC_A_INTAGG_MASK HSM_CTRL::HSM_TPCC_A_INTAGG_STATUS HSM_CTRL::HSM_TPCC_A_INTAGG_STATUS_RAW

For an event to generate an interrupt to the processor, the corresponding bit field must be unmasked in TPCC\_x\_INTAGG\_MASK.

An interrupt processor can read the TPCC\_x\_INTAGG\_STATUS register to detect which event triggered the interrupt.

The interrupt can be cleared by writing 0x1 to the corresponding bit in TPCC\_x\_INTAGG\_STATUS. The software must verify that all the aggregated interrupts are cleared so that the level interrupt is deserted before exiting the ISR. This makes sure that a new pulse interrupt is generated to the processor. Thus, after clearing software, the user can read the register to confirm a value of 0x0.

The register TPCC\_x\_INTAGG\_STATUS\_RAW is set on an event irrespective of the value in TPCC\_x\_INTAGG\_MASK. This field can be cleared by writing 0x1 to the corresponding bit in TPCC\_x\_INTAGG\_STATUS\_RAW.

### 11.2.5 EDMA Error Interrupt Aggregator

The following interrupts are aggregated and sent to the processor:

- TPCC Error
- TPCC MPU Error
- TPTCs Error
- TPCC Read and Write Config Space Access error
- TPTCs Read and Write Config Space Access error

**Table 11-6. TPCC Error Interrupt Aggregators**

TPCC	Interrupt	Registers Space
MSS_TPCC_A	MSS_TPCC_A_ERRAGG	MSS_CTRL::MSS_TPCC_A_ERRAGG_MASK MSS_CTRL::MSS_TPCC_A_ERRAGG_STATUS MSS_CTRL::MSS_TPCC_A_ERRAGG_STATUS_RAW

**Table 11-6. TPCC Error Interrupt Aggregators (continued)**

TPCC	Interrupt	Registers Space
MSS_TPCC_B	MSS_TPCC_B_ERRAGG	MSS_CTRL::MSS_TPCC_B_ERRAGG_MASK MSS_CTRL::MSS_TPCC_B_ERRAGG_STATUS MSS_CTRL::MSS_TPCC_B_ERRAGG_STATUS_RAW
DSS_TPCC_A	DSS_TPCC_A_ERRAGG	DSS_CTRL::DSS_TPCC_A_ERRAGG_MASK DSS_CTRL::DSS_TPCC_A_ERRAGG_STATUS DSS_CTRL::DSS_TPCC_A_ERRAGG_STATUS_RAW
DSS_TPCC_B	DSS_TPCC_B_ERRAGG	DSS_CTRL::DSS_TPCC_B_ERRAGG_MASK DSS_CTRL::DSS_TPCC_B_ERRAGG_STATUS DSS_CTRL::DSS_TPCC_B_ERRAGG_STATUS_RAW
DSS_TPCC_C	DSS_TPCC_C_ERRAGG	DSS_CTRL::DSS_TPCC_C_ERRAGG_MASK DSS_CTRL::DSS_TPCC_C_ERRAGG_STATUS DSS_CTRL::DSS_TPCC_C_ERRAGG_STATUS_RAW
RSS_TPCC_A	RSS_TPCC_A_ERRAGG	RSS_CTRL::RSS_TPCC_A_ERRAGG_MASK RSS_CTRL::RSS_TPCC_A_ERRAGG_STATUS RSS_CTRL::RSS_TPCC_A_ERRAGG_STATUS_RAW
HSM_TPCC_A	HSM_TPCC_A_ERRAGG	HSM_CTRL::HSM_TPCC_A_ERRAGG_MASK HSM_CTRL::HSM_TPCC_A_ERRAGG_STATUS HSM_CTRL::HSM_TPCC_A_ERRAGG_STATUS_RAW

For an event to generate an interrupt to the processor, the corresponding bit field must be unmasked in TPCC\_x\_ERRAGG\_MASK.

An interrupt processor can read the TPCC\_x\_ERRAGG\_STATUS register to detect which event triggered the interrupt.

The interrupt can be cleared by writing 0x1 to the corresponding bit in TPCC\_x\_ERRAGG\_STATUS. The software must ensure that all the aggregated interrupts are cleared so that the level interrupt is deserted before exiting the ISR. Only then is it ensured that a new pulse interrupt is generated to the processor. Thus, after clearing the software, the user should read the register to confirm a value of 0x0.

The register TPCC\_x\_ERRAGG\_STATUS\_RAW is set on an event irrespective of the value in TPCC\_x\_ERRAGG\_MASK. This field can be cleared by writing 0x1 to the corresponding bit in TPCC\_x\_ERRAGG\_STATUS\_RAW.

### 11.2.6 EDMA Configuration

- The MSS has 2 channel controllers: MSS\_TPCC-A and MSS\_TPCC-B. MSS\_TPCC-A has two transfer controllers: MSS\_TPTC-A0 and MSS\_TPTC-A1. MSS\_TPCC-B has one transfer controller MSS\_TPTC-B0.
- The DSS has 3 channel controllers: DSS\_TPCC-A, DSS\_TPCC-B and DSS\_TPCC-C. Each channel controller has 2 transfer controllers.
- RSS has 1 channel controller: RCSS\_TPCC-A, it has two transfer controllers: RCSS\_TPTC-A0 and RCSS\_TPTC-A1.

**Table 11-7. EDMA3 Channel Controller Configuration**

Parameters	MSS_TPCC_A	MSS_TPCC_B	DSS_TPCC_A	DSS_TPCC_B	DSS_TPCC_C	RCSS_TPCC_A

## 11.3 EDMA Controller Functional Description

This chapter discusses the architecture of the EDMA controller. The description contained in this section is generic to the EDMA module, and not all features mentioned here are supported by the device. See the EDMA integration section of the device to determine the applicability of these features.

### 11.3.1 Block Diagram

Figure 11-5 shows the functional block diagram of the EDMA controller.

**Figure 11-5. EDMA Controller Block Diagram**

#### 11.3.1.1 Third-Party Channel Controller

The TPCC is the EDMA transfer scheduler responsible for scheduling, arbitrating, and issuing user programmed transfers to the two TPTCs.

The functional block diagram below describes EDMA channel controller (EDMA\_TPCC).

The main blocks of the EDMA\_TPCC are as follows:

- **Parameter RAM (PaRAM):** The PaRAM maintains parameter sets for channel and reload parameter sets. The PaRAM must be written with the transfer context for the desired channels and link parameter sets. EDMA\_TPCC processes and sets based on a trigger event and submits a transfer request (TR) to the transfer controllers.
- **EDMA event and interrupt processing registers:** Allows mapping of events to parameter sets, enable/disable events, enable/disable interrupt conditions, and clearing interrupts.
- **Completion detection:** The completion detect block detects completion of transfers by the EDMA\_TPTCs or follower peripherals. The completion of transfers can be used optionally to chain trigger new transfers or to assert interrupts.
- **Event queues:** Event queues form the interface between the event detection logic and the transfer request submission logic.
- **Memory protection registers:** Memory protection registers define the accesses (privilege level and requestor(s)) that are allowed to access the DMA channel shadow region view(s) and regions of PaRAM.

Other functions include the following:

- **Region registers:** Region registers allow DMA resources (DMA channels and interrupts) to be assigned to unique regions that different EDMA programmers own (for example, DSPs).
- **Debug registers:** Debug registers allow debug visibility by providing registers to read the queue status, controller status, and missed event status.

The EDMA\_TPCC includes two channel types: DMA channels (64 channels) and QDMA channels (8 channels).

Each channel is associated with a given event queue/transfer controller and with a given PaRAM set. These channels are identical. The main difference between a DMA channel and a QDMA channel is the method that the system uses to trigger transfers.

- DMA channels are triggered by external events by the event set registers EDMA\_TPCC\_ESR and EDMA\_TPCC\_ESRH, or through chaining register EDMA\_TPCC\_CER.
- QDMA channels are triggered automatically (auto-triggered) by the CPU. QDMAs allow a minimum number of linear writes to be issued to the TPCC to force a series of transfers to occur.

The TPCC arbitrates among pending DMA and QDMA events with a fixed [64:1] and [8:1] priority encoder for these events, respectively (a low channel number corresponds to a high priority).

DMA events are always higher priority than QDMA events. The higher-priority event is placed in the event queue to await submission to the transfer controllers, which occurs at the earliest opportunity. Each event queue is serviced in FIFO order, with a maximum of 16 queued events per event queue. If more than one TPTC is ready to be programmed with a transmission request (TR), the event queues are serviced with fixed priority: Q0 is higher than Q1. When an event is ready to be queued and the event queue and the TC channel are empty, the event bypasses the event queue and goes directly to the PaRAM processing logic for submission to the appropriate TC. If the transfer request TR bus or PaRAM processing are busy, the bypass path is not used. The bypass is not used to dequeue for a higher-priority event.

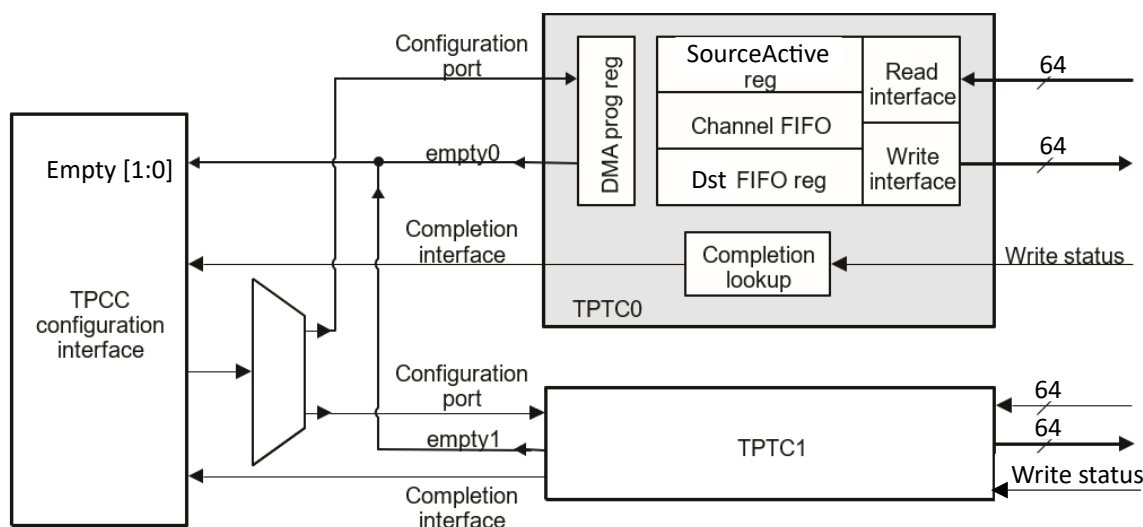

Events are extracted from the event queue when the EDMA\_TPTC is available for a new TR to be programmed into the EDMA\_TPTC (signaled with the empty signal, indicating an empty program register set). As an event is extracted from the event queue, the associated PaRAM entry is processed and submitted to the TPTC as a TR. The TPCC updates the appropriate counts and addresses in the PaRAM entry in anticipation of the next trigger event for that PaRAM entry.

The EDMA\_TPCC also has an error detection logic that causes an error interrupt generation on various error conditions (for example: missed events EDMA\_TPCC\_EMR and EDMA\_TPCC\_EMRH registers, exceeding event queue thresholds in EDMA\_TPCC\_CCERR register, etc.).

#### 11.3.1.2 Third-Party Transfer Controller

The TPTC module is the EDMA transfer engine that generates transfers as programmed in dedicated working registers, using two dedicated controller ports: a read-only port and a write-only port.

[Figure 11-6](#) shows a functional block diagram and of the EDMA transfer controller (EDMA\_TPTC) and its connection to the EDMA\_TPCC.

**Figure 11-6. TPTC Block Diagram**

#### Note

The port data bus width of the instances of the TPTC is fixed at 64 bits.

Two instances of the EDMA\_TPTC generate concurrent traffic on the L3\_VBUSM interconnect. Each TC controller consists of the following components:

- **DMA Program Register Set:** Stores the context for the DMA transfer that is loaded into the active register set when the current active register set completes. The CPU or TPCC programs the Program Register Set, not the active register set. For typical standalone operation, the CPU programs the Program Register while the TC services the Active register set. The Program Register set includes ownership control such that CPU software and the EDMA stay synchronized relative to one another.
- **Source Active Register Set :** Stores the context (src/dst/cnt/etc) for the DMA Transfer Request (TR) in progress in the Read Controller. The Active register set is split into independent Source and Destination, because the source interconnect controller and the destination interconnect controller operate independently of one another.
- **Destination FIFO Register Set:** Stores the context (src/dst/cnt/etc) for the DMA Transfer Request (TR) in progress, or pending, in the Write Controller. The pending register must allow the source controller to begin processing a new TR while the destination register set processes the previous TR.
- **Channel FIFO:** Temporary holding buffer for in-flight data. The read return data of the source peripheral is stored in the Data FIFO, and then is written to the destination peripheral by the write command/data bus.
- **Read Controller/Interconnect Read Interface:** The Interconnect read interface issues optimally sized read commands to the source peripheral, based on a burst size of 32 bytes and available landing space in the channel FIFO.
- **Write controller/Interconnect Write interface:** The local interconnect write interface issues optimally sized write commands to the destination peripheral, based on a burst size of 32 bytes and available data in the channel FIFO.
- **Completion interface:** sends completion codes to the EDMA\_TPCC when a transfer completes and generates interrupts and chained events in the TPCC module.
- **Configuration port:** Target interface that provides read/write access to program registers and read access to all memory-mapped TPTC registers.

When one EDMA\_TPTC module is idle and receive its first TR, DMA program register set receives the TR, where it transitions to the DMA source active set and the destination FIFO register set immediately. The second

TR (if pending from EDMA\_TPCC) is loaded into the DMA program set, ensuring it can start as soon as possible when the active transfer completes. As soon as the current active set is exhausted, the TR is loaded from the DMA program register set into the DMA source active register set as well as to the appropriate entry in the destination FIFO register set.

The read controller issues read commands controlled by the rules of command fragmentation and optimization. These are issued only when the data FIFO has space available for the data read. When sufficient data is in the data FIFO, the write controller starts issuing a write command again following the rules for command fragmentation and optimization.

Depending on the number of entries, the read controller can process up to two or four transfer requests ahead of the destination subject to the amount of free data FIFO.

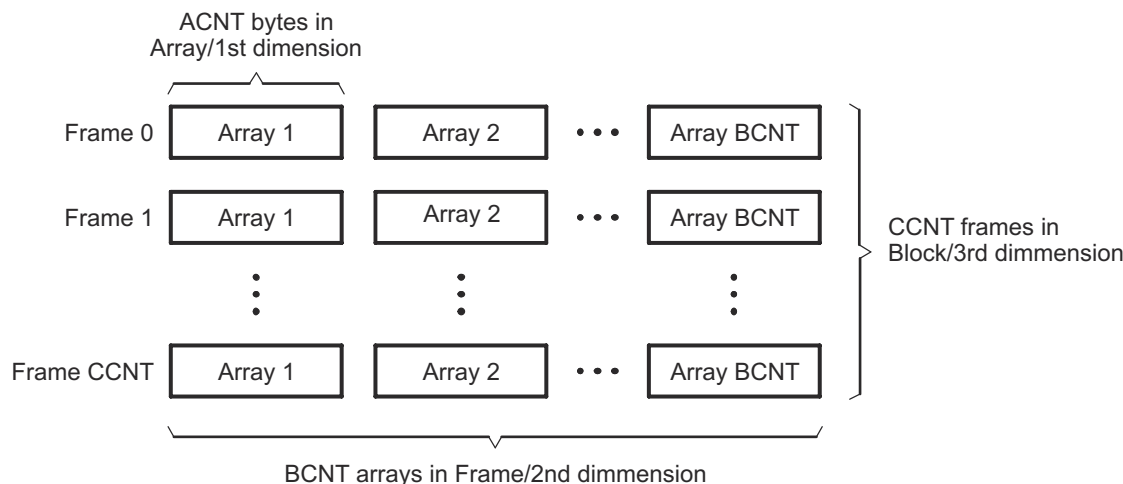

### 11.3.2 Types of EDMA Controller Transfers

An EDMA transfer is always defined in terms of three dimensions. Figure 11-7 shows the three dimensions used by EDMA controller transfers. These three dimensions are defined as:

- 1st Dimension or Array (A): The 1st dimension in a transfer consists of EDMA\_TPCC\_ABCNT\_n[15:0] ACNT contiguous bytes.
- 2nd Dimension or Frame (B): The 2nd dimension in a transfer consists of EDMA\_TPCC\_ABCNT\_n[31:16] BCNT arrays of ACNT bytes. Each array transfer in the 2nd dimension is separated from each other by an index programmed using bit-fields EDMA\_TPCC\_BIDX\_n[15:0] SBIDX or EDMA\_TPCC\_BIDX\_n[31:16] DBIDX.
- 3rd Dimension or Block (C): The 3rd dimension in a transfer consists of CCNT frames of BCNT arrays of ACNT bytes. The Count for 3rd Dimension is defined in PaRAM memory EDMA\_TPCC\_CCNT\_n[15:0] CCNT. Each transfer in the 3rd dimension is separated from the previous by an index programmed using EDMA\_TPCC\_CIDX\_n[15:0] SCIDX or EDMA\_TPCC\_CIDX\_n[31:16] DCIDX.

#### Note

The reference point for the index depends on the synchronization type. The amount of data transferred upon receipt of a trigger/synchronization event is controlled by the synchronization types (EDMA\_TPCC\_OPT\_n[2] SYNCDIM bit). For these three dimensions, only two synchronization types are supported: A-synchronized transfers and AB-synchronized transfers.

edma-007

**Figure 11-7. Definition of ACNT, BCNT, and CCNT**

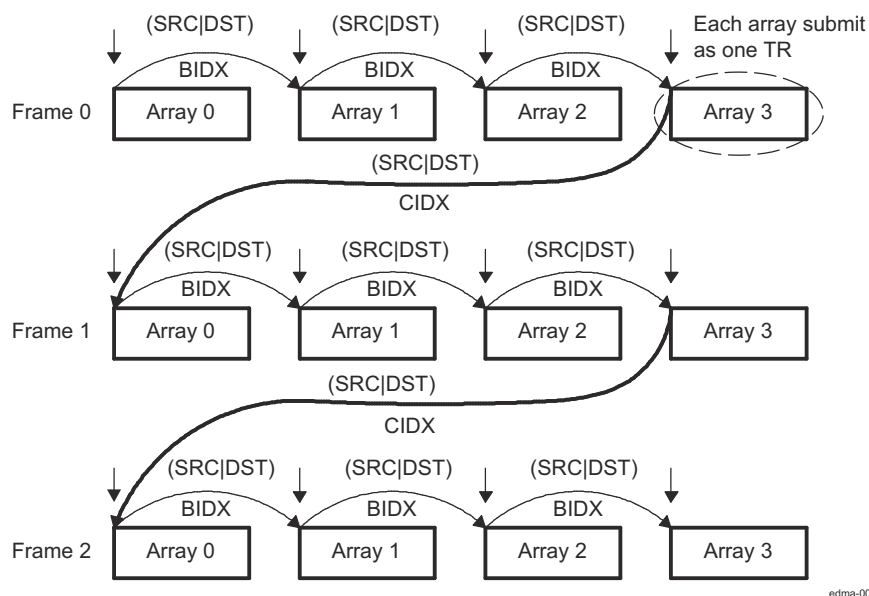

### 11.3.2.1 A-Synchronized Transfers

In an A-synchronized transfer, each EDMA sync event initiates the transfer of the 1st dimension of EDMA\_TPCC\_ABCNT\_n[15:0] ACNT bytes, or one array of ACNT bytes. Each event/TR packet conveys the transfer information for one array only. Thus, BCNT × CCNT events are needed to completely service a PaRAM set.

Arrays are always separated by EDMA\_TPCC\_BIDX\_n[15:0] SBIDX and EDMA\_TPCC\_BIDX\_n[31:16] DBIDX, as shown in Figure 11-8, where the start address of Array N is equal to the start address of Array N – 1 plus source (SRC) or destination (DST) in EDMA\_TPCC\_BIDX\_n register.

Frames are always separated by EDMA\_TPCC\_CIDX\_n[15:0] SCIDX and EDMA\_TPCC\_CIDX\_n[31:16] DCIDX. For A-synchronized transfers, after the frame is exhausted, the address is updated by adding SRCCIDX/ DSTCIDX to the beginning address of the last array in the frame. As in Figure 11-8, SRCCIDX / DSTCIDX is the difference between the start of Frame 0 Array 3 to the start of Frame 1 Array 0.

Figure 11-8 shows an A-synchronized transfer of 3 (CCNT) frames of 4 (BCNT) arrays of n (ACNT) bytes. In this example, a total of 12 sync events (BCNT × CCNT) exhaust a PaRAM set. See Figure 11-8 for details on parameter set updates.

**Figure 11-8. A-Synchronized Transfers (ACNT = n, BCNT = 4, CCNT = 3)**

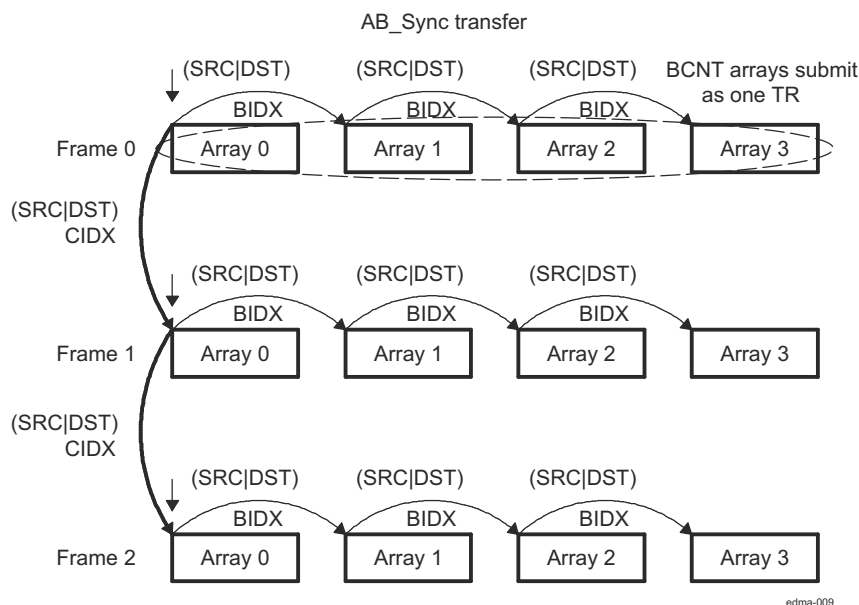

### 11.3.2.2 AB-Synchronized Transfers

In a AB-synchronized transfer, each EDMA sync event initiates the transfer of 2 dimensions or one frame. Each event/TR packet conveys information for one entire frame of BCNT\_n arrays of ACNT\_n bytes. Thus, EDMA\_TPCC\_CCNT\_n events are needed to completely service a PaRAM set.

Arrays are always separated by EDMA\_TPCC\_BIDX\_n[15:0] SBIDX and EDMA\_TPCC\_BIDX\_n[31:16] DBIDX as shown in Figure 11-9. Frames are always separated by SRCCIDX and DSTCIDX.

Note that for AB-synchronized transfers, after a TR for the frame is submitted, the address update is to add EDMA\_TPCC\_CIDX\_n[15:0] SCIDX / EDMA\_TPCC\_CIDX\_n[31:16] DCIDX to the beginning address of the beginning array in the frame. This is different from A-synchronized transfers where the address is updated by adding SRCCIDX/DSTCIDX to the start address of the last array in the frame. See Section 11.3.3.6 for details on parameter set updates.

Figure 11-9 shows an AB-synchronized transfer of 3 (CCNT) frames of 4 (BCNT) arrays of n (ACNT) bytes. In this example, a total of 3 sync events (CCNT) exhaust a PaRAM set; that is, a total of 3 transfers of 4 arrays each completes the transfer.

**Figure 11-9. AB-Synchronized Transfers (ACNT = n, BCNT = 4, CCNT = 3)**

#### Note

ABC-synchronized transfers are not directly supported. It can be logically achieved by chaining between multiple AB-synchronized transfers.

### 11.3.3 Parameter RAM (PaRAM)

The EDMA controller is a RAM-based architecture. The transfer context (source/destination addresses, count, indexes, etc.) for DMA or QDMA channels is programmed in a parameter RAM table in EDMA\_TPCC. The PaRAM table is segmented into multiple PaRAM sets. Each PaRAM set includes eight four-byte PaRAM set entries (32-bytes total per PaRAM set), which includes typical DMA transfer parameters such as source address, destination address, transfer counts, indexes, options, etc.

The PaRAM structure supports flexible ping-pong, circular buffering, channel chaining, and auto-reloading (linking).

The contents of the PaRAM include the following:

- PaRAM sets
- 64 channels that are direct mapped and can be used as link or QDMA sets if not used for DMA channels
- 8 channels remain for link or QDMA sets

By default, all channels map to PaRAM set to 0 and should be remapped before use by EDMA\_TPCC\_DCHMAPN\_m and EDMA\_TPCC\_QCHMAPN\_j registers.

**Table 11-11. EDMA Parameter RAM Contents**

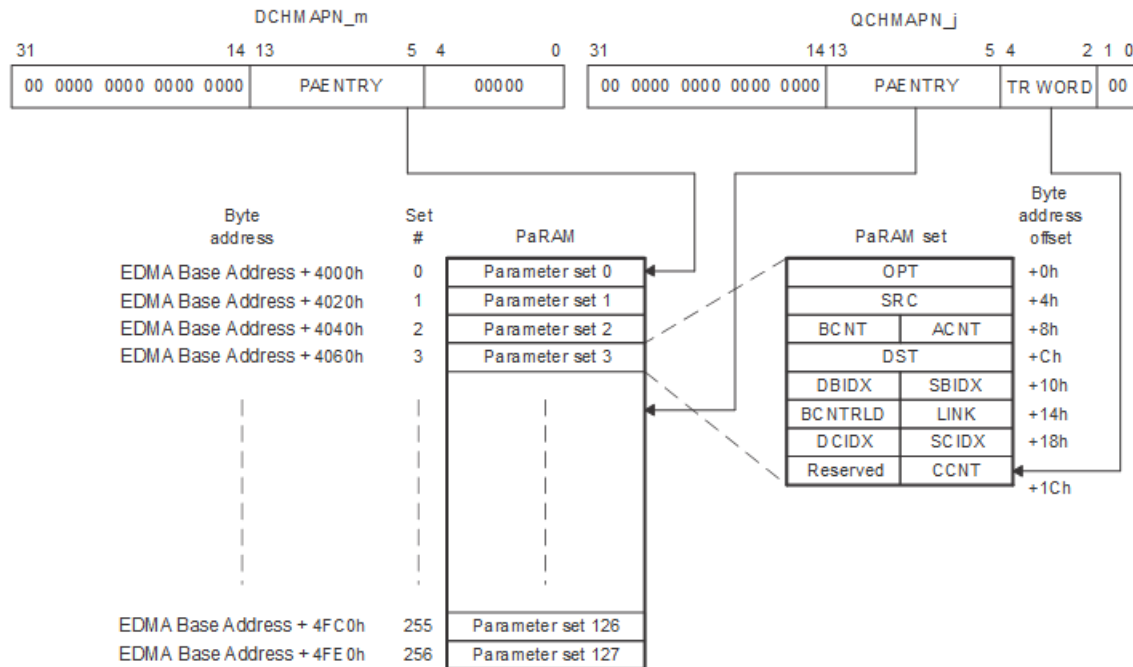

PaRAM Set Number	Base Address	Parameters <sup>(1)</sup>
0	EDMA Base Address + 4000h to EDMA Base Address + 401Fh	PaRAM set 0
1	EDMA Base Address + 4020h to EDMA Base Address + 403Fh	PaRAM set 1
2	EDMA Base Address + 4040h to EDMA Base Address + 405Fh	PaRAM set 2
3	EDMA Base Address + 4060h to EDMA Base Address + 407Fh	PaRAM set 3
4	EDMA Base Address + 4080h to EDMA Base Address + 409Fh	PaRAM set 4
5	EDMA Base Address + 40A0h to EDMA Base Address + 40BFh	PaRAM set 5
6	EDMA Base Address + 40C0h to EDMA Base Address + 40DFh	PaRAM set 6
7	EDMA Base Address + 40E0h to EDMA Base Address + 40FFh	PaRAM set 7
8	EDMA Base Address + 4100h to EDMA Base Address + 411Fh	PaRAM set 8
9	EDMA Base Address + 4120h to EDMA Base Address + 413Fh	PaRAM set 9
...	...	...
63	EDMA Base Address + 47E0h to EDMA Base Address + 47FFh	PaRAM set 63
64	EDMA Base Address + 4800h to EDMA Base Address + 481Fh	PaRAM set 64
65	EDMA Base Address + 4820h to EDMA Base Address + 483Fh	PaRAM set 65
...	...	...
127	EDMA Base Address + 5000h to EDMA Base Address + 4FE0h	PaRAM set 127

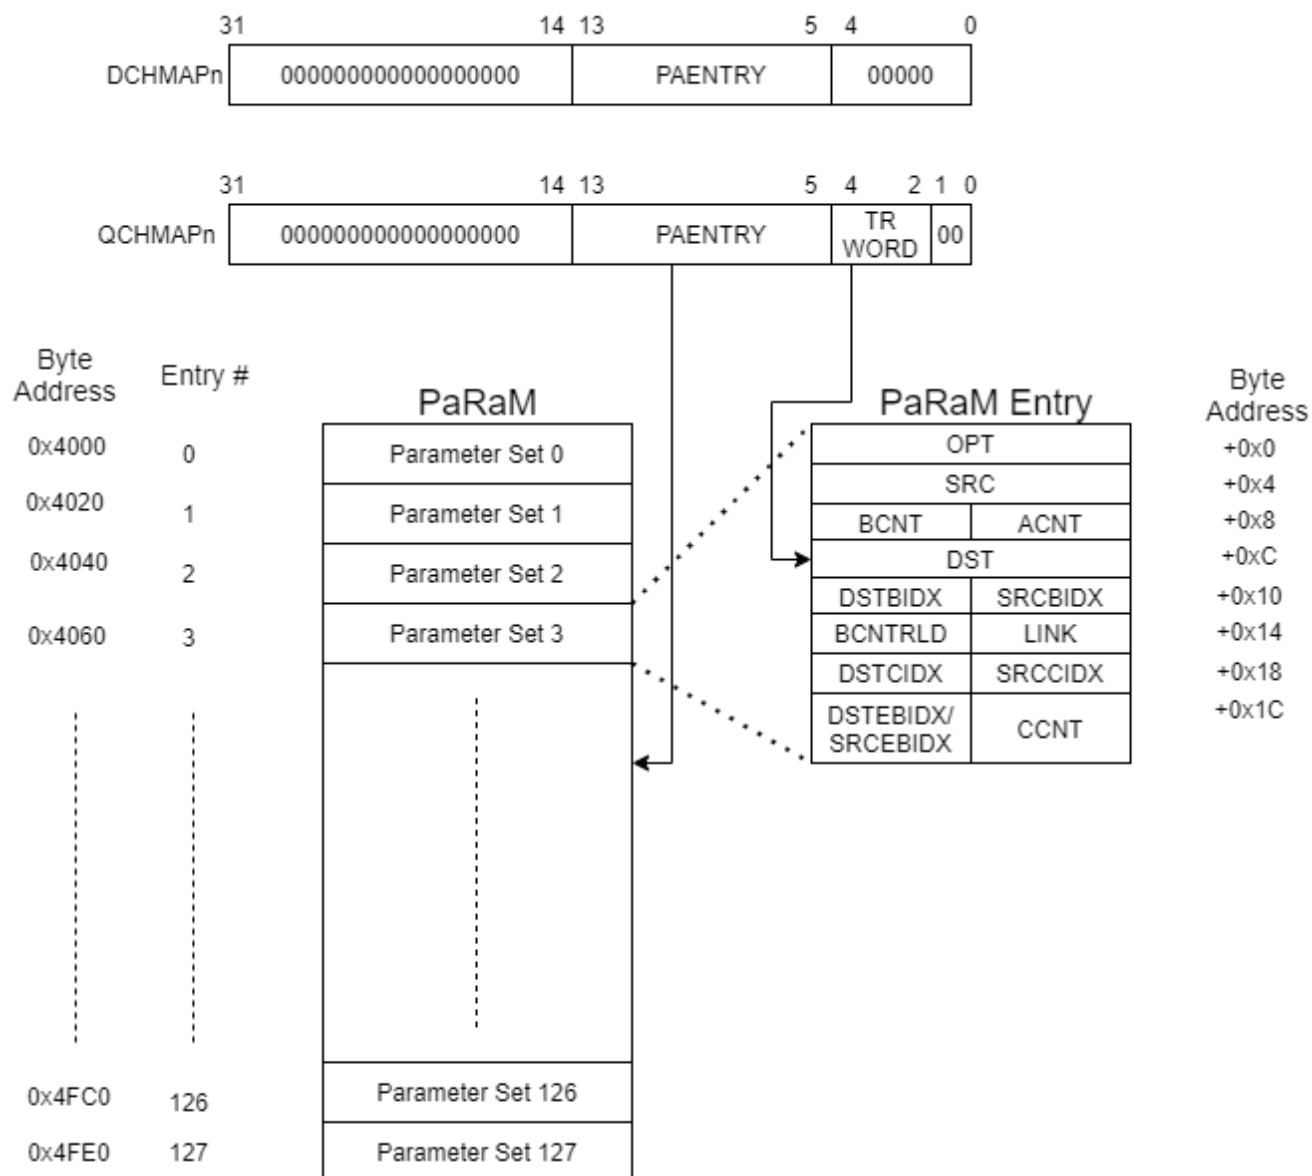

(1) The device has 8 QDMA channels that can be mapped to any parameter set number from 0 to .

### Note

#### 11.3.3.1 PaRAM

Each parameter set of PaRAM is organized into eight 32-bit words or 32 bytes, as shown in [Figure 11-10](#) and described in [Table 11-12](#). Each PaRAM set consists of 16-bit and 32-bit parameters.

**Figure 11-10. PaRAM Set**

### Note

Figure above is a representation of 128 bit entries. For device specific details please refer to [EDMA Configuration](#) chapter.

**Table 11-12. EDMA Channel Parameter Description**

Offset Address (bytes)	Acronym	Parameter	Description
0h	OPT	Channel Options EDMA_TPCC_OPT_n register	Transfer configuration options
4h	SRC	Channel Source Address EDMA_TPCC_SRC_n register	The byte address from which data is transferred
8h <sup>(1)</sup>	ACNT	Count for 1st Dimension EDMA_TPCC_ABCNT_n[15:0] ACNT bit-field.	Unsigned value specifying the number of contiguous bytes within an array (first dimension of the transfer). Valid values range from 1 to 65 535.
	BCNT	Count for 2nd Dimension EDMA_TPCC_ABCNT_n[31:16] BCNT bit-field.	Unsigned value specifying the number of arrays in a frame, where an array is ACNT bytes. Valid values range from 1 to 65 535.
Ch	DST	Channel Destination Address EDMA_TPCC_DST_n register	The byte address to which data is transferred
10h <sup>(1)</sup>	SBIDX	Source BCNT Index EDMA_TPCC_BIDX_n[15:0] SBIDX bit-field.	Signed value specifying the byte address offset between source arrays within a frame (2nd dimension). Valid values range from –32 768 and 32 767.
	DBIDX	Destination BCNT Index EDMA_TPCC_BIDX_n[31:16] DBIDX bit-field.	Signed value specifying the byte address offset between destination arrays within a frame (2nd dimension). Valid values range from –32 768 and 32 767.
14h <sup>(1)</sup>	LINK	Link Address EDMA_TPCC_LNK_n[15:0] LINK bit-field	The PaRAM address containing the PaPARAM set to be linked (copied from) when the current PaPARAM set is exhausted. A value of FFFFh specifies a null link.
	BCNTRLD	BCNT Reload EDMA_TPCC_LNK_n[31:16] BCNTRLD bit-field	The count value used to reload BCNT when BCNT decrements to 0 (TR is submitted for the last array in 2nd dimension). Only relevant in A-synchronized transfers.
18h <sup>(1)</sup>	SCIDX	Source CCNT index. EDMA_TPCC_CIDX_n[15:0] SCIDX bit-field.	Signed value specifying the byte address offset between frames within a block (3rd dimension). Valid values range from –32 768 and 32 767.  A-synchronized transfers: The byte address offset from the beginning of the last source array in a frame to the beginning of the first source array in the next frame.  AB-synchronized transfers: The byte address offset from the beginning of the first source array in a frame to the beginning of the first source array in the next frame.
	DCIDX	Destination CCNT index. EDMA_TPCC_CIDX_n[31:16] DCIDX bit-field.	Signed value specifying the byte address offset between frames within a block (3rd dimension). Valid values range from –32 768 and 32 767.  A-synchronized transfers: The byte address offset from the beginning of the last destination array in a frame to the beginning of the first destination array in the next frame.  AB-synchronized transfers: The byte address offset from the beginning of the first destination array in a frame to the beginning of the first destination array in the next frame.
1Ch	CCNT	Count for 3rd Dimension. EDMA_TPCC_CCNT_n[15:0] CCNT bit-field.	Unsigned value specifying the number of frames in a block, where a frame is BCNT arrays of ACNT bytes. Valid values range from 1 to 65 535.
	Reserved	Reserved	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts can result in undefined behavior.

- (1) If OPT, SRC, or DST is the trigger word for a QDMA transfer, then it is required to do a 32-bit access to that field. Furthermore, it is recommended to perform only 32-bit accesses on the parameter RAM for best code compatibility. For example, switching the endianness of the processor swaps addresses of the 16-bit fields, but 32-bit accesses avoid the issue entirely.

### 11.3.3.2 EDMA Channel PaRAM Set Entry Fields

#### 11.3.3.2.1 Channel Options Parameter (OPT)

This is the control register for TPCC channel configuration options. Refer to the EDMA\_TPCC\_OPT\_n register bitfield description in the for additional details.

#### 11.3.3.2.2 Channel Source Address (SRC)

The 32-bit source address parameter specifies the starting byte address of the source. For SAM in increment mode, there are no alignment restrictions imposed by EDMA. For SAM in FIFO addressing mode, it must program the source address to be aligned to a 256-bit aligned address (5 LSBs of address must be 0). If this rule is not observed, the EDMA\_TPTC returns an error. Refer to [Section 11.3.12.3 Error Generation](#) for additional details.

#### 11.3.3.2.3 Channel Destination Address (DST)

The 32-bit destination address parameter specifies the starting byte address of the destination. For DAM in increment mode, there are no alignment restrictions imposed by EDMA. For DAM in FIFO addressing mode, it must program the destination address to be aligned to a 256-bit aligned address (5 LSBs of address must be 0). If this rule is not observed, the EDMA\_TPTC returns an error. Refer to *Error Generation* for additional details.

#### 11.3.3.2.4 Count for 1st Dimension (ACNT)

EDMA\_TPCC\_ABCNT\_n[15:0] ACNT represents the number of bytes within the 1st dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 1 and 65535. Therefore, the maximum number of bytes in an array is 65 535 bytes (64K – 1 bytes). ACNT must be greater than or equal to 1 for a TR to be submitted to EDMA\_TPTC. A transfer with ACNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in EDMA\_TPCC\_OPT\_n.

Refer to [Section 11.3.3.5 Dummy Versus Null Transfer Comparison](#) and [Section 11.3.5.3 Dummy or Null Completion](#) for details on dummy/null completion conditions.

#### 11.3.3.2.5 Count for 2nd Dimension (BCNT)

EDMA\_TPCC\_ABCNT\_n[15:0] BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation, valid values for BCNT are between 1 and 65 535. Therefore, the maximum number of arrays in a frame is 65 535 (64K – 1 arrays). A transfer with BCNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in EDMA\_TPCC\_OPT\_n.

Refer to [Section 11.3.3.5 Dummy Versus Null Transfer Comparison](#) and [Section 11.3.5.3 Dummy or Null Completion](#) for details on dummy/null completion conditions.

#### 11.3.3.2.6 Count for 3rd Dimension (CCNT)

EDMA\_TPCC\_CCNT\_n[15:0] CCNT is a 16-bit unsigned value that specifies the number of frames in a block. Valid values for CCNT are between 1 and 65 535. Therefore, the maximum number of frames in a block is 65 535 (64K – 1 frames). A transfer with CCNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in EDMA\_TPCC\_OPT\_n.

A CCNT value of 0 is considered either a null or dummy transfer.

Refer to [Section 11.3.3.5 Dummy Versus Null Transfer Comparison](#) and [Section 11.3.5.3 Dummy or Null Completion](#) for details on dummy/null completion conditions.

#### 11.3.3.2.7 BCNT Reload (BCNTRLD)

EDMA\_TPCC\_LNK\_n[31:16] BCNTRLD is a 16-bit unsigned value used to reload the EDMA\_TPCC\_ABCNT\_n[15:0] BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-synchronized transfers. In this case, the EDMA\_TPCC decrements the BCNT value by 1 on

each TR submission. When BCNT reaches 0, the EDMA\_TPCC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value.

For AB-synchronized transfers, the EDMA\_TPCC submits the BCNT in the TR and the EDMA\_TPTC decrements BCNT appropriately. For AB-synchronized transfers, BCNTRLD is not used.

#### 11.3.3.2.8 Source B Index (SBIDX)

EDMA\_TPCC\_BIDX\_n[15:0] SBIDX is a 16-bit signed value (2s complement) used for source address modification between each array in the 2nd dimension. Valid values for EDMA\_TPCC\_BIDX\_n[15:0] SBIDX are between –32 768 and 32 767. It provides a byte address offset from the beginning of the source array to the beginning of the next source array. It applies to both A-synchronized and AB-synchronized transfers. Some examples:

- EDMA\_TPCC\_BIDX\_n[15:0] SBIDX = 0000h (0): no address offset from the beginning of an array to the beginning of the next array. All arrays are fixed to the same beginning address.
- EDMA\_TPCC\_BIDX\_n[15:0] SBIDX = 0003h (+3): the address offset from the beginning of an array to the beginning of the next array in a frame is 3 bytes. For example, if the current array begins at address 1000h, the next array begins at 1003h.
- EDMA\_TPCC\_BIDX\_n[15:0] SBIDX = FFFFh (–1): the address offset from the beginning of an array to the beginning of the next array in a frame is –1 byte. For example, if the current array begins at address 5054h, the next array begins at 5053h.

#### 11.3.3.2.9 Destination B Index (DBIDX)

EDMA\_TPCC\_BIDX\_n[31:16] DBIDX is a 16-bit signed value (2s complement) used for destination address modification between each array in the 2nd dimension. Valid values for EDMA\_TPCC\_BIDX\_n[31:16] DBIDX are between –32 768 and 32 767. It provides a byte address offset from the beginning of the destination array to the beginning of the next destination array within the current frame. It applies to both A-synchronized and AB-synchronized transfers. Refer to [Section 11.3.3.2.8 Source B Index \(SBIDX\)](#) for examples.

#### 11.3.3.2.10 Source C Index (SCIDX)

EDMA\_TPCC\_CIDX\_n[15:0] SCIDX is a 16-bit signed value (2s complement) used for source address modification in the 3rd dimension. Valid values for EDMA\_TPCC\_CIDX\_n[15:0] SCIDX are between –32 768 and 32 767. It provides a byte address offset from the beginning of the current array (pointed to by SRC address) to the beginning of the first source array in the next frame. It applies to both A-synchronized and AB-synchronized transfers.

#### Note

When SCIDX is applied, the current array in an A-synchronized transfer is the last array in the frame ([Figure 11-8](#)), while the current array in an AB-synchronized transfer is the first array in the frame ([Figure 11-9](#)).

#### 11.3.3.2.11 Destination C Index (DCIDX)

EDMA\_TPCC\_CIDX\_n[31:16] DCIDX is a 16-bit signed value (2s complement) used for destination address modification in the 3rd dimension. Valid values are between –32 768 and 32 767. It provides a byte address offset from the beginning of the current array (pointed to by DST address) to the beginning of the first destination array TR in the next frame. It applies to both A-synchronized and AB-synchronized transfers.

#### Note

When DCIDX is applied, the current array in an A-synchronized transfer is the last array in the frame ([Figure 11-8](#)), while the current array in a AB-synchronized transfer is the first array in the frame ([Figure 11-9](#)).

### 11.3.3.2.12 Link Address (LINK)

The EDMA\_TPCC provides a mechanism, called linking, to reload the current PaRAM set upon its natural termination (that is, after the count fields are decremented to 0) with a new PaRAM set. The 16-bit parameter EDMA\_TPCC\_LNK\_n[15:0] LINK specifies the byte address offset in the PaRAM from which the EDMA\_TPCC loads/reloads the next PaRAM set during linking.

It must program the link address to point to a valid aligned 32-byte PaRAM set. The 5 LSBs of the LINK field should be cleared to 0.

The EDMA\_TPCC ignores the upper 2 bits of the LINK entry, allowing the flexibility of programming the link address as either an absolute/literal byte address or use the PaRAM-base-relative offset address. Therefore, if it use the literal address with a range from 4000h to 7FFFh, it will be treated as a PaRAM-base-relative value of 0000h to 3FFFh.

It should check that the programmed value in the EDMA\_TPCC\_LNK\_n[15:0] LINK field is correctly, so that link update is requested from a PaRAM address that falls in the range of the available PaRAM addresses on the device.

Value of FFFFh in EDMA\_TPCC\_LNK\_n[15:0] LINK bit-field is referred to as a NULL link that should cause the EDMA\_TPCC to perform an internal write of 0 to all entries of the current PaRAM set, except for the EDMA\_TPCC\_LNK\_n[15:0] LINK field is set to FFFFh. Also, see [Section 11.3.5 Completion of a DMA Transfer](#) for details on terminating a transfer.

### 11.3.3.3 Null PaRAM Set

A null PaRAM set is defined as a PaRAM set where all count fields (EDMA\_TPCC\_ABCNT\_n[15:0] ACNT, EDMA\_TPCC\_ABCNT\_n[31:16] BCNT, and EDMA\_TPCC\_CCNT\_n[15:0] CCNT) are cleared to 0. If a PaRAM set associated with a channel is a NULL set, then when serviced by the EDMA\_TPCC, the bit corresponding to the channel is set in the associated event missed register (EDMA\_TPCC\_EMR, EDMA\_TPCC\_EMRH, or EDMA\_TPCC\_QEMR). This bit remains set in the associated secondary event register (EDMA\_TPCC\_SER, EDMA\_TPCC\_SERH, or EDMA\_TPCC\_QSER).

*This implies that any future events on the same channel are ignored by the EDMA\_TPCC and it is required to clear the bit in EDMA\_TPCC\_SER, EDMA\_TPCC\_SERH, or EDMA\_TPCC\_QSER for the channel. This is considered an error condition, since events are not expected on a channel that is configured as a null transfer.*

### 11.3.3.4 Dummy PaRAM Set

A dummy PaRAM set is defined as a PaRAM set where at least one of the count fields (EDMA\_TPCC\_ABCNT\_n[15:0] ACNT, EDMA\_TPCC\_ABCNT\_n[31:16] BCNT, or EDMA\_TPCC\_CCNT\_n[15:0] CCNT) is cleared to 0 and at least one of the count fields is nonzero.

If a PaRAM set associated with a channel is a dummy set, then when serviced by the EDMA\_TPCC, it will not set the bit corresponding to the channel (DMA/QDMA) in the event missed register (EDMA\_TPCC\_EMR, EDMA\_TPCC\_EMRH, or EDMA\_TPCC\_QEMR) and the secondary event register (EDMA\_TPCC\_SER, EDMA\_TPCC\_SERH, or EDMA\_TPCC\_QSER) bit gets cleared similar to a normal transfer. Future events on that channel are serviced. A dummy transfer is a legal transfer of 0 bytes.

### 11.3.3.5 Dummy Versus Null Transfer Comparison

There are some differences in the way the EDMA\_TPCC logic treats a dummy versus a null transfer request. A null transfer request is an error condition, but a dummy transfer is a legal transfer of 0 bytes. A null transfer causes an error bit (*En*) in EDMA\_TPCC\_EMR to get set and the *En* bit in EDMA\_TPCC\_SER remains set, essentially preventing any further transfers on that channel without clearing the associated error registers.

[Table 11-13](#) summarizes the conditions and effects of null and dummy transfer requests.

**Table 11-13. Dummy and Null Transfer Request**

Feature	Null TR	Dummy TR
EDMA_TPCC_EMR / EDMA_TPCC_EMRH / EDMA_TPCC_QEMR is set	Yes	No
EDMA_TPCC_SER / EDMA_TPCC_SERH / EDMA_TPCC_QSER remains set	Yes	No

**Table 11-13. Dummy and Null Transfer Request (continued)**

Feature	Null TR	Dummy TR
Link update (STATIC = 0 in EDMA_TPCC_OPT_n)	Yes	Yes
EDMA_TPCC_QER is set	Yes	Yes
EDMA_TPCC_IPR / EDMA_TPCC_IPRH, EDMA_TPCC_CER / EDMA_TPCC_CERH is set using early completion	Yes	Yes

### 11.3.3.6 Parameter Set Updates

When a TR is submitted for a given DMA/QDMA channel and its corresponding PaRAM set, the EDMA\_TPCC is responsible for updating the PaRAM set in anticipation of the next trigger event. For events that are not final, this includes address and count updates; for final events, this includes the link update.

The specific PaRAM set entries that are updated depend on the channel's synchronization type (A-synchronized or AB-synchronized) and the current state of the PaRAM set. A B-update refers to the decrementing of EDMA\_TPCC\_ABCNT\_n[31:16] BCNT in the case of A-synchronized transfers after the submission of successive TRs. A C-update refers to the decrementing of CCNT in the case of A-synchronized transfers after BCNT TRs for EDMA\_TPCC\_ABCNT\_n[15:0] ACNT byte transfers have submitted. For AB-synchronized transfers, a C-update refers to the decrementing of EDMA\_TPCC\_CCNT\_n[15:0] CCNT after submission of every transfer request.

Refer to [Table 11-14](#) for details and conditions on the parameter updates. A link update occurs when the PaRAM set is exhausted, as described in [Section 11.3.3.7 Linking Transfers](#).

After the TR is read from the PaRAM (and is in process of being submitted to EDMA\_TPTC), the following fields are updated if needed:

- A-synchronized: BCNT, CCNT, SRC, DST.
- AB-synchronized: CCNT, SRC, DST.

The following fields are not updated (except for during linking, where all fields are overwritten by the link PaRAM set):

- A-synchronized: EDMA\_TPCC\_ABCNT\_n[15:0] ACNT, EDMA\_TPCC\_LNK\_n[31:16] BCNTRLD, EDMA\_TPCC\_BIDX\_n[15:0] SBIDX, EDMA\_TPCC\_BIDX\_n[31:16] DBIDX, EDMA\_TPCC\_CIDX\_n[15:0] SCIDX, EDMA\_TPCC\_CIDX\_n[31:16] DCIDX, EDMA\_TPCC\_OPT\_n, EDMA\_TPCC\_LNK\_n[15:0] LINK.
- AB-synchronized: EDMA\_TPCC\_ABCNT\_n[15:0] ACNT, EDMA\_TPCC\_ABCNT\_n[31:16] BCNT, EDMA\_TPCC\_LNK\_n[31:16] BCNTRLD, EDMA\_TPCC\_BIDX\_n[15:0] SBIDX, EDMA\_TPCC\_BIDX\_n[31:16] DBIDX, EDMA\_TPCC\_CIDX\_n[15:0] SCIDX, EDMA\_TPCC\_CIDX\_n[31:16] DCIDX, EDMA\_TPCC\_OPT\_n, EDMA\_TPCC\_LNK\_n[15:0] LINK.

### Note

PaRAM updates only pertain to the information that is needed to properly submit the next transfer request to the EDMA\_TPTC. Updates that occur while data is moved within a transfer request are tracked within the transfer controller, and is detailed in [Section 11.3.12 EDMA Transfer Controller \(EDMA\\_TPTC\)](#). For A-synchronized transfers, the EDMA\_TPCC always submits a TRP for EDMA\_TPCC\_ABCNT\_n[15:0] ACNT bytes (EDMA\_TPCC\_ABCNT\_n[31:16] BCNT = 1 and EDMA\_TPCC\_CCNT\_n[15:0] CCNT = 1). For AB-synchronized transfers, the EDMA\_TPCC always submits a TRP for EDMA\_TPCC\_ABCNT\_n[15:0] ACNT bytes of BCNT arrays (EDMA\_TPCC\_CCNT\_n[15:0] CCNT = 1). The EDMA\_TPTC is responsible for updating source and destination addresses within the array based on EDMA\_TPCC\_ABCNT\_n[15:0] ACNT and EDMA\_TPCC\_OPT\_n[10:8] FWID. For AB-synchronized transfers, the EDMA\_TPTC is also responsible to update source and destination addresses between arrays based on EDMA\_TPCC\_BIDX\_n[15:0] SBIDX and EDMA\_TPCC\_BIDX\_n[31:16] DBIDX.

[Table 11-14](#) shows the details of parameter updates that occur within EDMA\_TPCC for A-synchronized and AB-synchronized transfers.

**Table 11-14. Parameter Updates in EDMA\_TPCC (for Non-Null, Non-Dummy PaRAM Set)**

	A-Synchronized Transfer			AB-Synchronized Transfer		
	B-Update	C-Update	Link Update	B-Update	C-Update	Link Update
Condition:	BCNT > 1	BCNT == 1 && CCNT > 1	BCNT == 1 && CCNT == 1	N/A	EDMA_TPCC_CCNT_n[15:0] CCNT > 1	EDMA_TPCC_CCNT_n[15:0] CCNT == 1
SRC	+= SBIDX	+= SCIDX	= Link.EDMA_TPCC_SRC_n	in EDMA_TPT C	+= SCIDX	= Link.EDMA_TPCC_SRC_n
DST	+= DBIDX	+= DCIDX	= Link.EDMA_TPCC_DST_n	in EDMA_TPT C	+= DCIDX	= Link.EDMA_TPCC_DST_n
ACNT	None	None	= Link.EDMA_TPCC_ABCNT_n[15:0] ACNT	None	None	= Link.EDMA_TPCC_ABCNT_n[15:0] ACNT
BCNT	-- 1	= BCNTRL	= Link.EDMA_TPCC_ABCNT_n[31:16] BCNT	in EDMA_TPT C	N/A	= Link.EDMA_TPCC_ABCNT_n[31:16] BCNT
CCNT	None	-- 1	= Link.EDMA_TPCC_CCNT_n[15:0] CCNT	in EDMA_TPT C	-- 1	= Link.EDMA_TPCC_CCNT_n[15:0] CCNT
SBIDX	None	None	= Link.EDMA_TPCC_BIDX_n[15:0] SBIDX	in EDMA_TPT C	None	= Link.EDMA_TPCC_BIDX_n[15:0] SBIDX
DBIDX	None	None	= Link.EDMA_TPCC_BIDX_n[31:16] DBIDX	None	None	= Link.EDMA_TPCC_BIDX_n[31:16] DBIDX
SCIDX	None	None	= Link.EDMA_TPCC_BIDX_n[15:0] SBIDX	in EDMA_TPT C	None	= Link.EDMA_TPCC_BIDX_n[15:0] SBIDX
DCIDX	None	None	= Link.EDMA_TPCC_BIDX_n[31:16] DBIDX	None	None	= Link.EDMA_TPCC_BIDX_n[31:16] DBIDX
LINK	None	None	= Link.EDMA_TPCC_LNK_n[15:0] LINK	None	None	= Link.EDMA_TPCC_LNK_n[15:0] LINK
BCNTRLD	None	None	= Link.EDMA_TPCC_LNK_n[31:16] BCNTRLD	None	None	= Link.EDMA_TPCC_LNK_n[31:16] BCNTRLD
OPT <sup>(1)</sup>	None	None	= LINK.EDMA_TPCC_OPT_n	None	None	= LINK.EDMA_TPCC_OPT_n

(1) In all cases, no updates occur if EDMA\_TPCC\_OPT\_n[3] STATIC == 1 for the current PaRAM set.

### Note

The EDMA\_TPCC includes no special hardware to detect when an indexed address update calculation overflows/underflows. The address update will wrap across boundaries as programmed by the user. It should ensure that no transfer is allowed to cross internal port boundaries between peripherals. A single TR must target a single source/destination peripheral endpoint.

### 11.3.3.7 Linking Transfers

The EDMA\_TPCC provides a mechanism known as linking, which allows the entire PaRAM set to be reloaded from a location within the PaRAM memory map (for both DMA and QDMA channels). Linking is especially useful for maintaining ping-pong buffers, circular buffering, and repetitive/continuous transfers with no CPU intervention. Upon completion of a transfer, the current transfer parameters are reloaded with the parameter set pointed to by the 16-bit link address field of the current parameter set. Linking only occurs when the EDMA\_TPCC\_OPT\_n[3] STATIC bit is cleared.

---

#### Note

It should always link a transfer (EDMA or QDMA) to another useful transfer. If it must terminate a transfer, then link the transfer to a NULL parameter set. Refer to [Section 11.3.3.3 Null PaRAM Set](#).

---

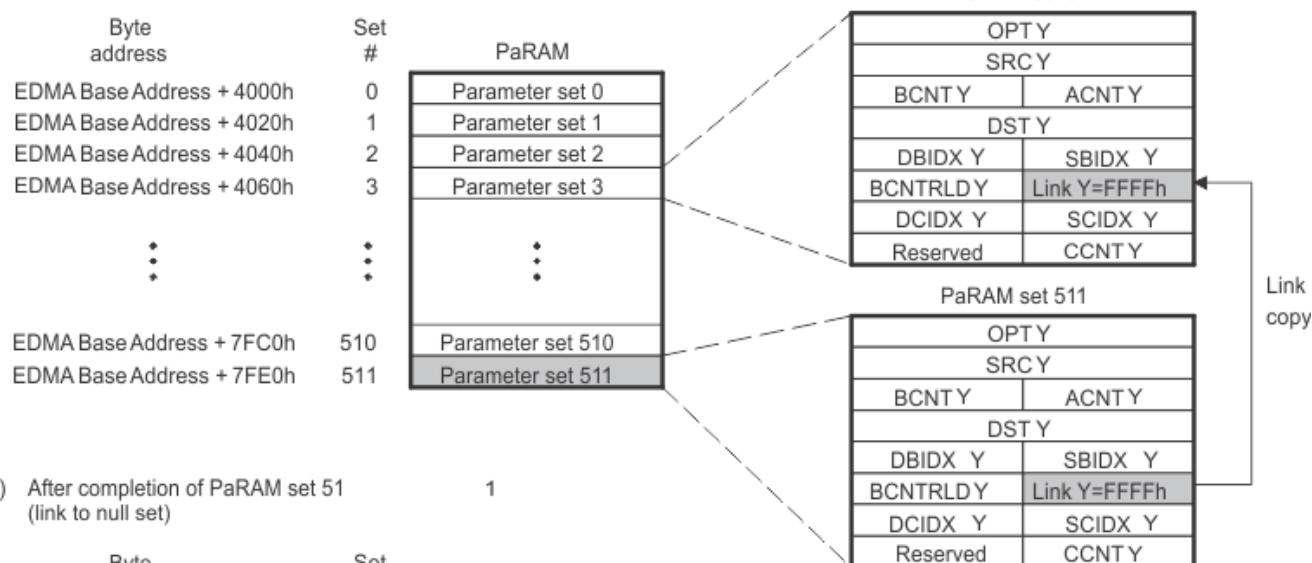

The link update occurs after the current PaRAM set event parameters have been exhausted. An event's parameters are exhausted when the EDMA channel controller has submitted all of the transfers that are associated with the PaRAM set.

A link update occurs for null and dummy transfers depending on the state of the EDMA\_TPCC\_OPT\_n[3] STATIC bit and the EDMA\_TPCC\_LNK\_n[15:0] LINK field. In both cases (null or dummy), if the value of EDMA\_TPCC\_LNK\_n[15:0] LINK is FFFFh, then a null PaRAM set (with all 0s and EDMA\_TPCC\_LNK\_n[15:0] LINK set to FFFFh) is written to the current PaRAM set.

Similarly, if EDMA\_TPCC\_LNK\_n[15:0] LINK is set to a value other than FFFFh, then the appropriate PaRAM location that EDMA\_TPCC\_LNK\_n[15:0] LINK points to is copied to the current PaRAM set.

Once the channel completion conditions are met for an event, the transfer parameters that are located at the link address are loaded into the current DMA or QDMA channel's associated parameter set. This indicates that the EDMA\_TPCC reads the entire set (eight words) from the PaRAM set specified by EDMA\_TPCC\_LNK\_n[15:0] LINK and writes all eight words to the PaRAM set that is associated with the current channel. [Figure 11-11](#) shows an example of a linked transfer.

(a) At initialization

(b) After completion of PaRAM set 3  
(link update)

(c) After completion of PaRAM set 51  
(link to null set)

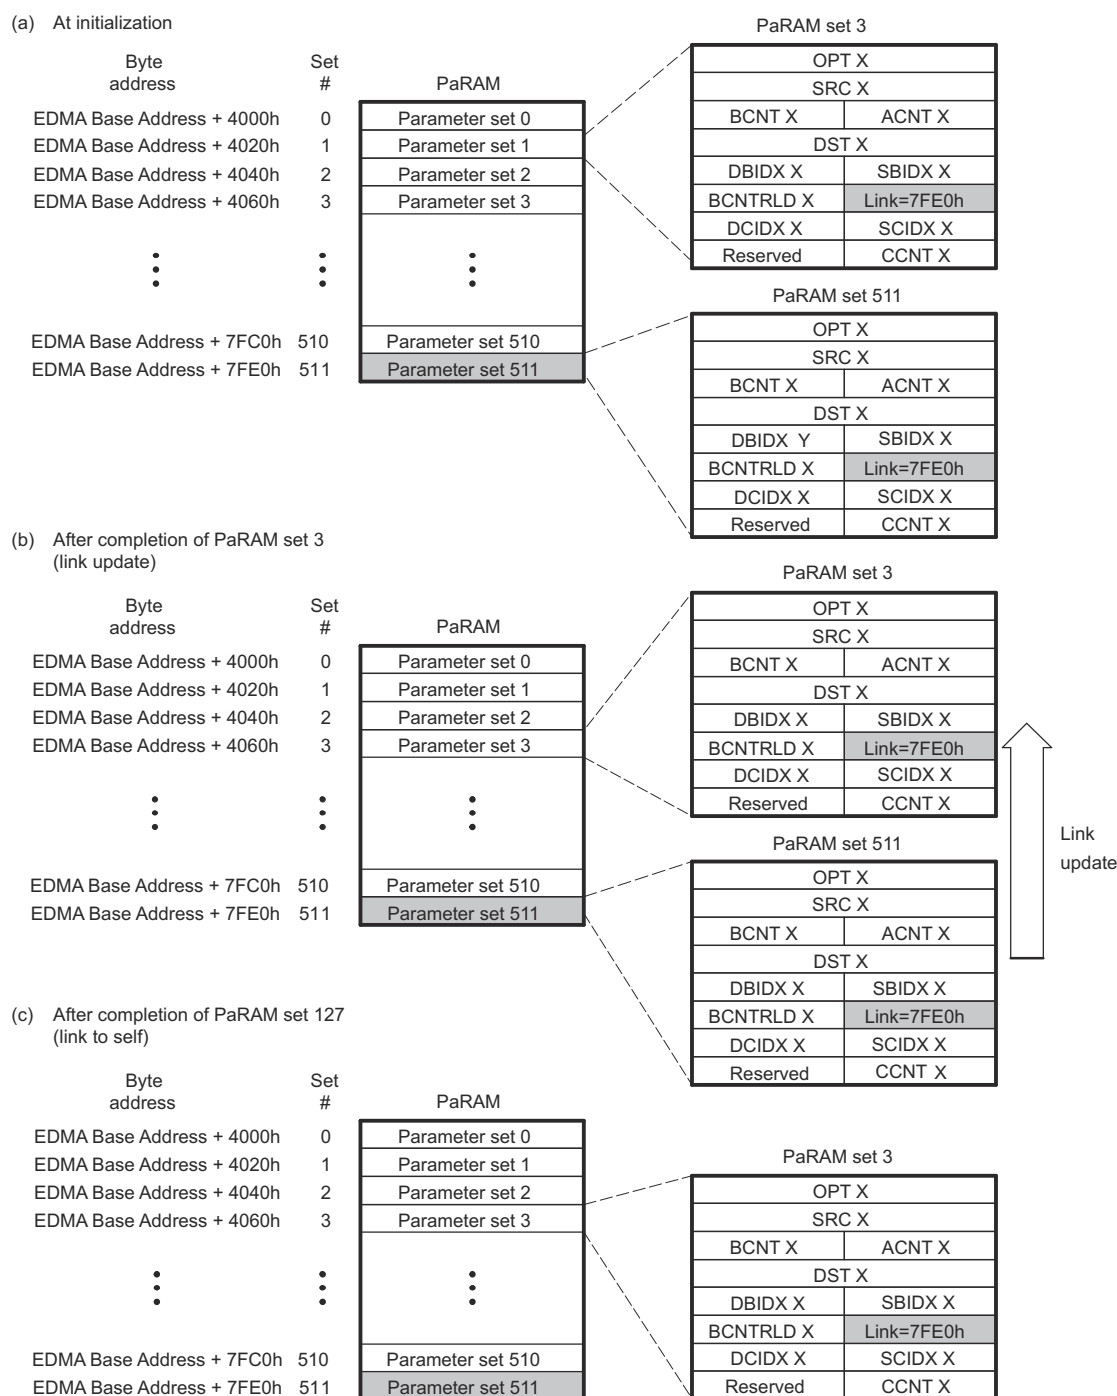

awr254-011

**Figure 11-11. Linked Transfer**

Any PaRAM set in the PaRAM can be used as a link/reload parameter set. The PaRAM sets associated with peripheral synchronization events (refer to [Section 11.3.6 Event, Channel, and PaRAM Mapping](#)) only use for linking if the corresponding events are disabled.

If a PaRAM set location is defined as a QDMA channel PaRAM set (by EDMA\_TPCC\_QCHMAPN\_j register), then copying the link PaRAM set into the current QDMA channel PaRAM set is recognized as a trigger event. It is latched in EDMA\_TPCC\_QER because a write to the trigger word was performed. This feature is used to create a linked list of transfers using a single QDMA channel and multiple PaRAM sets. Refer to [Section 11.3.4.2 QDMA Channels](#).

Linking to itself replicates the behavior of auto-initialization, thus facilitating the use of circular buffering and repetitive transfers. After an EDMA channel exhausts its current PaRAM set, it reloads all of the parameter set entries from another PaRAM set, which is initialized with values that are identical to the original PaRAM set. [Figure 11-12](#) shows an example of a linked to self transfer. Here, the PaRAM set 511 has the link field pointing to the address of parameter set 511 (linked to self).

edma-012

**Figure 11-12. Link-to-Self Transfer**

### Note

If the in EDMA\_TPCC\_OPT\_n[3] STATIC bit is set for a PaRAM set, then link updates are not performed.

### 11.3.3.8 Constant Addressing Mode Transfers/Alignment Issues

If either EDMA\_TPCC\_OPT\_n[0] SAM or EDMA\_TPCC\_OPT\_n[1] DAM is set (constant addressing mode), then the source or destination address must be aligned to a 256-bit aligned address, respectively, and the corresponding EDMA\_TPCC\_BIDX\_n is an even multiple of 32 bytes (256 bits). The EDMA\_TPCC does not recognize errors here, but the EDMA\_TPTC asserts an error if this is not true. Refer to [Section 11.3.12.3 Error Generation](#).

#### Note

The constant addressing (CONST) mode has limited applicability. The EDMA is configured for the constant addressing mode (EDMA\_TPCC\_OPT\_n[0] SAM / EDMA\_TPCC\_OPT\_n[1] DAM = 1) only if the transfer source or destination (on-chip memory, off-chip memory controllers, target peripherals) support the constant addressing mode. If the constant addressing mode is not supported, the similar logical transfer can be achieved using the increment (INCR) mode (EDMA\_TPCC\_OPT\_n[0] SAM / EDMA\_TPCC\_OPT\_n[1] DAM = 0) by appropriately programming the count and indices values.

### 11.3.3.9 Element Size

The EDMA controller does not use element-size and element-indexing. Instead, all transfers are defined in terms of all three dimensions: EDMA\_TPCC\_ABCNT\_n[15:0] ACNT, EDMA\_TPCC\_ABCNT\_n[31:16] BCNT, and EDMA\_TPCC\_CCNT\_n[15:0] CCNT. An element-indexed transfer is logically achieved by programming EDMA\_TPCC\_ABCNT\_n[15:0] ACNT to the size of the element and EDMA\_TPCC\_ABCNT\_n[31:16] BCNT to the number of elements that need to be transferred. For example: If there are 16-bit audio data and 256 audio samples that must be transferred to a serial port, therefore the EDMA\_TPCC\_ABCNT\_n[15:0] ACNT = 2 (2 bytes) and EDMA\_TPCC\_ABCNT\_n[31:16] BCNT = 256.

### 11.3.4 Initiating a DMA Transfer

There are multiple ways to initiate a programmed data transfer using the EDMA\_TPCC channel controller. Transfers on DMA channels are initiated by three sources.

They are listed as follows:

- **Event-triggered transfer request** (this is the typical usage of EDMA controller): A peripheral, system, or externally-generated event triggers a transfer request.
- **Manually-triggered transfer request:** The CPU manually triggers a transfer by writing a 1 to the corresponding bit in the event set registers (EDMA\_TPCC\_ESR / EDMA\_TPCC\_ESRH).
- **Chain-triggered transfer request:** A transfer is triggered on the completion of another transfer or sub-transfer.

Transfers on QDMA channels are initiated by two sources. They are as follows:

- **Auto-triggered transfer request:** Writing to the programmed trigger word triggers a transfer.
- **Link-triggered transfer requests:** Writing to the trigger word triggers the transfer when linking occurs.

#### 11.3.4.1 DMA Channels

##### 11.3.4.1.1 Event-Triggered Transfer Request

When an event is asserted from a peripheral or device pins, it gets latched in the corresponding bit of the event register (EDMA\_TPCC\_ER[31:0] En = 1). For more information about peripheral events to EDMA events mapping, refer to *the device data manual*.

If the corresponding event in the event enable register (EDMA\_TPCC\_EER) is enabled (EDMA\_TPCC\_EER[31:0] En = 1), then the EDMA\_TPCC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

If the PaPARAM set is valid (not a NULL set), then a transfer request packet (TRP) is submitted to the EDMA\_TPTC and the EDMA\_TPCC\_ER[31:0] En bit is cleared. At this point, a new event can be safely received by the EDMA\_TPCC.

If the PaRAM set associated with the channel is a NULL set (see [Section 11.3.3.3 Null PaRAM Set](#)), then no transfer request (TR) is submitted and the corresponding EDMA\_TPCC\_ER[31:0] *En* bit is cleared and simultaneously the corresponding channel bit is set in the event miss register (EDMA\_TPCC\_EMR[31:0] *En* = 1) to indicate that the event was discarded due to a null TR being serviced. Good programming practices should include cleaning the event missed error before re-triggering the DMA channel.

When an event is received, the corresponding event bit in the event register is set (EDMA\_TPCC\_ER[31:0] *En* = 1), regardless of the state of EDMA\_TPCC\_EER[31:0] *En*. If the event is disabled when an external event is received (EDMA\_TPCC\_ER[31:0] *En* = 1 and EDMA\_TPCC\_EER[31:0] *En* = 0), the EDMA\_TPCC\_ER[31:0] *En* bit remains set. If the event is subsequently enabled (EDMA\_TPCC\_EER[31:0] *En* = 1), then the pending event is processed by the EDMA\_TPCC and the TR is processed/submitted, after which the EDMA\_TPCC\_ER[31:0] *En* bit is cleared.

If an event is being processed (prioritized or is in the event queue) and another sync event is received for the same channel prior to the original being cleared (EDMA\_TPCC\_ER[31:0] *En* != 0), then the second event is registered as a missed event in the corresponding bit of the event missed register (EDMA\_TPCC\_EMR[31:0] *En* = 1).

#### 11.3.4.1.2 Manually-Triggered Transfer Request

The CPU or any peripheral device module initiates a DMA transfer by writing to the event set register EDMA\_TPCC\_ESR. Writing a 1 to an event bit in the EDMA\_TPCC\_ESR results in the event being prioritized/queued in the appropriate event queue, regardless of the state of the EDMA\_TPCC\_EER[31:0] *En* bit. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA\_TPTC and the channel can be triggered again.

If the PaRAM set associated with the channel is a NULL set (see [Section 11.3.3.3 Null PaRAM Set](#)), then no transfer request (TR) is submitted and the corresponding EDMA\_TPCC\_ER[31:0] *En* bit is cleared and simultaneously the corresponding channel bit is set in the event miss register EDMA\_TPCC\_EMR[31:0] *En* = 1 to indicate that the event was discarded due to a null TR being serviced. Good programming practices should include clearing the event missed error before re-triggering the DMA channel.

If an event is being processed (prioritized or is in the event queue) and the same channel is manually set by a write to the corresponding channel bit of the event set register EDMA\_TPCC\_ESR[31:0] *En* = 1 prior to the original being cleared EDMA\_TPCC\_ESR[31:0] *En* = 0, then the second event is registered as a missed event in the corresponding bit of the event missed register EDMA\_TPCC\_EMR[31:0] *En* = 1.

#### 11.3.4.1.3 Chain-Triggered Transfer Request

Chaining is a mechanism by which the completion of one transfer automatically sets the event for another channel. When a chained completion code is detected, the value of which is dictated by the transfer completion code EDMA\_TPCC\_OPT\_n[17:12] TCC of the PaRAM set associated with the channel, it results in the corresponding bit in the chained event register EDMA\_TPCC\_CER to be set EDMA\_TPCC\_CER[31:0] *E*[TCC] = 1).

Once a bit is set in EDMA\_TPCC\_CER, the EDMA\_TPCC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA\_TPTC and the channel can be triggered again.

If the PaRAM set associated with the channel is a NULL set (see [Section 11.3.3.3 Null PaRAM Set](#)), then no transfer request (TR) is submitted and the corresponding EDMA\_TPCC\_CER[31:0] *En* bit is cleared and simultaneously the corresponding channel bit is set in the event miss register EDMA\_TPCC\_EMR[31:0] *En* = 1 to indicate that the event was discarded due to a null TR being serviced. In this case, the error condition must

be cleared before the DMA channel can be re-triggered. Good programming practices might include clearing the event missed error before re-triggering the DMA channel.

If a chaining event is being processed (prioritized or queued) and another chained event is received for the same channel prior to the original being cleared  $EDMA\_TPCC\_CER[31:0] \text{ } En \neq 0$ , then the second chained event is registered as a missed event in the corresponding channel bit of the event missed register  $EDMA\_TPCC\_EMR[31:0] \text{ } En = 1$ .

---

#### Note

Chained event registers  $EDMA\_TPCC\_CER$ , event registers  $EDMA\_TPCC\_ER$ , and event set registers  $EDMA\_TPCC\_ESR$  operate independently. An event  $En$  can be triggered by any of the trigger sources (event-triggered, manually-triggered, or chain-triggered).

---

### 11.3.4.2 QDMA Channels

#### 11.3.4.2.1 Auto-Triggered and Link-Triggered Transfer Request

QDMA-based transfer requests are issued when a QDMA event gets latched in the QDMA event register  $EDMA\_TPCC\_QER[31:0] \text{ } En = 1$ . A bit corresponding to a QDMA channel is set in the QDMA event register  $EDMA\_TPCC\_QER$  when the following occurs:

- A CPU (or any device module) write occurs to a PaRAM address that is defined as a QDMA channel trigger word (programmed in the QDMA channel mapping register  $EDMA\_TPCC\_QCHMAPN\_j$  for the particular QDMA channel and the QDMA channel is enabled via the QDMA event enable register  $EDMA\_TPCC\_QEER[31:0] \text{ } En = 1$ .
- $EDMA\_TPCC$  performs a link update on a PaRAM set address that is configured as a QDMA channel matches  $EDMA\_TPCC\_QCHMAPN\_j$  settings and the corresponding channel is enabled via the QDMA event enable register  $EDMA\_TPCC\_QEER[31:0] \text{ } En = 1$ .

Once a bit is set in  $EDMA\_TPCC\_QER$ , the  $EDMA\_TPCC$  prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated  $EDMA\_TPTC$  and the channel can be triggered again.

If a bit is already set in  $EDMA\_TPCC\_QER[31:0] \text{ } En = 1$  and a second QDMA event for the same QDMA channel occurs prior to the original being cleared, the second QDMA event gets captured in the QDMA event miss register  $EDMA\_TPCC\_QEMR[7:0] \text{ } En = 1$ .

#### 11.3.4.3 Comparison Between DMA and QDMA Channels

The primary difference between DMA and QDMA channels is the event/channel synchronization.

QDMA events are either auto-triggered or link triggered. Auto-triggering allows QDMA channels to be triggered by CPU(s) with a minimum number of linear writes to PaRAM. Link triggering allows a linked list of transfers to be executed, using a single QDMA PaRAM set and multiple link PaRAM sets.

A QDMA transfer is triggered when a CPU (or other device modules) writes to the trigger word of the QDMA channel parameter set (auto-triggered) or when the  $EDMA\_TPCC$  performs a link update on a PaRAM set that has been mapped to a QDMA channel (link triggered).

---

#### Note

The CPUs triggered (manually triggered) DMA channels, in addition to writing to the PaRAM set, it is required to write to the event set register  $EDMA\_TPCC\_ESR$  to kick-off the transfer.

---

QDMA channels are typically for cases where a single event accomplishes a complete transfer since the CPU (or other device modules) must reprogram some portion of the QDMA PaRAM set in order to re-trigger the channel. QDMA transfers are programmed with  $EDMA\_TPCC\_ABCNT\_n[31:0] \text{ } BCNT = 1$  and

EDMA\_TPCC\_CCNT\_n[15:0] CCNT = 1 for A-synchronized transfers, and EDMA\_TPCC\_CCNT\_n[15:0] CCNT = 1 for AB-synchronized transfers.

Additionally, since linking is also supported (if EDMA\_TPCC\_OPT\_n[3] STATIC = 0) for QDMA transfers, it allows to initiate a linked list of QDMAs, so when EDMA\_TPCC copies over a link PaRAM set (including the write to the trigger word), the current PaRAM set mapped to the QDMA channel automatically recognizes as a valid QDMA event and initiate another set of transfers as specified by the linked set.

### 11.3.5 Completion of a DMA Transfer

A parameter set for a given channel is complete when the required number of transfer requests is submitted (based on receiving the number of synchronization events). The expected number of TRs for a non-null/non-dummy transfer is shown in Table 11-15 for both synchronization types along with state of the PaRAM set prior to the final TR being submitted. When the counts (EDMA\_TPCC\_ABCNT\_n[31:0] BCNT and/or EDMA\_TPCC\_CCNT\_n[15:0] CCNT) are this value, the next TR results in:

- Final chaining or interrupt codes sent by the transfer controllers (instead of intermediate).
- Link updates (linking to either null or another valid link set).

**Table 11-15. Expected Number of Transfers for Non-Null Transfer**

Sync Mode	Counts at time 0	Total # Transfers	Counts prior to final TR
A-synchronized	ACNT BCNT CCNT	(BCNT × CCNT ) TRs of ACNT bytes each	EDMA_TPCC_ABCNT_n[31:0] BCNT == 1 && EDMA_TPCC_CCNT_n[15:0] CCNT == 1
AB-synchronized	ACNT BCNT CCNT	CCNT TRs for ACNT × BCNT bytes each	EDMA_TPCC_CCNT_n[15:0] CCNT == 1

The PaRAM OPT field must program with a specific transfer completion code TCC or EDMA\_TPCC\_OPT\_n[17:12] TCC along with the other EDMA\_TPCC\_OPT\_n fields ([22] TCCHEN, [20] TCINTEN, [23] ITCCHEN, and [21] ITCINTEN bits) to indicate whether the completion code is to be used for generating a chained event or/and for generating an interrupt upon completion of a transfer.

The specific EDMA\_TPCC\_OPT\_n[17:12] TCC value (6-bit binary value) programmed dictates which of the 64-bits in the chain event register EDMA\_TPCC\_CER [TCC] and/or interrupt pending register EDMA\_TPCC\_IPR [TCC] is set.

It can selectively program whether the transfer controller sends back completion codes on completion of the final transfer request (TR) of a parameter set EDMA\_TPCC\_OPT\_n[22] TCCHEN or EDMA\_TPCC\_OPT\_n[20] TCINTEN, for all but the final transfer request (TR) of a parameter set EDMA\_TPCC\_OPT\_n[23] ITCCHEN or EDMA\_TPCC\_OPT\_n[21] ITCINTEN, or for all TRs of a parameter set (both). Refer to Section 11.3.8 Chaining EDMA Channels for details on chaining (intermediate/final chaining) and Section 11.3.9 EDMA Interrupts for details on intermediate/final interrupt completion.

A completion detection interface exists between the EDMA channel controller and transfer controller(s). This interface sends back information from the transfer controller to the channel controller to indicate that a specific transfer is completed. Completion of a transfer is used for generating chained events and/or generating interrupts to the CPU(s).

All DMA/QDMA PaRAM sets must also specify a link address value. For repetitive transfers such as ping-pong buffers, the link address value must point to another predefined PaRAM set. Alternatively, a non-repetitive transfer must set the link address value to the null link value. The null link value is defined as FFFFh. Refer to Section 11.3.3.7 Linking Transfers for more details.

### Note

Any incoming events that are mapped to a null PaRAM set results in an error condition. The error condition must clear before the corresponding channel is used again. Refer to [Section 11.3.3.5 Dummy Versus Null Transfer Comparison](#).

There are three ways the EDMA\_TPCC gets updated/informed about a transfer completion: normal completion, early completion, and dummy/null completion. This applies to both chained events and completion interrupt generation.

#### 11.3.5.1 Normal Completion

In normal completion mode EDMA\_TPCC\_OPT\_n[11] TCCMODE = 0, the transfer or sub-transfer is considered to be complete when the EDMA channel controller receives the completion codes from the EDMA transfer controller. In this mode, the completion code to the channel controller is posted by the transfer controller after it receives a signal from the destination peripheral. Normal completion is typically used to generate an interrupt to inform the CPU that a set of data is ready for processing.

#### 11.3.5.2 Early Completion

In early completion mode EDMA\_TPCC\_OPT\_n[11] TCCMODE = 1, the transfer is considered to be complete when the EDMA channel controller submits the transfer request (TR) to the EDMA transfer controller. In this mode, the channel controller generates the completion code internally. Early completion is typically useful for chaining, as it allows subsequent transfers to be chained-triggered while the previous transfer is still in progress within the transfer controller, maximizing the overall throughput of the set of the transfers.

#### 11.3.5.3 Dummy or Null Completion

This is a variation of early completion. Dummy or null completion is associated with a dummy set [Section 11.3.3.4](#) or null set [Section 11.3.3.3](#). In both cases, the EDMA channel controller does not submit the associated transfer request to the EDMA transfer controller(s). However, if the set (dummy/null) has the OPT field programmed to return completion code (intermediate/final interrupt/chaining completion), then it sets the appropriate bits in the interrupt pending registers EDMA\_TPCC\_IPR and EDMA\_TPCC\_IPRH or chained event register EDMA\_TPCC\_CER and EDMA\_TPCC\_CERH. The internal early completion path is used by the channel controller to return the completion codes internally (that is, EDMA\_TPCC generates the completion code).

### 11.3.6 Event, Channel, and PaRAM Mapping

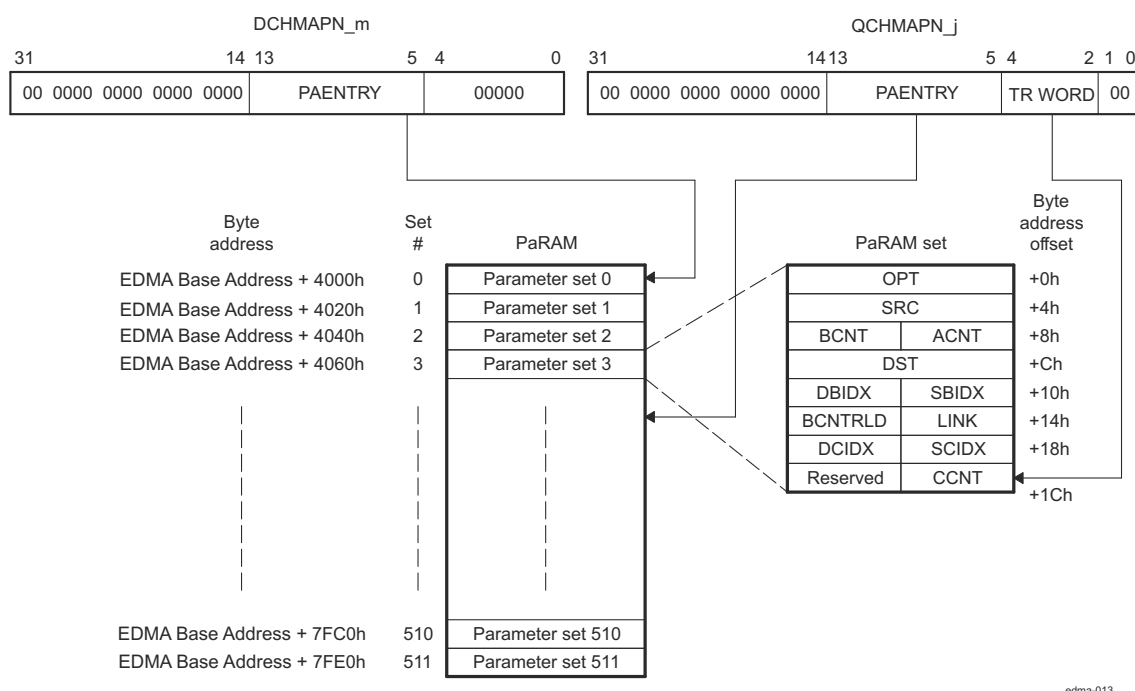

Several of the 64 DMA channels are tied to a specific hardware event, thus allowing events from device peripherals or external hardware (via the dma\_evt[3:0] pins) to trigger transfers. A DMA channel typically requests a data transfer when it receives its event (apart from manually-triggered, chain-triggered, and other transfers). The amount of data transferred per synchronization event depends on the channel's configuration (EDMA\_TPCC\_ABCNT\_n[15:0] ACNT, EDMA\_TPCC\_ABCNT\_n[31:16] BCNT, EDMA\_TPCC\_CCNT\_n[15:0] CCNT, etc.) and the synchronization type (A-synchronized or AB-synchronized).

The association of an event to a channel is fixed within the EDMA Channel Controller, that is, each DMA channel has one specific event associated with it.

In an application, if a channel does not use the associated synchronization event or if it does not have an associated synchronization event (unused), that channel can be used for manually-triggered or chained-triggered transfers, for linking/reloading, or as a QDMA channel.

#### 11.3.6.1 DMA Channel to PaRAM Mapping

The mapping between the DMA channel numbers and the PaRAM sets is programmable (see [Section 11.3.3](#)). The DMA channel mapping registers EDMA\_TPCC\_DCHMAPN\_m in the EDMA\_TPCC provide programmability that allows the DMA channels to be mapped to any of the PaRAM sets in the PaRAM memory map. [Figure 11-13](#) illustrates the use of EDMA\_TPCC\_DCHMAPN\_m. There is one EDMA\_TPCC\_DCHMAPN\_m register per channel.

**Figure 11-13. DMA Channel and QDMA Channel to PaRAM Mapping**

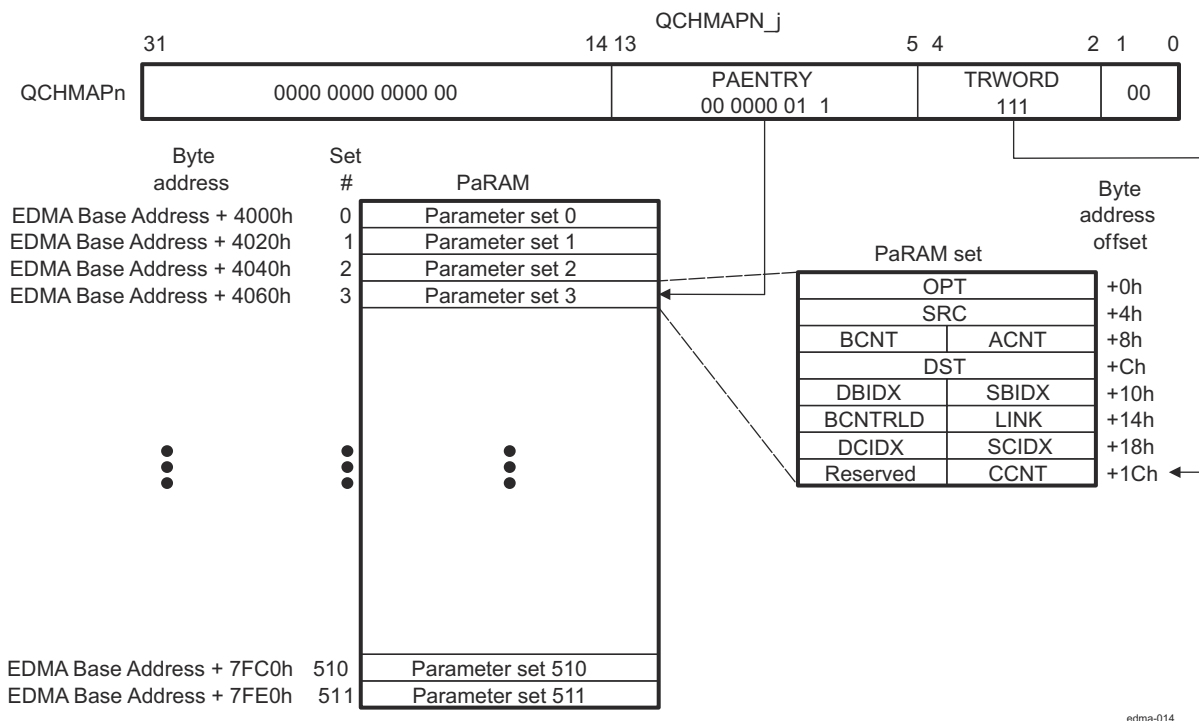

### Note

#### 11.3.6.2 QDMA Channel to PaRAM Mapping

The mapping between the QDMA channels and the PaRAM sets is programmable. The QDMA channel mapping register `EDMA_TPCC_QCHMAPN_j` in the `EDMA_TPCC` allows to map the QDMA channels to any of the PaRAM sets in the PaRAM memory map. [Figure 11-14](#) illustrates the use of `EDMA_TPCC_QCHMAPN_j`.

`EDMA_TPCC_QCHMAPN_j[4:2]` TRWORD bit-field allows to program the trigger word in the PaRAM set for the QDMA channel. A trigger word is one of the eight words in the PaRAM set. For a QDMA transfer to occur, a valid TR synchronization event for `EDMA_TPCC` is a write to the trigger word in the PaRAM set pointed to by `EDMA_TPCC_QCHMAPN_j` for a particular QDMA channel. By default, QDMA channels are mapped to PaRAM set 0.

It must appropriately re-map PaRAM set 0 before use.

**Figure 11-14. QDMA Channel to PaRAM Mapping**

### 11.3.7 EDMA Channel Controller Regions

The EDMA channel controller divides its address space into eight regions. Individual channel resources are assigned to a specific region, where each region is typically assigned to a specific device module uses the EDMA controller.

Application software can use regions or to ignore them altogether. It can be used active memory protection in conjunction with regions so that only a specific device module which uses the EDMA (for example, privilege identification) or privilege level (for example, user vs. supervisor) is allowed access to a given region, and thus to a given DMA or QDMA channel. This allows robust system-level DMA code where each EDMA initiator only modifies the state of the assigned resources. Memory protection is described in [Section 11.3.10 Memory Protection](#).

#### 11.3.7.1 Region Overview

The EDMA channel controller memory-mapped registers are divided in three main categories:

1. Global registers
2. Global region channel registers
3. Shadow region channel registers

The global registers are located at a single/fixed location in the EDMA\_TPCC memory map. These registers control EDMA resource mapping and provide debug visibility and error tracking information.

The channel registers (including DMA, QDMA, and interrupt registers) are accessible via the global channel region address range, or in the shadow *n* channel region address range(s). For example, the event enable register EDMA\_TPCC\_EER is visible at the global address of EDMA Base Address + 1020h or region addresses of EDMA Base Address + 2020h for region 0, EDMA Base Address + 2220h for region 1, ... EDMA Base Address + 2E20h for region 7.

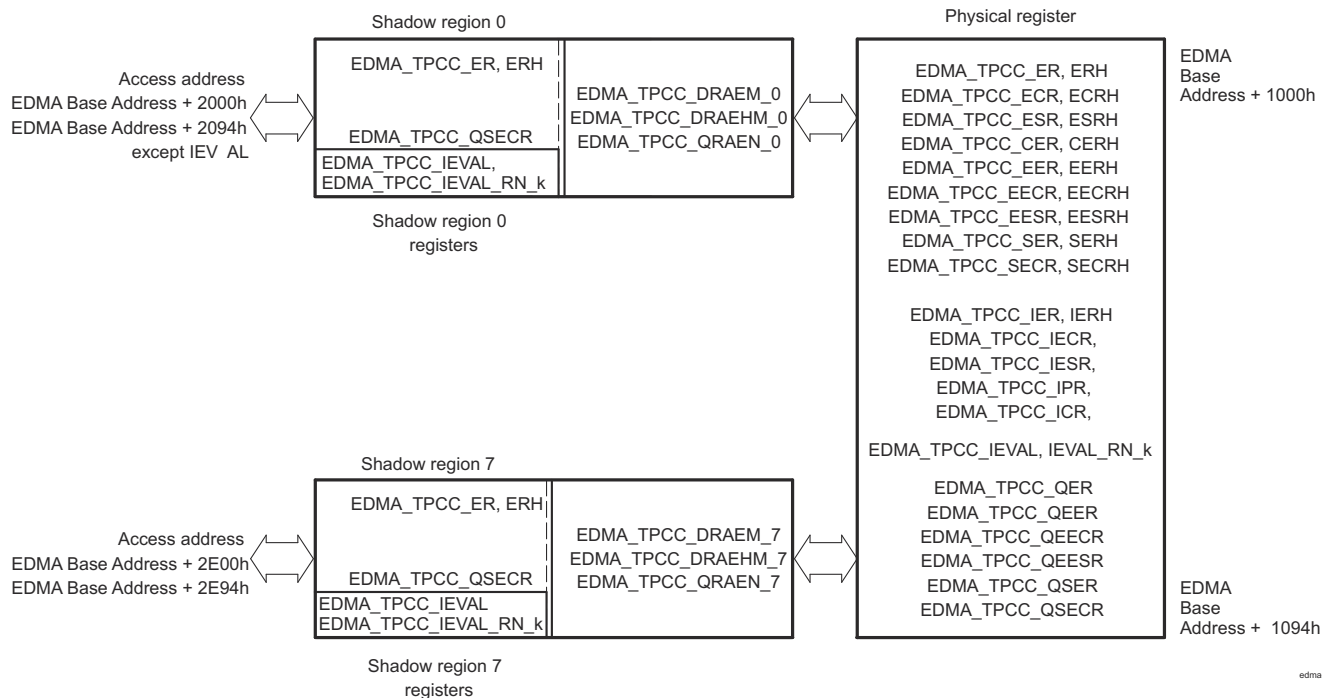

The DMA region access enable registers EDMA\_TPCC\_DRAEM<sub>k</sub> and the QDMA region access enable registers EDMA\_TPCC\_QRAEN<sub>k</sub> control the underlying control register bits that are accessible via the shadow region address space (except for EDMA\_TPCC\_IEVAL and EDMA\_TPCC\_IEVAL\_RN<sub>k</sub> registers). [Table 11-16](#)

lists the registers in the shadow region memory map. Refer to *EDMA\_TPCC register mapping summary* for the complete global and shadow region memory maps.

**Table 11-16. Shadow Region Registers**

Figure 11-15 illustrates the conceptual view of the regions.

**Figure 11-15. Shadow Region Registers**

### 11.3.7.2 Channel Controller Regions

There are eight EDMA shadow regions (and associated memory maps). Associated with each shadow region are a set of registers defining which channels and interrupt completion codes belong to that region. These registers are user-programmed per region to assign ownership of the DMA/QDMA channels to a region.

- **EDMA\_TPCC\_DRAEM\_k and EDMA\_TPCC\_DRAEHM\_k:** One register pair exists for each of the shadow regions. The number of bits in each register pair matches the number of DMA channels (64 DMA channels). These registers need to be programmed to assign ownership of DMA channels and interrupt (or EDMA\_TPCC\_OPT\_n[17:12] TCC codes) to the respective region. Accesses to DMA and interrupt registers via the shadow region address view are filtered through the DRAEM/DRAEHM pair. A value of 1 in the corresponding EDMA\_TPCC\_DRAEM\_k[31:0] / EDMA\_TPCC\_DRAEHM\_k[31:0] bit implies that the corresponding DMA interrupt channel is accessible; a value of 0 in the corresponding EDMA\_TPCC\_DRAEM\_k[31:0] / EDMA\_TPCC\_DRAEHM\_k[31:0] bit forces writes to be discarded and returns a value of 0 for reads.
- **EDMA\_TPCC\_QRAEN\_k:** One register exists for every region. The number of bits in each register matches the number of QDMA channels (8 QDMA channels). These registers must be programmed to assign ownership of QDMA channels to the respective region. To enable a channel in a shadow region using shadow region 0 EDMA\_TPCC\_QEER, the corresponding bits in QRAE must be set or writing into EDMA\_TPCC\_QEESR there will be no the desired effect.
- **EDMA\_TPCC\_MPPAN\_k and EDMA\_TPCC\_MPPAG:** One register exists for every region. This register defines the privilege level, requestor, and types of accesses allowed to a region's memory-mapped registers.

It is typical for an application to have a unique assignment of QDMA/DMA channels (and, therefore, a given bit position) to a given region.

The use of shadow regions allows restricted access to EDMA resources (DMA channels, QDMA channels, TCC, interrupts) by tasks in a system by setting or clearing bits in the EDMA\_TPCC\_DRAEM\_k / EDMA\_TPCC\_QRAEN\_k registers.

If exclusive access to any given channel / TCC code is required for a region, then only that region's EDMA\_TPCC\_DRAEM\_k / EDMA\_TPCC\_QRAEN\_k have the associated bit set.

### Example 11-1. Resource Pool Division Across Two Regions

This example illustrates a resource pool division across two regions, assuming region 0 must be allocated 16 DMA channels (0-15) and 1 QDMA channel (0) and 32 TCC codes (0-15 and 48-63).

Region 1 needs to be allocated 16 DMA channels (16-32) and the remaining 7 QDMA channels (1-7) and TCC codes (16-47).

EDMA\_TPCC\_DRAEM\_k should be equal to the OR of the bits that are required for the DMA channels and the TCC codes:

Region 0: DRAEHM, DRAEM = 0xFFFF0000, 0x0000FFFF QRAEN = 0x00000001 Region 1: DRAEHM, DRAEM = 0x0000FFFF, 0xFFFF0000 QRAEN = 0x000000FE
--

#### 11.3.7.3 Region Interrupts

In addition to the EDMA\_TPCC global completion interrupt, there is an additional completion interrupt line that is associated with every shadow region. Along with the interrupt enable register EDMA\_TPCC\_IER, DRAEM acts as a secondary interrupt enable for the respective shadow region interrupts. Refer to *Hardware Request* for more information about EDMA Interrupts.

#### 11.3.8 Chaining EDMA Channels

The channel chaining capability for the EDMA allows the completion of an EDMA channel transfer to trigger another EDMA channel transfer. The purpose is to allow the ability to chain several events through one event occurrence.

Chaining is different from linking ([Section 11.3.3.7 Linking Transfers](#)). The EDMA link feature reloads the current channel parameter set with the linked parameter set. The EDMA chaining feature does not modify or update any channel parameter set. It provides a synchronization event to the chained channel (see [Section 11.3.4.1.3 Chain-Triggered Transfer Request](#)).

Chaining is achieved at either final transfer completion or intermediate transfer completion, or both, of the current channel. Consider a channel  $m$  (DMA/QDMA) required to chain to channel  $n$ . Channel number  $n$  (0-63) needs to be programmed into the EDMA\_TPCC\_OPT\_n[17:12] TCC bit-field of channel  $m$  channel options parameter (OPT) set.

- If final transfer completion chaining EDMA\_TPCC\_OPT\_n[22] TCCHEN = 1 is enabled, the chain-triggered event occurs after the submission of the last transfer request of channel  $m$  is either submitted or completed (depending on early or normal completion).

- If intermediate transfer completion chaining EDMA\_TPCC\_OPT\_n[23] ITCCHEN = 1 is enabled, the chain-triggered event occurs after every transfer request, except the last of channel *m* is either submitted or completed (depending on early or normal completion).
- If both final and intermediate transfer completion chaining (EDMA\_TPCC\_OPT\_n[22] TCCHEN = 1 and EDMA\_TPCC\_OPT\_n[23] ITCCHEN = 1) are enabled, then the chain-trigger event occurs after every transfer request is submitted or completed (depending on early or normal completion).

**Table 11-17** illustrates the number of chain event triggers occurring in different synchronized scenarios. Consider channel 31 programmed with EDMA\_TPCC\_ABCNT\_n[15:0] ACNT = 3, EDMA\_TPCC\_ABCNT\_n[31:16] BCNT = 4, EDMA\_TPCC\_CCNT\_n[15:0] CCNT = 5, and EDMA\_TPCC\_OPT\_n[17:12] TCC = 30.

**Table 11-17. Chain Event Triggers**

Options	(Number of chained event triggers on channel 30)	
	A-Synchronized	AB-Synchronized
EDMA_TPCC_OPT_n[22] TCCHEN = 1, EDMA_TPCC_OPT_n[23] ITCCHEN = 0	1 (Owing to the last TR)	1 (Owing to the last TR)
EDMA_TPCC_OPT_n[22] TCCHEN = 0, EDMA_TPCC_OPT_n[23] ITCCHEN = 1	19 (Owing to all but the last TR)	4 (Owing to all but the last TR)
EDMA_TPCC_OPT_n[22] TCCHEN = 1, EDMA_TPCC_OPT_n[23] ITCCHEN = 1	20 (Owing to a total of 20 TRs)	5 (Owing to a total of 5 TRs)

### 11.3.9 EDMA Interrupts

The EDMA interrupts are divided into 2 categories: transfer completion interrupts and error interrupts.

There are nine region interrupts, eight shadow regions and one global region. The transfer completion interrupts are listed in **Table 11-18**. The transfer completion interrupts and the error interrupts from the transfer controllers are all routed to the device interrupt controllers INTCs.

**Table 11-18. EDMA Transfer Completion Interrupts**

Name	Description
EDMA_TPCC_INT0	EDMA_TPCC Transfer Completion Interrupt Shadow Region 0
EDMA_TPCC_INT1	EDMA_TPCC Transfer Completion Interrupt Shadow Region 1
EDMA_TPCC_INT2	EDMA_TPCC Transfer Completion Interrupt Shadow Region 2
EDMA_TPCC_INT3	EDMA_TPCC Transfer Completion Interrupt Shadow Region 3
EDMA_TPCC_INT4	EDMA_TPCC Transfer Completion Interrupt Shadow Region 4
EDMA_TPCC_INT5	EDMA_TPCC Transfer Completion Interrupt Shadow Region 5
EDMA_TPCC_INT6	EDMA_TPCC Transfer Completion Interrupt Shadow Region 6
EDMA_TPCC_INT7	EDMA_TPCC Transfer Completion Interrupt Shadow Region 7

**Table 11-19. EDMA Error Interrupts**

Name	Description
EDMA_TPCC_ERRINT	EDMA_TPCC Error Interrupt
EDMA_TPCC_MPINT	EDMA_TPCC Memory Protection Interrupt
EDMA_TC0_ERRINT	TC0 Error Interrupt
EDMA_TC1_ERRINT	TC1 Error Interrupt

#### 11.3.9.1 Transfer Completion Interrupts

The EDMA\_TPCC is responsible for generating transfer completion interrupts to the CPU(s) (and other EDMA controllers). The EDMA generates a single completion interrupt per shadow region, as well as one for the global region on behalf of all 64 channels. The various control registers and bit fields facilitate EDMA interrupt generation.

The software architecture must either use the global interrupt or the shadow interrupts, but not both.

The transfer completion code EDMA\_TPCC\_OPT\_n[17:12] TCC value is directly mapped to the bits of the interrupt pending register EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH.

For example, if EDMA\_TPCC\_OPT\_n[17:12] TCC = 10 0001b, EDMA\_TPCC\_IPRH[1] is set after transfer completion, and results in interrupt generation to the CPU(s) if the completion interrupt is enabled for the CPU. See [Section 11.3.9.1.1 Enabling Transfer Completion Interrupts](#) for details about enabling EDMA transfer completion interrupts.

When a completion code is returned (as a result of early or normal completions), the corresponding bit in EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH registers is set if transfer completion interrupt (final/intermediate) is enabled in the channel options parameter (OPT) for a PaRAM set associated with the transfer.

**Table 11-20. Transfer Complete Code (TCC) to EDMA\_TPCC Interrupt Mapping**

TCC values in EDMA_TPCC_OPT_n[17:12] TCC (EDMA_TPCC_OPT_n[20] TCINTEN / EDMA_TPCC_OPT_n[21] ITCINTEN = 1)	EDMA_TPCC_IPR Bit Set	TCC values in EDMA_TPCC_OPT_n[17:12] TCC (EDMA_TPCC_OPT_n[20] TCINTEN / EDMA_TPCC_OPT_n[21] ITCINTEN = 1)	EDMA_TPCC_IPRH Bit Set <sup>(1)</sup>
0	EDMA_TPCC_IPR[0]	20h	EDMA_TPCC_IPR[32] / EDMA_TPCC_IPRH[0]
1	EDMA_TPCC_IPR[1]	21h	EDMA_TPCC_IPR[33] / EDMA_TPCC_IPRH[1]
2h	EDMA_TPCC_IPR[2]	22h	EDMA_TPCC_IPR[34] / EDMA_TPCC_IPRH[2]
3h	EDMA_TPCC_IPR[3]	23h	EDMA_TPCC_IPR[35] / EDMA_TPCC_IPRH[3]
4h	EDMA_TPCC_IPR[4]	24h	EDMA_TPCC_IPR[36] / EDMA_TPCC_IPRH[4]
...	...	...	...
1Eh	EDMA_TPCC_IPR[30]	3Eh	EDMA_TPCC_IPR[62] / EDMA_TPCC_IPRH[30]
1Fh	EDMA_TPCC_IPR[31]	3Fh	EDMA_TPCC_IPR[63] / EDMA_TPCC_IPRH[31]

(1) Bit fields EDMA\_TPCC\_IPR [32-63] correspond to bits 0 to 31 in EDMA\_TPCC\_IPRH, respectively.

The transfer completion code (TCC) can program to any value for a DMA/QDMA channel. A direct relation between the channel number and the transfer completion code value does not need to exist. This allows multiple channels having the same transfer completion code value to cause a CPU to execute the same interrupt service routine (ISR) for different channels.

If the channel is used in the context of a shadow region and it intends for the shadow region interrupt to be asserted, then ensure that the bit corresponding to the TCC code is enabled in EDMA\_TPCC\_IER / EDMA\_TPCC\_IERH and in the corresponding shadow region's DMA region access registers (EDMA\_TPCC\_DRAEM\_k / EDMA\_TPCC\_DRAEHM\_k).

Interrupt generation can be enabled at either final transfer completion or intermediate transfer completion, or both. Consider channel *m* as an example.

- If the final transfer interrupt (EDMA\_TPCC\_OPT\_n[20] TCINTEN = 1) is enabled, the interrupt occurs after the last transfer request of channel *m* is either submitted or completed (depending on early or normal completion).
- If the intermediate transfer interrupt (EDMA\_TPCC\_OPT\_n[21] ITCINTEN = 1) is enabled, the interrupt occurs after every transfer request, except the last TR of channel *m* is either submitted or completed (depending on early or normal completion).

- If both final and intermediate transfer completion interrupts (EDMA\_TPCC\_OPT\_n[20] TCINTEN = 1, and EDMA\_TPCC\_OPT\_n[21] ITCINTEN = 1) are enabled, then the interrupt occurs after every transfer request is submitted or completed (depending on early or normal completion).

Table 11-21 shows the number of interrupts that occur in different synchronized scenarios. Consider channel 31, programmed with ABCNT\_n[15:0] ACNT = 3, EDMA\_TPCC\_ABCNT\_n[31:16] BCNT = 4, EDMA\_TPCC\_CCNT\_n[15:0]CCNT = 5, and EDMA\_TPCC\_OPT\_n[17:12] TCC = 30.

**Table 11-21. Number of Interrupts**

Options	A-Synchronized	AB-Synchronized
EDMA_TPCC_OPT_n[20] TCINTEN = 1, EDMA_TPCC_OPT_n[21] ITCINTEN = 0	1 (Last TR)	1 (Last TR)
EDMA_TPCC_OPT_n[20] TCINTEN = 0, EDMA_TPCC_OPT_n[21] ITCINTEN = 1	19 (All but the last TR)	4 (All but the last TR)
EDMA_TPCC_OPT_n[20] TCINTEN = 1, EDMA_TPCC_OPT_n[21] ITCINTEN = 1	20 (All TRs)	5 (All TRs)

#### 11.3.9.1.1 Enabling Transfer Completion Interrupts

For the EDMA channel controller to assert a transfer completion to the external environment, the interrupts must be enabled in the EDMA\_TPCC. This is in addition to setting up the EDMA\_TPCC\_OPT\_n[20] TCINTEN and EDMA\_TPCC\_OPT\_n[21] ITCINTEN bits of the associated PaRAM set.

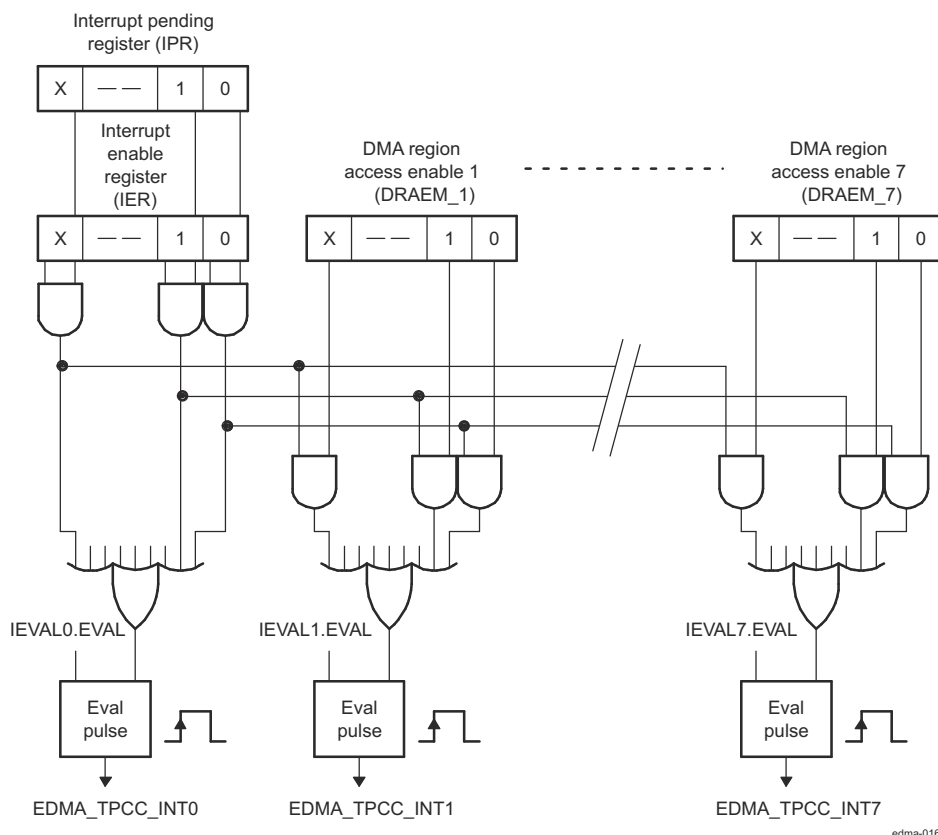

The EDMA channel controller has interrupt enable registers EDMA\_TPCC\_IER / EDMA\_TPCC\_IERH and each bit location in EDMA\_TPCC\_IER / EDMA\_TPCC\_IERH serves as a primary enable for the corresponding interrupt pending registers EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH.

All of the interrupt registers (EDMA\_TPCC\_IER, EDMA\_TPCC\_IESR, EDMA\_TPCC\_IECR, and EDMA\_TPCC\_IPR) are either manipulated from the global DMA channel region, or by the DMA channel shadow regions. The shadow regions provide a view to the same set of physical registers that are in the global region.

The EDMA channel controller has a hierarchical completion interrupt scheme that uses a single set of interrupt pending registers EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH and single set of interrupt enable registers EDMA\_TPCC\_IER / EDMA\_TPCC\_IERH. The programmable DMA region access enable registers EDMA\_TPCC\_DRAEM\_k / EDMA\_TPCC\_DRAEHM\_k provides a second level of interrupt masking. The global region interrupt output is gated based on the enable mask that is provided by EDMA\_TPCC\_IER / EDMA\_TPCC\_IERH, see [Figure 11-16](#)

The region interrupt outputs are gated by EDMA\_TPCC\_IER and the specific EDMA\_TPCC\_DRAEM\_k / EDMA\_TPCC\_DRAEHM\_k associated with the region.

[Figure 11-16](#) shows the Interrupt diagram of the EDMA controller.

**Figure 11-16. Interrupt Diagram**

The EDMA\_TPCC generates the transfer completion interrupts that are associated with each shadow region, the following conditions must be true:

- EDMA\_TPCC\_INT0: (EDMA\_TPCC\_IPR[0] E0 & EDMA\_TPCC\_IER[0] E0 & EDMA\_TPCC\_DRAEM\_k.DRAEM\_0[0] E0) | (EDMA\_TPCC\_IPR[1] E1 & EDMA\_TPCC\_IER[1] E1 & EDMA\_TPCC\_DRAEM\_k.DRAEM\_0[1] E1) | ... | (EDMA\_TPCC\_IPRH[31] E63 & EDMA\_TPCC\_IERH[31] E63 & EDMA\_TPCC\_DRAEHM\_k.DRAEHM\_0[31] E63)
- EDMA\_TPCC\_INT1: (EDMA\_TPCC\_IPR[0] E0 & EDMA\_TPCC\_IER[0] E0 & EDMA\_TPCC\_DRAEM\_k.DRAEM\_1[0] E0) | (EDMA\_TPCC\_IPR[1] E1 & EDMA\_TPCC\_IER[1] E1 & EDMA\_TPCC\_DRAEM\_k.DRAEM\_1[1] E1) | ... | (EDMA\_TPCC\_IPRH[31] E63 & EDMA\_TPCC\_IERH[31] E63 & EDMA\_TPCC\_DRAEHM\_k.DRAEHM\_1[31] E63)
- EDMA\_TPCC\_INT2: (EDMA\_TPCC\_IPR[0] E0 & EDMA\_TPCC\_IER[0] E0 & EDMA\_TPCC\_DRAEM\_k.DRAEM\_2[0] E0) | (EDMA\_TPCC\_IPR[1] E1 & EDMA\_TPCC\_IER[1] E1 & EDMA\_TPCC\_DRAEM\_k.DRAEM\_2[1] E1) | ... | (EDMA\_TPCC\_IPRH[31] E63 & EDMA\_TPCC\_IERH[31] E63 & EDMA\_TPCC\_DRAEHM\_k.DRAEHM\_2[31] E63)...
- Up to EDMA\_TPCC\_INT7: (EDMA\_TPCC\_IPR[0] E0 & EDMA\_TPCC\_IER[0] E0 & EDMA\_TPCC\_DRAEM\_k.DRAEM\_7[0] E0) | (EDMA\_TPCC\_IPR[1] E1 & EDMA\_TPCC\_IER[1] E1 & EDMA\_TPCC\_DRAEM\_k.DRAEM\_7[1] E1) | ... | (EDMA\_TPCC\_IPRH[31] E63 & EDMA\_TPCC\_IERH[31] E63 & EDMA\_TPCC\_DRAEHM\_k.DRAEHM\_7[31] E63)

### Note

The EDMA\_TPCC\_DRAEM\_k / EDMA\_TPCC\_DRAEHM\_k for all regions are expected to be set up at system initialization and to remain static for an extended period of time. The interrupt enable registers are used for dynamic enable/disable of individual interrupts.

Because there is no relation between the EDMA\_TPCC\_OPT\_n[17:12] TCC value and the DMA/QDMA channel, it is possible, the DMA channel 0 to have the EDMA\_TPCC\_OPT\_n[17:12] TCC = 63 in its associated PaRAM set. This mean that if a transfer completion interrupt is enabled (EDMA\_TPCC\_OPT\_n[20] TCINTEN or EDMA\_TPCC\_OPT\_n[21] ITCINTEN is set), then based on the TCC value, EDMA\_TPCC\_IPRH[31] E63 is set up on completion. For proper channel operations and interrupt generation using the shadow region map - program the EDMA\_TPCC\_DRAEM\_k / EDMA\_TPCC\_DRAEHM\_k that is associated with the shadow region to have read/write access to both bit 0 (corresponding to channel 0) and bit 63 (corresponding to EDMA\_TPCC\_IPRH bit that is set upon completion).

#### 11.3.9.1.2 Clearing Transfer Completion Interrupts

Transfer completion interrupts that are latched to the interrupt pending registers ( EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH ) are cleared by writing a 1 to the corresponding bit in the interrupt pending clear register ( EDMA\_TPCC\_ICR / EDMA\_TPCC\_ICRH ). For example, a write of 1 to EDMA\_TPCC\_ICR[0] E0 clears a pending interrupt in EDMA\_TPCC\_IPR[0] E0.

If an incoming transfer completion code TCC (EDMA\_TPCC\_OPT\_n[17:12] TCC) gets latched to a bit in EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH, then additional bits that get set due to a subsequent transfer completion does not result in asserting the EDMA\_TPCC completion interrupt. In order for the completion interrupt to be pulsed, the required transition is from a state where no enabled interrupts are set to a state where at least one enabled interrupt is set.

#### 11.3.9.2 EDMA Interrupt Servicing

Upon completion of a transfer (early or normal completion), the EDMA channel controller sets the appropriate bit in the interrupt pending registers ( EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH ), as the transfer completion codes specify. If the completion interrupts are appropriately enabled, then the CPU enters the interrupt service routine (ISR) when the completion interrupt is asserted.

After servicing the interrupt, the ISR should clear the corresponding bit in EDMA\_TPCC\_IPR/ EDMA\_TPCC\_IPRH, thereby enabling recognition of future interrupts. The EDMA\_TPCC only asserts additional completion interrupts when all EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH bits clear.

When one interrupt is serviced many other transfer completions may result in additional bits being set in EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH, thereby resulting in additional interrupts. Each of the bits in EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH may need different types of service therefore, the ISR must check all pending interrupts and continue until all of the posted interrupts are serviced appropriately.

Examples of pseudo code for a CPU interrupt service routine for an EDMA\_TPCC completion interrupt are shown in [Example 11-2](#) and [Example 11-3](#).

The ISR routine in [Example 11-2](#) is more exhaustive and incurs a higher latency.

#### Example 11-2. Interrupt Servicing

The pseudo code:

1. Reads the interrupt pending register EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH.
2. Performs the operations needed.
3. Writes to the interrupt pending clear register EDMA\_TPCC\_ICR / EDMA\_TPCC\_ICRH to clear the corresponding EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH bit(s).
4. Reads EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH again:

- a. If `EDMA_TPCC_IPR / EDMA_TPCC_IPRH` is not equal to 0, repeat from step 2 (implies occurrence of new event between step 2 to step 4).
- b. If `EDMA_TPCC_IPR / EDMA_TPCC_IPRH` is equal to 0, assure that all of the enabled interrupts are inactive.

#### Note

An event may occur during step 4 while the `EDMA_TPCC_IPR / EDMA_TPCC_IPRH` bits are read as 0 and the application is still in the interrupt service routine. If this happens, a new interrupt is recorded in the device interrupt controller and a new interrupt generates as soon as the application exits in the interrupt service routine.

#### 11.3.9.3

[Example 11-3](#) is less rigorous, with less burden on the software in polling for set interrupt bits, but can occasionally cause a race condition as mentioned above.

#### Example 11-3. Interrupt Servicing

If any enabled and pending (possibly lower priority) interrupts are left, force the interrupt logic to reassert the interrupt pulse by setting the `EDMA_TPCC_IEVAL[0]` EVAL bit in the interrupt evaluation register.

The pseudo code is as follows:

1. Enters ISR.
2. Reads `EDMA_TPCC_IPR / EDMA_TPCC_IPRH`.
3. For the condition that is set in `EDMA_TPCC_IPR / EDMA_TPCC_IPRH`:
  - a. Service interrupt as the application requires.
  - b. Clear the bit for serviced conditions (others may still be set, and other transfers may have resulted in returning the TCC to `EDMA_TPCC` after step 2).
4. Reads `EDMA_TPCC_IPR / EDMA_TPCC_IPRH` prior to exiting the ISR:
  - a. If `EDMA_TPCC_IPR / EDMA_TPCC_IPRH` is equal to 0, then exit the ISR.
  - b. If `EDMA_TPCC_IPR / EDMA_TPCC_IPRH` is not equal to 0, then set `EDMA_TPCC_IEVAL` so that upon exit of ISR, a new interrupt triggers if any enabled interrupts are still pending.

#### 11.3.9.4 Interrupt Evaluation Operations

The `EDMA_TPCC` has interrupt evaluate registers `EDMA_TPCC_IEVAL` that exist in the global region and in each shadow region. The registers in the shadow region are the only registers in the DMA channel shadow region memory map that are not affected by the settings for the DMA region access enable registers `EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k`. Writing a 1 to the `EDMA_TPCC_IEVAL[0]` EVAL bit in the registers that are associated with a particular shadow region results in pulsing the associated region interrupt (global or shadow), if any enabled interrupt (via `EDMA_TPCC_IER / EDMA_TPCC_IERH`) is still pending `EDMA_TPCC_IPR / EDMA_TPCC_IPRH`. This register assures that the CPU does not miss the interrupts (or the EDMA controller associated with the shadow region) if the software architecture chooses not to use all interrupts. Refer to [Example 11-3](#) about the use of `EDMA_TPCC_IEVAL` in the EDMA interrupt service routine (ISR).

Similarly an error evaluation register `EDMA_TPCC_EEVAL` exists in the global region. Writing a 1 to the `EDMA_TPCC_EEVAL[0]` EVAL bit causes the pulsing of the error interrupt if any pending errors are in `EDMA_TPCC_EMR / EDMA_TPCC_EMRH`, `EDMA_TPCC_QEMR`, or `EDMA_TPCC_CCERR`. See [Section 11.3.9.5 Error Interrupts](#) for additional information regarding error interrupts.

---

**Note**

While using EDMA\_TPCC\_IEVAL for shadow region completion interrupts, check that the EDMA\_TPCC\_IEVAL operated upon is from that particular shadow region memory map.

---

### 11.3.9.5 Error Interrupts

The EDMA\_TPCC error registers provide the capability to differentiate error conditions (event missed, threshold exceed, etc.). Additionally, setting the error bits in these registers results in asserting the EDMA\_TPCC error interrupt. If the EDMA\_TPCC error interrupt is enabled in the device interrupt controller(s), then it allows the CPU(s) to handle the error conditions.

The EDMA\_TPCC has a single error interrupt (EDMA\_TPCC\_ERRINT) that is asserted for all EDMA\_TPCC error conditions. There are four conditions that cause the error interrupt:

- DMA missed events: for all 64 DMA channels. DMA missed events are latched in the event missed registers EDMA\_TPCC\_EMR / EDMA\_TPCC\_EMRH.
- QDMA missed events: for all 8 QDMA channels. QDMA missed events are latched in the QDMA event missed register EDMA\_TPCC\_QEMR.
- Threshold exceed: for all event queues. These are latched in EDMA\_TPCC error register EDMA\_TPCC\_CCERR.
- TCC error: for outstanding transfer requests that are expected to return completion code EDMA\_TPCC\_OPT\_n[22] TCCHEN or EDMA\_TPCC\_OPT\_n[23] TCINTEN bit is set to 1, exceeding the maximum limit of 63. This is also latched in the EDMA\_TPCC error register EDMA\_TPCC\_CCERR.

Figure 11-17 illustrates the EDMA\_TPCC error interrupt generation operation.

If any of the bits are set in the error registers due to any error condition, the EDMA\_TPCC\_ERRINT is always asserted, as there are no enables for masking these error events. Similar to transfer completion interrupts (EDMA\_TPCC\_INT), the error interrupt also only pulses when the error interrupt condition transitions from no errors being set to at least one error being set. If additional error events are latched prior to the original error bits clearing, the EDMA\_TPCC does not generate additional interrupt.

To reduce the burden on the software, there is an error evaluate register EDMA\_TPCC\_EEVAL that allows re-evaluation of pending set error events/bits, similar to the interrupt evaluate register EDMA\_TPCC\_IEVAL. Unlike the EDMA\_TPCC\_IEVAL functionality, the EDMA\_TPCC\_EEVAL register must be written with '1' after any error interrupts are serviced (even when all pending errors are cleared) in order for subsequent errors to trigger a new interrupt.

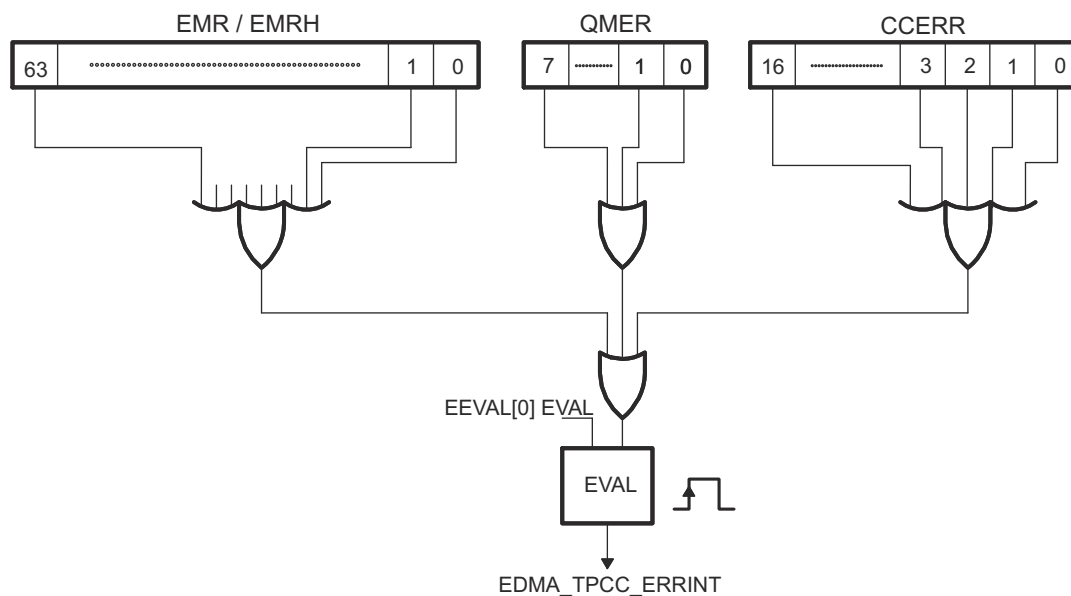

---

#### Note

It is good practice to enable the error interrupt in the device interrupt controller and to associate an interrupt service routine with it to address the various error conditions appropriately. Doing so puts less burden on the software (polling for error status), it provides a good debug mechanism for unexpected error conditions.

---

Figure 11-17. Error Interrupt Operation

### 11.3.10 Memory Protection

The EDMA channel controller supports two kinds of memory protection: active and proxy.

#### 11.3.10.1 Active Memory Protection

Active memory protection is a feature that allows or prevents read and write accesses to the EDMA\_TPCC registers. Active memory protection is achieved by a set of memory protection permissions attribute EDMA\_TPCC\_MPPAN\_k registers.

The EDMA\_TPCC register map is divided into three categories:

- a global region.
- a global channel region.
- eight shadow regions.

Each shadow region consists of the respective shadow region registers and the associated PaRAM. For more detailed information regarding the contents of a shadow region, refer to the associated Register Addendum.

Each of the eight shadow regions has an associated EDMA\_TPCC\_MPPAN\_k registers that defines the specific requestor(s) and types of requests that are allowed to the regions resources.

The global channel region is also protected with a memory-mapped register EDMA\_TPCC\_MPPAG. The EDMA\_TPCC\_MPPAG applies to the global region and to the global channel region, except the other EDMA\_TPCC\_MPPAN\_k registers themselves.

Table 11-22 shows the accesses that are allowed or not allowed to the EDMA\_TPCC\_MPPAG and EDMA\_TPCC\_MPPAN\_k. The active memory protection uses the EDMA\_TPCC\_OPT\_n[31] PRIV and EDMA\_TPCC\_OPT\_n[27:24] PRIVID attributes of the EDMA peripheral modules. The EDMA\_TPCC\_OPT\_n[31] PRIV is the privilege level (i.e., user vs. supervisor).

The EDMA\_TPCC\_OPT\_n[27:24] PRIVID refers to a privilege ID with a number that is associated with an EDMA peripheral modules.

**Table 11-22. Allowed Accesses**

Access	Supervisor	User
Read	Yes	Yes
Write	Yes	No

Table 11-23 describes the EDMA\_TPCC\_MPPAN\_k register mapping for the shadow regions (which includes shadow region registers and PaRAM addresses).

The region-based EDMA\_TPCC\_MPPAN\_k registers are used to protect accesses to the DMA shadow regions and the associated region PaRAM. Because there are eight regions, there are eight EDMA\_TPCC\_MPPAN\_k region registers (MPPAN[0-7]).

**Table 11-23. MPPA Registers to Region Assignment**

Register	Registers Protect	Address Range	PaRAM Protect <sup>(1)</sup>	Address Range
EDMA_TPCC_MPPAG	Global Range	0000h-1FFCh	N/A	N/A
EDMA_TPCC_MPPAN_k. MPPAN_0	DMA Shadow 0	2000h-21FCh	1st octant	4000h-47FCh
MPPAN_1	DMA Shadow 1	2200h-23FCh	2nd octant	4800h-4FFCh
MPPAN_2	DMA Shadow 2	2400h-25FCh	3rd octant	5000h-57FCh
MPPAN_3	DMA Shadow 3	2600h-27FCh	4th octant	5800h-5FFCh
MPPAN_4	DMA Shadow 4	2800h-29FCh	5th octant	6000h-67FCh
MPPAN_5	DMA Shadow 5	2A00h-2BFCh	6th octant	6800h-6FFCh
MPPAN_6	DMA Shadow 6	2C00h-2DFCh	7th octant	7000h-77FCh

**Table 11-23. MPPA Registers to Region Assignment (continued)**

Register	Registers Protect	Address Range	PaRAM Protect <sup>(1)</sup>	Address Range
MPPAN_7	DMA Shadow 7	2E00h-2FFCh	8th octant	7800h-7FFCh

(1) The PARAM region is divided into 8 regions referred to as an octant.

#### Example Access denied.

Write access to shadow region 7's event enable set register EDMA\_TPCC\_EESR:

1. The original value of the event enable register EDMA\_TPCC\_EER at address offset 0x1020 is 0x0.
2. The EDMA\_TPCC\_MPPAN\_k. EDMA\_TPCC\_MPPAN\_7[7] NS is set to prevent user level accesses (EDMA\_TPCC\_MPPAN\_k. EDMA\_TPCC\_MPPAN\_7[1] UW = 0, EDMA\_TPCC\_MPPAN\_k. EDMA\_TPCC\_MPPAN\_7[2] UR = 0), but it allows supervisor level accesses (EDMA\_TPCC\_MPPAN\_k. EDMA\_TPCC\_MPPAN\_7[4] SW = 1, EDMA\_TPCC\_MPPAN\_k. EDMA\_TPCC\_MPPAN\_7[5] SR = 1) with a privilege ID of 0. (EDMA\_TPCC\_MPPAN\_k. EDMA\_TPCC\_MPPAN\_7[10] AID0 = 1).
3. EDMA peripheral modules with a privilege ID of 0 attempts to perform a user-level write of a value of 0xFF00FF00 to shadow region 7's event enable set register EDMA\_TPCC\_EESR at address offset 0x2E30.

#### Note

The EDMA\_TPCC\_EER is a read-only register and the only way that write to it is by writing to the EDMA\_TPCC\_EESR. There is only one physical register for EDMA\_TPCC\_EER, EDMA\_TPCC\_EESR, etc. and that the shadow regions only provide to the same physical set.

4. Since the EDMA\_TPCC\_MPPAN\_k. EDMA\_TPCC\_MPPAN\_7[1] UW = 0, though the privilege ID of the write access is set to 0, the access is not allowed and the EDMA\_TPCC\_EER is not written too.

#### Example Access Allowed

Write access to shadow region 7's event enable set register EDMA\_TPCC\_EESR:

1. The original value of the event enable register EDMA\_TPCC\_EER at address offset 0x1020 is 0x0.
2. The EDMA\_TPCC\_MPPAN\_k.EDMA\_TPCC\_MPPAN\_7 is set to allow user-level accesses (EDMA\_TPCC\_MPPAN\_k.EDMA\_TPCC\_MPPAN\_7[1] UW = 1, EDMA\_TPCC\_MPPAN\_k. EDMA\_TPCC\_MPPAN\_7[2] UR = 1) and supervisor-level accesses (EDMA\_TPCC\_MPPAN\_k. EDMA\_TPCC\_MPPAN\_7[4] SW = 1, EDMA\_TPCC\_MPPAN\_k. EDMA\_TPCC\_MPPAN\_7[5] SR = 1) with a privilege ID of 0. (EDMA\_TPCC\_MPPAN\_k. EDMA\_TPCC\_MPPAN\_7[10] AID0 = 1).
3. EDMA peripheral modules with a privilege ID of 0, attempts to perform a user-level write of a value of 0xABCD0123 to shadow region 7's event enable set register EDMA\_TPCC\_EESR at address offset 0x2E30.

#### Note

The EDMA\_TPCC\_EER is a read-only register and the only way that write to it is by writing to the EDMA\_TPCC\_EESR. There is only one physical register for EDMA\_TPCC\_EER, EDMA\_TPCC\_EESR, etc. and that the shadow regions only provide to the same physical set.

4. Since the EDMA\_TPCC\_MPPAN\_k. EDMA\_TPCC\_MPPAN\_7[1] UW = 1 and EDMA\_TPCC\_MPPAN\_k. MPPAN\_7[10] AID0 = 1, the user-level write access is allowed.
5. The accesses to shadow region registers are masked by their respective EDMA\_TPCC\_DRAEM\_k register. In this example, the EDMA\_TPCC\_DRAEM\_k. EDMA\_TPCC\_DRAEM\_7 is set of 0x9FF00FC2.
6. The value finally written to EDMA\_TPCC\_EER is 0x8BC00102.

#### 11.3.10.2 Proxy Memory Protection

Proxy memory protection allows an EDMA transfer programmed by a given peripheral module connected to EDMA, to have its permissions travel with the transfer through the EDMA\_TPTC. The permissions travel along with the read transactions to the source and the write transactions to the destination endpoints. The

EDMA\_TPCC\_OPT\_n[31] PRIV bit and EDMA\_TPCC\_OPT\_n[27:24] PRIVID bit is set with the peripheral module's PRIV value and PRIVID values, respectively, when any part of the PaRAM set is written.

The EDMA\_TPCC\_OPT\_n[31] PRIV is the privilege level (i.e., user vs. supervisor). The EDMA\_TPCC\_OPT\_n[27:24] PRIVID refers to a privilege ID with a number that is associated with an peripheral module connected to EDMA.

These options are part of the TR that are submitted to the transfer controller. The transfer controller uses the above values on their respective read and write command bus so that the target endpoints can perform memory protection checks based on these values.

Consider a parameter set that is programmed by a CPU in user privilege level for a simple transfer with the source buffer on an L2 page and the destination buffer on an L1D page. The EDMA\_TPCC\_OPT\_n[31] PRIV is 0 for user-level and the CPU has a EDMA\_TPCC\_OPT\_n[27:24] PRIVID to 0.

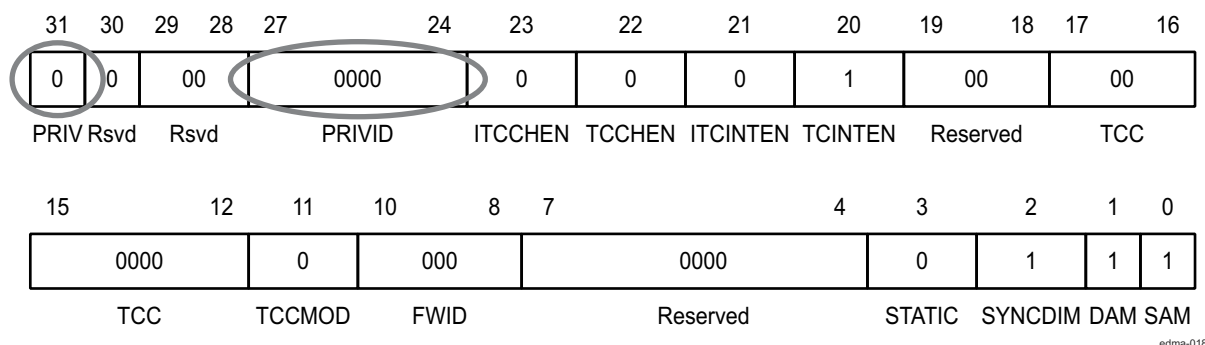

The PaRAM set is shown in Figure 11-18.

**Figure 11-18. PaRAM Set Content for Proxy Memory Protection Example**

(a) EDMA Parameters

Parameter Contents				Parameter	
	0010 0007h			Channel Options Parameter (OPT)	
	009F 0000h			Channel Source Address (SRC)	
	0001h	0004h		Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
	00F0 7800h			Channel Destination Address (DST)	
	0001h	0001h		Destination BCNT Index (DBIDX)	Source BCNT Index (SBIDX)
	0000h	FFFFh		BCNT Reload (BCNTRLD)	Link Address (LINK)
	0001h	1000h		Destination CCNT Index (DCIDX)	Source CCNT Index (SCIDX)
	0000h	0001h		Reserved	Count for 3rd Dimension (CCNT)

(b) Channel Options Parameter (OPT\_n) Content

edma-018

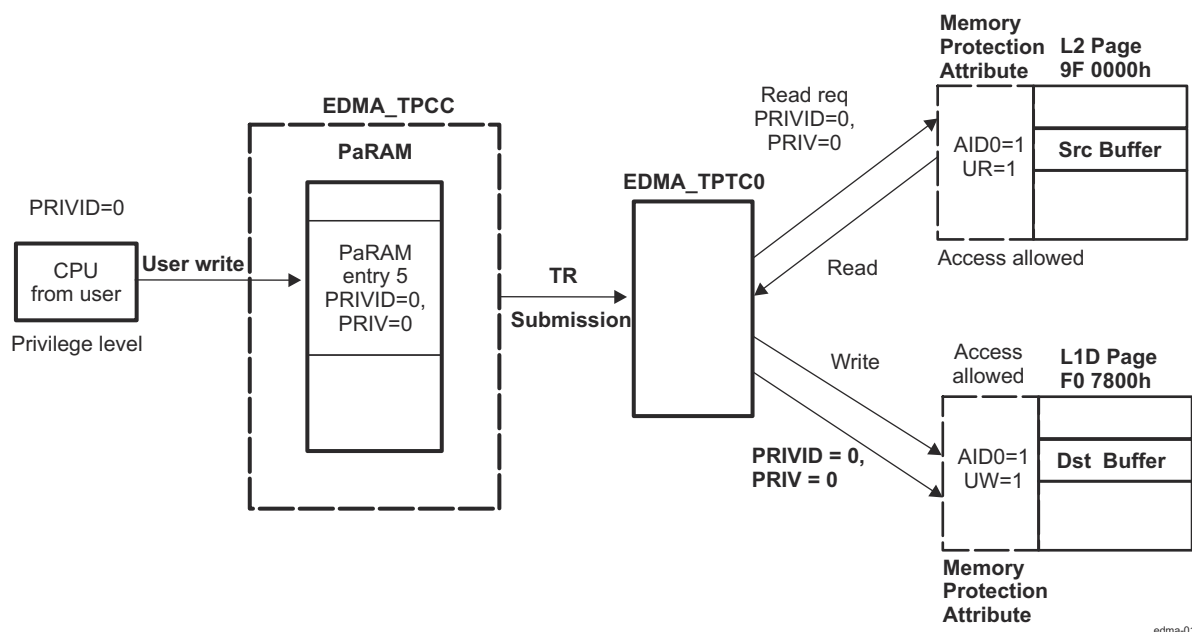

**Figure 11-19. Channel Options Parameter (OPT) Example**

The EDMA\_TPCC\_OPT\_n[31] PRIV and EDMA\_TPCC\_OPT\_n[27:24] PRIVID information travels along with the read and write requests that are issued to the source and destination memories.

For example, if the access attributes that are associated with the L2 page with the source buffer only allow supervisor read, write accesses (EDMA\_TPCC\_MPPAN\_k[4] SW and EDMA\_TPCC\_MPPAN\_k[5] SR), the user-level read request above is refused. Similarly, if the access attributes that are associated with the L1D page with the destination buffer only allow supervisor read and write accesses (EDMA\_TPCC\_MPPAN\_k[4] SW, EDMA\_TPCC\_MPPAN\_k[5] SR), the user-level write request above is refused. For the transfer to succeed, the source and destination pages must have user-read and user-write permissions, respectively, along with allowing accesses from a PRIVID = 0.

Because the privilege level and privilege identification travel with the read and write requests, EDMA acts as a proxy.

Figure 11-20 illustrates the propagation of EDMA\_TPCC\_OPT\_n[31] PRIV and EDMA\_TPCC\_OPT\_n[27:24] PRIVID at the boundaries of all the interacting entities (CPU, EDMA\_TPCC, EDMA\_TPTCs, and target memories).

**Figure 11-20. Proxy Memory Protection Example**

### 11.3.11 Event Queue(s)

Event queues are a part of the EDMA channel controller. Event queues form the interface between the event detection logic in the EDMA\_TPCC and the transfer request (TR) submission logic of the EDMA\_TPCC. Each queue is 16 entries deep. Each event queue can queue a maximum of 16 events. If there are more than 16 events, then the events that cannot find a place in the event queue remain set in the associated event register and the CPU does not stall.

There are two event queues for the device: Queue0, Queue1. Events in Queue0 result in submission of its associated transfer requests (TRs) to TC0. The transfer requests that are associated with events in Queue1 are submitted to TC1.

An event that wins prioritization against other DMA and/or QDMA pending events is placed at the tail of the appropriate event queue. Each event queue is serviced in FIFO order. Once the event reaches the head of its queue and the corresponding transfer controller is ready to receive another TR, the event is de-queued and the PaRAM set corresponding to the de-queued event is processed and submitted as a transfer request packet (TRP) to the associated EDMA transfer controller.

Queue0 has highest priority and Queue1 has the lowest priority, if Queue0 and Queue1 both have at least one event entry and if both TC0 and TC1 can accept transfer requests, then the event in Queue0 is de-queued first and its associated PaRAM set is processed and submitted as a transfer request (TR) to TC0.

Refer to *Performance Considerations* for system-level performance considerations. All of the event entries in all of the event queues are software readable (not writeable) by accessing the event entry registers EDMA\_TPCC\_Q0E\_p and EDMA\_TPCC\_Q1E\_p. Each event entry register characterizes the queued event in terms of the type of event (manual, event, chained or auto-triggered) and the event number. Refer to the associated Register Addendum for EDMA\_TPCC\_Q0E\_p / EDMA\_TPCC\_Q1E\_p descriptions of the bit fields.

### 11.3.11.1 DMA/QDMA Channel to Event Queue Mapping

Each of the 64 DMA channels and eight QDMA channels are programmed independently to map to a specific queue, using the DMA queue number register EDMA\_TPCC\_DMAQNUMN\_k and the QDMA queue number register EDMA\_TPCC\_QDMAQNUM. The mapping of DMA/QDMA channels is critical to achieving the desired performance level for the EDMA and most importantly, in meeting real-time deadlines. Refer to *System-level Performance Considerations*.

#### Note

If an event is ready to be queued and both the event queue and the EDMA transfer controller that is associated to the event queue are empty, then the event bypasses the event queue, and moves the PaRAM processing logic, and eventually to the transfer request submission logic for submission to the EDMA\_TPTC. In this case, the event is not logged in the event queue status registers.

### 11.3.11.2 Queue RAM Debug Visibility

There are two event queues and each queue has 16 entries. These 16 entries are managed in a circular FIFO. There is a queue status register EDMA\_TPCC\_QSTATN\_i associated with each queue. These along with all of the 16 entries per queue can be read via registers EDMA\_TPCC\_QSTATN\_i and Q0E\_p / Q1E\_p, respectively.

These registers provide user visibility.

The event queue entry register (QxEy Q0E\_p / Q1E\_p) uniquely identifies the specific event type (event-triggered, manually-triggered, chain-triggered, and QDMA events) along with the event number (for all DMA/QDMA event channels) that are in the queue or have been de-queued (passed through the queue).

Each of the 16 entries in the event queue are read using the EDMA\_TPCC memory-mapped register. To see the history of the last 16 TRs that have been processed by the EDMA on a given queue, read the event queue registers. This provides user/software visibility and is helpful for debugging real-time issues (typically post-mortem), involving multiple events and event sources.

The queue status register (QSTATn EDMA\_TPCC\_QSTATN\_i) includes fields for the start pointer EDMA\_TPCC\_QSTATN\_i[3:0] STRTPTR which provides the offset to the head entry of an event. It also includes a field called EDMA\_TPCC\_QSTATN\_i[12:8] NUMVAL that provides the total number of valid entries residing in the event queue at a given instance of time. The EDMA\_TPCC\_QSTATN\_i[3:0] STRTPTR is used to index appropriately into the 16 event entries. EDMA\_TPCC\_QSTATN\_i[12:8] NUMVAL number of entries starting from STRTPTR are indicative of events still queued in the respective queue. The remaining entry must be read to determine what's already de-queued and submitted to the associated transfer controller.

### 11.3.11.3 Queue Resource Tracking

The EDMA\_TPCC event queue includes watermarking/threshold logic that allows to keep track of maximum usage of all event queues. This is useful for debugging real-time deadline violations that may result from head-of-line blocking on a given EDMA event queue.

The maximum number of events are programmed that the queue up in an event queue by programming the threshold value (between 0 to 15) in the queue watermark threshold A register EDMA\_TPCC\_QWMTHRA. The maximum queue usage is recorded actively in the watermark EDMA\_TPCC\_QSTATN\_i[20:16] WM field of the queue status register, that keeps getting updated based on a comparison of number of valid entries, which is also visible in the EDMA\_TPCC\_QSTATN\_i[12:8] NUMVAL bit and the maximum number of entries.

If the queue usage is exceeded, this status is visible in the EDMA\_TPCC registers: the QTHRXCDn bits in the channel controller error register EDMA\_TPCC\_CCERR[7:0] and the EDMA\_TPCC\_QSTATN\_i[24] THRXCD bit, where n stands for the event queue number. Any bits that are set in EDMA\_TPCC\_CCERR also generate an EDMA\_TPCC error interrupt.

### 11.3.11.4 Performance Considerations

The device system bus infrastructure arbitrates bus requests from all of the controllers (TCs, CPU(S), and other bus controllers) to the shared target resources (peripherals and memories).

Therefore, the priority of unloading queues has a secondary affect compared to the priority of the transfers as they are executed by the EDMA\_TPTC.

### 11.3.12 EDMA Transfer Controller (EDMA\_TPTC)

The EDMA channel controller is the user-interface of the EDMA and the EDMA transfer controller (EDMA\_TPTC) is the data movement engine of the EDMA controller. The EDMA\_TPCC submits transfer requests (TR) to the EDMA\_TPTC and the EDMA\_TPTC performs the data transfers dictated by the TR, so the EDMA\_TPTC is a target to the EDMA\_TPCC.

#### 11.3.12.1 Architecture Details

##### 11.3.12.1.1 Command Fragmentation

The TC read and write controllers in conjunction with the source and destination register sets are responsible for issuing optimally-sized reads and writes to the target endpoints. An optimally-sized command is defined by the transfer controller default burst size (DBS), which is defined in the *TPTC DBS Configuration registers*.

The EDMA\_TPTC attempts to issue the largest possible command size as limited by the DBS value or the EDMA\_TPCC\_ABCNT\_n[15:0] ACNT and EDMA\_TPCC\_ABCNT\_n[31:16] BCNT value of the TR. EDMA\_TPTC obeys the following rules:

- The read/write controllers always issue commands less than or equal to the DBS value.
- The first command of a 1D transfer command always aligns the address of subsequent commands to the DBS value.

Table 11-24 lists the TR segmentation rules that are followed by the EDMA\_TPTC. In summary, if the EDMA\_TPCC\_ABCNT\_n[15:0] ACNT value is larger than the DBS value, then the EDMA\_TPTC breaks the EDMA\_TPCC\_ABCNT\_n[15:0] ACNT array into DBS-sized commands to the source/destination addresses. Each EDMA\_TPCC\_ABCNT\_n[31:16] BCNT number of arrays are then serviced in succession.

For BCNT arrays of ACNT bytes (that is, a 2D transfer), if the EDMA\_TPCC\_ABCNT\_n[15:0] ACNT value is less than or equal to the DBS value, then the TR may be optimized into a 1D-transfer in order to maximize efficiency. The optimization takes place if the EDMA\_TPTC recognizes that the 2D-transfer is organized as a single dimension (EDMA\_TPCC\_ABCNT\_n[15:0] ACNT == EDMA\_TPCC\_BIDX\_n) and the ACNT value is a power of 2.

Table 11-24 lists conditions in which the optimizations are performed.

**Table 11-24. Read/Write Command Optimization Rules**

ACNT ≤ DBS	ACNT is power of 2	BIDX = ACNT	BCNT ≤ 1023	SAM/DAM = Increment	Description
Yes	Yes	Yes	Yes	Yes	Optimized
No	x	x	x	x	Not Optimized
x	No	x	x	x	Not Optimized
x	x	No	x	x	Not Optimized
x	x	x	No	x	Not Optimized
x	x	x	x	No	Not Optimized

##### 11.3.12.1.2 TR Pipelining

TR pipelining refers to the ability of the source active set to proceed ahead of the destination active set. Essentially, the reads for a given TR may already be in progress while the writes of a previous TR may not have completed.

The number of outstanding TRs is limited by the number of destination FIFO register entries.

TR pipelining is useful for maintaining throughput on back-to-back small TRs. It minimizes the startup overhead because reads start in the background of a previous TR writes.

### Example 11-4. Command Fragmentation (DBS = 64)

The pseudo code:

1. EDMA\_TPTCn\_PCNT[15:0] ACNT = 8, EDMA\_TPTCn\_PCNT[31:16] BCNT = 8,  
EDMA\_TPTCn\_PBDX[15:0] SBIDX = 8, EDMA\_TPTCn\_PBDX[31:16] DBIDX = 10,  
EDMA\_TPTCn\_PSRC[31:0] SADDR = 64, EDMA\_TPTCn\_SADST[31:0] DADDR = 191

Read Controller: This is optimized from a 2D-transfer to a 1D-transfer such that the read side is equivalent to EDMA\_TPTCn\_PCNT[15:0] ACNT = 64, EDMA\_TPTCn\_PCNT[31:16] BCNT = 1.

Cmd0 = 64 byte

Write Controller: Because DBIDX != ACNT, it is not optimized.

Cmd0 = 8 byte, Cmd1 = 8 byte, Cmd2 = 8 byte, Cmd3 = 8 byte, Cmd4 = 8 byte, Cmd5 = 8 byte, Cmd6 = 8 byte, Cmd7 = 8 byte.

2. EDMA\_TPTCn\_PCNT[15:0] ACNT=128, EDMA\_TPTCn\_PCNT[31:16] BCNT = 1,  
EDMA\_TPTCn\_PSRC[31:0] SADDR = 63, EDMA\_TPTCn\_SADST[31:0] DADDR = 513

Read Controller: Read address is not aligned.

Cmd0 = 1 byte, (now the SADDR is aligned to 64 for the next command)

Cmd1 = 64 bytes

Cmd2 = 63 bytes

Write Controller: The write address is also not aligned.

Cmd0 = 63 bytes, (now the DADDR is aligned to 64 for the next command)

Cmd1 = 64 bytes

Cmd2 = 1 byte

#### 11.3.12.1.3 Performance Tuning

By default, reads are as issued as fast as possible. In some cases, the reads issued by the EDMA\_TPTC could fill the available command buffering for a target, delaying other (potentially higher priority) controllers from successfully submitting commands to that target. The rate at which read commands are issued by the EDMA\_TPTC is controlled by the EDMA\_TPTCn\_RDRATE register. The EDMA\_TPTCn\_RDRATE register defines the number of cycles that the EDMA\_TPTC read controller waits before issuing subsequent commands for a given TR, thus minimizing the chance of the EDMA\_TPTC consuming all available target resources. The EDMA\_TPTCn\_RDRATE[2:0] RDRATE value must be set to a relatively small value if the transfer controller is targeted for high priority transfers and to a higher value if the transfer controller is targeted for low priority transfers.

In contrast, the Write Interface does not have any performance turning knobs because writes always have an interval between commands as write commands are submitted along with the associated write data.

#### 11.3.12.2 Memory Protection

The transfer controller plays an important role in handling proxy memory protection. There are two access properties associated with a transfer: for instance, the privilege id (system-wide identification assigned to a controller) of the controller initiating the transfer, and the privilege level (user versus supervisor) used to program the transfer. This information is maintained in the PaRAM set when it is programmed in the channel controller. When a TR is submitted to the transfer controller, this information is made available to the EDMA\_TPTC and used by the EDMA\_TPTC while issuing read and write commands. The read or write commands have the same privilege identification, and privilege level as that programmed in the EDMA transfer in the channel controller.

### 11.3.12.3 Error Generation

Errors are generated if enabled under three conditions:

- EDMA\_TPTC detection of an error signaled by the source or destination address.
- Attempt to read or write to an invalid address in the configuration memory map.
- Detection of a constant addressing mode TR violating the constant addressing mode transfer rules (the source/destination addresses and source/destination indexes must be aligned to 32 bytes).

Either or all error types may be disabled. If an error bit is set and enabled, the error interrupt for the concerned transfer controller is generated.

### 11.3.12.4 Debug Features

The DMA program register set, DMA source active register set, and the destination FIFO register set are used to derive a brief history of TRs serviced through the transfer controller.

Additionally, the EDMA\_TPTC status register EDMA\_TPTCn\_TCSTAT has dedicated bit fields to indicate the ongoing activity within different parts of the transfer controller:

- The EDMA\_TPTCn\_TCSTAT[1] SRCACTV bit indicates whether the source active set is active.
- The EDMA\_TPTCn\_TCSTAT[6:4] DSTACTV bit indicates the number of TRs resident in the destination register active set at a given instance.
- The EDMA\_TPTCn\_TCSTAT[0] PROGBUSY bit indicates whether a valid TR is present in the DMA program set.

---

#### Note

If the TRs are in progression, it must realize that there is a chance that the values read from the EDMA\_TPTC status registers will be inconsistent since the EDMA\_TPTC changes the values of these registers due to ongoing activities.

It is recommended that to ensure no additional submission of TRs to the EDMA\_TPTC in order to facilitate ease of debug.

---

#### 11.3.12.4.1 Destination FIFO Register Pointer

The destination FIFO register pointer is implemented as a circular buffer with the start pointer being EDMA\_TPTCn\_TCSTAT[12:11] DFSTRTPTR and a buffer depth of usually 2 or 4. The EDMA\_TPTC maintains two important status details in EDMA\_TPTCn\_TCSTAT that are used during advanced debugging, if necessary. The EDMA\_TPTCn\_TCSTAT[12:11] DFSTRTPTR is a start pointer, the index to the head of the destination FIFO register. The EDMA\_TPTCn\_TCSTAT[6:4] DSTACTV is a counter for the number of valid (occupied) entries. These registers are used to get a brief history of transfers.

Examples of some register field values and their interpretation:

- EDMA\_TPTCn\_TCSTAT[12:11] DFSTRTPTR = 0x0 and EDMA\_TPTCn\_TCSTAT[6:4] DSTACTV = 0x0 implies that no TRs are stored in the destination FIFO register.
- EDMA\_TPTCn\_TCSTAT[12:11] DFSTRTPTR = 0x1 and EDMA\_TPTCn\_TCSTAT[6:4] DSTACTV = 0x2 implies that two TRs are present. The first pending TR is read from the destination FIFO register entry 1 and the second pending TR is read from the destination FIFO register entry 2.
- EDMA\_TPTCn\_TCSTAT[12:11] DFSTRTPTR = 0x3 and EDMA\_TPTCn\_TCSTAT[6:4] DSTACTV = 0x2 implies that two TRs are present. The first pending TR is read from the destination FIFO register entry 3 and the second pending TR is read from the destination FIFO register entry 0.

### 11.3.13 Event Dataflow

This section summarizes the data flow of a single event, from the time the event is latched to the channel controller to the time the transfer completion code is returned. The following steps list the sequence of EDMA\_TPCC activity:

1. Event is asserted from an external source (peripheral or external interrupt). This also is similar for a manually-triggered, chained-triggered, or QDMA-triggered event. The event is latched into the `EDMA_TPCC_ER[31:0]En / EDMA_TPCC_ERH[31:0] En` (or `EDMA_TPCC_CER[31:0] En / EDMA_TPCC_CERH[31:0] En`, `EDMA_TPCC_ESR[31:0] En / EDMA_TPCC_ESRH[31:0] En`, `EDMA_TPCC_QER[7:0] En`) bit.
2. Once an event is prioritized and queued into the appropriate event queue, the `EDMA_TPCC_SER[31:0] En \ EDMA_TPCC_SERH[31:0] En` (or `EDMA_TPCC_QSER[7:0] En`) bit is set to inform the event prioritization / processing logic to disregard this event since it is already in the queue. Alternatively, if the transfer controller and the event queue are empty, then the event bypasses the queue.
3. The `EDMA_TPCC` processing and the submission logic evaluates the appropriate PaRAM set and determines whether it is a non-null and non-dummy transfer request (TR).
4. The `EDMA_TPCC` clears the `EDMA_TPCC_ER[31:0] En/ EDMA_TPCC_ERH[31:0] En` (or `EDMA_TPCC_CER[31:0] En / EDMA_TPCC_CERH[31:0] En`, `EDMA_TPCC_ESR[31:0]En / EDMA_TPCC_ESRH[31:0] En`, `EDMA_TPCC_QER[31:0] En`) bit and the `EDMA_TPCC_SER[31:0] En/ EDMA_TPCC_SERH[31:0] En` bit as soon as it determines the TR is non-null. In the case of a null set, the `EDMA_TPCC_SER[31:0] En/ EDMA_TPCC_SERH[31:0] En` bit remains set. It submits the non-null/non-dummy TR to the associated transfer controller. If the TR was programmed for early completion, the `EDMA_TPCC` immediately sets the interrupt pending register (`EDMA_TPCC_IPR[31:0] I[TCC] / EDMA_TPCC_IPRH[31:0] I[TCC] - 32`).
5. If the TR was programmed for normal completion, the `EDMA_TPCC` sets the interrupt pending register (`EDMA_TPCC_IPR[31:0] I[TCC] / EDMA_TPCC_IPRH[31:0] I[TCC]`) when the `EDMA_TPTC` informs the `EDMA_TPCC` about completion of the transfer (returns transfer completion codes).
6. The `EDMA_TPCC` programs the associated `EDMA_TPTC`'s Program Register Set with the TR.
7. The TR is then passed to the Source Active set and the DST FIFO Register Set, if both the register sets are available.
8. The Read Controller processes the TR by issuing read commands to the source peripheral endpoint. The Read Data lands in the Data FIFO of the `EDMA_TPTCn`.
9. As soon as sufficient data is available, the Write Controller begins processing the TR by issuing write commands to the destination peripheral endpoint.
10. This continues until the TR completes and the `EDMA_TPTCn` then signals completion status to the `EDMA_TPCC`.

### 11.3.14 EDMA Controller Prioritization

The EDMA controller has many implementation rules to deal with concurrent events/channels, transfers, etc. The following subsections detail various arbitration details whenever there might be occurrence of concurrent activity. [Figure 11-21](#) shows the different places EDMA priorities come into play.

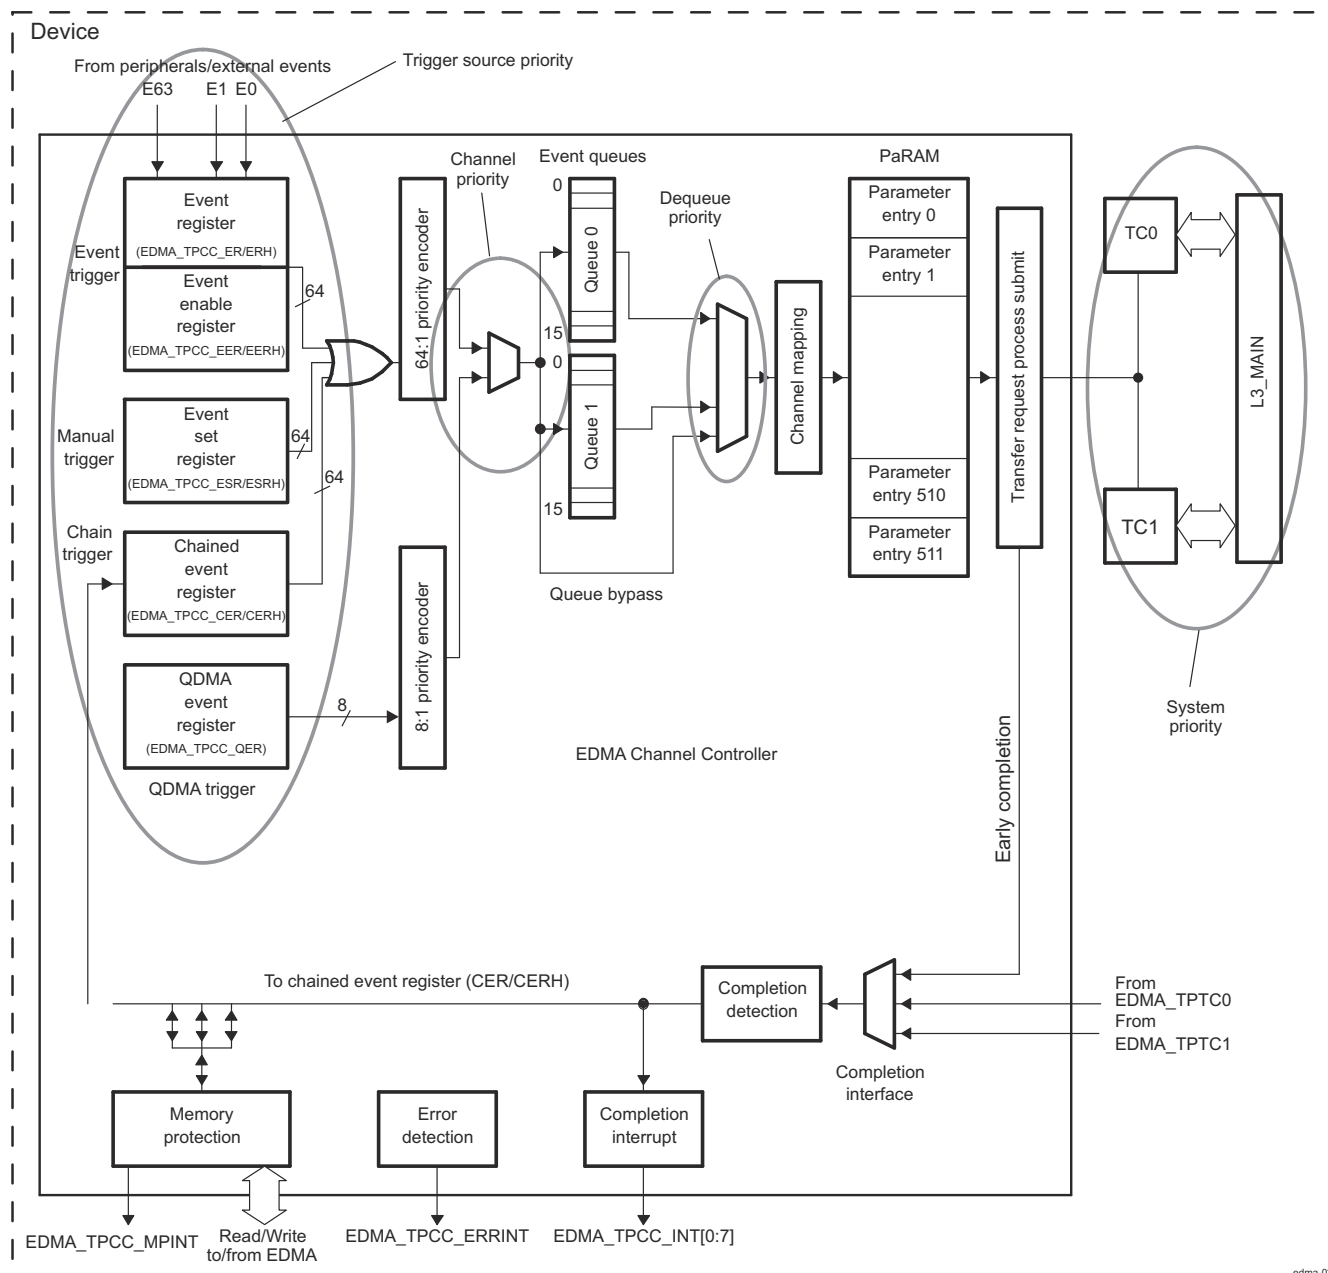

Figure 11-21. EDMA Prioritization

#### 11.3.14.1 Channel Priority

The EDMA event registers EDMA\_TPCC\_ER and EDMA\_TPCC\_ERH capture up to 64 events, the QDMA event register EDMA\_TPCC\_QER captures QDMA events for all QDMA channels therefore, it is possible for events to occur simultaneously on the DMA/QDMA event inputs. For events arriving simultaneously, the event associated with the lowest channel number is prioritized for submission to the event queues (for DMA events, channel 0 has the highest priority and channel 63 has the lowest priority, for QDMA events, channel 0 has the highest priority and channel 7 has the lowest priority). This mechanism only sorts simultaneous events for submission to the event queues.

If a DMA and QDMA event occurs simultaneously, the DMA event always has prioritization against the QDMA event for submission to the event queues.

#### 11.3.14.2 Trigger Source Priority

If a EDMA channel is associated with more than one trigger source (event trigger, manual trigger, and chain trigger), and if multiple events are set simultaneously for the same channel (EDMA\_TPCC\_ER[31:0]  $E_n = 1$ , EDMA\_TPCC\_ESR[31:0]  $E_n = 1$ , EDMA\_TPCC\_CER[31:0]  $E_n = 1$ ), then the EDMA\_TPCC always services these events in the following priority order: event trigger (via EDMA\_TPCC\_ER) is higher priority than chain trigger (via EDMA\_TPCC\_CER) and chain trigger is higher priority than manual trigger (via EDMA\_TPCC\_ESR).

This implies that if for channel 0, both EDMA\_TPCC\_ER[0]  $E_0 = 1$  and EDMA\_TPCC\_CER[0]  $E_0 = 1$  at the same time, then the EDMA\_TPCC\_ER[0]  $E_0$  event is always queued before the EDMA\_TPCC\_CER[0]  $E_0$  event.

#### 11.3.14.3 Dequeue Priority

The priority of the associated transfer request (TR) is further mitigated by which event queue is being used for event submission (dictated by EDMA\_TPCC\_DMAQNUMN\_k and EDMA\_TPCC\_QDMAQNUM). For submission of a TR to the transfer request, events need to be de-queued from the event queues. Queue 0 has the highest dequeue priority and queue 1 the lowest.

#### 11.3.15 Emulation Considerations

During debug when using the emulator, the CPU(s) may be halted on an execute packet boundary for single-stepping, benchmarking, profiling, or other debug purposes. During an emulation halt, the EDMA channel controller and transfer controller operations continue. Events continue to be latched and processed and transfer requests continue to be submitted and serviced.

Since EDMA is involved in servicing multiple controller and target peripherals, it is not feasible to have an independent behavior of the EDMA for emulation halts. EDMA functionality would be coupled with the peripherals it is servicing, which might have different behavior during emulation halts.

## 11.4 EDMA Transfer Examples

The EDMA channel controller performs a variety of transfers depending on the parameter configuration. The following sections provide a description and PaRAM configuration for some typical use case scenarios.

### 11.4.1 Block Move Example

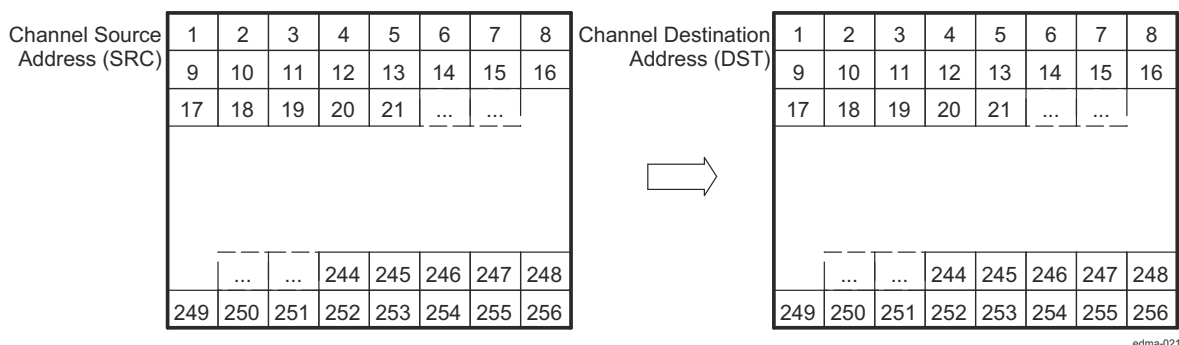

The most basic transfer performed by the EDMA is a block move. During device operation it is often necessary to transfer a block of data from one location to another, usually between on-chip and off-chip memory.

In this example, a section of data is to be copied from external memory to internal L2 SRAM as shown in [Figure 11-22](#).

The source address for the transfer is set to the start of the data block in external memory, and the destination address is set to the start of the data block in L2. If the data block is less than 64K bytes, the PaRAM configuration shown in [Figure 11-23](#) holds true with the synchronization type set to A-synchronized and indexes cleared to 0. If the amount of data is greater than or equal to 64K bytes, EDMA\_TPCC\_ABCNT\_n[31:16] BCNT and the B-indexes need to be set appropriately with the synchronization type set to AB-synchronized. The EDMA\_TPCC\_OPT\_n[3] STATIC bit is set to prevent linking.

This transfer example may also be set up using QDMA. For successive transfer submissions, of a similar nature, the number of cycles used to submit the transfer are fewer depending on the number of changing transfer parameters. The QDMA trigger word must be programmed to be the highest numbered offset in the PaRAM set that undergoes change.

[Figure 11-23](#) shows the parameters Block Move transfer.

**Figure 11-22. Block Move Example**

**Figure 11-23. Block Move Example PaRAM Configuration**

(a) EDMA Parameters

Parameter Contents			Parameter	
0010 0008h			Channel Options Parameter (OPT)	
Channel Source Address (SRC)			Channel Source Address (SRC)	
0001h	FFFFh		Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
Channel Destination Address (DST)			Channel Destination Address (DST)	
0000h	0000h		Destination BCNT Index (DBIDX)	Source BCNT Index (SBIDX)
0000h	FFFFh		BCNT Reload (BCNTRLD)	Link Address (LINK)
0000h	0000h		Destination CCNT Index (DCIDX)	Source CCNT Index (SCIDX)
0000h	0001h		Reserved	Count for 3rd Dimension (CCNT)

(b) Channel Options Parameter (OPT) Content

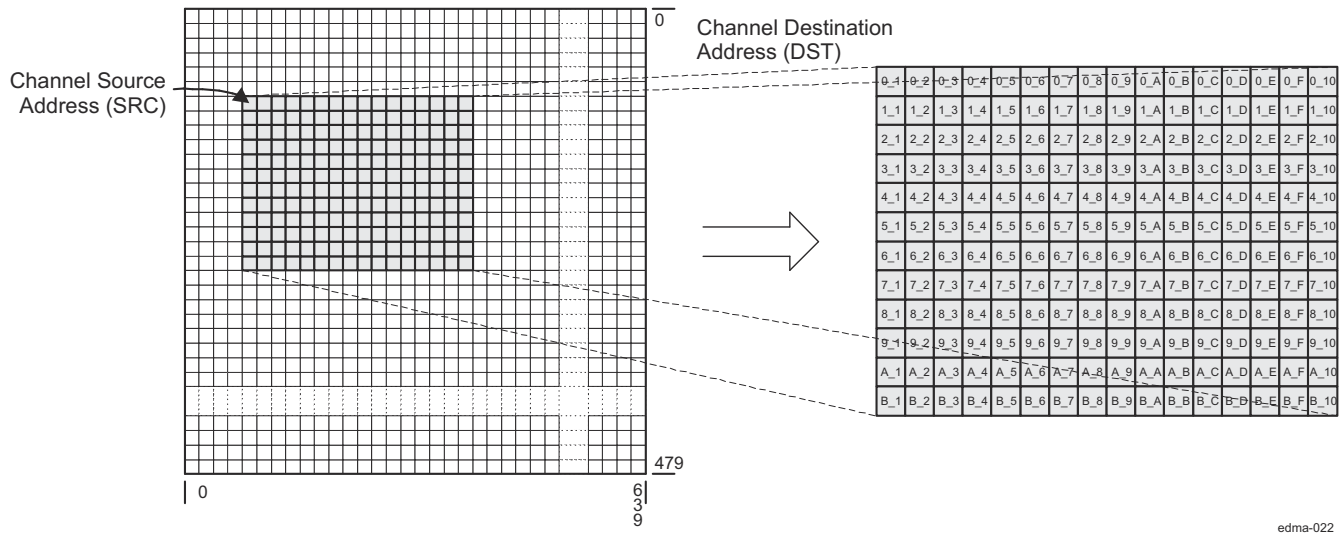

- EDMA\_TPCC\_OPT\_n[3] STATIC = 0x1
- EDMA\_TPCC\_OPT\_n[20] TCINTEN = 0x1

### 11.4.2 Subframe Extraction Example

The EDMA can efficiently extract a small frame of data from a larger frame of data. By performing a 2D-to-1D transfer, the EDMA retrieves a portion of data for the CPU to process. In this example, a 640 × 480-pixel frame of video data is stored in external memory. Each pixel is represented by a 16-bit halfword. The CPU extracts a 16 × 12-pixel subframe of the image for processing. To facilitate more efficient processing time by the CPU, the EDMA places the subframe in internal L2 SRAM. Figure 11-24 shows the transfer of a subframe from external memory to L2.

The same PaRAM entry options are used for QDMA channels, as well as DMA channels. The EDMA\_TPCC\_OPT\_n[3] STATIC bit is set to prevent linking. For successive transfers, only changed parameters need to be programmed before triggering the channel.

Figure 11-25 shows the parameters for Subframe Extraction transfer.

**Figure 11-24. Subframe Extraction Transfer**

**Figure 11-25. Subframe Extraction Example PaRAM Configuration**

(a) EDMA Parameters

Parameter Contents		Parameter	
0010 000Ch		Channel Options Parameter (OPT)	
Channel Source Address (SRC)		Channel Source Address (SRC)	
000Ch	0020h	Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
Channel Destination Address (DST)		Channel Destination Address (DST)	
0020h	0500h	Destination BCNT Index (DBIDX)	Source BCNT Index (SBIDX)
0000h	FFFFh	BCNT Reload (BCNTRLD)	Link Address (LINK)
0000h	0000h	Destination CCNT Index (DCIDX)	Source CCNT Index (SCIDX)
0000h	0001h	Reserved	Count for 3rd Dimension (CCNT)

(b) Channel Options Parameter (OPT) Content

- EDMA\_TPCC\_OPT\_n[2] SYNCDIM = 0x1
- EDMA\_TPCC\_OPT\_n[3] STATIC = 0x1
- EDMA\_TPCC\_OPT\_n[20] TCINTEN = 0x1

### 11.4.3 Data Sorting Example

Many applications require the use of multiple data arrays, it is often desirable to have the arrays arranged such that the first elements of each array are adjacent, the second elements are adjacent, and so on. Often this is not how the data is presented to the device. Either data is transferred via a peripheral with the data arrays arriving one after the other or the arrays are located in memory with each array occupying a portion of contiguous memory spaces. For these instances, the EDMA can reorganize the data into the desired format.

To determine the parameter set values, the following need to be considered:

- ACNT - Program this to be the size in bytes of an element.
- BCNT - Program this to be the number of elements in a frame.
- CCNT - Program this to be the number of frames.
- SBIDX - Program this to be the size of the element or ACNT.
- DBIDX - CCNT × ACNT
- SCIDX - ACNT × BCNT
- DCIDX - ACNT

The synchronization type needs to be AB-synchronized and the EDMA\_TPCC\_OPT\_n[3] STATIC bit is 0 to allow updates to the parameter set. It is advised to use normal EDMA channels for sorting.

It is not possible to sort this with a single trigger event. Instead, the channel can be programmed to be chained to itself. After BCNT elements get sorted, intermediate chaining could be used to trigger the channel again causing the transfer of the next BCNT elements and so on. [Figure 11-27](#) shows the parameter set programming for this transfer, assuming channel 0 and an element size of 4 bytes.

[Figure 11-26](#) shows the Data Sorting transfer

**Figure 11-26. Data Sorting Example**

edma-023

**Figure 11-27. Data Sorting Example PaRAM Configuration**

(a) EDMA Parameters

Parameter Contents			Parameter	
0090 0004h			Channel Options Parameter (OPT)	
Channel Source Address (SRC)			Channel Source Address (SRC)	
0400h	0004h		Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
Channel Destination Address (DST)			Channel Destination Address (DST)	
0010h	0001h		Destination BCNT Index (DSTBIDX)	Source BCNT Index (SRCBIDX)
0000h	FFFFh		BCNT Reload (BCNTRLD)	Link Address (LINK)
0001h	1000h		Destination CCNT Index (DSTCIDX)	Source CCNT Index (SRCCIDX)
0000h	0004h		Reserved	Count for 3rd Dimension (CCNT)

(b) Channel Options Parameter (OPT) Content

- EDMA\_TPCC\_OPT\_n[2] SYNCDIM = 0x1
- EDMA\_TPCC\_OPT\_n[20] TCINTEN = 0x1
- EDMA\_TPCC\_OPT\_n[23] ITCCHEN = 0x1

### 11.4.4 Setting Up an EDMA Transfer

The following list provides a quick guide for the typical steps involved in setting up a transfer.

1. Initiating a DMA/QDMA channel
  - a. Determine the type of channel (QDMA or DMA) to be used.
  - b. Channel mapping
    - i. If using a QDMA channel, program the EDMA\_TPCC\_QCHMAPN\_j with the parameter set number to which the channel maps and the trigger word.
    - ii. If using a DMA channel, program the EDMA\_TPCC\_DCHMAPN\_m with the parameter set number to which the channel maps.
  - c. If the channel is being used in the context of a shadow region, ensure the EDMA\_TPCC\_DRAEM\_k / EDMA\_TPCC\_DRAEHM\_k for the region is properly set up to allow read write accesses to bits in the event registers and interrupt registers in the Shadow region memory map. The subsequent steps in this process should be done using the respective shadow region registers. (Shadow region descriptions and usage are provided in [Section 11.3.7.1.](#))
  - d. Determine the type of triggering used.
    - i. If external events are used for triggering (DMA channels), enable the respective event in EDMA\_TPCC\_EER / EDMA\_TPCC\_EERH by writing into EDMA\_TPCC\_EESR / EDMA\_TPCC\_EESRH.
    - ii. If QDMA Channel is used, enable the channel in EDMA\_TPCC\_QEER by writing into EDMA\_TPCC\_QEESR.
  - e. Queue setup
    - i. If a QDMA channel is used, set up the EDMA\_TPCC\_QDMAQNUM to map the channel to the respective event queue.
    - ii. If a DMA channel is used, set up the EDMA\_TPCC\_DMAQNUMN\_k to map the event to the respective event queue.
2. Parameter set setup
  - a. Program the PaRAM set number associated with the channel. Note that

#### Note

If it is a QDMA channel, the PaPARAM entry that is configured as trigger word is written to last. Alternatively, enable the QDMA channel (step 1-d-ii above) just before the write to the trigger word.

3. Interrupt setup
  - a. Enable the interrupt in the EDMA\_TPCC\_IER / EDMA\_TPCC\_IERH by writing into EDMA\_TPCC\_IESR / EDMA\_TPCC\_IESRH.
  - b. Ensure the EDMA\_TPCC completion interrupt (this refers to either the Global interrupt or the shadow region interrupt) is enabled properly in the Device Interrupt controller.
  - c. Set up the interrupt controller properly to receive the expected EDMA interrupt.
4. Initiate transfer
  - a. This step is highly dependent on the event trigger source:
    - i. If the source is an external event coming from a peripheral, the peripheral will be enabled to start generating relevant EDMA events that can be latched to the EDMA\_TPCC\_ER transfer.
    - ii. For QDMA events, writes to the trigger word (step 2-a above) will initiate the transfer.
    - iii. Manually triggered transfers will be initiated by writes to the Event Set Registers EDMA\_TPCC\_ESR / EDMA\_TPCC\_ESRH.
    - iv. Chained-trigger events initiate when a previous transfer returns a transfer completion code equal to the chained channel number.
5. Wait for completion

- a. If the interrupts are enabled as mentioned in step 3 above, then the EDMA\_TPCC will generate a completion interrupt to the CPU whenever transfer completion results in setting the corresponding bits in the interrupt pending register EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH. The set bits must be cleared in the EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH by writing to corresponding bit in EDMA\_TPCC\_ICR / EDMA\_TPCC\_ICRH.
- b. If polling for completion (interrupts not enabled in the device controller), then the application code can wait on the expected bits to be set in the EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH. Again, the set bits in the EDMA\_TPCC\_IPR / EDMA\_TPCC\_IPRH must be manually cleared via EDMA\_TPCC\_ICR / EDMA\_TPCC\_ICRH before the next set of transfers is performed for the same transfer completion code values.

## 11.5 EDMA Debug Checklist and Programming Tips

This section lists some tips to keep in mind while debugging applications using the EDMA controller.

### 11.5.1 EDMA Debug Checklist

Table 11-25 provides some common issues and their probable causes and resolutions.

**Table 11-25. Debug Checklist**

Issue	Description/Solution
The transfer associated with the channel does not happen. The channel does not get serviced.	The EDMA_TPCC may not service a transfer request, even though the associated PaRAM set is programmed appropriately. Check for the following: 1) Verify that events are enabled, i.e., if an external/peripheral event is latched in Event Registers EDMA_TPCC_ER / EDMA_TPCC_ERH, check that the event is enabled in the Event Enable Registers EDMA_TPCC_EER / EDMA_TPCC_EERH. Similarly, for QDMA channels, check that QDMA events are appropriately enabled in the QDMA Event Enable Register EDMA_TPCC_QEER. 2) Verify that the DMA or QDMA Secondary Event Register EDMA_TPCC_SER / EDMA_TPCC_SERH / EDMA_TPCC_QSER bits corresponding to the particular event or channel are not set.
The Secondary Event Registers bits are set, not allowing additional transfers to occur on a channel.	It is possible that a trigger event was received when the parameter set associated with the channel/event was a NULL set for a previous transfer on the channel. This is typical in two cases: 1) QDMA channels: Typically if the parameter set is non-static and expected to be terminated by a NULL set (i.e., EDMA_TPCC_OPT_n[3] STATIC = 0x0, EDMA_TPCC_LNK_n[15:0] LINK = 0xFFFF), the parameter set is updated with a NULL set after submission of the last TR. Because QDMA channels are auto-triggered, this update caused the generation of an event. An event generated for a NULL set causes an error condition and results in setting the bits corresponding to the QDMA channel in the EDMA_TPCC_QEMR and EDMA_TPCC_QSER. This will disable further prioritization of the channel. 2) DMA channels used in a continuous mode: The peripheral may be set up to continuously generate infinite events. The parameter set may be programmed to expect only a finite number of events and to be terminated by a NULL link. After the expected number of events, the parameter set is reloaded with a NULL parameter set. Because the peripheral will generate additional events, an error condition is set in the EDMA_TPCC_SER[31:0] En and EDMA_TPCC_EMR[31:0] En set, preventing further event prioritization. Check the number of events received is limited to the expected number of events for which the parameter set is programmed, or check the bits corresponding to particular channel or event are not set in the Secondary event registers (EDMA_TPCC_SER / EDMA_TPCC_SERH / EDMA_TPCC_QSER) and Event Missed Registers (EDMA_TPCC_EMR / EDMA_TPCC_EMRH / EDMA_TPCC_QEMR) before trying to perform subsequent transfers for the event/channel.

**Table 11-25. Debug Checklist (continued)**

Issue	Description/Solution
Completion interrupts are not asserted, or no further interrupts are received after the first completion interrupt.	<p>Check the following:</p> <ol style="list-style-type: none"> <li>1) The interrupt generation is enabled in the EDMA_TPCC_OPT_n of the associated PaRAM set (EDMA_TPCC_OPT_n[20] TCINTEN = 0x1 and/or EDMA_TPCC_OPT_n[20] ITCINTEN = 0x1).</li> <li>2) The interrupts are enabled in the EDMA Channel Controller, via the Interrupt Enable Registers (EDMA_TPCC_IER / EDMA_TPCC_IERH ).</li> <li>3) The corresponding interrupts are enabled in the device interrupt controller.</li> <li>4) The set interrupts are cleared in the interrupt pending registers (EDMA_TPCC_IPR / EDMA_TPCC_IPRH) before exiting the transfer completion interrupt service routine (ISR). See <a href="#">Section 11.3.9.1.2 Clearing Transfer Completion Interrupts</a> for details on writing EDMA ISRs.</li> <li>5) If working with shadow region interrupts, make sure that the DMA Region Access registers (EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k ) are set up properly, because the EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k registers act as secondary enables for shadow region completion interrupts, along with the EDMA_TPCC_IER / EDMA_TPCC_IERH registers.</li> </ol> <p>If working with shadow region interrupts, make sure that the bits corresponding to the transfer completion code EDMA_TPCC_OPT_n[17:12] TCC value are also enabled in the EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k registers. For instance, if the PaRAM set associated with Channel 0 returns a completion code of 63 EDMA_TPCC_OPT_n[17:12] TCC = 63, ensure that EDMA_TPCC_DRAEHM_k[31] E63 is also set for a shadow region completion interrupt because the interrupt pending register bit set will be EDMA_TPCC_IPRH[31] I63 (not EDMA_TPCC_IPR[0] I0).</p>

## 11.5.2 EDMA Programming Tips

- For several registers, the setting and clearing of bits needs to be done via separate dedicated registers. For example, the Event Register (EDMA\_TPCC\_ER / EDMA\_TPCC\_ERH) can only be cleared by writing a 1 to the corresponding bits in the Event Clear Registers (EDMA\_TPCC\_ECR / EDMA\_TPCC\_ECRH). Similarly, the Event Enable Register (EDMA\_TPCC\_EER / EDMA\_TPCC\_EERH) bits can only be set with writing of 0x1 to the Event Enable Set Registers (EDMA\_TPCC\_EESR / EDMA\_TPCC\_EESRH) and cleared with writing of 0x1 to the corresponding bits in the Event Enable Clear Register (EDMA\_TPCC\_EECR / EDMA\_TPCC\_EECRH).
- Writes to the shadow region memory maps are governed by region access registers (EDMA\_TPCC\_DRAE / EDMA\_TPCC\_DRAEHM\_k / EDMA\_TPCC\_QRAEN\_k). If the appropriate channels are not enabled in these registers, read/write access to the shadow region memory map is not enabled.
- When working with shadow region completion interrupts, ensure that the DMA Region Access Registers (EDMA\_TPCC\_DRAEM\_k / EDMA\_TPCC\_DRAEHM\_k) for every region are set in a mutually exclusive way (unless it is a requirement for an application). If there is an overlap in the allocated channels and transfer completion codes (setting of Interrupt Pending Register bits) in the region resource allocation, it results in multiple shadow region completion interrupts.  
For example, if EDMA\_TPCC\_DRAEM\_k.DRAEM\_0[0] E0 and EDMA\_TPCC\_DRAEM\_k.DRAEM\_1[0] E0 are both set, then on completion of a transfer that returns a TCC = 0x0, they will generate both shadow region 0 and 1 completion interrupts.
- While programming a non-dummy parameter set, ensure the EDMA\_TPCC\_CCNT\_n[15:0] CCNT is not left to zero.
- Enable the EDMA\_TPCC error interrupt in the device controller and attach an interrupt service routine (ISR) to ensure that error conditions are not missed in an application and are appropriately addressed with the ISR.
- Depending on the application, it can want to break large transfers into smaller transfers and use self-chaining to prevent starvation of other events in an event queue.
- In applications where a large transfer is broken into sets of small transfers using chaining or other methods, it chooses to use the early chaining option to reduce the time between the sets of transfers and increase the throughput.  
However, keep in mind that with early completion, all data might have not been received at the end point when completion is reported because the EDMA\_TPCC internally signals completion when the TR is submitted to the EDMA\_TPTC, potentially before any data has been transferred.
- The event queue entries can be observed to determine the last few events if there is a system failure (provided the entries were not bypassed).

## 11.6 EDMA Event Map

### 11.6.1 MSS TPCC\_A Event Map

**Table 11-26. MSSTPCC\_A Event Map**

TPCC Event	DefineName	Description
0	MSS_SPIA_DMA_REQ0	MSSSPIA DMA Request 0
1	MSS_SPIA_DMA_REQ1	MSSSPIA DMA Request 1
2	MSS_SPIA_DMA_REQ2	MSSSPIA DMA Request 2
3	MSS_SPIA_DMA_REQ3	MSSSPIA DMA Request 3
4	MSS_SPIA_DMA_REQ4	MSSSPIA DMA Request 4
5	MSS_SPIA_DMA_REQ5	MSSSPIA DMA Request 5
6	MSS_SPIB_DMA_REQ0	MSSSPIB DMA Request 0
7	MSS_SPIB_DMA_REQ1	MSSSPIB DMA Request 1
8	MSS_SPIB_DMA_REQ2	MSSSPIB DMA Request 2
9	MSS_SPIB_DMA_REQ3	MSSSPIB DMA Request 3
10	MSS_SPIB_DMA_REQ4	MSSSPIB DMA Request 4

### 11.8.1.1.1 PID Register (Offset = 0h) [reset = 4001AB00h]

PID is shown in [Figure 11-28](#) and described in [Table 11-33](#).

Return to the [Table 11-32](#).

Peripheral ID Register

**Figure 11-28. PID Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SCHEME		RES1		FUNC											
R-1h		R-0h		R-1h											
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RTL					MAJOR			CUSTOM		MINOR					
R-15h					R-3h			R-0h		R-0h					

**Table 11-33. PID Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-30	SCHEME	R	1h	PID Scheme: Used to distinguish between old ID scheme and current. Spare bit to encode future schemes EDMA uses 'new scheme' indicated with value of 0x1.
29-28	RES1	R	0h	RESERVE FIELD
27-16	FUNC	R	1h	Function indicates a software compatible module family.
15-11	RTL	R	15h	RTL Version
10-8	MAJOR	R	3h	Major Revision
7-6	CUSTOM	R	0h	Custom revision field: Not used on this version of EDMA.
5-0	MINOR	R	0h	Minor Revision

### 11.8.1.1.2 CCCFG Register (Offset = 4h) [reset = 00213445h]

CCCFG is shown in [Figure 11-29](#) and described in [Table 11-34](#).

Return to the [Table 11-32](#).

CC Configuration Register

**Figure 11-29. CCCFG Register**

31	30	29	28	27	26	25	24
RES2						MPEXIST	CHMAPEXIST
R-0h						R-0h	R-0h
23	22	21	20	19	18	17	16
RES3		NUMREGN		RES4	NUMTC		
R-0h		R-2h		R-0h	R-1h		
15	14	13	12	11	10	9	8
RES5	NUMPAENTRY			RES6	NUMINTCH		
R-0h	R-3h			R-0h	R-4h

RES7	NUMQDMACH			RES8	NUMDMACH		
R-0h	R-4h			R-0h	R-5h		

**Table 11-34. CCCFG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-26	RES2	R	0h	RESERVE FIELD
25	MPEXIST	R	0h	Memory Protection Existence MPEXIST = 0 : No memory protection. MPEXIST = 1 : Memory Protection logic included.
24	CHMAPEXIST	R	0h	Channel Mapping Existence CHMAPEXIST = 0 : No Channel mapping. CHMAPEXIST = 1 : Channel mapping logic included.
23-22	RES3	R	0h	RESERVE FIELD
21-20	NUMREGN	R	2h	Number of MP and Shadow regions
19	RES4	R	0h	RESERVE FIELD
18-16	NUMTC	R	1h	Number of Queues/Number of TCs
15	RES5	R	0h	RESERVE FIELD
14-12	NUMPAENTRY	R	3h	Number of PaRAM entries
11	RES6	R	0h	RESERVE FIELD
10-8	NUMINTCH	R	4h	Number of Interrupt Channels
7	RES7	R	0h	RESERVE FIELD
6-4	NUMQDMACH	R	4h	Number of QDMA Channels
3	RES8	R	0h	RESERVE FIELD
2-0	NUMDMACH	R	5h	Number of DMA Channels

### 11.8.1.1.3 QCHMAPN Register (Offset = 200h) [reset = 0h]

QCHMAPN is shown in [Figure 11-30](#) and described in [Table 11-35](#).

Return to the [Table 11-32](#).

QDMA Channel N Mapping Register

**Figure 11-30. QCHMAPN Register**

2-0	E0	R/W	0h	DMA Queue Number for event #0

### 11.8.1.1.5 QDMAQNUM Register (Offset = 260h) [reset = 0h]

QDMAQNUM is shown in [Figure 11-32](#) and described in [Table 11-37](#).

Return to the [Table 11-32](#).

QDMA Queue Number Register Contains the Event queue number to be used for the corresponding QDMA Channel.

**Figure 11-32. QDMAQNUM Register**

Bit	Field	Type	Reset	Description
31-7	RES29	R	0h	RESERVE FIELD
6-4	PRIQ1	R/W	0h	Priority Level for Queue 1 Dictates the priority level used for the OPTIONS field programming for Qn TRs. Sets the priority used for TC read and write commands.
3	RES30	R	0h	RESERVE FIELD
2-0	PRIQ0	R/W	0h	Priority Level for Queue 0 Dictates the priority level used for the OPTIONS field programming for Qn TRs. Sets the priority used for TC read and write commands.

### 11.8.1.1.8 EMR Register (Offset = 300h) [reset = 0h]

EMR is shown in [Figure 11-35](#) and described in [Table 11-40](#).

Return to the [Table 11-32](#).

Event Missed Register: The Event Missed register is set if 2 events are received without the first event being cleared or if a Null TR is serviced. Chained events (CER) Set Events (ESR) and normal events (ER) are treated individually. If any bit in the EMR register is set (and all errors (including QEMR/CCERR) were previously clear) then an error will be signaled with TPCC error interrupt.

**Figure 11-35. EMR Register**

**Table 11-46. CCERR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-17	RES33	R	0h	RESERVE FIELD
16	TCERR	R	0h	Transfer Completion Code Error: TCCERR = 0 : Total number of allowed TCCs outstanding has not been reached. TCCERR = 1 : Total number of allowed TCCs has been reached. TCCERR can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors were previously clear) then an error will be signaled with TPCC error interrupt.
15-8	RES34	R	0h	RESERVE FIELD
7	QTHRXCD7	R	0h	Queue Threshold Error for Q7: QTHRXCD7 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD7 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD7 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
6	QTHRXCD6	R	0h	Queue Threshold Error for Q6: QTHRXCD6 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD6 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD6 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.

**Table 11-46. CCERR Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
5	QTHRXCD5	R	0h	Queue Threshold Error for Q5: QTHRXCD5 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD5 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD5 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
4	QTHRXCD4	R	0h	Queue Threshold Error for Q4: QTHRXCD4 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD4 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD4 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
3	QTHRXCD3	R	0h	Queue Threshold Error for Q3: QTHRXCD3 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD3 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD3 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
2	QTHRXCD2	R	0h	Queue Threshold Error for Q2: QTHRXCD2 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD2 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD2 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
1	QTHRXCD1	R	0h	Queue Threshold Error for Q1: QTHRXCD1 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD1 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD1 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
0	QTHRXCD0	R	0h	Queue Threshold Error for Q0: QTHRXCD0 = 0 : Watermark/ threshold has not been exceeded. QTHRXCD0 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXCD0 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.

### 11.8.1.1.15 CCERRCLR Register (Offset = 31Ch) [reset = 0h]

CCERRCLR is shown in [Figure 11-42](#) and described in [Table 11-47](#).

Return to the [Table 11-32](#).

R-0h						W-0h	W-0h

**Table 11-48. EEVAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	RES37	R	0h	RESERVE FIELD
1	SET	W	0h	Error Interrupt Set: CPU write of '1' to the SET bit causes the TPCC error interrupt to be pulsed regardless of state of EMR/EMRH QEMR or CCERR. CPU write of '0' has no effect.
0	EVAL	W	0h	Error Interrupt Evaluate: CPU write of '1' to the EVAL bit causes the TPCC error interrupt to be pulsed if any errors have not been cleared in the EMR/EMRH QEMR or CCERR registers. CPU write of '0' has no effect.

### 11.8.1.1.17 DRAEM Register (Offset = 340h) [reset = 0h]

DRAEM is shown in [Figure 11-44](#) and described in [Table 11-49](#).

Return to the [Table 11-32](#).

DMA Region Access enable for bit N in Region M: En = 0 : Accesses via Region M address space to Bit N in any DMA Channel Register are not allowed. Reads will return 'b0 on Bit N and writes will not modify the state of bit N. Enabled interrupt bits for bit N do not contribute to the generation of the TPCC region M interrupt. En = 1 : Accesses via Region M address space to Bit N in any DMA Channel Register are allowed. Reads will return the value from Bit N and writes will modify the state of bit N. Enabled interrupt bits for bit N do contribute to the generation of the TPCC region M interrupt.

15	14	13	12	11	10	9	8
RES57				NUMVAL			
R-0h				R-0h			
7	6	5	4	3	2	1	0
RES58				STRTPTR			
R-0h				R-0h			

**Table 11-68. QSTATN Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-25	RES55	R	0h	RESERVE FIELD
24	THRXCD	R	0h	Threshold Exceeded: THRXCD = 0 : Threshold specified by QWMTHR(A B).Qn has not been exceeded. THRXCD = 1 : Threshold specified by QWMTHR(A B).Qn has been exceeded. QSTATn.THXXCD is cleared via CCERR.WMCLRN bit.
23-21	RES56	R	0h	RESERVE FIELD
20-16	WM	R	0h	Watermark for Maximum Queue Usage: Watermark tracks the most entries that have been in QueueN since reset or since the last time that the watermark (WM) was cleared. QSTATn.WM is cleared via CCERR.WMCLRN bit. Legal values = 0x0 (empty) to 0x10 (full)
15-13	RES57	R	0h	RESERVE FIELD
12-8	NUMVAL	R	0h	Number of Valid Entries in QueueN: Represents the total number of entries residing in the Queue Manager FIFO at a given instant. Always enabled. Legal values = 0x0 (empty) to 0x10 (full)
7-4	RES58	R	0h	RESERVE FIELD
3-0	STRTPTR	R	0h	Start Pointer: Represents the offset to the head entry of QueueN in units of entries. Always enabled. Legal values = 0x0 (0th entry) to 0xF (15th entry)

### 11.8.1.1.37 QWMTHRA Register (Offset = 620h) [reset = 1010h]

QWMTHRA is shown in [Figure 11-64](#) and described in [Table 11-69](#).

Return to the [Table 11-32](#).

Queue Threshold A for Q[3:0]: CCERR.QTHRXCdN and QSTATn.THRXCD error bit is set when the number of Events in QueueN at an instant in time (visible via QSTATn.NUMVAL) equals or exceeds the value specified by QWMTHRA.Qn. Legal values = 0x0 (ever used?) to 0x10 (ever full?) A value of 0x11 disables threshold errors.

**Figure 11-64. QWMTHRA Register**

16	QUEACTV0	R	0h	Queue 0 Active QUEACTV0 = 0 : No Evts are queued in Q0. QUEACTV0 = 1 : At least one TR is queued in Q0.
15-14	RES62	R	0h	RESERVE FIELD

**Table 11-70. CCSTAT Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
13-8	COMPACTV	R	0h	Completion Request Active: Counter that tracks the total number of completion requests submitted to the TC. The counter increments when a TR is submitted with TCINTEN or TCCHEN set to '1'. The counter decrements for every valid completion code received from any of the external TCs. The CC will not service new TRs if COMPACTV count is already at the limit. COMPACTV = 0 : No completion requests outstanding. COMPACTV = 1: Total of '1' completion request outstanding. ... COMPACTV = 63 : Total of 63 completion requests are outstanding. No additional TRs will be submitted until count is less than 63.
7-5	RES63	R	0h	RESERVE FIELD
4	ACTV	R	0h	Channel Controller Active: Channel Controller Active is a logical-OR of each of the ACTV signals. The ACTV bit must remain high through the life of a TR. ACTV = 0 : Channel is idle. ACTV = 1 : Channel is busy.
3	RES64	R	0h	RESERVE FIELD
2	TRACTV	R	0h	Transfer Request Active: TRACTV = 0 : Transfer Request processing/submission logic is inactive. TRACTV = 1 : Transfer Request processing/submission logic is active.
1	QEVACTV	R	0h	QDMA Event Active: QEVACTV = 0 : No enabled QDMA Events are active within the CC. QEVACTV = 1 : At least one enabled DMA Event (ER & EER ESR CER) is active within the CC.
0	EVTACTV	R	0h	DMA Event Active: EVTACTV = 0 : No enabled DMA Events are active within the CC. EVTACTV = 1 : At least one enabled DMA Event (ER & EER ESR CER) is active within the CC.

### 11.8.1.1.39 AETCTL Register (Offset = 700h) [reset = 0h]

AETCTL is shown in [Figure 11-66](#) and described in [Table 11-71](#).

Return to the [Table 11-32](#).

Bit	Field	Type	Reset	Description
31-1	RES68	R	0h	RESERVE FIELD
0	CLR	W	0h	AET Clear command: CPU write of '1' to the CLR bit causes the tpcc_aet output signal and AETSTAT.STAT register to be cleared. CPU write of '0' has no effect..

### 11.8.1.1.42 ER Register (Offset = 1000h) [reset = 0h]

ER is shown in [Figure 11-69](#) and described in [Table 11-74](#).

Return to the [Table 11-32](#).

Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

### 11.8.1.1.48 CER Register (Offset = 1018h) [reset = 0h]

CER is shown in [Figure 11-75](#) and described in [Table 11-80](#).

Return to the [Table 11-32](#).

Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

### 11.8.1.1.49 CERH Register (Offset = 101Ch) [reset = 0h]

CERH is shown in [Figure 11-76](#) and described in [Table 11-81](#).

Return to the [Table 11-32](#).

Chained Event Register (High Part): If CERH.En bit is set (regardless of state of EERH.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CERH.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CERH.En bit is cleared when the corresponding event is prioritized and serviced. If the CERH.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CERH.En cannot be set or cleared via software.

### 11.8.1.1.50 EER Register (Offset = 1020h) [reset = 0h]

EER is shown in [Figure 11-77](#) and described in [Table 11-82](#).

Return to the [Table 11-32](#).

Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc\_eventN\_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

### 11.8.1.1.56 SER Register (Offset = 1038h) [reset = 0h]

SER is shown in [Figure 11-83](#) and described in [Table 11-88](#).

Return to the [Table 11-32](#).

Secondary Event Register: The secondary event register is used along with the Event Register (ER) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

### 11.8.1.1.68 ICR Register (Offset = 1070h) [reset = 0h]

ICR is shown in [Figure 11-95](#) and described in [Table 11-100](#).

Return to the [Table 11-32](#).

Interrupt Clear Register: CPU write of '1' to the ICR.In bit causes the IPR.In bit to be cleared. CPU write of '0' has no effect. All IPR.In bits must be cleared before additional interrupts will be asserted by CC.

**Figure 11-95. ICR Register**

15	14	13	12	11	10	9	8
RES69							
R-0h							
7	6	5	4	3	2	1	0
RES69						SET	EVAL
R-0h						W-0h	W-0h

**Table 11-102. IEVAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	RES69	R	0h	RESERVE FIELD
1	SET	W	0h	Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable (IERn) and status (IPRn). CPU write of '0' has no effect.
0	EVAL	W	0h	Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts (IERn) are still pending (IPRn). CPU write of '0' has no effect..

### 11.8.1.1.71 QER Register (Offset = 1080h) [reset = 0h]

QER is shown in [Figure 11-98](#) and described in [Table 11-103](#).

Return to the [Table 11-32](#).

QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

**Figure 11-98. QER Register**

3	E3	R	0h	Event #3
2	E2	R	0h	Event #2
1	E1	R	0h	Event #1
0	E0	R	0h	Event #0

### 11.8.1.1.72 QEER Register (Offset = 1084h) [reset = 0h]

QEER is shown in [Figure 11-99](#) and described in [Table 11-104](#).

Return to the [Table 11-32](#).

QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

**Figure 11-99. QEER Register**

0	E0	W	0h	Event #0

### 11.8.1.1.75 QSER Register (Offset = 1090h) [reset = 0h]

QSER is shown in [Figure 11-102](#) and described in [Table 11-107](#).

Return to the [Table 11-32](#).

QDMA Secondary Event Register: The QDMA secondary event register is used along with the QDMA Event Register (QER) to provide information on the state of a QDMA Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

**Figure 11-102. QSER Register**

0	E0	R	0h	Event #0

### 11.8.1.1.76 QSECR Register (Offset = 1094h) [reset = 0h]

QSECR is shown in [Figure 11-103](#) and described in [Table 11-108](#).

Return to the [Table 11-32](#).

QDMA Secondary Event Clear Register: The secondary event clear register is used to clear the status of the QSER and QER register (note that this is slightly different than the SER operation which does not clear the ER.En register). CPU write of '1' to the QSECR.En bit clears the QSER.En and QER.En register fields. CPU write of '0' has no effect..

**Figure 11-103. QSECR Register**

0	E0	W	0h	Event #0

### 11.8.1.1.77 ER\_RN Register (Offset = 2000h) [reset = 0h]

ER\_RN is shown in [Figure 11-104](#) and described in [Table 11-109](#).

Return to the [Table 11-32](#).

Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

**Figure 11-104. ER\_RN Register**

### 11.8.1.1.83 CER\_RN Register (Offset = 2018h) [reset = 0h]

CER\_RN is shown in [Figure 11-110](#) and described in [Table 11-115](#).

Return to the [Table 11-32](#).

Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

### 11.8.1.1.85 EER\_RN Register (Offset = 2020h) [reset = 0h]

EER\_RN is shown in [Figure 11-112](#) and described in [Table 11-117](#).

Return to the [Table 11-32](#).

Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc\_eventN\_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

### 11.8.1.1.91 SER\_RN Register (Offset = 2038h) [reset = 0h]

SER\_RN is shown in [Figure 11-118](#) and described in [Table 11-123](#).

Return to the [Table 11-32](#).

Secondary Event Register: The secondary event register is used along with the Event Register (ER) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

**Figure 11-118. SER\_RN Register**

### 11.8.1.1.92 SERH\_RN Register (Offset = 203Ch) [reset = 0h]

SERH\_RN is shown in [Figure 11-119](#) and described in [Table 11-124](#).

Return to the [Table 11-32](#).

Secondary Event Register (High Part): The secondary event register is used along with the Event Register (ERH) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

Bit	Field	Type	Reset	Description
31-2	RES76	R	0h	RESERVE FIELD
1	SET	W	0h	Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable (IERn) and status (IPRn). CPU write of '0' has no effect.
0	EVAL	W	0h	Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts (IERn) are still pending (IPRn). CPU write of '0' has no effect..

### 11.8.1.1.106 QER\_RN Register (Offset = 2080h) [reset = 0h]

QER\_RN is shown in [Figure 11-133](#) and described in [Table 11-138](#).

Return to the [Table 11-32](#).

QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

**Figure 11-133. QER\_RN Register**

R-0h				R/W-0h	R/W-0h	R/W-0h	R/W-0h

**Table 11-144. OPT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	PRIV	R	0h	Privilege level: privilege level (supervisor vs. user) for the host/cpu/dma that programmed this PaRAM Entry. Value is set with the vbus priv value when any part of the PaRAM Entry is written. Not writeable via vbus wdata bus. Is readable via VBus rdata bus. PRIV = 0 : User level privilege PRIV = 1 : Supervisor level privilege
30-28	RES83	R	0h	RESERVE FIELD
27-24	PRIVID	R	0h	Privilege ID: Privilege ID for the external host/cpu/dma that programmed this PaRAM Entry. This value is set with the vbus privid value when any part of the PaRAM Entry is written. Not writeable via vbus wdata bus. Is readable via VBus rdata bus.
23	ITCCHEN	R/W	0h	Intermediate transfer completion chaining enable: 0: Intermediate transfer complete chaining is disabled. 1: Intermediate transfer complete chaining is enabled.
22	TCCHEN	R/W	0h	Transfer complete chaining enable: 0: Transfer complete chaining is disabled. 1: Transfer complete chaining is enabled.
21	ITCINTEN	R/W	0h	Intermediate transfer completion interrupt enable: 0: Intermediate transfer complete interrupt is disabled. 1: Intermediate transfer complete interrupt is enabled (corresponding IER[TCC] bit must be set to 1 to generate interrupt)
20	TCINTEN	R/W	0h	Transfer complete interrupt enable: 0: Transfer complete interrupt is disabled. 1: Transfer complete interrupt is enabled (corresponding IER[TCC] bit must be set to 1 to generate interrupt)

**Table 11-144. OPT Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
19	WIMODE	R/W	0h	Backward compatibility mode: 0: Normal operation 1 : WI Backwards Compatibility mode forces BCNT to be adjusted by '1' upon TR submission (0 means 1 1 means 2 ... ) and forces ACNT to be treated as a word-count (left shifted by 2 by hardware to create byte cnt for TR submission)
18	RES84	R	0h	RESERVE FIELD
17-12	TCC	R/W	0h	Transfer Complete Code: The 6-bit code is used to set the relevant bit in CER (bit CER[TCC]) for chaining or in IER (bit IER[TCC]) for interrupts.
11	TCCMODE	R/W	0h	Transfer complete code mode: Indicates the point at which a transfer is considered completed. Applies to both chaining and interrupt. 0: Normal Completion A transfer is considered completed after the transfer parameters are returned to the CC from the TC (which was returned from the peripheral). 1: Early Completion A transfer is considered completed after the CC submits a TR to the TC. CC generates completion code internally .
10-8	FWID	R/W	0h	FIFO width: Applies if either SAM or DAM is set to FIFO mode. Pass-thru to TC.
7-4	RES85	R	0h	RESERVE FIELD
3	STATIC	R/W	0h	Static Entry: 0: Entry is updated as normal 1: Entry is static Count and Address updates are not updated after TRP is submitted. Linking is not performed.
2	SYNCDIM	R/W	0h	Transfer Synchronization Dimension: 0: A-Sync Each event triggers the transfer of ACNT elements. 1: AB-Sync Each event triggers the transfer of BCNT arrays of ACNT elements
1	DAM	R/W	0h	Destination Address Mode: Destination Address Mode within an array. Pass-thru to TC. 0: INCR Dst addressing within an array increments. Dst is not a FIFO. 1: FIFO Dst addressing within an array wraps around upon reaching FIFO width.
0	SAM	R/W	0h	Source Address Mode: Source Address Mode within an array. Pass-thru to TC. 0: INCR Src addressing within an array increments. Source is not a FIFO. 1: FIFO Src addressing within an array wraps around upon reaching FIFO width.

### 11.8.1.1.113 SRC Register (Offset = 4004h) [reset = 0h]

SRC is shown in [Figure 11-140](#) and described in [Table 11-145](#).

Return to the [Table 11-32](#).

Source Address

**Figure 11-140. SRC Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SRC																															
R/W-0h																															

**Table 11-145. SRC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	SRC	R/W	0h	Source Address: The 32-bit source address parameters specify the starting byte address of the source . If SAM is set to FIFO mode then the user should program the Source address to be aligned to the value specified by the OPT.FWID field. No errors are recognized here but TC will assert error if this is not true.

### 11.8.1.1.114 ABCNT Register (Offset = 4008h) [reset = 0h]

ABCNT is shown in [Figure 11-141](#) and described in [Table 11-146](#).

Return to the [Table 11-32](#).

A and B byte count

**Figure 11-141. ABCNT Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BCNT																ACNT															
R/W-0h																R/W-0h															

**Table 11-146. ABCNT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	BCNT	R/W	0h	BCNT : Count for 2nd Dimension: BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation valid values for BCNT can be anywhere between 1 and 65535. Therefore the maximum number of arrays in a frame is 65535 (64K-1 arrays). BCNT=1 means 1 array in the frame and BCNT=0 means 0 arrays in the frame. In normal mode a BCNT of '0' is considered as either a Null or Dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the programmed BCNT value will be incremented by '1' before submission to TC. I.e. 0 means 1 1 means 2 2 means 3 ...
15-0	ACNT	R/W	0h	ACNT : number of bytes in 1st dimension: ACNT represents the number of bytes within the first dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65535. Therefore the maximum number of bytes in an array is 65535 bytes (64K-1 bytes). ACNT must be greater than or equal to '1' for a TR to be submitted to TC. An ACNT of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the ACNT field represents a word count. The CC must internally multiply by 4 to translate the word count to a byte count prior to submission to the TC. The 2 MSBs of the 16-bit ACNT are reserved and should always be written as 'b00 by the user. If user writes a value other than 0 it will still be treated as 0 since the multiply-by-4 operation (to translate between a word count and a byte count) will drop the 2 msbits. For dummy and null transfer definition the ACNT definition will disregard the 2 msbits. I.e. a programmed ACNT value of 0x8000 in WI-mode will be treated as 0 byte transfer resulting in null or dummy operation dependent on the state of BCNT and CCNT.

### 11.8.1.1.115 DST Register (Offset = 400Ch) [reset = 0h]

DST is shown in [Figure 11-142](#) and described in [Table 11-147](#).

Return to the [Table 11-32](#).

Destination Address

**Figure 11-142. DST Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DST																															
R/W-0h																															

**Table 11-147. DST Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	DST	R/W	0h	Destination Address: The 32-bit destination address parameters specify the starting byte address of the destination. If DAM is set to FIFO mode then the user should program the Destination address to be aligned to the value specified by the OPT.FWID field. No errors are recognized here but TC will assert error if this is not true.

### 11.8.1.1.116 BIDX Register (Offset = 4010h) [reset = 0h]

BIDX is shown in [Figure 11-143](#) and described in [Table 11-148](#).

Return to the [Table 11-32](#).

Register description is not available

**Figure 11-143. BIDX Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DBIDX																SBIDX															
R/W-0h																R/W-0h															

**Table 11-148. BIDX Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	DBIDX	R/W	0h	Destination 2nd Dimension Index: DBIDX is a 16-bit signed value (2's complement) used for destination address modification in between each array in the 2nd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the destination array to the beginning of the next destination array within the current frame. It applies to both A-Sync and AB-Sync transfers.
15-0	SBIDX	R/W	0h	Source 2nd Dimension Index: SBIDX is a 16-bit signed value (2's complement) used for source address modification in between each array in the 2nd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the source array to the beginning of the next source array. It applies to both A-sync and AB-sync transfers.

### 11.8.1.1.117 LNK Register (Offset = 4014h) [reset = 0h]

LNK is shown in [Figure 11-144](#) and described in [Table 11-149](#).

Return to the [Table 11-32](#).

Link and Reload parameters

**Figure 11-144. LNK Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BCNTRLD																LINK															
R/W-0h																R/W-0h															

**Table 11-149. LNK Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	BCNTRLD	R/W	0h	BCNT Reload: BCNTRLD is a 16-bit unsigned value used to reload the BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-Sync'ed transfers. In this case the CC decrements the BCNT value by one on each TR submission. When BCNT (conceptually) reaches zero then the CC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value. For AB-synchronized transfers the CC submits the BCNT in the TR and therefore the TC is responsible to keep track of BCNT not thus BCNTRLD is a don't care field.
15-0	LINK	R/W	0h	Link Address: The CC provides a mechanism to reload the current PaRAM Entry upon its natural termination (i.e. after count fields are decremented to '0') with a new PaRAM Entry. This is called 'linking'. The 16-bit parameter LINK specifies the byte address offset in the PaRAM from which the CC loads/reloads the next PaRAM entry in the link. The CC should disregard the value in the upper 2 bits of the LINK field as well as the lower 5-bits of the LINK field. The upper two bits are ignored such that the user can program either the 'literal' byte address of the LINK parameter or the 'PaRAM base-relative' address of the link field. Therefore if the user uses the literal address with a range from 0x4000 to 0x7FFF it will be treated as a PaRAM-base-relative value of 0x0000 to 0x3FFF. The lower-5 bits are ignored and treated as 'b00000 thereby guaranteeing that all Link pointers point to a 32-byte aligned PaRAM entry. In the latter case (5-lsbs) behavior is undefined for the user (i.e. don't have to test it). In the former case (2 msbs) user should be able to take advantage of this feature (i.e. do have to test it). If a Link Update is requested to a PaRAM address that is beyond the actual range of implemented PaRAM then the Link will be treated as a Null Link and all 0s plus 0xFFFF will be written to the current entry location. A LINK value of 0xFFFF is referred to as a NULL link which should cause the CC to write 0x0 to all entries of the current PaRAM Entry except for the LINK field which is set to 0xFFFF. The Priv/Privid/Secure state is overwritten to 0x0 when linking. MSBs and LSBS should not be masked when comparing against the 0xFFFF value. I.e. a value of 0x3FFE is a non-NULL PaRAM link field.

### 11.8.1.1.118 CIDX Register (Offset = 4018h) [reset = 0h]

CIDX is shown in [Figure 11-145](#) and described in [Table 11-150](#).

Return to the [Table 11-32](#).

Register description is not available

**Figure 11-145. CIDX Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DCIDX																SCIDX															
R/W-0h																R/W-0h															

**Table 11-150. CIDX Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	DCIDX	R/W	0h	Destination Frame Index: DCIDX is a 16-bit signed value (2's complement) used for destination address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array (pointed to by DST address) to the beginning of the first destination array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when DCIDX is applied the current array in an A-sync transfer is the last array in the frame while the current array in a ABsync transfer is the first array in the frame.
15-0	SCIDX	R/W	0h	Source Frame Index: SCIDX is a 16-bit signed value (2's complement) used for source address modification for the 3rd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the current array (pointed to by SRC address) to the beginning of the first source array in the next frame. It applies to both A-sync and AB-sync transfers. Note that when SCIDX is applied the current array in an A-sync transfer is the last array in the frame while the current array in a AB-sync transfer is the first array in the frame.

### 11.8.1.1.119 CCNT Register (Offset = 401Ch) [reset = 0h]

CCNT is shown in [Figure 11-146](#) and described in [Table 11-151](#).

Return to the [Table 11-32](#).

C byte count

**Figure 11-146. CCNT Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES86																CCNT															
R-0h																R/W-0h															

**Table 11-151. CCNT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	RES86	R	0h	RESERVE FIELD
15-0	CCNT	R/W	0h	CCNT : Count for 3rd Dimension: CCNT is a 16-bit unsigned value that specifies the number of frames in a block. Valid values for CCNT can be anywhere between 1 and 65535. Therefore the maximum number of frames in a block is 65535 (64K-1 frames). CCNT of '1' means '1' frame in the block and CCNT of '0' means '0' frames in the block. A CCNT value of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. WIMODE has no affect on CCNT operation.

### 11.8.1.2 TPTC Registers

Table 11-152 lists the TPTC registers. All register offset addresses not listed in Table 11-152 should be considered as reserved locations and the register contents should not be modified.

**Table 11-152. TPTC Registers**

RESERVED	DSTACTV			RESERVED	WSACTV	SRCACTV	PROGBUSY
R-X	R-0h			R-X	R-0h	R-0h	R-0h

**Table 11-155. TCSTAT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-14	RESERVED	R	X	
13-12	DFSTRTPTR	R	0h	Dst FIFO Start Pointer Represents the offset to the head entry of Dst Register FIFO in units of entries. Legal values = 0x0 to 0x3
11-9	RESERVED	R	X	
8	ACTV	R	1h	Channel Active Channel Active is a logical-OR of each of the BUSY/ACTV signals. The ACTV bit must remain high through the life of a TR. ACTV = 0 : Channel is idle. ACTV = 1 : Channel is busy.
7	RESERVED	R	X	
6-4	DSTACTV	R	0h	Destination Active State Specifies the number of TRs that are resident in the Dst Register FIFO at a given instant. Legal values are constrained by the DSTREGDEPTH parameter.
3	RESERVED	R	X	
2	WSACTV	R	0h	Write Status Active WSACTV = 0 : Write status is not pending. Write status has been received for all previously issued write commands. WSACTV = 1 : Write Status is pending. Write status has not been received for all previously issued write commands.

**Table 11-155. TCSTAT Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
1	SRCACTV	R	0h	Source Active State SRCACTV = 0 : Source Active set is idle. Any TR written to Prog Set will immediately transition to Source Active set as long as the Dst FIFO Set is not full [DSTFULL == 1]. SRCACTV = 1 : Source Active set is busy either performing read transfers or waiting to perform read transfers for current Transfer Request.
0	PROGBUSY	R	0h	Program Register Set Busy PROGBUSY = 0 : Prog set idle and is available for programming. PROGBUSY = 1 : Prog set busy. User should poll for PROGBUSY equal to '0' prior to re-programming the Program Register set.

#### 11.8.1.2.4 INTSTAT Register (Offset = 104h) [reset = X]

INTSTAT is shown in [Figure 11-150](#) and described in [Table 11-156](#).

Return to the [Table 11-152](#).

Interrupt Status Register

**Table 11-163. ERRDET Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-18	RESERVED	R	X	
17	TCCHEN	R	0h	Contains the OPT.TCCHEN value programmed by the user for the Read or Write transaction that resulted in an error.
16	TCINTEN	R	0h	Contains the OPT.TCINTEN value programmed by the user for the Read or Write transaction that resulted in an error.
15-14	RESERVED	R	X	
13-8	TCC	R	0h	Transfer Complete Code: Contains the OPT.TCC value programmed by the user for the Read or Write transaction that resulted in an error.
7-4	RESERVED	R	X	
3-0	STAT	R	0h	Transaction Status: Stores the non-zero status/error code that was detected on the read status or write status bus. MS-bit effectively serves as the read vs. write error code. If read status and write status are returned on the same cycle then the TC chooses non-zero version. If both are non-zero then write status is treated as higher priority. Encoding of errors matches the CBA spec.

### 11.8.1.2.12 ERRCMD Register (Offset = 130h) [reset = X]

ERRCMD is shown in [Figure 11-158](#) and described in [Table 11-164](#).

Return to the [Table 11-152](#).

Chapter 12

# Multi-Buffered Serial Peripheral Interface Module (MibSPI) with Parallel Pin Option (MibSPIP)

This chapter provides the specifications for a 16-bit configurable synchronous multi-buffered multi-pin serial peripheral interface (MibSPI). This chapter also provides the specifications for MibSPI with Parallel Pin Option (MibSPIP). The MibSPI is a programmable-length shift register used for high-speed communication between external peripherals or other microcontrollers.

Throughout this chapter, all references to SPI also apply to MibSPI/MibSPIP, unless otherwise noted.

**Note**

This chapter describes a superset implementation of the MibSPI/SPI modules that includes features and functionality that may not be available on some devices. Device-specific content that should be determined by referencing the datasheet includes DMA functionality, MibSPI RAM size, number of transfer groups, number of chip selects, parallel mode support, and availability of 5-pin operation (SPIENA).

<b>12.11 MibSPI Pin Timing Parameters</b>	<b>3829</b>

## 12.1 Overview

The MibSPI/MibSPIP is a high-speed synchronous serial input/output port that allows a serial bit stream of programmed length (2 to 16 bits) to be shifted in and out of the device at a programmed bit-transfer rate. Typical applications for the SPI include interfacing to external peripherals, such as I/Os, memories, display drivers, and analog-to-digital converters.

The SPI has the following attributes:

- 16-bit shift register
- Receive buffer register
- 11-bit baud clock generator
- Serial clock (SPICLK) pin
- 1 SPIPOCI/SPIPICO pin for data transfer, with programmable pin direction
- SPI enable (  $\overline{\text{SPIENA}}$  ) pin
- Up to 6 peripheral chip select (  $\overline{\text{SPICS}}$  ) pins
- SPICLK can be internally-generated (and driven) or received from an external clock source
- Each word transferred can have a unique format
- SPI pins can be used as functional or digital Input/Output pins (GIOs)

---

### Note

PICO - Peripheral In Controller Out Pin  
POCI - Peripheral Out Controller In Pin  
SPICS - SPI Chip Select Pin  
SPIENA - SPI Enable Pin

---

### 12.1.1 Word Format Options

Each word transferred can have a unique format. Several format characteristics are programmable for each word transferred:

- SPICLK frequency
- Character length (2 to 16 bits)
- Phase (with and without delay)
- Polarity (high or low)
- Parity enabled/disabled
- Chip Select(CS) timers for setup and hold
- Shift direction (Most-Significant Bit (MSB) first or Least-Significant Bit (LSB) first)
- Multi-pin parallel modes

### 12.1.2 Multi-buffering (Mib) Support

The MibSPI has a programmable buffer memory that enables programmed transmission to be completed without CPU intervention. The buffers are combined in different Transfer Groups (TGs) that can be triggered by external events (timers, Input/Output activity, and so on) or by the internal tick counter. The internal tick counter supports periodic trigger events. Each buffer of the MibSPI can be associated with different DMA channels in different TGs, allowing the user to move data between internal memory and an external controller with minimal CPU interaction.

### 12.1.2.1 Multi-buffer Mode

Multi-buffer Mode is an extension to the SPI. In multi-buffer mode, many extended features are configurable:

- Number of buffers for each peripheral (or data source/destination, up to 128 buffers supported) or group (up to 8 groupings)
- Triggers for each group, trigger types, trigger sources for individual groups (14 external trigger sources and 1 internal trigger source supported)
- Memory fault detection via an internal parity circuit
- Number of DMA-controlled buffers and number of DMA request channels (up to 8 for each of transmit and receive)
- Number of DMA transfers for each buffer (up to 65536 words for up to 8 buffers)
- Uninterrupted DMA buffer transfer (NOBREAK buffer)

### 12.1.2.2 Compatibility Mode

Compatibility Mode of the MibSPI makes it behave exactly like a standard platform SPI module and ensures full compatibility with other SPIs. All features in compatibility mode of the MibSPI are directly applicable to a SPI. Multi-buffer Mode features are not available in Compatibility Mode.

---

#### Note

The SPIDAT0 register is not accessible in the multi-buffer mode of MibSPI. It is only accessible in compatibility mode.

---

### 12.1.3 Transmission Lock (Multi-Buffer Mode Controller Only)

Some peripheral devices require transmission of a command followed by data. In this case the SPI transaction should not be interrupted by another group transfer. The LOCK bit within each buffer allows a consecutive transfer to happen without being interrupted by another higher-priority group transfer.

## 12.2 Operating Modes

The SPI can be configured via software to operate as either a controller or a peripheral. The CONTROLLER bit (SPIGCR1[0]) selects the configuration of the SPIPICO and SPIPOCI pins. CLKMOD bit (SPIGCR1[1]) determines whether an internal or external clock source will be used.

The chip select ( $\overline{\text{SPICS}}$ ) pins are used when communicating with multiple peripheral devices or, with a single peripheral device, to delimit messages containing a leading register address. When a write occurs to SPIDAT1 in controller mode, the  $\overline{\text{SPICS}}$  pins are automatically driven to select the specified peripheral device.

Handshaking mechanism, provided by the  $\overline{\text{SPIENA}}$  pin, enables a peripheral SPI to delay the generation of the clock signal supplied by the controller if it is not prepared for the next exchange of data.

---

#### Note

If in the peripheral mode of operation and configured in either 3-pin or 4-pin (without  $\overline{\text{SPIENA}}$ ) modes, there must be a minimum of 8 VCLK cycles of delay between the last SPICLK and the start of the SPICLK for the next buffer transmit. In general, this equates to a VCLK/SPICLK ratio of  $\leq 16$  requiring a minimum of 1 SPICLK delay between transmissions.

---

### 12.2.1 Pin Configurations

The SPI supports data connections as shown in [Table 12-1](#).

#### Note

1. When the SPICS signals are disabled, the chip select field in the transmit data is not used.
2. When the SPIENA signal is disabled, the SPIENA pin is ignored in controller mode, and not driven as part of the SPI transaction in peripheral mode.

**Table 12-1. Pin Configurations**

Pin	Controller Mode		Peripheral Mode	
SPICLK	Drives the clock to external devices		Receives the clock from the external controller	
SPISOC	Receives data from the external peripheral		Sends data to the external controller	
SPICPO	Transmits data to the external peripheral		Receives data from the external controller	
SPIENA	<b>SPIENA disabled:</b> GIO	<b>SPIENA enabled:</b> Receives ENA signal from the external peripheral	<b>SPIENA disabled:</b> GIO	<b>SPIENA enabled:</b> Drives ENA signal from the external controller
SPICS	<b>SPICS disabled:</b> GIO	<b>SPICS enabled:</b> Selects one or more peripheral devices	<b>SPICS disabled:</b> GIO	<b>SPICS enabled:</b> Receives the CS signal from the external controller

### 12.2.2 Data Handling

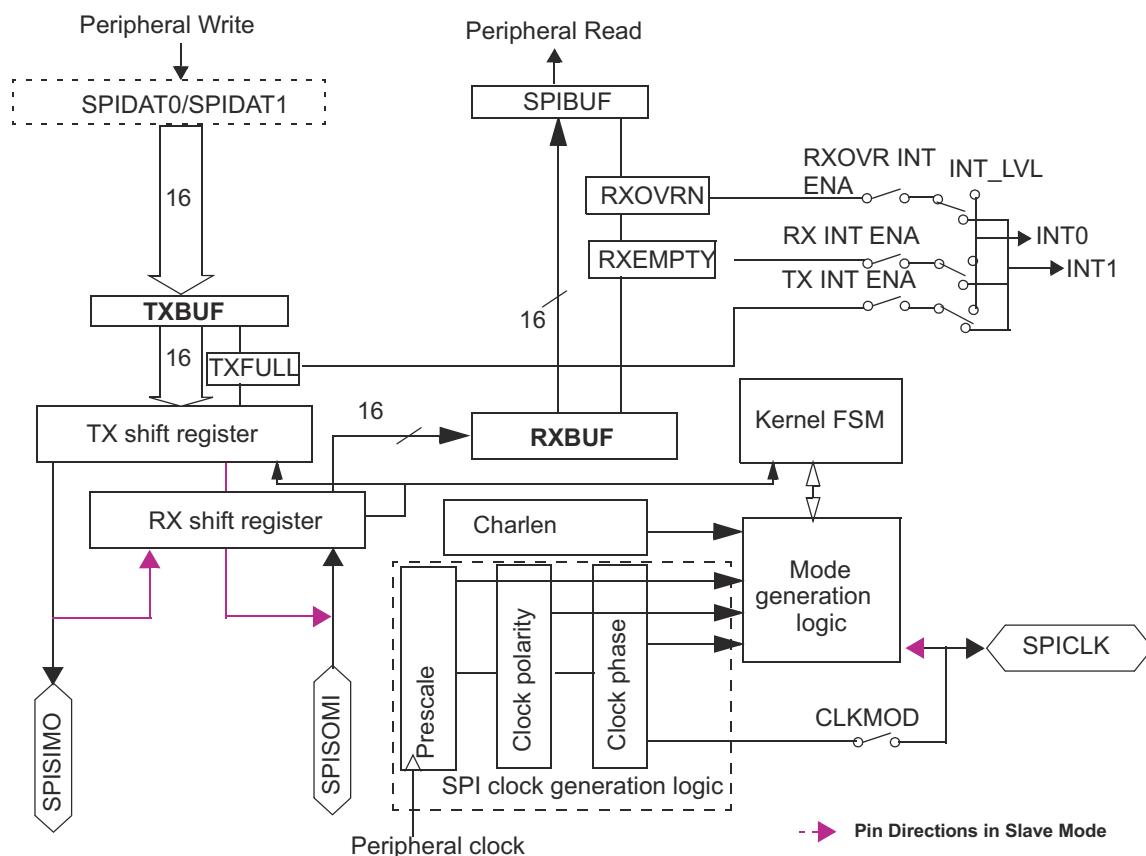

[Figure 12-1](#) shows the SPI transaction hardware. TXBUF and RXBUF are internal buffers that are intended to improve the overall throughput of data transfer. TXBUF is a transmit buffer, while RXBUF is a receive buffer.

#### 12.2.2.1 Data Sequencing when SPIDAT0 or SPIDAT1 is Written

- If both the TX shift register and TXBUF are empty, then the data is directly copied to the TX shift register. For devices with DMA, if DMA is enabled, a transmit DMA request (TX\_DMA\_REQ) is generated to cause the next word to be fetched. If transmit interrupts are enabled, a transmitter-empty interrupt is generated.
- If the TX shift register is already full or is in the process of shifting and if TXBUF is empty then the data written to SPIDAT0 / SPIDAT1 is copied to TXBUF and TXFULL flag is set to 1 at the same time.
- When a shift operation is complete, data from the TXBUF (if it is full) is copied into TX shift register and the TXFULL flag is cleared to 0 to indicate that next data can be fetched. A transmit DMA request (if enabled) or a transmitter-empty interrupt (if enabled) is generated at the same time.

#### 12.2.2.2 Data Sequencing when All Bits Shifted into RXSHIFT Register

- If both SPIBUF and RXBUF are empty, the received data in RX shift register is directly copied into SPIBUF and the receive DMA request (if enabled) is generated and the receive-interrupt (if enabled) is generated. The RXEMPTY flag in SPIBUF is cleared at the same time.
- If SPIBUF is already full at the end of receive completion, the RX shift register contents is copied to RXBUF. A receive DMA request is generated, if enabled. The receive complete interrupt line remains high.
- If SPIBUF is read by the CPU or DMA and if RXBUF is full, then the contents of RXBUF are copied to SPIBUF as soon as SPIBUF is read. RXEMPTY flag remains cleared, indicating that SPIBUF is still full.
- If both SPIBUF and RXBUF are full, then RXBUF will be overwritten and the RXOVR interrupt flag is set and an interrupt is generated, if enabled.

- 1 This is a representative diagram, which shows three-pin mode hardware.
- 2 TXBUF, RXBUF, and SHIFT\_REGISTER are user-invisible registers.
- 3 SPIDAT0 and SPIDAT1 are user-visible, and are physically mapped to the contents of TXBUF.
- 4 SPISIMO, SPISOMI, SPICLK pin directions depend on the Master or Slave Mode.

**Figure 12-1. SPI Functional Logic Diagram**

### 12.2.2.3 Three-Pin Mode

In controller mode configuration (MASTER = 1 and CLKMOD = 1), the SPI provides the serial clock on the SPICLK pin. Data is transmitted on the SPISIMO pin and received on the SPISOMI pin (see Figure 12-2).

Data written to the shift register (SPIDAT0 / SPIDAT1) initiates data transmission on the SPISIMO pin, MSB first. Simultaneously, received data is shifted through the SPISOMI pin into the LSB of the SPIDAT0 register. When the selected number of bits have been transmitted, the received data in the shift register is transferred to the SPIBUF register for the CPU to read. Data is stored right-justified in SPIBUF.

See Section 12.2.2.1 and Section 12.2.2.2 for details about the data handling for transmit and receive operations.

In peripheral mode configuration (MASTER = 0 and CLKMOD = 0), data shifts out on the SPIPOCI pin and in on the SPIPICO pin. The SPICLK pin is used as the input for the serial shift clock, which is supplied from the external network controller. The transfer rate is defined by this clock.

Data written to the SPIDAT0 or SPIDAT1 register is transmitted to the network when the SPICLK signal is received from the network controller. To receive data, the SPI waits for the network controller to send the SPICLK signal and then shifts data on the SPISIMO pin into the RX shift register. If data is to be transmitted by the peripheral simultaneously, it must be written to the SPIDAT0 or SPIDAT1 register before the beginning of the SPICLK signal.

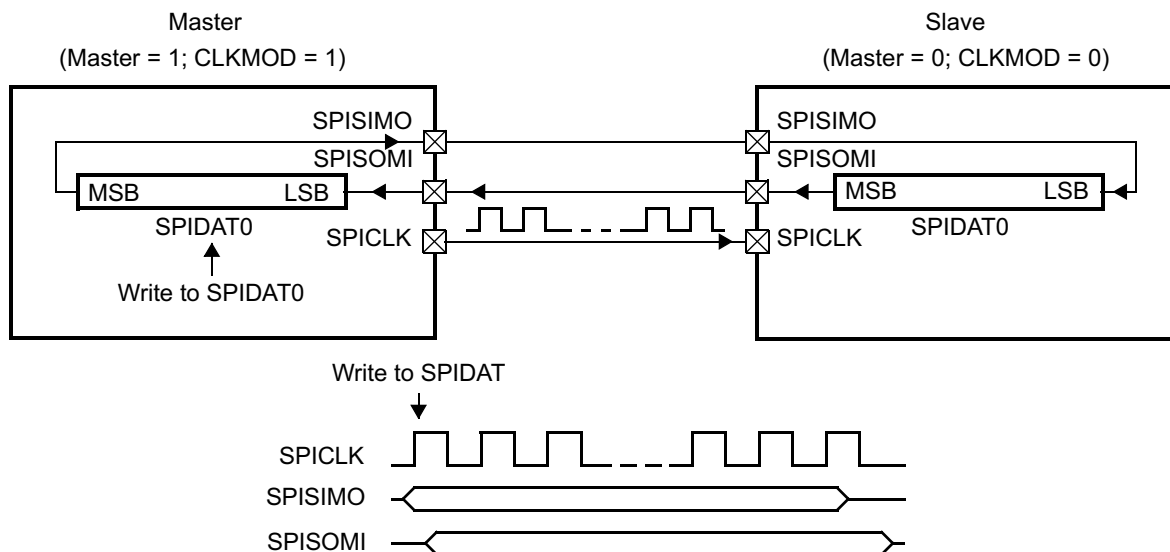

Figure 12-2. SPI Three-Pin Operation

## 12.2.3 Operation with $\overline{\text{SPICS}}$

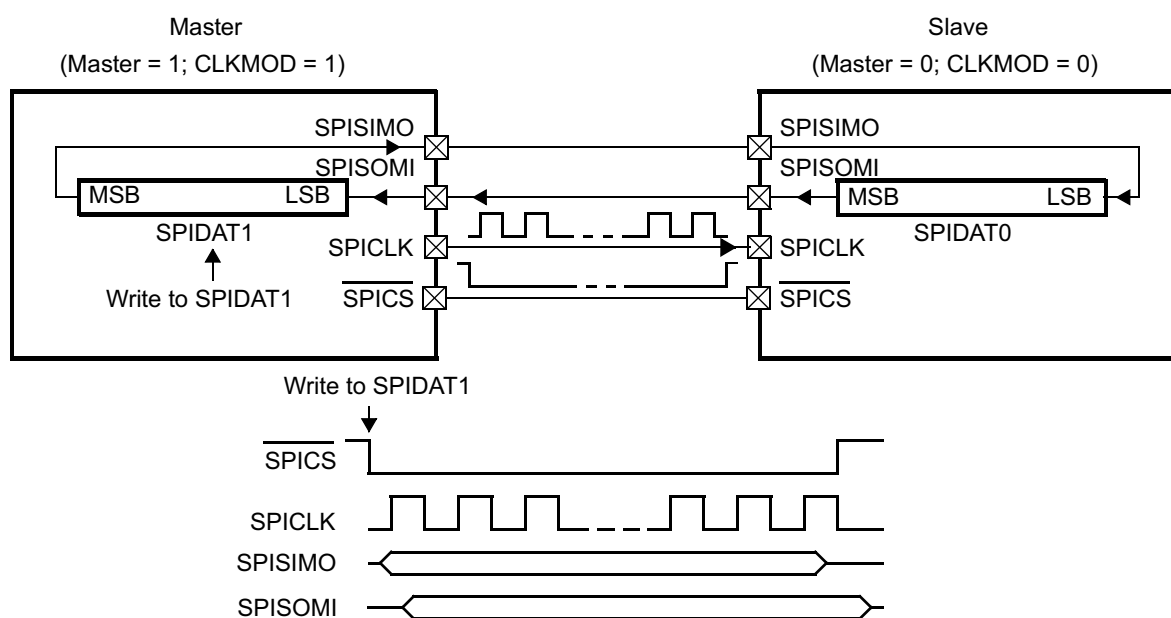

In controller mode, each chip select signal is used to select a specific peripheral. In peripheral mode, the chip select signal is used to enable and disable the transfer. Chip-select functionality is enabled by setting one of the  $\overline{\text{SPICS}}$  pins as a chip select. It is disabled by setting all  $\overline{\text{SPICS}}$  pins as GPIOs in SPIPC0.

### 12.2.3.1 Multiple Chip Selects

The  $\overline{\text{SPICS}}$  pins that are used must be configured as functional pins in the SPIPC0 register. The default pattern to be put on the  $\overline{\text{SPICS}}$  when all the peripherals are deactivated is set in the SPIDEF register. This pattern allows different peripherals with different chip-select polarity to be activated by the SPI.

The controller-mode SPI is capable of driving either 0 or 1 as the active value for any  $\overline{\text{SPICS}}$  output pin. The drive state for the  $\overline{\text{SPICS}}$  pins is controlled by the CSNR field of SPIDAT1. The pattern that is driven will select the peripheral to which the transmission is dedicated.

In peripheral mode, the SPI can only be selected by an active value of 0 on any of its selected  $\overline{\text{SPICS}}$  input pins.

**Figure 12-3. Operation with  $\overline{\text{SPICS}}$**

### 12.2.4 Operation with $\overline{\text{SPIENA}}$

The  $\overline{\text{SPIENA}}$  operates as a WAIT signal pin. For both the peripheral and the controller, the  $\overline{\text{SPIENA}}$  pin must be configured to be functional ( $\text{SPIPC0}[8] = 1$ ). In this mode, an active-low signal from the peripheral on the  $\overline{\text{SPIENA}}$  pin allows the controller SPI to drive the clock pulse stream. A high signal tells the controller to hold the clock signal (and delay SPI activity).

If the  $\overline{\text{SPIENA}}$  pin is in high-impedance mode ( $\text{ENABLE\_HIGHZ} = 1$ ), the peripheral will put  $\overline{\text{SPIENA}}$  into the high-impedance once it completes receiving a new character. If the  $\overline{\text{SPIENA}}$  pin is in push-pull mode ( $\text{ENABLE\_HIGHZ} = 0$ ), the peripheral will drive  $\overline{\text{SPIENA}}$  to 1 once it completes receiving a new character. The peripheral will drive  $\overline{\text{SPIENA}}$  low again for the next word to transfer, after new data is written to the peripheral TX shift register.

In controller mode ( $\text{CLKMOD} = 1$ ), if the  $\overline{\text{SPIENA}}$  pin is configured as functional, then the pin acts as an input pin. If configured as a peripheral SPI and as functional, the  $\overline{\text{SPIENA}}$  pin acts as an output pin.

#### Note

During a transfer, if a peripheral-mode SPI detects a deassertion of its chip select before its internal character length counter overflows, then it places  $\text{SPISOMI}$  and  $\overline{\text{SPIENA}}$  (if  $\text{ENABLE\_HIGHZ}$  bit is set to 1) in high-impedance mode. Once this condition has occurred, if a  $\text{SPICLK}$  edge is detected while the chip select is deasserted, then the SPI stops that transfer and sets an  $\text{DLENERR}$  error flag and generates an interrupt (if enabled).

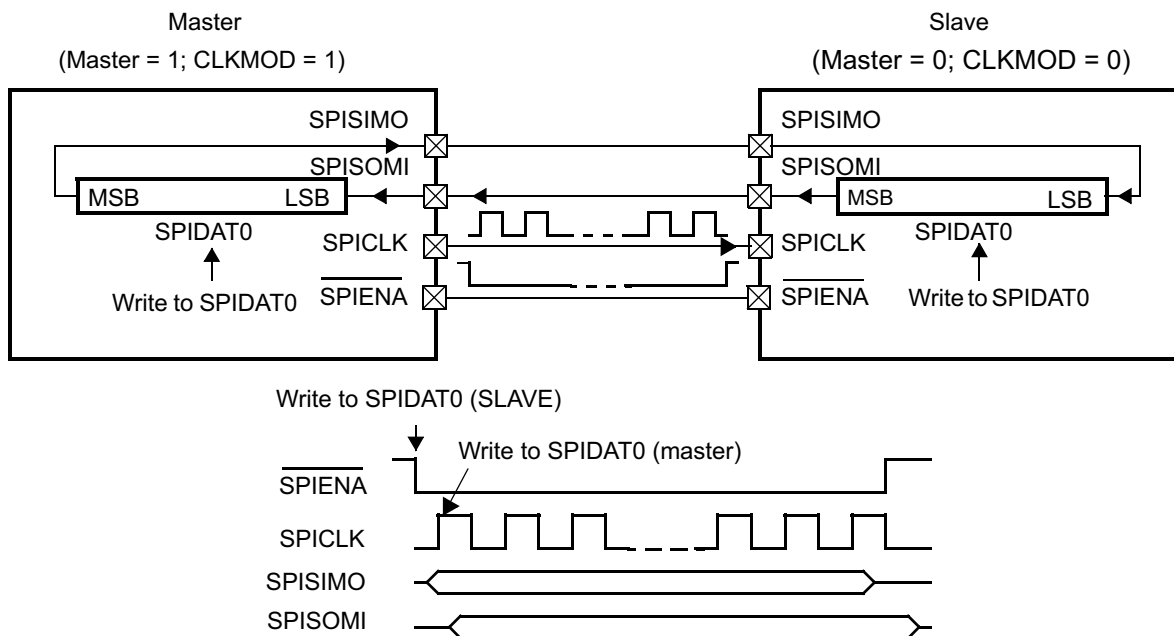

Figure 12-4. Operation with  $\overline{\text{SPIENA}}$

### 12.2.5 Five-Pin Operation (Hardware Handshaking)

Five-pin operation combines the functionality of three-pin mode, plus the enable pin and one or more chip select pins. The result is full hardware handshaking. To use this mode, both the  $\overline{\text{SPIENA}}$  pin and the required number of  $\overline{\text{SPICS}}$  pins must be configured as functional pins.

If the  $\overline{\text{SPIENA}}$  pin is in high-impedance mode ( $\text{ENABLE\_HIGHZ} = 1$ ), the peripheral SPI will put this signal into the high-impedance state by default. The peripheral will drive the signal  $\overline{\text{SPIENA}}$  low when new data is written to the peripheral shift register and the peripheral has been selected by the controller ( $\overline{\text{SPICS}}$  is low).

If the  $\overline{\text{SPIENA}}$  pin is in push-pull mode ( $\text{ENABLE\_HIGHZ} = 0$ ), the peripheral SPI drives this pin high by default when it is in functional mode. The peripheral SPI will drive the  $\overline{\text{SPIENA}}$  signal low when new data is written to the peripheral shift register ( $\text{SPIDAT0}/\text{SPIDAT1}$ ) and the peripheral is selected by the controller ( $\overline{\text{SPICS}}$  is low). If the peripheral is deselected by the controller ( $\overline{\text{SPICS}}$  goes high), the peripheral  $\overline{\text{SPIENA}}$  signal is driven high.

#### Note

Push-pull mode of the  $\overline{\text{SPIENA}}$  pin can be used only when there is a single peripheral in the system. When multiple SPI peripheral devices are connected to the common  $\overline{\text{SPIENA}}$  pin, all of the peripherals should configure their  $\overline{\text{SPIENA}}$  pins in high-impedance mode.

In controller mode, if the  $\overline{\text{SPICS}}$  pins are configured as functional pins, then the pins will be in output mode. A write to the controller's  $\text{SPIDAT1}/\text{SPIDAT0}$  register will automatically drive the  $\overline{\text{SPICS}}$  signals low. The controller will drive the  $\overline{\text{SPICS}}$  signals high again after completing the transfer of the bits of the data.

In peripheral mode ( $\text{CLKMOD} = 0$ ), the  $\overline{\text{SPICS}}$  pins act as SPI functional inputs.

Figure 12-5. SPI Five-Pin Option with  $\overline{\text{SPIENA}}$  and  $\overline{\text{SPICS}}$

### 12.2.6 Data Formats

To support multiple different types of peripherals in one SPI network, four independent data word formats are implemented that allow configuration of individual data word length, polarity, phase, and bit rate. Each word transmitted can select which data format to use via the bits DFSEL[1:0] in its control field from one of the four data word formats. Same data format can be supported on multiple chip selects.

Data formats 0, 1, 2, and 3 can be configured through SPIFMTx control registers.

Each SPI data format includes the standard SPI data format with enhanced features:

- Individually-configurable shift direction can be used to select MSB first or LSB first, whereas the position of the MSB depends on the configured data word length.
- Receive data is automatically right-aligned, independent of shift direction and data word length. Transmit data has to be written right-aligned into the SPI and the internal shift register will transmit according to the selected shift direction and data word length for correct transfer.
- To increase fault detection of data transmission and reception, an odd or even parity bit can be added at the end of a data word. The parity generator can be enabled or disabled individually for each data format. If a received parity bit does not match with the locally calculated parity bit, the parity error flag (PARITYERR) is set and an interrupt is asserted (if enabled).

Since the controller-mode SPI can drive two consecutive accesses to the same peripheral, an 8-bit delay counter is available to satisfy the delay time for data to be refreshed in the accessed peripheral. The delay counter can be programmed as part of the data format.

CHARLEN[4:0] specifies the number of bits (2 to 16) in the data word. The CHARLEN[4:0] value directs the state control logic to count the number of bits received or transmitted to determine when a complete word is transferred.

Data word length **must** be programmed to the same length for both the **controller** and the **peripheral**. However, when chip selects are used, there may be multiple targets with different lengths in the system.

#### Note

Data must be right-justified when it is written to the SPI for transmission irrespective of its character length or word length.

Figure 12-6 shows how a 12-bit word (0xEC9) needs to be written to the transmit buffer to be transmitted correctly.

**Figure 12-6. Format for Transmitting an 12-Bit Word**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
x	x	x	x	1	1	1	0	1	1	0	0	1	0	0	1

#### Note

The received data is always stored right-justified regardless of the character length or direction of shifting and is padded with leading 0s when the character length is less than 16 bits.

Figure 12-7 shows how a 10-bit word (0x0A2) is stored in the buffer once it is received.

**Figure 12-7. Format for Receiving an 10-Bit Word**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	0	1	0	1	0	0	0	1	0

## 12.2.7 Clocking Modes

**SPICLK** may operate in four different modes, depending on the choice of phase (delay/no delay) and the polarity (rising edge/falling edge) of the clock.

The data input and output edges depend on the values of both **POLARITY** and **PHASE** as shown in Table 12-2.

**Table 12-2. Clocking Modes**

POLARITY	PHASE	Action
0	0	Data is output on the rising edge of SPICLK. Input data is latched on the falling edge.
0	1	Data is output one half-cycle before the first rising edge of SPICLK and on subsequent falling edges. Input data is latched on the rising edge of SPICLK.
1	0	Data is output on the falling edge of SPICLK. Input data is latched on the rising edge.
1	1	Data is output one half-cycle before the first falling edge of SPICLK and on subsequent rising edges. Input data is latched on the falling edge of SPICLK.

Figure 12-8 to Figure 12-11 illustrate the four possible configurations of **SPICLK** corresponding to each mode. Having four signal options allows the SPI to interface with many different types of serial devices.

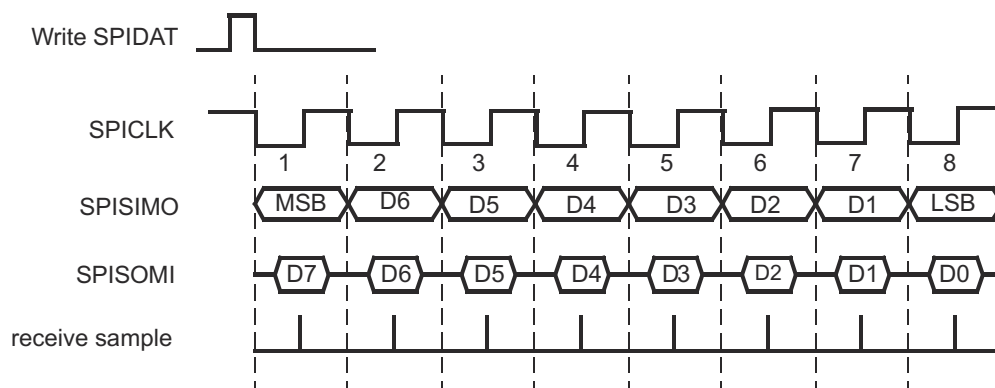

Data is output on the rising edge of SPICLK.  
Input data is latched on the falling edge of SPICLK.

**Figure 12-8. Clock Mode with Polarity = 0 and Phase = 0**

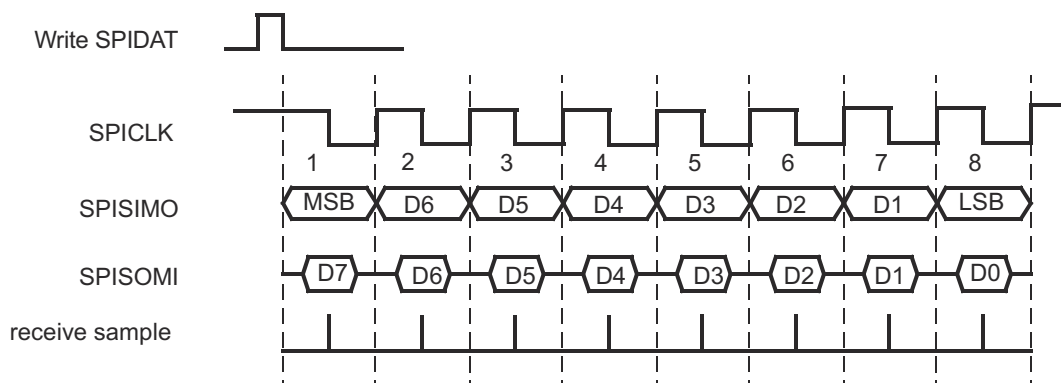

Data is output one-half cycle before the first rising edge of SPICLK and on subsequent falling edges of SPICLK  
Input data is latched on the rising edge of SPICLK

**Figure 12-9. Clock Mode with Polarity = 0 and Phase = 1**

Data is output on the falling edge of SPICLK.  
Input data is latched on the rising edge of SPICLK.

**Figure 12-10. Clock Mode with Polarity = 1 and Phase = 0**

Data is output one-half cycle before the first falling edge of SPICLK and on the subsequent rising edges of SPICLK.  
Input data is latched on the falling edge of SPICLK.

**Figure 12-11. Clock Mode with Polarity = 1 and Phase = 1**

### 12.2.8 Data Transfer Example

Figure 12-12 illustrates a SPI data transfer between two devices using a character length of five bits.

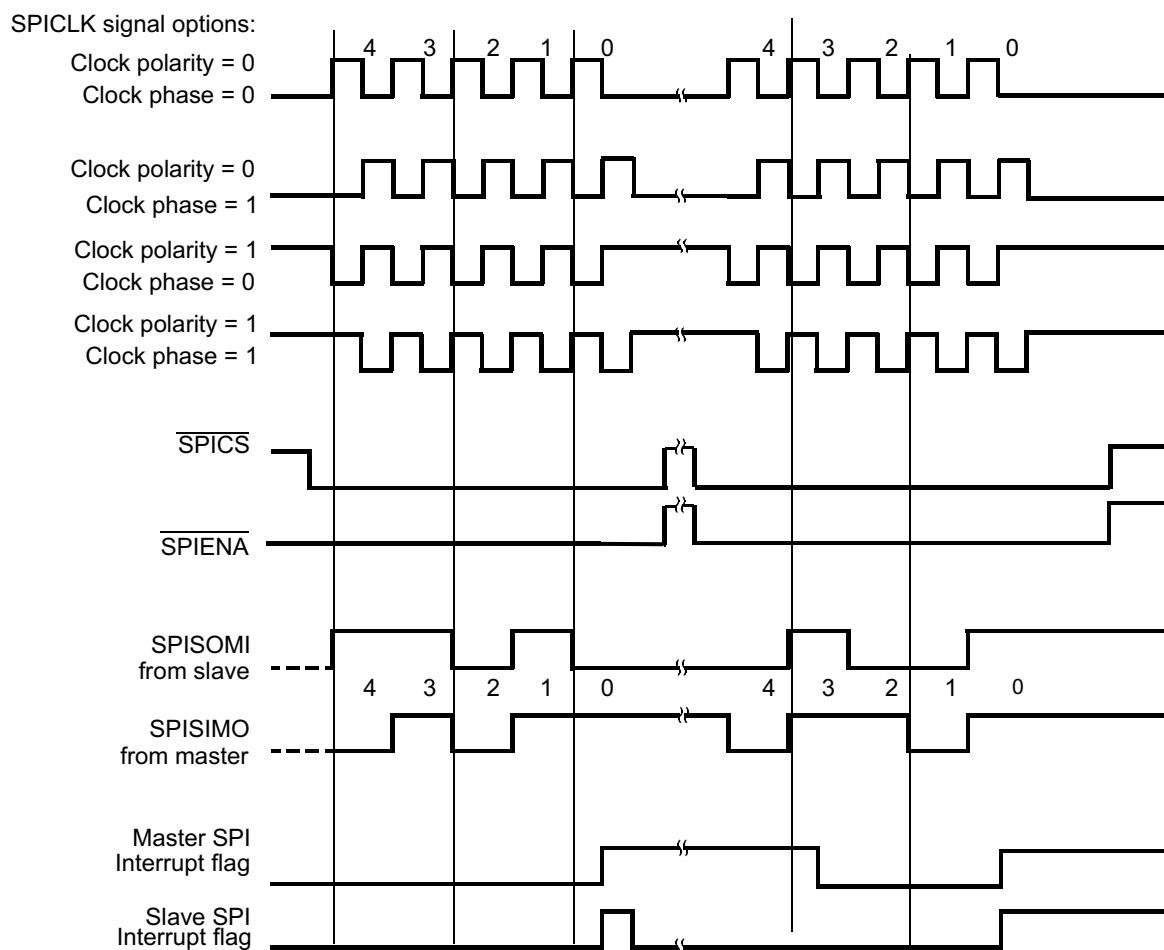

Figure 12-12. Five Bits per Character (5-Pin Option)

### 12.2.9 Decoded and Encoded Chip Select (Controller Only)

In this device, the SPI can connect to up to 6 individual peripheral devices using chip-selects by routing one wire to each peripheral. The 6 chip selects in the control field are directly connected to the 6 pins. The default value of each chip select (not active) can be configured via the register CSDEF. During a transmission, the value of the chip select control field (CSNR) of the SPIDAT1 register (SPIDAT1) is driven on the  $\overline{\text{SPICS}}$  pins. When the transmission finishes, the default chip-select value (defined by the CSDEF register) is put on the  $\overline{\text{SPICS}}$  pins.

The SPI can support more than 6 slaves by using encoded chip selects. To connect the SPI with encoded slaves devices, the CSNR field allows multiple active  $\overline{\text{SPICS}}$  pins at the same time, which enables encoded chip selects from 0 to 16. To use encoded chip selects, all 6 chip select lines have to be connected to each peripheral device and each peripheral needs to have a unique chip-select address. The CSDEF register is used to provide the address at which slaves devices are all de-selected.

Users can combine decoded and encoded chip selects. For example,  $n$   $\overline{\text{SPICS}}$  pins can be used for encoding an  $n$ -bit address and the remaining pins can be connected to decoded-mode slaves.

### 12.2.10 Variable Chip Select Setup and Hold Timing (Controller Only)

In order to support slow peripheral devices, a delay counter can be configured to delay data transmission after the chip select is activated. A second delay counter can be configured to delay the chip select deactivation after the last data bit is transferred. Both delay counters are clocked with the peripheral clock (VCLK).

If a particular data format specifically does not require these additional set-up or hold times for the chip select pins, then they can be disabled in the corresponding SPIFMTx register.

### 12.2.11 Hold Chip-Select Active

Some peripheral devices require the chip select signal to be held continuously active during several consecutive data word transfers. Other peripheral devices require the chip select signal to be deactivated between consecutive data word transfers.

CSHOLD is programmable in both controller and peripheral modes of the multi-buffer mode of SPI. However, the meaning of CSHOLD in controller mode and peripheral mode are different.

#### Note

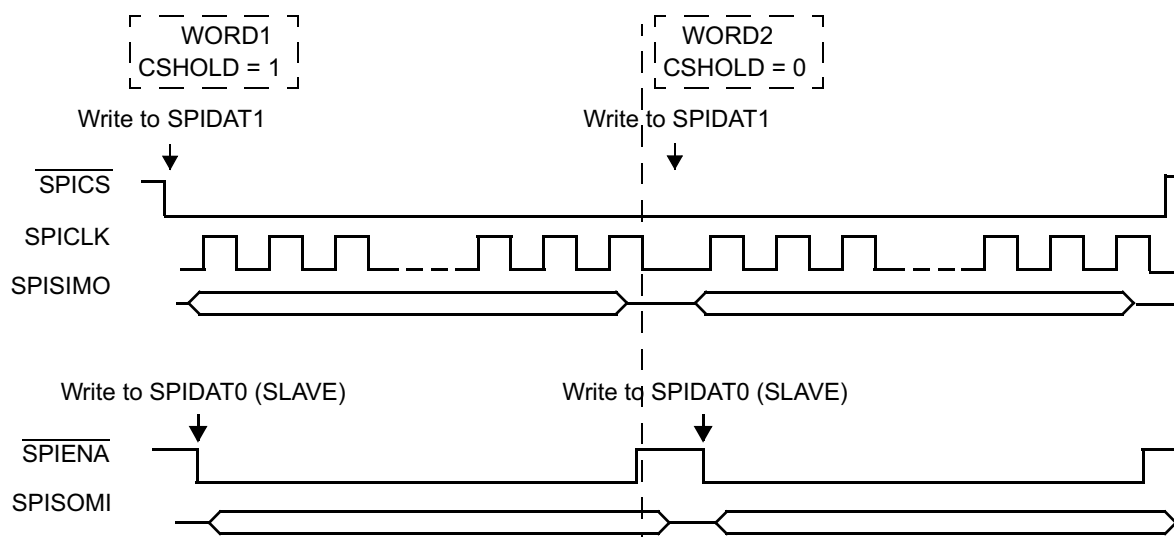

If the CSHOLD bit is set within the current data control field, the programmed hold time and the following programmed set-up time will not be applied between transactions.

#### 12.2.11.1 CSHOLD Bit in Controller Mode

Each word in a controller-mode SPI can be individually initialized for one of the two modes via the CSHOLD bit in its control field.

If the CSHOLD bit is set in the control field of a word, the chip select signal will not be deactivated until the next control field is loaded with new chip select information. Since the chip-select is maintained active between two transfers, the chip-select hold delay (T2CDELAY) is not applied at the end of the current transaction, and the chip-select set-up time delay (C2TDELAY) is not applied as well at the beginning of the following transaction. However, the wait delay (WDELAY) will be still applied between the two transactions, if the WDEL bit is set within the control field.

Figure 12-13 shows the SPI pins when a controller-mode SPI transfers a word that has its CSHOLD bit set. The chip-select pins will not be deasserted after the completion of this word. If the next word to transmit has the same chip-select number (CSNR) value, the chip select pins will be maintained until the completion of the second word, regardless of whether the CSHOLD bit is set or not.

**Figure 12-13. Typical Diagram when a Buffer in controller is in CSHOLD Mode (SPI-SPI)**

### 12.2.11.2 CSHOLD Bit in Peripheral Mode (Multi-buffered Mode)

If the CSHOLD bit in a buffer is set to 1, then the MibSPI does not wait for the  $\overline{\text{SPICS}}$  pins to be de-asserted at the end of the shift operation to copy the received data to the receive RAM. With this feature, it is possible for a peripheral in multi-buffer mode to do multiple data transfers without requiring the  $\overline{\text{SPICS}}$  pins to be deasserted between two buffer transfers.

If the CSHOLD bit in a buffer is cleared to 0 in a peripheral MibSPI, even after the shift operation is done, the MibSPI waits until the  $\overline{\text{SPICS}}$  pin (if functional) is deasserted to copy the received data to the RXRAM.

If the CSHOLD bit is maintained as 0 across all the buffers, then the peripheral in multi-buffer mode requires its  $\overline{\text{SPICS}}$  pins to be deasserted between any two buffer transfers; otherwise, the peripheral SPI will be unable to respond to the next data transfer.

#### Note

In compatibility mode, the peripheral does not require the  $\overline{\text{SPICS}}$  pin to be deasserted between two buffer transfers. The CSHOLD bit of the peripheral will be ignored in compatibility mode.

### 12.2.12 Detection of Peripheral Desynchronization (Controller Only)

When a peripheral supports generation of an enable signal (ENA), desynchronization can be detected. With the enable signal a peripheral indicates to the controller that it is ready to exchange data. A desynchronization can occur if one or more clock edges are missed by the peripheral. In this case, the peripheral may block the SOMI line until it detects clock edges corresponding to the next data word. This would corrupt the data word of the desynchronized peripheral and the consecutive data word. A configurable 8-bit time-out counter (T2EDELAY), which is clocked with SPICLK, is implemented to detect this peripheral malfunction. After the transmission has finished (end of last bit transferred: either last data bit or parity bit) the counter is started. If the ENA signal generated by the peripheral does not become inactive before the counter overflows, the DESYNC flag is set and an interrupt is asserted (if enabled).

---

### Note

#### Inconsistency of Desynchronization Flag in Compatibility Mode MibSPI

Because of the nature of this error, under some circumstances it is possible for a desync error detected for the previous buffer to be visible in the current buffer. This is due to the fact that receive completion flag/interrupt will be generated when the buffer transfer is completed. But desync will be detected after the buffer transfer is completed. So, if VBUS controller reads the received data quickly when an RXINT is detected, then the status flag may not reflect the correct desync condition. This inconsistency in the desync flag is valid only in compatibility mode of MibSPI. In multi-buffer mode, the desync flag is always assured to be for the current buffer.

---

#### 12.2.13 ENA Signal Time-Out (Controller Only)

The SPI in controller mode waits for the hardware handshake signal (ENA) coming from the addressed peripheral before performing a data transfer. To avoid stalling the SPI by a non-responsive peripheral device, a time-out value can be configured using C2EDELAY. If the time-out counter overflows before an active ENA signal is sampled, the TIMEOUT flag in the status register SPIFLG is set and the TIMEOUT flag in the status field of the corresponding buffer is set.

---

### Note

When the chip select signal becomes active, no breaks in transmission are allowed. The next arbitration is performed while waiting for the time-out to occur.

---

#### 12.2.14 Data-Length Error

A SPI can generate an error flag by detecting any mismatch in length of received or transmitted data and the programmed character length under certain conditions.

**Data-Length Error in Controller Mode:** During a data transfer, if the SPI detects a de-assertion of the  $\overline{\text{SPIENA}}$  pin (by the peripheral) while the character counter is not overflowed, then an error flag is set to indicate a data-length error. This can be caused by a peripheral receiving extra clocks (for example, due to noise on the SPICLK line).

---

### Note

In a controller mode SPI, the data length error will be generated only if the  $\overline{\text{SPIENA}}$  pin is enabled as a functional pin.

---

**Data-Length Error in peripheral Mode:** During a transfer, if the SPI detects a de-assertion of the  $\overline{\text{SPICS}}$  pin before its character length counter overflows, then an error flag is set to indicate a data-length error. This situation can arise if the peripheral SPI misses one or more SPICLK pulses from the controller. This error in peripheral mode implies that both the transmitted and received data were not complete.

---

### Note

In a peripheral mode SPI, the data-length error flag will be generated only if at least one of the  $\overline{\text{SPICS}}$  pins are configured as functional, and are being used for selecting the peripheral.

---

#### 12.2.15 Parallel Mode (Multiple PICO/POCI Support, not available on all devices)

In order to increase throughput, the parallel mode of the SPI enables the module to send data over more than one data line (parallel 2, 4, or 8). When parallel mode is used, the data length must be set as 16 bits. Only module MIBSPIP5 supports Parallel Mode.

This feature increases throughput by 2 for 2 pins, by 4 for 4 pins, or by 8 for 8 pins.

Parallel mode supports the following features:

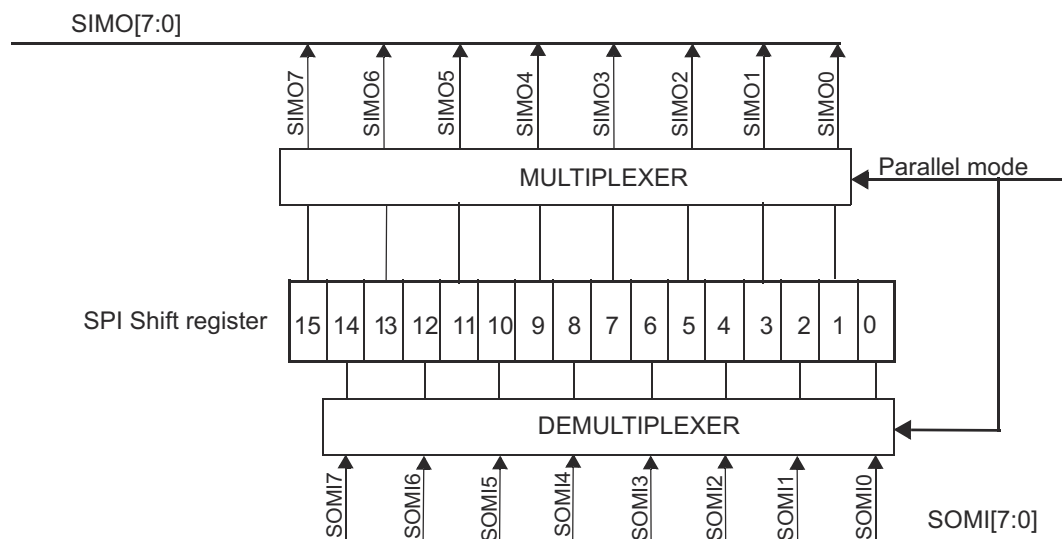

- Scalable data lines (1, 2, 4, 8) per direction. (POCI and PICO lines)
- All clock schemes are supported (clock phase and polarity)
- Parity is supported. The parity bit will be transmitted on bit0 of the PICO/POCI lines. The receive parity is expected on bit0 of the POCI/PICO pins.

Parallel mode can be programmed using the PMODEx bits of SPIPMCTRL register. See [Section 12.8.26](#) for details about this register.

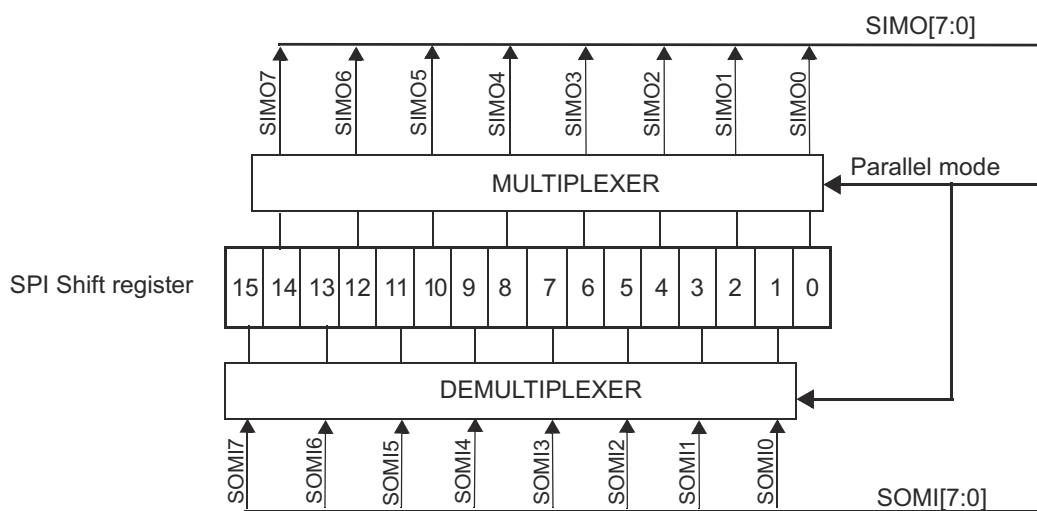

After reset the parallel mode selection bits are cleared (single PICO/POCI lines).

### 12.2.15.1 Parallel Mode Block Diagram

[Figure 12-14](#) and [Figure 12-15](#) show the parallel connections to the SPI shift register.

**Figure 12-14. Block Diagram Shift Register, MSB First**

**Figure 12-15. Block Diagram Shift Register, LSB First**

### 12.2.15.2 Parallel Mode Pin Mapping, MSB First

Table 12-3 and Table 12-4 describe the POCI and PICO pin mapping when the SPI is used in parallel mode (1, 2, 4, 8) pin mode, MSB first.

#### Note

MSB-first or LSB-first can be configured using the SHIFTDIRx bit of the SPIFMTx registers.

**Table 12-3. Pin Mapping for PICO Pin with MSB First**

Parallel Mode	Shift Register Bit	PICO[7:0]
1	15	0
2	15	1

#### 12.2.15.4 2-Data Line Mode (MSB First, Phase 0, Polarity 0)

In 2-data line mode (controller mode) the shift register bits 15 and 7 will be connected to the pins PICO[1] and PICO[0], and the shift register bits 8 and 0 will be connected to the pins POCI[1] and POCI[0] or vice versa in peripheral mode. After writing to the SPIDAT0/SPIDAT1 register, the bits 15 and 7 will be output on PICO[1] and PICO[0] on the rising edge of SPICLK. With the falling clock edge of the SPICLK, the received data on POCI[1] and POCI[0] will be latched to the shift register bits 8 and 0. The subsequent rising edge of SPICLK will shift the data in the shift register by 1 bit to the left. (PICO[1] will shift the data out from bit 15 to 8, PICO[0] will shift the data out from bit 7 to 0). After eight SPICLK cycles, when the full data word is transferred, the shift register (16 bits) is copied to the receive buffer, and the RXINT flag will be set. Figure 12-16 shows the clock/data diagram of the 2-data line mode. Figure 12-17 shows the timing of a two-pin parallel transfer.

**Figure 12-16. 2-data Line Mode (Phase 0, Polarity 0)**

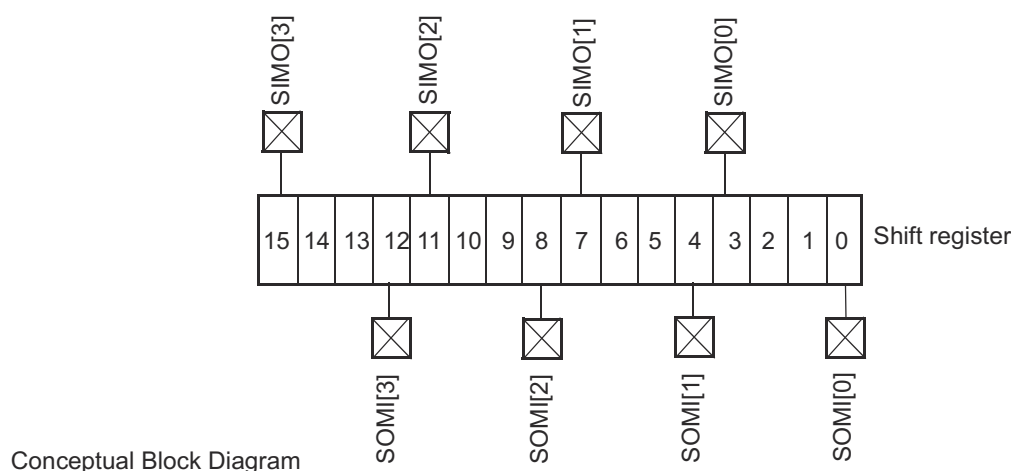

**Figure 12-17. Two-Pin Parallel Mode Timing Diagram (Phase 0, Polarity 0)**

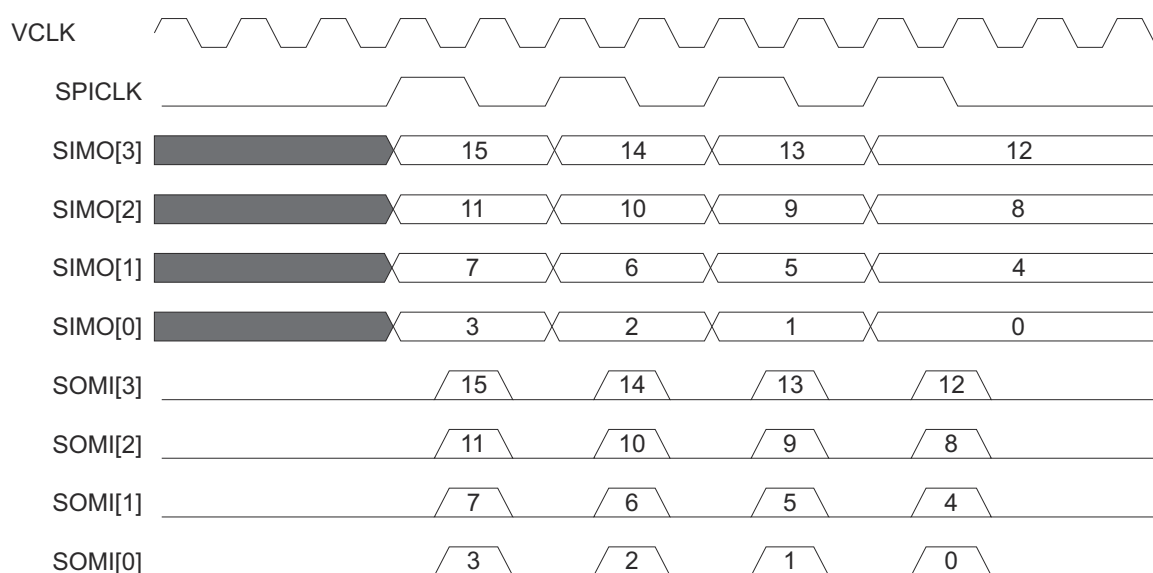

### 12.2.15.5 4-Data Line Mode (MSB First, Phase 0, Polarity 0)

In 4-data line mode (controller mode) the shift register bits 15, 11, 7, and 3 will be connected to the pins SIMO[3], SIMO[2], SIMO[1], and SIMO[0], and the shift register bits 12, 8, 4, and 0 will be connected to the pins SOMI[3], SOMI[2], SOMI[1], and SOMI[0] (or vice versa in peripheral mode). After writing to SPIDAT1/SPIDAT0, the bits 15, 11, 7, and 3 will be output on SIMO[3], SIMO[2], SIMO[1], and SIMO[0] on the rising edge of SPICLK. With the falling clock edge of the SPICLK, the received data on SOMI[3], SOMI[2], SOMI[1] and SOMI[0] will be latched to shift register bits 12, 8, 4, and 0. The subsequent rising edge of SPICLK will shift data in the shift register by 1 bit to the left (SIMO[3] will shift the data out from bit 15 to 12, SIMO[2] will shift the data out from bit 11 to 8, SIMO[1] will shift the data out from bit 7 to 4, SIMO[0] will shift the data out from bit 3 to 0). After four SPICLK cycles, when the full data word is transferred, the shift register (16 bits) is copied to the receive buffer, and the RXINT flag will be set.

Figure 12-18 shows the clock/data diagram of the four-data line mode. Figure 12-19, shows the timing diagram for four-data line mode.

**Figure 12-18. 4-Data Line Mode (Phase 0, Polarity 0)**

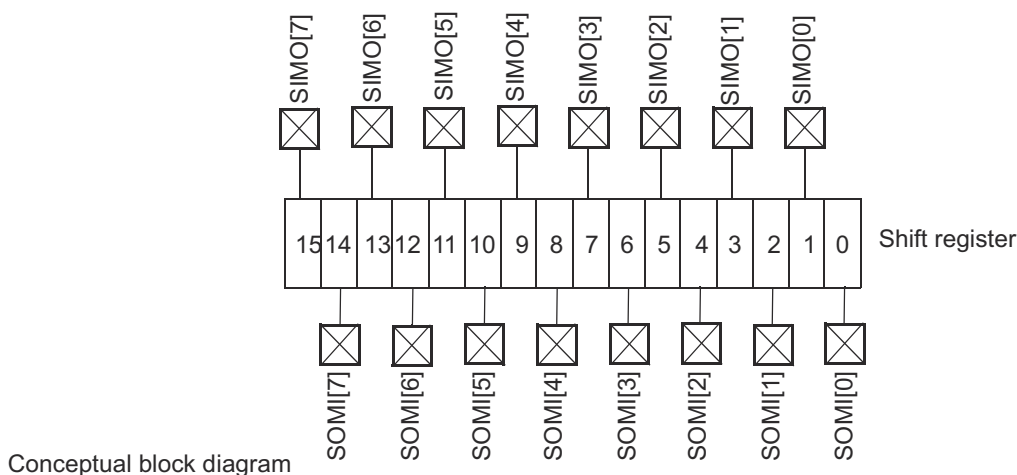

**Figure 12-19. 4 Pins Parallel Mode Timing Diagram (Phase 0, Polarity 0)**

### 12.2.15.6 8-Data Line Mode (MSB First, Phase 0, Polarity 0)

In 8-data line mode (controller mode) the shift register bits 15, 13, 11, 9, 7, 5 and 3 will be connected to the pins PICO[7], PICO[6], PICO[5], PICO[4], PICO[3], PICO[2], PICO[1], and PICO[0], and the shift-register bits 14, 12, 10, 8, 6, 4, and 0 will be connected to the pins POIC[7], POIC[6], POIC[5], POIC[4], POIC[3], POIC[2], POIC[1], and POIC[0] (or vice versa in peripheral mode).

After writing to SPIDAT0/SPIDAT1, the bits 15, 13, 11, 9, 7, 5, 3, and 1 will be output on PICO[7], PICO[6], PICO[5], PICO[4], PICO[3], PICO[2], PICO[1], and PICO[0], on the rising edge of SPICLK. On the falling clock edge of the SPICLK, the received data on POIC[8], POIC[7], POIC[6], POIC[5], POIC[4], POIC[3], POIC[2], POIC[1], and POIC[0] will be latched to the shift register bits 14, 12, 10, 8, 6, 4, 2, and 0.

The subsequent rising edge of SPICLK will shift the data in the shift register by 1 bit to the left. After two SPICLK cycles, when the full data word is transferred the shift register (16 bits) is copied to the receive buffer, and the RXINT flag will be set. Figure 12-20 shows the clock/data diagram of the 8-data line mode. Figure 12-21 shows the pin timings for 8-data line mode.

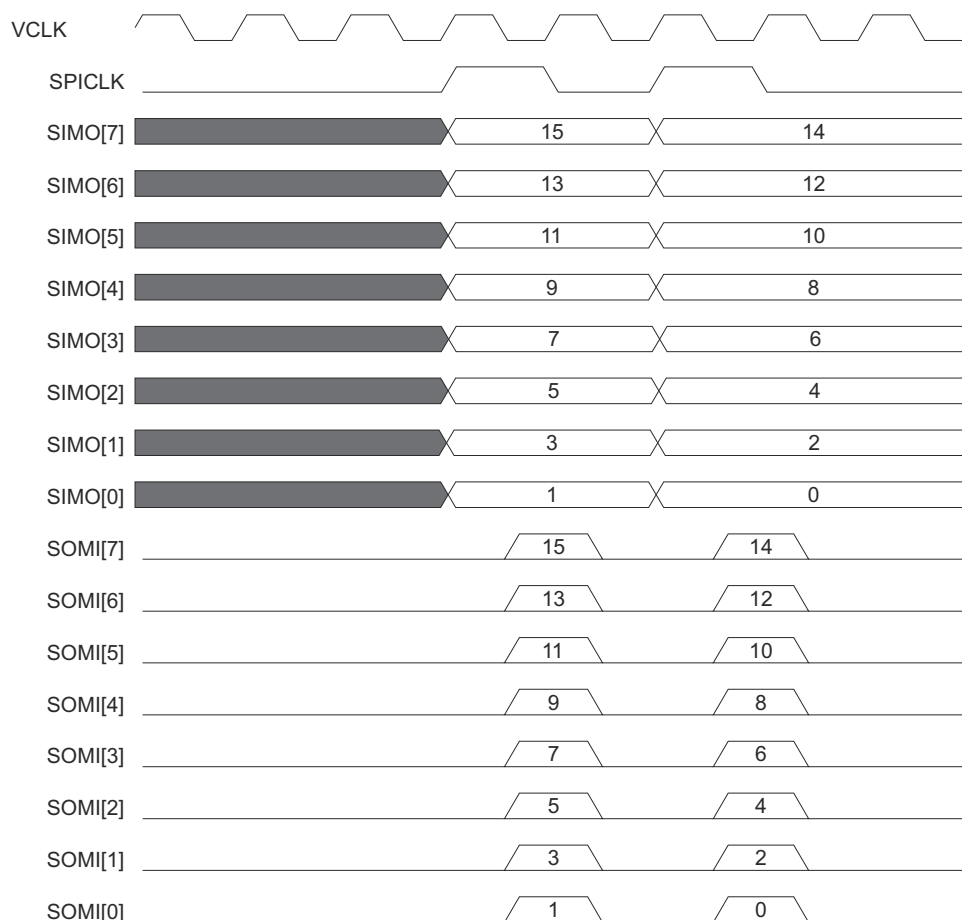

**Figure 12-20. 8-data Line Mode (Phase 0, Polarity 0)**

#### Note

##### Parity Support

Using the parity support in parallel mode may seriously affect throughput. For an eight-line mode to transfer 16 bits of data, only two SPICLK pulses are enough. If parity is enabled, one extra SPICLK pulse will be used to transfer and receive the parity bit. Parity will be transmitted and received on the 0th line regardless of 1/2/4/8-line modes. During the parity bit transfer, other data bits are not valid.

**Figure 12-21. 8 Pins Parallel Mode Timing Diagram (Phase 0, Polarity 0)**

### Note

Modulo Count Parallel Mode is not supported in this device.

### 12.2.16 Continuous Self-Test (Controller/Peripheral)

During data transfer, the SPI compares its own internal transmit data with its transmit data on the bus. The sample point for the compare is at one-half SPI clock after transmit point. If the data on the bus does not match the expected value, the bit-error (BITERR) flag is set and an interrupt is asserted if enabled.

---

#### Note

The compare is made from the output pin using its input buffer.

---

### 12.2.17 Half Duplex Mode

SPI by protocol is Full Duplex in nature, which means simultaneous TX and RX operations happen on two separate data pins, SIMO and SOMI. However, it is possible to use SPI/MibSPI to do the TX-only operation (ignoring the RX data) and the RX-only operation (using dummy TX data and ignoring the TX pin). But this requires that both SOMI and SIMO lines are bonded out in a chip to be able to support both TX-only or RX-only features.

#### 12.2.17.1 Half Duplex Mode in Master

The Half Duplex Mode gives an additional flexibility to use the SIMO pin, which is normally used as a TX pin in Controller mode, to work like an RX pin while the HDUPLEX\_ENAx bit in SPIFMTx register is set to 1. In Half Duplex Controller mode, the SIMO pin acts as an RX pin. Switching between Full Duplex and Half Duplex can be achieved using the SPIFMTx register being selected using the DFSEL bit of SPIDAT1 register or TXRAM locations.

#### 12.2.17.2 Half Duplex Mode in Peripheral

In Half Duplex Peripheral mode, the SIMO pin, which is normally an RX pin, acts as a TX pin while the HDUPLEX\_ENAx bit in SPIFMTx register is set to 1. In Half Duplex Peripheral mode, the SIMO pin acts as a TX pin. Switching between Full Duplex and Half Duplex can be achieved using the SPIFMTx register being selected using the DFSEL bit of SPIDAT1 register or TXRAM locations.

## 12.3 Test Features

### 12.3.1 Internal Loop-Back Test Mode (Controller Only)

The internal loop-back self-test mode can be utilized to test the SPI transmit and receive paths, including the shift registers, the SPI buffer registers, and the parity generator. In this mode the transmit signal is internally feedback to the receiver, whereas the SIMO, SOMI, and CLK pin are disconnected; that is, the transmitted data is internally transferred to the corresponding receive buffer while external signals remain unchanged.

This mode allows the CPU to write into the transmit buffer, and check that the receive buffer contains the correct transmit data. If an error occurs the corresponding error is set within the status field.

---

#### Note

This mode cannot be changed during transmission.

---

### 12.3.2 Input/Output Loopback Test Mode

Input/Output Loopback Test mode supports the testing of all Input/Output pins without the aid of an external interface. Loopback can be configured as either analog-loopback (loopback through the pin-level input/output buffers) or digital loopback (internal to the SPI module). With Input/Output Loopback, all functional features of the SPI can be tested. Transmit data is fed back through the receive-data line(s). See Figure 12-22 for a diagram of the types of feedback available. The IOLPBKTSTCR register defines all of the available control fields.

In loopback mode, it is also possible to induce various error conditions. See Section 12.8.44 for details of the register field controlling these features.

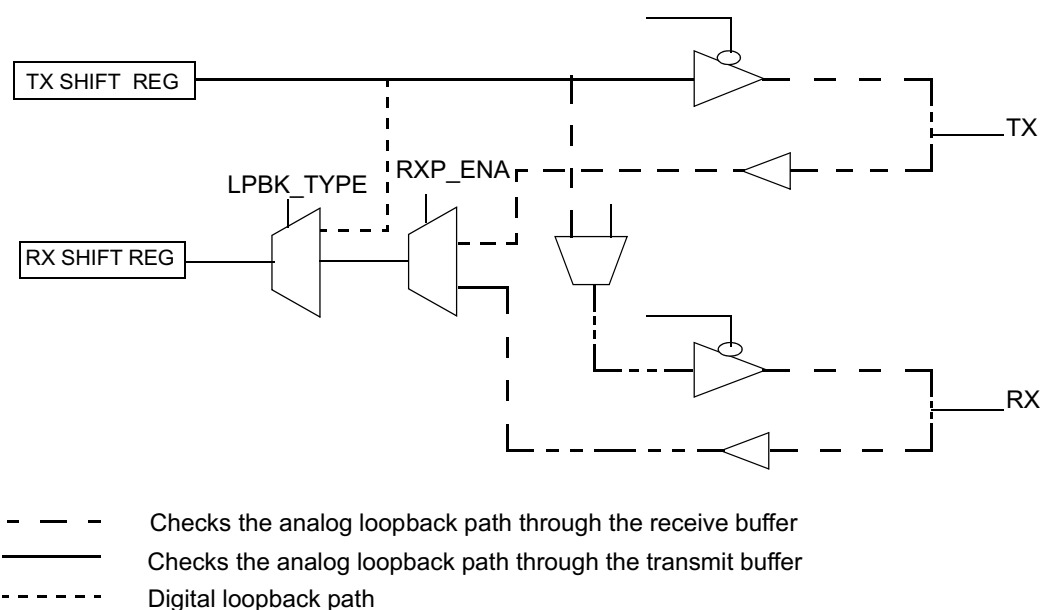

In Input/Output loopback test modes, even when the module is in slave mode, the SPICLK is generated internally. This SPICLK is used for all loopback-mode SPI transactions. Peripheral-mode features can be tested without the help of another controller SPI, using the internally-generated SPICLK. Chip selects are also generated by the slave itself while it is in Input/Output loopback mode.

In Input/Output loopback test modes, if the module is in controller mode, the  $\overline{\text{ENA}}$  signal is also generated by internal logic so that an external interface is not required.

#### Note

##### Usage Guideline for Input/Output Loopback

Input/Output Loopback mode should be used with caution because, in some configurations, even the receive pins will be driven with transmit data. During testing, it should be ensured that none of the SPI pins are driven by any other device connected to them. Otherwise, if analog loopback is selected in I/O Loopback mode, then testing may damage the device.

This diagram is intended to illustrate loopback paths and therefore may omit some normal-mode paths.

**Figure 12-22. I/O Paths during I/O Loopback Modes**

### 12.3.2.1 Input/Output Loopback Mode Operation in Peripheral Mode

In multi-buffer slave mode, there are some additional requirements for using I/O loopback mode (IOLPBK). In multi-buffer peripheral mode, the chip-select pins are the triggers for various TGs. Enabling the IOLPBK mode by writing 0xA to the IOLPBTSTENA bits of the IOLPBKTSTCR register triggers TG0 by driving SPICS to 0. The actual number of chip selects can be programmed to have any or all of the SPICS pins as functional. All other configurations should be completed before enabling the IOLPBK mode in multi-buffer peripheral mode since it triggers TG0.

After the first buffer transfer is completed, the CSNR field of the current buffer is used to trigger the next buffer. So, if multiple TGs are desired to be tested, then the CSNR field of the final buffer in each TG should hold the number of the next TG to be triggered. As long as TG boundaries are well defined and are enabled, the completion of one TG will trigger the next TG.

To stop the transfer in multi-buffer peripheral mode in I/O Loopback configuration, either IOLPBK mode can be disabled by writing 0x5 to the IOLPBTSTENA bits or all of the TGs can be disabled.

## 12.4 General-Purpose I/O

All of the SPI pins may be programmed via the SPIPCx control registers to be either functional or general-purpose I/O pins.

If the SPI function is to be used, application software must ensure that at least the SPICLK pin and the SOMI and/or SIMO pins are configured as SPI functional pins, and not as GIO pins, or else the SPI state machine will be held in reset, preventing SPI transactions.

SPI pins support:

- internal pull-up resistors
- internal pull-down resistors
- open-drain or push-pull mode

## 12.5 Interrupts

There are two levels of vectorized interrupts supported by the SPI. These interrupts can be caused under the following circumstances:

- Transmission error
- Receive overrun
- Receive complete (receive buffer full)
- Transmit buffer empty

These interrupts may be enabled or disabled via the SPIINT0 register.

During transmission, if one of the following errors occurs: BITERR, DESYNC, DLENERR, PARITYERR, or TIMEOUT, the corresponding bit in the SPIFLG register is set. If the corresponding enable bit is set, then an interrupt is generated. The level of all the above interrupts is set by the bit fields in the SPILVL register.

The error interrupts are enabled and prioritized independently from each other, but the interrupt generated will be the same if multiple errors are enabled on the same level. The SPIFLG register should be used to determine the actual cause of an error.

---

### Note

Since there are two interrupt lines, one each for Level 0 and Level 1, it is possible for a programmer to separate out the interrupts for receive buffer full and transmit buffer empty. By programming one to Level 0 and the other to Level 1, it is possible to avoid a check on whether an interrupt occurred for transmit or for receive. A programmer can also choose to group all of the error interrupts into one interrupt line and both TX-empty and RX-full interrupts into another interrupt line using the LVL control register. In this way, it is possible to separate error-checking from normal data handling.

---

### 12.5.1 Interrupts in Multi-Buffer Mode

In multi-buffer mode, the SPI can generate interrupts on two levels.

In normal multi-buffer operation, the receive and transmit are not used and therefore the enable bits of SPIINT0 are not used.

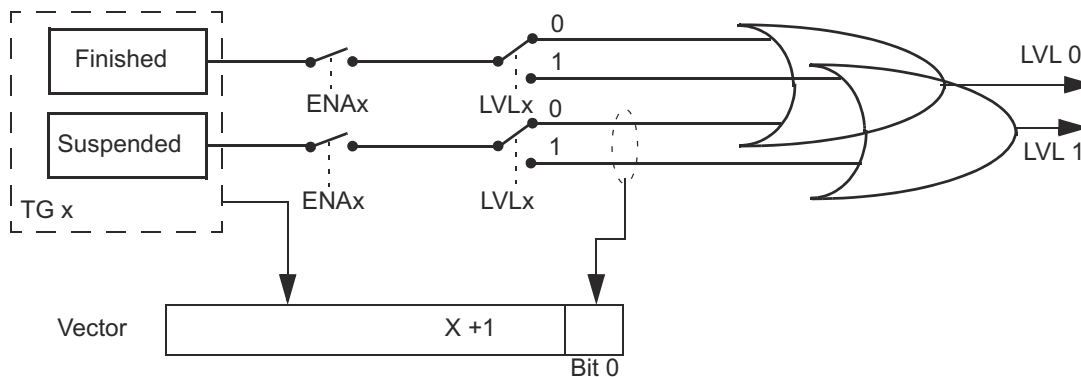

The interrupts available in multi-buffer mode are:

- Transmission error interrupt
- Receive overrun interrupt
- TG suspended interrupt
- TG completed interrupt

When a TG has finished and the corresponding enable bit in the TGINTENA register is set, a transfer-finished interrupt is generated. The level of priority of the interrupt is determined by the corresponding bit in the TGINTLVL register.

When a TG is suspended by a buffer that has been set as suspend to wait until TXFULL flag or/and RXEMPTY flag are set, and if the corresponding bit in the TGINTENA register is set, a transfer-suspended interrupt is generated. The level of priority of the interrupt is determined by the corresponding bit in the TGINTLVL register.

[Figure 12-23](#) illustrates the TG interrupts.

**Figure 12-23. TG Interrupt Structure**

During transmission, if one of the following errors occurs, BITERR, DESYNC, PARITYERR, TIMEOUT, DLENERR, the corresponding flag in the SPIFLG register is set. If the enable bit is set, then an interrupt is generated. The level of the interrupts could be generated according to the bit field in SPILVL register.

The RXOVRN interrupt is generated when a buffer in the RXRAM is overwritten by a new received word. While writing newly received data to a RXRAM location, if the RXEMPTY bit of the corresponding location is 0, then the RXOVR bit will be set to 1 during the write operation, so that the buffer starts to indicate an overrun. This RXOVR flag is also reflected in SPIFLG register as RXOVRNINTFLG and the corresponding vector number is updated in TGINTVECT0/TGINTVECT1 register. If an overrun interrupt is enabled, then an interrupt will be generated indicating an overrun condition.

The error interrupts are enabled and prioritized independently from each other, but the vector generated by the SPI will be the same if multiple errors are enabled on the same level.

**Figure 12-24. SPIFLG Interrupt Structure**

Since the priority of an error interrupt is lower than a completion/suspend interrupt for a TG, the interrupts can be split into two levels. By programming all the error interrupts into Level 0 and TG-complete / TG-suspend interrupts into Level 1, it is possible to get a clear indication of the source of error interrupts. However, when a vector register shows an error interrupt, the actual buffer for which the error has occurred is not readily identifiable. Since each buffer in the multi-buffer RAM is stored along with its individual status flags, each buffer should be read until a buffer with any error flag set is found.

A separate interrupt line is provided to indicate the uncorrectable error condition in the MibSPI. This line is available (and valid) only in the multi-buffer mode of the MibSPI module and if the parity error detection feature for multi-buffer RAM is enabled.

## 12.6 DMA Interface

In order to reduce CPU overhead in handling SPI message traffic on a character-by-character basis, SPI can use the DMA controller to transfer the data. The DMA request enable bit (DMA REQ EN) controls the assertion of requests to the DMA controller module. When a character is being transmitted or received, the SPI will signal the DMA via the DMA request signals, TX\_DMA\_REQ and RX\_DMA\_REQ. The DMA controller will then perform the required data transfer.

For efficient behavior during DMA operations, the transmitter empty and receive-buffer full interrupts can be disabled. For specific DMA features, see the DMA controller specification.

The SPI generates a request on the TX\_DMA\_REQ line each time the TX data is copied to the TX shift register either from the TXBUF or from peripheral data bus (when TXBUF is empty).

The first TX\_DMA\_REQ pulse is generated when either of the following is true:

- DMAREQEN (SPIINT0[16]) is set to 1 while SPIEN (SPIGCR1[24]) is already 1.
- SPIEN (SPIGCR1[24]) is set to 1 while DMAREQEN (SPIINT0[16]) is already 1.

The SPI generates a request on the RX\_DMA\_REQ line each time the received data is copied to the SPIBUF.

### 12.6.1 DMA in Multi-Buffer Mode

The MibSPI provides sophisticated programmable DMA control logic that completely eliminates the necessity of CPU intervention for data transfers, once programmed. When the multi-buffer mode is used, the DMA enable bit in the SPIINT0 register is ignored. DMA source or destination should be only the multi-buffer RAM and not SPIDAT0 / SPIDAT1 or SPIBUF register as in case of compatibility mode DMA.

The MibSPI offers up to eight DMA channels (for SEND and RECEIVE). All of the DMA channels are programmable individually and can be hooked to any buffer. The MibSPI provides up to 16 DMA request lines, and DMA requests from any channel can be programmed to be routed through any of these 16 lines. A DMA transfer can trigger both transmit and receive.

Each DMA channel has the capability to transfer a block of up to 32 data words without interruption using only one buffer of the array by configuring the DMAxCTRL register. Using the DMAxCOUNT and DMAxTNTLEN register, up to 65535 (64K) words of data can be transferred without any interruption using just one buffer of the array. This enables the transfer of memory blocks from or into an external SPI memory.

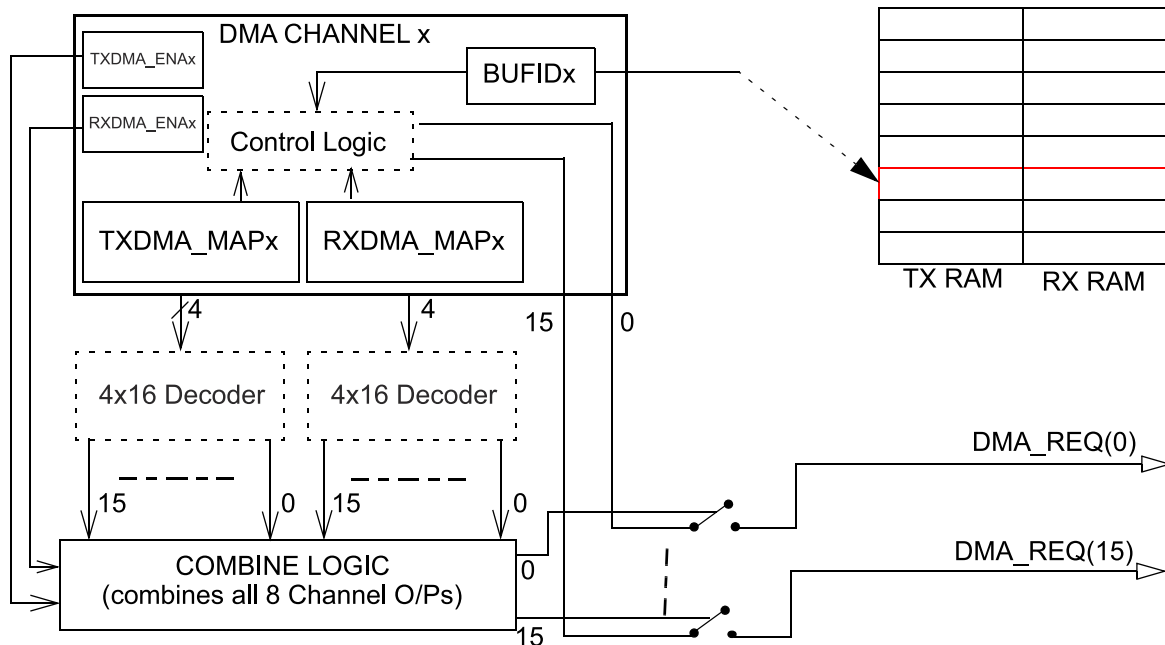

Figure 12-25. DMA Channel and Request Line (Logical) Structure in Multi-buffer Mode

## 12.7 Module Configuration

MibSPI/MibSPIP can be configured to function as Normal SPI and Multi-buffered SPI. Upon power-up or a system-level reset, each bit in the module registers is set to a default state. The registers are writable only after the RESET bit is set to 1.

### 12.7.1 Compatibility (SPI) Mode Configuration

The following list details the configuration steps that software should perform prior to the transmission or reception of data. As long as the SPIEN bit in the Global Control Register 1 (SPIGCR1) is cleared to 0 the entire time that the SPI is being configured, the order in which the registers are programmed is not important.

- Enable SPI by setting RESET bit.
- Configure the SIMO, SOMI, SPICLK, and optional  $\overline{\text{SPICS}}$  and  $\overline{\text{SPIENA}}$  pins for SPI functionality by setting the corresponding bit in SPIPC0 register.
- Configure the module to function as Controller or Peripheral using CLKMOD and MASTER bits.
- Configure the required SPI data format using SPIFMTx register.
- If the module is selected to function as Controller, the delay parameters can be configured using SPIDELAY register.
- Enable the Interrupts using SPIINT0 register if required.
- Select the chip select to be used by setting CSNR bits in SPIDAT1 register.
- Configure CSHOLD and WDEL bits in SPIDAT1 register if required.
- Select the Data word format by setting DFSEL bits. Select the Number of the configured SPIFMTx register (0 to 3) to used for the communication.
- Set LOOPBACK bit to connect the transmitter to the receiver internally. (This feature is used to perform a self-test. Do not configure for normal communication to external devices).
- Set SPIEN bit to 1 after the SPI is configured.
- Perform Transmit and receive data, using SPIDAT1 and SPIBUF register.
- You must wait for TXFULL to reset or TXINT before writing next data to SPIDAT1 register.
- You must wait for RXEMPTY to reset or RXINT before reading the data from SPIBUF register.

### 12.7.2 MibSPI Mode Configuration

The following list details the configuration steps that software should perform prior to the transmission or reception of data in MIBSPI mode. As long as the SPIEN bit in the Global Control Register 1 (SPIGCR1) is cleared to 0 the entire time that the SPI is being configured, the order in which the registers are programmed is not important.

- Enable SPI by setting RESET bit.
- Set MSPIENA bit to 1 to get access to multi-buffer mode registers.
- Configure the SIMO, SOMI, SPICLK, and optional  $\overline{\text{SPICS}}$  and  $\overline{\text{SPIENA}}$  pins for SPI functionality by setting the corresponding bit in SPIPC0 register.
- Configure the module to function as Controller or Peripheral using CLKMOD and MASTER bits.
- Configure the required SPI data format using SPIFMTx register.
- If the module is selected to function as Controller, the delay parameters can be configured using SPIDELAY register.
- Check for BUFINITACTIVE bit to be active before configuring MIBSPI RAM. (From Device Power On it take Number of Buffers × Peripheral clock period to initialize complete RAM.)
- Enable the Transfer Group interrupts using TGITENST register if required.
- Enable error interrupts using SPIINT0 register if required.
- Set SPIEN bit to 1 after the SPI is configured.
- The Trigger Source, Trigger Event, Transfer Group start address for the corresponding Transfer groups can be configured using the corresponding TGxCTRL register.
- Configure LPEND to specify the end address of the last TG.
- Similar to SPIDAT1 register, the 16 bit control fields in every TXRAM buffer in the TG have to be configured.
- Configure one of the eight BUFMODE available for each buffer.
- Fill the data to be transmitted in TXDATA field in TXRAM buffers.
- Configure TGENA bit to enable the required Transfer groups. (In case of Trigger event always setting TGENA will trigger the transfer group).
- At the occurrence of the correct trigger event, the Transfer group will be triggered and data gets transmitted and received one after the other with out any CPU intervention.
- You can poll Transfer Group interrupt flag or wait for a transfer-completed interrupt to read and write new data to the buffers.

## 12.8 Control Registers

This section describes the SPI control, data, and pin registers. The registers support 8-bit, 16-bit and 32-bit writes. The offset is relative to the associated base address of this module in a system.

### Note

TI highly recommends that write values corresponding to the reserved locations of registers be maintained as 0 consistently. This allows future enhancements to use these reserved bits as control bits without affecting the functionality of the module with any older versions of software.

### 12.8.1 SPI Global Control Register 0 (SPIGCR0)

**Figure 12-26. SPI Global Control Register 0 (SPIGCR0) [offset = 00]**

LEGEND: R/W = Read/Write; R = Read only; WP = Write in privilege mode only; -n = value after reset

**Table 12-8. SPI Global Control Register 0 (SPIGCR0) Field Descriptions**

Bit	Field	Value	Description
31-1	Reserved	0	Reads return 0. Writes have no effect.
0	nRESET	0	This is the local reset control for the module. This bit needs to be set to 1 before any operation on SPI / MibSPI can be done. Only after setting this bit to 1, the Auto Initialization of Multi-buffer RAM starts. Clearing this bit to 0 will result in all of the control and status register values to return to their default values..
		1	SPI is in the reset state.
		1	SPI is out of the reset state.

## 12.8.2 SPI Global Control Register 1 (SPIGCR1)

**Figure 12-27. SPI Global Control Register 1 (SPIGCR1) [offset = 04h]**

31		25	24	23		17		16
Reserved			SPIEN	Reserved			LOOPBACK	
R-0			R/W-0	R-0			R/WP-0	
15		9	8	7		2	1	0
Reserved			POWERDOWN	Reserved			CLKMOD	MASTER
R-0			R/W-0	R-0			R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; WP = Write in privilege mode only; -n = value after reset

**Table 12-9. SPI Global Control Register 1 (SPIGCR1) Field Descriptions**

Bit	Field	Value	Description
31-25	Reserved	0	Reads return 0. Writes have no effect.
24	SPIEN	0 1	SPI enable. This bit enables SPI transfers. This bit must be set to 1 after all other SPI configuration bits have been written. When the SPIEN bit is 0 or cleared to 0, the following SPI registers get forced to their default states: <ul style="list-style-type: none"> <li>Both TX and RX shift registers</li> <li>The TXDATA fields of the SPI Transmit Data Register 0 (SPIDAT0) and the SPI Transmit Data Register 1 (SPIDAT1)</li> <li>All the fields of the SPI Flag Register (SPIFLG)</li> <li>Contents of SPIBUF and the internal RXBUF registers</li> </ul> The SPI is not activated for transfers. Activates SPI.
23-17	Reserved	0	Reads return 0. Writes have no effect.
16	LOOPBACK	0 1	Internal loop-back test mode. The internal self-test option can be enabled by setting this bit. If the SPISIMO and SPISOMI pins are configured with SPI functionality, then the SPISIMO[7:0] pins are internally connected to the SPISOMI[7:0] pins (transmit data is looped back as receive data). GIO mode for these pins is not supported in loopback mode. Externally, during loop-back operation, the SPICLK pin outputs an inactive value and SPISOMI[7:0] remains in the high-impedance state. If the SPI is initialized in slave mode or a data transfer is ongoing, errors may result.  <b>Note: This loopback mode can only be used in master mode. Master mode must be selected before setting LOOPBACK. When this mode is selected, the CLKMOD bit should be set to 1, meaning that SPICLK is internally generated.</b> Internal loop-back test mode is disabled. Internal loop-back test mode is enabled.
15-9	Reserved	0	Reads return 0. Writes have no effect.
8	POWERDOWN	0 1	When active, the SPI state machine enters a power-down state. The SPI is in active mode. The SPI is in power-down mode.
7-2	Reserved	0	Reads return 0. Writes have no effect.

**Table 12-9. SPI Global Control Register 1 (SPIGCR1) Field Descriptions (continued)**

Bit	Field	Value	Description
1	CLKMOD	0 1	Clock mode. This bit selects either an internal or external clock source. This bit also determines the I/O direction of the SPIENA and SPICS pins in functional mode.  Clock is external. <ul style="list-style-type: none"> <li>SPIENA is an output.</li> <li>SPICS are inputs.</li> </ul> Clock is internally-generated. <ul style="list-style-type: none"> <li>SPIENA is an input.</li> <li>SPICS are outputs.</li> </ul>
0	MASTER	0 1	SPISIMO/SPISOMI pin direction determination. Sets the direction of the SPISIMO and SPISOMI pins.  <b>Note: For master-mode operation of the SPI, MASTER bit should be set to 1 and CLKMOD bit can be set either 1 or 0. The master-mode SPI can run on an external clock on SPICLK.</b>  <b>For slave mode operation, both the MASTER and CLKMOD bits should be cleared to 0. Any other combinations may result in unpredictable behavior of the SPI. In slave mode, SPICLK will not be generated internally in slave mode.</b>  0 SPISIMO[7:0] pins are inputs, SPISOMI[7:0] pins are outputs. 1 SPISOMI[7:0] pins are inputs, SPISIMO[7:0] pins are outputs.

### 12.8.3 SPI Interrupt Register (SPIINT0)

**Figure 12-28. SPI Interrupt Register (SPIINT0) [offset = 08h]**

31						25	24

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 12-10. SPI Interrupt Register (SPIINT0) Field Descriptions**

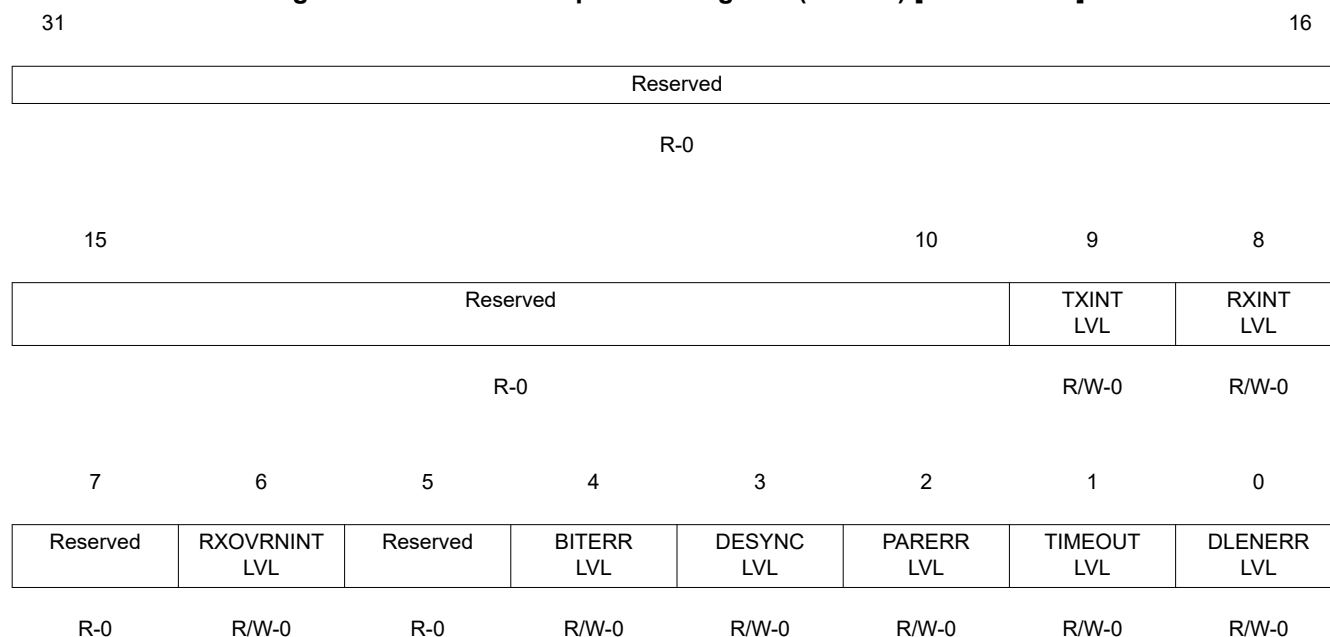

Bit	Field	Value	Description
31-25	Reserved	0	Reads return 0. Writes have no effect.
24	ENABLEHIGHZ	0 1	<p>SPIEN<math>\overline{A}</math> pin high-impedance enable. When active, the SPIEN<math>\overline{A}</math> pin (when it is configured as a WAIT functional output signal in a slave SPI) is forced to high-impedance when not driving a low signal. If inactive, then the pin will output both a high and a low signal.</p> <p>0 SPIEN<math>\overline{A}</math> pin is pulled high when not active.</p> <p>1 SPIEN<math>\overline{A}</math> pin remains high-impedance when not active.</p>
23-17	Reserved	0	Reads return 0. Writes have no effect.
16	DMAREQEN	0 1	<p>DMA request enable. Enables the DMA request signal to be generated for both receive and transmit channels. Enable DMA REQ only after setting the SPIEN bit to 1.</p> <p>0 DMA is not used.</p> <p>1 DMA requests will be generated.</p> <p><b>Note: A DMA request will be generated on the TX DMA REQ line each time a word is copied to the shift register either from TXBUF or directly from SPIDAT0/SPIDAT1 writes.</b></p> <p><b>Note: A DMA request will be generated on the RX DMA REQ line each time a word is copied to the SPIBUF register either from RXBUF or directly from the shift register.</b></p>
15-10	Reserved	0	Reads return 0. Writes have no effect.
9	TXINTENA	0 1	<p>Causes an interrupt to be generated every time data is written to the shift register, so that the next word can be written to TXBUF. Setting this bit will generate an interrupt if the TXINTFLG bit (SPI Flag Register (SPIFLG)[9]) is set to 1.</p> <p>0 No interrupt will be generated upon TXINTFLG being set to 1.</p> <p>1 An interrupt will be generated upon TXINTFLG being set to 1.</p> <p>The transmitter empty interrupt is valid in compatibility mode of SPI only. In multi-buffered mode, this interrupts will not be generated, even if it is enabled.</p> <p><b>Note: An interrupt request will be generated as soon as this bit is set to 1. By default it will be generated on the INT0 line. The SPILVL register can be programmed to change the interrupt line.</b></p>
8	RXINTENA	0 1	<p>Causes an interrupt to be generated when the RXINTFLAG bit (SPI Flag Register (SPIFLG)[8]) is set by hardware.</p> <p>0 Interrupt will not be generated.</p> <p>1 Interrupt will be generated.</p> <p>The receiver full interrupt is valid in compatibility mode of SPI only. In multi-buffered mode, this interrupts will not be generated, even if it is enabled.</p>
7	Reserved	0	Reads return 0. Writes have no effect.
6	RXOVRNINTENA	0 1	<p>Overrun interrupt enable.</p> <p>0 Overrun interrupt will not be generated.</p> <p>1 Overrun interrupt will be generated.</p>
5	Reserved	0	Reads return 0. Writes have no effect.
4	BITERRENA	0 1	<p>Enables interrupt on bit error.</p> <p>0 No interrupt asserted upon bit error.</p> <p>1 Enables interrupt on bit error.</p>
3	DESYNCENA	0 1	<p>Enables interrupt on desynchronized slave. DESYNCENA is used in master mode only.</p> <p>0 No interrupt asserted upon desynchronization error.</p> <p>1 An interrupt is asserted on desynchronization of the slave (DESYNC = 1).</p>
2	PARERRENA	0 1	<p>Enables interrupt-on-parity-error.</p> <p>0 No interrupt asserted on parity error.</p> <p>1 An interrupt is asserted on a parity error.</p>

**Table 12-10. SPI Interrupt Register (SPIINT0) Field Descriptions (continued)**

Bit	Field	Value	Description
1	TIMEOUTENA	0 1	Enables interrupt on ENA signal time-out. No interrupt asserted upon ENA signal time-out. An interrupt is asserted on a time-out of the ENA signal.
0	DLENERRENA	0 1	Data length error interrupt enable. A data length error occurs under the following conditions. <b>Master:</b> When $\overline{\text{SPIENA}}$ is used, if the $\overline{\text{SPIENA}}$ pin from the slave is deasserted before the master has completed its transfer, the data length error is set. That is, if the character length counter has not overflowed while $\overline{\text{SPIENA}}$ deassertion is detected, then it means that the slave has neither received full data from the master nor has it transmitted complete data. <b>Slave:</b> When $\overline{\text{SPICS}}$ pins are used, if the incoming valid $\overline{\text{SPICS}}$ pin is deactivated before the character length counter overflows, then the data length error is set. No interrupt is generated upon data length error. An interrupt is asserted when a data-length error occurs.

## 12.8.4 SPI Interrupt Level Register (SPILVL)

**Figure 12-29. SPI Interrupt Level Register (SPILVL) [offset = 0Ch]**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 12-11. SPI Interrupt Level Register (SPILVL) Field Descriptions**

Bit	Field	Value	Description
31-10	Reserved	0	Reads return 0. Writes have no effect.
9	TXINTLVL	0 1	Transmit interrupt level. Transmit interrupt is mapped to interrupt line INT0. Transmit interrupt is mapped to interrupt line INT1.
8	RXINTLVL	0 1	Receive interrupt level. Receive interrupt is mapped to interrupt line INT0. Receive interrupt is mapped to interrupt line INT1.
7	Reserved	0	Reads return 0. Writes have no effect.
6	RXOVRNINTLVL	0 1	Receive overrun interrupt level. Receive overrun interrupt is mapped to interrupt line INT0. Receive overrun interrupt is mapped to interrupt line INT1.
5	Reserved	0	Reads return 0. Writes have no effect.
4	BITERRLVL	0 1	Bit error interrupt level. Bit error interrupt is mapped to interrupt line INT0. Bit error interrupt is mapped to interrupt line INT1.
3	DESYNCLVL	0 1	Desynchronized slave interrupt level. (master mode only). An interrupt caused by desynchronization of the slave is mapped to interrupt line INT0. An interrupt caused by desynchronization of the slave is mapped to interrupt line INT1.
2	PARERRLVL	0 1	Parity error interrupt level. A parity error interrupt is mapped to interrupt line INT0. A parity error interrupt is mapped to interrupt line INT1.

**Table 12-11. SPI Interrupt Level Register (SPILVL) Field Descriptions (continued)**

Bit	Field	Value	Description
1	TIMEOUTLVL	0	SPIEN $\bar{A}$ pin time-out interrupt level.
		1	An interrupt on a time-out of the ENA signal (TIMEOUT = 1) is mapped to interrupt line INT0.
0	DLENERRLVL	0	An interrupt on a time-out of the ENA signal (TIMEOUT = 1) is mapped to interrupt line INT1.
		1	Data length error interrupt level (line) select.
		0	An interrupt on data length error is mapped to interrupt line INT0.
		1	An interrupt on data length error is mapped to interrupt line INT1.

## 12.8.5 SPI Flag Register (SPIFLG)

Software must check all flag bits when reading this register.

**Figure 12-30. SPI Flag Register (SPIFLG) [offset = 10h]**

31		25	24	23			16
Reserved			BUFINIT ACTIVE	Reserved			
R-0			R-0	R-0			
15				10	9	8	
Reserved					TXINT FLG	RXINT FLG	
R-0					R-0	R/W1C-0	
7	6	5	4	3	2	1	0
Reserved	RXOVRNINT FLG	Reserved	BITERR FLG	DESYNC FLG	PARERR FLG	TIMEOUT FLG	DLENERR FLG
R-0	R/W1C-0	R-0	R/W1C-0	R/W1C-0	R/W1C-0	R/W1C-0	R/W1C-0

LEGEND: R/W = Read/Write; R = Read only; W1C = Write 1 to clear; -n = value after reset

**Table 12-12. SPI Flag Register (SPIFLG) Field Descriptions**

Bit	Field	Value	Description
31-25	Reserved	0	Reads return 0. Writes have no effect.
24	BUFINITACTIVE	<p>0 Multi-buffer RAM initialization is complete.</p> <p>1 Multi-buffer RAM is still being initialized. Do not attempt to write to either multi-buffer RAM or any multi-buffer mode registers.</p>	<p>Indicates the status of multi-buffer initialization process. Software can poll for this bit to determine if it can proceed with the register configuration of multi-buffer mode registers or buffer handling.</p> <p><b>Note: If the SPIFLG register is read while the multi-buffer RAM is being initialized, the BUFINITACTIVE bit will be read as 1. If SPIFLG is read after the internal automatic buffer initialization is complete, this bit will be read as 0. This bit will show a value of 1 as long as the nRESET bit is 0, but does not really indicate that buffer initialization is underway. Buffer initialization starts only when the nRESET bit is set to 1.</b></p>
23-10	Reserved	0	Reads return 0. Writes have no effect.
9	TXINTFLG	<p>0 Transmit buffer is now full. No interrupt pending for transmitter empty.</p> <p>1 Transmit buffer is empty. An interrupt is pending to fill the transmitter.</p>	<p>Transmitter-empty interrupt flag. Serves as an interrupt flag indicating that the transmit buffer (TXBUF) is empty and a new word can be written to it. This flag is set when a word is copied to the shift register either directly from SPIDAT0/SPIDAT1 or from the TXBUF register. This bit is cleared by one of following methods:</p> <ul style="list-style-type: none"> <li>Writing a new data to either SPIDAT0 or SPIDAT1</li> <li>Writing a 0 to SPIEN (SPIGCR1[24])</li> </ul>

**Table 12-12. SPI Flag Register (SPIFLG) Field Descriptions (continued)**

Bit	Field	Value	Description
8	RXINTFLG	<div>0</div> <div>1</div>	<p>Receiver-full interrupt flag. This flag is set when a word is received and copied into the buffer register (SPIBUF). If RXINTEN is enabled, an interrupt is also generated. This bit is cleared under the following methods:</p> <ul style="list-style-type: none"><li>• Reading the SPIBUF register</li><li>• Reading TGINTVECT0 or TGINTVECT1 register when there is a receive buffer full interrupt</li><li>• Writing a 1 to this bit</li><li>• Writing a 0 to SPIEN (SPIGCR1[24])</li><li>• System reset</li></ul> <p>During emulation mode, however, a read to the emulation register (SPIEMU) does not clear this flag bit.</p> <p>No new received data pending. Receive buffer is empty.</p> <p>A newly received data is ready to be read. Receive buffer is full.</p> <p><b>Note: Clearing RXINTFLG bit by writing a 1 before reading the SPIBUF sets the RXEMPTY bit of the SPIBUF register too. In this way, one can ignore a received word. However, if the internal RXBUF is already full, the data from RXBUF will be copied to SPIBUF and the RXEMPTY bit will be cleared again. The SPIBUF contents should be read first if this situation needs to be avoided.</b></p>
7	Reserved	0	Reads return 0. Writes have no effect.
6	RXOVRNINTFLG	<div>0</div> <div>1</div>	<p>Receiver overrun flag. The SPI hardware sets this bit when a receive operation completes before the previous character has been read from the receive buffer. The bit indicates that the last received character has been overwritten and therefore lost. The SPI will generate an interrupt request if this bit is set and the RXOVRN INTEN bit (SPIINT0.6) is set high. This bit is cleared under the following conditions in compatibility mode of MibSPI:</p> <ul style="list-style-type: none"><li>• Reading TGINTVECT0 or TGINTVECT1 register when there is a receive-buffer-overrun interrupt</li><li>• Writing a 1 to RXOVRNINTFLG in the SPI Flag Register (SPIFLG) itself</li><li>• Writing a 0 to SPIEN</li><li>• Reading the data field of the SPIBUF register</li></ul> <p><b>Note: Reading the SPIBUF register does not clear this RXOVRNINTFLG bit. If an RXOVRN interrupt is detected, then the SPIBUF may need to be read twice to get to the overrun buffer. This is due to the fact that the overrun will always occur to the internal RXBUF. Each read to the SPIBUF will result in RXBUF contents (if it is full) getting copied to SPIBUF.</b></p> <p><b>Note: There is a special condition under which the RXOVRNINTFLG flag gets set. If both SPIBUF and RXBUF are already full and while another reception is underway, if any errors (TIMEOUT, BITERR, and DLEN_ERR) occur, then RXOVR in RXBUF and RXOVRNINTFLG in SPIFLG registers will be set to indicate that the status flags are getting overwritten by the new transfer. This overrun should be treated like a receive overrun.</b></p> <p>In multi-buffer mode of MibSPI, this bit is cleared under the following conditions:</p> <ul style="list-style-type: none"><li>• Reading the RXOVRN_BUF_ADDR register</li><li>• Writing a 1 to RXOVRNINTFLG in the SPI Flag Register (SPIFLG) itself</li></ul> <p>In multi-buffer mode, if RXOVRNINTFLG is set, then the address of the buffer which experienced the overrun is available in RXOVRN_BUF_ADDR.</p> <p>Overrun condition did not occur.</p> <p>Overrun condition has occurred.</p>
5	Reserved	0	Reads return 0. Writes have no effect.

**Table 12-12. SPI Flag Register (SPIFLG) Field Descriptions (continued)**

Bit	Field	Value	Description
4	BITERRFLG	<div>0</div> <div>1</div>	<p>Mismatch of internal transmit data and transmitted data. This flag can be cleared by one of the following methods:</p> <ul style="list-style-type: none"> <li>Write a 1 to this bit</li> <li>Clear the SPIEN bit to 0</li> </ul> <p>No bit error occurred.</p> <p>A bit error occurred. The SPI samples the signal of the transmit pin (master: SIMO, slave: SOMI) at the receive point (half clock cycle after transmit point). If the sampled value differs from the transmitted value a bit error is detected and the flag BITERRFLG is set. If BITERRFLG is set an interrupt is asserted. Possible reasons for a bit error can be an excessively high bit rate, capacitive load, or another master/slave trying to transmit at the same time.</p>
3	DESYNCFLG	<div>0</div> <div>1</div>	<p>Desynchronization of slave device. Desynchronization monitor is active in master mode only. This flag can be cleared by one of the following methods:</p> <ul style="list-style-type: none"> <li>Write a 1 to this bit</li> <li>Clear the SPIEN bit to 0</li> </ul> <p>No slave desynchronization is detected.</p> <p>A slave device is desynchronized. The master monitors the ENAble signal coming from the slave device and sets the DESYNC flag after the last bit is transmitted plus <math>t_{T2EDELAY}</math>. If DESYNCEA is set an interrupt is asserted. Desynchronization can occur if a slave device misses a clock edge coming from the master.</p>
2	PARERRFLG	<div>0</div> <div>1</div>	<p>Calculated parity differs from received parity bit. If the parity generator is enabled (can be selected individually for each buffer) an even or odd parity bit is added at the end of a data word. During reception of the data word the parity generator calculates the reference parity and compares it to the received parity bit. In the event of a mismatch the PARITYERR flag is set and an interrupt is asserted if PARERRFLG is set. This flag can be cleared by one of the following methods:</p> <ul style="list-style-type: none"> <li>Write a 1 to this bit</li> <li>Clear the SPIEN bit to 0</li> </ul> <p>No parity error is detected.</p> <p>A parity error occurred.</p>
1	TIMEOUTFLG	<div>0</div> <div>1</div>	<p>Time-out caused by nonactivation of ENA signal. This flag can be cleared by one of the following methods:</p> <ul style="list-style-type: none"> <li>Write a 1 to this bit</li> <li>Clear the SPIEN bit to 0</li> </ul> <p>No ENA-signal time-out occurred.</p> <p>An ENA signal time-out occurred. The SPI generates a time-out because the slave hasn't responded in time by activating the ENA signal after the chip select signal has been activated. If a time-out condition is detected the corresponding chip select is deactivated immediately and the TIMEOUT flag is set. In addition the TIMEOUT flag in the status field of the corresponding buffer is set. The transmit request of the concerned buffer is cleared, that is, the SPI does not re-start a data transfer from this buffer.</p>
0	DLENERRFLG	<div>0</div> <div>1</div>	<p>Data-length error flag. This flag can be cleared by one of the following methods:</p> <ul style="list-style-type: none"> <li>Write a 1 to this bit</li> <li>Clear the SPIEN bit to 0</li> </ul> <p><b>Note: Whenever any transmission errors (TIMEOUT, BITERR, DLEN_ERR, PARITY_ERR, DESYNC) are detected and the error flags are cleared by writing to the error bit in the SPIFLG register, the corresponding error flag in SPIBUF does not get cleared. Software needs to read the SPIBUF until it becomes empty before proceeding. This ensures that all of the old status bits in SPIBUF are cleared before starting the next transfer.</b></p> <p>No data length error has occurred.</p> <p>A data length error has occurred.</p>

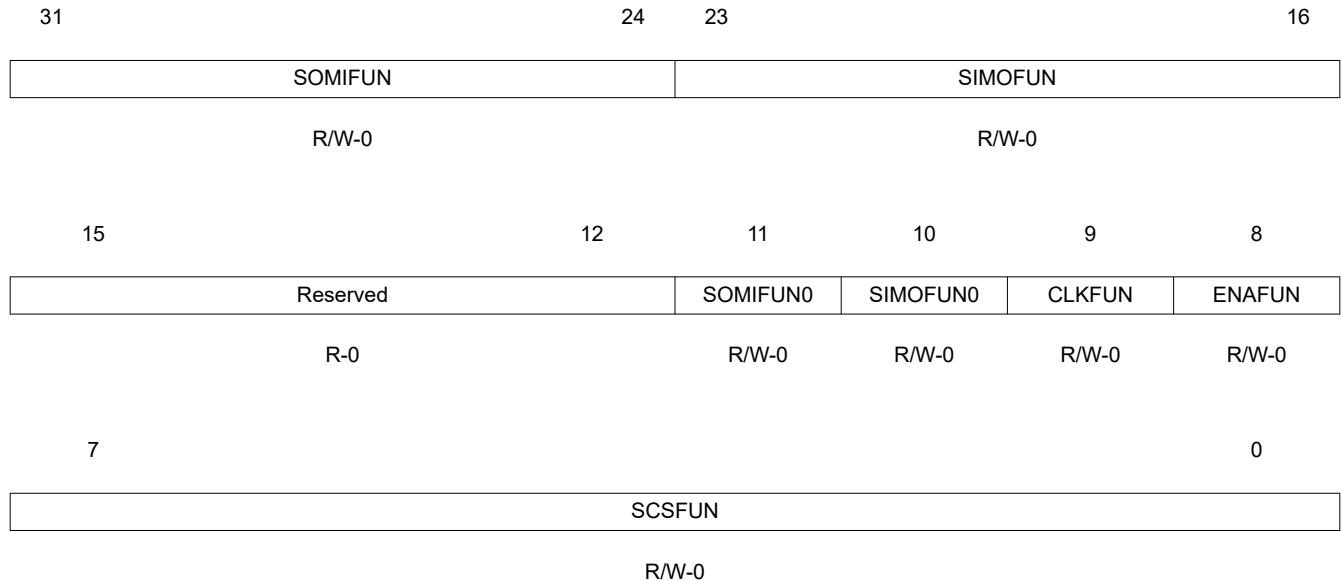

## 12.8.6 SPI Pin Control Register 0 (SPIPC0)

### Note

#### Register bits vary by device

Register bits 31:24 and 23:16 of SPIPC0 to SPIPC9 reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

**Figure 12-31. SPI Pin Control Register 0 (SPIPC0) [offset = 14h]**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 12-13. SPI Pin Control (SPIPC0) Field Descriptions**

Bit	Field	Value	Description
31-24	SOMIFUN	<div> <div></div> <div>0</div> <div>1</div> </div>	<p>Slave out, master in function. Determines whether each SPISOMI[x] pin is to be used as a general-purpose I/O pin or as a SPI functional pin.</p> <p><b>Note: Duplicate Control Bits for SPISOMI[0]. Bit 24 is not physically implemented. It is a mirror of Bit 11. Any write to bit 24 will be reflected on bit 11. When bit 24 and bit 11 are simultaneously written, the value of bit 11 will control the SPISOMI[0] pin. The read value of bit 24 always reflects the value of bit 11.</b></p> <p>The SPISOMI[x] pin is a GIO pin.</p> <p>The SPISOMI[x] pin is a SPI functional pin.</p>
23-16	SIMOFUN	<div> <div></div> <div>0</div> <div>1</div> </div>	<p>Slave in, master out function. Determines whether each SPISIMO[x] pin is to be used as a general-purpose I/O pin or as a SPI functional pin.</p> <p><b>Note: Duplicate Control Bits for SPISIMO[0]. Bit 16 is not physically implemented. It is a mirror of Bit 10. Any write to bit 16 will be reflected on bit 10. When bit 16 and bit 10 are simultaneously written, the value of bit 10 will control the SPISIMO[0] pin. The read value of bit 16 always reflects the value of bit 10.</b></p> <p>The SPISIMO[x] pin is a GIO pin.</p> <p>The SPISIMO[x] pin is a SPI functional pin.</p>
15-12	Reserved	0	Reads return 0. Writes have no effect.

**Table 12-13. SPI Pin Control (SPIPC0) Field Descriptions (continued)**

Bit	Field	Value	Description
11	SOMIFUN0	0 1	Slave out, master in function. This bit determines whether the SPISOMI[0] pin is to be used as a general-purpose I/O pin or as a SPI functional pin. The SPISOMI[0] pin is a GIO pin. The SPISOMI[0] pin is a SPI functional pin. <b>Note: Regardless of the number of parallel pins used, the SPISOMI[0] pin will always have to be programmed as functional pins for any SPI transfers.</b>
10	SIMOFUN0	0 1	Slave in, master out function. This bits determine whether each SPISIMO[0] pin is to be used as a general-purpose I/O pin or as a SPI functional pin. The SPISIMO[0] pin is a GIO pin. The SPISIMO[0] pin is a SPI functional pin. <b>Note: Regardless of the number of parallel pins used, the SPISIMO[0] pin will always have to be programmed as functional pins for any SPI transfers.</b>
9	CLKFUN	0 1	SPI clock function. This bit determines whether the SPICLK pin is to be used as a general-purpose I/O pin, or as a SPI functional pin. The SPICLK pin is a GIO pin. The SPICLK pin is a SPI functional pin.
8	ENAFUN	0 1	SPIEN $\overline{A}$ function. This bit determines whether the SPIEN $\overline{A}$ pin is to be used as a general-purpose I/O pin or as a SPI functional pin. The SPIEN $\overline{A}$ pin is a GIO pin. The SPIEN $\overline{A}$ pin is a SPI functional pin.
7-0	SCSFUN	0 1	SPICS function. Determines whether each SPICS pin is to be used as a general-purpose I/O pin or as a SPI functional pin. If the slave SPICS pins are in functional mode and receive an inactive high signal, the slave SPI will place its output in a high-impedance state and disable shifting. The SPICS pin is a GIO pin. The SPICS pin is a SPI functional pin.

### 12.8.7 SPI Pin Control Register 1 (SPIPC1)

#### Note

#### Register bits vary by device

Register bits 31:24 and 23:16 of this register reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

31-24	SOMIDIR	<p>0 The SPISOMI[x] pin is an input.</p> <p>1 The SPISOMI[x] pin is an output.</p>	<p>SPISOMI[x] direction. Controls the direction of each SPISOMI[x] pin when used for general-purpose I/O. If SPISOMI[x] pin is used as a SPI functional pin, the I/O direction is determined by the MASTER bit in the SPIGCR1 register.</p> <p><b>Note: Duplicate Control Bits for SPISOMI[0]. Bit 24 is not physically implemented. It is a mirror of Bit 11. Any write to bit 24 will be reflected on bit 11. When bit 24 and bit 11 are simultaneously written, the value of bit 11 will control the SPISOMI[0] pin. The read value of bit 24 always reflects the value of bit 11.</b></p>
23-16	SIMODIR	<p>0 The SPISIMO[x] pin is an input.</p> <p>1 The SPISIMO[x] pin is an output.</p>	<p>SPISIMO[x] direction. Controls the direction of each SPISIMO[x] pin when used for general-purpose I/O. If SPISIMO[x] pin is used as a SPI functional pin, the I/O direction is determined by the MASTER bit in the SPIGCR1 register.</p> <p><b>Note: Duplicate Control Bits for SPISIMO[0]. Bit 16 is not physically implemented. It is a mirror of Bit 10. Any write to bit 16 will be reflected on bit 10. When bit 16 and bit 10 are simultaneously written, the value of bit 10 will control the SPISIMO[0] pin. The read value of bit 16 always reflects the value of bit 10.</b></p>
15-12	Reserved	0	Reads return 0. Writes have no effect.
11	SOMIDIR0	<p>0 The SPISOMI[0] pin is an input.</p> <p>1 The SPISOMI[0] pin is an output.</p>	<p>SPISOMI[0] direction. This bit controls the direction of the SPISOMI[0] pin when it is used as a general-purpose I/O pin. If the SPISOMI[0] pin is used as a SPI functional pin, the I/O direction is determined by the MASTER bit in the SPIGCR1 register.</p>
10	SIMODIR0	<p>0 The SPISIMO[0] pin is an input.</p> <p>1 The SPISIMO[0] pin is an output.</p>	<p>SPISIMO[0] direction. This bit controls the direction of the SPISIMO[0] pin when it is used as a general-purpose I/O pin. If the SPISIMO[0] pin is used as a SPI functional pin, the I/O direction is determined by the MASTER bit in the SPIGCR1 register.</p>
9	CLKDIR	<p>0 The SPICLK pin is an input.</p> <p>1 The SPICLK pin is an output.</p>	<p>SPICLK direction. This bit controls the direction of the SPICLK pin when it is used as a general-purpose I/O pin. In functional mode, the I/O direction is determined by the CLKMOD bit.</p>
8	ENADIR	<p>0 The <math>\overline{\text{SPIEN}}\text{A}</math> pin is an input.</p> <p>1 The <math>\overline{\text{SPIEN}}\text{A}</math> pin is an output.</p>	<p><math>\overline{\text{SPIEN}}\text{A}</math> direction. This bit controls the direction of the <math>\overline{\text{SPIEN}}\text{A}</math> pin when it is used as a general-purpose I/O. If the <math>\overline{\text{SPIEN}}\text{A}</math> pin is used as a functional pin, then the I/O direction is determined by the CLKMOD bit (SPIGCR1[1]).</p>
7-0	SCSDIR	<p>0 The <math>\overline{\text{SPICS}}</math> pin is an input.</p> <p>1 The <math>\overline{\text{SPICS}}</math> pin is an output.</p>	<p><math>\overline{\text{SPICS}}</math> direction. These bits control the direction of each <math>\overline{\text{SPICS}}</math> pin when it is used as a general-purpose I/O pin. Each pin could be configured independently from the others if the <math>\overline{\text{SPICS}}</math> is used as a SPI functional pin. The I/O direction is determined by the CLKMOD bit (SPIGCR1[1]).</p>

## 12.8.8 SPI Pin Control Register 2 (SPIPC2)

### Note

#### Register bits vary by device

Register bits 31:24 and 23:16 of this register reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

**Figure 12-33. SPI Pin Control Register 2 (SPIPC2) [offset = 1Ch]**

LEGEND: R/W = Read/Write; R = Read only; U = Undefined; -n = value after reset

**Table 12-15. SPI Pin Control Register 2 (SPIPC2) Field Descriptions**

Bit	Field	Value	Description
31-24	SOMIDIN	0 1	SPISOMI[x] data in. The value of each SPISOMI[x] pin. The SPISOMI[x] pin is logic 0. The SPISOMI[x] pin is logic 1.
23-16	SIMODIN	0 1	SPISIMO[x] data in. The value of each SPISIMO[x] pin. The SPISIMO[x] pin is logic 0. The SPISIMO[x] pin is logic 1.
15-12	Reserved	0	Reads return 0. Writes have no effect.
11	SOMIDIN0	0 1	SPISOMI[0] data in. The value of the SPISOMI[0] pin. The SPISOMI[0] pin is logic 0. The SPISOMI[0] pin is logic 1.
10	SIMODIN0	0 1	SPISIMO[0] data in. The value of the SPISIMO[0] pin. The SPISIMO[0] pin is logic 0. The SPISIMO[0] pin is logic 1.
9	CLKDIN	0 1	Clock data in. The value of the SPICLK pin. The SPICLK pin is logic 0. The SPICLK pin is logic 1.

**Table 12-15. SPI Pin Control Register 2 (SPIPC2) Field Descriptions (continued)**

Bit	Field	Value	Description

		0	The SPIEN $\overline{A}$ pin is logic 0.
		1	The SPIEN $\overline{A}$ pin is logic 1.
7-0	SCSDIN		SPICS data in. The value of each SPICS pin.
		0	The SPICS pin is logic 0.
		1	The SPICS pin is logic 1.

### 12.8.9 SPI Pin Control Register 3 (SPIPC3)

#### Note

#### Register bits vary by device

Register bits 31:24 and 23:16 of this register reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

**Figure 12-34. SPI Pin Control Register 3 (SPIPC3) [offset = 20h]**

LEGEND: R/W = Read/Write; R = Read only; U = Undefined; -n = value after reset

**Table 12-16. SPI Pin Control Register 3 (SPIPC3) Field Descriptions**

Bit	Field	Value	Description
31-24	SOMIDOUT	0 Current value on SPISOMI[x] pin is logic 0. 1 Current value on SPISOMI[x] pin is logic 1	SPISOMI[x] data out write. This bit is only active when the SPISOMI[x] pin is configured as a general-purpose I/O pin and configured as an output pin. The value of this bit indicates the value sent to the pin.  <b>Bit 11 or bit 24 can be used to set the direction for pin SPISOMI[0]. If a 32-bit write is performed, bit 11 will have priority over bit 24.</b>
23-16	SIMODOUT	0 Current value on SPISIMO[x] pin is logic 0. 1 Current value on SPISIMO[x] pin is logic 1.	SPISIMO[x] data out write. This bit is only active when the SPISIMO[x] pin is configured as a general-purpose I/O pin and configured as an output pin. The value of this bit indicates the value sent to the pin.  <b>Bit 10 or bit 16 can be used to set the direction for pin SPISIMO[0]. If a 32-bit write is performed, bit 10 will have priority over bit 16.</b>
15-12	Reserved	0	Reads return 0. Writes have no effect.
11	SOMIDOUT0	0 Current value on SPISOMI[0] pin is logic 0. 1 Current value on SPISOMI[0] pin is logic 1.	SPISOMI[0] data out write. This bit is only active when the SPISOMI[0] pin is configured as a general-purpose I/O pin and configured as an output pin. The value of this bit indicates the value sent to the pin.

**Table 12-16. SPI Pin Control Register 3 (SPIPC3) Field Descriptions (continued)**

Bit	Field	Value	Description
10	SIMODOUT0	0 1	SPISIMO[0] data out write. This bit is only active when the SPISIMO[0] pin is configured as a general-purpose I/O pin and configured as an output pin. The value of this bit indicates the value sent to the pin. Current value on SPISIMO[0] pin is logic 0. Current value on SPISIMO[0] pin is logic 1.
9	CLKDOUT	0 1	SPICLK data out write. This bit is only active when the SPICLK pin is configured as a general-purpose I/O pin and configured as an output pin. The value of this bit indicates the value sent to the pin. The SPICLK pin is logic 0. The SPICLK pin is logic 1.
8	ENADOUT	0 1	SPIEN $\overline{A}$ data out write. Only active when the SPIEN $\overline{A}$ pin is configured as a general-purpose I/O pin and configured as an output pin. The value of this bit indicates the value sent to the pin. The SPIEN $\overline{A}$ pin is logic 0. The SPIEN $\overline{A}$ pin is logic 1.
7-0	SCSDOUT	0 1	SPIC $\overline{S}$ data out write. Only active when the SPIC $\overline{S}$ pins are configured as a general-purpose I/O pins and configured as output pins. The value of these bits indicates the value sent to the pins. The SPIC $\overline{S}$ pin is logic 0. The SPIC $\overline{S}$ pin is logic 1.

#### 12.8.10 SPI Pin Control Register 4 (SPIPC4)

##### Note

##### Register bits vary by device

Register bits 31:24 and 23:16 of this register reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

**Figure 12-35. SPI Pin Control Register 4 (SPIPC4) [offset = 24h]**

LEGEND: R/W = Read/Write; R = Read only; U = Undefined; -n = value after reset

**Table 12-17. SPI Pin Control Register 4 (SPIPC4) Field Descriptions**

Bit	Field	Value	Description
31-24	SOMISET	0	SPISOMI[x] data out set. This pin is only active when the SPISOMI[x] pin is configured as a general-purpose output pin. <b>Bit 11 or bit 24 can be used to set the SPISOMI[0] pin. If a 32-bit write is performed, bit 11 will have priority over bit 24.</b> Read: SPISOMI[x] is logic 0. Write: Writing a 0 to this bit has no effect.
		1	Read: SPISOMI[x] is logic 1. Write: Logic 1 is placed on SPISOMI[x] pin, if it is in general-purpose output mode.
23-16	SIMOSET	0	SPISIMO[x] data out set. This bit is only active when the SPISIMO[x] pin is configured as a general-purpose output pin. <b>Bit 10 or bit 16 can be used to set the SPISIMO[0] pin. If a 32-bit write is performed, bit 10 will have priority over bit 16.</b> Read: SPISIMO[x] is logic 0. Write: Writing a 0 to this bit has no effect.
		1	Read: SPISIMO[x] is logic 1. Write: Logic 1 is placed on SPISIMO[x] pin, if it is in general-purpose output mode.
15-12	Reserved	0	Reads return 0. Writes have no effect.
11	SOMISET0	0	SPISOMI[0] data out set. This pin is only active when the SPISOMI[0] pin is configured as a general-purpose output pin. Read: SPISOMI[0] is logic 0. Write: Writing a 0 to this bit has no effect.
		1	Read: SPISOMI[0] is logic 1. Write: Logic 1 is placed on SPISOMI[0] pin, if it is in general-purpose output mode.
10	SIMOSET0	0	SPISIMO[0] data out set. This pin is only active when the SPISIMO[0] pin is configured as a general-purpose output pin. Read: SPISIMO[0] is logic 0. Write: Writing a 0 to this bit has no effect.
		1	Read: SPISIMO[0] is logic 1. Write: Logic 1 is placed on SPISIMO[0] pin, if it is in general-purpose output mode.
9	CLKSET	0	SPICLK data out set. This bit is only active when the SPICLK pin is configured as a general-purpose output pin. Read: SPICLK is logic 0. Write: Writing a 0 to this bit has no effect.
		1	Read: SPICLK is logic 1. Write: Logic 1 is placed on SPICLK pin, if it is in general-purpose output mode.
8	ENASET	0	$\overline{\text{SPIEN}}\text{A}$ data out set. This bit is only active when the $\overline{\text{SPIEN}}\text{A}$ pin is configured as a general-purpose output pin. Read: $\overline{\text{SPIEN}}\text{A}$ is logic 0. Write: Writing a 0 to this bit has no effect.
		1	Read: $\overline{\text{SPIEN}}\text{A}$ is logic 1. Write: Logic 1 is placed on $\overline{\text{SPIEN}}\text{A}$ pin, if it is in general-purpose output mode.

**Table 12-17. SPI Pin Control Register 4 (SPIPC4) Field Descriptions (continued)**

Bit	Field	Value	Description
7-0	SCSSET	0	<p><math>\overline{\text{SPICS}}</math> data out set. This bit is only active when the <math>\overline{\text{SPICS}}</math> pin is configured as a general-purpose output pin. A value of 1 written to this bit sets the corresponding SCSDOUT bit to 1.</p> <p>Read: <math>\overline{\text{SPICS}}</math> is logic 0.</p> <p>Write: Writing a 0 to this bit has no effect.</p>
		1	<p>Read: <math>\overline{\text{SPICS}}</math> is logic 1.</p> <p>Write: Logic 1 is placed on <math>\overline{\text{SPICS}}</math> pin, if it is in general-purpose output mode.</p>

## 12.8.11 SPI Pin Control Register 5 (SPIPC5)

### Note

#### Register bits vary by device

Register bits 31:24 and 23:16 of this register reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

**Figure 12-36. SPI Pin Control Register 5 (SPIPC5) [offset = 28h]**

LEGEND: R/W = Read/Write; R = Read only; U = Undefined; -n = value after reset

**Table 12-18. SPI Pin Control Register 5 (SPIPC5) Field Descriptions**

Bit	Field	Value	Description
31-24	SOMICLR		SPISOMI[x] data out clear. This pin is only active when the SPISOMI[x] pin is configured as a general-purpose output pin. <b>Bit 11 or bit 24 can be used to set the SPISOMI[0] pin. If a 32-bit write is performed, bit 11 will have priority over bit 24.</b>
		0	Read: The current value on SPISOMI[x] is 0. Write: Writing a 0 to this bit has no effect.
		1	Read: The current value on SPISOMI[x] is 1. Write: Logic 0 is placed on SPISOMI[x] pin, if it is in general-purpose output mode.
23-16	SIMOCLR		SPISIMO[x] data out clear. This bit is only active when the SPISIMO[x] pin is configured as a general-purpose output pin. <b>Bit 10 or bit 16 can be used to set the SPISIMO[0] pin. If a 32-bit write is performed, bit 10 will have priority over bit 16.</b>
		0	Read: The current value on SPISIMO[x] is 0. Write: Writing a 0 to this bit has no effect.
		1	Read: The current value on SPISIMO[x] is 1. Write: Logic 0 is placed on SPISIMO[x] pin, if it is in general-purpose output mode.
15-12	Reserved	0	Reads return 0. Writes have no effect.

**Table 12-18. SPI Pin Control Register 5 (SPIPC5) Field Descriptions (continued)**

Bit	Field	Value	Description
11	SOMICLR0	0	SPISOMI[0] data out clear. This pin is only active when the SPISOMI[0] pin is configured as a general-purpose output pin. Read: The current value on SPISOMI[0] is 0. Write: Writing a 0 to this bit has no effect.
		1	Read: The current value on SPISOMI[0] is 1. Write: Logic 0 is placed on SPISOMI[0] pin, if it is in general-purpose output mode.
10	SIMOCLR0	0	SPISIMO[0] data out clear. This pin is only active when the SPISIMO[0] pin is configured as a general-purpose output pin. Read: The current value on SPISIMO[0] is 0. Write: Writing a 0 to this bit has no effect.
		1	Read: The current value on SPISIMO[0] is 1. Write: Logic 0 is placed on SPISIMO[0] pin, if it is in general-purpose output mode.
9	CLKCLR	0	SPICLK data out clear. This bit is only active when the SPICLK pin is configured as a general-purpose output pin. Read: The current value on SPICLK is 0. Write: Writing a 0 to this bit has no effect.
		1	Read: The current value on SPICLK is 1. Write: Logic 0 is placed on SPICLK pin, if it is in general-purpose output mode.
8	ENACLR	0	SPIEN $\overline{A}$ data out clear. This bit is only active when the SPIEN $\overline{A}$ pin is configured as a general-purpose output pin. A value of 1 written to this bit clears the corresponding ENABLEDOUT bit to 0. Read: The current value on SPIEN $\overline{A}$ is 0. Write: Writing a 0 to this bit has no effect.
		1	Read: The current value on SPIEN $\overline{A}$ is 1. Write: Logic 0 is placed on SPIEN $\overline{A}$ pin, if it is in general-purpose output mode.
7-0	SCSCLR	0	SPICS data out clear. This bit is only active when the SPICS pin is configured as a general-purpose output pin. Read: The current value on SCSDOUT is 0. Write: Writing a 0 to this bit has no effect.
		1	Read: The current value on SCSDOUT is 1. Write: Logic 0 is placed on SPICS pin, if it is in general-purpose output mode.

### 12.8.12 SPI Pin Control Register 6 (SPIPC6)

#### Note

#### Register bits vary by device

Register bits 31:24 and 23:16 of SPIPC0 to SPIPC9 reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

### 12.8.13 SPI Pin Control Register 7 (SPIPC7)

#### Note

#### Register bits vary by device

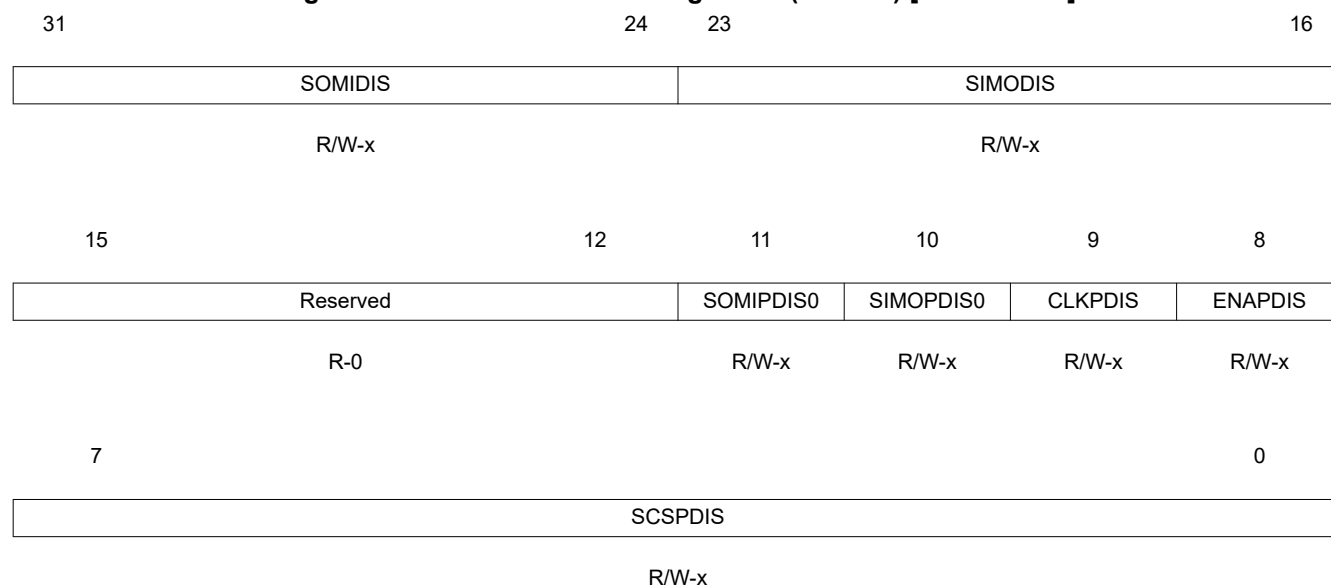

Register bits 31:24 and 23:16 of this register reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

#### Note

#### Default Register Value

The default values of these register bits vary by device. See your device datasheet for information about default pin states, which correspond to the register reset values (see the pin-list table).

**Figure 12-38. SPI Pin Control Register 7 (SPIPC7) [offset = 30h]**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset; -x = value varies by device

**Table 12-20. SPI Pin Control Register 7 (SPIPC7) Field Descriptions (continued)**

Bit	Field	Value	Description
11	SOMIPDIS0	0 1	SPISOMI[0] pull control disable. This bit disables pull control capability for the SPISOMI[0] pin if it is in input mode, regardless of whether it is in functional or GIO mode. Pull control on the SPISOMI[0] pin is enabled. Pull control on the SPISOMI[0] pin is disabled.
10	SIMOPDIS0	0 1	SPISIMO[0] pull control disable. This bit disables pull control capability for the SPISIMO[0] pin if it is in input mode, regardless of whether it is in functional or GIO mode. Pull control on the SPISIMO[0] pin is enabled. Pull control on the SPISIMO[0] pin is disabled.
9	CLKPDIS	0 1	SPICLK pull control disable. This bit disables pull control capability for the SPICLK pin if it is in input mode, regardless of whether it is in functional or GIO mode. Pull control on the SPICLK pin is enabled. Pull control on the SPICLK pin is disabled.
8	ENAPDIS	0 1	SPIEN $\bar{A}$ pull control disable. This bit disables pull control capability for the SPIEN $\bar{A}$ pin if it is in input mode, regardless of whether it is in functional or GIO mode. Pull control on the SPIEN $\bar{A}$ pin is enabled. Pull control on the SPIEN $\bar{A}$ pin is disabled.
7-0	SCSPDIS	0 1	SPICS pull control disable. This bit disables pull control capability for each SPICS pin if it is in input mode, regardless of whether it is in functional or GIO mode. Pull control on the SPICS pin is enabled. Pull control on the SPICS pin is disabled.

#### 12.8.14 SPI Pin Control Register 8 (SPIPC8)

##### Note

##### Register bits vary by device

Register bits 31:24 and 23:16 of this register reflect the number of SIMO/SOMI data lines per device. On devices with 8 data-line support, all of bits 31 to 16 are implemented. On devices with less than 8 data lines, only a subset of these bits are available. Unimplemented bits return 0 upon read and are not writable.

##### Note

##### Default Register Value

The default values of these register bits vary by device. See your device datasheet for information about default pin states, which correspond to the register reset values (see the pin-list table).

**Table 12-22. SPI Transmit Data Register 0 (SPIDAT0) Field Descriptions**

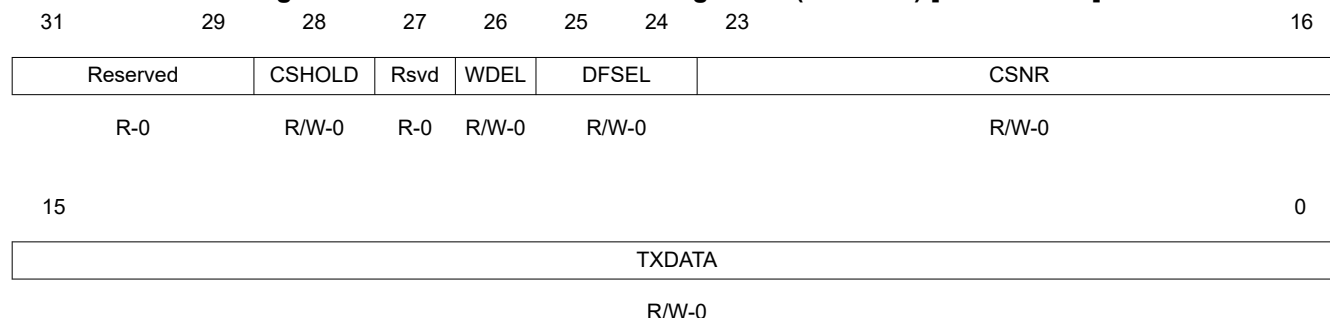

Bit	Field	Value	Description
31-16	Reserved	0	Reads return 0. Writes have no effect.
15-0	TXDATA	0-FFFFh	<p>SPI transmit data. When written, these bits will be copied to the shift register if it is empty. If the shift register is not empty, TXBUF holds the written data. SPIEN (SPICGR1[24]) must be set to 1 before this register can be written to. Writing a 0 to the SPIEN register forces the lower 16 bits of the SPIDAT0 to 0x00.</p> <p><b>Note:</b> When this register is read, the contents TXBUF, which holds the latest written data, will be returned.</p> <p><b>Note:</b> Regardless of character length, the transmit word should be right-justified before writing to the SPIDAT1 register.</p> <p><b>Note:</b> The default data format control register for SPIDAT0 is SPIFMT0. However, it is possible to reprogram the DFSEL[1:0] fields of SPIDAT1 before using SPIDAT0, to select a different SPIFMTx register.</p> <p><b>Note:</b> It is highly recommended to use SPIDAT1 register, SPIDAT0 is supported for compatibility reasons.</p>

### 12.8.16 SPI Transmit Data Register 1 (SPIDAT1)

#### Note

Writing to only the control fields, bits 28 through 16, does not initiate any SPI transfer in master mode. This feature can be used to set up SPICLK phase or polarity before actually starting the transfer by only updating the DFSEL bit field to select the required phase and polarity combination.

**Figure 12-41. SPI Transmit Data Register 1 (SPIDAT1) [offset = 3Ch]**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 12-23. SPI Transmit Data Register 1 (SPIDAT1) Field Descriptions**

Bit	Field	Value	Description
31-29	Reserved	0	Reads return 0. Writes have no effect.
28	CSHOLD	0	Chip select hold mode. The CSHOLD bit is supported in master mode only in compatibility-mode of SPI, (it is ignored in slave mode). CSHOLD defines the behavior of the chip select line at the end of a data transfer.  The chip select signal is deactivated at the end of a transfer after the T2CDELAY time has passed. If two consecutive transfers are dedicated to the same chip select this chip select signal will be deactivated for at least 2VCLK cycles before it is activated again.
		1	The chip select signal is held active at the end of a transfer until a control field with new data and control information is loaded into SPIDAT1. If the new chip select number equals the previous one, the active chip select signal is extended until the end of transfer with CSHOLD cleared, or until the chip-select number changes.
27	Reserved	0	Reads return 0. Writes have no effect.
26	WDEL	0	Enable the delay counter at the end of the current transaction.  <b>Note: The WDEL bit is supported in master mode only. In slave mode, this bit will be ignored.</b>  No delay will be inserted. However, the $\overline{\text{SPICS}}$ pins will still be de-activated for at least for 2VCLK cycles if CSHOLD = 0.
		1	<b>Note: The duration for which the <math>\overline{\text{SPICS}}</math> pin remains deactivated depends upon the time taken to supply a new word after completing the shift operation. If TXBUF is already full, then the <math>\overline{\text{SPICS}}</math> pin will be deasserted for at least two VCLK cycles (if WDEL = 0).</b>  After a transaction, WDELAY of the corresponding data format will be loaded into the delay counter. No transaction will be performed until the WDELAY counter overflows. The $\overline{\text{SPICS}}$ pins will be de-activated for at least (WDELAY + 2) × VCLK_Period duration.
25-24	DFSEL	0	Data word format 0 is selected.
		1h	Data word format 1 is selected.
		2h	Data word format 2 is selected.
		3h	Data word format 3 is selected.

**Table 12-23. SPI Transmit Data Register 1 (SPIDAT1) Field Descriptions (continued)**

Bit	Field	Value	Description
23-16	CSNR	0-FFh	<p>Chip select (CS) number. CSNR defines the chip select pins that will be activated during the data transfer. CSNR is a bit-mask that controls all chip select pins. See <a href="#">Table 12-24</a>.</p> <p><b>Note: If your MibSPI has less than 8 chip select pins, all unused upper bits will be 0. For example, MiBSPi3 has 6 chip select pins, if you write FFh to CSNR, the actual number stored in CSNR is 3Fh.</b></p>
15-0	TXDATA	0-FFFFh	<p>Transfer data. When written, these bits are copied to the shift register if it is empty. If the shift register is not empty, then they are held in TXBUF.</p> <p>SPIEN must be set to 1 before this register can be written to. Writing a 0 to SPIEN forces the lower 16 bits of SPIDAT1 to 0x0000.</p> <p>A write to this register (or to the TXDATA field only) drives the contents of the CSNR field on the SPICS pins, if the pins are configured as functional pins (automatic chip select, see <a href="#">Section 12.2</a>).</p> <p>When this register is read, the contents of TXBUF, which holds the latest data written, will be returned.</p> <p><b>Note: Regardless of the character length, the transmit data should be right-justified before writing to the SPIDAT1 register.</b></p>

**Table 12-24. Chip Select Number Active**

(1) If your MibSPI does not have this chip select pin, this bit is 0.

### 12.8.17 SPI Receive Buffer Register (SPIBUF)

**Figure 12-42. SPI Receive Buffer Register (SPIBUF) [offset = 40h]**

LEGEND: R = Read only; -n = value after reset

**Table 12-25. SPI Receive Buffer Register (SPIBUF) Field Descriptions**

Bit	Field	Value	Description
31	RXEMPTY	<div>0</div> <div>1</div>	<p>Receive data buffer empty. When the host reads the RXDATA field or the entire SPIBUF register, it automatically sets the RXEMPTY flag. When a data transfer is completed, the received data is copied into RXDATA and the RXEMPTY flag is cleared.</p> <p>New data has been received and copied into RXDATA.</p> <p>No data has been received since the last read of RXDATA.</p> <p>This flag gets set to 1 under the following conditions:</p> <ul style="list-style-type: none"> <li>Reading the RXDATA field of the SPIBUF register</li> <li>Writing a 1 to clear the RXINTFLG bit in the SPI Flag Register (SPIFLG)</li> </ul> <p>Write-clearing the RXINTFLG bit before reading the SPIBUF indicates the received data is being ignored. Conversely, RXINTFLG can be cleared by reading the RXDATA field of SPIBUF (or the entire register).</p>
30	RXOVR	<div>0</div> <div>1</div>	<p>Receive data buffer overrun. When a data transfer is completed and the received data is copied into RXBUF while it is already full, RXOVR is set. Overruns always occur to RXBUF, not to SPIBUF; the contents of SPIBUF are overwritten only after it is read by the Peripheral (VBUSP) master (CPU, DMA, or other host processor).</p> <p>If enabled, the RXOVRN interrupt is generated when RXBUF is overwritten, and reading either SPI Flag Register (SPIFLG) or SPIVEXTx shows the RXOVRN condition. Two read operations from the SPIBUF register are required to reach the overwritten buffer word (one to read SPIBUF, which then transfers RXDATA into SPIBUF for the second read).</p> <p><b>Note:</b> This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.</p> <p><b>Note:</b> A special condition under which RXOVR flag gets set. If both SPIBUF and RXBUF are already full and while another buffer receive is underway, if any errors such as TIMEOUT, BITERR, and DLEN_ERR occur, then RXOVR in RXBUF and SPI Flag Register (SPIFLG) registers will be set to indicate that the status flags are getting overwritten by the new transfer. This overrun should be treated like a normal receive overrun.</p> <p>No receive data overrun condition occurred since last read of the data field.</p> <p>A receive data overrun condition occurred since last read of the data field.</p>

**Table 12-25. SPI Receive Buffer Register (SPIBUF) Field Descriptions (continued)**

Bit	Field	Value	Description
29	TXFULL	0 1	<p>Transmit data buffer full. This flag is a read-only flag. Writing into the SPIDAT0 or SPIDAT1 field while the TX shift register is full will automatically set the TXFULL flag. Once the word is copied to the shift register, the TXFULL flag will be cleared. Writing to SPIDAT0 or SPIDAT1 when both TXBUF and the TX shift register are empty does not set the TXFULL flag.</p> <p>The transmit buffer is empty; SPIDAT0/SPIDAT1 is ready to accept a new data.</p> <p>The transmit buffer is full; SPIDAT0/SPIDAT1 is not ready to accept new data.</p>
28	BITERR	0 1	<p>Bit error. There was a mismatch of internal transmit data and transmitted data.</p> <p><b>Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.</b></p> <p>No bit error occurred.</p> <p>A bit error occurred. The SPI samples the signal of the transmit pins (master: SIMOx, slave: SOMIx) at the receive point (one-half clock cycle after the transmit point). If the sampled value differs from the transmitted value, a bit error is detected and the BITERR flag is set. Possible reasons for a bit error include noise, an excessively high bit rate, capacitive load, or another master/slave trying to transmit at the same time.</p>
27	DESYNC	0 1	<p>Desynchronization of slave device. This bit is valid in master mode only.</p> <p>The master monitors the ENA signal coming from the slave device and sets the DESYNC flag if ENA is deactivated before the last reception point or after the last bit is transmitted plus <math>t_{T2DELAY}</math>. If DESYNCENA is set, an interrupt is asserted. Desynchronization can occur if a slave device misses a clock edge coming from the master.</p> <p><b>Note: In the Compatibility Mode MibSPI, under some circumstances it is possible for a desync error detected for the previous buffer to be visible in the current buffer. This is because the receive completion flag/interrupt is generated when the buffer transfer is completed. But desynchronization is detected after the buffer transfer is completed. So, if the VBUS master reads the received data quickly when an RXINT is detected, then the status flag may not reflect the correct desync condition. In multi-buffer mode, the desync flag is always assured to be for the current buffer.</b></p> <p><b>Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.</b></p> <p>No slave desynchronization is detected.</p> <p>A slave device is desynchronized.</p>
26	PARITYERR	0 1	<p>Parity error. The calculated parity differs from the received parity bit.</p> <p>If the parity generator is enabled (selected individually for each buffer) an even or odd parity bit is added at the end of a data word. During reception of the data word, the parity generator calculates the reference parity and compares it to the received parity bit. If a mismatch is detected, the PARITYERR flag is set.</p> <p><b>Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.</b></p> <p>No parity error is detected.</p> <p>A parity error occurred.</p>
25	TIMEOUT	0 1	<p>Time-out because of non-activation of <math>\overline{\text{SPIEN}}_A</math> pin.</p> <p>The SPI generates a time-out when the slave does not respond in time by activating the ENA signal after the chip select signal has been activated. If a time-out condition is detected, the corresponding chip select is deactivated immediately and the TIMEOUT flag is set. In addition, the TIMEOUT flag in the status field of the corresponding buffer and in the SPI Flag Register (SPIFLG) is set.</p> <p><b>Note: This bit is valid only in master mode.</b></p> <p><b>Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.</b></p> <p>No <math>\overline{\text{SPIEN}}_A</math> pin time-out occurred.</p> <p>An <math>\overline{\text{SPIEN}}_A</math> signal time-out occurred.</p>
24	DLENERR	0 1	<p>Data length error flag.</p> <p><b>Note: This flag is cleared to 0 when the RXDATA field of the SPIBUF register is read.</b></p> <p>No data-length error occurred.</p> <p>A data length error occurred.</p>
23-16	LCSNR	0-FFh	<p>Last chip select number. LCSNR in the status field is a copy of CSNR in the corresponding control field. It contains the chip select number that was activated during the last word transfer.</p>

**Table 12-25. SPI Receive Buffer Register (SPIBUF) Field Descriptions (continued)**

Bit	Field	Value	Description
15-0	RXDATA	0-FFFFh	SPI receive data. This is the received word, transferred from the receive shift-register at the end of a transfer. Regardless of the programmed character length and the direction of shifting, the received data is stored right-justified in the register.

**Table 12-27. SPI Delay Register (SPIDELAY) Field Descriptions (continued)**

Bit	Field	Value	Description
23-16	T2CDELAY	0-FFh	<p>Transmit-end-to-chip-select-inactive-delay. See <a href="#">Figure 12-46</a> for an example. T2CDELAY is used only in master mode. It defines a hold time for the slave device that delays the chip select deactivation by a multiple of VCLK cycles after the last bit is transferred.</p> <p>The hold time value is calculated as follows:  <math>t_{T2CDELAY} = (T2CDELAY + 1) \times VCLK \text{ Period}</math></p> <p>Example: VCLK = 25 MHz -&gt; VCLK Period = 40ns; T2CDELAY = 03h;  <math>&gt; t_{T2CDELAY} = 160 \text{ ns}</math></p> <p>After the last data bit (or parity bit) is being transferred the chip select signal is held active for 160 ns.</p> <p><b>Note: If phase = 0, then between the last edge of SPICLK and rise-edge of SPICS there will be an additional delay of 0.5 SPICLK period. This is as per the SPI protocol.</b></p> <p>Both C2TDELAY and T2CDELAY counters do not have any dependency on the <math>\overline{SPIEN}</math> pin value. Even if the <math>\overline{SPIEN}</math> pin is asserted by the slave, the master will continue to delay the start of SPICLK until the C2TDELAY counter overflows.</p> <p>Similarly, even if the <math>\overline{SPIEN}</math> pin is deasserted by the slave, the master will continue to hold the SPICS pins active until the T2CDELAY counter overflows. In this way, it is assured that the setup and hold times of the <math>\overline{SPICS}</math> pins are determined by the delay timers alone. To achieve better throughput, it should be ensured that these two timers are kept at the minimum possible values.</p>
15-8	T2EDELAY	0-FFh	<p>Transmit-data-finished to ENA-pin-inactive time-out. T2EDELAY is used in master mode only. It defines a time-out value as a multiple of SPI clock before <math>\overline{SPIEN}</math> signal has to become inactive and after <math>\overline{SPICS}</math> becomes inactive. SPICLK depends on which data format is selected. If the slave device is missing one or more clock edges, it becomes de-synchronized. In this case, although the master has finished the data transfer, the slave is still waiting for the missed clock pulses and the ENA signal is not disabled.</p> <p>The T2EDELAY defines a time-out value that triggers the DESYNC flag, if the <math>\overline{SPIEN}</math> signal is not deactivated in time. The DESYNC flag is set to indicate that the slave device did not de-assert its <math>\overline{SPIEN}</math> pin in time to acknowledge that it received all bits of the sent word. See <a href="#">Figure 12-47</a> for an example of this condition.</p> <p><b>Note: DESYNC is also set if the SPI detects a de-assertion of <math>\overline{SPIEN}</math> before the end of the transmission.</b></p> <p>The time-out value is calculated as follows:  <math>t_{T2EDELAY} = T2EDELAY / SPIclock</math></p> <p>Example: SPIclock = 8 Mbit/s; T2EDELAY = 10h;  <math>&gt; t_{T2EDELAY} = 2 \mu s</math></p> <p>The slave device has to disable the ENA signal within 2 <math>\mu s</math>, otherwise DESYNC is set and an interrupt is asserted (if enabled).</p>
7-0	C2EDELAY	0-FFh	<p>Chip-select-active to ENA-signal-active time-out. C2EDELAY is used only in master mode and it applies only if the addressed slave generates an ENA signal as a hardware handshake response. C2EDELAY defines the maximum time between when the SPI activates the chip-select signal and the addressed slave has to respond by activating the ENA signal. C2EDELAY defines a time-out value as a multiple of SPI clocks. The SPI clock depends on whether data format 0 or data format 1 is selected. See <a href="#">Figure 12-48</a> for an example of this condition.</p> <p><b>Note: If the slave device does not respond with the ENA signal before the time-out value is reached, the TIMEOUT flag in the SPIFLG register is set and a interrupt is asserted (if enabled).</b></p> <p>If a time-out occurs, the SPI clears the transmit request of the timed-out buffer, sets the TIMEOUT flag for the current buffer, and continues with the transfer of the next buffer in the sequence that is enabled.</p> <p>The timeout value is calculated as follows:  <math>t_{C2EDELAY} = C2EDELAY / SPIclock</math></p> <p>Example: SPIclock = 8 Mbit/s; C2EDELAY = 30h;  <math>&gt; t_{C2EDELAY} = 6 \text{ ms}</math></p> <p>The slave device has to activate the ENA signal within 6 ms after the SPI has activated the chip select signal ( <math>\overline{SPICS}</math> ), otherwise the TIMEOUT flag is set and an interrupt is asserted (if enabled).</p>

**Figure 12-45. Example:  $t_{C2TDELAY} = 8$  VCLK Cycles**

**Figure 12-46. Example:  $t_{T2CDELAY} = 4$  VCLK Cycles**

**Figure 12-48. Chip-Select-Active-to-ENA-Signal-Active-Timeout**

## 12.8.20 SPI Default Chip Select Register (SPIDEF)

**Figure 12-49. SPI Default Chip Select Register (SPIDEF) [offset = 4Ch]**

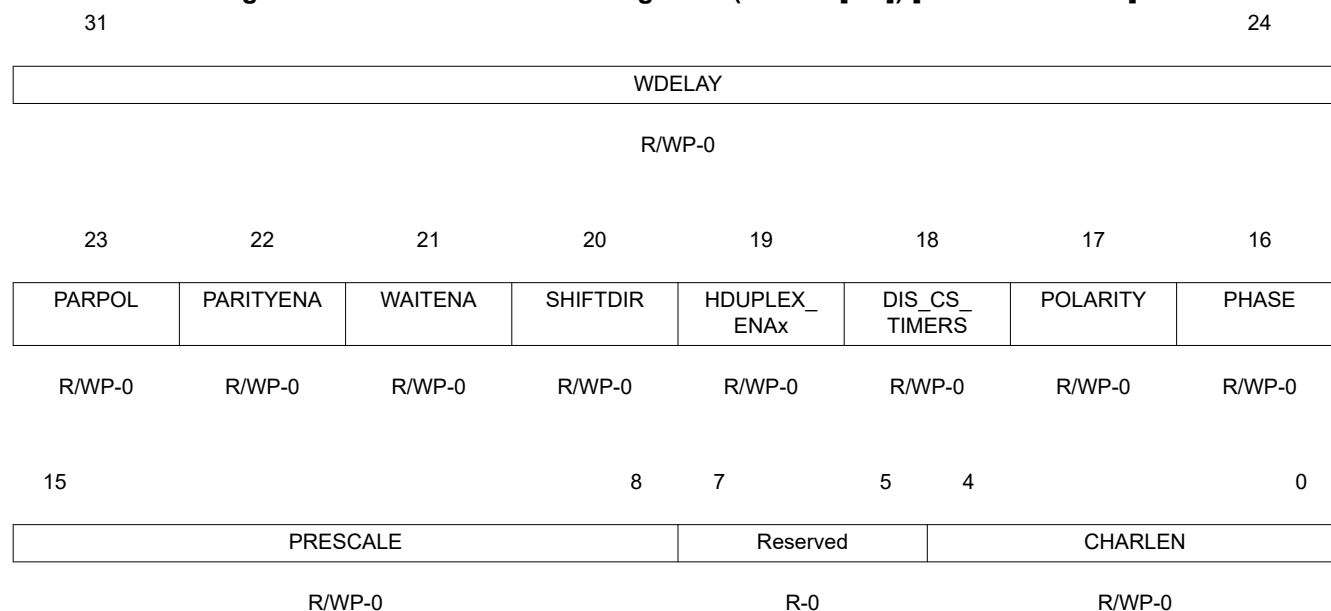

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 12-28. SPI Default Chip Select Register (SPIDEF) Field Descriptions**

Bit	Field	Value	Description
31-8	Reserved	0	Reads return 0. Writes have no effect.
7-0	CDEF	0-FFh	Chip select default pattern. Master-mode only. The CSDEF bits are output to the $\overline{\text{SPICS}}$ pins when no transmission is being performed. It allows the user to set a programmable chip-select pattern that deselects all of the SPI slaves.
		0	$\overline{\text{SPICS}}$ is cleared to 0 when no transfer is active.
		1	$\overline{\text{SPICS}}$ is set to 1 when no transfer is active.

## 12.8.21 SPI Data Format Registers (SPIFMT)

**Figure 12-50. SPI Data Format Registers (SPIFMT[3:0]) [offset = 5Ch-50h]**

LEGEND: R/W = Read/Write; R = Read only; WP = Write in privilege mode only; -n = value after reset

**Table 12-29. SPI Data Format Registers (SPIFMT) Field Descriptions**

Bit	Field	Value	Description
31-24	WDELAY	0-FFh	Delay in between transmissions for data format x (x= 0,1,2,3).Idle time that will be applied at the end of the current transmission if the bit WDEL is set in the current buffer. The delay to be applied is equal to: $WDELAY \times P_{VCLK} + 2 \times P_{VCLK}$ $P_{VCLK} \rightarrow$ Period of VCLK.
23	PARPOL	0 1	Parity polarity: even or odd. PARPOLx can be modified in privilege mode only. It can be used for data format x (x= 0,1,2,3). 0 An even parity flag is added at the end of the transmit data stream. 1 An odd parity flag is added at the end of the transmit data stream.
22	PARITYENA	0 1	Parity enable for data format x. No parity generation/ verification is performed for this data format. 0 A parity bit is transmitted at the end of each transmitted word. At the end of a transfer the parity generator compares the received parity bit with the locally-calculated parity flag. If the parity bits do not match, the RXERR flag is set in the corresponding control field. The parity type (even or odd) can be selected via the PARPOL bit. 1 <b>Note: If an uncorrectable error flag is set in a slave-mode SPI, then the wrong parity bit will be transmitted to indicate to the master that there has been some issue with the data parity. The SPISOMI pins will be forced to transmit all 0s, and the parity bit will be transmitted as 1 if even parity is selected and as 0 if odd parity is selected (using the PARPOLx bit of this register). This behavior occurs regardless of an uncorrectable parity error on either TXRAM or RXRAM.</b>

**Table 12-29. SPI Data Format Registers (SPIFMT) Field Descriptions (continued)**

Bit	Field	Value	Description
21	WAITENA	0 1	The master waits for the ENA signal from slave for data format x. WAITENA is valid in master mode only. WAITENA enables a flexible SPI network where slaves with ENA signal and slaves without ENA signal can be mixed. WAITENA defines, for each transferred word, whether the addressed slave generates the ENA signal or not.  The SPI does not wait for the ENA signal from the slave and directly starts the transfer.  Before the SPI starts the data transfer it waits for the ENA signal to become low. If the ENA signal is not pulled down by the addressed slave before the internal time-out counter (C2EDELAY) overflows, then the master aborts the transfer and sets the TIMEOUT error flag.
20	SHIFTDIR	0 1	Shift direction for data format x. With bit SHIFTDIRx, the shift direction for data format x (x=0,1,2,3) can be selected.  0 MSB is shifted out first. 1 LSB is shifted out first.
19	HDUPLEX_ENAx	0 1	Half Duplex transfer mode enable for Data Format x. This bit controls the I/O function of SOMI/SIMO lines for a specific requirement where in the case of Master mode, TX pin - SIMO will act as an RX pin, and in the case of Slave mode, RX pin - SIMO will act as a TX pin.  0 Normal Full Duplex transfer. 1 If MASTER = 1, SPISIMO pin will act as an RX pin (No TX possible) If MASTER = 0, SPISIMO pin will act as a TX pin (No RX possible).  For all normal operations, HDUPLEX_ENAx bits should always remain 0. It is intended for the usage when the SPISIMO pin is used for both TX and RX operations at different times.
18	DIS CS TIMERS	0 1	Disable chip-select timers for this format. The C2TDELAY and T2CDELAY timers are by default enabled for all the data format registers. Using this bit, these timers can be disabled for a particular data format, if they are not required. When a master is handling multiple slaves, with varied set-up hold requirement, the application can selectively choose to include or not include the chip-select delay timers for any slaves.  0 Both C2TDELAY and T2CDELAY counts are inserted for the chip selects. 1 No C2TDELAY or T2CDELAY is inserted in the chip select timings.
17	POLARITY	0 1	SPI data format x clock polarity. POLARITYx defines the clock polarity of data format x. The following restrictions apply when switching clock phase and/or polarity: <ul style="list-style-type: none"> <li>In 3-pin/4-pin with <math>\overline{\text{SPIEN}}\text{A}</math> pin configuration of a slave SPI, the clock phase and polarity cannot be changed on-the-fly between two transfers. The slave should be reset and reconfigured if clock phase/polarity needs to be switched. In summary, SPI format switching is not fully supported in slave mode.</li> <li>Even while using chip select pins, the polarity of SPICLK can be switched only while the slave is not selected by a valid chip select. The master SPI should ensure that while switching SPICLK polarity, it has deselected all of its slaves. Otherwise, the switching of SPICLK polarity may be incorrectly treated as a clock edge by some slaves.</li> </ul> 0 If POLARITYx is cleared to 0, the SPI clock signal is low-inactive, that is, before and after data transfer the clock signal is low. 1 If POLARITYx is set to 1, the SPI clock signal is high-inactive, that is, before and after data transfer the clock signal is high.
16	PHASE	0 1	SPI data format x clock delay. PHASEx defines the clock delay of data format x.  0 If PHASEx is cleared to 0, the SPI clock signal is not delayed versus the transmit/receive data stream. The first data bit is transmitted with the first clock edge and the first bit is received with the second (inverse) clock edge.  1 If PHASEx is set to 1, the SPI clock signal is delayed by a half SPI clock cycle versus the transmit/receive data stream. The first transmit bit has to output prior to the first clock edge. The master and slave receive the first bit with the first edge.

**Table 12-29. SPI Data Format Registers (SPIFMT) Field Descriptions (continued)**

Bit	Field	Value	Description
15-8	PRESCALE		<p>SPI data format x prescaler. PRESCALE<sub>x</sub> determines the bit transfer rate of data format x if the SPI is the network master. PRESCALE<sub>x</sub> is use to derive SPICLK from VCLK. If the SPI is configured as slave, PRESCALE<sub>x</sub> <b>does not need</b> to be configured. The clock rate for data format x can be calculated as:</p> $BR_{Formatx} = VCLK / (PRESCALEx + 1)$ <p><b>Note: When PRESCALE<sub>x</sub> is cleared to 0, the SPI clock rate defaults to VCLK/2.</b></p>
7-5	Reserved	0	Reads return 0. Writes have no effect.
4-0	CHARLEN	0-1Fh	<p>SPI data format x data-word length. CHARLEN<sub>x</sub> defines the word length of data format x. Legal values are 0x02 (data word length = 2 bit) to 10h (data word length = 16). Illegal values, such as 00 or 1Fh are not allowed; their effect is indeterminate.</p>

## 12.8.22 Interrupt Vector 0 (INTVECT0)

### Note

The TG interrupt is not available in MibSPI in compatibility mode. Therefore, there is no possibility to access this register in compatibility mode.

**Figure 12-51. Interrupt Vector 0 (NTVECT0) [offset = 60h]**

LEGEND: R = Read only; -n = value after reset

**Table 12-30. Transfer Group Interrupt Vector 0 (INTVECT0)**

Bit	Field	Value	Description
31-6	Reserved	0	Reads return 0. Writes have no effect.
5-1	INTVECT0	<div>0</div> <div>1h + x</div> <div>11h</div> <div>13h</div> <div>12h</div> <div>14h</div> <div>All Other Combinations</div>	<p>INTVECT0. Interrupt vector for interrupt line INT0.</p> <p>Returns the vector of the pending interrupt at interrupt line INT0. If more than one interrupt is pending, INTVECT0 always references the highest prior interrupt source first.</p> <p><b>Note: This field reflects the status of the SPIFLG register in vector format. Any updates to the SPIFLG register will automatically cause updates to this field.</b></p> <p>There is no pending interrupt.</p> <p>Transfer group x (x = 0 to 15) has a pending interrupt. SUSPEND0 reflects the type of interrupt (<i>suspend</i> or <i>finished</i>).</p> <p>Error Interrupt pending. The lower half of SPIFLG contains more details about the type of error.</p> <p>The pending interrupt is a Receive Buffer Overrun interrupt.</p> <p><b>SPI mode:</b> The pending interrupt is a Receive Buffer Full interrupt.  <b>Mib mode:</b> Reserved. This bit combination should not occur.</p> <p><b>SPI mode:</b> The pending interrupt is a Transmit Buffer Empty interrupt.  <b>Mib mode:</b> Reserved. This bit combination should not occur.</p> <p><b>SPI mode:</b> Reserved. These bit combinations should not occur.</p>
0	SUSPEND0	<div>0</div> <div>1</div>	<p>Transfer suspended / Transfer finished interrupt flag.</p> <p>Every time INTVECT0 is read by the host, the corresponding interrupt flag of the referenced transfer group is cleared and INTVECT0 is updated with the vector coming next in the priority chain.</p> <p>The interrupt type is a transfer finished interrupt. In other words, the buffer array referenced by INTVECT0 has asserted an interrupt because all of data from the transfer group has been transferred.</p> <p>The interrupt type is a transfer suspended interrupt. In other words, the transfer group referenced by INTVECT0 has asserted an interrupt because the buffer to be transferred next is in suspend-to-wait mode.</p>

### Note

Reading from the INTVECT0 register when Transmit Empty is indicated does not clear the TXINTFLG flag in the SPI Flag Register (SPIFLG). Writing a new word to the SPIDATx register clears the Transmit Empty interrupt.

### Note

In multi-buffer mode, INTVECT0 contains the interrupt for the highest priority transfer group. A read from INTVECT0 automatically causes the next-highest priority transfer group's interrupt status to get loaded into INTVECT0 and its corresponding SUSPEND flag to get loaded into SUSPEND0. The transfer group with the lowest number has the highest priority, and the transfer group with the highest number has the lowest priority.

Reading the INTVECT0 register when the RXOVRN interrupt is indicated in multi-buffer mode does not clear the RXOVRN flag and hence does not clear the vector. The RXOVRN interrupt vector may be cleared in multi-buffer mode either by write-clearing the RXOVRN flag in the SPI Flag Register (SPIFLG) or by reading the RXRAM Overrun Buffer Address Register (RXOVRN\_BUF\_ADDR).

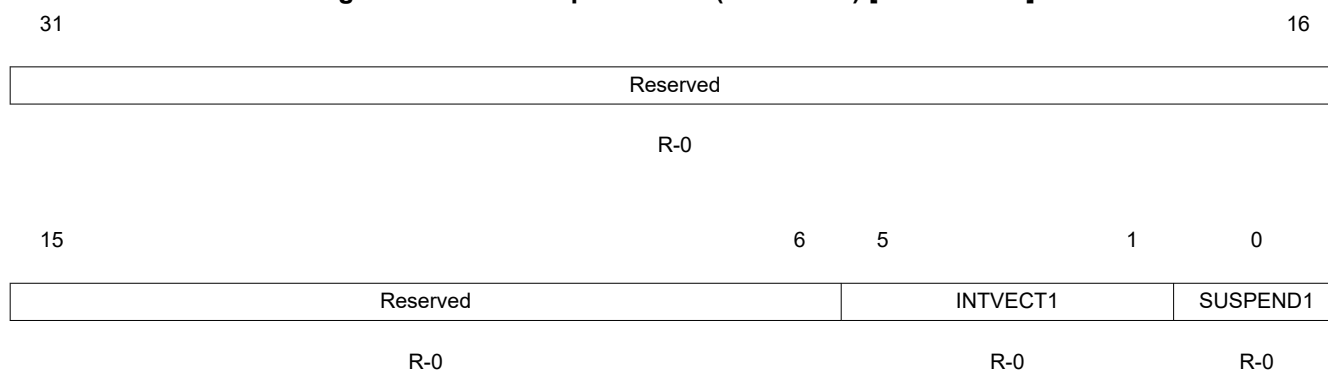

## 12.8.23

### 12.8.24 Interrupt Vector 1 (INTVECT1)

### Note

The TG interrupt is not available in SPI in compatibility mode compatibility mode. Therefore, there is no possibility to access this register in compatibility mode.

**Figure 12-52. Interrupt Vector 1 (INTVECT1) [offset = 64h]**

LEGEND: R = Read only; -n = value after reset

**Table 12-31. Transfer Group Interrupt Vector 1 (INTVECT1)**

Bit	Field	Value	Description
31-6	Reserved	0	Reads return 0. Writes have no effect.

**Table 12-31. Transfer Group Interrupt Vector 1 (INTVECT1) (continued)**

Bit	Field	Value	Description
5-1	INTVECT1		INTVECT1. Interrupt vector for interrupt line INT1.  Returns the vector of the pending interrupt at interrupt line INT1. If more than one interrupt is pending, INTVECT1 always references the highest prior interrupt source first.  <b>Note: This field reflects the status of the SPIFLG register in vector format. Any updates to the SPIFLG register will automatically cause updates to this field.</b>
		0	There is no pending interrupt. <b>SPI mode only.</b>
		11h	Error Interrupt pending. The lower half of SPIINT1 contains more details about the type of error. <b>SPI mode only.</b>
		13h	The pending interrupt is a Receive Buffer Overrun interrupt. <b>SPI mode only.</b>
		12h	The pending interrupt is a Receive Buffer Full interrupt. <b>SPI mode only.</b>
		14h	The pending interrupt is a Transmit Buffer Empty interrupt. <b>SPI mode only.</b>
		All Other Combinations	Reserved. These bit combinations should not occur. <b>SPI mode only.</b>
0	SUSPEND1		Transfer suspended / Transfer finished interrupt flag.  Every time INTVECT1 is read by the host, the corresponding interrupt flag of the referenced transfer group is cleared and INTVECT1 is updated with the vector coming next in the priority chain.
		0	The interrupt type is a transfer finished interrupt. In other words, the buffer array referenced by INTVECT1 has asserted an interrupt because all of data from the transfer group has been transferred.
		1	The interrupt type is a transfer suspended interrupt. In other words, the transfer group referenced by INTVECT1 has asserted an interrupt because the buffer to be transferred next is in suspend-to-wait mode.

#### Note

Reading from the INTVECT1 register when Transmit Empty is indicated does not clear the TXINTFLG flag in the SPI Flag Register (SPIFLG). Writing a new word to the SPIDATx register clears the Transmit Empty interrupt.

#### Note

In multi-buffer mode, INTVECT1 contains the interrupt for the highest priority transfer group. A read from INTVECT1 automatically causes the next-highest priority transfer group's interrupt status to get loaded into INTVECT1 and its corresponding SUSPEND flag to get loaded into SUSPEND1. The transfer group with the lowest number has the highest priority, and the transfer group with the highest number has the lowest priority.

Reading the INTVECT1 register when the RXOVRN interrupt is indicated in multi-buffer mode does not clear the RXOVRN flag and hence does not clear the vector. The RXOVRN interrupt vector may be cleared in multi-buffer mode either by write-clearing the RXOVRN flag in the SPI Flag Register (SPIFLG) or by reading the RXOVRN\_BUF\_ADDR register.

### 12.8.25 SPI Pin Control Register 9 (SPIPC9)

SPIPC9 only applies to SPI2.

**Figure 12-53. SPI Pin Control Register 9 (SPIPC9) [offset = 68h]**

31	25	24	23	17	16
Reserved		SOMISRS0	Reserved		SIMOSRS0

R-0		R/W-0	R/W-0	R/W-0	R-0

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 12-32. SPI Pin Control Register 9 (SPIPC9) Field Descriptions**

Bit	Field	Value	Description
31-25	Reserved	0	Reads return the value that was last written. Writes have no effect.
24	SOMISRS0	0 1	SPI2 SOMI[0] slew control. This bit controls between the fast or slow slew mode. <b>Note: Duplicate Control Bits for SPI2 SOMI[0]. Bit 24 is not physically implemented. It is a mirror of bit 11. Any write to bit 24 will be reflected on bit 11. When bit 24 and bit 11 are simultaneously written, the value of bit 11 will control the SPI2 SOMI[0] pin. The read value of bit 24 always reflects the value of bit 11.</b> Fast mode is enabled; the normal output buffer is used for this pin. Slow mode is enabled; slew rate control is used for this pin.
23-17	Reserved	0	Reads return the value that was last written. Writes have no effect.
16	SIMOSRS0	0 1	SPI2 SIMO[0] slew control. This bit controls between the fast or slow slew mode. <b>Note: Duplicate Control Bits for SPI2 SIMO[0]. Bit 16 is not physically implemented. It is a mirror of bit 10. Any write to bit 16 will be reflected on bit 10. When bit 16 and bit 10 are simultaneously written, the value of bit 10 will control the SPI2 SIMO[0] pin. The read value of bit 16 always reflects the value of bit 10.</b> Fast mode is enabled; the normal output buffer is used for this pin. Slow mode is enabled; slew rate control is used for this pin.
15-12	Reserved	0	Reads return 0. Writes have no effect.
11	SOMISRS0	0 1	SPI2 SOMI[0] slew control. This bit controls between the fast or slow slew mode. Fast mode is enabled; the normal output buffer is used for this pin. Slow mode is enabled; slew rate control is used for this pin.
10	SIMOSRS0	0 1	SPI2 SIMO[0] slew control. This bit controls between the fast or slow slew mode. Fast mode is enabled; the normal output buffer is used for this pin. Slow mode is enabled; slew rate control is used for this pin.
9	CLKSRS	0 1	SPI2 CLK slew control. This bit controls between the fast or slow slew mode. Fast mode is enabled; the normal output buffer is used for this pin. Slow mode is enabled; slew rate control is used for this pin.
8-0	Reserved	0	Reads return the value that was last written. Writes have no effect.

## 12.8.26 Parallel/Modulo Mode Control Register (SPIPMCTRL)

### Note

Do not configure MODCLKPOLx and MMODEx bits since this device does not support modulo mode.

### Note

The bits of this register are used in conjunction with the SPIFMTx registers. Each byte of this register corresponds to one of the SPIFMTx registers.

1. Byte0 (Bits 7:0) are used when SPIFMT0 register is selected by DFSEL[1:0] = 00 in the control field of a buffer.
2. Byte1 (Bits 15:8) are used when SPIFMT1 register is selected by DFSEL[1:0] = 01 in the control field of a buffer.
3. Byte2 (Bits 23:16) are used when SPIFMT2 register is selected by DFSEL[1:0] = 10 in the control field of a buffer.
4. Byte3 (Bits 31:24) are used when SPIFMT3 register is selected by DFSEL[1:0] = 11 in the control field of a buffer.

**Figure 12-54. Parallel/Modulo Mode Control Register (SPIPMCTRL) [offset = 6Ch]**

Bit	Field	Value	Description
31-30	Reserved	0	Reads return 0. Writes have no effect.

**Table 12-33. SPI Parallel/Modulo Mode Control Register (SPIPMCTRL) Field Descriptions (continued)**

Bit	Field	Value	Description
29	MODCLKPOL3	0 1	Modulo mode SPICLK polarity. This bit determines the polarity of the SPICLK in modulo mode only. If the MMODE3 bits are 000, this bit will be ignored. Normal SPICLK in all the modes. Polarity of the SPICLK will be inverted if Modulo mode is selected.
28-26	MMODE3	0 1h 2h 3h 4h 5h 6h-7h	These bits determine whether the SPI/MibSPI operates with 1, 2, 4, 5, or 6 data lines (if modulo option is supported by the module). Normal single data line mode - default (PMODE3 should be set to 00) 2-data line mode (PMODE3 should be set to 00) 3-data line mode (PMODE3 should be set to 00) 4-data line mode (PMODE3 should be set to 00) 5-data line mode (PMODE3 should be set to 00) 6-data line mode (PMODE3 should be set to 01) Reserved
25-24	PMODE3	0 1h 2h 3h	Parallel mode bits determine whether the SPI/MibSPI operates with 1, 2, 4, or 8 data lines. Normal operation/1-data line (MMODE3 should be set to 000) 2-data line mode (MMODE3 should be set to 000) 4-data line mode (MMODE3 should be set to 000) 8-data line mode (MMODE3 should be set to 000)
23-22	Reserved	0	Reads return 0. Writes have no effect.
21	MODCLKPOL2	0 1	Modulo mode SPICLK polarity. This bit determines the polarity of the SPICLK in modulo mode only. If the MMODE2 bits are 000, this bit will be ignored. Normal SPICLK in all the modes. Polarity of the SPICLK will be inverted if Modulo mode is selected.
20-18	MMODE2	0 1h 2h 3h 4h 5h 6h-7h	These bits determine whether the SPI/MibSPI operates with 1, 2, 4, 5, or 6 data lines (if modulo option is supported by the module). 1-data line Mode - default (PMODE2 should be set to 00) 2-data line Mode (PMODE2 should be set to 00) 3-data line mode (PMODE2 should be set to 00) 4-data line mode (PMODE2 should be set to 00) 5-data line mode (PMODE2 should be set to 00) 6-data line mode (PMODE2 should be set to 01) Reserved
17-16	PMODE2	0 1h 2h 3h	Parallel mode bits determine whether the SPI/MibSPI operates with 1, 2, 4, or 8 data lines. Normal operation/1-data line (MMODE2 should be set to 000) 2-data line mode (MMODE2 should be set to 000) 4-data line mode (MMODE2 should be set to 000) 8-data line mode (MMODE2 should be set to 000)
15-14	Reserved	0	Reads return 0. Writes have no effect.
13	MODCLKPOL1	0 1	Modulo mode SPICLK polarity. This bit determines the polarity of the SPICLK in modulo mode only. If the MMODE1 bits are 000, this bit will be ignored. Normal SPICLK in all the modes. Polarity of the SPICLK will be inverted if Modulo mode is selected.

**Table 12-33. SPI Parallel/Modulo Mode Control Register (SPIPMCTRL) Field Descriptions (continued)**

Bit	Field	Value	Description
12-10	MMODE1		These bits determine whether the SPI/MibSPI operates with 1, 2, 4, 5, or 6 data lines (if modulo option is supported by the module).
		0	1-data line mode - default (PMODE1 should be set to 00)
		1h	2-data line mode (PMODE1 should be set to 00)
		2h	3-data line mode (PMODE1 should be set to 00)

		5h	6-data line mode (PMODE1 should be set to 01)
		6h-7h	Reserved
9-8	PMODE1		Parallel mode bits determine whether the SPI/MibSPI operates with 1, 2, 4, or 8 data lines.
		0	Normal operation/1-data line (MMODE1 should be set to 000)
		1h	2-data line mode (MMODE1 should be set to 000)
		2h	4-data line mode (MMODE1 should be set to 000)
		3h	8-data line mode (MMODE1 should be set to 000)
7-6	Reserved	0	Reads return 0. Writes have no effect.
5	MODCLKPOL0		Modulo mode SPICLK polarity. This bit determines the polarity of the SPICLK in modulo mode only. If the MMODE0 bits are 000, this bit will be ignored.
		0	Normal SPICLK in all the modes.
		1	Polarity of the SPICLK will be inverted if Modulo mode is selected.
4-2	MMODE0		These bits determine whether the SPI/MibSPI operates with 1, 2, 4, 5, or 6 data lines (if modulo option is supported by the module).
		0	1-data line mode - default (PMODE0 should be set to 00)
		1h	2-data line mode (PMODE0 should be set to 00)
		2h	3-data line mode (PMODE0 should be set to 00)
		3h	4-data line mode (PMODE0 should be set to 00)
		4h	5-data line mode (PMODE0 should be set to 00)
		5h	6-data line mode (PMODE0 should be set to 01)
		6h-7h	Reserved
1-0	PMODE0		Parallel mode bits determine whether the SPI/MibSPI operates with 1, 2, 4, or 8 data lines.
		0	Normal operation/1-data line (MMODE0 should be set to 000)
		1h	2-data line mode (MMODE0 should be set to 000)
		2h	4-data line mode (MMODE0 should be set to 000)
		3h	8-data line mode (MMODE0 should be set to 000)

## 12.8.27 Multi-buffer Mode Enable Register (MIBSPIE)

### Note

#### Accessibility of Multi-Buffer RAM

The multi-buffer RAM is not accessible unless the MSPIENA bit set to 1. The only exception to this is in test mode, where, by setting RXRAMACCESS to 1, the multi-buffer RAM can be fully accessed for both read and write.

**Figure 12-55. Multi-buffer Mode Enable Register (MIBSPIE) [offset = 70h]**

31		17	16
Reserved			RXRAM_ACCESS
	R-0		R/WP-0
15		1	0
Reserved			MSPIENA
	R-0		R/WP-0

LEGEND: R/W = Read/Write; R = Read only; WP = Write in privilege mode only; -n = value after reset

**Table 12-34. Multi-buffer Mode Enable Register (MIBSPIE) Field Descriptions**

Bit	Field	Value	Description
31-17	Reserved	0	Reads return 0. Writes have no effect.
16	RXRAM ACCESS	0 1	Receive-RAM access control. During normal operating mode of SPI, the receive data/status portion of multi-buffer RAM is read-only. To enable testing of receive RAM, direct read/write access is enabled by setting this bit. The RX portion of multi-buffer RAM is not writable by the CPU. The whole of multi-buffer RAM is fully accessible for read/write by the CPU. <b>Note: The RX RAM ACCESS bit remains 0 after reset and it should remain cleared to 0 at all times, except when testing the RAM. SPI should be given a local reset by using the nRESET (SPIGCR0[0]) bit after RAM testing is performed so that the multi-buffer RAM gets re-initialized.</b>
15-1	Reserved	0	Reads return 0. Writes have no effect.
0	MSPIENA	0 1	Multi-buffer mode enable. After power-up or reset, MSPIENA remains cleared, which means that the SPI runs in compatibility mode by default. If multi-buffer mode is desired, this register should be configured first after configuring the SPIGCR0 register. If MSPIENA is not set to 1, the multi-buffer mode registers are not writable. The SPI runs in compatibility mode, that is, in this mode the MibSPI is fully code-compliant to the standard device SPI. No multi-buffered-mode features are supported. The SPI is configured to run in multi-buffer mode.

### Note

#### Accessibility of Registers

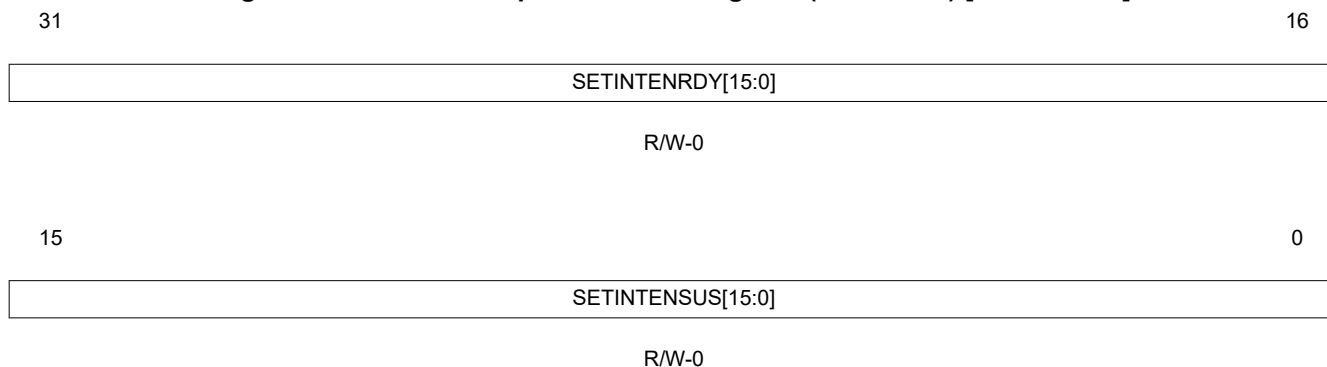

Registers from this offset address onwards are not accessible in SPI compatibility mode. They are accessible only in the multi-buffer mode.

### 12.8.28 TG Interrupt Enable Set Register (TGITENST)

The register TGITENST contains the TG interrupt enable flags for transfer-finished and for transfer-suspended events. Each of the enable bits in the higher half-word and the lower half-word of TGITENST belongs to one TG.

The register map shown in [Figure 12-56](#) and [Table 12-35](#) represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

**Figure 12-56. TG Interrupt Enable Set Register (TGITENST) [offset = 74h]**

LEGEND: R/W = Read/Write; -n = value after reset

**Table 12-35. TG Interrupt Enable Set Register (TGITENST) Field Descriptions**

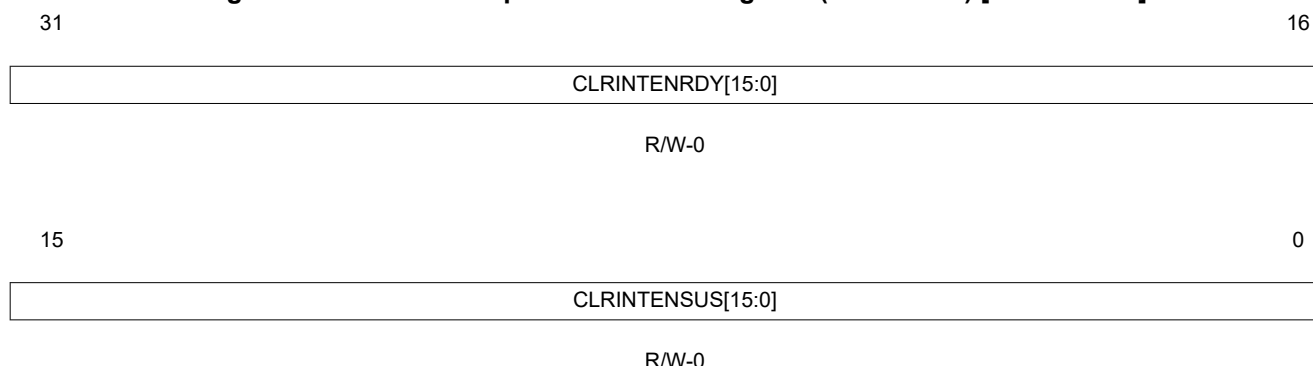

Bit	Field	Value	Description
31-16	SETINTENRDY[n]	0	TG interrupt set (enable) when transfer finished. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on. Read: The TGx-completed interrupt is disabled. This interrupt does not get generated when TGx completes. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is enabled. The interrupt gets generated when TGx completes. Write: Enable the TGx-completed interrupt. The interrupt gets generated when TGx completes.
15-0	SETINTENSUS[n]	0	TG interrupt set (enabled) when transfer suspended. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on. Read: The TGx-completed interrupt is disabled. This interrupt does not get generated when TGx is suspended. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is enabled. The interrupt gets generated when TGx is suspended. Write: Enable the TGx-completed interrupt. The interrupt gets generated when TGx is suspended.

## 12.8.29 TG Interrupt Enable Clear Register (TGITENCR)

The register TGITENCR is used to clear the interrupt enables for the TG-completed interrupt and the TG-suspended interrupts.

The register map shown in [Figure 12-57](#) and [Table 12-36](#) represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

**Figure 12-57. TG Interrupt Enable Clear Register (TGITENCR) [offset = 78h]**

LEGEND: R/W = Read/Write; -n = value after reset

**Table 12-36. TG Interrupt Enable Clear Register (TGITENCR) Field Descriptions**

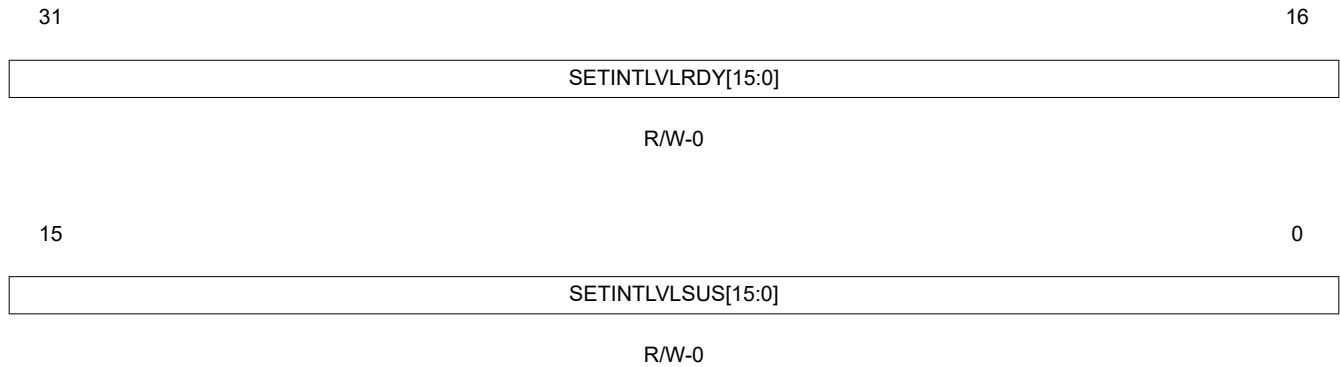

Bit	Field	Value	Description
31-16	CLRINTENRDY[n]	0	TG interrupt clear (disabled) when transfer finished. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on. Read: The TGx-completed interrupt is disabled. This interrupt does not get generated when TGx completes. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is enabled. The interrupt gets generated when TGx completes. Write: Disable the TGx-completed interrupt. The interrupt does not get generated when TGx completes.
15-0	CLRINTENSUS[n]	0	TG interrupt clear (disabled) when transfer suspended. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on. Read: The TGx-completed interrupt is disabled. This interrupt does not get generated when TGx is suspended. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is enabled. The interrupt gets generated when TGx is suspended. Write: Disable the TGx-completed interrupt. The interrupt does not get generated when TGx is suspended.

### 12.8.30 Transfer Group Interrupt Level Set Register (TGITLVST)

The register TGITLVST sets the level of interrupts for transfer completed interrupt and for transfer suspended interrupt to level 1.

The register map shown in [Figure 12-58](#) and [Table 12-37](#) represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

**Figure 12-58. Transfer Group Interrupt Level Set Register (TGITLVST) [offset = 7Ch]**

LEGEND: R/W = Read/Write; -n = value after reset

**Table 12-37. Transfer Group Interrupt Level Set Register (TGITLVST) Field Descriptions**

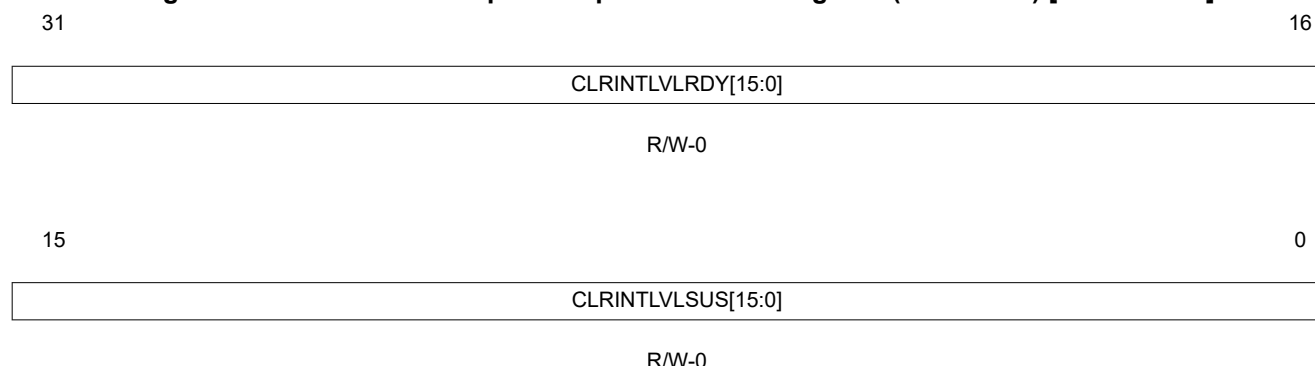

Bit	Field	Value	Description
31-16	SETINTLVLRDY[n]	0	Transfer-group completed interrupt level set. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on. Read: The TGx-completed interrupt is set to INT0. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is set to INT1. Write: Set the TGx-completed interrupt to INT1.
15-0	SETINTLVLSUS[n]	0	Transfer-group suspended interrupt level set. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on. Read: The TGx-suspended interrupt is set to INT0. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-suspended interrupt is set to INT1. Write: Set the TGx-suspended interrupt to INT1.

### 12.8.31 Transfer Group Interrupt Level Clear Register (TGITLVCR)

The register TGITLVCR clears the level of interrupts for transfer completed interrupt and for transfer suspended interrupt to level 0.

The register map shown in [Figure 12-59](#) and [Table 12-38](#) represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

**Figure 12-59. Transfer Group Interrupt Level Clear Register (TGITLVCR) [offset = 80h]**

LEGEND: R/W = Read/Write; -n = value after reset

**Table 12-38. Transfer Group Interrupt Level Clear Register (TGITLVCR) Field Descriptions**

Bit	Field	Value	Description
31-16	CLRINTLVLRDY[n]	0	Transfer-group completed interrupt level clear. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on. Read: The TGx-completed interrupt is set to INT0. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-completed interrupt is set to INT1. Write: Clear the TGx-completed interrupt to INT0.
15-0	CLRINTLVLSUS[n]	0	Transfer group suspended interrupt level clear. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on. Read: The TGx-suspended interrupt is set to INT0. Write: A write of 0 to this bit has no effect.
		1	Read: The TGx-suspended interrupt is set to INT1. Write: Clear the TGx-suspended interrupt to INT0.

### 12.8.32 Transfer Group Interrupt Flag Register (TGINTFLG)

The TGINTFLG register comprises the transfer group interrupt flags for transfer-completed interrupts (INTFLGRDYx) and for transfer-suspended interrupts (INTFLGSUSx). Each of the interrupt flags in the higher half-word and the lower half-word of TGINTFLG belongs to one TG.

The register map shown in [Figure 12-60](#) and [Table 12-39](#) represents a super-set device with the maximum number of TGs (16) assumed. The actual number of bits available varies per device.

**Figure 12-60. Transfer Group Interrupt Flag Register (TGINTFLG) [offset = 84h]**

LEGEND: R/W = Read/Write; W1C = Write 1 to clear; -n = value after reset

**Table 12-39. Transfer Group Interrupt Flag Register (TGINTFLG) Field Descriptions**

Bit	Field	Value	Description
31-16	INTFLGRDY[n]	0	Transfer-group interrupt flag for a transfer-completed interrupt. Bit 16 corresponds to TG0, bit 17 corresponds to TG1, and so on.  <b>Note: Read Clear Behavior.</b> Reading the interrupt vector registers TGINTVECT0 or TGINTVECT1 automatically clears the interrupt flag bit INTFLGRDYx referenced by the vector number given by INTVECT0/INTVECT1 bits, if the SUSPEND[0:1] bit in the vector registers is 0.  Read: No transfer-completed interrupt occurred since last clearing of the INTFLGRDYx flag. Write: A write of 0 to this bit has no effect.
		1	Read: A transfer finished interrupt from transfer group x occurred. No matter whether the interrupt is enabled or disabled (INTENRDYx = don't care) or whether the interrupt is mapped to INT0 or INT1, INTFLGRDYx is set right after the transfer from TGx is finished. Write: The corresponding bit flag is cleared.
15-0	INTFLGSUS[n]	0	Transfer-group interrupt flag for a transfer-suspend interrupt. Bit 0 corresponds to TG0, bit 1 corresponds to TG1, and so on.  <b>Note: Read Clear Behavior.</b> Reading the interrupt vector registers TGINTVECT0 or TGINTVECT1 automatically clears the interrupt flag bit INTFLGSUSx referenced by the vector number given by INTVECT0/INTVECT1 bits, if the SUSPEND[0:1] bit in the corresponding vector registers is 1.  Read: No transfer-suspended interrupt occurred since the last clearing of the INTFLGSUSx flag. Write: A write of 0 to this bit has no effect.
		1	Read: A transfer-suspended interrupt from TGx occurred. No matter whether the interrupt is enabled or disabled (INTENSUSx = don't care) or whether the interrupt is mapped to INT0 or INT1, INTFLGSUSx is set right after the transfer from transfer group x is suspended. Write: The corresponding bit flag is cleared.

### 12.8.33 Tick Count Register (TICKCNT)

One of the trigger sources for TGs is an internal periodic time trigger. This time trigger is called a tick counter and is basically a down-counter with a preload/reload value. Every time the tick counter detects an underflow it reloads the initial value and toggles the trigger signal provided to the TGs.

The trigger signal, shown in Figure 12-61 as a square wave, illustrates the different trigger event types for the TGs (for example, rising edge, falling edge, and both edges).

**Figure 12-61. Tick Counter Operation**

This register is shown in Figure 12-62 and described in Table 12-40.

**Figure 12-62. Tick Count Register (TICKCNT) [offset = 90h]**

31	30	29	28	27	16
TICKENA	RELOAD	CLKCTRL	Reserved		
R/W-0	R/S-0	R/W-0	R-0		
15					0
TICKVALUE					
R/W-0					

LEGEND: R/W = Read/Write; R = Read only; S = Set; -n = value after reset

**Table 12-40. Tick Count Register (TICKCNT) Field Descriptions**

Bit	Field	Value	Description
31	TICKENA	0	Tick counter enable. The internal tick counter is disabled. The counter value remains unchanged. <b>Note: When the tick counter is disabled, the trigger signal is forced low.</b>
		1	The internal tick counter is enabled and is clocked by the clock source selected by CLKCTRL. When TICKENA goes from 0 to 1, the tick counter is automatically loaded with the contents of TICKVALUE.
30	RELOAD		Pre-load the tick counter. RELOAD is a set-only bit; writing a 1 to it reloads the tick counter with the value stored in TICKVALUE. Reading RELOAD always returns a 0. <b>Note: When the tick counter is reloaded by the RELOAD bit, the trigger signal is not toggled.</b>
29-28	CLKCTRL	0	SPICLK of data word format 0 is selected as the clock source of the tick counter.
		1h	SPICLK of data word format 1 is selected as the clock source of the tick counter.
		2h	SPICLK of data word format 2 is selected as the clock source of the tick counter.
		3h	SPICLK of data word format 3 is selected as the clock source of the tick counter.
27-16	Reserved	0	Reads return 0. Writes have no effect.

**Table 12-40. Tick Count Register (TICKCNT) Field Descriptions (continued)**

Bit	Field	Value	Description
15-0	TICKVALUE	0-FFFFh	Initial value for the tick counter. TICKVALUE stores the initial value for the tick counter. The tick counter is loaded with the contents of TICKVALUE every time an underflow condition occurs and every time the RELOAD flag is set by the host.

### 12.8.34 Last TG End Pointer (LTGPEND)

**Figure 12-63. Last TG End Pointer (LTGPEND) [offset = 94h]**

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 12-41. Last TG End Pointer (LTGPEND) Field Descriptions**

Bit	Field	Value	Description
31-29	Reserved	0	Reads return 0. Writes have no effect.
28-24	TG_IN_SERVICE	0 1h : 10h 11h-1Fh	<p>The TG number currently being serviced by the sequencer. These bits indicate the current TG that is being serviced. This field can generally be used for code debugging.</p> <p>No TG is being serviced by the sequencer.</p> <p>TG0 is being serviced by the sequencer.</p> <p>:</p> <p>TG15 is being serviced by the sequencer.</p> <p><b>Note: The number of transfer groups varies by device.</b></p> <p>Invalid values.</p>
23-15	Reserved	0	Reads return 0. Writes have no effect.
14-8	LPEND	0-7Fh	<p>Last TG end pointer. Usually the TG end address (PEND) is inherently defined by the start value of the starting pointer of the subsequent TG (PSTART). The TG ends one word before the next TG starts (PEND[x] = PSTART[x+1] - 1). For a full configuration of MibSPI, the last TG has no subsequent TG, that is, no end address is defined. Therefore, LPEND has to be programmed to specify explicitly the end address of the last TG.</p> <p><b>Note: When using all 8 transfer groups, program the LPEND bits to define the end of the last transfer group. When using less than 8 transfer groups, leave the LPEND bits programmed to point to the end of the buffer and create a dummy transfer group that defines the end of your last intentional transfer group and occupies all the remaining buffer space.</b></p>
7-0	Reserved	0	Reads return 0. Writes have no effect.

### 12.8.35 TGx Control Registers (TGxCTRL)

Each TG can be configured via one dedicated control register. The register description shows one control register (x) that is identical for all TGs. For example, the control register for TG2 is named TG2CTRL and is located at *base address + 98h + 4 × 2*. The actual number of available control registers varies by device.

**Figure 12-64. MibSPI TG Control Registers (TGxCTRL) [offsets = 98h-D4h]**

31		30		29		28		27		24	
TGENA		ONESHOT		PRST		TGTD		Reserved			
R/W-0		R/W-0		R/W-0		R-0		R-0			
23						20		19		16

R/W-0						R/W-0					
15		14				8		7		6	
0											
Rsvd		PSTART						Rsvd		PCURRENT	
R-0				R/W-0				R-0		R-0	

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 12-42. TG Control Registers (TGxCTRL) Field Descriptions**

Bit	Field	Value	Description
31	TGENA	0 1	TGx enable. If the correct event (TRIGEV <sub>x</sub> ) occurs at the selected source (TRIGSRC <sub>x</sub> ), a group transfer is initiated if no higher-priority TG is in active-transfer mode or if one or more higher-priority TGs are in transfer-suspend mode. Disabling a TG while a transfer is ongoing will finish the ongoing word transfer but not the whole group transfer. TGx is disabled. TGx is enabled.
30	ONESHOT <sub>x</sub>	0 1	Single transfer for TGx. TGx initiates a transfer every time a trigger event occurs and TGENA is set. A transfer from TGx will be performed only once (one shot) after a valid trigger event at the selected trigger source. After the transfer is finished the TGENA <sub>x</sub> control bit will be cleared and therefore no additional transfer can be triggered before the host enables the TG again. This one shot mode ensures that after one group transfer the host has enough time to read the received data and to provide new transmit data.

**Table 12-42. TG Control Registers (TGxCTRL) Field Descriptions (continued)**

Bit	Field	Value	Description
29	PRSTx		<p>TGx pointer reset mode. Configures the way to resolve trigger events during an ongoing transfer. This bit is meaningful only for level-triggered TGs. Edge-triggered TGs cannot be restarted before their completion by another edge. The PRST bit will have no effect on this behavior.</p> <p><b>Note: When the PRST bit is set, if the buffer being transferred at the time of a new trigger event is a LOCK, CSHOLD or NOBRK buffer, then only after finishing those transfers, the TG will be restarted. This means that even if the TG is retriggered, the TG will only be restarted after finishing the transfer of the first non-LOCK or non-CSHOLD buffer. In the case of the NOBRK buffer, after completing the ICOUNT number of transfers, the TG will be restarted from its PSTART.</b></p> <p>This means that TX control fields such as LOCK and CSHOLD, and DMA control fields such as NOBRK have higher priority over anything else. They have the capability to delay the restart of the TG even if it is retriggered when PRST is 1.</p> <p>0 If a trigger event occurs during a transfer from TGx, the event is ignored and is not stored internally. The TGx transfer has priority over additional trigger events.</p> <p>1 The TGx pointer (PCURRENTx) will be reset to the start address (PSTARTx) when a valid trigger event occurs at the selected trigger source while a transfer from the same TG is ongoing. Every trigger event resets PCURRENTx no matter whether the concerned TG is in transfer mode or not. The trigger events have priority over the ongoing transfer.</p>
28	TGTDx	<p>0 TGx has not been triggered or is no longer waiting for service.</p> <p>1 TGx has been triggered and is either currently being serviced or waiting for servicing.</p>	
27-24	Reserved	0	Reads return 0. Writes have no effect.

**Table 12-42. TG Control Registers (TGxCTRL) Field Descriptions (continued)**

Bit	Field	Value	Description
23-20	TRIGEVTx		Type of trigger event. A level-triggered TG can be stopped by de-activating the level trigger. However, the following restrictions apply. <ul style="list-style-type: none"> <li>Deactivating the level trigger for a TG during a NOBRK transfer does not stop the transfers until all of the ICOUNT number of buffers are transferred for the NOBRK buffer. Once a NOBRK buffer is prefetched, the trigger event loses control over the TG until the NOBRK buffer transfer is completed.</li> <li>Once the transfer of a buffer with CSHOLD or LOCK bit set starts, deactivating the trigger level does not stop the transfer until the sequencer completes the transfer of the next non-CSHOLD or non-LOCK buffer in the same TG.</li> <li>Once the last buffer in a TG is pre-fetched, de-activating the trigger level does not stop the transfer group until the last buffer transfer is completed. This means even if the trigger level is deactivated at the beginning of the penultimate (one-before-last) buffer transfer, the sequencer continues with the same TG until it is completed.</li> </ul>
		0	never Never trigger TGx. This is the default value after reset.
		1h	rising edge A rising edge (0 to 1) at the selected trigger source (TRIGSRCx) initiates a transfer for TGx
		2h	falling edge A falling edge (1 to 0) at the selected trigger source (TRIGSRCx) initiates a transfer for TGx
		3h	both edges Rising and falling edges at the selected trigger source (TRIGSRCx) initiates a transfer for TGx
		4h	Rsvd Reserved
		5h	high-active While the selected trigger source (TRIGSRCx) is at a logic-high level (1), the group transfer is continued and at the end of one group, transfer is restarted at the beginning. If the logic level changes to low (0) during an ongoing group transfer, the whole group transfer will be stopped. <b>Note: If ONESHOTx is set, the transfer is performed only once.</b>
		6h	low-active While the selected trigger source (TRIGSRCx) is at a logic-low level (0), the group transfer is continued and at the end of one group, transfer is restarted at the beginning. If the logic level changes to high (1) during an ongoing group transfer, the whole group transfer will be stopped. <b>Note: If ONESHOTx is set, the transfer is performed only once.</b>
		7h	always A repetitive group transfer will be performed. <b>Note: By setting the TRIGSRC to 0, the TRIGEVt to 7h (ALWAYS), and the ONESHOTx bit to 1, software can trigger this TG. Upon setting the TGENA bit, the TG is immediately triggered.</b> <b>Note: If ONESHOTx is set, the transfer is performed only once.</b>
		8h-Fh	Rsvd Reserved

**Table 12-42. TG Control Registers (TGxCTRL) Field Descriptions (continued)**

Bit	Field	Value	Description
19-16	TRIGSRCx	0	Disabled
		1h	EXT0 External trigger source 0. The actual source varies per device (for example, HET I/O channel, event pin).
		2h	EXT1 External trigger source 1. The actual source varies per device (for example, HET I/O channel, event pin).
		3h	EXT2 External trigger source 2. The actual source varies per device (for example, HET I/O channel, event pin).
		4h	EXT3 External trigger source 3. The actual source varies per device (for example, HET I/O channel, event pin).
		5h	EXT4 External trigger source 4. The actual source varies per device (for example, HET I/O channel, event pin).
		6h	EXT5 External trigger source 5. The actual source varies per device (for example, HET I/O channel, event pin).
		7h	EXT6 External trigger source 6. The actual source varies per device (for example, HET I/O channel, event pin).
		8h	EXT7 External trigger source 7. The actual source varies per device (for example, HET I/O channel, event pin).
		9h	EXT8 External trigger source 8. The actual source varies per device (for example, HET I/O channel, event pin).
		Ah	EXT9 External trigger source 9. The actual source varies per device (for example, HET I/O channel, event pin).
		Bh	EXT10 External trigger source 10. The actual source varies per device (for example, HET I/O channel, event pin).
		Ch	EXT11 External trigger source 11. The actual source varies per device (for example, HET I/O channel, event pin).
		Dh	EXT12 External trigger source 12. The actual source varies per device (for example, HET I/O channel, event pin).
		Eh	EXT13 External trigger source 13. The actual source varies per device (for example, HET I/O channel, event pin).
		Fh	TICK Internal periodic event trigger. The tick counter can initiate periodic group transfers.
15	Reserved	0	Reads return 0. Writes have no effect.
14-8	PSTARTx	0-7Fh	TG start address. PSTARTx stores the start address of the corresponding TG. The corresponding end address is inherently defined by the subsequent TG start address minus 1 ( $PENDx[TGx] = PSTARTx[TGx+1]-1$ ). PSTARTx is copied into PCURRENTx when: <ul style="list-style-type: none"> <li>The TG is enabled</li> <li>The end of the TG is reached during a transfer</li> <li>A trigger event occurs while PRST is set to 1</li> </ul>
7	Reserved	0	Reads return 0. Writes have no effect.
6-0	PCURRENTx	0-7Fh	Pointer to current buffer. PCURRENT is read-only. PCURRENTx stores the address (0...127) of the buffer that corresponds to this TG. If the TG switches from active-transfer mode to suspend-to-wait mode, PCURRENTx contains the address of the currently suspended word. After the TG resumes from suspend-to-wait mode, the next buffer will be transferred; that is, no buffer data is transferred because of suspend-to-wait mode.

---

**Note****Register bits vary by device**

TG0 has the highest priority and TG15 has the lowest priority. Under the following conditions, a lower-priority TG cannot be interrupted by a higher-priority TG:

1. When there is a CSHOLD or LOCK buffer, until the completion of the next buffer transfer that is a non-CSHOLD or non-LOCK buffer.
  2. An entire sequence of words transferred for a NOBRK DMA buffer.
  3. Once the last word in a TG is pre-fetched.
-

### 12.8.36 DMA Channel Control Register (DMAxCTRL)

Each DMA channel can be configured via one dedicated control register. The register description below shows one exemplary control register that is identical for all DMA channels; for example, the control register for DMA channel 0 is named DMA0CTRL. The MibSPI supports up to 8 bidirectional DMA channels.

The number of bidirectional DMA channels varies by device. The number of DMA channels and hence the number of DMA channel control registers may vary.

**Figure 12-65. DMA Channel Control Register (DMAxCTRL) [offset = D8h-F4h]**

31	30	24	23	20	19	16
ONESHOT	BUFID		RXDMA_MAP		TXDMA_MAP	
R/W-0		R/W-0		R/W-0		R/W-0
15	14	13	12	8		
RXDMAENA	TXDMAENA	NOBRK	ICOUNT			
R/W-0		R/W-0		R/W-0		
7	6	5	0			
Reserved	COUNT_BIT17	COUNT				
R-0	R-0	R-0				

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 12-43. DMA Channel Control Register (DMAxCTRL) Field Descriptions**

Bit	Field	Value	Description
31	ONESHOT	<div>0</div> <div>1</div>	<p>Auto-disable of DMA channel after ICOUNT + 1 transfers.</p> <p><b>Note: This ONESHOT applies to the DMA channel identified by x and will autotisable based on ICOUNTx.</b></p> <p>The length of the block transfer is fully controlled by the DMA controller. The enable bits RXDMAENAx and TXDMAENAx are not modified by the MibSPI.</p> <p>ONESHOT allows a block transfer of defined length (ICOUNTx + 1), mainly controlled by the MibSPI and not by the DMA controller. After ICOUNTx + 1 transfers, the enable bits RXDMAENAx and TXDMAENAx are automatically cleared by the MibSPI, hence no more DMA requests are generated. In conjunction with NOBRKx, a burst transfer can be initiated without any other transfer through another buffer.</p>
30-24	BUFIDx	0-7Fh	Buffer utilized for DMA transfer. BUFIDx defines the buffer that is utilized for the DMA transfer. In order to synchronize the transfer with the DMA controller with the NOBRK condition the "suspend to wait until..." modes must be used.
23-20	RXDMA_MAPx	0-Fh	<p>Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. One request line for receive data and the other for request line for transmit data. RXDMA_MAPx defines the number of the physical DMA Request line that is connected to the receive path of the MibSPI DMA channel.</p> <p>If RXDMAENAx and TXDMAENAx are both set to 1, then RXDMA_MAPx shall differ from TXDMA_MAPx and shall differ from any other used physical DMA Request line. Otherwise, unexpected interference may occur.</p>

**Table 12-43. DMA Channel Control Register (DMAxCTRL) Field Descriptions (continued)**

Bit	Field	Value	Description
19-16	TXDMA_MAPx	0-Fh	Each MibSPI DMA channel can be linked to two physical DMA Request lines of the DMA controller. One request line for receive data and the other for request line for transmit data.  TXDMA_MAPx defines the number of the physical DMA Request line that is connected to the transmit path of the MibSPI DMA channel.  If RXDMAENAx and TXDMAENAx are both set to 1, then TXDMA_MAPx shall differ from RXDMA_MAPx and shall differ from any other used physical DMA Request line. Otherwise, unexpected interference may occur.
15	RXDMAENAx	0 1	Receive data DMA channel enable.  0 No DMA request upon new receive data.  1 The physical DMA channel for the receive path is enabled. The first DMA request pulse is generated after the first transfer from the referenced buffer (BUFIDx) is finished. The buffer should be configured in as "skip until RXEMPTY is set" or "suspend to wait until RXEMPTY is set" in order to ensure synchronization between the DMA controller and the MibSPI sequencer.
14	TXDMAENAx	0 1	Transmit data DMA channel enable.  0 No DMA request upon new transmit data.  1 The physical DMA channel for the transmit path is enabled. The first DMA request pulse is generated right after setting TXDMAENAx to load the first transmit data. The buffer should be configured in the as "skip until TXFULL is set" or "suspend to wait until TXFULL is set" in order to ensure synchronization between the DMA controller and the MibSPI sequencer.
13	NOBRKx	0 1	Non-interleaved DMA block transfer. This bit is available in master mode only.  <b>Note: Special Conditions during a NOBRK Buffer Transfer. If a NOBRK DMA buffer is currently being serviced by the sequencer, then it is not allowed to be disabled prematurely.</b>  During a NOBRK transfer, the following operations are not allowed: <ul style="list-style-type: none"> <li>• Clearing the NOBRKx bit to 0</li> <li>• Clearing the RXDMAENAx to 0 (if it is already 1)</li> <li>• Clearing the TXDMAENAx to 0 (if it is already 1)</li> <li>• Clearing the BUFMODE[2:0] bits in TXRAM to 000</li> </ul> <b>Note: Any attempts to perform these actions during a NOBRK transfer will produce unpredictable results.</b>  0 DMA transfers through the buffer referenced by BUFIDx are interleaved by data transfers from other active buffers or TGs. Every time the sequencer checks the DMA buffer, it performs one transfer and then steps to the next buffer.  1 NOBRKx ensures that ICOUNTx + 1 data transfers are performed from the buffer referenced by BUFIDx without a data transfer from any other buffer. The sequencer remains at the DMA buffer until ICOUNTx + 1 transfers have been processed. For example, this can be used to generate a burst transfer to one device without disabling the chip select signal in-between (the concerned buffer has to be configured with CSHOLD = 1). Another example would be to have a defined block data transfer in slave mode, synchronous to the master SPI.  <b>Note: Triggering of higher priority TGs or enabling of higher priority DMA channels will not interrupt a NOBRK block transfer.</b>
12-8	ICOUNTx	0-1Fh	Initial count of DMA transfers. ICOUNTx is used to preset the transfer counter COUNTx. Every time COUNTx hits 0, it is reloaded with ICOUNTx. The real number of transfers equals ICOUNTx plus 1.  If ONESHOTx is set, ICOUNTx defines the number of DMA transfers that are performed before the MibSPI automatically disables the DMA channels. If NOBRKx is set, ICOUNTx defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer. If ONESHOTx and NOBRKx are not set, ICOUNTx should be 0.  <b>Note: See Section 12.8.37 (ICOUNT) and Section 12.8.38 (DMACNTLEN) about how to increase the ICOUNT to a 16-bit value. With this extended capability, MibSPI can transfer a block of up to 65535 (65K) words without interleaving (if NOBRK is used) or without deasserting the chip select between the buffers (if CSHOLD is used).</b>
7	Reserved	0	Reads return 0. Writes have no effect.
6	COUNT_BIT17x		The 17th bit of the COUNT field of DMAxCOUNT register.

**Table 12-43. DMA Channel Control Register (DMAxCTRL) Field Descriptions (continued)**

Bit	Field	Value	Description
5-0	COUNTx	0-3Fh	<p>Actual number of remaining DMA transfers. This field contains the actual number of DMA transfers that remain, until the DMA channel is disabled, if ONESHOTx is set.</p> <p><b>Note: If the TX and RX DMA requests are enabled, the COUNT register will be decremented when the RX has been serviced.</b></p>

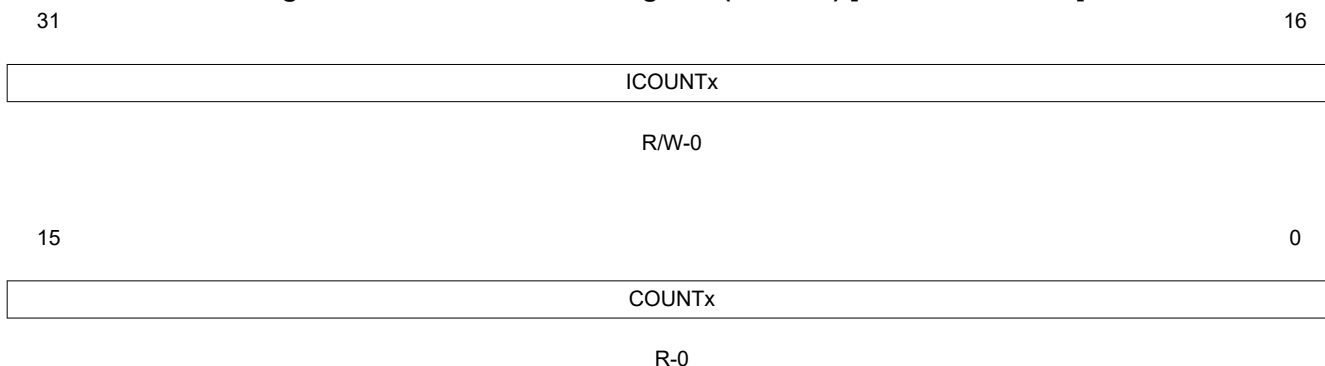

### 12.8.37 DMAxCOUNT Register (ICOUNT)

#### Note

These registers are used only if the LARGE COUNT bit in the DMACNTLEN register is set.

The number of bidirectional DMA channels varies by device. The number of DMA channels and hence the number of DMA registers varies by device.

**Figure 12-66. DMAxCOUNT Register (ICOUNT) [offset = F8h-114h]**

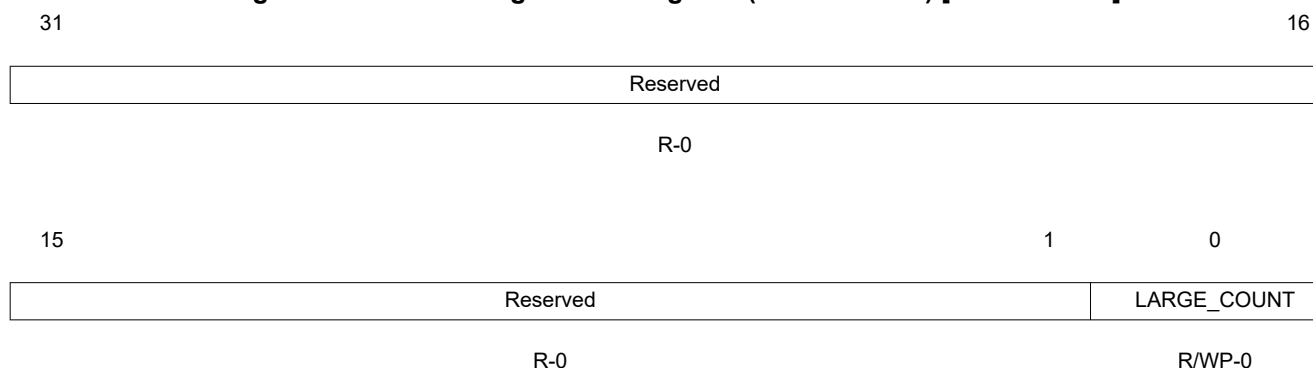

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 12-44. MibSPI DMAxCOUNT Register (ICOUNT) Field Descriptions**

Bit	Field	Value	Description
31-16	ICOUNTx	0-FFFFh	Initial number of DMA transfers. ICOUNTx is used to preset the transfer counter COUNTx. Every time COUNTx hits 0, it is reloaded with ICOUNTx. The real number of transfer equals ICOUNTx plus 1. If ONESHOTx is set, ICOUNTx defines the number of DMA transfers that are performed before the MibSPI automatically disables the corresponding DMA channel. If NOBRKx is set, ICOUNTx defines the number of DMA transfers that are performed in one sequence without a transfer from any other buffer.
15-0	COUNTx	0-FFFFh	Actual number of remaining DMA transfers. COUNTx Contains the actual number of DMA transfers that remain, until the DMA channel is disabled, if ONESHOTx is set. Since the real counter value is always ICOUNTx +1, the 17th bit of COUNTx is available on DMACTRLx[6] bit.  <b>Note: Usage Tip for Block Transfer Using a Single DMA Request.</b> It is possible to use the multi-buffer RAM to transfer chunks of data to/from an external SPI. A DMA Controller can be used to handle the data in bursts. Suppose a chunk of 64 bytes of data needs to be transferred and a single DMA request needs to be generated at the end of transferring the 64 bytes. This can be easily achieved by configuring a TG register for the 64 buffer locations and using the DMAxCTRL/DMAxCOUNT registers to configure the last buffer (64th) of the TG as the BUFID and enable RXDMA (NOBRK = 0). At the end of the transfer of the 64th buffer, a DMA request will be generated on the selected DMA request channel. The DMA controller can do a burst read of all 64 bytes from RXRAM and/or then do a burst write to all 64 bytes to the TXRAM for the next chunk.

### 12.8.38 DMA Large Count (DMACNTLEN)

**Figure 12-67. DMA Large Count Register (DMACNTLEN) [offset = 118h]**

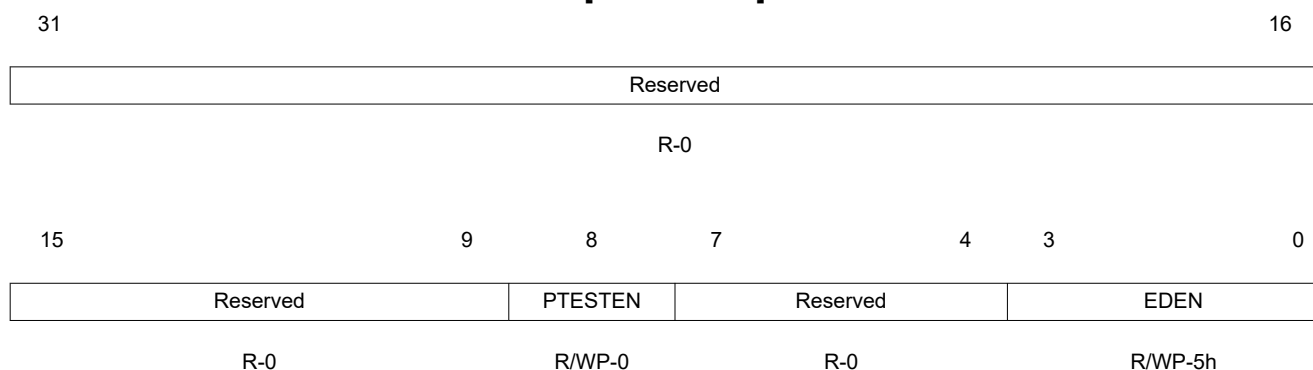

LEGEND: R/W = Read/Write; R = Read only; WP = Write in privilege mode only; -n = value after reset

**Table 12-45. MibSPI DMA Large Count Register (DMACNTLEN) Field Descriptions**

Bit	Field	Value	Description
31-1	Reserved	0	Reads return 0. Writes have no effect.
0	LARGE_COUNT	0	Select either the 16-bit DMAxCOUNT counters or the smaller counters in DMAxCTRL. Select the DMAxCTRL counters. Writes to the DMAxCTRL register will modify the ICOUNT value. Reading ICOUNT and COUNT can be done from the DMAxCTRL register. The DMAxCOUNT register should not be used since any write to this register will be overwritten by a subsequent write to the DMAxCTRL register to set the TXDMAENA or RXDMAENA bits.
		1	Select the DMAxCOUNT counters. Writes to the DMAxCTRL register will not modify the ICOUNT value. The ICOUNT value must be written to in the DMAxCOUNT register before the RXDMAENA or TXDMAENA bits are set in the DMAxCTRL register. The DMAxCOUNT register should be used for reading COUNT or ICOUNT.

### 12.8.39 Multi-buffer RAM Uncorrectable Parity Error Control Register (UERRCTRL)

**Figure 12-68. Multi-buffer RAM Uncorrectable Parity Error Control Register (UERRCTRL) [offset = 120h]**

LEGEND: R/W = Read/Write; R = Read only; WP = Write in privilege mode only; -n = value after reset

**Table 12-46. Multi-buffer RAM Uncorrectable Parity Error Control Register (UERRCTRL) Field Descriptions**

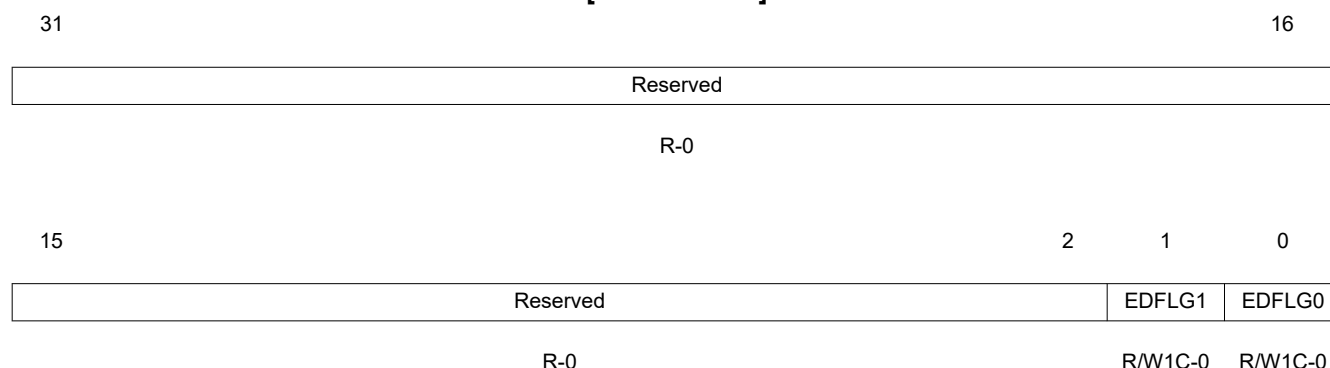

Bit	Field	Value	Description
31-9	Reserved	0	Reads return 0. Writes have no effect.

**Table 12-46. Multi-buffer RAM Uncorrectable Parity Error Control Register (UERRCTRL)**  
**Field Descriptions (continued)**

Bit	Field	Value	Description
8	PTESTEN	0 1	Parity memory test enable. This bit maps the parity bits corresponding to multi-buffer RAM locations into the peripheral RAM frame to make them accessible by the CPU. See <a href="#">Section 12.10</a> for further details about parity memory testing. Parity bits are not memory-mapped. Parity bits are memory-mapped.
7-4	Reserved	0	Reads return 0. Writes have no effect.
3-0	EDEN	5h All Other Values	Error detection enable. These bits enable parity error detection. Parity error detection logic (default) is disabled. Parity error detection logic is enabled. <b>Note: It is recommended to write a 1010 to enable error detection, to guard against a soft error from disabling parity error detect</b>

### 12.8.40 Multi-buffer RAM Uncorrectable Parity Error Status Register (UERRSTAT)

**Figure 12-69. Multi-buffer RAM Uncorrectable Parity Error Status Register (UERRSTAT)**  
[offset = 124h]

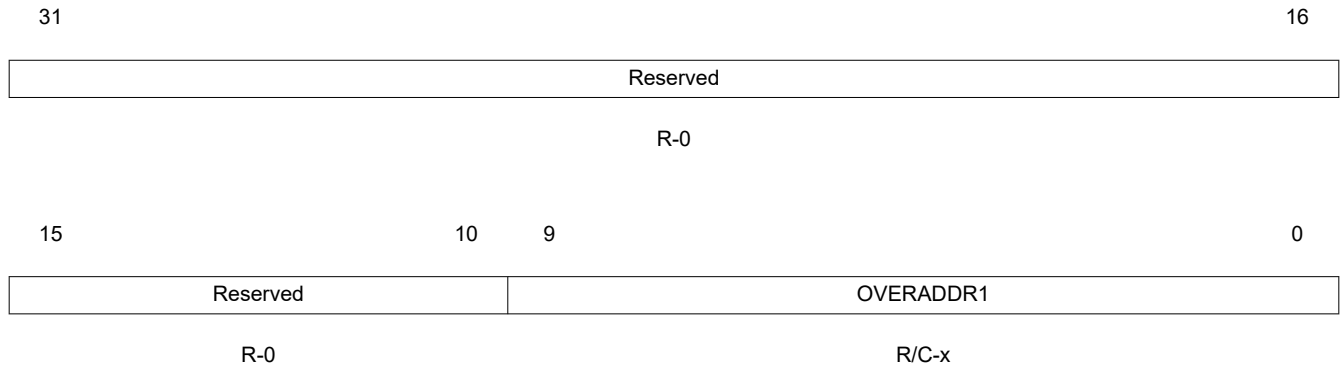

LEGEND: R/W = Read/Write; R = Read only; W1C = Write 1 to clear; -n = value after reset

**Field Descriptions**

Bit	Field	Value	Description
31-2	Reserved	0	Reads return 0. Writes have no effect.
1	EDFLG1	0	Uncorrectable parity error detection flag. This flag indicates if a parity error occurred in the RXRAM. <b>Note: Reading the UERRADDR1 register clears the EDFLG1 bit.</b> Read: No error has occurred. Write: Writing a 0 to this bit has no effect.
		1	Read: An error was detected and the address is captured in the UERRADDR1 register. Write: The bit is cleared to 0.
0	EDFLG0	0	Uncorrectable parity error detection flag. This flag indicates if a parity error occurred in the TXRAM. <b>Note: Reading the UERRADDR0 register clears the EDFLG0 bit.</b> Read: No error has occurred. Write: Writing a 0 to this bit has no effect.
		1	Read: An error was detected and the address is captured in the UERRADDR0 register. Write: The bit is cleared to 0.

### 12.8.41 RXRAM Uncorrectable Parity Error Address Register (UERRADDR1)

**Figure 12-70. RXRAM Uncorrectable Parity Error Address Register (UERRADDR1) [offset = 128h]**

LEGEND: R = Read only; C = Clear; -n = value after reset

**Table 12-48. RXRAM Uncorrectable Parity Error Address Register (UERRADDR1) Field Descriptions**

Bit	Field	Value	Description
31-10	Reserved	0	Reads return 0. Writes have no effect.
9-0	OVERADDR1	200h-3FFh	<p>Uncorrectable parity error address for RXRAM. This register holds the address where a parity error is generated while reading RXRAM. Only the CPU or DMA can read from RXRAM locations. The address captured is byte-aligned. This error address is frozen from being updated until it is read by the CPU. The offset address of RXRAM varies from 200h-3FFh.</p> <p>The register does not clear its contents during or after module-level reset, system-level reset or even power-on reset.</p> <p>A read operation to this register clears its contents to the default value 200h. After a power-on reset the contents will be unpredictable. A read operation can be performed after power-up to keep the register at its default value, if required. However, the contents of this register are meaningful only when EDFLG1 is set to 1.</p> <p><b>Note: A read of the UERRADDR1 register will clear EDFLG1 in the UERRSTAT register. However, in emulation mode when the SUSPEND signal is high, a read from the UERRADDR1 register does not clear EDFLG1.</b></p>

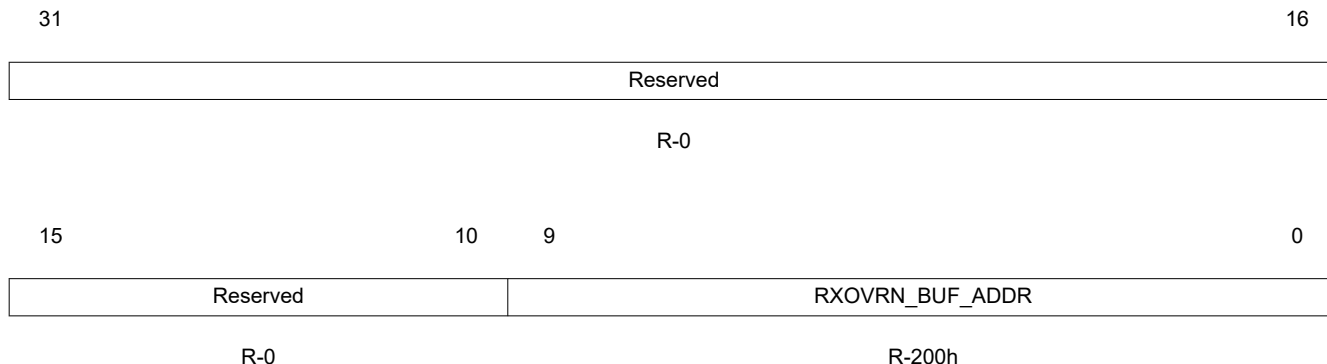

### 12.8.43 RXRAM Overrun Buffer Address Register (RXOVRN\_BUF\_ADDR)

In multi-buffer mode, if a particular RXRAM location is written by the MibSPI sequencer logic after the completion of a new transfer when that location already contains valid data, the RX\_OVR bit will be set to 1 while the data is being written. The RXOVRN\_BUF\_ADDR register captures the address of the RXRAM location for which a receiver overrun condition occurred.

**Figure 12-72. RXRAM Overrun Buffer Address Register (RXOVRN\_BUF\_ADDR) [offset = 130h]**

LEGEND: R = Read only; -n = value after reset

**Table 12-50. RXRAM Overrun Buffer Address Register (RXOVRN\_BUF\_ADDR) Field Descriptions**

Bit	Field	Value	Description
31-10	Reserved	0	Reads return 0. Writes have no effect.
9-0	RXOVRN_BUF_ADDR	200h-3FCh	<p>Address in RXRAM at which an overwrite occurred. This address value will show only the offset address of the RAM location in the multi-buffer RAM address space. Refer to the device-specific data sheet for the actual absolute address of RXRAM.</p> <p>This word-aligned address can vary from 200h-3FCh. Contents of this register are valid only when any of the INTVECT0 or INTVECT1 and SPIFLG registers show an RXOVRN error vector while in multi-buffer mode. If there are multiple overrun errors, then this register holds the address of first overrun address until it is read.</p> <p><b>Note:</b> Reading this register clears the RXOVRN interrupt flag in the SPIFLG register and the TGINTVECTx.</p> <p><b>Note:</b> Receiver overrun errors in multi-buffer mode can be completely avoided by using the SUSPEND until RXEMPTY feature, which can be programmed into each buffer of any TG. However, using the SUSPEND until RXEMPTY feature will make the sequencer wait until the current RXRAM location is read by the VBUS master before it can start the transfer for the same buffer location again. This may affect the overall throughput of the SPI transfer. By enabling the interrupt on RXOVRN in multi-buffer mode, the user can rely on interrupts to know if a receiver overrun has occurred. The address of the overrun in RXRAM is indicated in this RXOVRN_BUF_ADDR register.</p>

**Table 12-51. I/O-Loopback Test Control Register (IOLPBKTSTCR) Field Descriptions (continued)**

Bit	Field	Value	Description
19	CTRL DESYNC	0 1	Controls inducing of the desync error during I/O loopback test mode. Do not cause a desync error. Induce a desync error by forcing the incoming $\overline{\text{SPIEN}}\overline{\text{A}}$ pin (if functional) to remain 0 even after the transfer is complete. This forcing will be retained until the kernel reaches the idle state.
18	CTRL PARERR	0 1	Controls inducing of the parity errors during I/O loopback test mode. Do not cause a parity error. Induce a parity error by inverting the polarity of the parity bit.
17	CTRL TIMEOUT	0 1	Controls inducing of the timeout error during I/O loopback test mode. Do not cause a timeout error. Induce a timeout error by forcing the incoming $\overline{\text{SPIEN}}\overline{\text{A}}$ pin (if functional) to remain 1 when transmission is initiated. The forcing will be retained until the kernel reaches the idle state.
16	CTRL DLENERR	0 1	Controls inducing of the data length error during I/O loopback test mode. Do not cause a data-length error. Induce a data-length error. <i>Master mode:</i> The $\overline{\text{SPIEN}}\overline{\text{A}}$ pin (if functional) is forced to 1 when the module starts shifting data. <i>Slave mode:</i> The incoming $\overline{\text{SPICS}}$ pin (if functional) is forced to 1 when the module starts shifting data.
15-12	Reserved	0	Reads return 0. Writes have no effect.
11-8	IOLPBKSTENA	Ah All Other Values	Module I/O loopback test enable key. Enable I/O loopback test mode. Disable I/O loopback test mode.
7-6	Reserved	0	Reads return 0. Writes have no effect.
5-3	ERR SCS PIN	0 1h : 7h	Inject error on chip-select pin number x. The value in this field is decoded as the number of the chip select pin on which to inject an error. During analog loopback, if CTRL SCS PIN ERR bit is set to 1, then the chip select pin selected by this field is forced to the opposite of its value in the CSNR. Select $\overline{\text{SPICS}}[0]$ for injecting error. Select $\overline{\text{SPICS}}[1]$ for injecting error. : Select $\overline{\text{SPICS}}[7]$ for injecting error.
2	CTRL SCS PIN ERR	0 1	Enable/disable the injection of an error on the $\overline{\text{SPICS}}$ pins. The individual $\overline{\text{SPICS}}$ pins can be chosen using the ERR SCS PIN field. Disable the $\overline{\text{SPICS}}$ error-inducing logic. Enable the $\overline{\text{SPICS}}$ error-inducing logic.
1	LPBK TYPE	0 1	Module I/O loopback type (analog/digital). See <a href="#">Figure 12-22</a> for the different types of loopback modes. Enable Digital loopback when IOLPBKSTENA = 1010. Enable Analog loopback when IOLPBKSTENA = 1010.
0	RXPENA	0 1	Enable analog loopback through the receive pin. <b>Note: This bit is valid only when LPBK TYPE = 1, which chooses analog loopback mode.</b> Analog loopback is through the transmit pin. Analog loopback is through the receive pin.

### 12.8.45 SPI Extended Prescale Register 1 (EXTENDED\_PRESCALE1 for SPIFMT0 and SPIFMT1)

This register provides an extended Prescale values for SPICLK generation to be able to interface with much slower SPI Slaves. This is an extension of SPIFMT0 and SPIFMT1 registers. For example, EPRESCALE\_FMT1[7:0] of EXTENDED\_PRESCALE1 and PRESCALE1 of SPIFMT1 register will always reflect the same contents. Similarly, EPRESCALE\_FMT0[7:0] and PRESCALE0 of SPIFMT0 reflect the same contents.

**Figure 12-74. SPI Extended Prescale Register 1 (EXTENDED\_PRESCALE1 for SPIFMT0 and SPIFMT1)**  
[offset = 138h]

**Table 12-52. SPI Extended Prescale Register 1 (EXTENDED\_PRESCALE1) Field Descriptions**

Bit	Field	Value	Description
31-27	Reserved	0	Reads return 0. Writes have no effect.
26-16	EPRESCALE_FMT1	0-7FFh	<p>EPRESCALE_FMT1. Extended Prescale value for SPIFMT1. EPRESCALE_FMT1 determines the bit transfer rate of data format 1 if the SPI/MibSPI is the network master. EPRESCALE_FMT1 is use to derive SPICLK from VCLK. If the SPI is configured as slave, EPRESCALE_FMT1 <b>does not need</b> to be configured. These EPRESCALE_FMT1[7:0] bits and PRESCALE1 bits of SPIFMT1 register will point to the same physically implemented register. The clock rate for data format 1 can be calculated as:</p> $BR_{Format1} = VCLK / (EPRESCALE\_FMT1 + 1)$ <p>Write: This register field should be written if a SPICLK prescaler of more VCLK/256 is required. This field provides a prescaler of up to VCLK/2048 for SPICLK. Writing to this register field will also get reflected in the PRESCALE1 bits of SPIFMT1 register.</p> <p>Read: Reading this field will reflect the PRESCALE value based on the last written register field, that is, EXTENDED_PRESCALE1[26:16] or SPIFMT1[15:8] register.</p> <p><b>Note: If Extended Prescaler is required, it should be ensured that EXTENDED_PRESCALE1 register is programmed after SPIFMT1 register is programmed. This is to ensure that the final SPICLK prescale value is controlled by EXTENDED_PRESCALE1 register when a prescale of more 256 is intended on SPICLK. Writing to PRESCALE1 field of SPIFMT1 will automatically clear EPRESCALE_FMT1[10:8] bits to 000 so that the integrity of PRESCALE value is maintained.</b></p>
15-11	Reserved	0	Reads return 0. Writes have no effect.

**Table 12-52. SPI Extended Prescale Register 1 (EXTENDED\_PRESCALE1) Field Descriptions (continued)**

Bit	Field	Value	Description
10-0	EPRESCALE_FMT0	0-7FFh	<p>EPRESCALE_FMT0. Extended Prescale value for SPIFMT0. EPRESCALE_FMT0 determines the bit transfer rate of data format 0 if the SPI/MibSPI is the network master. EPRESCALE_FMT0 is use to derive SPICLK from VCLK. If the SPI is configured as slave, EPRESCALE_FMT0 <b>does not need</b> to be configured. These EPRESCALE_FMT0[7:0] bits and PRESCALE0 bits of SPIFMT0 register will point to the same physically implemented register. The clock rate for data format 0 can be calculated as:</p> $BR_{Format0} = VCLK / (EPRESCALE\_FMT0 + 1)$ <p>Write: This register field should be written if a SPICLK prescaler of more VCLK/256 is required. This field provides a prescaler of up to VCLK/2048 for SPICLK. Writing to this register field will also get reflected in the PRESCALE0 bits of SPIFMT0 register.</p> <p>Read: Reading this field will reflect the PRESCALE value based on the last written register field, that is, EXTENDED_PRESCALE0[10:0] or SPIFMT0[15:8] register.</p> <p><b>Note: If Extended Prescaler is required, it should be ensured that EXTENDED_PRESCALE1 register is programmed after SPIFMT0 register is programmed. This is to ensure that the final SPICLK prescale value is controlled by EXTENDED_PRESCALE1 register when a prescale of more 256 is intended on SPICLK. Writing to PRESCALE0 field of SPIFMT0 will automatically clear EPRESCALE_FMT0[10:8] bits to 000 so that the integrity of PRESCALE value is maintained.</b></p>

### 12.8.46 SPI Extended Prescale Register 2 (EXTENDED\_PRESCALE2 for SPIFMT2 and SPIFMT3)

This register provides an extended Prescale values for SPICLK generation to be able to interface with much slower SPI Slaves. This is an extension of SPIFMT2 and SPIFMT3 registers. For example, EPRESCALE\_FMT3[7:0] of EXTENDED\_PRESCALE2 and PRESCALE3 of SPIFMT3 register will always reflect the same contents. Similarly, EPRESCALE\_FMT2[7:0] and PRESCALE2 of SPIFMT2 reflect the same contents.

**Figure 12-75. SPI Extended Prescale Register 2 (EXTENDED\_PRESCALE2 for SPIFMT2 and SPIFMT3)**

26-16	EPRESCALE_FMT3	0-7FFh	<p>EPRESCALE_FMT3. Extended Prescale value for SPIFMT3. EPRESCALE_FMT3 determines the bit transfer rate of data format 3 if the SPI/MibSPI is the network master. EPRESCALE_FMT3 is use to derive SPICLK from VCLK. If the SPI is configured as slave, EPRESCALE_FMT3 <b>does not need</b> to be configured. These EPRESCALE_FMT3[7:0] bits and PRESCALE3 bits of SPIFMT3 register will point to the same physically implemented register. The clock rate for data format 1 can be calculated as:</p> $BR_{Format3} = VCLK / (EPRESCALE\_FMT3 + 1)$ <p>Write: This register field should be written if a SPICLK prescaler of more VCLK/256 is required. This field provides a prescaler of up to VCLK/2048 for SPICLK. Writing to this register field will also get reflected in the PRESCALE3 bits of SPIFMT3 register.</p> <p>Read: Reading this field will reflect the PRESCALE value based on the last written register field, that is, EXTENDED_PRESCALE3[26:16] or SPIFMT3[15:8] register.</p> <p><b>Note: If Extended Prescaler is required, it should be ensured that EXTENDED_PRESCALE2 register is programmed after SPIFMT3 register is programmed. This is to ensure that the final SPICLK prescale value is controlled by EXTENDED_PRESCALE2 register when a prescale of more 256 is intended on SPICLK. Writing to PRESCALE3 field of SPIFMT3 will automatically clear EPRESCALE_FMT3[10:8] bits to 000 so that the integrity of PRESCALE value is maintained.</b></p>
15-11	Reserved	0	Reads return 0. Writes have no effect.

**Table 12-53. SPI Extended Prescale Register 2 (EXTENDED\_PRESCALE2) Field Descriptions (continued)**

Bit	Field	Value	Description
10-0	EPRESCALE_FMT2	0-7FFh	<p>EPRESCALE_FMT2. Extended Prescale value for SPIFMT2. EPRESCALE_FMT2 determines the bit transfer rate of data format 2 if the SPI/MibSPI is the network master. EPRESCALE_FMT2 is use to derive SPICLK from VCLK. If the SPI is configured as slave, EPRESCALE_FMT2 <b>does not need</b> to be configured. These EPRESCALE_FMT2[7:0] bits and PRESCALE2 bits of SPIFMT2 register will point to the same physically implemented register. The clock rate for data format 0 can be calculated as:</p> $BR_{Format2} = VCLK / (EPRESCALE_FMT2 + 1)$ <p>Write: This register field should be written if a SPICLK prescaler of more VCLK/256 is required. This field provides a prescaler of up to VCLK/2048 for SPICLK. Writing to this register field will also get reflected in the PRESCALE2 bits of SPIFMT2 register.</p> <p>Read: Reading this field will reflect the PRESCALE value based on the last written register field, that is, EXTENDED_PRESCALE2[10:0] or SPIFMT2[15:8] register.</p> <p><b>Note: If Extended Prescaler is required, it should be ensured that EXTENDED_PRESCALE2 register is programmed after SPIFMT2 register is programmed. This is to ensure that the final SPICLK prescale value is controlled by EXTENDED_PRESCALE2 register when a prescale of more 256 is intended on SPICLK. Writing to PRESCALE2 field of SPIFMT2 will automatically clear EPRESCALE_FMT2[10:8] bits to 000 so that the integrity of PRESCALE value is maintained.</b></p>

## 12.9 Multi-Buffer RAM

The multi-buffer RAM is used for holding transmit and received data, control and status information. The multi-buffer RAM contains two banks of up to 128 32-bit words for a maximum configuration. One bank (TXRAM) contains entries for transmit data (replicating the SPIDAT1 register). The other bank (RXRAM) contains received data (replicating the SPIBUF register). The buffers can be partitioned into multiple TGs, each containing a programmable number of buffers. Each of the buffers can be subdivided into 16-bit transmit field, 16-bit receive field, 16-bit control field, and 16-bit status field, as displayed in Figure 12-76. A 4-bit parity field per word is also included in each bank of RAM.

**Figure 12-76. Multi-Buffer RAM Configuration**

All fields can be read and written with 8-bit, 16-bit, or 32-bit accesses.

The transmit fields can be written and read in the address range 000h to 1FFh. The transmit words contain data and control fields.

The receive RAM fields are read-only and can be accessed through the address range 200h to 3FCh. The receive words contain data and status fields.

The chip select number (CSNR) bit field of the control field for a given word is mirrored into the corresponding receive-buffer status field after transmission.

The Parity is automatically calculated and copied to Parity location

### Note

Please refer to the specific device datasheet for the actual number of transmit and receive buffers.

Write to unimplemented buffer is overwriting the corresponding implemented buffer. In MIBSPI, if the RAM SIZE specified is 32 buffers, write to 33rd buffer overwrites 1st buffer, write to 34th buffer overwrites 2nd buffer and so on.

### 12.9.1 Multi-Buffer RAM Auto Initialization

When the MIBSPI is out of reset mode, auto initialization of multi-buffer RAM starts. The application code must check for BUFINITACTIVE bit to be 0 (Multi-buffer RAM initialization is complete) before configuring multi-buffer RAM.

Besides the default auto initialization after reset, the auto-initialization sequence can also be done by:

1. Enable the global hardware memory initialization key by programming a value of 1010b to the bits [3:0] of the MINITGCR register of the System module.
2. Set the control bit for the multi-buffer RAM in the MSINENA System module register. This bit is device-specific for each memory that support auto-initialization. Please refer to the device datasheet to identify the control bit for the multi-buffer RAM. This starts the initialization process. The BUFINITACTIVE bit will get set to reflect that the initialization is ongoing.
3. When the memory initialization is completed, the corresponding status bit in the MINISTAT register will be set. Also, the BUFINITACTIVE bit will get cleared.
4. Disable the global hardware memory initialization key by programming a value of 0101 to the bits [3:0] of the MINITGCR register of the System module.

Please refer to the *Architecture* chapter for more details on the memory auto-initialization process.

#### Note

During Auto Initialization process, all the Multi-buffer mode registers (except MIBSPIE) will be reset to their default values. So, it should be ensured that Auto Initialization is completed before configuring the Multi-buffer mode registers.

### 12.9.2 Multi-Buffer RAM Register Summary

This section describes the multi-buffer RAM control and transmit-data fields of each word of TXRAM, and the status and receive-data fields of each word of RXRAM. The base address for multi-buffer RAM is FF0E 0000h for MibSPI1 RAM, FF0C 000h for MibSPI3 RAM, and FF0A 0000h for MibSPI5 RAM.

**Table 12-54. Multi-Buffer RAM Register Summary**

Offset	Acronym	Register Description	Section
Base + 0h-1FFh	TXRAM	Multi-Buffer RAM Transmit Data Register	<a href="#">Section 12.9.3</a>
Base + 200h-3FFh	RXRAM	Multi-Buffer RAM Receive Buffer Register	<a href="#">Section 12.9.4</a>

### 12.9.3 Multi-Buffer RAM Transmit Data Register (TXRAM)

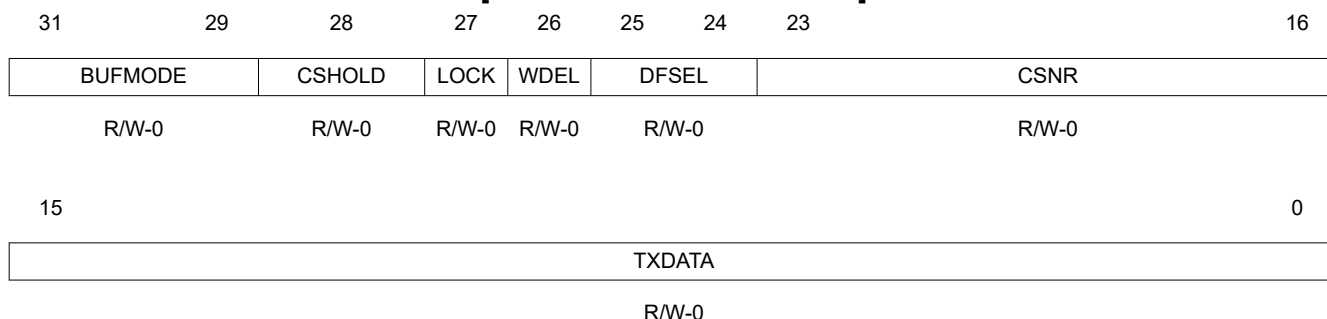

Each word of TXRAM is a transmit-buffer register.

#### Note

Writing to only the control fields, bits 28 through 16, does not initiate any SPI transfer in master mode. This feature can be used to set up SPICLK phase or polarity before actually starting the transfer by only updating the DFSEL bit field to select the required phase and polarity combination.

**Figure 12-77. Multi-Buffer RAM Transmit Data Register (TXRAM)**

[offset = RAM Base + 0h-1FFh]

LEGEND: R/W = Read/Write; -n = value after reset

**Table 12-55. Multi-Buffer RAM Transmit Data Register (TXRAM) Field Descriptions**

Bit	Field	Value	Description
31-29	BUFMODE		Specify conditions that are recognized by the sequencer to initiate transfers of each buffer word. When one of the "skip" modes is selected, the sequencer checks the buffer status every time it reads from this buffer. If the current buffer status (TXFULL, RXEMPTY) does not match, the buffer is skipped without a data transfer. When one of the "suspend" modes is selected, the sequencer checks the buffer status when it reads from this buffer. If TxFULL and/or RXEMPTY do not match, the sequencer waits until a match occurs. No data transfer is initiated until the status condition of this buffer changes.
		0	<b>disabled.</b> The buffer is disabled.
		1h	<b>skip single-transfer mode.</b> Skip this buffer until the corresponding TxFULL flag is set (new transmit data is available).
		2h	<b>skip overwrite-protect mode.</b> Skip this buffer until the corresponding RXEMPTY flag is set (new receive data can be stored in RXDATA without data loss).
		3h	<b>skip single-transfer overwrite-protect mode.</b> Skip this buffer until both of the corresponding TxFULL and RXEMPTY flags are set. (new transmit data available and previous data received by the host).
		4h	<b>continuous mode.</b> Initiate a transfer each time the sequencer checks this buffer. Data words are retransmitted if the buffer has not been updated. Receive data is overwritten, even if it has not been read.
		5h	<b>suspend single-transfer mode.</b> Suspend-to-wait until the corresponding TxFULL flag is set (the sequencer stops at the current buffer until new transmit data is written in the TXDATA field).
		6h	<b>suspend overwrite-protect mode.</b> Suspend-to-wait until the corresponding RXEMPTY flag is set (the sequencer stops at the current buffer until the previously-received data is read by the host).
		7h	<b>suspend single-transfer overwrite-protect mode.</b> Suspend-to-wait until the corresponding TxFULL and RXEMPTY flags are set (the sequencer stops at the current buffer until new transmit data is written into the TXDATA field and the previously-received data is read by the host).

**Table 12-55. Multi-Buffer RAM Transmit Data Register (TXRAM) Field Descriptions (continued)**

Bit	Field	Value	Description
28	CSHOLD	0 1	<p>Chip select hold mode. The CSHOLD bit is supported in master mode only, it is ignored in slave mode. CSHOLD defines the behavior of the chip select line at the end of a data transfer.</p> <p>The chip select signal is deactivated at the end of a transfer after the T2CDELAY time has passed. If two consecutive transfers are dedicated to the same chip select this chip select signal will be deactivated for at least 2VCLK cycles before it is activated again.</p> <p>The chip select signal is held active at the end of a transfer until a control field with new data and control information is loaded into SPIDAT1. If the new chip select number equals the previous one, the active chip select signal is extended until the end of transfer with CSHOLD cleared, or until the chip-select number changes.</p>
27	LOCK	0 1	<p>Lock two consecutive buffer words. Do not allow interruption by TGs with higher priority.</p> <p>Any higher-priority TG can begin at the end of the current transaction.</p> <p>A higher-priority TG cannot occur until after the next unlocked buffer word is transferred.</p>
26	WDEL	0 1	<p>Enable the delay counter at the end of the current transaction.</p> <p><b>Note: The WDEL bit is supported in master mode only. In slave mode, this bit is ignored.</b></p> <p>No delay will be inserted. However, <math>\overline{\text{SPICS}}</math> pins will still be de-activated for at least for 2VCLK cycles if CSHOLD = 0.</p> <p><b>Note: The duration for which the <math>\overline{\text{SPICS}}</math> pin remains deactivated also depends upon the time taken to supply a new word after completing the shift operation (in compatibility mode). If TXBUF is already full, then the <math>\overline{\text{SPICS}}</math> pin will be deasserted for at least two VCLK cycles (if WDEL = 0).</b></p> <p>After a transaction, WDELAY of the corresponding data format will be loaded into the delay counter. No transaction will be performed until the WDELAY counter overflows. The SPICS pins will be de-activated for at least (WDELAY + 2) × VCLK_Period duration.</p>
25-24	DFSEL	0 1h 2h 3h	<p>Data word format select.</p> <p>Data word format 0 is selected.</p> <p>Data word format 1 is selected.</p> <p>Data word format 2 is selected.</p> <p>Data word format 3 is selected.</p>
23-16	CSNR	0-FFh	<p>Chip select (CS) number. CSNR defines the chip select pins that will be activated during the data transfer. CSNR is a bit-mask that controls all chip select pins. See <a href="#">Table 12-56</a>.</p> <p><b>Note: If your MibSPI has less than 8 chip select pins, all unused upper bits will be 0. For example, MiBSPI3 has 6 chip select pins, if you write FFh to CSNR, the actual number stored in CSNR is 3Fh.</b></p>
15-0	TXDATA	0-7FFFh	<p>Transfer data. When written, these bits are copied to the shift register if it is empty. If the shift register is not empty, then they are held in TXBUF.</p> <p>SPIEN must be set to 1 before this register can be written to. Writing a 0 to SPIEN forces the lower 16 bits of TXDATA to 0.</p> <p>A write to this register (or to the TXDATA field only) drives the contents of the CSNR field on the <math>\overline{\text{SPICS}}</math> pins, if the pins are configured as functional pins (automatic chip select, see <a href="#">Section 12.2</a>).</p> <p>When this register is read, the contents of TXBUF, which holds the latest data written, will be returned.</p> <p><b>Note: Regardless of the character length, the transmit data should be right-justified before writing to the SPIDAT1 register.</b></p>

**Table 12-56. Chip Select Number Active**

CSNR Value	Chip Select Active:						CSNR Value	Chip Select Active:

1Fh		x	x	x	x	x	3Fh	x	x	x	x	x	x

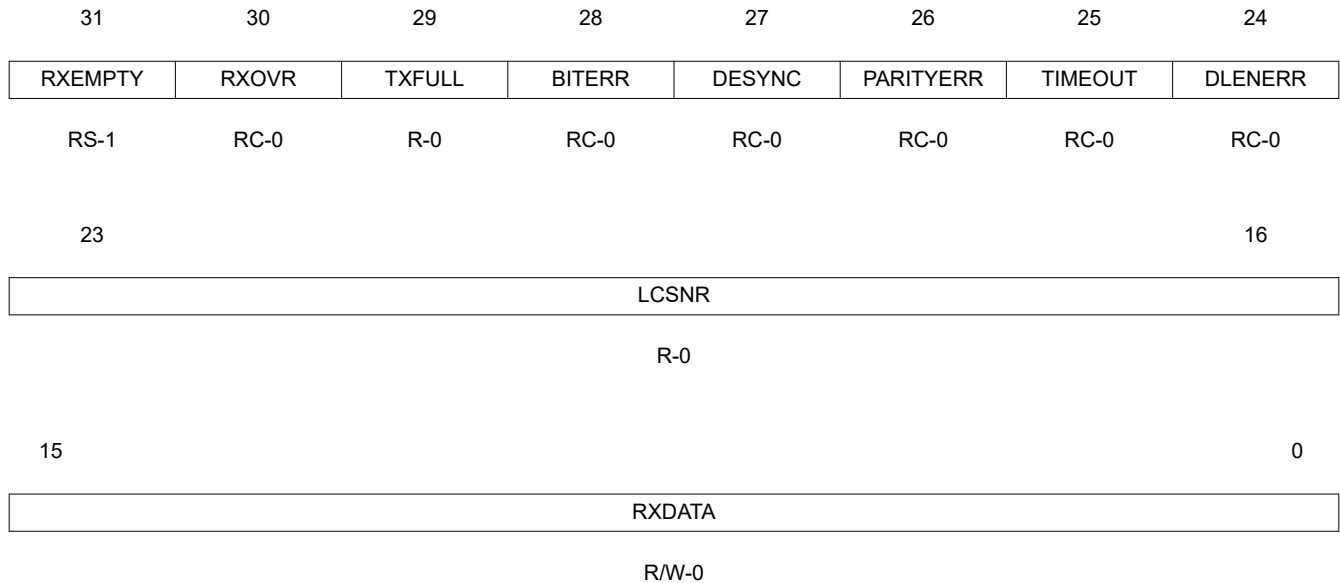

(1) If your MibSPI does not have this chip select pin, this bit is 0.

### 12.9.4 Multi-Buffer RAM Receive Buffer Register (RXRAM)

Each word of RXRAM is a receive-buffer register.

**Figure 12-78. Multi-Buffer RAM Receive Buffer Register (RXRAM)**

**[offset = RAM Base + 200h-3FFh]**

LEGEND: R/W = Read/Write; R = Read only; C = Clear; S = Set; -n = value after reset

**Table 12-57. Multi-Buffer Receive Buffer Register (RXRAM) Field Descriptions**

Bit	Field	Value	Description
31	RXEMPTY	<div>0</div> <div>1</div>	<p>Receive data buffer empty. When the host reads the RXDATA field or the entire RXRAM register, it automatically sets the RXEMPTY flag. When a data transfer is completed, the received data is copied into RXDATA, and the RXEMPTY flag is cleared.</p> <p>New data has been received and copied into RXDATA.</p> <p>No data has been received since the last read of RXDATA.</p> <p>This flag gets set to 1 under the following conditions:</p> <ul style="list-style-type: none"> <li>Reading the RXDATA field of the RXRAM register</li> <li>Writing a 1 to clear the RXINTFLG bit in the SPI Flag Register (SPIFLG)</li> </ul> <p>Write-clearing the RXINTFLG bit before reading RXDATA indicates the received data is being ignored. Conversely, RXINTFLG can be cleared by reading the RXDATA field of RXRAM (or the entire register).</p>
30	RXOVR	<div>0</div> <div>1</div>	<p>Receive data buffer overrun. When a data transfer is completed and the received data is copied into RXBUF while it is already full, RXOVR is set. Overruns always occur to RXBUF, not to RXRAM; the contents of RXRAM are overwritten only after it is read by the Peripheral (VBUSP) master (CPU, DMA, or other host processor).</p> <p>If enabled, the RXOVRN interrupt is generated when RXBUF is overwritten, and reading either SPI Flag Register (SPIFLG) or SPIVEXTx shows the RXOVRN condition. Two read operations from the RXRAM register are required to reach the overwritten buffer word (one to read RXRAM, which then transfers RXDATA into RXRAM for the second read).</p> <p><b>Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.</b></p> <p><b>Note: A special condition under which RXOVR flag gets set. If both RXRAM and RXBUF are already full and while another buffer receive is underway, if any errors such as TIMEOUT, BITERR, and DLEN_ERR occur, then RXOVR in RXBUF and SPI Flag Register (SPIFLG) registers will be set to indicate that the status flags are getting overwritten by the new transfer. This overrun should be treated like a normal receive overrun.</b></p> <p>No receive data overrun condition occurred since last read of the data field.</p> <p>A receive data overrun condition occurred since last read of the data field.</p>

**Table 12-57. Multi-Buffer Receive Buffer Register (RXRAM) Field Descriptions (continued)**

Bit	Field	Value	Description
29	TXFULL	0 1	<p>Transmit data buffer full. This flag is a read-only flag. Writing into the SPIDAT0 or SPIDAT1 field while the TX shift register is full will automatically set the TXFULL flag. Once the word is copied to the shift register, the TXFULL flag will be cleared. Writing to SPIDAT0 or SPIDAT1 when both TXBUF and the TX shift register are empty does not set the TXFULL flag.</p> <p>The transmit buffer is empty; SPIDAT0/SPIDAT1 is ready to accept a new data.</p> <p>The transmit buffer is full; SPIDAT0/SPIDAT1 is not ready to accept new data.</p>
28	BITERR	0 1	<p>Bit error. There was a mismatch of internal transmit data and transmitted data.</p> <p><b>Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.</b></p> <p>No bit error occurred.</p> <p>A bit error occurred. The SPI samples the signal of the transmit pins (master: SIMOx, slave: SOMIx) at the receive point (one-half clock cycle after the transmit point). If the sampled value differs from the transmitted value, a bit error is detected and the BITERR flag is set. Possible reasons for a bit error include noise, an excessively high bit rate, capacitive load, or another master/slave trying to transmit at the same time.</p>
27	DESYNC	0 1	<p>Desynchronization of slave device. This bit is valid in master mode only.</p> <p>The master monitors the ENA signal coming from the slave device and sets the DESYNC flag if ENA is deactivated before the last reception point or after the last bit is transmitted plus <math>t_{T2DELAY}</math>. If DESYNCENA is set, an interrupt is asserted. Desynchronization can occur if a slave device misses a clock edge coming from the master.</p> <p><b>Note: In the Compatibility Mode MibSPI, under some circumstances it is possible for a desync error detected for the previous buffer to be visible in the current buffer. This is because the receive completion flag/interrupt is generated when the buffer transfer is completed. But desynchronization is detected after the buffer transfer is completed. So, if the VBUS master reads the received data quickly when an RXINT is detected, then the status flag may not reflect the correct desync condition. In multi-buffer mode, the desync flag is always guaranteed to be for the current buffer.</b></p> <p><b>Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.</b></p> <p>No slave desynchronization is detected.</p> <p>A slave device is desynchronized.</p>
26	PARITYERR	0 1	<p>Parity error. The calculated parity differs from the received parity bit.</p> <p>If the parity generator is enabled (selected individually for each buffer) an even or odd parity bit is added at the end of a data word. During reception of the data word, the parity generator calculates the reference parity and compares it to the received parity bit. If a mismatch is detected, the PARITYERR flag is set.</p> <p><b>Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.</b></p> <p>No parity error is detected.</p> <p>A parity error occurred.</p>
25	TIMEOUT	0 1	<p>Time-out because of non-activation of <math>\overline{\text{SPIEN}}_A</math> pin.</p> <p>The SPI generates a time-out when the slave does not respond in time by activating the ENA signal after the chip select signal has been activated. If a time-out condition is detected, the corresponding chip select is deactivated immediately and the TIMEOUT flag is set. In addition, the TIMEOUT flag in the status field of the corresponding buffer and in the SPI Flag Register (SPIFLG) is set.</p> <p><b>Note: This bit is valid only in master mode.</b></p> <p><b>Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.</b></p> <p>No <math>\overline{\text{SPIEN}}_A</math> pin time-out occurred.</p> <p>An <math>\overline{\text{SPIEN}}_A</math> signal time-out occurred.</p>
24	DLENERR	0 1	<p>Data length error flag.</p> <p><b>Note: This flag is cleared to 0 when the RXDATA field of the RXRAM register is read.</b></p> <p>No data-length error occurred.</p> <p>A data length error occurred.</p>
23-16	LCSNR	0-FFh	<p>Last chip select number. LCSNR in the status field is a copy of CSNR in the corresponding control field. It contains the chip select number that was activated during the last word transfer.</p>

**Table 12-57. Multi-Buffer Receive Buffer Register (RXRAM) Field Descriptions (continued)**

Bit	Field	Value	Description
15-0	RXDATA	0-FFFFh	SPI receive data. This is the received word, transferred from the receive shift-register at the end of a transfer. Regardless of the programmed character length and the direction of shifting, the received data is stored right-justified in the register.

## 12.10 Parity Memory

The parity portion of multi-buffer RAM is not accessible by the CPU during normal operating modes. However, each read or write operation to the control/data/status portion of the multi-buffer RAM causes reads/writes to the parity portion as well.

- Each write to the multi-buffer RAM (either from the Peripheral interface or by the MibSPI itself) causes a write operation to the parity portion of RAM simultaneously to update the equivalent parity bits.
- Each read operation from the multi-buffer RAM (either from the Peripheral interface or by the MibSPI itself) causes a read operation from the parity portion of the RAM for parity comparison purpose.
- Reads/Writes to multi-buffer RAM can either be caused by any CPU/DMA accesses or by the sequencer logic of MibSPI itself.
- In case of Parity error ESM module is notified to generate MIBSPI Parity ESM interrupt. User can check the error status and address location captured in the UERRSTAT and UERRADDRx registers respectively.

For testing the parity portion of the multi-buffer RAM, which is a 4-bit field per word address (1 bit per byte), a separate parity memory test mode is available. Parity memory test mode can be enabled and disabled by the PTESTEN bit in the UERRCTRL register.

During the parity test mode, the parity locations are addressable at the address between RAM\_BASE\_ADDR + 0x400h and RAM\_BASE\_ADDR + 0x7FFh. Each location corresponds, sequentially, to each TXRAM word, then to each RXRAM word. See [Figure 12-79](#) for a diagram of the memory map of parity memory during normal operating mode and during parity test mode.

During parity test mode, after writing the data/control portion of the RAM, the parity locations can be written with incorrect parity bits to intentionally cause parity errors.

See the device-specific data sheet to get the actual base address of the multi-buffer RAM.

---

### Note

The RX\_RAM\_ACCESS bit can also be set to 1 during the parity test mode to be enable writes to RXRAM locations. Both parity RAM testing and RXRAM testing can be done together.

---

There are 4 bits of parity corresponding to each of the 32-bit multi-buffer locations. Individual bits in the parity memory are byte-addressable in parity test mode. See the example in [Figure 12-80](#) for further details.

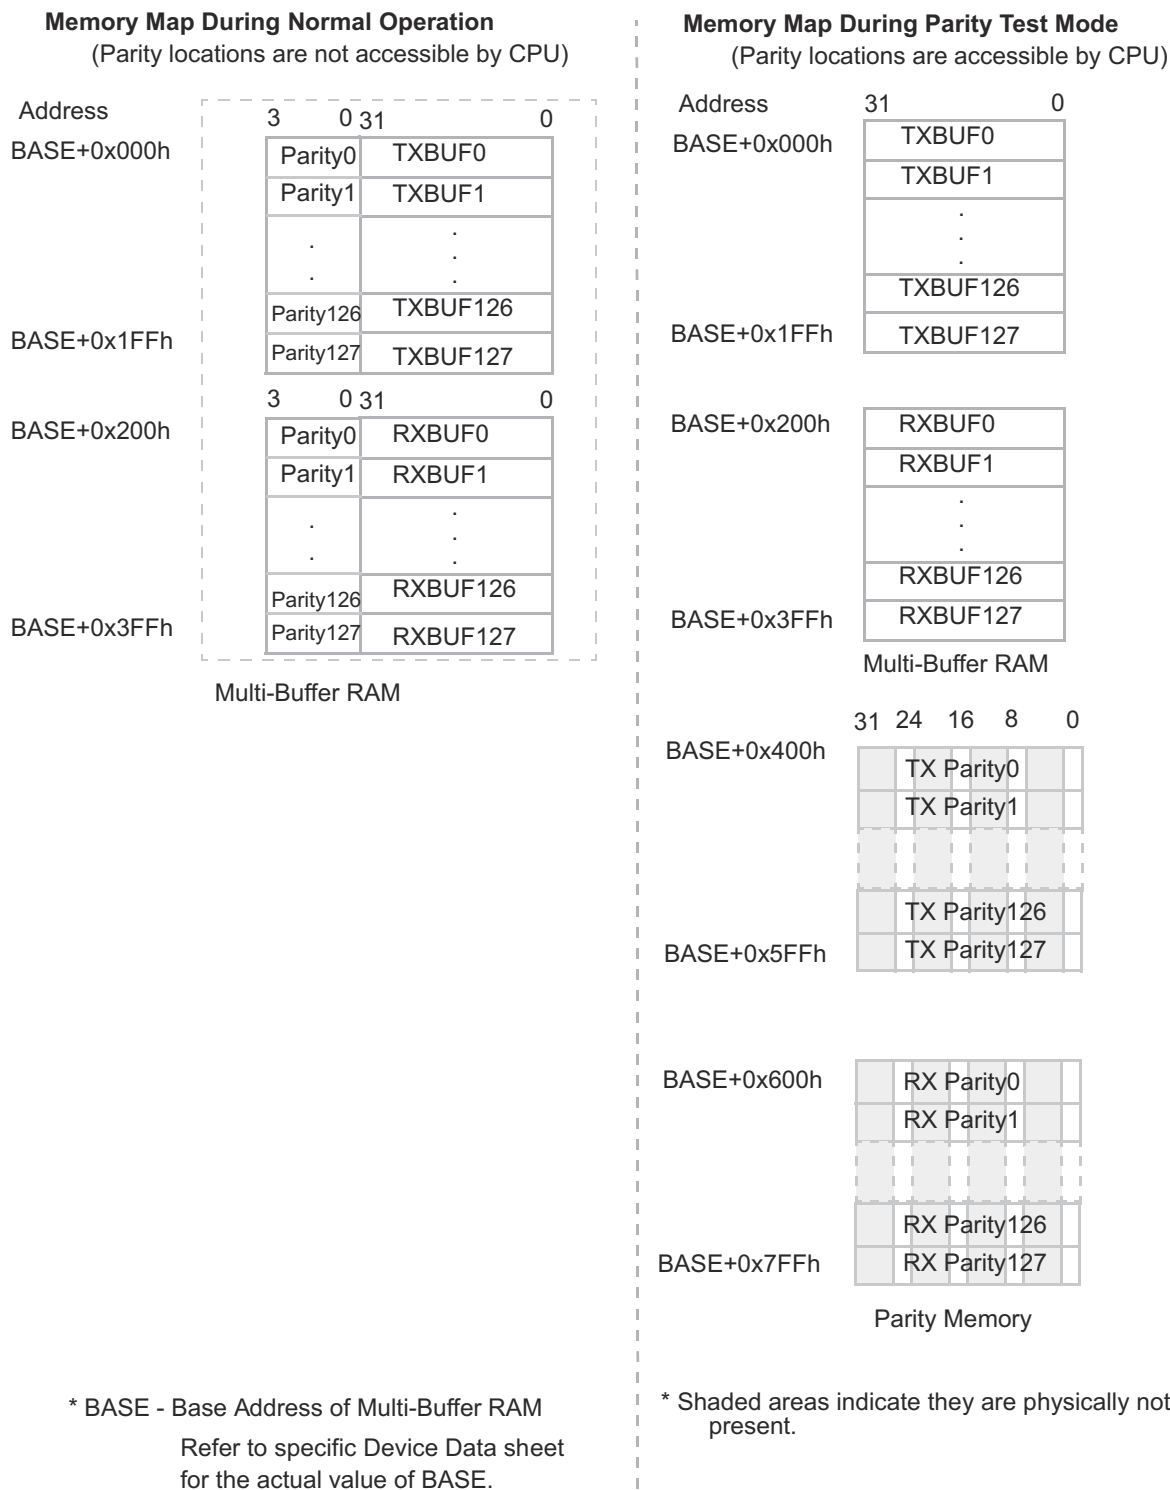

---

### Note

Polarity of the parity (odd/even) varies by device. In some devices, a control register in the system module can be used to select odd or even parity.

---

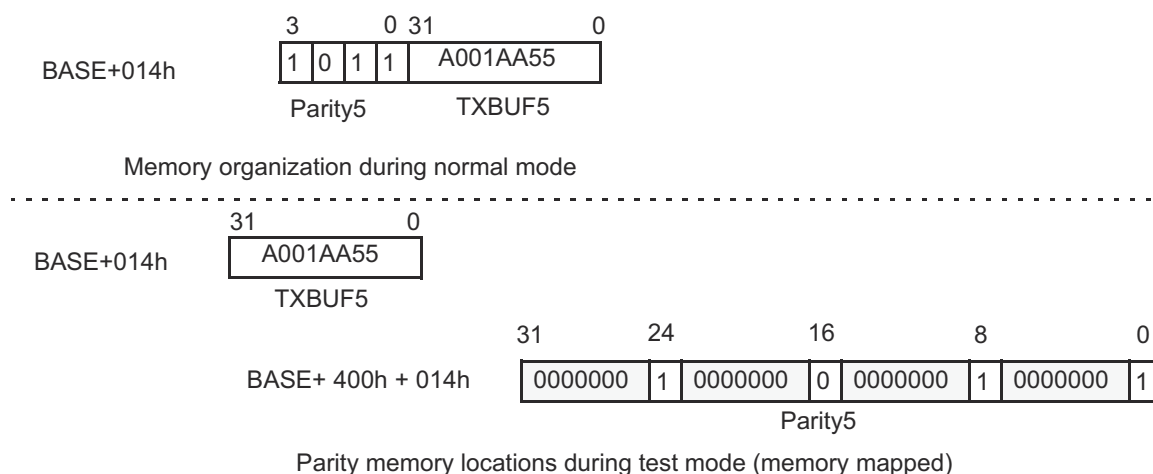

**Figure 12-79. Memory Map for Parity Locations During Normal and Test Mode**

### 12.10.1 Example of Parity Memory Organization

Suppose TXBUF5 (6th location in TXRAM) in the multi-buffer RAM is written with a value of A001\_AA55. If the polarity of the parity is set to odd, the corresponding parity location parity5 will get updated with equivalent parity of 1011 in its field.

During parity-memory test mode, these bits can be individually byte addressed. The return data will be a byte adjusted with actual parity bit in the LSB of the byte. If a word is read from the word-boundary address of parity locations, then each bit of the 4-bit parity is byte-adjusted and a 32-bit word is returned. 0s will be padded into the parity bits to get each byte. See Figure 12-80 for a diagram.

- 1 Shaded areas indicate reads return 0, writes have no effect. These registers are not physically present.

**Figure 12-80. Example of Memory-Mapped Parity Locations During Test Mode**

#### Note

##### Read Access to Parity Memory Locations

Parity memory locations can be read even without entering into parity memory test mode. Their address remains as in memory test mode. It is only to enter parity-memory test mode to enable write access to the parity memory locations.

## 12.11 MibSPI Pin Timing Parameters

The pin timings of SPI can be classified based on its mode of operation. In each mode, different configurations like Phase and Polarity affect the pin timings.

The pin directions are based on the mode of operation.

### Controller mode SPI:

- SPICLK (SPI Clock) - Output
- SPISIMO (SPI Peripheral In Controller Out) - Output
- $\overline{\text{SPICS}}$  (SPI Peripheral Chip Selects) - Output
- SPISOMI (SPI Peripheral Out Controller In) - Input
- $\overline{\text{SPIENA}}$  (SPI Peripheral ready Enable) - Input

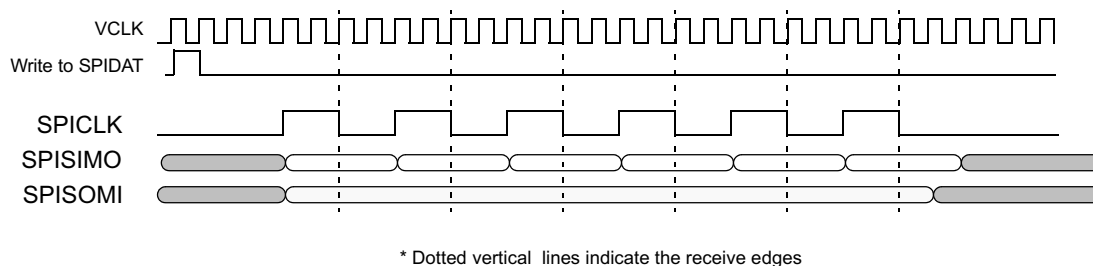

### Peripheral mode SPI:

- SPICLK - Input
- SPISIMO - Input
- $\overline{\text{SPICS}}$  - Input
- SPISOMI - Output
- $\overline{\text{SPIENA}}$  - Output

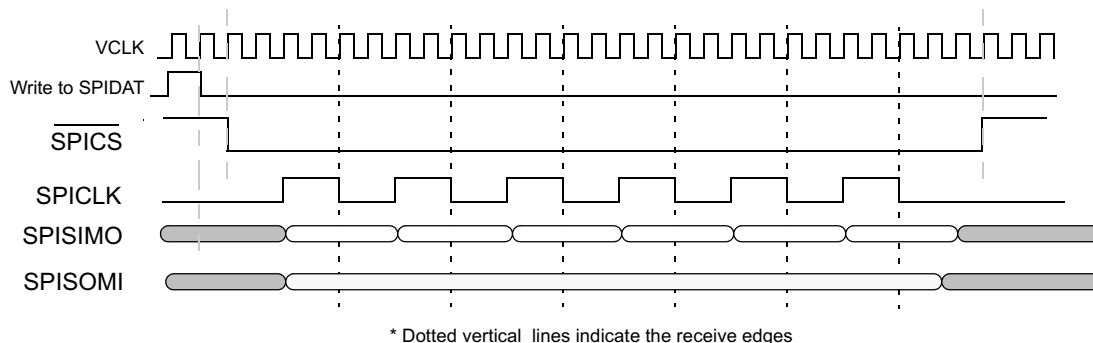

### Note

All the timing diagrams given below are with Phase = 0 and Polarity = 0, unless explicitly stated otherwise.

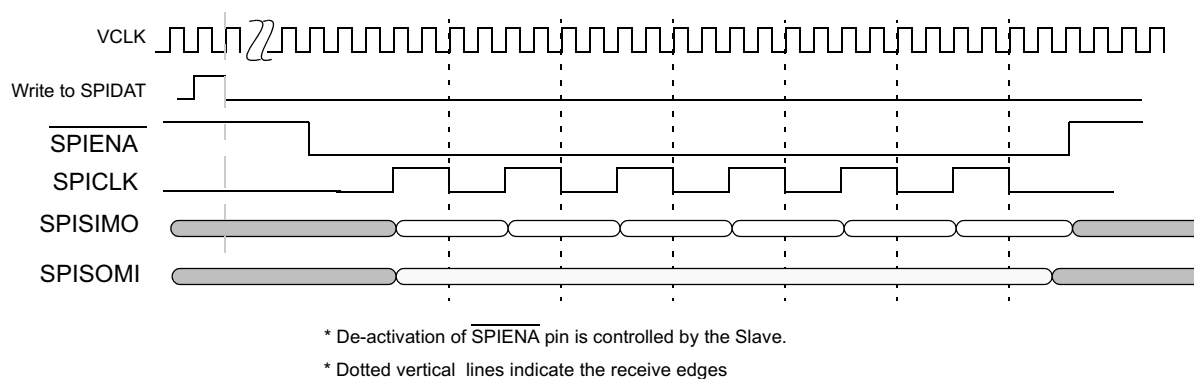

#### 12.11.1 Controller Mode Timings for SPI/MibSPI

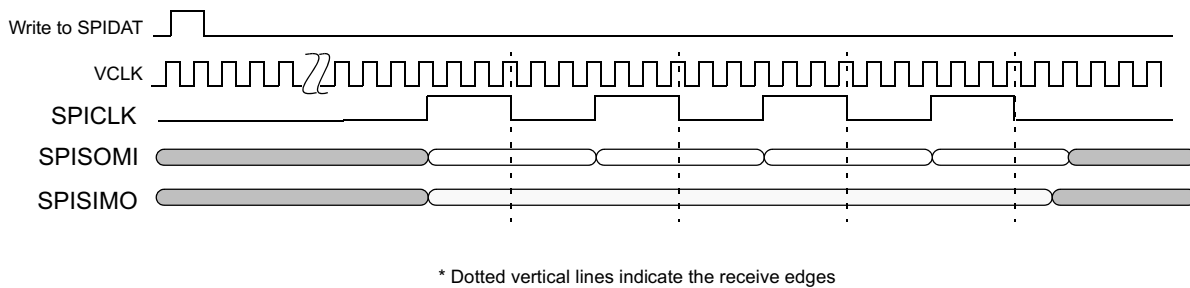

**Figure 12-81. SPI/MibSPI Pins During Controller Mode 3-pin Configuration**

**Figure 12-82. SPI/MibSPI Pins During Controller Mode 4-pin with  $\overline{\text{SPICS}}$  Configuration**

**Figure 12-83. SPI/MibSPI Pins During Controller Mode 4-pin with  $\overline{\text{SPIENA}}$  Configuration**

**Figure 12-84. SPI/MibSPI Pins During Controller/Peripheral Mode with 5-pin Configuration**

### 12.11.2 Peripheral Mode Timings for SPI/MibSPI

**Figure 12-85. SPI/MibSPI Pins During Peripheral Mode 3-pin Configuration**

**Figure 12-86. SPI/MibSPI Pins During Peripheral Mode 4-pin with  $\overline{\text{SPIENA}}$  Configuration**

**Figure 12-87. SPI/MibSPI Pins During Peripheral Mode in 5-pin Configuration - (Single Peripheral)**

**Figure 12-88. SPI/MibSPI Pins During Peripheral Mode in 5-pin Configuration - (Single/Multi Peripheral)**

### 12.11.3 Controller Timing Parameter Details

In case of Controller the module drives out SPICLK. It also drives out the Transmit data on SPISIMO with respect to its internal SPICLK. In case of Controller mode, the RX data on the SPISOMI pin is registered with respect to SPICLK received through the input buffer from the I/O pad.

If the chip select pin is functional, then the Controller will drive out the  $\overline{\text{SPICS}}$  pins before starting the SPICLK. If the  $\overline{\text{SPIENA}}$  pin is functional, then Controller will wait for an active low from the Peripheral on the input pin to start the SPICLK.

### 12.11.4 Peripheral Mode Timing Parameter Details

In case of Peripheral mode, the module will drive only the SPISOMI and  $\overline{\text{SPIENA}}$  pins. All other pins are inputs to it. The RX data on the SPISIMO pin will be registered with respect to the SPICLK pin. The Peripheral will use the  $\overline{\text{SPICS}}$  pin to drive out the  $\overline{\text{SPIENA}}$  pin if both are functional. If 4-pin with  $\overline{\text{SPIENA}}$  is configured, then the Peripheral will drive out an active-low signal on the  $\overline{\text{SPIENA}}$  pin when new data is written to the TX Shift Register. Irrespective of 4-pin with  $\overline{\text{SPIENA}}$  or 5-pin configuration, the Peripheral will deassert the  $\overline{\text{SPIENA}}$  pin after the last bit is received. If ENABLE\_HIGHZ (SPIINT0.24) bit is 0, the deasserted value of the  $\overline{\text{SPIENA}}$  pin will be 1. Otherwise, it will depend upon the internal pull up or pull down resistor (if implemented) depending upon the Specification of the Chip.

## Chapter 13

# ***Vectored Interrupt Manager (VIM) Module***

---

This chapter describes the behavior of the vectored interrupt manager (VIM) module of the device family.

<b>13.1 VIM Overview</b> .....	<b>3834</b>
<b>13.2 VIM Interrupt Inputs</b> .....	<b>3834</b>

<b>13.9 VIM Interrupt Handling</b> .....	<b>3836</b>
<b>13.10 MSS_VIM Registers</b> .....	<b>3840</b>

## 13.1 VIM Overview

The VIM aggregates device interrupts and sends them to the R5F CPU(s). It can be used in either split or lockstep configuration. In split, it has two independent interrupt cores, one per CPU. In lockstep, CPU1 acts as a diagnostic on CPU0; only CPU0's outputs are used but all outputs are compared to CPU1 to provide diagnostic coverage.

The VIM module supports the following features:

- 256 interrupt inputs per R5F core
- Each interrupt has its own 4-bit programmable priority
  - Defined via the INTPRIORITY\_j register
  - The VIM provides support for priority interruption of interrupts
- Each interrupt has its own enable mask
  - Interrupt enable is done via the INTR\_EN\_SET\_j register
  - Interrupt disable is done via the INTR\_EN\_CLR\_j register
- Each interrupt can be programmed as either an IRQ or FIQ
  - Defined via the INTMAP\_j register
- Each interrupt has its own programmable 32-bit vector address associated with it
  - Defined via the INTVECTOR\_j register
  - Protected with SECED
- One IRQn and one FIQn output per core
- Vectored interrupt interface
  - Compatible with R5F VIC port
- Default vector provided when a double-bit error is detected
- Split or lockstep capable
  - In lockstep mode, only interrupts connected to VIM interrupt core 0 are available
- Software interrupt generation

## 13.2 VIM Interrupt Inputs

The VIM supports 256 interrupt inputs per core. Each interrupt can be either a level or a pulse (both active-high). The interrupt mapping for the two R5F cores can be found in [Chapter 7, Interrupts](#).

## 13.3 VIM Interrupt Outputs

The VIM has two interrupt outputs per core:

- *CoreN\_IRQn*: This is a normal interrupt for core *N* (active-low level). It can be serviced via the VIC interface or through the MMR interface. Whenever an interrupt input goes high, if that interrupt is mapped as an IRQ (via the INTMAP\_j register) and is enabled (via the INTR\_EN\_SET\_j register), then it will cause an IRQ to assert
- *CoreN\_FIQn*: This is a fast (or non-maskable) interrupt for core *N* (active-low level). FIQs always have priority over IRQs. An FIQ can be serviced through the MMR interface. Whenever an interrupt input goes high, if that interrupt is mapped as an FIQ and is enabled, then it will cause an FIQ to assert

## 13.4 VIM Interrupt Vector Table (VIM RAM)

For each VIM interrupt core, there is an associated interrupt vector table (VIM RAM) that is used to store the address of ISRs. During register vectored interrupt and hardware vectored interrupt, VIM accesses the interrupt vector table using the vector value to fetch the address of the corresponding ISR. Note that both interrupt vector tables are identical in their memory organization.

The VIM RAM is basically comprised of a set of interrupt vector registers (INTVECTOR\_j). Hence, the interrupt vector table is organized in 256 words of 30 bits, with a base address corresponding to the physical address of the first register in the group.

### Note

The lower two bits of the 32-bit interrupt vector are always 0s.

Figure 13-1 shows the VIM RAM interrupt vector map.

VIM RAM Address Space	VIM RAM Entries
Base Address + 0h	Interrupt 0 Vector
Base Address + 4h	Interrupt 1 Vector
Base Address + 8h	Interrupt 2 Vector
⋮	⋮
Base Address + 3F8h	Interrupt 254 Vector
Base Address + 3FCh	Interrupt 255 Vector

**Figure 13-1. VIM RAM Interrupt Vector Map**

The interrupt vector table has protection by ECC to indicate corruption due to soft errors. The ECC logic inside VIM supports SECDED. Refer to the ECC aggregator map for the VIM RAM ID.

## 13.5 VIM Interrupt Prioritization

The VIM supports the interruption of the currently active interrupt by one with a higher priority. FIQs and IRQs are completely separate but both use the same mechanism.

When an interrupt goes from pending to active (FIQ: reading the FIQVEC register; IRQ: reading the IRQVEC register, then the interrupt is loaded into the corresponding active register (ACTFIQ / ACTIRQ), and all interrupts of an equal or lesser priority are masked (discarded). If prior to this interrupt being cleared (by writing to the FIQVEC register, or IRQVEC register) another interrupt of higher priority arrives, then the FIQn/IRQn will be asserted and that interrupt made pending as normal. If the CPU switches this interrupt to active (by reading the FIQVEC / IRQVEC register), then the currently active interrupt will be pushed onto a stack. When an interrupt is cleared by reading the FIQVEC / IRQVEC register, if there are any interrupts on the stack, the first entry is popped off and put back into the ACTFIQ / ACTIRQ register, so that software may continue where it left off.

## 13.6 VIM ECC Support

The memory that holds the interrupt vector for each interrupt is protected by SECDED ECC. Single-bit errors are corrected and written back. Double-bit errors are not corrected. If a double-bit error occurs while trying to load a vector, then the DEDVEC register is used to provide the default vector for the *coreN\_IRQADDRV* signal, the IRQVEC register, and the FIQVEC register. The DEDVEC should point to an ISR that handles the fact that there was an uncorrectable error in the interrupt handling.

Some possible remediating actions would be to:

1. Reconstruct the vector table and re-start the application
  - a. Potentially switch to a completely software interrupt handler in the mean time
2. Restart the application from scratch
3. Reset the device

4. Sit in a loop (or WFI) while something external (for example, the ESM) responds to the DED interrupt that will be generated

It is up to the user and the application to determine the appropriate action.

---

#### Note

An interrupt that has an uncorrectable vector error (and thus uses the DED vector) will still have the priority of the original interrupt. This makes it possible for a higher priority interrupt to supercede the handling of the error.

Control and reporting are done by the ECC aggregator.

---

### 13.7 VIM Lockstep Mode

In lockstep mode, CPU1 is used as a diagnostic for CPU0. In this mode, only the interrupt inputs for CPU0 are used. Besides to CPU0, these interrupt inputs are also internally routed to CPU1 (through the level-sync / edge-detect logic dedicated to CPU1, and additionally through some delay circuits). The outputs from both VIM interrupt cores are then sent to the MSS CCMR5 module through dedicated compare buses (with CPU0's outputs delayed). The CCMR5 module is responsible for comparing the two sets of output signals and for reporting any mismatches by generating an interrupt (MSS\_CCMR5\_ERR).

---

#### Note

In lockstep mode, only the RAM dedicated to CPU0 is used, so software *must not* do anything with the ECC interface on the RAM dedicated to CPU1.

---

### 13.8 VIM IDLE State

The VIM will indicate IDLE when there are no pending unmasked interrupts or MMR accesses. The VIM does not have a clock stop interface.

### 13.9 VIM Interrupt Handling

There are multiple ways to service an interrupt depending on how much of the hardware assistance offered by the VIM the software wants to take advantage of.

For IRQs, it is recommended to use the procedure in [Section 13.9.1](#), but the procedures in [Section 13.9.2](#) or [Section 13.9.3](#) (if a user wants to implement a fully software prioritization scheme) may be used as alternatives.

For FIQs, it is recommended to use the procedure in [Section 13.9.4](#), but the procedure in [Section 13.9.5](#) may be used as an alternative.

---

#### Note

These descriptions do not include steps such as stack pushes and state retention that software must take in order to return from the ISR. It is assumed that the programmer is aware of these steps.

---

#### 13.9.1 Servicing IRQ Through Vector Interface

If the associated CPU has the vector (VIC) interface enabled, then the following method is used for servicing IRQs:

1. Hardware handshake
  - a. CPU asserts *coreN\_IRQACK* high
  - b. VIM asserts *coreN\_IRQADDRV* to indicate that the *coreN\_IRQADDR* bus is stable with the correct vector address
  - c. CPU reads *coreN\_IRQADDR*, jumps to that address, and de-asserts *coreN\_IRQACK* low
  - d. VIM de-asserts *coreN\_IRQn* and *coreN\_IRQADDRV*, VIM masks (discards) all IRQs with the same or lower priority

- e. VIM loads the value from the PRIIRQ[9:0] NUM bit field (which corresponds to the vector address) into the ACTIRQ[9:0] NUM bit field, which causes the ACTIRQ[31] VALID bit to be set
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level (determined by reading the ACTIRQ[9:0] NUM bit field to determine number, and reading the appropriate bit in the INTTYPE\_j register to determine type)
  - a. Pulse
    - i. Clear the status by writing a '1' to the appropriate bit in the IRQSTS\_j register, or STS\_j register
    - ii. Clear the interrupt at the source. This way, the source can generate another pulse, if it needs to, and the VIM will process this as a new interrupt
  - b. Level
    - i. Clear the interrupt at the source
    - ii. Clear the status by writing a '1' to the appropriate bit in the IRQSTS\_j register, or STS\_j register. This way, the level should be gone at the input to the VIM, it will avoid falsely re-calling the interrupt. If the source maintains the level, then it means there is another interrupt
4. Write any value to the IRQVEC register
  - a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
  - b. This will also clear the ACTIRQ[31] VALID bit

### 13.9.2 Servicing IRQ Through MMR Interface

When an IRQ interrupt is received, the CPU should follow these steps if not using the vector interface:

1. Read the IRQVEC register and jump to that address to service the ISR
  - a. Reading this register will mask (discard) all interrupts of an equal or lower priority and de-assert the *coreN\_IRQn* output. If another interrupt of a higher priority becomes available, the *coreN\_IRQn* will re-assert, allowing priority interruption of an interrupt
  - b. Reading this register will cause the value from the PRIIRQ[9:0] NUM bit field to be loaded into the ACTIRQ[9:0] NUM bit field, and the ACTIRQ[31] VALID bit to be set
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level
  - a. Pulse
    - i. Clear the status by writing a '1' to the appropriate bit in the STS\_j register, or IRQSTS\_j register
    - ii. Clear the interrupt at the source
  - b. Level
    - i. Clear the interrupt at the source
    - ii. Clear the status by writing a '1' to the appropriate bit in the STS\_j register, or IRQSTS\_j register
4. Write any value to the IRQVEC register
  - a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
  - b. This will also clear the ACTIRQ[31] VALID bit

### 13.9.3 Servicing IRQ Through MMR Interface (Alternative)

If a user does not want to use the IRQVEC register, the VIM may be used as a more traditional interrupt controller. Note that in this mode, there is no hardware priority masking (because the IRQVEC register is never read). Software would be responsible for doing all priority operations.

1. Determine which interrupt to service

- a. Read the PRIIRQ register to determine which interrupt is the highest priority IRQ currently asserted, OR
  - b. Optionally read the IRQGSTS register to determine which groups have IRQs pending, then read the IRQSTS\_j register and use a software prioritization scheme to determine which IRQ to service
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level
  - a. Pulse
    - i. Clear the status by writing a '1' to the appropriate bit in the STS\_j register, or IRQSTS\_j register
    - ii. Clear the interrupt at the source.
  - b. Level
    - i. Clear the interrupt at the source
    - ii. Clear the status by writing a '1' to the appropriate bit in the STS\_j register, or IRQSTS\_j register

### 13.9.4 Servicing FIQ

When an FIQ interrupt is received, the CPU should follow these steps:

1. Read the FIQVEC register and jump to that address to service the ISR
  - a. Reading this register will mask (discard) all interrupts of an equal or lower priority and de-assert the *coreN\_FIQn* output. If another interrupt of a higher priority becomes available, the *coreN\_FIQn* will re-assert, allowing priority interruption of an interrupt.
  - b. Reading this register will cause the value from the PRIFIQ[9:0] NUM bit field to be loaded into the ACTFIQ[9:0] NUM bit field, and the ACTFIQ[31] VALID bit to be set
2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level (determined by reading the ACTFIQ[9:0] NUM bit field to determine number, and reading the appropriate bit in the INTTYPE\_j register to determine type)
  - a. Pulse
    - i. Clear the status by writing a '1' to the appropriate bit in the STS\_j register, or FIQSTS\_j register
    - ii. Clear the interrupt at the source. This way, the source can generate another pulse, if it needs to, and the VIM will process this as a new interrupt
  - b. Level
    - i. Clear the interrupt at the source
    - ii. Clear the status by writing a '1' to the appropriate bit in the STS\_j register, or FIQSTS\_j register. This way, the level should be gone at the input to the VIM, it will avoid falsely re-calling the interrupt. If the source maintains the level, then it means there is another interrupt
4. Write any value to the FIQVEC register
  - a. This will clear the priority mask and will cause all interrupts to be re-evaluated for the new highest priority interrupt
  - b. This will also clear the ACTFIQ[31] VALID bit

### 13.9.5 Servicing FIQ (Alternative)

If a user does not want to use the FIQVEC register, the VIM may be used as a more traditional interrupt controller. Note that in this mode, there is no hardware priority masking (because the FIQVEC register is never read). Software would be responsible for doing all priority operations.

1. Determine which interrupt to service
  - a. Read the PRIFIQ register to determine which interrupt is the highest priority FIQ currently asserted, OR
  - b. Optionally read the FIQGSTS register to determine which groups have IRQs pending, then read the FIQSTS\_j register and use a software prioritization scheme to determine which FIQ to service

2. Service the interrupt
3. Depending on whether the original source of the interrupt was a pulse or a level
  - a. Pulse
    - i. Clear the status by writing a '1' to the appropriate bit in the STS<sub>j</sub> register, or FIQSTS<sub>j</sub> register
    - ii. Clear the interrupt at the source.
  - b. Level
    - i. Clear the interrupt at the source
    - ii. Clear the status by writing a '1' to the appropriate bit in the STS<sub>j</sub> register, or FIQSTS<sub>j</sub> register.

## 13.10 MSS\_VIM Registers

Table 13-1 lists the memory-mapped registers for the MSS\_VIM registers. All register offset addresses not listed in Table 13-1 should be considered as reserved locations and the register contents should not be modified.

**Table 13-1. MSS\_VIM Registers**

Offset	Acronym	Register Name	Section
0h	PID	PID	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. [Table 13-2](#) shows the codes that are used for access types in this section.

**Table 13-2. MSS\_VIM Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

### 13.10.1 PID Register (Offset = 0h) [Reset = 00000000h]

PID is shown in [Table 13-3](#).

Return to the [Summary Table](#).

The Revision Register contains the major and minor revisions for the module.

**Table 13-3. PID Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-30	SCHEME	R	1h	PID register scheme
29-28	BU	R	2h	Business Unit: 10 = Processors
27-16	FUNC	R	90h	Module ID
15-11	RTL	R	0h	RTL revision. Will vary depending on release.
10-8	MAJOR	R	0h	Major revision
7-6	CUSTOM	R	0h	Custom
5-0	MINOR	R	1h	Minor revision

### 13.10.2 INFO Register (Offset = 4h) [Reset = 00000000h]

INFO is shown in [Table 13-4](#).

Return to the [Summary Table](#).

The Info Register gives the configuration Information of this VIM.

**Table 13-4. INFO Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-11	RES1	R	0h	RESERVE FIELD
10-0	INTERRUPTS	R	100h	Total number of Interrupts

### 13.10.3 PRIIRQ Register (Offset = 8h) [Reset = 00000000h]

PRIIRQ is shown in [Table 13-5](#).

Return to the [Summary Table](#).

The Prioritized IRQ Register shows the number of the highest priority pending IRQ.

**Table 13-5. PRIIRQ Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	VALID	R	0h	Indicates that the num field is valid.
30-20	RES2	R	0h	RESERVE FIELD
19-16	PRI	R	0h	Priority of the highest priority pending IRQ. valid only if the valid flag is set.
15-10	RES3	R	0h	RESERVE FIELD
9-0	NUM	R	0h	Number of the highest priority pending IRQ. valid only if the valid flag is set.

### 13.10.4 PRIFIQ Register (Offset = Ch) [Reset = 00000000h]

PRIFIQ is shown in [Table 13-6](#).

Return to the [Summary Table](#).

The Prioritized FIQ Register shows the number of the highest priority pending FIQ.

**Table 13-6. PRIFIQ Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	VALID	R	0h	Indicates that the num field is valid.
30-20	RES4	R	0h	RESERVE FIELD
19-16	PRI	R	0h	Priority of the highest priority pending FIQ. valid only if the valid flag is set.
15-10	RES5	R	0h	RESERVE FIELD
9-0	NUM	R	0h	Number of the highest priority pending FIQ. valid only if the valid flag is set.

### 13.10.5 IRQGSTS Register (Offset = 10h) [Reset = 00000000h]

IRQGSTS is shown in [Table 13-7](#).

Return to the [Summary Table](#).

The IRQ Group Status Register indicates which groups have pending IRQ interrupts.

**Table 13-7. IRQGSTS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STS	R	0h	Indicates that the num field is valid.

### 13.10.6 FIQGSTS Register (Offset = 14h) [Reset = 00000000h]

FIQGSTS is shown in [Table 13-8](#).

Return to the [Summary Table](#).

The FIQ Group Status Register indicates which groups have pending FIQ interrupts.

**Table 13-8. FIQGSTS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STS	R	0h	Indicates that the num field is valid.

### 13.10.7 IRQVEC Register (Offset = 18h) [Reset = 00000000h]

IRQVEC is shown in [Table 13-9](#).

Return to the [Summary Table](#).

The IRQ Vector Address Register contains the 32-bit address of the interrupt vector for the current pending IRQ.

**Table 13-9. IRQVEC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	Upper 30 bits of the 32-bit vector address. Only valid if the Prioritized IRQ Register valid flag is true.
1-0	RES21	R	0h	RESERVE FIELD

### 13.10.8 FIQVEC Register (Offset = 1Ch) [Reset = 00000000h]

FIQVEC is shown in [Table 13-10](#).

Return to the [Summary Table](#).

The FIQ Vector Address Register contains the 32-bit address of the interrupt vector for the current pending FIQ.

**Table 13-10. FIQVEC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	Upper 30 bits of the 32-bit vector address. Only valid if the Prioritized FIQ Register valid flag is true.
1-0	RES22	R	0h	RESERVE FIELD

### 13.10.9 ACTIRQ Register (Offset = 20h) [Reset = 00000000h]

ACTIRQ is shown in [Table 13-11](#).

Return to the [Summary Table](#).

The Active IRQ Register shows the number of the currently active IRQ.

**Table 13-11. ACTIRQ Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	VALID	R	0h	Indicates that the num field is valid. Set when the IRQ Vector Address Register is read and cleared whenever the IRQ Vector Address Register is written.
30-20	RES6	R	0h	RESERVE FIELD
19-16	PRI	R	0h	Priority of the highest priority pending IRQ. valid only if the valid flag is set.
15-10	RES7	R	0h	RESERVE FIELD
9-0	NUM	R	0h	Number of the currently active IRQ. Loaded from teh Prioritized IRQ Register whenever the IRQ Vector Address is read. Valid only if the valid flag is set.

### 13.10.10 ACTFIQ Register (Offset = 24h) [Reset = 00000000h]

ACTFIQ is shown in [Table 13-12](#).

Return to the [Summary Table](#).

The Active FIQ Register shows the number of the currently active FIQ.

**Table 13-12. ACTFIQ Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	VALID	R	0h	Indicates that the num field is valid. Set when the FIQ Vector Address Register is read and cleared whenever the FIQ Vector Address Register is written.
30-20	RES8	R	0h	RESERVE FIELD
19-16	PRI	R	0h	Priority of the highest priority pending IRQ. valid only if the valid flag is set.
15-10	RES9	R	0h	RESERVE FIELD
9-0	NUM	R	0h	Number of the currently active FIQ. Loaded from teh Prioritized FIQ Register whenever the FIQ Vector Address is read. Valid only if the valid flag is set.

### 13.10.11 DEDVEC Register (Offset = 30h) [Reset = 00000000h]

DEDVEC is shown in [Table 13-13](#).

Return to the [Summary Table](#).

The DED Vector Address contains a default vector address for when an uncorrectable error is detected for an active IRQ or FIQ.

**Table 13-13. DEDVEC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	Upper 30 bits of the 32-bit vector address.
1-0	RES23	R	0h	RESERVE FIELD

### 13.10.12 RAW Register (Offset = 400h) [Reset = 00000000h]

RAW is shown in [Table 13-14](#).

Return to the [Summary Table](#).

Group M Interrupt Raw Status/Set Register (M is 0 to 7)  $h400 + M \times h20 + h00$

**Table 13-14. RAW Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

### 13.10.13 STS Register (Offset = 404h) [Reset = 00000000h]

STS is shown in [Table 13-15](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7)  $h400 + M \times h20 + h04$

**Table 13-15. STS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

### 13.10.14 INTR\_EN\_SET Register (Offset = 408h) [Reset = 00000000h]

INTR\_EN\_SET is shown in [Table 13-16](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Set Register (M is 0 to 7)  $h400 + M \times h20 + h08$

**Table 13-16. INTR\_EN\_SET Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

### 13.10.15 INTER\_EN\_CLR Register (Offset = 40Ch) [Reset = 00000000h]

INTER\_EN\_CLR is shown in [Table 13-17](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Clear Register (M is 0 to 7)  $h400 + M \times h20 + h0C$

**Table 13-17. INTER\_EN\_CLR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

### 13.10.16 IRQSTS Register (Offset = 410h) [Reset = 00000000h]

IRQSTS is shown in [Table 13-18](#).

Return to the [Summary Table](#).

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7)  $h400 + M \times h20 + h10$

**Table 13-18. IRQSTS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ . Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

### 13.10.17 FIQSTS Register (Offset = 414h) [Reset = 00000000h]

FIQSTS is shown in [Table 13-19](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7)  $h400 + M \times h20 + h14$

**Table 13-19. FIQSTS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

### 13.10.18 INTMAP Register (Offset = 418h) [Reset = 00000000h]

INTMAP is shown in [Table 13-20](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7)  $\text{h}400 + \text{M} \times \text{h}20 + \text{h}18$

**Table 13-20. INTMAP Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where $Q = \text{M} \times 32 + \text{Bit } 0$ IRQ Interrupt (default) 1 FIQ Interrupt

### 13.10.19 INTTYPE Register (Offset = 41Ch) [Reset = 00000000h]

INTTYPE is shown in [Table 13-21](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7)  $h400 + M \times h20 + 0x1C$

**Table 13-21. INTTYPE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	<p>This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M.</p> <p>This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling).</p> <p>The value has no effect on how the VIM hardware functions.</p> <p>The input interrupts are agnostic as to whether they are pulse or level.</p> <p>Each bit corresponds to event Q where <math>Q = M \times 32 + \text{Bit 0 Level}</math> (default) 1 Pulse</p>

### 13.10.20 RAW\_1 Register (Offset = 420h) [Reset = 00000000h]

RAW\_1 is shown in [Table 13-22](#).

Return to the [Summary Table](#).

Group M Interrupt Raw Status/Set Register (M is 0 to 7)  $h400 + M \times h20 + h00$

**Table 13-22. RAW\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

### 13.10.21 STS\_1 Register (Offset = 424h) [Reset = 00000000h]

STS\_1 is shown in [Table 13-23](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7)  $h400 + M \times h20 + h04$

**Table 13-23. STS\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

### 13.10.22 INTR\_EN\_SET\_1 Register (Offset = 428h) [Reset = 00000000h]

INTR\_EN\_SET\_1 is shown in [Table 13-24](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Set Register (M is 0 to 7)  $h400 + M \times h20 + h08$

**Table 13-24. INTR\_EN\_SET\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

### 13.10.23 INTER\_EN\_CLR\_1 Register (Offset = 42Ch) [Reset = 00000000h]

INTER\_EN\_CLR\_1 is shown in [Table 13-25](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Clear Register (M is 0 to 7)  $h400 + M \times h20 + h0C$

**Table 13-25. INTER\_EN\_CLR\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

### 13.10.24 IRQSTS\_1 Register (Offset = 430h) [Reset = 00000000h]

IRQSTS\_1 is shown in [Table 13-26](#).

Return to the [Summary Table](#).

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7)  $h400 + M \times h20 + h10$

**Table 13-26. IRQSTS\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ . Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

### 13.10.25 FIQSTS\_1 Register (Offset = 434h) [Reset = 00000000h]

FIQSTS\_1 is shown in [Table 13-27](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

**Table 13-27. FIQSTS\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

### 13.10.26 INTMAP\_1 Register (Offset = 438h) [Reset = 00000000h]

INTMAP\_1 is shown in [Table 13-28](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7)  $h400 + M \times h20 + h18$

**Table 13-28. INTMAP\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit 0}$ IRQ Interrupt (default) 1 FIQ Interrupt

### 13.10.27 INTTYPE\_1 Register (Offset = 43Ch) [Reset = 00000000h]

INTTYPE\_1 is shown in [Table 13-29](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

**Table 13-29. INTTYPE\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	<p>This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M.</p> <p>This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling).</p> <p>The value has no effect on how the VIM hardware functions.</p> <p>The input interrupts are agnostic as to whether they are pulse or level.</p> <p>Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse</p>

### 13.10.28 RAW\_2 Register (Offset = 440h) [Reset = 00000000h]

RAW\_2 is shown in [Table 13-30](#).

Return to the [Summary Table](#).

Group M Interrupt Raw Status/Set Register (M is 0 to 7)  $h400 + M \times h20 + h00$

**Table 13-30. RAW\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

### 13.10.29 STS\_2 Register (Offset = 444h) [Reset = 00000000h]

STS\_2 is shown in [Table 13-31](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7)  $h400 + M \times h20 + h04$

**Table 13-31. STS\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

### 13.10.30 INTR\_EN\_SET\_2 Register (Offset = 448h) [Reset = 00000000h]

INTR\_EN\_SET\_2 is shown in [Table 13-32](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Set Register (M is 0 to 7)  $h400 + M \times h20 + h08$

**Table 13-32. INTR\_EN\_SET\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

### 13.10.31 INTER\_EN\_CLR\_2 Register (Offset = 44Ch) [Reset = 00000000h]

INTER\_EN\_CLR\_2 is shown in [Table 13-33](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Clear Register (M is 0 to 7)  $h400 + M \times h20 + h0C$

**Table 13-33. INTER\_EN\_CLR\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

### 13.10.32 IRQSTS\_2 Register (Offset = 450h) [Reset = 00000000h]

IRQSTS\_2 is shown in [Table 13-34](#).

Return to the [Summary Table](#).

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7)  $h400 + M \times h20 + h10$

**Table 13-34. IRQSTS\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ . Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

### 13.10.33 FIQSTS\_2 Register (Offset = 454h) [Reset = 00000000h]

FIQSTS\_2 is shown in [Table 13-35](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

**Table 13-35. FIQSTS\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

### 13.10.34 INTMAP\_2 Register (Offset = 458h) [Reset = 00000000h]

INTMAP\_2 is shown in [Table 13-36](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7)  $h400 + M \times h20 + h18$

**Table 13-36. INTMAP\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit 0}$ IRQ Interrupt (default) 1 FIQ Interrupt

### 13.10.35 INTTYPE\_2 Register (Offset = 45Ch) [Reset = 00000000h]

INTTYPE\_2 is shown in [Table 13-37](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

**Table 13-37. INTTYPE\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	<p>This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M.</p> <p>This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling).</p> <p>The value has no effect on how the VIM hardware functions.</p> <p>The input interrupts are agnostic as to whether they are pulse or level.</p> <p>Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse</p>

### 13.10.36 RAW\_3 Register (Offset = 460h) [Reset = 00000000h]

RAW\_3 is shown in [Table 13-38](#).

Return to the [Summary Table](#).

Group M Interrupt Raw Status/Set Register (M is 0 to 7)  $h400 + M \times h20 + h00$

**Table 13-38. RAW\_3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

### 13.10.37 STS\_3 Register (Offset = 464h) [Reset = 00000000h]

STS\_3 is shown in [Table 13-39](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7)  $h400 + M \times h20 + h04$

**Table 13-39. STS\_3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

### 13.10.38 INTR\_EN\_SET\_3 Register (Offset = 468h) [Reset = 00000000h]

INTR\_EN\_SET\_3 is shown in [Table 13-40](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Set Register (M is 0 to 7)  $h400 + M \times h20 + h08$

**Table 13-40. INTR\_EN\_SET\_3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

### 13.10.39 INTER\_EN\_CLR\_3 Register (Offset = 46Ch) [Reset = 00000000h]

INTER\_EN\_CLR\_3 is shown in [Table 13-41](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Clear Register (M is 0 to 7)  $h400 + M \times h20 + h0C$

**Table 13-41. INTER\_EN\_CLR\_3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

### 13.10.40 IRQSTS\_3 Register (Offset = 470h) [Reset = 00000000h]

IRQSTS\_3 is shown in [Table 13-42](#).

Return to the [Summary Table](#).

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7)  $h400 + M \times h20 + h10$

**Table 13-42. IRQSTS\_3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ . Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

### 13.10.41 FIQSTS\_3 Register (Offset = 474h) [Reset = 00000000h]

FIQSTS\_3 is shown in [Table 13-43](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

**Table 13-43. FIQSTS\_3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

### 13.10.42 INTMAP\_3 Register (Offset = 478h) [Reset = 00000000h]

INTMAP\_3 is shown in [Table 13-44](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7)  $\text{h400} + \text{M} \times \text{h20} + \text{h18}$

**Table 13-44. INTMAP\_3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where $Q = \text{Mx32} + \text{Bit 0 IRQ Interrupt}$ (default) 1 FIQ Interrupt

### 13.10.43 INTTYPE\_3 Register (Offset = 47Ch) [Reset = 00000000h]

INTTYPE\_3 is shown in [Table 13-45](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

**Table 13-45. INTTYPE\_3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	<p>This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M.</p> <p>This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling).</p> <p>The value has no effect on how the VIM hardware functions.</p> <p>The input interrupts are agnostic as to whether they are pulse or level.</p> <p>Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse</p>

### 13.10.44 RAW\_4 Register (Offset = 480h) [Reset = 00000000h]

RAW\_4 is shown in [Table 13-46](#).

Return to the [Summary Table](#).

Group M Interrupt Raw Status/Set Register (M is 0 to 7)  $h400 + M \times h20 + h00$

**Table 13-46. RAW\_4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

### 13.10.45 STS\_4 Register (Offset = 484h) [Reset = 00000000h]

STS\_4 is shown in [Table 13-47](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7)  $h400 + M \times h20 + h04$

**Table 13-47. STS\_4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

### 13.10.46 INTR\_EN\_SET\_4 Register (Offset = 488h) [Reset = 00000000h]

INTR\_EN\_SET\_4 is shown in [Table 13-48](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Set Register (M is 0 to 7)  $h400 + M \times h20 + h08$

**Table 13-48. INTR\_EN\_SET\_4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

### 13.10.47 INTER\_EN\_CLR\_4 Register (Offset = 48Ch) [Reset = 00000000h]

INTER\_EN\_CLR\_4 is shown in [Table 13-49](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Clear Register (M is 0 to 7)  $h400 + M \times h20 + h0C$

**Table 13-49. INTER\_EN\_CLR\_4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

### 13.10.48 IRQSTS\_4 Register (Offset = 490h) [Reset = 00000000h]

IRQSTS\_4 is shown in [Table 13-50](#).

Return to the [Summary Table](#).

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7)  $h400 + M \times h20 + h10$

**Table 13-50. IRQSTS\_4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ . Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

### 13.10.49 FIQSTS\_4 Register (Offset = 494h) [Reset = 00000000h]

FIQSTS\_4 is shown in [Table 13-51](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

**Table 13-51. FIQSTS\_4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

### 13.10.50 INTMAP\_4 Register (Offset = 498h) [Reset = 00000000h]

INTMAP\_4 is shown in [Table 13-52](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7)  $\text{h}400 + \text{M} \times \text{h}20 + \text{h}18$

**Table 13-52. INTMAP\_4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where $Q = \text{M} \times 32 + \text{Bit } 0$ IRQ Interrupt (default) 1 FIQ Interrupt

### 13.10.51 INTTYPE\_4 Register (Offset = 49Ch) [Reset = 00000000h]

INTTYPE\_4 is shown in [Table 13-53](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

**Table 13-53. INTTYPE\_4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	<p>This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M.</p> <p>This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling).</p> <p>The value has no effect on how the VIM hardware functions.</p> <p>The input interrupts are agnostic as to whether they are pulse or level.</p> <p>Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse</p>

### 13.10.52 RAW\_5 Register (Offset = 4A0h) [Reset = 00000000h]

RAW\_5 is shown in [Table 13-54](#).

Return to the [Summary Table](#).

Group M Interrupt Raw Status/Set Register (M is 0 to 7)  $h400 + M \times h20 + h00$

**Table 13-54. RAW\_5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

### 13.10.53 STS\_5 Register (Offset = 4A4h) [Reset = 00000000h]

STS\_5 is shown in [Table 13-55](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h04

**Table 13-55. STS\_5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

### 13.10.54 INTR\_EN\_SET\_5 Register (Offset = 4A8h) [Reset = 00000000h]

INTR\_EN\_SET\_5 is shown in [Table 13-56](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Set Register (M is 0 to 7) h400 + M x h20 + h08

**Table 13-56. INTR\_EN\_SET\_5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

### 13.10.55 INTER\_EN\_CLR\_5 Register (Offset = 4ACh) [Reset = 00000000h]

INTER\_EN\_CLR\_5 is shown in [Table 13-57](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Clear Register (M is 0 to 7)  $h400 + M \times h20 + h0C$

**Table 13-57. INTER\_EN\_CLR\_5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

### 13.10.56 IRQSTS\_5 Register (Offset = 4B0h) [Reset = 00000000h]

IRQSTS\_5 is shown in [Table 13-58](#).

Return to the [Summary Table](#).

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

**Table 13-58. IRQSTS\_5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where Q = Mx32+Bit. Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

### 13.10.57 FIQSTS\_5 Register (Offset = 4B4h) [Reset = 00000000h]

FIQSTS\_5 is shown in [Table 13-59](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

**Table 13-59. FIQSTS\_5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

### 13.10.58 INTMAP\_5 Register (Offset = 4B8h) [Reset = 00000000h]

INTMAP\_5 is shown in [Table 13-60](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7)  $h400 + M \times h20 + h18$

**Table 13-60. INTMAP\_5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit 0}$ IRQ Interrupt (default) 1 FIQ Interrupt

### 13.10.59 INTTYPE\_5 Register (Offset = 4BCh) [Reset = 00000000h]

INTTYPE\_5 is shown in [Table 13-61](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

**Table 13-61. INTTYPE\_5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	<p>This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M.</p> <p>This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling).</p> <p>The value has no effect on how the VIM hardware functions.</p> <p>The input interrupts are agnostic as to whether they are pulse or level.</p> <p>Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse</p>

### 13.10.60 RAW\_6 Register (Offset = 4C0h) [Reset = 00000000h]

RAW\_6 is shown in [Table 13-62](#).

Return to the [Summary Table](#).

Group M Interrupt Raw Status/Set Register (M is 0 to 7)  $h400 + M \times h20 + h00$

**Table 13-62. RAW\_6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

### 13.10.61 STS\_6 Register (Offset = 4C4h) [Reset = 00000000h]

STS\_6 is shown in [Table 13-63](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7)  $h400 + M \times h20 + h04$

**Table 13-63. STS\_6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

### 13.10.62 INTR\_EN\_SET\_6 Register (Offset = 4C8h) [Reset = 00000000h]

INTR\_EN\_SET\_6 is shown in [Table 13-64](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Set Register (M is 0 to 7)  $h400 + M \times h20 + h08$

**Table 13-64. INTR\_EN\_SET\_6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

### 13.10.63 INTER\_EN\_CLR\_6 Register (Offset = 4CCh) [Reset = 00000000h]

INTER\_EN\_CLR\_6 is shown in [Table 13-65](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Clear Register (M is 0 to 7)  $h400 + M \times h20 + h0C$

**Table 13-65. INTER\_EN\_CLR\_6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

### 13.10.64 IRQSTS\_6 Register (Offset = 4D0h) [Reset = 00000000h]

IRQSTS\_6 is shown in [Table 13-66](#).

Return to the [Summary Table](#).

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

**Table 13-66. IRQSTS\_6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where Q = Mx32+Bit. Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

### 13.10.65 FIQSTS\_6 Register (Offset = 4D4h) [Reset = 00000000h]

FIQSTS\_6 is shown in [Table 13-67](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

**Table 13-67. FIQSTS\_6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

### 13.10.66 INTMAP\_6 Register (Offset = 4D8h) [Reset = 00000000h]

INTMAP\_6 is shown in [Table 13-68](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7)  $h400 + M \times h20 + h18$

**Table 13-68. INTMAP\_6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit 0 IRQ Interrupt (default) 1 FIQ Interrupt}$

### 13.10.67 INTTYPE\_6 Register (Offset = 4DCh) [Reset = 00000000h]

INTTYPE\_6 is shown in [Table 13-69](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

**Table 13-69. INTTYPE\_6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	<p>This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M.</p> <p>This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling).</p> <p>The value has no effect on how the VIM hardware functions.</p> <p>The input interrupts are agnostic as to whether they are pulse or level.</p> <p>Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse</p>

### 13.10.68 RAW\_7 Register (Offset = 4E0h) [Reset = 00000000h]

RAW\_7 is shown in [Table 13-70](#).

Return to the [Summary Table](#).

Group M Interrupt Raw Status/Set Register (M is 0 to 7)  $h400 + M \times h20 + h00$

**Table 13-70. RAW\_7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STS	R/W	0h	This is the raw status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive Read 1 Active/ Pending Write 0 No effect Write 1 Set to Interrupt Raw Status

### 13.10.69 STS\_7 Register (Offset = 4E4h) [Reset = 00000000h]

STS\_7 is shown in [Table 13-71](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Status/Clear Register (M is 0 to 7)  $h400 + M \times h20 + h04$

**Table 13-71. STS\_7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Inactive or Disabled Read 1 Active/Pending and Enabled Write 0 No effect Write 1 Clear Interrupt Raw Status

### 13.10.70 INTR\_EN\_SET\_7 Register (Offset = 4E8h) [Reset = 00000000h]

INTR\_EN\_SET\_7 is shown in [Table 13-72](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Set Register (M is 0 to 7)  $h400 + M \times h20 + h08$

**Table 13-72. INTR\_EN\_SET\_7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to enable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Set Enable

### 13.10.71 INTER\_EN\_CLR\_7 Register (Offset = 4ECh) [Reset = 00000000h]

INTER\_EN\_CLR\_7 is shown in [Table 13-73](#).

Return to the [Summary Table](#).

Group M Interrupt Enabled Clear Register (M is 0 to 7)  $h400 + M \times h20 + h0C$

**Table 13-73. INTER\_EN\_CLR\_7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to disable the mask of events in Group M Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit}$ Read 0 Disabled Read 1 Enabled Write 0 No effect Write 1 Clear Enable

### 13.10.72 IRQSTS\_7 Register (Offset = 4F0h) [Reset = 00000000h]

IRQSTS\_7 is shown in [Table 13-74](#).

Return to the [Summary Table](#).

Group M Interrupt IRQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h10

**Table 13-74. IRQSTS\_7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to IRQ. Each bit corresponds to event Q where Q = Mx32+Bit. Read 0 Inactive, Disabled, or not an IRQ. Read 1 Active/Pending, Enabled, and IRQ. Write 0 No effect. Write 1 Clear Interrupt Raw Status (if IRQ).

### 13.10.73 FIQSTS\_7 Register (Offset = 4F4h) [Reset = 00000000h]

FIQSTS\_7 is shown in [Table 13-75](#).

Return to the [Summary Table](#).

Group M Interrupt FIQ Enabled Status/Clear Register (M is 0 to 7) h400 + M x h20 + h14

**Table 13-75. FIQSTS\_7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This is the masked status of the events in group M that are mapped to FIQ Each bit corresponds to event Q where Q = Mx32+Bit Read 0 Inactive, Disabled, or not an FIQ Read 1 Active/Pending, Enabled, and FIQ Write 0 No effect Write 1 Clear Interrupt Raw Status (if FIQ)

### 13.10.74 INTMAP\_7 Register (Offset = 4F8h) [Reset = 00000000h]

INTMAP\_7 is shown in [Table 13-76](#).

Return to the [Summary Table](#).

Group M Interrupt Map Register (M is 0 to 7)  $h400 + M \times h20 + h18$

**Table 13-76. INTMAP\_7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK	R/W	0h	This field is used to indicate which interrupt the corresponding event influences (if enabled) for event group M. Each bit corresponds to event Q where $Q = M \times 32 + \text{Bit 0}$ IRQ Interrupt (default) 1 FIQ Interrupt

### 13.10.75 INTTYPE\_7 Register (Offset = 4FCh) [Reset = 00000000h]

INTTYPE\_7 is shown in [Table 13-77](#).

Return to the [Summary Table](#).

Group M Type Map Register (M is 0 to 7) h400 + M x h20 + 0x1C

**Table 13-77. INTTYPE\_7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	VAL	R/W	0h	<p>This field is used to indicate whether the source of an interrupt is a level (default) or a pulse for event group M.</p> <p>This is informational so that an ISR may query this register and know whether it has to clear a pulse event or a level event (see 3.4 Interrupt Handling).</p> <p>The value has no effect on how the VIM hardware functions.</p> <p>The input interrupts are agnostic as to whether they are pulse or level.</p> <p>Each bit corresponds to event Q where Q = Mx32+Bit 0 Level (default) 1 Pulse</p>

### 13.10.76 INTPRIORITY Register (Offset = 1000h) [Reset = 00000000h]

INTPRIORITY is shown in [Table 13-78](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h4

**Table 13-78. INTPRIORITY Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.77 INTPRIORITY\_1 Register (Offset = 1004h) [Reset = 00000000h]

INTPRIORITY\_1 is shown in [Table 13-79](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h5

**Table 13-79. INTPRIORITY\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.78 INTPRIORITY\_2 Register (Offset = 1008h) [Reset = 00000000h]

INTPRIORITY\_2 is shown in [Table 13-80](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h6

**Table 13-80. INTPRIORITY\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.79 INTPRIORITY\_3 Register (Offset = 100Ch) [Reset = 00000000h]

INTPRIORITY\_3 is shown in [Table 13-81](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h7

**Table 13-81. INTPRIORITY\_3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.80 INTPRIORITY\_4 Register (Offset = 1010h) [Reset = 00000000h]

INTPRIORITY\_4 is shown in [Table 13-82](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h8

**Table 13-82. INTPRIORITY\_4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.81 INTPRIORITY\_5 Register (Offset = 1014h) [Reset = 00000000h]

INTPRIORITY\_5 is shown in [Table 13-83](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h9

**Table 13-83. INTPRIORITY\_5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.82 INTPRIORITY\_6 Register (Offset = 1018h) [Reset = 00000000h]

INTPRIORITY\_6 is shown in [Table 13-84](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h10

**Table 13-84. INTPRIORITY\_6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.83 INTPRIORITY\_7 Register (Offset = 101Ch) [Reset = 00000000h]

INTPRIORITY\_7 is shown in [Table 13-85](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h11

**Table 13-85. INTPRIORITY\_7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.84 INTPRIORITY\_8 Register (Offset = 1020h) [Reset = 00000000h]

INTPRIORITY\_8 is shown in [Table 13-86](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h12

**Table 13-86. INTPRIORITY\_8 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.85 INTPRIORITY\_9 Register (Offset = 1024h) [Reset = 00000000h]

INTPRIORITY\_9 is shown in [Table 13-87](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h13

**Table 13-87. INTPRIORITY\_9 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.86 INTPRIORITY\_10 Register (Offset = 1028h) [Reset = 00000000h]

INTPRIORITY\_10 is shown in [Table 13-88](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h14

**Table 13-88. INTPRIORITY\_10 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.87 INTPRIORITY\_11 Register (Offset = 102Ch) [Reset = 00000000h]

INTPRIORITY\_11 is shown in [Table 13-89](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h15

**Table 13-89. INTPRIORITY\_11 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.88 INTPRIORITY\_12 Register (Offset = 1030h) [Reset = 00000000h]

INTPRIORITY\_12 is shown in [Table 13-90](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h16

**Table 13-90. INTPRIORITY\_12 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.89 INTPRIORITY\_13 Register (Offset = 1034h) [Reset = 00000000h]

INTPRIORITY\_13 is shown in [Table 13-91](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h17

**Table 13-91. INTPRIORITY\_13 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.90 INTPRIORITY\_14 Register (Offset = 1038h) [Reset = 00000000h]

INTPRIORITY\_14 is shown in [Table 13-92](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h18

**Table 13-92. INTPRIORITY\_14 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.91 INTPRIORITY\_15 Register (Offset = 103Ch) [Reset = 00000000h]

INTPRIORITY\_15 is shown in [Table 13-93](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h19

**Table 13-93. INTPRIORITY\_15 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.92 INTPRIORITY\_16 Register (Offset = 1040h) [Reset = 00000000h]

INTPRIORITY\_16 is shown in [Table 13-94](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h20

**Table 13-94. INTPRIORITY\_16 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.93 INTPRIORITY\_17 Register (Offset = 1044h) [Reset = 00000000h]

INTPRIORITY\_17 is shown in [Table 13-95](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h21

**Table 13-95. INTPRIORITY\_17 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.94 INTPRIORITY\_18 Register (Offset = 1048h) [Reset = 00000000h]

INTPRIORITY\_18 is shown in [Table 13-96](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h22

**Table 13-96. INTPRIORITY\_18 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.95 INTPRIORITY\_19 Register (Offset = 104Ch) [Reset = 00000000h]

INTPRIORITY\_19 is shown in [Table 13-97](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h23

**Table 13-97. INTPRIORITY\_19 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.96 INTPRIORITY\_20 Register (Offset = 1050h) [Reset = 00000000h]

INTPRIORITY\_20 is shown in [Table 13-98](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h24

**Table 13-98. INTPRIORITY\_20 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.97 INTPRIORITY\_21 Register (Offset = 1054h) [Reset = 00000000h]

INTPRIORITY\_21 is shown in [Table 13-99](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h25

**Table 13-99. INTPRIORITY\_21 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.98 INTPRIORITY\_22 Register (Offset = 1058h) [Reset = 00000000h]

INTPRIORITY\_22 is shown in [Table 13-100](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h26

**Table 13-100. INTPRIORITY\_22 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.99 INTPRIORITY\_23 Register (Offset = 105Ch) [Reset = 00000000h]

INTPRIORITY\_23 is shown in [Table 13-101](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h27

**Table 13-101. INTPRIORITY\_23 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.100 INTPRIORITY\_24 Register (Offset = 1060h) [Reset = 00000000h]

INTPRIORITY\_24 is shown in [Table 13-102](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h28

**Table 13-102. INTPRIORITY\_24 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.101 INTPRIORITY\_25 Register (Offset = 1064h) [Reset = 00000000h]

INTPRIORITY\_25 is shown in [Table 13-103](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h29

**Table 13-103. INTPRIORITY\_25 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.102 INTPRIORITY\_26 Register (Offset = 1068h) [Reset = 00000000h]

INTPRIORITY\_26 is shown in [Table 13-104](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h30

**Table 13-104. INTPRIORITY\_26 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.103 INTPRIORITY\_27 Register (Offset = 106Ch) [Reset = 00000000h]

INTPRIORITY\_27 is shown in [Table 13-105](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h31

**Table 13-105. INTPRIORITY\_27 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.104 INTPRIORITY\_28 Register (Offset = 1070h) [Reset = 00000000h]

INTPRIORITY\_28 is shown in [Table 13-106](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h32

**Table 13-106. INTPRIORITY\_28 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.105 INTPRIORITY\_29 Register (Offset = 1074h) [Reset = 00000000h]

INTPRIORITY\_29 is shown in [Table 13-107](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h33

**Table 13-107. INTPRIORITY\_29 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.106 INTPRIORITY\_30 Register (Offset = 1078h) [Reset = 00000000h]

INTPRIORITY\_30 is shown in [Table 13-108](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h34

**Table 13-108. INTPRIORITY\_30 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.107 INTPRIORITY\_31 Register (Offset = 107Ch) [Reset = 00000000h]

INTPRIORITY\_31 is shown in [Table 13-109](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h35

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.113 INTPRIORITY\_37 Register (Offset = 1094h) [Reset = 00000000h]

INTPRIORITY\_37 is shown in [Table 13-115](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h41

**Table 13-115. INTPRIORITY\_37 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.114 INTPRIORITY\_38 Register (Offset = 1098h) [Reset = 00000000h]

INTPRIORITY\_38 is shown in [Table 13-116](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h42

**Table 13-116. INTPRIORITY\_38 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.115 INTPRIORITY\_39 Register (Offset = 109Ch) [Reset = 00000000h]

INTPRIORITY\_39 is shown in [Table 13-117](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h43

**Table 13-117. INTPRIORITY\_39 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.116 INTPRIORITY\_40 Register (Offset = 10A0h) [Reset = 00000000h]

INTPRIORITY\_40 is shown in [Table 13-118](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h44

**Table 13-118. INTPRIORITY\_40 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.117 INTPRIORITY\_41 Register (Offset = 10A4h) [Reset = 00000000h]

INTPRIORITY\_41 is shown in [Table 13-119](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h45

**Table 13-119. INTPRIORITY\_41 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.118 INTPRIORITY\_42 Register (Offset = 10A8h) [Reset = 00000000h]

INTPRIORITY\_42 is shown in [Table 13-120](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h46

**Table 13-120. INTPRIORITY\_42 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.119 INTPRIORITY\_43 Register (Offset = 10ACh) [Reset = 00000000h]

INTPRIORITY\_43 is shown in [Table 13-121](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h47

**Table 13-121. INTPRIORITY\_43 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.120 INTPRIORITY\_44 Register (Offset = 10B0h) [Reset = 00000000h]

INTPRIORITY\_44 is shown in [Table 13-122](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h48

**Table 13-122. INTPRIORITY\_44 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.121 INTPRIORITY\_45 Register (Offset = 10B4h) [Reset = 00000000h]

INTPRIORITY\_45 is shown in [Table 13-123](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h49

**Table 13-123. INTPRIORITY\_45 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.122 INTPRIORITY\_46 Register (Offset = 10B8h) [Reset = 00000000h]

INTPRIORITY\_46 is shown in [Table 13-124](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h50

**Table 13-124. INTPRIORITY\_46 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.123 INTPRIORITY\_47 Register (Offset = 10BCh) [Reset = 00000000h]

INTPRIORITY\_47 is shown in [Table 13-125](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h51

**Table 13-125. INTPRIORITY\_47 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.124 INTPRIORITY\_48 Register (Offset = 10C0h) [Reset = 00000000h]

INTPRIORITY\_48 is shown in [Table 13-126](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h52

**Table 13-126. INTPRIORITY\_48 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.125 INTPRIORITY\_49 Register (Offset = 10C4h) [Reset = 00000000h]

INTPRIORITY\_49 is shown in [Table 13-127](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h53

**Table 13-127. INTPRIORITY\_49 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.126 INTPRIORITY\_50 Register (Offset = 10C8h) [Reset = 00000000h]

INTPRIORITY\_50 is shown in [Table 13-128](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h54

**Table 13-128. INTPRIORITY\_50 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.127 INTPRIORITY\_51 Register (Offset = 10CCh) [Reset = 00000000h]

INTPRIORITY\_51 is shown in [Table 13-129](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h55

**Table 13-129. INTPRIORITY\_51 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.128 INTPRIORITY\_52 Register (Offset = 10D0h) [Reset = 00000000h]

INTPRIORITY\_52 is shown in [Table 13-130](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h56

**Table 13-130. INTPRIORITY\_52 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.129 INTPRIORITY\_53 Register (Offset = 10D4h) [Reset = 00000000h]

INTPRIORITY\_53 is shown in [Table 13-131](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h57

**Table 13-131. INTPRIORITY\_53 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.130 INTPRIORITY\_54 Register (Offset = 10D8h) [Reset = 00000000h]

INTPRIORITY\_54 is shown in [Table 13-132](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h58

**Table 13-132. INTPRIORITY\_54 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.131 INTPRIORITY\_55 Register (Offset = 10DCh) [Reset = 00000000h]

INTPRIORITY\_55 is shown in [Table 13-133](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h59

**Table 13-133. INTPRIORITY\_55 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.132 INTPRIORITY\_56 Register (Offset = 10E0h) [Reset = 00000000h]

INTPRIORITY\_56 is shown in [Table 13-134](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h60

**Table 13-134. INTPRIORITY\_56 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.133 INTPRIORITY\_57 Register (Offset = 10E4h) [Reset = 00000000h]

INTPRIORITY\_57 is shown in [Table 13-135](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h61

**Table 13-135. INTPRIORITY\_57 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.134 INTPRIORITY\_58 Register (Offset = 10E8h) [Reset = 00000000h]

INTPRIORITY\_58 is shown in [Table 13-136](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h62

**Table 13-136. INTPRIORITY\_58 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.135 INTPRIORITY\_59 Register (Offset = 10ECh) [Reset = 00000000h]

INTPRIORITY\_59 is shown in [Table 13-137](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h63

**Table 13-137. INTPRIORITY\_59 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD

INTPRIORITY\_74 is shown in [Table 13-152](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h78

**Table 13-152. INTPRIORITY\_74 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.151 INTPRIORITY\_75 Register (Offset = 112Ch) [Reset = 00000000h]

INTPRIORITY\_75 is shown in [Table 13-153](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h79

**Table 13-153. INTPRIORITY\_75 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.152 INTPRIORITY\_76 Register (Offset = 1130h) [Reset = 00000000h]

INTPRIORITY\_76 is shown in [Table 13-154](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h80

**Table 13-154. INTPRIORITY\_76 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.153 INTPRIORITY\_77 Register (Offset = 1134h) [Reset = 00000000h]

INTPRIORITY\_77 is shown in [Table 13-155](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h81

**Table 13-155. INTPRIORITY\_77 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.154 INTPRIORITY\_78 Register (Offset = 1138h) [Reset = 00000000h]

INTPRIORITY\_78 is shown in [Table 13-156](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h82

**Table 13-156. INTPRIORITY\_78 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.155 INTPRIORITY\_79 Register (Offset = 113Ch) [Reset = 00000000h]

INTPRIORITY\_79 is shown in [Table 13-157](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h83

**Table 13-157. INTPRIORITY\_79 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.156 INTPRIORITY\_80 Register (Offset = 1140h) [Reset = 00000000h]

INTPRIORITY\_80 is shown in [Table 13-158](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h84

**Table 13-158. INTPRIORITY\_80 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.157 INTPRIORITY\_81 Register (Offset = 1144h) [Reset = 00000000h]

INTPRIORITY\_81 is shown in [Table 13-159](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h85

**Table 13-159. INTPRIORITY\_81 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.158 INTPRIORITY\_82 Register (Offset = 1148h) [Reset = 00000000h]

INTPRIORITY\_82 is shown in [Table 13-160](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h86

**Table 13-160. INTPRIORITY\_82 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.159 INTPRIORITY\_83 Register (Offset = 114Ch) [Reset = 00000000h]

INTPRIORITY\_83 is shown in [Table 13-161](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h87

**Table 13-161. INTPRIORITY\_83 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.160 INTPRIORITY\_84 Register (Offset = 1150h) [Reset = 00000000h]

INTPRIORITY\_84 is shown in [Table 13-162](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h88

**Table 13-162. INTPRIORITY\_84 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.161 INTPRIORITY\_85 Register (Offset = 1154h) [Reset = 00000000h]

INTPRIORITY\_85 is shown in [Table 13-163](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h89

**Table 13-163. INTPRIORITY\_85 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.162 INTPRIORITY\_86 Register (Offset = 1158h) [Reset = 00000000h]

INTPRIORITY\_86 is shown in [Table 13-164](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h90

**Table 13-164. INTPRIORITY\_86 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.163 INTPRIORITY\_87 Register (Offset = 115Ch) [Reset = 00000000h]

INTPRIORITY\_87 is shown in [Table 13-165](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h91

**Table 13-165. INTPRIORITY\_87 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.164 INTPRIORITY\_88 Register (Offset = 1160h) [Reset = 00000000h]

INTPRIORITY\_88 is shown in [Table 13-166](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h92

**Table 13-166. INTPRIORITY\_88 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.165 INTPRIORITY\_89 Register (Offset = 1164h) [Reset = 00000000h]

INTPRIORITY\_89 is shown in [Table 13-167](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h93

**Table 13-167. INTPRIORITY\_89 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.166 INTPRIORITY\_90 Register (Offset = 1168h) [Reset = 00000000h]

INTPRIORITY\_90 is shown in [Table 13-168](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h94

**Table 13-168. INTPRIORITY\_90 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.167 INTPRIORITY\_91 Register (Offset = 116Ch) [Reset = 00000000h]

INTPRIORITY\_91 is shown in [Table 13-169](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h95

**Table 13-169. INTPRIORITY\_91 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.168 INTPRIORITY\_92 Register (Offset = 1170h) [Reset = 00000000h]

INTPRIORITY\_92 is shown in [Table 13-170](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h96

**Table 13-170. INTPRIORITY\_92 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.169 INTPRIORITY\_93 Register (Offset = 1174h) [Reset = 00000000h]

INTPRIORITY\_93 is shown in [Table 13-171](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h97

**Table 13-171. INTPRIORITY\_93 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.170 INTPRIORITY\_94 Register (Offset = 1178h) [Reset = 00000000h]

INTPRIORITY\_94 is shown in [Table 13-172](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h98

**Table 13-172. INTPRIORITY\_94 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.171 INTPRIORITY\_95 Register (Offset = 117Ch) [Reset = 00000000h]

INTPRIORITY\_95 is shown in [Table 13-173](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h99

**Table 13-173. INTPRIORITY\_95 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.172 INTPRIORITY\_96 Register (Offset = 1180h) [Reset = 00000000h]

INTPRIORITY\_96 is shown in [Table 13-174](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h100

**Table 13-174. INTPRIORITY\_96 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.173 INTPRIORITY\_97 Register (Offset = 1184h) [Reset = 00000000h]

INTPRIORITY\_97 is shown in [Table 13-175](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h101

**Table 13-175. INTPRIORITY\_97 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.174 INTPRIORITY\_98 Register (Offset = 1188h) [Reset = 00000000h]

INTPRIORITY\_98 is shown in [Table 13-176](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h102

**Table 13-176. INTPRIORITY\_98 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.175 INTPRIORITY\_99 Register (Offset = 118Ch) [Reset = 00000000h]

INTPRIORITY\_99 is shown in [Table 13-177](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h103

**Table 13-177. INTPRIORITY\_99 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.176 INTPRIORITY\_100 Register (Offset = 1190h) [Reset = 00000000h]

INTPRIORITY\_100 is shown in [Table 13-178](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h104

**Table 13-178. INTPRIORITY\_100 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.177 INTPRIORITY\_101 Register (Offset = 1194h) [Reset = 00000000h]

INTPRIORITY\_101 is shown in [Table 13-179](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h105

**Table 13-179. INTPRIORITY\_101 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.178 INTPRIORITY\_102 Register (Offset = 1198h) [Reset = 00000000h]

INTPRIORITY\_102 is shown in [Table 13-180](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h106

**Table 13-180. INTPRIORITY\_102 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.179 INTPRIORITY\_103 Register (Offset = 119Ch) [Reset = 00000000h]

INTPRIORITY\_103 is shown in [Table 13-181](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h107

**Table 13-181. INTPRIORITY\_103 Register Field Descriptions**

**Table 13-189. INTPRIORITY\_111 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.188 INTPRIORITY\_112 Register (Offset = 11C0h) [Reset = 00000000h]

INTPRIORITY\_112 is shown in [Table 13-190](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h116

**Table 13-190. INTPRIORITY\_112 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.189 INTPRIORITY\_113 Register (Offset = 11C4h) [Reset = 00000000h]

INTPRIORITY\_113 is shown in [Table 13-191](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h117

**Table 13-191. INTPRIORITY\_113 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.190 INTPRIORITY\_114 Register (Offset = 11C8h) [Reset = 00000000h]

INTPRIORITY\_114 is shown in [Table 13-192](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h118

**Table 13-192. INTPRIORITY\_114 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.191 INTPRIORITY\_115 Register (Offset = 11CCh) [Reset = 00000000h]

INTPRIORITY\_115 is shown in [Table 13-193](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h119

**Table 13-193. INTPRIORITY\_115 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.192 INTPRIORITY\_116 Register (Offset = 11D0h) [Reset = 00000000h]

INTPRIORITY\_116 is shown in [Table 13-194](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h120

**Table 13-194. INTPRIORITY\_116 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.193 INTPRIORITY\_117 Register (Offset = 11D4h) [Reset = 00000000h]

INTPRIORITY\_117 is shown in [Table 13-195](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h121

**Table 13-195. INTPRIORITY\_117 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.194 INTPRIORITY\_118 Register (Offset = 11D8h) [Reset = 00000000h]

INTPRIORITY\_118 is shown in [Table 13-196](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h122

**Table 13-196. INTPRIORITY\_118 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.195 INTPRIORITY\_119 Register (Offset = 11DCh) [Reset = 00000000h]

INTPRIORITY\_119 is shown in [Table 13-197](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h123

**Table 13-197. INTPRIORITY\_119 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.196 INTPRIORITY\_120 Register (Offset = 11E0h) [Reset = 00000000h]

INTPRIORITY\_120 is shown in [Table 13-198](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h124

**Table 13-198. INTPRIORITY\_120 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.197 INTPRIORITY\_121 Register (Offset = 11E4h) [Reset = 00000000h]

INTPRIORITY\_121 is shown in [Table 13-199](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h125

**Table 13-199. INTPRIORITY\_121 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.198 INTPRIORITY\_122 Register (Offset = 11E8h) [Reset = 00000000h]

INTPRIORITY\_122 is shown in [Table 13-200](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h126

**Table 13-200. INTPRIORITY\_122 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.199 INTPRIORITY\_123 Register (Offset = 11ECh) [Reset = 00000000h]

INTPRIORITY\_123 is shown in [Table 13-201](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h127

**Table 13-201. INTPRIORITY\_123 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.200 INTPRIORITY\_124 Register (Offset = 11F0h) [Reset = 00000000h]

INTPRIORITY\_124 is shown in [Table 13-202](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h128

**Table 13-202. INTPRIORITY\_124 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.201 INTPRIORITY\_125 Register (Offset = 11F4h) [Reset = 00000000h]

INTPRIORITY\_125 is shown in [Table 13-203](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h129

**Table 13-203. INTPRIORITY\_125 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.202 INTPRIORITY\_126 Register (Offset = 11F8h) [Reset = 00000000h]

INTPRIORITY\_126 is shown in [Table 13-204](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h130

**Table 13-204. INTPRIORITY\_126 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.203 INTPRIORITY\_127 Register (Offset = 11FCh) [Reset = 00000000h]

INTPRIORITY\_127 is shown in [Table 13-205](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h131

**Table 13-205. INTPRIORITY\_127 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.204 INTPRIORITY\_128 Register (Offset = 1200h) [Reset = 00000000h]

INTPRIORITY\_128 is shown in [Table 13-206](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h132

**Table 13-206. INTPRIORITY\_128 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.205 INTPRIORITY\_129 Register (Offset = 1204h) [Reset = 00000000h]

INTPRIORITY\_129 is shown in [Table 13-207](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h133

**Table 13-207. INTPRIORITY\_129 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.206 INTPRIORITY\_130 Register (Offset = 1208h) [Reset = 00000000h]

INTPRIORITY\_130 is shown in [Table 13-208](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h134

**Table 13-208. INTPRIORITY\_130 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.207 INTPRIORITY\_131 Register (Offset = 120Ch) [Reset = 00000000h]

INTPRIORITY\_131 is shown in [Table 13-209](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h135

**Table 13-209. INTPRIORITY\_131 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.208 INTPRIORITY\_132 Register (Offset = 1210h) [Reset = 00000000h]

INTPRIORITY\_132 is shown in [Table 13-210](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h136

**Table 13-210. INTPRIORITY\_132 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.209 INTPRIORITY\_133 Register (Offset = 1214h) [Reset = 00000000h]

INTPRIORITY\_133 is shown in [Table 13-211](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h137

**Table 13-211. INTPRIORITY\_133 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.210 INTPRIORITY\_134 Register (Offset = 1218h) [Reset = 00000000h]

INTPRIORITY\_134 is shown in [Table 13-212](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h138

**Table 13-212. INTPRIORITY\_134 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.211 INTPRIORITY\_135 Register (Offset = 121Ch) [Reset = 00000000h]

INTPRIORITY\_135 is shown in [Table 13-213](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h139

**Table 13-213. INTPRIORITY\_135 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.212 INTPRIORITY\_136 Register (Offset = 1220h) [Reset = 00000000h]

INTPRIORITY\_136 is shown in [Table 13-214](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h140

**Table 13-214. INTPRIORITY\_136 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.213 INTPRIORITY\_137 Register (Offset = 1224h) [Reset = 00000000h]

INTPRIORITY\_137 is shown in [Table 13-215](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h141

**Table 13-215. INTPRIORITY\_137 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.214 INTPRIORITY\_138 Register (Offset = 1228h) [Reset = 00000000h]

INTPRIORITY\_138 is shown in [Table 13-216](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h142

**Table 13-216. INTPRIORITY\_138 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.215 INTPRIORITY\_139 Register (Offset = 122Ch) [Reset = 00000000h]

INTPRIORITY\_139 is shown in [Table 13-217](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h143

**Table 13-217. INTPRIORITY\_139 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.216 INTPRIORITY\_140 Register (Offset = 1230h) [Reset = 00000000h]

INTPRIORITY\_140 is shown in [Table 13-218](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h144

**Table 13-218. INTPRIORITY\_140 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.217 INTPRIORITY\_141 Register (Offset = 1234h) [Reset = 00000000h]

INTPRIORITY\_141 is shown in [Table 13-219](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h145

**Table 13-219. INTPRIORITY\_141 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.218 INTPRIORITY\_142 Register (Offset = 1238h) [Reset = 00000000h]

INTPRIORITY\_142 is shown in [Table 13-220](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h146

**Table 13-220. INTPRIORITY\_142 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.219 INTPRIORITY\_143 Register (Offset = 123Ch) [Reset = 00000000h]

INTPRIORITY\_143 is shown in [Table 13-221](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h147

**Table 13-221. INTPRIORITY\_143 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.220 INTPRIORITY\_144 Register (Offset = 1240h) [Reset = 00000000h]

INTPRIORITY\_144 is shown in [Table 13-222](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h148

**Table 13-222. INTPRIORITY\_144 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.221 INTPRIORITY\_145 Register (Offset = 1244h) [Reset = 00000000h]

INTPRIORITY\_145 is shown in [Table 13-223](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h149

**Table 13-223. INTPRIORITY\_145 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.222 INTPRIORITY\_146 Register (Offset = 1248h) [Reset = 00000000h]

INTPRIORITY\_146 is shown in [Table 13-224](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h150

**Table 13-224. INTPRIORITY\_146 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.223 INTPRIORITY\_147 Register (Offset = 124Ch) [Reset = 00000000h]

INTPRIORITY\_147 is shown in [Table 13-225](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h151

**Table 13-225. INTPRIORITY\_147 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.224 INTPRIORITY\_148 Register (Offset = 1250h) [Reset = 00000000h]

INTPRIORITY\_148 is shown in [Table 13-226](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h152

**Table 13-226. INTPRIORITY\_148 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.225 INTPRIORITY\_149 Register (Offset = 1254h) [Reset = 00000000h]

INTPRIORITY\_149 is shown in [Table 13-227](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h153

**Table 13-227. INTPRIORITY\_149 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.226 INTPRIORITY\_150 Register (Offset = 1258h) [Reset = 00000000h]

INTPRIORITY\_150 is shown in [Table 13-228](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h154

**Table 13-228. INTPRIORITY\_150 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.227 INTPRIORITY\_151 Register (Offset = 125Ch) [Reset = 00000000h]

INTPRIORITY\_151 is shown in [Table 13-229](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h155

**Table 13-229. INTPRIORITY\_151 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.228 INTPRIORITY\_152 Register (Offset = 1260h) [Reset = 00000000h]

INTPRIORITY\_152 is shown in [Table 13-230](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h156

**Table 13-230. INTPRIORITY\_152 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.229 INTPRIORITY\_153 Register (Offset = 1264h) [Reset = 00000000h]

INTPRIORITY\_153 is shown in [Table 13-231](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h157

**Table 13-231. INTPRIORITY\_153 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.230 INTPRIORITY\_154 Register (Offset = 1268h) [Reset = 00000000h]

INTPRIORITY\_154 is shown in [Table 13-232](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h158

**Table 13-232. INTPRIORITY\_154 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.231 INTPRIORITY\_155 Register (Offset = 126Ch) [Reset = 00000000h]

INTPRIORITY\_155 is shown in [Table 13-233](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h159

**Table 13-233. INTPRIORITY\_155 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.232 INTPRIORITY\_156 Register (Offset = 1270h) [Reset = 00000000h]

INTPRIORITY\_156 is shown in [Table 13-234](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h160

**Table 13-234. INTPRIORITY\_156 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.233 INTPRIORITY\_157 Register (Offset = 1274h) [Reset = 00000000h]

INTPRIORITY\_157 is shown in [Table 13-235](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h161

**Table 13-235. INTPRIORITY\_157 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.234 INTPRIORITY\_158 Register (Offset = 1278h) [Reset = 00000000h]

INTPRIORITY\_158 is shown in [Table 13-236](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h162

**Table 13-236. INTPRIORITY\_158 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.235 INTPRIORITY\_159 Register (Offset = 127Ch) [Reset = 00000000h]

INTPRIORITY\_159 is shown in [Table 13-237](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h163

**Table 13-237. INTPRIORITY\_159 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.236 INTPRIORITY\_160 Register (Offset = 1280h) [Reset = 00000000h]

INTPRIORITY\_160 is shown in [Table 13-238](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h164

**Table 13-238. INTPRIORITY\_160 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.237 INTPRIORITY\_161 Register (Offset = 1284h) [Reset = 00000000h]

INTPRIORITY\_161 is shown in [Table 13-239](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h165

**Table 13-239. INTPRIORITY\_161 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.238 INTPRIORITY\_162 Register (Offset = 1288h) [Reset = 00000000h]

INTPRIORITY\_162 is shown in [Table 13-240](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h166

**Table 13-240. INTPRIORITY\_162 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.239 INTPRIORITY\_163 Register (Offset = 128Ch) [Reset = 00000000h]

INTPRIORITY\_163 is shown in [Table 13-241](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h167

**Table 13-241. INTPRIORITY\_163 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.240 INTPRIORITY\_164 Register (Offset = 1290h) [Reset = 00000000h]

INTPRIORITY\_164 is shown in [Table 13-242](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h168

**Table 13-242. INTPRIORITY\_164 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.241 INTPRIORITY\_165 Register (Offset = 1294h) [Reset = 00000000h]

INTPRIORITY\_165 is shown in [Table 13-243](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h169

**Table 13-243. INTPRIORITY\_165 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.242 INTPRIORITY\_166 Register (Offset = 1298h) [Reset = 00000000h]

INTPRIORITY\_166 is shown in [Table 13-244](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h170

**Table 13-244. INTPRIORITY\_166 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.243 INTPRIORITY\_167 Register (Offset = 129Ch) [Reset = 00000000h]

INTPRIORITY\_167 is shown in [Table 13-245](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h171

**Table 13-245. INTPRIORITY\_167 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.244 INTPRIORITY\_168 Register (Offset = 12A0h) [Reset = 00000000h]

INTPRIORITY\_168 is shown in [Table 13-246](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h172

**Table 13-246. INTPRIORITY\_168 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.245 INTPRIORITY\_169 Register (Offset = 12A4h) [Reset = 00000000h]

INTPRIORITY\_169 is shown in [Table 13-247](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h173

INTPRIORITY\_185 is shown in [Table 13-263](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h189

**Table 13-263. INTPRIORITY\_185 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.262 INTPRIORITY\_186 Register (Offset = 12E8h) [Reset = 00000000h]

INTPRIORITY\_186 is shown in [Table 13-264](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h190

**Table 13-264. INTPRIORITY\_186 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.263 INTPRIORITY\_187 Register (Offset = 12ECh) [Reset = 00000000h]

INTPRIORITY\_187 is shown in [Table 13-265](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h191

**Table 13-265. INTPRIORITY\_187 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.264 INTPRIORITY\_188 Register (Offset = 12F0h) [Reset = 00000000h]

INTPRIORITY\_188 is shown in [Table 13-266](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h192

**Table 13-266. INTPRIORITY\_188 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.265 INTPRIORITY\_189 Register (Offset = 12F4h) [Reset = 00000000h]

INTPRIORITY\_189 is shown in [Table 13-267](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h193

**Table 13-267. INTPRIORITY\_189 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.266 INTPRIORITY\_190 Register (Offset = 12F8h) [Reset = 00000000h]

INTPRIORITY\_190 is shown in [Table 13-268](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h194

**Table 13-268. INTPRIORITY\_190 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.267 INTPRIORITY\_191 Register (Offset = 12FCh) [Reset = 00000000h]

INTPRIORITY\_191 is shown in [Table 13-269](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h195

**Table 13-269. INTPRIORITY\_191 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.268 INTPRIORITY\_192 Register (Offset = 1300h) [Reset = 00000000h]

INTPRIORITY\_192 is shown in [Table 13-270](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h196

**Table 13-270. INTPRIORITY\_192 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.269 INTPRIORITY\_193 Register (Offset = 1304h) [Reset = 00000000h]

INTPRIORITY\_193 is shown in [Table 13-271](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h197

**Table 13-271. INTPRIORITY\_193 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.270 INTPRIORITY\_194 Register (Offset = 1308h) [Reset = 00000000h]

INTPRIORITY\_194 is shown in [Table 13-272](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h198

**Table 13-272. INTPRIORITY\_194 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.271 INTPRIORITY\_195 Register (Offset = 130Ch) [Reset = 00000000h]

INTPRIORITY\_195 is shown in [Table 13-273](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h199

**Table 13-273. INTPRIORITY\_195 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.272 INTPRIORITY\_196 Register (Offset = 1310h) [Reset = 00000000h]

INTPRIORITY\_196 is shown in [Table 13-274](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h200

**Table 13-274. INTPRIORITY\_196 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.273 INTPRIORITY\_197 Register (Offset = 1314h) [Reset = 00000000h]

INTPRIORITY\_197 is shown in [Table 13-275](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h201

**Table 13-275. INTPRIORITY\_197 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.274 INTPRIORITY\_198 Register (Offset = 1318h) [Reset = 00000000h]

INTPRIORITY\_198 is shown in [Table 13-276](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h202

**Table 13-276. INTPRIORITY\_198 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.275 INTPRIORITY\_199 Register (Offset = 131Ch) [Reset = 00000000h]

INTPRIORITY\_199 is shown in [Table 13-277](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h203

**Table 13-277. INTPRIORITY\_199 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.276 INTPRIORITY\_200 Register (Offset = 1320h) [Reset = 00000000h]

INTPRIORITY\_200 is shown in [Table 13-278](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h204

**Table 13-278. INTPRIORITY\_200 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.277 INTPRIORITY\_201 Register (Offset = 1324h) [Reset = 00000000h]

INTPRIORITY\_201 is shown in [Table 13-279](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h205

**Table 13-279. INTPRIORITY\_201 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.278 INTPRIORITY\_202 Register (Offset = 1328h) [Reset = 00000000h]

INTPRIORITY\_202 is shown in [Table 13-280](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h206

**Table 13-280. INTPRIORITY\_202 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.279 INTPRIORITY\_203 Register (Offset = 132Ch) [Reset = 00000000h]

INTPRIORITY\_203 is shown in [Table 13-281](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h207

**Table 13-281. INTPRIORITY\_203 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.280 INTPRIORITY\_204 Register (Offset = 1330h) [Reset = 00000000h]

INTPRIORITY\_204 is shown in [Table 13-282](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h208

**Table 13-282. INTPRIORITY\_204 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.281 INTPRIORITY\_205 Register (Offset = 1334h) [Reset = 00000000h]

INTPRIORITY\_205 is shown in [Table 13-283](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h209

**Table 13-283. INTPRIORITY\_205 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.282 INTPRIORITY\_206 Register (Offset = 1338h) [Reset = 00000000h]

INTPRIORITY\_206 is shown in [Table 13-284](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h210

**Table 13-284. INTPRIORITY\_206 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.283 INTPRIORITY\_207 Register (Offset = 133Ch) [Reset = 00000000h]

INTPRIORITY\_207 is shown in [Table 13-285](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h211

**Table 13-285. INTPRIORITY\_207 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.284 INTPRIORITY\_208 Register (Offset = 1340h) [Reset = 00000000h]

INTPRIORITY\_208 is shown in [Table 13-286](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h212

**Table 13-286. INTPRIORITY\_208 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.285 INTPRIORITY\_209 Register (Offset = 1344h) [Reset = 00000000h]

INTPRIORITY\_209 is shown in [Table 13-287](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h213

**Table 13-287. INTPRIORITY\_209 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.286 INTPRIORITY\_210 Register (Offset = 1348h) [Reset = 00000000h]

INTPRIORITY\_210 is shown in [Table 13-288](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h214

**Table 13-288. INTPRIORITY\_210 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.287 INTPRIORITY\_211 Register (Offset = 134Ch) [Reset = 00000000h]

INTPRIORITY\_211 is shown in [Table 13-289](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h215

**Table 13-289. INTPRIORITY\_211 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.288 INTPRIORITY\_212 Register (Offset = 1350h) [Reset = 00000000h]

INTPRIORITY\_212 is shown in [Table 13-290](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h216

**Table 13-290. INTPRIORITY\_212 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.289 INTPRIORITY\_213 Register (Offset = 1354h) [Reset = 00000000h]

INTPRIORITY\_213 is shown in [Table 13-291](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h217

**Table 13-291. INTPRIORITY\_213 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.290 INTPRIORITY\_214 Register (Offset = 1358h) [Reset = 00000000h]

INTPRIORITY\_214 is shown in [Table 13-292](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h218

**Table 13-292. INTPRIORITY\_214 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.291 INTPRIORITY\_215 Register (Offset = 135Ch) [Reset = 00000000h]

INTPRIORITY\_215 is shown in [Table 13-293](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h219

**Table 13-293. INTPRIORITY\_215 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.292 INTPRIORITY\_216 Register (Offset = 1360h) [Reset = 00000000h]

INTPRIORITY\_216 is shown in [Table 13-294](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h220

**Table 13-294. INTPRIORITY\_216 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.293 INTPRIORITY\_217 Register (Offset = 1364h) [Reset = 00000000h]

INTPRIORITY\_217 is shown in [Table 13-295](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h221

**Table 13-295. INTPRIORITY\_217 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.294 INTPRIORITY\_218 Register (Offset = 1368h) [Reset = 00000000h]

INTPRIORITY\_218 is shown in [Table 13-296](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h222

**Table 13-296. INTPRIORITY\_218 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.295 INTPRIORITY\_219 Register (Offset = 136Ch) [Reset = 00000000h]

INTPRIORITY\_219 is shown in [Table 13-297](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h223

**Table 13-297. INTPRIORITY\_219 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.296 INTPRIORITY\_220 Register (Offset = 1370h) [Reset = 00000000h]

INTPRIORITY\_220 is shown in [Table 13-298](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h224

**Table 13-298. INTPRIORITY\_220 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.297 INTPRIORITY\_221 Register (Offset = 1374h) [Reset = 00000000h]

INTPRIORITY\_221 is shown in [Table 13-299](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h225

**Table 13-299. INTPRIORITY\_221 Register Field Descriptions**

31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.298 INTPRIORITY\_222 Register (Offset = 1378h) [Reset = 00000000h]

INTPRIORITY\_222 is shown in [Table 13-300](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h226

**Table 13-300. INTPRIORITY\_222 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.299 INTPRIORITY\_223 Register (Offset = 137Ch) [Reset = 00000000h]

INTPRIORITY\_223 is shown in [Table 13-301](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h227

**Table 13-301. INTPRIORITY\_223 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.300 INTPRIORITY\_224 Register (Offset = 1380h) [Reset = 00000000h]

INTPRIORITY\_224 is shown in [Table 13-302](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h228

**Table 13-302. INTPRIORITY\_224 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.301 INTPRIORITY\_225 Register (Offset = 1384h) [Reset = 00000000h]

INTPRIORITY\_225 is shown in [Table 13-303](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h229

**Table 13-303. INTPRIORITY\_225 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.302 INTPRIORITY\_226 Register (Offset = 1388h) [Reset = 00000000h]

INTPRIORITY\_226 is shown in [Table 13-304](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h230

**Table 13-304. INTPRIORITY\_226 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.303 INTPRIORITY\_227 Register (Offset = 138Ch) [Reset = 00000000h]

INTPRIORITY\_227 is shown in [Table 13-305](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h231

**Table 13-305. INTPRIORITY\_227 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.304 INTPRIORITY\_228 Register (Offset = 1390h) [Reset = 00000000h]

INTPRIORITY\_228 is shown in [Table 13-306](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h232

**Table 13-306. INTPRIORITY\_228 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.305 INTPRIORITY\_229 Register (Offset = 1394h) [Reset = 00000000h]

INTPRIORITY\_229 is shown in [Table 13-307](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h233

**Table 13-307. INTPRIORITY\_229 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.306 INTPRIORITY\_230 Register (Offset = 1398h) [Reset = 00000000h]

INTPRIORITY\_230 is shown in [Table 13-308](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h234

**Table 13-308. INTPRIORITY\_230 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.307 INTPRIORITY\_231 Register (Offset = 139Ch) [Reset = 00000000h]

INTPRIORITY\_231 is shown in [Table 13-309](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h235

**Table 13-309. INTPRIORITY\_231 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.308 INTPRIORITY\_232 Register (Offset = 13A0h) [Reset = 00000000h]

INTPRIORITY\_232 is shown in [Table 13-310](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h236

**Table 13-310. INTPRIORITY\_232 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.309 INTPRIORITY\_233 Register (Offset = 13A4h) [Reset = 00000000h]

INTPRIORITY\_233 is shown in [Table 13-311](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h237

**Table 13-311. INTPRIORITY\_233 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.310 INTPRIORITY\_234 Register (Offset = 13A8h) [Reset = 00000000h]

INTPRIORITY\_234 is shown in [Table 13-312](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h238

**Table 13-312. INTPRIORITY\_234 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.311 INTPRIORITY\_235 Register (Offset = 13ACh) [Reset = 00000000h]

INTPRIORITY\_235 is shown in [Table 13-313](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h239

**Table 13-313. INTPRIORITY\_235 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.312 INTPRIORITY\_236 Register (Offset = 13B0h) [Reset = 00000000h]

INTPRIORITY\_236 is shown in [Table 13-314](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h240

**Table 13-314. INTPRIORITY\_236 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.313 INTPRIORITY\_237 Register (Offset = 13B4h) [Reset = 00000000h]

INTPRIORITY\_237 is shown in [Table 13-315](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h241

**Table 13-315. INTPRIORITY\_237 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.314 INTPRIORITY\_238 Register (Offset = 13B8h) [Reset = 00000000h]

INTPRIORITY\_238 is shown in [Table 13-316](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h242

**Table 13-316. INTPRIORITY\_238 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.315 INTPRIORITY\_239 Register (Offset = 13BCh) [Reset = 00000000h]

INTPRIORITY\_239 is shown in [Table 13-317](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h243

**Table 13-317. INTPRIORITY\_239 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.316 INTPRIORITY\_240 Register (Offset = 13C0h) [Reset = 00000000h]

INTPRIORITY\_240 is shown in [Table 13-318](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h244

**Table 13-318. INTPRIORITY\_240 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.317 INTPRIORITY\_241 Register (Offset = 13C4h) [Reset = 00000000h]

INTPRIORITY\_241 is shown in [Table 13-319](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h245

**Table 13-319. INTPRIORITY\_241 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.318 INTPRIORITY\_242 Register (Offset = 13C8h) [Reset = 00000000h]

INTPRIORITY\_242 is shown in [Table 13-320](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h246

**Table 13-320. INTPRIORITY\_242 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.319 INTPRIORITY\_243 Register (Offset = 13CCh) [Reset = 00000000h]

INTPRIORITY\_243 is shown in [Table 13-321](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h247

**Table 13-321. INTPRIORITY\_243 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.320 INTPRIORITY\_244 Register (Offset = 13D0h) [Reset = 00000000h]

INTPRIORITY\_244 is shown in [Table 13-322](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h248

**Table 13-322. INTPRIORITY\_244 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.321 INTPRIORITY\_245 Register (Offset = 13D4h) [Reset = 00000000h]

INTPRIORITY\_245 is shown in [Table 13-323](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h249

**Table 13-323. INTPRIORITY\_245 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.322 INTPRIORITY\_246 Register (Offset = 13D8h) [Reset = 00000000h]

INTPRIORITY\_246 is shown in [Table 13-324](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h250

**Table 13-324. INTPRIORITY\_246 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.323 INTPRIORITY\_247 Register (Offset = 13DCh) [Reset = 00000000h]

INTPRIORITY\_247 is shown in [Table 13-325](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h251

**Table 13-325. INTPRIORITY\_247 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.324 INTPRIORITY\_248 Register (Offset = 13E0h) [Reset = 00000000h]

INTPRIORITY\_248 is shown in [Table 13-326](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h252

**Table 13-326. INTPRIORITY\_248 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.325 INTPRIORITY\_249 Register (Offset = 13E4h) [Reset = 00000000h]

INTPRIORITY\_249 is shown in [Table 13-327](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h253

**Table 13-327. INTPRIORITY\_249 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.326 INTPRIORITY\_250 Register (Offset = 13E8h) [Reset = 00000000h]

INTPRIORITY\_250 is shown in [Table 13-328](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h254

**Table 13-328. INTPRIORITY\_250 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.327 INTPRIORITY\_251 Register (Offset = 13ECh) [Reset = 00000000h]

INTPRIORITY\_251 is shown in [Table 13-329](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h255

**Table 13-329. INTPRIORITY\_251 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.328 INTPRIORITY\_252 Register (Offset = 13F0h) [Reset = 00000000h]

INTPRIORITY\_252 is shown in [Table 13-330](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h256

**Table 13-330. INTPRIORITY\_252 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.329 INTPRIORITY\_253 Register (Offset = 13F4h) [Reset = 00000000h]

INTPRIORITY\_253 is shown in [Table 13-331](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h257

**Table 13-331. INTPRIORITY\_253 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.330 INTPRIORITY\_254 Register (Offset = 13F8h) [Reset = 00000000h]

INTPRIORITY\_254 is shown in [Table 13-332](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h258

**Table 13-332. INTPRIORITY\_254 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.331 INTPRIORITY\_255 Register (Offset = 13FCh) [Reset = 00000000h]

INTPRIORITY\_255 is shown in [Table 13-333](#).

Return to the [Summary Table](#).

Interrupt Q Priority Register (Q is 0 to 255 , Q= M+1 x 32) h1000 + Q x h259

**Table 13-333. INTPRIORITY\_255 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RES19	R	0h	RESERVE FIELD
3-0	PRI	R/W	Fh	This is the priority for interrupt Q. If two interrupts have the same priority, then whichever interrupt has the lower number Q wins arbitration 0 Highest Priority 15 Lowest Priority (Default)

### 13.10.332 INTVECTOR Register (Offset = 2000h) [Reset = 00000000h]

INTVECTOR is shown in [Table 13-334](#).

Return to the [Summary Table](#).

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h4

**Table 13-334. INTVECTOR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	<p>This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.</p>
1-0	RES20	R	0h	<p>Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.</p>

### 13.10.333 INTVECTOR\_1 Register (Offset = 2004h) [Reset = 00000000h]

INTVECTOR\_1 is shown in [Table 13-335](#).

Return to the [Summary Table](#).

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h5

**Table 13-335. INTVECTOR\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	<p>This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.</p>
1-0	RES20	R	0h	<p>Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.</p>

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	<p>This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.</p>
1-0	RES20	R	0h	<p>Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.</p>

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	<p>This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.</p>
1-0	RES20	R	0h	<p>Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.</p>

### 13.10.410 INTVECTOR\_78 Register (Offset = 2138h) [Reset = 00000000h]

INTVECTOR\_78 is shown in [Table 13-412](#).

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	<p>This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.</p>
1-0	RES20	R	0h	<p>Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.</p>

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h119

**Table 13-449. INTVECTOR\_115 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	<p>This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.</p>
1-0	RES20	R	0h	<p>Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.</p>

### 13.10.448 INTVECTOR\_116 Register (Offset = 21D0h) [Reset = 00000000h]

INTVECTOR\_116 is shown in [Table 13-450](#).

Return to the [Summary Table](#).

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h120

**Table 13-450. INTVECTOR\_116 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	<p>This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. ### 13.10.466 INTVECTOR\_134 Register (Offset = 2218h) [Reset = 00000000h]

INTVECTOR\_134 is shown in [Table 13-468](#).

Return to the [Summary Table](#).

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h138

**Table 13-468. INTVECTOR\_134 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	<p>This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.</p>
1-0	RES20	R	0h	<p>Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.</p>

### 13.10.467 INTVECTOR\_135 Register (Offset = 221Ch) [Reset = 00000000h]

INTVECTOR\_135 is shown in [Table 13-469](#).

Return to the [Summary Table](#).

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h139

**Table 13-469. INTVECTOR\_135 Register Field Descriptions**

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h194

**Table 13-524. INTVECTOR\_190 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	<p>This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.</p>
1-0	RES20	R	0h	<p>Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.</p>

### 13.10.523 INTVECTOR\_191 Register (Offset = 22FCh) [Reset = 00000000h]

INTVECTOR\_191 is shown in [Table 13-525](#).

Return to the [Summary Table](#).

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h195

**Table 13-525. INTVECTOR\_191 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	<p>This is the 32-bit Vector Address associated with interrupt Q. ### 13.10.541 INTVECTOR\_209 Register (Offset = 2344h) [Reset = 00000000h]

INTVECTOR\_209 is shown in [Table 13-543](#).

Return to the [Summary Table](#).

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h213

**Table 13-543. INTVECTOR\_209 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	ADDR	R/W	0h	<p>This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address (Base Address + 0x18) or FIQ Vector Address (Base Address + 0x1C) and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.</p>
1-0	RES20	R	0h	<p>Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.</p>

### 13.10.542 INTVECTOR\_210 Register (Offset = 2348h) [Reset = 00000000h]

INTVECTOR\_210 is shown in [Table 13-544](#).

Return to the [Summary Table](#).

Interrupt Q Vector Register (Q is 0 to 255 , Q= M+1 x 32) h2000 + Q x h214

**Table 13-544. INTVECTOR\_210 Register Field Descriptions**

## Chapter 14

# Real-Time Interrupt (RTI) and Watchdog Module

---

This chapter describes the functionality of the real-time interrupt (RTI) module. The RTI is designed as an operating system timer to support a real time operating system (RTOS).

---

### Note

This chapter describes a superset implementation of the RTI module that includes features and functionality related to DMA and Timebase control. These features are dependent on the device-specific feature content. Consult your device-specific datasheet to determine the applicability of these features to your device being used.

---

## 14.1 Overview

The real-time interrupt (RTI) module provides timer functionality for operating systems and for benchmarking code. The RTI module can incorporate several counters that define the time bases needed for scheduling in the operating system.

The timers also allow you to benchmark certain areas of code by reading the values of the counters at the beginning and the end of the desired code range and calculating the difference between the values.

There are two instances of the RTI and Watchdog modules: One in the APPSS, and one in the HWASS.

### 14.1.1 Features

The RTI module has the following features:

- Two independent 64 bit counter blocks
- Windowed Watchdog Timer (WWDT) Feature
- Four configurable compares for generating operating system ticks or DMA requests. Each event can be driven by either counter block 0 or counter block 1.
- Fast enabling/disabling of events
- Two time stamp (capture) functions for system or peripheral interrupts, one for each counter block
- Digital windowed watchdog

The RTI does not support the following features:

- External clock supervising circuit to switch to internal prescale counter 0, if external clock source fails to increment in a predefined window.
- Capture events to capture timestamps through recording of timer status.
- Two time-stamp (capture) functions for system or peripheral interrupts, one for each counter block.
- Analog Watchdog via external RC Network to prevent for runaway code.

### 14.1.2 Industry Standard Compliance Statement

This module is specifically designed to fulfill the requirements for OSEK (**O**ffene **S**ysteme und deren **S**chnittstellen für die **E**lektronik im **K**raftfahrzeug, or Open Systems and the Corresponding Interfaces for Automotive Electronics) as well as OSEK/time-compliant operating systems, but is not limited to it.

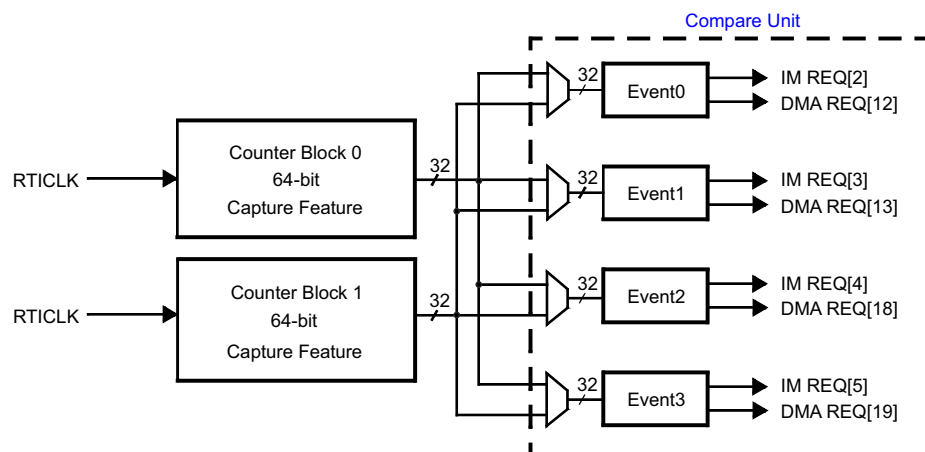

## 14.2 Module Operation

Figure 14-1 illustrates the high level block diagram of the RTI module.

The RTI module has two independent counter blocks for generating different timebases: counter block 0 and counter block 1. The two counter blocks provide the same basic functionality.

A compare unit compares the counters with programmable values and generates four independent interrupt or DMA requests on compare matches. Each of the compare registers can be programmed to be compared to either counter block 0 or counter block 1.

The following sections describe the individual functions in more detail.

**Figure 14-1. RTI Block Diagram**

### Note

During deep sleep entry, there is a need to disable the WDT warm reset propagation.

The WDT does **not** provide coverage in deep sleep mode. Thus, proper care must be taken by the application to ensure the WDT is not enabled when entering this mode.

TOP\_PRCM:RST\_WDT\_RESET\_EN[0] must be set to 0.

### 14.2.1 Counter Operation

Each counter block consists of the following (see Figure 14-2):

- One 32-bit prescale counter (RTIUC0 or RTIUC1)
- One 32-bit free running counter (RTIFRC0 or RTIFRC1)

The RTIUC0/1 is driven by the RTICLK and counts up until the compare value in the compare up counter register (RTICPUC0 or RTICPUC1) is reached. When the compare matches, RTIFRC0/1 is incremented and RTIUC0/1 is reset to 0. If RTIFRC0/1 overflows, an interrupt is generated to the interrupt manager (NVIC/IM). The overflow interrupt is not intended to generate the timebase for the operating system. See Section 14.2.2 for the timebase generation. The up counter together with the compare up counter value prescale the RTI clock. The resulting formula for the frequency of the free running counter (RTIFRC0/1) is:

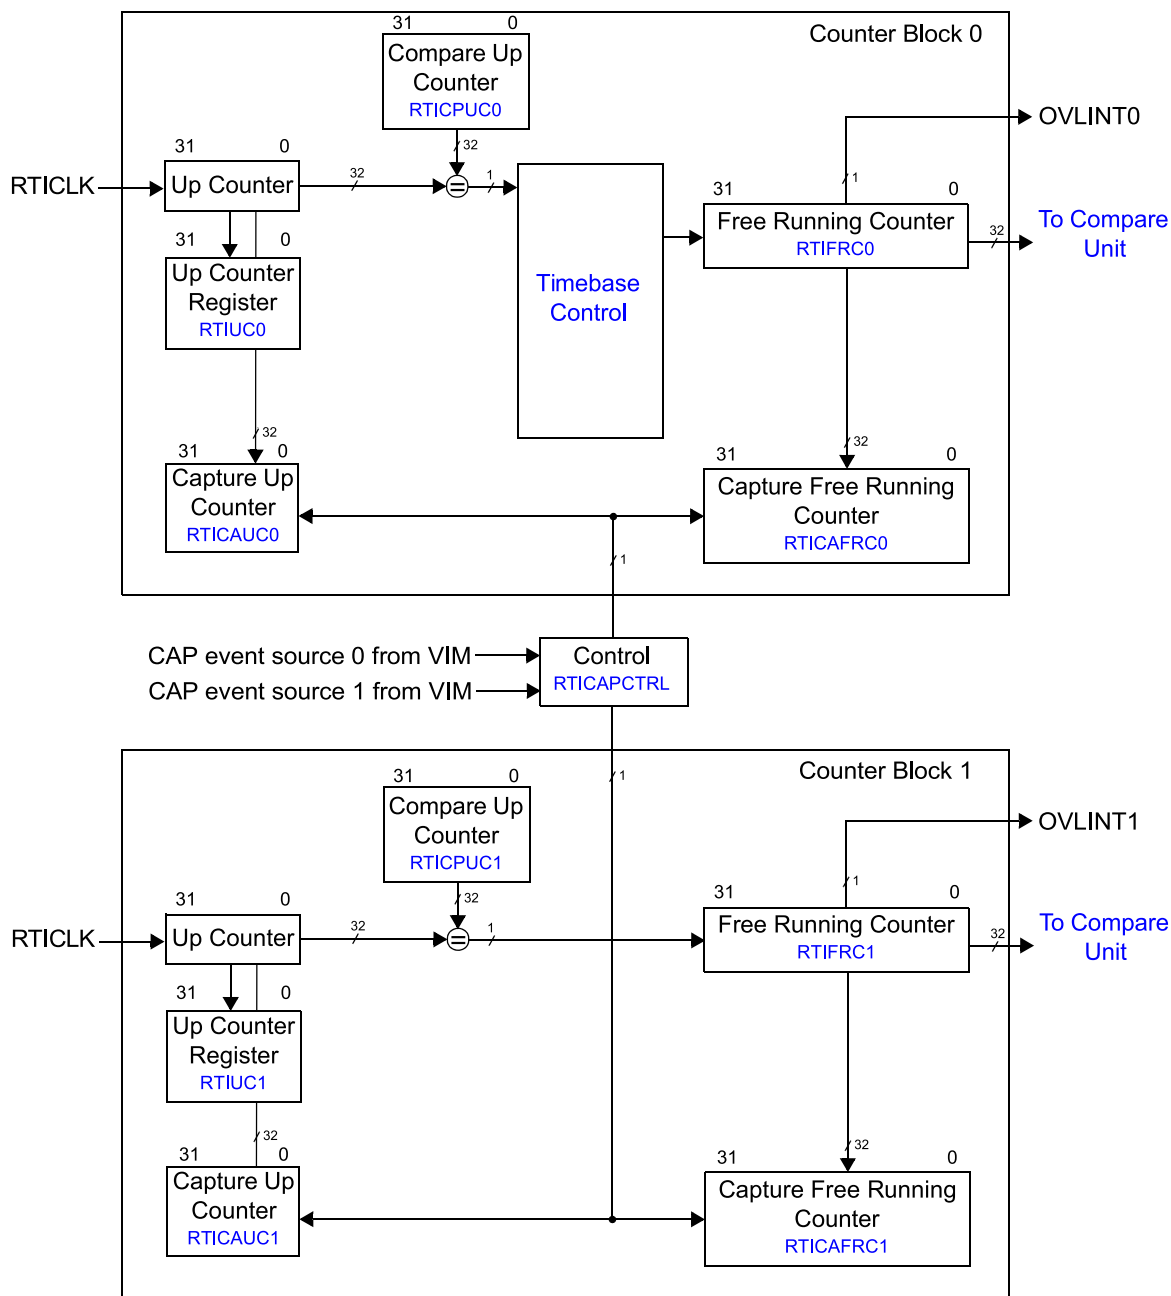

$$f_{RTIFRCx} = \begin{cases} \frac{f_{RTICLK}}{RTICPUCx + 1} & \text{when } RTICPUCx \neq 0 \\ \frac{f_{RTICLK}}{2^{32} + 1} & \text{when } RTICPUCx = 0 \end{cases} \quad (1)$$

### Note

Setting RTICPUCx equal to zero is not recommended. Doing so will hold the Up Counter at zero for two RTICLK cycles after it overflows from 0xFFFFFFFF to zero.

The counter values can be determined by reading the respective counter registers or by generating a hardware event which captures the counter value into the respective capture register. Both functions are described in the following sections.

**Figure 14-2. Counter Block Diagram**

#### 14.2.1.1 Counter and Capture Read Consistency

Portions of the device internal databus are 32-bits wide. If the application wants to read the 64-bit counters or the 64-bit capture values, a certain order of 32-bit read operations needs to be followed. This is to prevent one counter incrementing in between the two separate read operations to both counters.

##### Reading the Counters

The free running counter (RTIFRCx) must be read first. This priority will ensure that in the cycle when the CPU reads RTIFRCx, the up counter value is stored in its counter register (RTIUCx). The second read has to access the up counter register (RTIUCx), which then holds the value which corresponds to the number of RTICLK cycles that have elapsed at the time reading the free running counter register (RTIFRCx).

---

##### Note

The up counters are implemented as shadow registers. Reading RTIUCx without having read RTIFRCx first will return always the same value. RTIUCx will only be updated when RTIFRCx is read.

---

##### Reading the Capture Values

The free running counter capture register (RTICAFRCx) must be read first. This priority will ensure that in the cycle when the CPU reads RTICAFRCx, the up counter value is stored in its counter register (RTICAUCx). The second read has to access the up counter register (RTICAUCx), which then holds the value captured at the time when reading the capture free running counter register (RTICAFRCx).

---

##### Note

The capture up counter registers are implemented as shadow registers. Reading RTICAUCx without having read RTICAFRCx first will return always the same value. RTICAUCx will only be updated when RTICAFRCx is read.

---

#### 14.2.1.2 Capture Feature

Both counter blocks also provide a capture feature on external events. Two capture sources can trigger the capture event. The source triggering the block is configurable (RTICAPCTRL). The sources originate from the Interrupt Manager (NVIC/IM) and allow the generation of capture events when a peripheral modules has generated an interrupt. Any of the peripheral interrupts can be selected as the capture event in the NVIC/IM.

When an event is detected, RTIUCx and RTIFRCx are stored in the capture up counter (RTICAUCx) and capture free running counter (RTICAFRCx) registers. The read order of the captured values must be the same as the read order of the actual counters (see [Section 14.2.1.1](#)).

#### 14.2.2 Interrupt/DMA Requests

There are four compare registers (RTICOMPy) to generate interrupt requests to the NVIC/IM or DMA requests to the DMA controller. The interrupts can be used to generate different timebases for the operating system. Each of the compare registers can be configured to be compared to either RTIFRC0 or RTIFRC1. When the counter value matches the compare value, an interrupt is generated. To allow periodic interrupts, a certain value can be added to the compare value in RTICOMPy automatically. This value is stored in the update compare register (RTIUDCPy) and will be added after a compare is matched. The period of the generated interrupt/DMA request can be calculated with:

$$t_{COMPx} = t_{RTICK} \times (RTICPUCy + 1) \times RTIUDCPy$$

if  $RTICPUCy \neq 0$ ,

$$t_{COMPx} = t_{RTICK} \times (2^{32} + 1) \times RTIUDCPy$$

if  $RTIUDCPy = 0$ ,

$$t_{COMPx} = t_{RTICK} \times (RTICPUCy + 1) \times 2^{32} \quad (2)$$

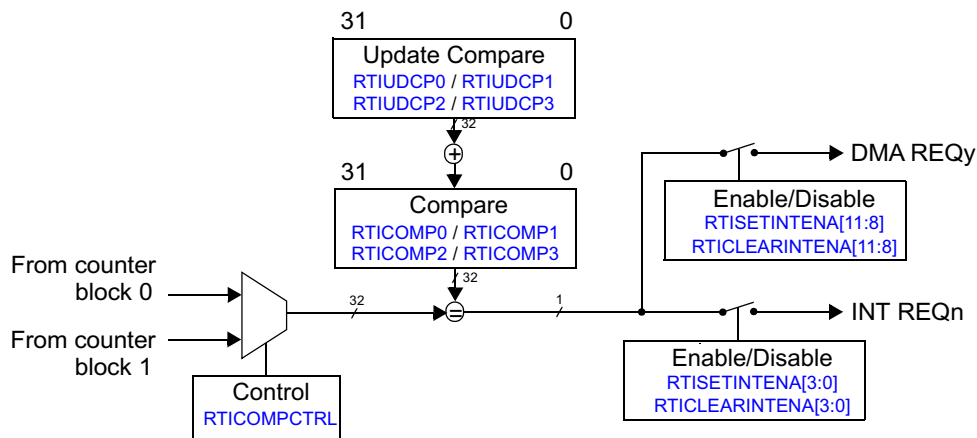

Figure 14-3. Compare Unit Block Diagram (shows only 1 of 4 blocks for simplification)

Another interrupt that can be generated is the overflow interrupt (OVLINTx) in case the RTIFRCx counter overflows.

The interrupts/DMA requests can be enabled in the RTISETINTENA register and disabled in the RTICLEARINTENA register. The RTIINTFLAG register shows the pending interrupts.

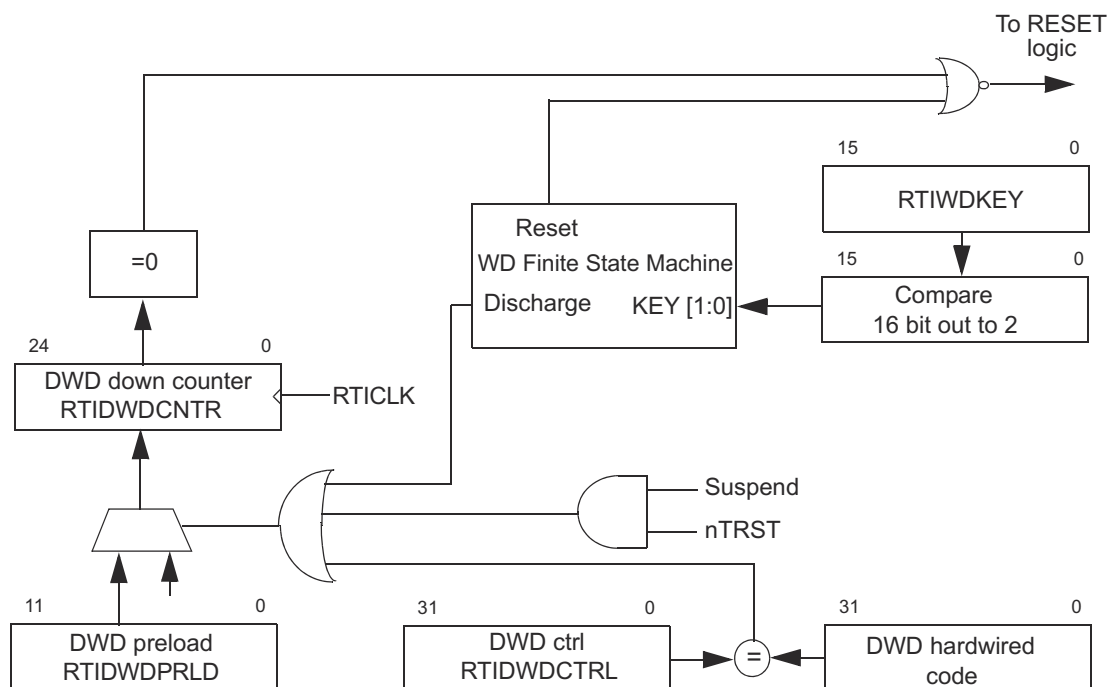

### 14.2.3 RTI Clocking

The counter blocks are clocked with RTICK.

A clock supervision for the NTUX clocking scheme is implemented to avoid missing operating system ticks.

### 14.2.4 Digital Watchdog (DWD)

The digital watchdog (DWD) is an optional safety diagnostic which can detect a runaway CPU and generate either a reset or NMI (non-maskable interrupt) response. It generates resets or NMIs after a programmable period, and generates a reset if no correct key sequence was written to the RTIWDKEY register. Figure 14-4 illustrates the DWD.

**Figure 14-4. Digital Watchdog**

#### 14.2.4.1 Digital Watchdog (DWD)

The DWD is disabled by default. If it should be used, it must be enabled by writing a 32-bit value to the RTIDWDCTRL register.

##### Note

Once the DWD is enabled, it cannot be disabled except by system reset or power on reset.

If the correct key sequence is written to the RTIWDKEY register (0xE51A followed by 0xA35C), the 25-bit DWD down counter is reloaded with the left justified 12-bit preload value stored in RTIDWDPRLD. If an incorrect value is written, a watchdog reset will occur immediately. Also a reset or NMI will be generated when the DWD down counter is decremented to 0.

While the device is in suspend mode (halting debug mode), the DWD down counter keeps the value it had when entering suspend mode.

The DWD down counter will be decremented with the RTICLK frequency.

**Figure 14-5. DWD Operation**

The expiration time of the DWD down counter can be determined with the following equation:

$$t_{exp} = (DWDPRLD + 1) \times 2^{13}/RTICLK$$

where

$$DWDPRLD = 0 \dots 4095$$

##### Note

Care should be taken to ensure that the CPU write to the watchdog register is made allowing time for the write to propagate to the RTI.

#### 14.2.4.2 Digital Windowed Watchdog (DWWD)

In addition to the time-out boundary configurable via the digital watchdog discussed in [Section 14.2.4.1](#), for enhanced safety metrics it is desirable to check for a watchdog "pet" within a time window rather than using a single time threshold. This is enabled by the digital windowed watchdog (DWWD) feature.

##### • Functional Behavior

The DWWD opens a configurable time window in which the watchdog must be serviced. Any attempt to service the watchdog outside this time window, or a failure to service the watchdog in this time window, will cause

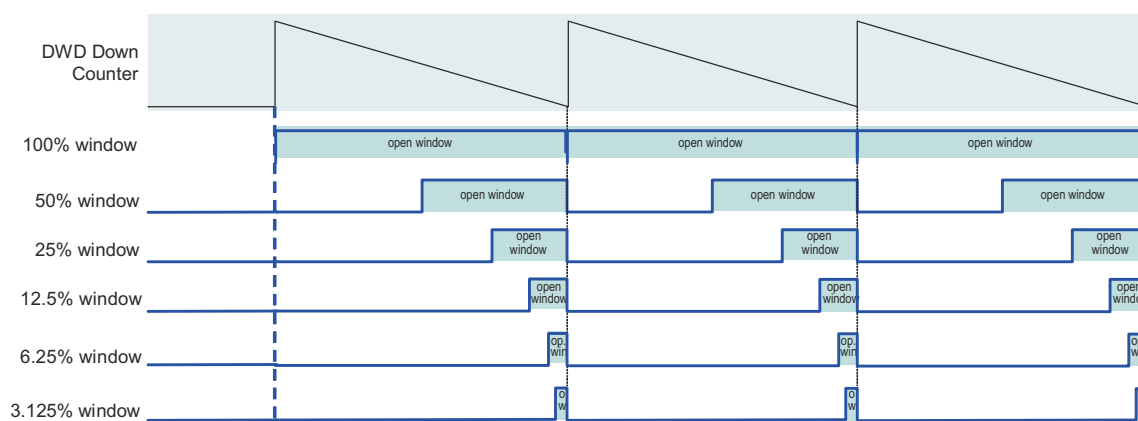

the watchdog to generate either a reset to the CPU. This is controlled by configuring the RTIWWDRXNCTRL register. As with the DWD, the DWWD is disabled after power on reset. When the DWWD is configured to generate a non-maskable interrupt on a window violation, the watchdog counter continues to count down. The NMI handler needs to clear the watchdog violation status flag(s) and then service the watchdog by writing the correct sequence in the watchdog key register. This service will cause the watchdog counter to get reloaded from the preload value and start counting down. If the NMI handler does not service the watchdog in time, it could count down all the way to zero and wrap around. If the NMI Handler does not service the watchdog in time, the NMI gets generated continuously, each time the counter counts to '0'.

The DWWD uses the Digital Watchdog (DWD) preload register (RTIDWDPRLD) setting to define the end-time of the window. The start-time of the window is defined by a window size configuration register(RTIWWDSIZECTRL).

The default window size is set to 100%, which corresponds to the DWD functionality of a time-out-only watchdog. The window size can be selected (through register RTIWWDSIZECTRL) from among 100%, 50%, 25%, 12.5%, 6.25% and 3.125% as shown in Figure 14-6. The window with the respective size will be opened before the end of the DWD expiration. The user has to serve the watchdog in the window. Otherwise, a reset or NMI will generate. Figure 14-7 shows an DWWD operation example (25% window).

- Configuration of DWWD

The DWWD preload value (same as DWD preload) can only be configured when the DWWD counter is disabled. The window size and watchdog reaction to a violation can be configured even after the watchdog has been enabled. Any changes to the window size and watchdog reaction configurations will only take effect after the next servicing of the DWWD. This feature can be utilized to dynamically set windows of different sizes based on task execution time, adding a program sequence element to the diagnostic which can improve fault coverage.

**Figure 14-6. Digital Windowed Watchdog Timing Example**

**Figure 14-7. Digital Windowed Watchdog Operation Example (25% Window)**

#### 14.2.5 Halting Debug Mode Behaviour

Once the system enters halting debug mode, the behavior of the RTI depends on the COS (continue on suspend) bit. If the bit is cleared and halting debug mode is active, all counters will stop operation. If the bit is set to one, all counters will be clocked normally and the RTI will work like in normal mode. However, if the external timebase (NTU) is used and the system is in halting debug mode, the timebase control circuit will switch to internal timebase once it detects the missing NTU signal of the suspended communication controller. This will be signaled with an TBINT interrupt so that software can resynchronize after the device exits halting debug mode.

## 14.3 MSS\_RTI Registers

Table 14-1 lists the memory-mapped registers for the MSS\_RTI registers. All register offset addresses not listed in Table 14-1 should be considered as reserved locations and the register contents should not be modified.

Complex bit access types are encoded to fit into small table cells. [Table 14-2](#) shows the codes that are used for access types in this section.

**Table 14-2. MSS\_RTI Access Type Codes**

Access Type	Code	Description
<b>Read Type</b>		
R	R	Read
<b>Write Type</b>		
W	W	Write
<b>Reset or Default Value</b>		
-n		Value after reset or the default value

### 14.3.1 RTIGCTRL Register (Offset = 0h) [Reset = 00000000h]

RTIGCTRL is shown in [Table 14-3](#).

Return to the [Summary Table](#).

Global Control Register starts / stops the counters

**Table 14-3. RTIGCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-20	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
19-16	NTUSEL	R/W	0h	NTUSEL: Select NTU signal. These bits determine which NTU input signal is used as external timebase. There are up to four inputs supported with four valid selection combinations. Any invalid selection value written to the NTUSEL bit-field will result in a TIED LOW being used as the NTU signal. The NTU signal will also be TIED LOW in case of a single-bit flip as it will result in an invalid combination of NTUSEL. User and privilege mode (read): 0000 = NTU0 0101 = NTU1 1010 = NTU2 1111 = NTU3 other = tied to '0' Privilege mode (write): 0000 = NTU0 0101 = NTU1 1010 = NTU2 1111 = NTU3 other = tied to '0'
15	COS	R/W	0h	COS: Continue On Suspend. This bit determines if both counters are stopped when the device goes into debug mode or if they continue counting. User and privilege mode (read): 0 = counters are stopped while in debug mode 1 = counters are running while in debug mode Privilege mode (write): 0 = stop counters in debug mode 1 = continue counting in debug mode
14-2	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
1	CNT1EN	R/W	0h	CNT1EN: Counter 1 Enable. The CNT1EN bit starts and stops the operation of counter block 1 (UC1 and FRC1). User and privilege mode (read): 0 = counters are stopped 1 = counters are running Privilege mode (write): 0 = stop counters 1 = start counters Gives the absolute 32 bit destination address (physical).
0	CNT0EN	R/W	0h	CNT0EN: Counter 0 Enable. The CNT0EN bit starts and stops the operation of counter block 0 (UC0 and FRC0). User and privilege mode (read): 0 = counters are stopped 1 = counters are running Privilege mode (write): 0 = stop counters 1 = start counters Gives the absolute 32 bits source address (physical).

### 14.3.2 RTITBCTRL Register (Offset = 4h) [Reset = 00000000h]

RTITBCTRL is shown in [Table 14-4](#).

Return to the [Summary Table](#).

Timebase Control selection which source triggers free running counter 0

**Table 14-4. RTITBCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	0h	Reserved
1	INC	R/W	0h	<p>INC: Increment Free Running Counter 0.</p> <p>This bit determines whether the Free Running Counter 0 is automatically incremented if a failing clock on the NTUx signal is detected.</p> <p>User and privilege mode (read):</p> <p>0 = FRC0 will not be incremented</p> <p>1 = FRC0 will be incremented</p> <p>Privilege mode (write):</p> <p>0 = Do not increment FRC0 on failing external clock</p> <p>1 = Increment FRC0 on failing external clock</p>
0	TBEXT	R/W	0h	<p>TBEXT: Timebase External.</p> <p>The Timebase External bit selects whether the Free Running Counter 0 is clocked by the internal Up Counter 0 or from the external signal NTUx.</p> <p>Since setting the TBEXT bit to 1 resets Up Counter 0, Free Running Counter 0 will not be incremented in this occurrence.</p> <p>The only source which is able to increment Free Running Counter 0 is NTUx.</p> <p>When the Timebase Supervisor circuit detects a missing clockedge, then the TBEXT bit is reset.</p> <p>The selection if the external signal should be used, can only be done by software.</p> <p>User and privilege mode (read):</p> <p>0 = UC0 clocks FRC0</p> <p>1 = NTUx clocks FRC0</p> <p>Privilege mode (write):</p> <p>0 = MUX is switched to internal UC0 clocking scheme</p> <p>1 = MUX is switched to external NTUx clocking scheme</p>

### 14.3.3 RTICAPCTRL Register (Offset = 8h) [Reset = 00000000h]

RTICAPCTRL is shown in [Table 14-5](#).

Return to the [Summary Table](#).

Capture Control controls the capture source for the counters

**Table 14-5. RTICAPCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
1	CAPCNTR1	R/W	0h	CAPCNTR 1: Capture Counter 1. This bit determines, which external interrupt source triggers a capture event of both UC1 and FRC1. User and privilege mode (read): 0 = capture event is triggered by Capture Event Source 0 1 = capture event is triggered by Capture Event Source 1 Privilege mode (write): 0 = enable capture event triggered by Capture Event Source 0 1 = enable capture event triggered by Capture Event Source 1
0	CAPCNTR0	R/W	0h	CAPCNTR 0: Capture Counter 0. This bit determines, which external interrupt source triggers a capture event of both UC0 and FRC0. User and privilege mode (read): 0 = capture event is triggered by Capture Event Source 0 1 = capture event is triggered by Capture Event Source 1 Privilege mode (write): 0 = enable capture event triggered by Capture Event Source 0 1 = enable capture event triggered by Capture Event Source 1 11 indexed 10 reserved 01 post-increment 00 constant

#### 14.3.4 RTICOMPCTRL Register (Offset = Ch) [Reset = 00000000h]

RTICOMPCTRL is shown in [Table 14-6](#).

Return to the [Summary Table](#).

Compare Control controls the source for the compare registers

**Table 14-6. RTICOMPCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-13	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
12	COMP3SEL	R/W	0h	COMPSEL 3: Compare Select 3. This bit determines the counter with which the compare value hold in compare register 3 is compared. User and privilege mode (read): 0 = value will be compared with FRC 0 1 = value will be compared with FRC 1 Privilege mode (write): 0 = enable compare with FRC 0 1 = enable compare with FRC 1
11-9	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
8	COMP2SEL	R/W	0h	COMPSEL 2: Compare Select 2. This bit determines the counter with which the compare value hold in compare register 2 is compared. User and privilege mode (read): 0 = value will be compared with FRC 0 1 = value will be compared with FRC 1 Privilege mode (write): 0 = enable compare with FRC 0 1 = enable compare with FRC 1
7-5	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
4	COMP1SEL	R/W	0h	COMPSEL 1: Compare Select 1. This bit determines the counter with which the compare value hold in compare register 1 is compared. User and privilege mode (read): 0 = value will be compared with FRC 0 1 = value will be compared with FRC 1 Privilege mode (write): 0 = enable compare with FRC 0 1 = enable compare with FRC 1
3-1	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
0	COMP0SEL	R/W	0h	COMPSEL 0: Compare Select 0. This bit determines the counter with which the compare value hold in compare register 0 is compared. User and privilege mode (read): 0 = value will be compared with FRC 0 1 = value will be compared with FRC 1 Privilege mode (write): 0 = enable compare with FRC 0 1 = enable compare with FRC 1

### 14.3.5 RTIFRC0 Register (Offset = 10h) [Reset = 00000000h]

RTIFRC0 is shown in [Table 14-7](#).

Return to the [Summary Table](#).

Free Running Counter 0 current value of free running counter 0

**Table 14-7. RTIFRC0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	FRC0	R/W	0h	<p>FRC0: Free Running Counter 0.</p> <p>This registers holds the current value of the Free Running Counter 0 and will be updated continuously.</p> <p>User and privilege mode (read): current value of the counter</p> <p>Privilege mode (write): The counter can be preset by writing to this register.</p> <p>The counter increments then from this written value upwards.</p> <p>Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC0 and RTIFRC0.</p>

### 14.3.6 RTIUC0 Register (Offset = 14h) [Reset = 00000000h]

RTIUC0 is shown in [Table 14-8](#).

Return to the [Summary Table](#).

Up Counter 0 current value of prescale counter 0

**Table 14-8. RTIUC0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	UC0	R/W	0h	<p>UC0: Up Counter 0.</p> <p>This registers holds the current value of the Up Counter 0 and prescales the RTI clock.</p> <p>It will be only updated by a previous read of Free Running Counter 0.</p> <p>This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 0 and Free Running Counter 0.</p> <p>User and privilege mode (read): value of the counter when the Free Running Counter 0 was read Privilege mode (write): the counter can be preset by writing to this register.</p> <p>The counter increments then from this written value upwards.</p> <p>Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC0 and RTIFRC0.</p> <p>Note: Preset value concern If the preset value is bigger than the compare value stored in register RTICPUC0 then it can take a long time until a compare matches, since RTIUC0 has to count up until it overflows.</p>

### 14.3.7 RTICPUC0 Register (Offset = 18h) [Reset = 00000000h]

RTICPUC0 is shown in [Table 14-9](#).

Return to the [Summary Table](#).

Compare Up Counter 0 compare value compared with prescale counter 0

**Table 14-9. RTICPUC0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CPUC0	R/W	0h	<p>This registers holds the compare value, which is compared with the Up Counter 0.</p> <p>When the compare matches, Free Running counter 0 is incremented.</p> <p>The Up Counter is set to zero when the counter value matches the CPUC0 value.</p> <p>The value set in this prescales the RTI clock.</p> <p>If CPUC</p> <p>0 = 0: then, frequency = <math>RTICLK / (2^{32})</math> If CPUC0 <math>\neq</math> 0: then , frequency = <math>RTICLK / (CPUC0 + 1)</math></p> <p>User and privilege mode (read): current compare value</p> <p>Privilege mode (write when TBEXT = 0): the compare value is updated</p> <p>Privilege mode (write when TBEXT = 1): the compare value is not changed</p>

### 14.3.8 RTICAFRC0 Register (Offset = 20h) [Reset = 00000000h]

RTICAFRC0 is shown in [Table 14-10](#).

Return to the [Summary Table](#).

Capture Free Running Counter 0 current value of free running counter 0 on external event

**Table 14-10. RTICAFRC0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CAFR0	R/W	0h	CAFR0: Capture Free Running Counter 0. This registers captures the current value of the Free Running Counter 0 when a event occurs, controlled by the external capture control block. User and privilege mode (read): value of Free Running Counter 0 on a capture event

### 14.3.9 RTICAUC0 Register (Offset = 24h) [Reset = 00000000h]

RTICAUC0 is shown in [Table 14-11](#).

Return to the [Summary Table](#).

Capture Up Counter 0 current value of prescale counter 0 on external event

**Table 14-11. RTICAUC0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CAUC0	R/W	0h	<p>CAUC0: Capture Up Counter 0.</p> <p>This registers captures the current value of the Up Counter 0 when a event occurs, controlled by the external capture control block. The read sequence has to be the same as with Up Counter 0 and Free Running Counter 0.</p> <p>So the RTICAFRC0 register has to be read first, before the RTICAUC0 register is read.</p> <p>This sequence ensures that the value of the RTICAUC0 register is the corresponding value to the RTICAFRC0 register, even if another capture event happens in between the two reads.</p> <p>User and privilege mode (read): value of Up Counter 0 on a capture event</p>

### 14.3.10 RTIFRC1 Register (Offset = 30h) [Reset = 00000000h]

RTIFRC1 is shown in [Table 14-12](#).

Return to the [Summary Table](#).

Free Running Counter 1 current value of free running counter 1

**Table 14-12. RTIFRC1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	FRC1	R/W	0h	<p>FRC1: Free Running Counter 1.</p> <p>This registers holds the current value of the Free Running Counter 1 and will be updated continuously.</p> <p>User and privilege mode (read): current value of the counter</p> <p>Privilege mode (write): The counter can be preset by writing to this register.</p> <p>The counter increments then from this written value upwards.</p> <p>Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC1 and RTIFRC1.</p>

### 14.3.11 RTIUC1 Register (Offset = 34h) [Reset = 00000000h]

RTIUC1 is shown in [Table 14-13](#).

Return to the [Summary Table](#).

Up Counter 1 current value of prescale counter 1

**Table 14-13. RTIUC1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	UC1	R/W	0h	<p>UC1: Up Counter 1.</p> <p>This registers holds the current value of the Up Counter 1 and prescales the RTI clock.</p> <p>It will be only updated by a previous read of Free Running Counter 1. This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 1 and Free Running Counter 1.</p> <p>User and privilege mode (read): value of the counter when the Free Running Counter 1 was read Privilege mode (write): the counter can be preset by writing to this register.</p> <p>The counter increments then from this written value upwards.</p> <p>Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC1 and RTIFRC1.</p> <p>Note: Preset value concern If the preset value is bigger than the compare value stored in register RTICPUC1 then it can take a long time until a compare matches, since RTIUC1 has to count up until it overflows.</p>

### 14.3.12 RTICPUC1 Register (Offset = 38h) [Reset = 00000000h]

RTICPUC1 is shown in [Table 14-14](#).

Return to the [Summary Table](#).

Compare Up Counter 1 compare value compared with prescale counter 1

**Table 14-14. RTICPUC1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CPUC1	R/W	0h	<p>This registers holds the compare value, which is compared with the Up Counter 1.</p> <p>When the compare matches, Free Running Counter 1 is incremented.</p> <p>The Up Counter is set to zero when the counter value matches the CPUC1 value.</p> <p>The value set in this prescales the RTI clock.</p> <p>If CPUC</p> <p>1 = 0: then, frequency = RTICLK/ (<math>2^{32}</math>) If CPUC1 <math>\neq</math> 0: then , frequency = RTICLK/(CPUC1 + 1) User and privilege mode (read): current compare value Privilege mode (write when TBEXT = 0): the compare value is updated Privilege mode (write when TBEXT = 1): the compare value is not changed</p>

### 14.3.13 RTICAFRC1 Register (Offset = 40h) [Reset = 00000000h]

RTICAFRC1 is shown in [Table 14-15](#).

Return to the [Summary Table](#).

Capture Free Running Counter 1 current value of free running counter 1 on external event

**Table 14-15. RTICAFRC1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CAFRC1	R/W	0h	CAFRC1: Capture Free Running Counter 1. This registers captures the current value of the Free Running Counter 1 when a event occurs, controlled by the external capture control block. User and privilege mode (read): value of Free Running Counter 1 on a capture event

### 14.3.14 RTICAUC1 Register (Offset = 44h) [Reset = 00000000h]

RTICAUC1 is shown in [Table 14-16](#).

Return to the [Summary Table](#).

Capture Up Counter 1 current value of prescale counter 1 on external event

**Table 14-16. RTICAUC1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CAUC1	R/W	0h	<p>CAUC1: Capture Up Counter 1.</p> <p>This registers captures the current value of the Up Counter 1 when a event occurs, controlled by the external capture control block. The read sequence has to be the same as with Up Counter 1 and Free Running Counter 1.</p> <p>So the RTICAFRC1 register has to be read first, before the RTICAUC1 register is read.</p> <p>This sequence ensures that the value of the RTICAUC1 register is the corresponding value to the RTICAFRC1 register, even if another capture event happens in between the two reads.</p> <p>User and privilege mode (read): value of Up Counter 1 on a capture event</p>

### 14.3.15 RTICOMP0 Register (Offset = 50h) [Reset = 00000000h]

RTICOMP0 is shown in [Table 14-17](#).

Return to the [Summary Table](#).

Compare 0 compare value to be compared with the counters

**Table 14-17. RTICOMP0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	COMP0	R/W	0h	<p>COMP0: Compare 0.</p> <p>This registers holds a compare value, which is compared with the counter selected in the compare control logic.</p> <p>If the Free Running Counter matches the compare value, an interrupt is flagged.</p> <p>With this register it is also possible to initiate a DMA request.</p> <p>User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.</p>

### 14.3.16 RTIUDCP0 Register (Offset = 54h) [Reset = 00000000h]

RTIUDCP0 is shown in [Table 14-18](#).

Return to the [Summary Table](#).

Update Compare 0 value to be added to the compare register 0 value on compare match

**Table 14-18. RTIUDCP0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	UDCP0	R/W	0h	UDCP0: Update Compare 0 Register. This registers holds a value, which is added to the value in the compare 0 register each time a compare matches. This gives the possibility to generate periodic interrupts without software intervention. User and privilege mode (read): value to be added to the compare 0 register on the next compare match Privilege mode (write): new update value

### 14.3.17 RTICOMP1 Register (Offset = 58h) [Reset = 00000000h]

RTICOMP1 is shown in [Table 14-19](#).

Return to the [Summary Table](#).

Compare 1 compare value to be compared with the counters

**Table 14-19. RTICOMP1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	COMP1	R/W	0h	<p>COMP1: compare1.</p> <p>This registers holds a compare value, which is compared with the counter selected in the compare control logic.</p> <p>If the Free Running Counter matches the compare value, an interrupt is flagged.</p> <p>With this register it is also possible to initiate a DMA request.</p> <p>User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.</p>

### 14.3.18 RTIUDCP1 Register (Offset = 5Ch) [Reset = 00000000h]

RTIUDCP1 is shown in [Table 14-20](#).

Return to the [Summary Table](#).

Update Compare 1 value to be added to the compare register 1 value on compare match

**Table 14-20. RTIUDCP1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	UDCP1	R/W	0h	UDCP1: Update compare1 Register. This registers holds a value, which is added to the value in the compare1 register each time a compare matches. This gives the possibility to generate periodic interrupts without software intervention. User and privilege mode (read): value to be added to the compare1 register on the next compare match Privilege mode (write): new update value

### 14.3.19 RTICOMP2 Register (Offset = 60h) [Reset = 00000000h]

RTICOMP2 is shown in [Table 14-21](#).

Return to the [Summary Table](#).

Compare 2 compare value to be compared with the counters

**Table 14-21. RTICOMP2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	COMP2	R/W	0h	<p>COMP2: compare 2.</p> <p>This registers holds a compare value, which is compared with the counter selected in the compare control logic.</p> <p>If the Free Running Counter matches the compare value, an interrupt is flagged.</p> <p>With this register it is also possible to initiate a DMA request.</p> <p>User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.</p>

### 14.3.20 RTIUDCP2 Register (Offset = 64h) [Reset = 00000000h]

RTIUDCP2 is shown in [Table 14-22](#).

Return to the [Summary Table](#).

Update Compare 2 value to be added to the compare register 2 value on compare match

**Table 14-22. RTIUDCP2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	UDCP2	R/W	0h	UDCP2: Update compare 2 Register. This registers holds a value, which is added to the value in the compare 2 register each time a compare matches. This gives the possibility to generate periodic interrupts without software intervention. User and privilege mode (read): value to be added to the compare 2 register on the next compare match Privilege mode (write): new update value

### 14.3.21 RTICOMP3 Register (Offset = 68h) [Reset = 00000000h]

RTICOMP3 is shown in [Table 14-23](#).

Return to the [Summary Table](#).

Compare 3 compare value to be compared with the counters

**Table 14-23. RTICOMP3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	COMP3	R/W	0h	<p>COMP3: compare 3.</p> <p>This registers holds a compare value, which is compared with the counter selected in the compare control logic.</p> <p>If the Free Running Counter matches the compare value, an interrupt is flagged.</p> <p>With this register it is also possible to initiate a DMA request.</p> <p>User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.</p>

### 14.3.22 RTIUDCP3 Register (Offset = 6Ch) [Reset = 00000000h]

RTIUDCP3 is shown in [Table 14-24](#).

Return to the [Summary Table](#).

Update Compare 3 value to be added to the compare register 3 value on compare match

**Table 14-24. RTIUDCP3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	UDCP3	R/W	0h	UDCP3: Update compare 3 Register. This registers holds a value, which is added to the value in the compare 3 register each time a compare matches. This gives the possibility to generate periodic interrupts without software intervention. User and privilege mode (read): value to be added to the compare 3 register on the next compare match Privilege mode (write): new update value

### 14.3.23 RTITBLCOMP Register (Offset = 70h) [Reset = 00000000h]

RTITBLCOMP is shown in [Table 14-25](#).

Return to the [Summary Table](#).

Timebase Low Compare compare value to activate edge detection circuit

**Table 14-25. RTITBLCOMP Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	TBLCOMP	R/W	0h	<p>TBLCOMP: Timebase Low Compare Value.</p> <p>This value determines when the edge detection circuit starts monitoring the NTUx signal.</p> <p>It will be compared with Up Counter 0.</p> <p>User and privilege mode (read): current compare value</p> <p>Privilege mode (write when TBEXT = 0): the compare value is updated</p> <p>Privilege mode (write when TBEXT = 1): the compare value is not changed</p> <p>Note: Reset behavior A reset does not generate a compare match.</p>

### 14.3.24 RTITBHCOMP Register (Offset = 74h) [Reset = 00000000h]

RTITBHCOMP is shown in [Table 14-26](#).

Return to the [Summary Table](#).

Timebase High Compare compare value to deactivate edge detection circuit

**Table 14-26. RTITBHCOMP Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	TBHCMP	R/W	0h	<p>TBHCMP: Timebase High Compare Value.</p> <p>This value determines when the edge detection circuit will stop monitoring the NTUx signal.</p> <p>It will be compared with Up Counter 0.</p> <p>RTITBHCOMP has to be less than RTICPUC0, since RTIUC0 will be reset when RTICPUC0 is reached.</p> <p>Example: The NTUx edge detection circuit should be active +/- 10 RTICLK cycles around RTICPUC0.</p> <p>RTICPUC</p> <p>0 = 0x00000050 RTITBLCOMP = 0x000046 RTITBHCOMP = 0x00000009</p> <p>User and privilege mode (read): current compare value</p> <p>Privilege mode (write when TBEXT = 0): the compare value is updated</p> <p>Privilege mode (write when TBEXT = 1): the compare value is not changed</p> <p>Note: Reset behavior A reset does not generate a compare match.</p>

### 14.3.25 RTISETINT Register (Offset = 80h) [Reset = 00000000h]

RTISETINT is shown in [Table 14-27](#).

Return to the [Summary Table](#).

Set Interrupt Enable sets interrupt enable bits in RTIINTCTRL without having to do a read-modify-write operation

**Table 14-27. RTISETINT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
18	SETOVL1INT	R/W	0h	SETOVL1INT: Set Free Running Counter 1 Overflow Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
17	SETOVL0INT	R/W	0h	SETOVL0INT: Set Free Running Counter 0 Overflow Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
16	SETTBINT	R/W	0h	SETTBINT: Set Timebase Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
15-12	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
11	SETDMA3	R/W	0h	SETDMA 3: Set Compare DMA Request 3. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request
10	SETDMA2	R/W	0h	SETDMA 2: Set Compare DMA Request 2. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request
9	SETDMA1	R/W	0h	SETDMA 1: Set Compare DMA Request 1. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request
8	SETDMA0	R/W	0h	SETDMA 0: Set Compare DMA Request 0. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request
7-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect

**Table 14-27. RTISETINT Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
3	SETINT3	R/W	0h	SETINT 3: Set Compare Interrupt 3. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged
2	SETINT2	R/W	0h	SETINT 2: Set Compare Interrupt 2. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
1	SETINT1	R/W	0h	SETINT 1: Set Compare Interrupt 1. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
0	SETINT0	R/W	0h	SETINT 0: Set Compare Interrupt 0. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt

### 14.3.26 RTICLEARINT Register (Offset = 84h) [Reset = 00000000h]

RTICLEARINT is shown in [Table 14-28](#).

Return to the [Summary Table](#).

Clear Interrupt Enable clears interrupt enable bits in RTIINTCTRL without having to do a read-modify-write operation

**Table 14-28. RTICLEARINT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
18	CLEAROVL1INT	R/W	0h	CLEAROVL1INT: CLEAR Free Running Counter 1 Overflow Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
17	CLEAROVL0INT	R/W	0h	CLEAROVL0INT: CLEAR Free Running Counter 0 Overflow Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
16	CLEARTBINT	R/W	0h	CLEARTBINT: CLEAR Timebase Interrupt. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
15-12	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
11	CLEARDMA3	R/W	0h	CLEARDMA 3: CLEAR Compare DMA Request 3. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request
10	CLEARDMA2	R/W	0h	CLEARDMA 2: CLEAR Compare DMA Request 2. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request
9	CLEARDMA1	R/W	0h	CLEARDMA 1: CLEAR Compare DMA Request 1. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request
8	CLEARDMA0	R/W	0h	CLEARDMA 0: CLEAR Compare DMA Request 0. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request

**Table 14-28. RTICLEARINT Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
7-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
3	CLEARINT3	R/W	0h	CLEARINT 3: CLEAR Compare Interrupt 3. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
2	CLEARINT2	R/W	0h	CLEARINT 2: CLEAR Compare Interrupt 2. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
1	CLEARINT1	R/W	0h	CLEARINT 1: CLEAR Compare Interrupt 1. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
0	CLEARINT0	R/W	0h	CLEARINT 0: CLEAR Compare Interrupt 0. User and privilege mode (read): 0 = interrupt is disabled 1 = interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt

### 14.3.27 RTIINTFLAG Register (Offset = 88h) [Reset = 00000000h]

RTIINTFLAG is shown in [Table 14-29](#).

Return to the [Summary Table](#).

Interrupt Flags interrupt pending bits

**Table 14-29. RTIINTFLAG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
18	OVL1INT	R/W	0h	OVL1INT: Free Running Counter 1 Overflow Interrupt Flag. User and privilege mode (read): determines if an interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
17	OVL0INT	R/W	0h	OVL0INT: Free Running Counter 0 Overflow Interrupt Flag. User and privilege mode (read): determines if an interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
16	TBINT	R/W	0h	User and privilege mode (read): this flag is set when the TBEXT bit is cleared by detection of a missing external clockedge. It will not be set by clearing TBEXT by software. determines if an interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
15-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
3	INT3	R/W	0h	INT 3: Interrupt Flag 3. User and privilege mode (read): determines if a interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
2	INT2	R/W	0h	INT 2: Interrupt Flag 2. User and privilege mode (read): determines if a interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
1	INT1	R/W	0h	INT 1: Interrupt Flag 1. User and privilege mode (read): determines if a interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0
0	INT0	R/W	0h	INT 0: Interrupt Flag 0. User and privilege mode (read): determines if a interrupt is pending 0 = no interrupt pending 1 = interrupt pending Privilege mode (write): 0 = leaves the bit unchanged 1 = set the bit to 0

### 14.3.28 RTIDWDCTRL Register (Offset = 90h) [Reset = 00000000h]

RTIDWDCTRL is shown in [Table 14-30](#).

Return to the [Summary Table](#).

Digital Watchdog Control Enables the Digital Watchdog

**Table 14-30. RTIDWDCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	DWDCTRL	R/W	0h	<p>DWDCTRL: Digital Watchdog Control.</p> <p>User and privileged mode (read): 0x5312ACED = DWD counter is disabled.</p> <p>This is the default value.</p> <p>0xA98559DA = DWD counter is enabled Any other value = DWD counter state is unchanged (enabled or disabled) Privileged mode (write): 0xA98559DA = DWD counter is enabled Any other value = State of DWD counter is unchanged (stays enabled or disabled) Note: One-Write Functionality of DWDCTRL Register The RTIDWDCTRL register implements a one-write functionality, such that the application cannot write to this register more than once.</p> <p>Writing the default value will not enable the watchdog as described above.</p> <p>Writing the enable value will start the watchdog counters.</p> <p>A write to RTIDWDCTRL will only be enabled after a system reset again.</p>

### 14.3.29 RTIDWDPRLD Register (Offset = 94h) [Reset = 00000000h]

RTIDWDPRLD is shown in [Table 14-31](#).

Return to the [Summary Table](#).

Digital Watchdog Preload sets the expiration time of the Digital Watchdog

**Table 14-31. RTIDWDPRLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
11-0	DWDPRLD	R/W	0h	DWDPRLD: Digital Watchdog Preload Value. User and privilege mode (read): A read from this register in any CPU mode returns the current preload value. Privilege mode (write): If the DWD is always enabled after reset is released: The DWD starts counting down from the reset value of the counter, that is, 0x002DFFFF. The application can configure the DWD preload register any time before this down counter expires. When the application services the DWD, the preload register contents are copied left-justified into the DWD down counter and it starts counting down from that value. If the DWD is implemented such that the down counter is enabled by software: The DWD preload register can be configured only when the DWD is disabled. Therefore, the application can only configure the DWD preload register before it enables the DWD down counter. The expiration time of the DWD Down Counter can be determined with following equation: $t_{exp} = (RTIDWDPRLD + 1) \times 2^{13} / RTICLK1$ where: RTIDWDPRLD = 0...4095

### 14.3.30 RTIWDSTATUS Register (Offset = 98h) [Reset = 00000000h]

RTIWDSTATUS is shown in [Table 14-32](#).

Return to the [Summary Table](#).

Watchdog Status reflects the status of Analog and Digital Watchdog

**Table 14-32. RTIWDSTATUS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-6	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
5	DWWD_ST	R/W	0h	DWWD ST: Windowed Watchdog Status. This bit denotes whether the time-window defined by the windowed watchdog configuration has been violated, or if a wrong key or key sequence was written to service the watchdog. User and privilege mode (read): 0 = no time-window violation has occurred. 1 = a time-window violation has occurred. The watchdog will generate either a system reset or a non-maskable interrupt to the CPU in this case. Privilege mode (write): 0 = leaves the current value unchanged. 1 = clears the bit to 0. This will also clear all other status flags in the RTIWDSTATUS register except for the AWD ST flag. Clearing of the status flags will deassert the non-maskable interrupt generated due to violation of the DWWD.
4	ENDTIMEVIOL	R/W	0h	END TIME VIOL: Windowed Watchdog End Time Violation Status. This bit denotes whether the end-time defined by the windowed watchdog configuration has been violated. This bit is effectively a copy of the DWD ST status flag. User and privilege mode (read): 0 = no end-time window violation has occurred. 1 = the end-time defined by the windowed watchdog configuration has been violated. Privilege mode (write): 0 = leaves the current value unchanged. 1 = clears the bit to 0.
3	STARTTIMEVIOL	R/W	0h	START TIME VIOL: Windowed Watchdog Start Time Violation Status. This bit denotes whether the start-time defined by the windowed watchdog configuration has been violated. This indicates that the WWD was serviced before the service window was opened. User and privilege mode (read): 0 = no start-time window violation has occurred. 1 = the start-time defined by the windowed watchdog configuration has been violated. Privilege mode (write): 0 = leaves the current value unchanged. 1 = clears the bit to 0.
2	KEYST	R/W	0h	KEYST: Watchdog KeyStatus. This bit denotes a reset generated by a wrong key or a wrong key-sequence written to the RTIWDKEY register. User and privilege mode (read): 0 = no wrong key or key-sequence written 1 = wrong key or key-sequence written to RTIWDKEY register Privilege mode (write): 0 = leaves the current value unchanged 1 = clears the bit to 0

**Table 14-32. RTIWDSTATUS Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
1	DWDST	R/W	0h	DWDST: Digital Watchdog Status. This bit is effectively a copy of the END TIME VIOL status flag and is maintained for compatibility reasons. User and privilege mode (read): 0 = DWD timeout period not expired 1 = DWD timeout period has expired Privilege mode (write): 0 = leaves the current value unchanged 1 = clears the bit to 0
0	AWDST	R/W	0h	AWDST: Analog Watchdog Status. User and privilege mode (read): 0 = AWD pin 0 → 1 threshold not exceeded 1 = AWD pin 0 → 1 threshold exceeded Privilege mode (write): 0 = leaves the current value unchanged 1 = clears the bit to 0

### 14.3.31 RTIWDKEY Register (Offset = 9Ch) [Reset = 00000000h]

RTIWDKEY is shown in [Table 14-33](#).

Return to the [Summary Table](#).

Watchdog Key correct written key values discharge the external capacitor

**Table 14-33. RTIWDKEY Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
15-0	WDKEY	R/W	0h	WDKEY: Watchdog Key. User and privilege mode reads are indeterminate. Privilege mode (write): A write of 0xE51A followed by 0xA35C in two separate write operations defines the Key Sequence and discharges the watchdog capacitor. This also causes the upper 12 bits of the DWD down counter to be reloaded with the contents of the DWD preload register and the lower 13 bits to become all 1's. Writing any other value causes a digital watchdog reset, as shown in <a href="#">Table 1-3</a> . Note: Register write access time precaution The user has to take into account that the write to the register takes 3 VCLK cycle. This needs to be considered for the AWD/DWD expiration calculation.

### 14.3.32 RTIDWDCNTR Register (Offset = A0h) [Reset = 00000000h]

RTIDWDCNTR is shown in [Table 14-34](#).

Return to the [Summary Table](#).

Digital Watchdog Down Counter current value of DWD down counter

**Table 14-34. RTIDWDCNTR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-25	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
24-0	DWDCNTR	R/W	0h	DWDCNTR: Digital Watchdog Down Counter. The value of the DWDCNTR after a system reset is 0x002D_FFFF. When the DWD is enabled and the DWD counter starts counting down from this value with an RTICK1 time base of 3MHz, a watchdog reset will be generated in 1 second. User and privilege mode (read): Reads return the current counter value. Privilege mode (write): Writes don't have an effect.

### 14.3.33 RTIWWDRXNCTRL Register (Offset = A4h) [Reset = 00000000h]

RTIWWDRXNCTRL is shown in [Table 14-35](#).

Return to the [Summary Table](#).

Windowed Watchdog Reaction Control configures the windowed watchdog to either generate a non-maskable interrupt to the CPU or to generate a system reset

**Table 14-35. RTIWWDRXNCTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
3-0	WWDRXN	R/W	0h	WWDRXN: Digital Windowed Watchdog Reaction. User and privilege mode (read), privileged mode (write): 0x5 = This is the default value. The windowed watchdog will cause a reset if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. 0xA = The windowed watchdog will generate a non-maskable interrupt to the CPU if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. Writing any other value will cause a system reset if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. Note: Configuration of DWWD Reaction The DWWD reaction can be selected by the application even when the DWWD counter is already enabled. If a change to the WWDRXN is made before the watchdog service window is opened, then the change in the configuration takes effect immediately. If a change to the WWDRXN is made when the watchdog service window is already open, then the change in configuration takes effect only after the watchdog is serviced.

### 14.3.34 RTIWWDSIZECTRL Register (Offset = A8h) [Reset = 00000000h]

RTIWWDSIZECTRL is shown in [Table 14-36](#).

Return to the [Summary Table](#).

Windowed Watchdog Size Control configures the size of the window for the digital windowed watchdog

**Table 14-36. RTIWWDSIZECTRL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	WWDSIZE	R/W	0h	<p>WWDSIZE: Digital Windowed Watchdog Window Size.</p> <p>User and privilege mode (read), privileged mode (write):</p> <p>Value written to WWDSIZE Window Size 0x00000005 100% (Functionality same as the time-out digital watchdog.) 0x00000050 50% 0x00000500 25% 0x00005000 12.5% 0x00050000 6.25% 0x00500000 3.125% Any other value 3.125% Note: Incorrect value being written to watchdog window size control register If an incorrect value is written to the WWDSIZE field, or if a system disturbance causes the WWDSIZE field to have a value other than 0x5, 0x50, 0x500, 0x5000, 0x50000, or 0x500000, then the window size will be configured to be 3.125%.</p> <p>This increases the chances of getting a reset due to the windowed watchdog, which enables the system to handle the cause for the incorrect configuration.</p> <p>Note: Configuration of DWWD Window Size The DWWD window size can be selected by the application even when the DWWD counter is already enabled.</p> <p>If a change to the WWDSIZE is made before the watchdog service window is opened, then the change in the configuration takes effect immediately.</p> <p>If a change to the WWDSIZE is made when the watchdog service window is already open, then</p>

### 14.3.35 RTIINTCLRENABLE Register (Offset = ACh) [Reset = 00000000h]

RTIINTCLRENABLE is shown in [Table 14-37](#).

Return to the [Summary Table](#).

RTI Compare Interrupt Clear Enable enable the auto clear functionality for each of the compare interrupts

**Table 14-37. RTIINTCLRENABLE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
27-24	INTCLRENABLE3	R/W	0h	INTCLRENABLE3. Enables the auto-clear functionality on the compare 3 interrupt. User and Privileged mode (read): 0x 5 = Auto-clear for compare 3 interrupt is disabled. Any other value = Auto-clear for compare 3 interrupt is enabled. Privileged mode (write): 0x 5 = Disables the auto-clear functionality on the compare 3 interrupt. Any other value = Enables the auto-clear functionality on the compare 3 interrupt.
23-20	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
19-16	INTCLRENABLE2	R/W	0h	INTCLRENABLE2. Enables the auto-clear functionality on the compare 2 interrupt. User and Privileged mode (read): 0x 5 = Auto-clear for compare 2 interrupt is disabled. Any other value = Auto-clear for compare 2 interrupt is enabled. Privileged mode (write): 0x 5 = Disables the auto-clear functionality on the compare 2 interrupt. Any other value = Enables the auto-clear functionality on the compare 2 interrupt.
15-12	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
11-8	INTCLRENABLE1	R/W	0h	INTCLRENABLE1. Enables the auto-clear functionality on the compare 1 interrupt. User and Privileged mode (read): 0x 5 = Auto-clear for compare 1 interrupt is disabled. Any other value = Auto-clear for compare 1 interrupt is enabled. Privileged mode (write): 0x 5 = Disables the auto-clear functionality on the compare 1 interrupt. Any other value = Enables the auto-clear functionality on the compare 1 interrupt.
7-4	RESERVED	R/W	0h	Reserved. Reads return 0 and writes have no effect
3-0	INTCLRENABLE0	R/W	0h	INTCLRENABLE0. Enables the auto-clear functionality on the compare 0 interrupt. User and Privileged mode (read): 0x 5 = Auto-clear for compare 0 interrupt is disabled. Any other value = Auto-clear for compare 0 interrupt is enabled. Privileged mode (write): 0x 5 = Disables the auto-clear functionality on the compare 0 interrupt. Any other value = Enables the auto-clear functionality on the compare 0 interrupt.

### 14.3.36 RTICOMP0CLR Register (Offset = B0h) [Reset = 00000000h]

RTICOMP0CLR is shown in [Table 14-38](#).

Return to the [Summary Table](#).

Compare 0 Clear compare value to be compared with the counter to clear the compare0 interrupt line

**Table 14-38. RTICOMP0CLR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	COMP0CLR	R/W	0h	COMP0CLR: Compare 0 Clear. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, the compare 0 interrupt or DMA request line is cleared. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

### 14.3.37 RTICOMP1CLR Register (Offset = B4h) [Reset = 00000000h]

RTICOMP1CLR is shown in [Table 14-39](#).

Return to the [Summary Table](#).

Compare 1 Clear compare value to be compared with the counter to clear the compare1 interrupt line

**Table 14-39. RTICOMP1CLR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	COMP1CLR	R/W	0h	COMP1CLR: Compare 1 Clear. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, the Compare 1 interrupt or DMA request line is cleared. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

### 14.3.38 RTICOMP2CLR Register (Offset = B8h) [Reset = 00000000h]

RTICOMP2CLR is shown in [Table 14-40](#).

Return to the [Summary Table](#).

Compare 2 Clear compare value to be compared with the counter to clear the compare2 interrupt line

**Table 14-40. RTICOMP2CLR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	COMP2CLR	R/W	0h	COMP2CLR: Compare 2 Clear. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, the Compare 2 interrupt or DMA request line is cleared. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

### 14.3.39 RTICOMP3CLR Register (Offset = BCh) [Reset = 00000000h]

RTICOMP3CLR is shown in [Table 14-41](#).

Return to the [Summary Table](#).

Compare 3 Clear compare value to be compared with the counter to clear the compare3 interrupt line

**Table 14-41. RTICOMP3CLR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	COMP3CLR	R/W	0h	COMP3CLR: Compare 3 Clear. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, the Compare 3 interrupt or DMA request line is cleared. User and privilege mode (read): current compare value Privilege mode (write): update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

This chapter contains the description of the serial communication interface (SCI) module.

## 15.1 Introduction

The SCI module is a universal asynchronous receiver-transmitter that implements the standard nonreturn to zero format. The SCI can be used to communicate, for example, through an RS-232 port or over a K-line.

### 15.1.1 SCI Features

The following are the features of the SCI module:

- Standard universal asynchronous receiver-transmitter (UART) communication
- Supports full- or half-duplex operation
- Standard nonreturn to zero (NRZ) format
- Double-buffered receive and transmit functions
- Supports two individually enabled interrupt lines: level 0 and level 1
- Configurable frame format of 3 to 13 bits per character based on the following:
  - Data word length programmable from one to eight bits
  - Additional address bit in address-bit mode
  - Parity programmable for zero or one parity bit, odd or even parity
  - Stop programmable for one or two stop bits
- Asynchronous communication mode with no CLK pin
- Two multiprocessor communication formats allow communication between more than two devices
- Sleep mode is available to free CPU resources during multiprocessor communication and then wake up to receive an incoming message
- The 24-bit programmable baud rate supports  $2^{24}$  different baud rates provide high accuracy baud rate selection
- Capability to use Direct Memory Access (DMA) for transmit and receive data
- Four error flags and Five status flags provide detailed information regarding SCI events
- Two external pins: SCIRX and SCITX

---

#### Note

SCI module does not support UART Hardware Flow Control. This feature can be implemented in Software using a General Purpose I/O pin.

---

### 15.1.2 Block Diagram

Three Major components of the SCI Module are:

- Transmitter
- Baud Clock Generator
- Receiver

**Transmitter (TX)** contains two major registers to perform double buffering:

- The transmitter data buffer register (SCITD) contains data loaded by the CPU to be transferred to the shift register for transmission.

- The transmitter shift register (SCITXSHF) loads data from the data buffer (SCITD) and shifts data onto the SCITX pin, one bit at a time.

**Baud Clock Generator**

- A programmable baud generator produces a baud clock scaled from VCLK.

**Receiver (RX)** contains two major registers to perform double buffering:

- The receiver shift register (SCIRXSHF) shifts data in from the SCIRX pin one bit at a time and transfers completed data into the receive data buffer.
- The receiver data buffer register (SCIRD) contains received data transferred from the receiver shift register

The SCI receiver and transmitter are double-buffered, and each has its own separate enable and interrupt bits. The receiver and transmitter can each be operated independently or simultaneously in full duplex mode.

To ensure data integrity, the SCI checks the data it receives for breaks, parity, overrun, and framing errors. The bit rate (baud) is programmable to over 16 million different rates through a 24-bit baud-select register. [Figure 15-1](#) shows the detailed SCI block diagram.

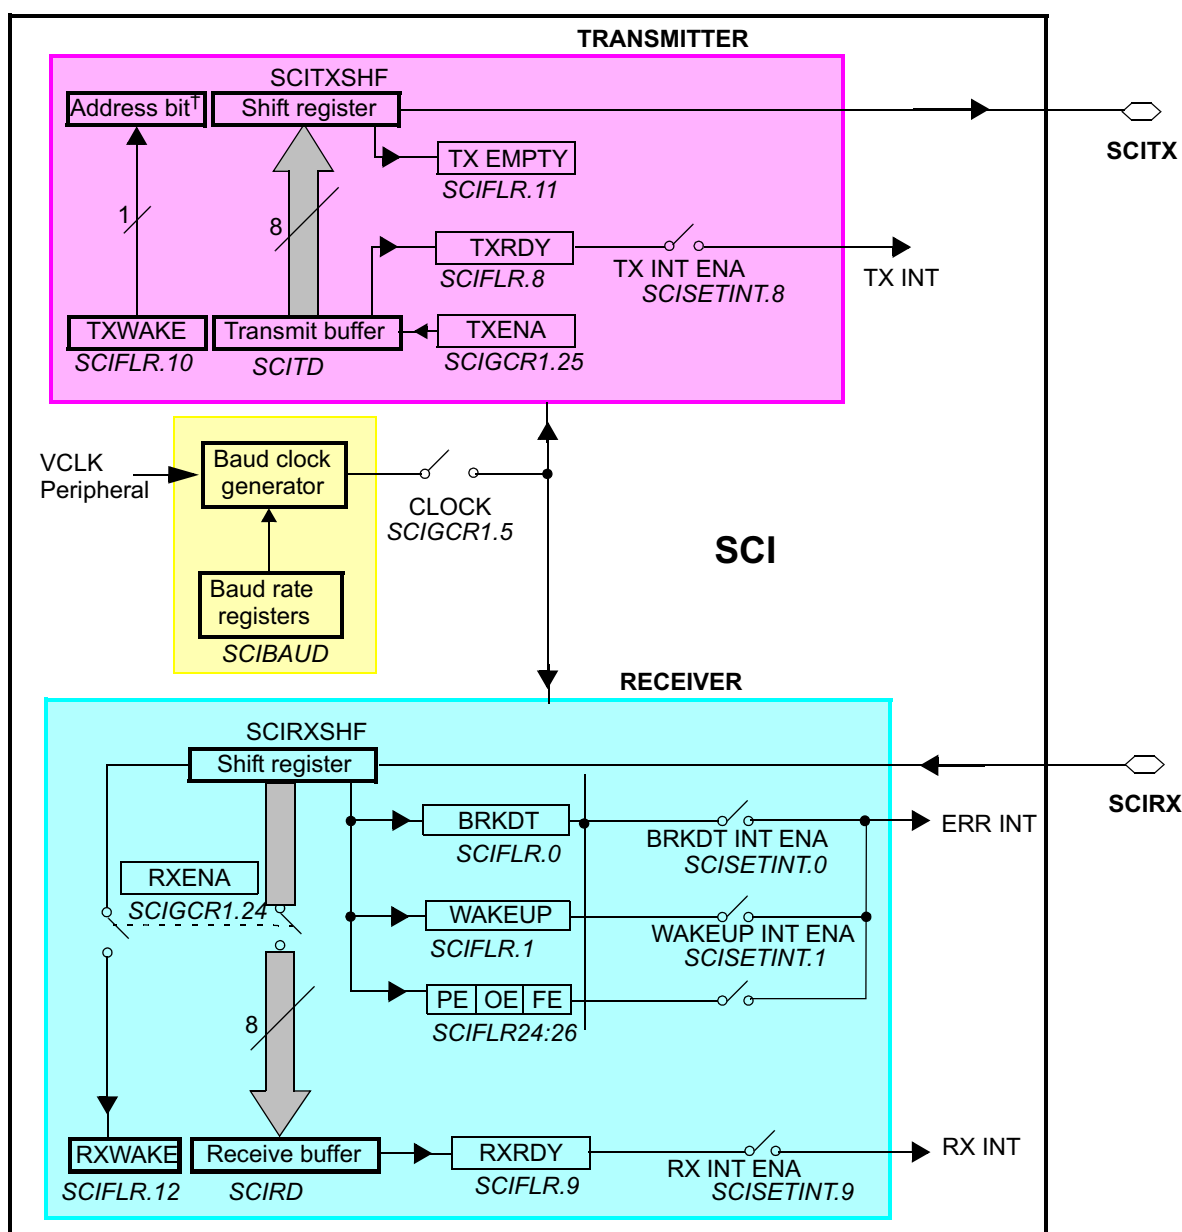

Figure 15-1. Detailed SCI Block Diagram

## 15.2 SCI Communication Formats

The SCI module can be configured to meet the requirements of many applications. Because communication formats vary depending on the specific application, many attributes of the SCI are user configurable. The list below describes these configuration options:

- SCI Frame format
- SCI Timing modes
- SCI Baud rate
- SCI Multiprocessor modes

### 15.2.1 SCI Frame Formats

The SCI uses a programmable frame format. All frames consist of the following:

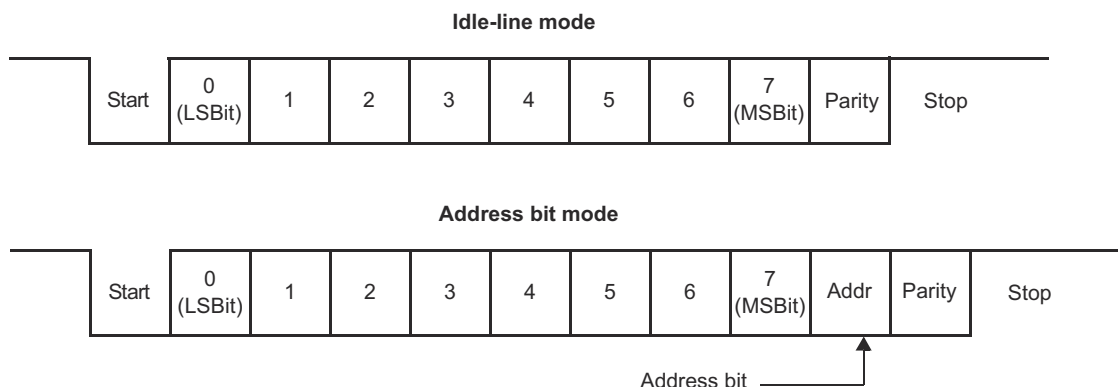

- One start bit
- One to eight data bits
- Zero or one address bit
- Zero or one parity bit
- One or two stop bits

The frame format for both the transmitter and receiver is programmable through the bits in the SCIGCR1 register. Both receive and transmit data is in nonreturn to zero (NRZ) format, which means that the transmit and receive lines are at logic high when idle. Each frame transmission begins with a start bit, in which the transmitter pulls the SCI line low (logic low). Following the start bit, the frame data is sent and received least significant bit first (LSB).

An address bit is present in each frame if the SCI is configured to be in address-bit mode but is not present in any frame if the SCI is configured for idle-line mode. The format of frames with and without the address bit is illustrated in [Figure 15-2](#).

A parity bit is present in every frame when the PARITY ENA bit is set. The value of the parity bit depends on the number of one bits in the frame and whether odd or even parity has been selected via the PARITY ENA bit. Both examples in [Figure 15-2](#) have parity enabled.

All frames include one stop bit, which is always a high level. This high level at the end of each frame is used to indicate the end of a frame to ensure synchronization between communicating devices. Two stop bits are transmitted if the STOP bit in SCIGCR1 register is set. The examples shown in [Figure 15-2](#) use one stop bit per frame.

**Figure 15-2. Typical SCI Data Frame Formats**

### 15.2.2 SCI Timing Mode

The SCI can be configured to use asynchronous or isosynchronous timing using TIMING MODE bit in SCIGCR1 register.

### 15.2.2.1 Asynchronous Timing Mode

The asynchronous timing mode uses only the receive and transmit data lines to interface with devices using the standard universal asynchronous receiver-transmitter (UART) protocol.

In the asynchronous timing mode, each bit in a frame has a duration of 16 SCI baud clock periods. Each bit therefore consists of 16 samples (one for each clock period). When the SCI is using asynchronous mode, the baud rates of all communicating devices must match as closely as possible. Receive errors result from devices communicating at different baud rates.

With the receiver in the asynchronous timing mode, the SCI detects a valid start bit if the first four samples after a falling edge on the SCIRX pin are of logic level 0. As soon as a falling edge is detected on SCIRX, the SCI assumes that a frame is being received and synchronizes itself to the bus.

To prevent interpreting noise as Start bit SCI expects SCIRX line to be low for at least four contiguous SCI baud clock periods to detect a valid start bit. The bus is considered idle if this condition is not met. When a valid start bit is detected, the SCI determines the value of each bit by sampling the SCIRX line value during the seventh, eighth, and ninth SCI baud clock periods. A majority vote of these three samples is used to determine the value stored in the SCI receiver shift register. By sampling in the middle of the bit, the SCI reduces errors caused by propagation delays and rise and fall times and data line noises. Figure 15-3 illustrates how the receiver samples a start bit and a data bit in asynchronous timing mode.

The transmitter transmits each bit for a duration of 16 SCI baud clock periods. During the first clock period for a bit, the transmitter shifts the value of that bit onto the SCITX pin. The transmitter then holds the current bit value on SCITX for 16 SCI baud clock periods.

**Figure 15-3. Asynchronous Communication Bit Timing**

### 15.2.2.2 Isosynchronous Timing Mode

In isosynchronous timing mode, each bit in a frame has a duration of exactly 1 baud clock period and therefore consists of a single sample. With this timing configuration, the transmitter and receiver are required to make use of the SCICLK pin to synchronize communication with other SCI. **This mode is not fully supported on this device because SCICLK pin is not available.**

### 15.2.3 SCI Baud Rate

The SCI has an internally generated serial clock determined by the peripheral VCLK and the prescalers BAUD. The SCI uses the 24-bit integer prescaler BAUD value of the BRS register to select the required baud rates.

In asynchronous timing mode, the SCI generates a baud clock according to the following formula:

$$\text{Asynchronous baud value} = \frac{\text{VCLK Frequency}}{16 * (\text{BAUD} + 1)}$$

For BAUD = 0,

$$\text{Asynchronous baud value} = \frac{\text{VCLK Frequency}}{32} \quad (3)$$

In isosynchronous timing mode, the SCI generates a baud clock according to the following formula:

$$\text{Isosynchronous baud value} = \frac{\text{VCLK Frequency}}{\text{BAUD} + 1}$$

For BAUD = 0,

$$\text{Isosynchronous baud value} = \frac{\text{VCLK Frequency}}{32} \quad (4)$$

### 15.2.4 SCI Multiprocessor Communication Modes

In some applications, the SCI may be connected to more than one serial communication device. In such a multiprocessor configuration, several frames of data may be sent to all connected devices or to an individual device. In the case of data sent to an individual device, the receiving devices must determine when they are being addressed. When a message is not intended for them, the devices can ignore the following data. When only two devices make up the SCI network, addressing is not needed, so multiprocessor communication schemes are not required.

SCI supports two multiprocessor Communication Modes which can be selected using COMM MODE bit:

- Idle-Line Mode
- Address Bit Mode

When the SCI is not used in a multiprocessor environment, software can consider all frames as data frames. In this case, the only distinction between the idle-line and address-bit modes is the presence of an extra bit (the address bit) in each frame sent with the address-bit protocol.

The SCI allows full-duplex communication where data can be sent and received via the transmit and receive pins simultaneously. However, the protocol used by the SCI assumes that only one device transmits data on the same bus line at any one time. No arbitration is done by the SCI.

---

#### Note

#### Avoid Transmitting Simultaneously on the Same Serial Bus

The system designer must ensure that devices connected to the same serial bus line do not attempt to transmit simultaneously. If two devices are transmitting different data, the resulting bus conflict could damage the device..

---

#### 15.2.4.2 Address-Bit Multiprocessor Mode

In the address-bit protocol, each frame has an extra bit immediately following the data field called an address bit. A frame with the address bit set to 1 is an address frame; a frame with the address bit set to 0 is a data frame. The idle period timing is irrelevant in this mode. Figure 15-5 illustrates the format of several blocks and frames with the address-bit mode.

When address-bit mode is used, the value of the TXWAKE bit is the value sent as the address bit. To send an address frame, software must set the TXWAKE bit. This bit is cleared as the contents of the SCITD are shifted from the TXWAKE register so that all frames sent are data except when the TXWAKE bit is written as a 1.

No dummy write to SCITD is required before an address frame is sent in address-bit mode. The first byte written to SCITD after the TXWAKE bit is written to 1 is transmitted with the address bit set when address-bit mode is used.

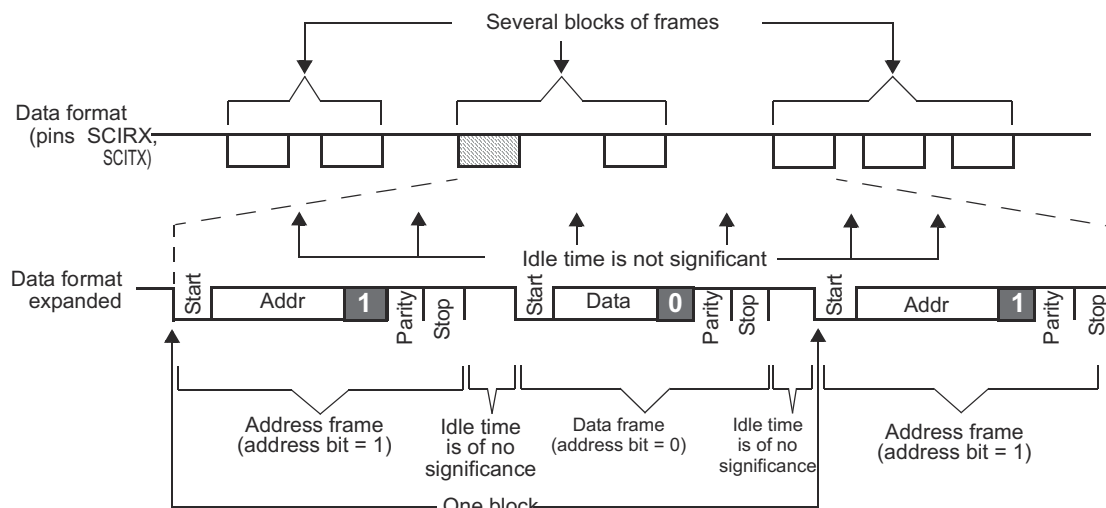

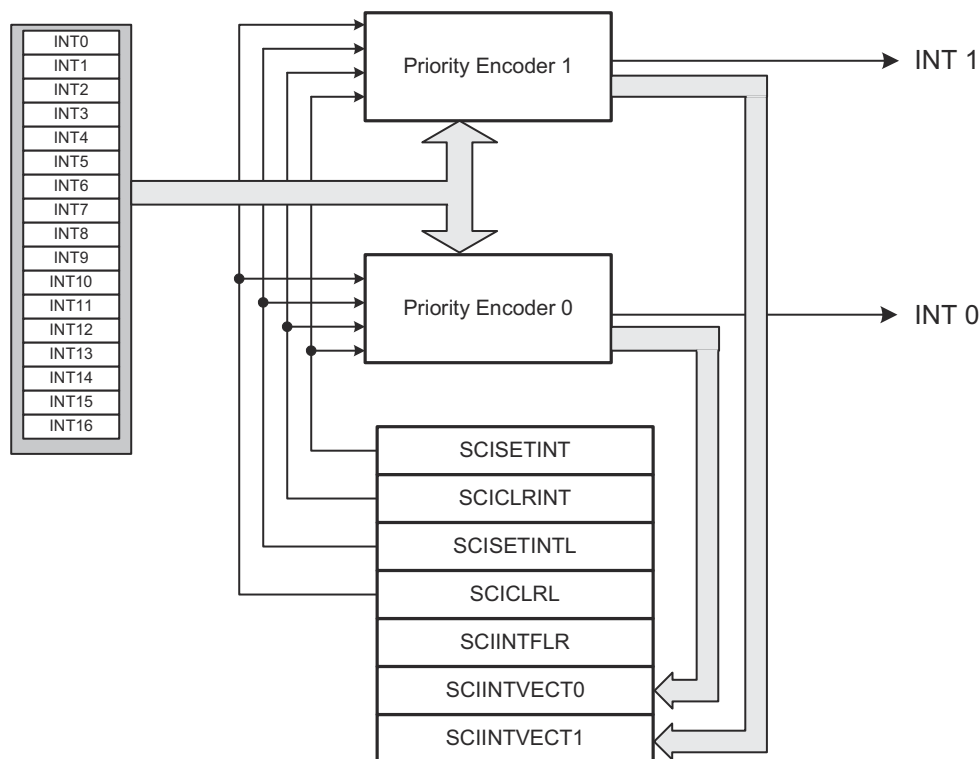

Figure 15-5. Address-Bit Multiprocessor Communication Format

## 15.3 SCI Interrupts

The SCI module has two interrupt lines, level 0 and level 1, to the interrupt manager (NVIC/IM) module (see [Figure 15-6](#)). Two offset registers SCIINTVECT0 and SCIINTVECT1 determine which flag triggered the interrupt according to the respective priority encoders. Each interrupt condition has a bit to enable and disable the interrupt in the SCISSETINT and SCICLRINT registers, respectively.

Each interrupt also has a bit that can be set as interrupt level 0 (INT0) or as interrupt level 1 (INT1). By default, interrupts are in interrupt level 0. SCISSETINTLVL sets a given interrupt to level1. SCICLEARINTLVL resets a given interrupt level to the default level 0.

The interrupt vector registers SCIINTVECT0 and SCIINTVECT1 return the vector of the pending interrupt line INT0 or INT1. If more than one interrupt is pending, the interrupt vector register holds the highest priority interrupt.

**Figure 15-6. General Interrupt Scheme**

**Figure 15-7. Interrupt Generation for Given Flags**

### 15.3.1 Transmit Interrupt

To use transmit interrupt functionality, SET TX INT bit must be enabled and SET TX DMA bit must be cleared. The transmit ready (TXRDY) flag is set when the SCI transfers the contents of SCITD to the shift register, SCITXSHF. The TXRDY flag indicates that SCITD is ready to be loaded with more data. In addition, the SCI sets the TX EMPTY bit if both the SCITD and SCITXSHF registers are empty. If the SET TX INT bit is set, then a transmit interrupt is generated when the TXRDY flag goes high. Transmit Interrupt is not generated immediately after setting the SET TX INT bit unlike transmit DMA request. Transmit Interrupt is generated only after the first transfer from SCITD to SCITXSHF, that is first data has to be written to SCITD by the User before any interrupt gets generated. To transmit further data the user can write data to SCITD in the transmit Interrupt service routine.

Writing data to the SCITD register clears the TXRDY bit. When this data has been moved to the SCITXSHF register, the TXRDY bit is set again. The interrupt request can be suspended by setting the CLR TX INT bit; however, when the SET TX INT bit is again set to 1, the TXRDY interrupt is asserted again. The transmit interrupt request can be eliminated until the next series of values is written to SCITD, by disabling the transmitter via the TXENA bit, by a software reset SWnRST, or by a device hardware reset.

### 15.3.2 Receive Interrupt

The receive ready (RXRDY) flag is set when the SCI transfers newly received data from SCIRXSHF to SCIRD. The RXRDY flag therefore indicates that the SCI has new data to be read. Receive interrupts are enabled by the SET RX INT bit. If the SET RX INT is set when the SCI sets the RXRDY flag, then a receive interrupt is generated. The received data can be read in the Interrupt Service routine.

On a device with both SCI and a DMA controller, the bits SET RX DMA ALL and SET RX DMA must be cleared to select interrupt functionality.

### 15.3.3 WakeUp Interrupt

SCI sets the WAKEUP flag if bus activity on the RX line either prevents power-down mode from being entered, or RX line activity causes an exit from power-down mode. If enabled (SET WAKEUP INT), wakeup interrupt is triggered once WAKEUP flag is set.

### 15.3.4 Error Interrupts

The following error detection features are supported with Interrupt by the SCI module:

- Parity errors (PE)
- Frame errors (FE)
- Break Detect errors (BRKDT)
- Overrun errors (OE)

If any of these errors (PE, FE, BRKDT, OE) is flagged, an interrupt for the flagged errors will be generated if enabled. A message is valid for both the transmitter and the receiver if there is no error detected until the end of the frame. Each of these flags is located in the receiver status (SCIFLR) register. Further details on these flags are explained in SCIFLR register description.

The SCI module supports the following 7 interrupts as listed in [Table 15-1](#).

**Table 15-1. SCI Interrupts**

Offset <sup>(1)</sup>	Interrupt
0	Reserved
1	Wakeup
2	Reserved
3	Parity error
4	Reserved
5	Reserved
6	Frame error
7	Break detect error
8	Reserved
9	Overrun error
10	Reserved
11	Receive
12	Transmit
13-15	Reserved

(1) Offset 1 is the highest priority. Offset 16 is the lowest priority.

## 15.4 SCI DMA Interface

DMA requests for receive (RXDMA request) and transmit (TXDMA request) are available for the SCI module. Refer to the DMA module chapter for DMA module configurations.

### 15.4.1 Receive DMA Requests

This DMA functionality is enabled/disabled by the CPU using the SET RX DMA/CLR RX DMA bits, respectively.

The receiver DMA request is set when a frame is received successfully and DMA functionality has been previously enabled. The RXRDY flag is set when the SCI transfers newly received data from the SCIRXSHF register to the SCIRD buffer. The RXRDY flag therefore indicates that the SCI has new data to be read. Receive DMA requests are enabled by the SET RX INT bit.

Parity, overrun, break detect, wakeup, and framing errors generate an error interrupt request immediately upon detection, if enabled, even if the device is in the process of a DMA data transfer. The DMA transfer is postponed until the error interrupt is served. The error interrupt can delete this particular DMA request by reading the receive buffer.

In multiprocessor mode, the SCI can generate receiver interrupts for address frames and DMA requests for data frames. This is controlled by an extra select bit SET RX DMA ALL.

If the SET RX DMA ALL bit is set and the SET RX DMA bit is set when the SCI sets the RXRDY flag, then a receive DMA request is generated for address and data frames.

If the SET RX DMA ALL bit is cleared and the SET RX DMA bit is set when the SCI sets the RXRDY flag upon receipt of a data frame, then a receive DMA request is generated. Receive interrupt requests are generated for address frames.

In multiprocessor mode with the SLEEP bit set, no DMA is generated for received data frames. The software must clear the SLEEP bit before data frames can be received. [Table 15-2](#) specifies the bit values for DMA requests in multiprocessor modes.

**Table 15-2. DMA and Interrupt Requests in Multiprocessor Modes**

SET RX INT	SET RX DMA	SET RX DMA ALL	ADDR FRAME INT	ADDR FRAME DMA	DATA FRAME INT	DATA FRAME DMA
0	0	x	N	N	N	N
0	1	0	Y	N	N	Y
0	1	1	N	Y	N	Y
1	0	x	Y	N	Y	N
1	1	0	Y	N	Y	Y
1	1	1	Y	Y	Y	Y

In multiprocessor mode, the SCI can generate receiver interrupts for address frames and DMA requests for data frames or DMA requests for both. This is controlled by the SET RX DMA ALL bit.

In multiprocessor mode with the SLEEP bit set, no DMA is generated for received data frames. The software must clear the SLEEP bit before data frames can be received.

### 15.4.2 Transmit DMA Requests

DMA functionality is enabled and disabled by the CPU with the SET TX DMA and CLR TX DMA bits, respectively.

The TXRDY flag is set when the SCI transfers the contents of SCITD to SCITXSHF. The TXRDY flag indicates that SCITD is ready to be loaded with more data. In addition, the SCI sets the TX EMPTY bit if both the SCITD and SCITXSHF registers are empty.

Transmit DMA requests are enabled by the setting SET TX DMA and SET TX INT bits. If the SET TX DMA bit is set, then a TX DMA request is sent to the DMA when data is written to SCITD and TXRDY is set. The DMA will write the first byte to the transmit buffer.

## 15.5 SCI Configurations

Before the SCI sends or receives data, its registers should be properly configured. Upon power-up or a system-level reset, each bit in the SCI registers is set to a default state. The registers are writable only after the RESET bit in the SCIGCR0 register is set to 1. Of particular importance is the SWnRST bit in the SCIGCR1 register. The SWnRST is an active-low bit initialized to 0 and keeps the SCI in a reset state until it is programmed to 1. Therefore, all SCI configuration should be completed before a 1 is written to the SWnRST bit.

The following list details the configuration steps that software should perform prior to the transmission or reception of data. As long as the SWnRST bit is cleared to 0 the entire time that the SCI is being configured, the order in which the registers are programmed is not important.

- Enable SCI by setting the RESET bit to 1.
- Clear the SWnRST bit to 0 before SCI is configured.
- Select the desired frame format by programming the SCIGCR1 register.
- Set both the RX FUNC and TX FUNC bits in SCIPIO0 to 1 to configure the SCIRX and SCITX pins for SCI functionality.
- Select the baud rate to be used for communication by programming the BRS register.
- Set the CLOCK bit in SCIGCR1 to 1 to select the internal clock.
- Set the CONT bit in SCIGCR1 to 1 to make SCI not halt for an emulation breakpoint until its current reception or transmission is complete (this bit is used only in an emulation environment).
- Set LOOP BACK bit in SCIGCR1 to 1 to connect the transmitter to the receiver internally (this feature is used to perform a self-test).
- Set the RXENA bit in SCIGCR1 to 1, if data is to be received.
- Set the TXENA bit in SCIGCR1 to 1, if data is to be transmitted.
- Set the SWnRST bit to 1 after SCI is configured.
- Perform receiving or transmitting data (see [Section 15.5.1](#) and [Section 15.5.2](#)).

### 15.5.1 Receiving Data

The SCI receiver is enabled to receive messages if both the RX FUNC bit and the RXENA bit are set to 1. If the RX FUNC bit is not set, the SCIRX pin functions as a general-purpose I/O pin rather than as an SCI function pin. After a valid idle period is detected, data is automatically received as it arrives on the SCIRX pin.

SCI sets the RXRDY bit when it transfers newly received data from SCIRXSHF to SCIRD. The SCI clears the RXRDY bit after the new data in SCIRD has been read. Also, as data is transferred from SCIRXSHF to SCIRD, the SCI sets the FE, OE, or PE flags if any of these error conditions were detected in the received data. These error conditions are supported with configurable interrupt capability. The wakeup and break-detect status bits are also set if one of these errors occurs, but they do not necessarily occur at the same time that new data is being loaded into SCIRD.

You can receive data by:

1. Polling Receive Ready Flag
2. Receive Interrupt
3. DMA

In polling method, software can poll for the RXRDY bit and read the data from SCIRD register once RXRDY is set high. The CPU is unnecessarily overloaded by selecting the polling method. To avoid this, you can use either the interrupt or DMA method. To use the interrupt method, the SET RX INT bit is set. To use the DMA method, the SET RX DMA bit is set. Either an interrupt or a DMA request is generated the moment the RXRDY bit is set.

### 15.5.2 Transmitting Data

The SCI transmitter is enabled if both the TX FUNC bit and the TXENA bit are set to 1. If the TX FUNC bit is not set, the SCITX pin functions as a general-purpose I/O pin rather than as an SCI function pin. Any value written to the SCITD before TXENA is set to 1 is not transmitted. Both of these control bits allow for the SCI transmitter to be held inactive independently of the receiver.

SCI waits for data to be written to SCITD, transfers it to SCITXSHF, and transmits the data. The TXRDY and TX EMPTY bits indicate the status of the transmit buffers. That is, when the transmitter is ready for data to be written to SCITD, the TXRDY bit is set. Additionally, if both SCITD and SCITXSHF are empty, then the TX EMPTY bit is also set.

You can transmit data by:

1. Polling Transmit Ready Flag
2. Transmit Interrupt
3. DMA

In polling method, software can poll for the TXRDY bit to go high before writing the data to the SCITD register. The CPU is unnecessarily overloaded by selecting the polling method. To avoid this, you can use either the interrupt or DMA method. To use the interrupt method, the SET TX INT bit is set. To use the DMA method, the SET TX DMA bit is set. Either an interrupt or a DMA request is generated the moment the TXRDY bit is set. When the SCI has completed transmission of all pending frames, the SCITXSHF register and SCITD are empty, the TXRDY bit is set, and an interrupt/DMA request is generated, if enabled. Because all data has been transmitted, the interrupt/DMA request should be halted. This can either be done by disabling the transmit interrupt (CLR TX INT) / DMA request (CLR TX DMA bit) or by disabling the transmitter (clear TXENA bit).

---

#### Note

The TXRDY flag cannot be cleared by reading the corresponding interrupt offset in the SCIINTVECT0 or SCIINTVECT1 register.

---

## 15.6 MSS\_SCI Registers

Table 15-3 lists the memory-mapped registers for the MSS\_SCI registers. All register offset addresses not listed in Table 15-3 should be considered as reserved locations and the register contents should not be modified.

**Table 15-3. MSS\_SCI Registers**

Offset	Acronym	Register Name	Section

23-19	RESERVED	R	0h	Reserved
18	SET_RX_DMA_ALL	R/W	0h	Determines if a separate interrupt is generated for the address frames sent in multiprocessor communications User and privilege mode (read): 0 = DMA request is disabled for address frames (RX interrupt request is enabled for address frames) 1 = DMA request is enabled for address and data frames User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request for address and data frames
17	SET_RX_DMA	R/W	0h	To select receiver DMA requests, this bit must be set. If it is cleared, interrupt requests are generated depending on bit SCISSETINT.9 User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable DMA request
16	SET_TX_DMA	R/W	0h	To select DMA requests for the transmitter, this bit must be set. If it is cleared, interrupt requests are generated depending on SET TX INT bit (SCISSETINT.8) User and privilege mode (read): 0 = TX interrupt request selected 1 = TX DMA request selected User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
15-10	RESERVED	R	0h	Reserved
9	SET_RX_INT	R/W	0h	Receiver interrupt enable: Setting this bit enables the SCI to generate a receive interrupt after a frame has been completely received and the data is being transferred from SCIRXSHF to SCIRD. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt

**Table 15-8. SCISSETINT Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
8	SET_TX_INT	R/W	0h	Set Transmitter interrupt. Setting this bit enables the SCI to generate a transmit interrupt as data is being transferred from SCITD to SCITXSHF and the TXRDY bit is being set. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
7-2	RESERVED	R	0h	Reserved
1	SET_WAKEUP_INT	R/W	0h	Set Wake-up interrupt User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
0	SET_BRKDT_INT	R/W	0h	Set Break-detect interrupt. Setting this bit enables the SCI to generate an error interrupt if a break condition is detected on the SCIRX pin. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt

### 15.6.5 SCICLEARINT Register (Offset = 10h) [Reset = 00000000h]

SCICLEARINT is shown in [Table 15-9](#).

Return to the [Summary Table](#).

SCI Clear Interrupt Register

**Table 15-9. SCICLEARINT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26	CLR_FE_INT	R/W	0h	Clear Framing-Error Interrupt: Setting this bit disables the SCI module to generate an interrupt when there is a Framing error. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
25	CLR_OE_INT	R/W	0h	Clear Overrun-Error Interrupt. This bit disables the SCI overrun interrupt when set. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
24	CLR_PE_INT	R/W	0h	Clear Parity Interrupt. Setting this bit disables the SCI Parity error interrupt. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = enable interrupt
23-19	RESERVED	R	0h	Reserved
18	CLR_RX_DMA_ALL	R/W	0h	User and privilege mode (read): 0 = DMA request is disabled for address frames (RX interrupt request is enabled for address frames). DMA request is enabled for data frames. 1 = DMA request is enabled for address and data frames User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request for address frames
17	CLR_RX_DMA	R/W	0h	Clear RX DMA request. This bit disables the receive DMA request when set. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request
16	CLR_TX_DMA	R/W	0h	Clear TX DMA request. This bit disables the transmit DMA request when set. User and privilege mode (read): 0 = DMA request is disabled 1 = DMA request is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable DMA request
15-10	RESERVED	R	0h	Reserved
9	CLR_RX_INT	R/W	0h	Clear Receiver interrupt. This bit disables the receiver interrupt when set. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled Privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt

**Table 15-9. SCICLEARINT Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
8	CLR_TX_INT	R/W	0h	Clear Transmitter interrupt. This bit disables the transmitter interrupt when set. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
7-2	RESERVED	R	0h	Reserved
1	CLR_WAKEUP_INT	R/W	0h	Clear Wake-up interrupt. This bit disables the wakeup interrupt when set. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt
0	CLR_BRKDT_INT	R/W	0h	Clear Break-detect interrupt. This bit disables the Break-detect interrupt when set. User and privilege mode (read): 0 = Interrupt is disabled 1 = Interrupt is enabled User and privilege mode (write): 0 = leaves the corresponding bit unchanged 1 = disable interrupt

### 15.6.6 SCISSETINTLVL Register (Offset = 14h) [Reset = 00000000h]

SCISSETINTLVL is shown in [Table 15-10](#).

Return to the [Summary Table](#).

SCI Set Interrupt Level Register

**Table 15-10. SCISSETINTLVL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26	SET_FE_INT_LVL	R/W	0h	Clear Framing-Error Interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Clear interrupt level to line INT1
25	SET_OE_INT_LVL	R/W	0h	Clear Overrun-Error Interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Clear interrupt level to line INT1
24	SET_PE_INT_LVL	R/W	0h	Clear Parity Error Interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Clear interrupt level to line INT1
23-19	RESERVED	R	0h	Reserved
18	SET_RX_DMA_ALL_INT_LVL	R/W	0h	User and privilege mode (read): 0 = RX interrupt request for address frames mapped to INT0 line. 1 = RX interrupt request for address frames mapped to INT1 line. User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Clear interrupt level to line INT1
17-16	RESERVED	R	0h	Reserved
15	SET_INC_BR_INT_LVL	R/W	0h	
14-10	RESERVED	R	0h	Reserved
9	SET_RX_INT_LVL	R/W	0h	Clear Receiver interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Clear interrupt level to line INT1
8	SET_TX_INT_LVL	R/W	0h	Clear Transmitter interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Clear interrupt level to line INT1
7-2	RESERVED	R	0h	Reserved

**Table 15-10. SCISSETINTLVL Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
1	SET_WAKEUP_INT_LVL	R/W	0h	Clear Wake-up interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Clear interrupt level to line INT1
0	SET_BRKDT_INT_LVL	R/W	0h	Clear Break-detect interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Clear interrupt level to line INT1

### 15.6.7 SCICLEARINTLVL Register (Offset = 18h) [Reset = 00000000h]

SCICLEARINTLVL is shown in [Table 15-11](#).

Return to the [Summary Table](#).

SCI Clear Interrupt Level Register

**Table 15-11. SCICLEARINTLVL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26	CLR_FE_INT_LVL	R/W	0h	Clear Framing-Error Interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Reset interrupt level to line INT0
25	CLR_OE_INT_LVL	R/W	0h	Clear Framing-Error Interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Reset interrupt level to line INT0
24	CLR_PE_INT_LVL	R/W	0h	Clear Framing-Error Interrupt Level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Reset interrupt level to line INT0
23-19	RESERVED	R	0h	Reserved
18	CLR_RX_DMA_ALL_INT_LVL	R/W	0h	Clear receive DMA ALL interrupt level. User and privilege mode (read): 0 = RX interrupt request for address frames is mapped to INT0 line. 1 = RX interrupt request for address frames is mapped to INT1 line. User and privilege mode (write): 0 = Leaves the corresponding bit unchanged. 1 = Reset interrupt level to line INT0.
17-16	RESERVED	R	0h	Reserved
15	CLR_INC_BR_INT_LVL	R/W	0h	
14-10	RESERVED	R	0h	Reserved
9	CLR_RX_INT_LVL	R/W	0h	Clear Receiver interrupt level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Reset interrupt level to line INT0
8	CLR_TX_INT_LVL	R/W	0h	Clear Transmitter interrupt level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Reset interrupt level to line INT0
7-2	RESERVED	R	0h	Reserved

**Table 15-11. SCICLEARINTLVL Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
1	CLR_WAKEUP_INT_LVL	R/W	0h	Clear Wake-up interrupt level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Reset interrupt level to line INT0
0	CLR_BRKDT_INT_LVL	R/W	0h	Clear Break-detect interrupt level. User and privilege mode (read): 0 = Interrupt level mapped to INT0 line 1 = Interrupt level mapped to INT1 line User and privilege mode (write): 0 = Leaves the corresponding bit unchanged 1 = Reset interrupt level to line INT0

### 15.6.8 SCIFLR Register (Offset = 1Ch) [Reset = 00000904h]

SCIFLR is shown in [Table 15-12](#).

Return to the [Summary Table](#).

SCI Flags Register

**Table 15-12. SCIFLR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-27	RESERVED	R	0h	Reserved
26	FE	R/W	0h	SCI framing error flag Read: 0=No framing error detected 1=Framing error detected Write: 0=No effect 1=Clears this bit to 0
25	OE	R	0h	SCI overrun error flag This bit is set when the transfer of data from SCIRXSHF to SCIRD overwrites unread data already in SCIRD
24	PE	R	0h	SCI parity error flag. This bit is set when a parity error is detected in the received data
23-13	RESERVED	R	0h	Reserved
12	RXWAKE	R	0h	Receiver wake-up detect flag. The SCI sets this bit to indicate that the data currently in SCIRD is an address
11	TX_EMPTY	R	1h	Transmitter empty flag. The value of this flag indicates the contents of the transmitter's buffer register (SCITD) and shift register (SCITXSHF)
10	TXWAKE	R/W	0h	SCI transmitter wake-up method select. The TXWAKE bit controls whether the data in SCITD should be sent as an address or data frame using multiprocessor communication format
9	RXRDY	R	0h	SCI receiver ready flag. The receiver sets this bit to indicate that the SCIRD contains new data and is ready to be read by the CPU or DMA.
8	TXRDY	R	1h	Transmitter buffer register ready flag. When set, this bit indicates that the transmit buffer register (SCITD) is ready to receive another character.
7-4	RESERVED	R	0h	Reserved
3	Bus_busy_flag	R	0h	This bit indicates whether the receiver is in the process of receiving a frame.
2	IDLE	R	1h	SCI receiver in idle state. While this bit is set, the SCI looks for an idle period to resynchronize itself with the bit stream.
1	WAKEUP	R	0h	Wake-up flag. This bit is set by the SCI when receiver or transmitter activity has taken the module out of power-down mode.
0	BRKDT	R	0h	SCI break-detect flag. This bit is set when the SCI detects a break condition on the SCIRX pin.

### 15.6.9 SCIINTVECT0 Register (Offset = 20h) [Reset = 00000000h]

SCIINTVECT0 is shown in [Table 15-13](#).

Return to the [Summary Table](#).

SCI Interrupt Offset Vector 0 Register

**Table 15-13. SCIINTVECT0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	INTVECT0	R	0h	Interrupt vector offset for INT0

### 15.6.10 SCIINTVECT1 Register (Offset = 24h) [Reset = 00000000h]

SCIINTVECT1 is shown in [Table 15-14](#).

Return to the [Summary Table](#).

SCI Interrupt Offset Vector 1 Register

**Table 15-14. SCIINTVECT1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	Reserved
3-0	INTVECT1	R	0h	Interrupt vector offset for INT1

### 15.6.11 SCICCHAR Register (Offset = 28h) [Reset = 00000000h]

SCICCHAR is shown in [Table 15-15](#).

Return to the [Summary Table](#).

SCI Character Control Register

**Table 15-15. SCICCHAR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2-0	CHAR	R/W	0h	Sets the SCI data length from 1 to 8 bits

### 15.6.12 SCIBAUD Register (Offset = 2Ch) [Reset = 00000000h]

SCIBAUD is shown in [Table 15-16](#).

Return to the [Summary Table](#).

SCI Baud Rate Selection Register

**Table 15-16. SCIBAUD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	RESERVED	R	0h	Reserved
23-0	BAUD	R/W	0h	SCI 24-bit baud selection

### 15.6.13 SCIED Register (Offset = 30h) [Reset = 00000000h]

SCIED is shown in [Table 15-17](#).

Return to the [Summary Table](#).

Receiver Emulation Data Buffer

**Table 15-17. SCIED Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	Reserved
7-0	ED	R	0h	Receiver Emulation Data Buffer

### 15.6.14 SCIRD Register (Offset = 34h) [Reset = 00000000h]

SCIRD is shown in [Table 15-18](#).

Return to the [Summary Table](#).

Receiver Data Buffer

**Table 15-18. SCIRD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	Reserved
7-0	RD	R	0h	Contains received data.

### 15.6.15 SCITD Register (Offset = 38h) [Reset = 00000000h]

SCITD is shown in [Table 15-19](#).

Return to the [Summary Table](#).

Transmit Data Buffer Register

**Table 15-19. SCITD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	Reserved
7-0	TD	R/W	0h	Contains Data to be transmitted. This is pushed to SCITXSHF(shift register) when TXENA bit is set in SCRGCR1 register.

### 15.6.16 SCIPIO0 Register (Offset = 3Ch) [Reset = 00000000h]

SCIPIO0 is shown in [Table 15-20](#).

Return to the [Summary Table](#).

SCI Pin I/O Control Register 0

**Table 15-20. SCIPIO0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_FUNC	R/W	0h	Defines the function of pin SCITX. 0=SCITX is a general-purpose digital I/O pin. 1=SCITX is the SCI transmit pin. 0=SCIRX is a general-purpose digital I/O pin. 1=SCIRX is the SCI receive pin.
1	RX_FUNC	R/W	0h	Determines the data direction on the SCIRX pin if it is configured with general-purpose I/O functionality (RX_FUNC = 0). See Table 12 for bit values. 0=SCIRX is a general-purpose input pin. 1=SCIRX is a general-purpose output pin
0	CLK_FUNC	R/W	0h	Clock function. Defines the function of pin SCICLK. 0=SCICLK is a general-purpose digital I/O pin. 1=SCICLK is the SCI serial clock pin. Determines the data direction on the SCICLK pin. The direction is defined differently depending upon the value of the CLK_FUNC bit

### 15.6.17 SCIPIO1 Register (Offset = 40h) [Reset = 00000000h]

SCIPIO1 is shown in [Table 15-21](#).

Return to the [Summary Table](#).

SCI Pin I/O Control Register 1

**Table 15-21. SCIPIO1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_DIR	R/W	0h	Determines the data direction on the SCITX pin if it is configured with general-purpose I/O functionality (TX FUNC = 0). See Table 11 for bit values. 0=SCITX is a general-purpose input pin. 1=SCITX is a general-purpose output pin
1	RX_DIR	R/W	0h	Determines the data direction on the SCIRX pin if it is configured with general-purpose I/O functionality (RX FUNC = 0). See Table 12 for bit values. 0=SCIRX is a general-purpose input pin. 1=SCIRX is a general-purpose output pin
0	CLK_DIR	R/W	0h	Clock data direction. Determines the data direction on the SCICLK pin. The direction is defined differently depending upon the value of the CLK FUNC bit

### 15.6.18 SCIPIO2 Register (Offset = 44h) [Reset = 00000000h]

SCIPIO2 is shown in [Table 15-22](#).

Return to the [Summary Table](#).

SCI Pin I/O Control Register 2

**Table 15-22. SCIPIO2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_DATA_IN	R/W	0h	Contains current value on the SCITX pin. 0=SCITX value is logic low. 1=SCITX value is logic high.
1	RX_DATA_IN	R/W	0h	Contains current value on the SCIRX pin. 0=SCIRX value is logic low. 1=SCIRX value is logic high.
0	CLK_DATA_IN	R/W	0h	Contains the current value on pin SCICLK. 0=Pin SCICLK value is logic low. 1=Pin SCICLK value is logic high.

### 15.6.19 SCIPIO3 Register (Offset = 48h) [Reset = 00000000h]

SCIPIO3 is shown in [Table 15-23](#).

Return to the [Summary Table](#).

SCI Pin I/O Control Register 3

**Table 15-23. SCIPIO3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_DATA_OUT	R/W	0h	Contains the data to be output on pin SCITX if the following conditions are met: TX FUNC = 0 (SCITX pin is a general-purpose I/O.) TX DATA DIR = 1 (SCITX pin is a general-purpose output.) 0=Output value on SCITX is a 0 (logic low). 1=Output value on SCITX is a 1 (logic high).
1	RX_DATA_OUT	R/W	0h	Contains the data to be output on pin SCIRX if the following conditions are met: RX FUNC = 0 (SCIRX pin is a general-purpose I/O.) RX DATA DIR = 1 (SCIRX pin is a general-purpose output.) 0=Output value on SCIRX is 0 (logic low). 1=Output value on SCIRX is 1 (logic high).
0	CLK_DATA_OUT	R/W	0h	Contains the data to be output on pin SCICLK if the following conditions are met: CLK FUNC = 0 (SCICLK pin is a general-purpose I/O.) CLK DATA DIR = 1 (SCICLK pin is a general-purpose output.) 0=Output value on SCICLK is a 0 (logic low). 1=Output value on SCICLK is a 1 (logic high).

### 15.6.20 SCIPIO4 Register (Offset = 4Ch) [Reset = 00000000h]

SCIPIO4 is shown in [Table 15-24](#).

Return to the [Summary Table](#).

SCI Pin I/O Control Register 4

**Table 15-24. SCIPIO4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_DATA_SET	R/W	0h	Sets the data to be output on pin SCITX if the following conditions are met: TX FUNC = 0 (SCITX pin is a general-purpose I/O.) TX DATA DIR = 1 (SCITX pin is a general-purpose output.)
1	RX_DATA_SET	R/W	0h	Sets the data to be output on pin SCIRX if the following conditions are met: RX FUNC = 0 (SCIRX pin is a general-purpose I/O.) RX DATA DIR = 1 (SCIRX pin is a general-purpose output.)
0	CLK_DATA_SET	R/W	0h	Sets the data to be output on pin SCICLK if the following conditions are met: CLK FUNC = 0 (SCICLK pin is a general-purpose I/O.) CLK DATA DIR = 1 (SCICLK pin is a general-purpose output.)

### 15.6.21 SCIPIO5 Register (Offset = 50h) [Reset = 00000000h]

SCIPIO5 is shown in [Table 15-25](#).

Return to the [Summary Table](#).

SCI Pin I/O Control Register 5

**Table 15-25. SCIPIO5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_DATA_CLR	R/W	0h	Clears the data to be output on pin SCITX if the following conditions are met: TX FUNC = 0 (SCITX pin is a general-purpose I/O.) TX DATA DIR = 1 (SCITX pin is a general-purpose output.)
1	RX_DATA_CLR	R/W	0h	Clears the data to be output on pin SCITX if the following conditions are met: TX FUNC = 0 (SCITX pin is a general-purpose I/O.) TX DATA DIR = 1 (SCITX pin is a general-purpose output.)
0	CLK_DATA_CLR	R/W	0h	Clears the data to be output on pin SCITX if the following conditions are met: TX FUNC = 0 (SCITX pin is a general-purpose I/O.) TX DATA DIR = 1 (SCITX pin is a general-purpose output.)

## 15.6.22 SCIPIO6 Register (Offset = 54h) [Reset = 00000000h]

SCIPIO6 is shown in [Table 15-26](#).

Return to the [Summary Table](#).

SCI Pin I/O Control Register 6

**Table 15-26. SCIPIO6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_PDR	R/W	0h	TX Open Drain Enable Enables open-drain capability in the output pin SCITX if the following conditions are met: TX DATA DIR = 1 (SCITX pin is a general-purpose output.) TX DOUT = 1
1	RX_PDR	R/W	0h	RX Open Drain Enable Enables open-drain capability in the output pin SCIRX if the following conditions are met: RX DATA DIR = 1 (SCIRX pin is a general-purpose output.) RX DOUT = 1
0	CLK_PDR	R/W	0h	CLK Open Drain Enable Enables open-drain capability in the output pin SCICLK if the following conditions are met: CLK DATA DIR = 1 (SCICLK pin is a general-purpose output.) CLK DOUT = 1

### 15.6.23 SCIPIO7 Register (Offset = 58h) [Reset = 00000000h]

SCIPIO7 is shown in [Table 15-27](#).

Return to the [Summary Table](#).

SCI Pin I/O Control Register 7

**Table 15-27. SCIPIO7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_PD	R/W	0h	TX pin Pull Control Disable Disables pull control capability in the output pin SCITX. 0=Pull Control on SCITX pin is enabled. 1=Pull Control on SCITX pin is disabled.
1	RX_PD	R/W	0h	RX pin Pull Control Disable Disables pull control capability in the output pin SCIRX. 0=Pull Control on SCIRX pin is enabled. 1=Pull Control on SCIRX pin is disabled.
0	CLK_PD	R/W	0h	CLK pin Pull Control Disable Disables pull control capability in the output pin SCICLK. 0=Pull Control on SCICLK pin is enabled. 1=Pull Control on SCICLK pin is disabled.

### 15.6.24 SCIPIO8 Register (Offset = 5Ch) [Reset = 00000000h]

SCIPIO8 is shown in [Table 15-28](#).

Return to the [Summary Table](#).

SCI Pin I/O Control Register 8

**Table 15-28. SCIPIO8 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-3	RESERVED	R	0h	Reserved
2	TX_PSL	R/W	0h	TX pin Pull Select Selects pull type in the output pin SCITX. 0=Pull-Down is on SCITX pin. 1=Pull-Up is on SCITX pin.
1	RX_PSL	R/W	0h	RX pin Pull Select Selects pull type in the output pin SCIRX. 0=Pull-Down is on SCIRX pin. 1=Pull-Up is on SCIRX pin.
0	CLK_PSL	R/W	0h	CLK pin Pull Select Selects pull type in the output pin SCICLK. 0=Pull-Down is on SCICLK pin. 1=Pull-Up is on SCICLK pin.

### 15.6.25 RESERVED2 Register (Offset = 60h) [Reset = 00000000h]

RESERVED2 is shown in [Table 15-29](#).

Return to the [Summary Table](#).

Reserved

**Table 15-29. RESERVED2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	RESERVED	R	0h	Reserved

### 15.6.26 RESERVED3 Register (Offset = 64h) [Reset = 00000000h]

## 15.7 SCI GPIO Functionality

The following sections apply to all device pins that can be configured as functional or general-purpose I/O pins.

### 15.7.1 GPIO Functionality

Figure 15-8 illustrates the GPIO functionality.

**Figure 15-8. GPIO Functionality**

### 15.7.2 Under Reset

The following apply if a device is under reset:

- Pull control. The reset pull control on the pins is enabled.
- Input buffer. The input buffer is enabled.
- Output buffer. The output buffer is disabled.

### 15.7.3 Out of Reset

The following apply if the device is out of reset:

- Pull control. The pull control is enabled by clearing the PD (pull control disable) bit in the SCPIO7 register (SCPIO7 Register (Offset = 58h) [Reset = 00000000h] ). In this case, if the PSL (pull select) bit in the SCPIO8 register (Section 15.6.24 ) is set, the pin will have a pull-up. If the PSL bit is cleared, the pin will have a pull-down. If the PD bit is set in the control register, there is no pull-up or pull-down on the pin.
- Input buffer. The input buffer is always enabled in functional mode.

#### Note

The pull-disable logic depends on the pin direction. It is independent of whether the device is in I/O or functional mode. If the pin is configured as output or transmit, then the pulls are disabled automatically. If the pin is configured as input or receive, the pulls are enabled or disabled depending on bit PD in the pull disable register SCPIO7 (Section 15.6.23 ).

- Output buffer. A pin can be driven as an output pin if the TX DIR bit is set in the pin direction control register (SCPIO1; Section 15.6.17 ) AND the open-drain feature is not enabled in the SCPIO6 register (Section 15.6.22 ).

### 15.7.4 Open-Drain Feature Enabled on a Pin

The following apply if the open-drain feature is enabled on a pin:

- The output buffer is enabled, if a low signal is being driven on to the pin.
- The output buffer is disabled (the direction control signal DIR is internally forced low), if a high signal is being driven on to the pin.

#### Note

The open-drain feature is available only in I/O mode (SCPIO0; Section 15.6.16 ).

### 15.7.5 Summary

The behavior of the input buffer, output buffer, and the pull control is summarized in Table 15-39.

**Table 15-39. Input Buffer, Output Buffer, and Pull Control Behavior as GPIO Pins**

Device under Reset?	Pin Direction (DIR) <sup>(1) (2)</sup>	Pull Disable (PULDIS) <sup>(1) (3)</sup>	Pull Select (PULSEL) <sup>(1) (4)</sup>	Pull Control	Output Buffer	Input Buffer
Yes	X	X	X	Enabled	Disabled	Enabled
No	0	0	0	Pull down	Disabled	Enabled
No	0	0	1	Pull up	Disabled	Enabled
No	0	1	0	Disabled	Disabled	Enabled
No	0	1	1	Disabled	Disabled	Enabled
No	1	X	X	Disabled	Enabled	Enabled

(1) X = Don't care

(2) DIR = 0 for input, = 1 for output

(3) PULDIS = 0 for enabling pull control  
= 1 for disabling pull control

(4) PULSEL = 0 for pull-down functionality  
= 1 for pull-up functionality

## Chapter 16

# Inter-Integrated Circuit (I2C) Module

---

This chapter describes the inter-integrated circuit (I2C or I<sup>2</sup>C) module. The I2C is a multi-Target communication module providing an interface between the Texas Instruments (TI) microcontroller and devices compliant with Philips Semiconductor I<sup>2</sup>C-bus specification version 2.1 and connected by an I2C-bus. This module will support any Controller or Target I2C compatible device.

### 16.1 Overview

The I2C has the following features:

- Compliance to the Philips (now NXP Semiconductors) I<sup>2</sup>C bus specification, v2.1 (*The I 2 C Specification*, Philips document number 9398 393 40011)
  - Bit/Byte format transfer
  - 7-bit and 10-bit device addressing modes
  - General call
  - START byte
  - Multi-controller transmitter/target receiver mode
  - Multi-controller receiver/target transmitter mode
  - Combined controller transmit/receive and receive/transmit mode
  - Transfer rates of 10 kbps up to 400 kbps (Fast mode transfer rate)
- Free data format
- Two DMA events (transmit and receive)
- DMA event enable/disable capability
- Seven interrupts that can be used by the CPU
- Operates with VBUS frequency from 6.7 MHz up
- Operates with module frequency between 6.7 MHz and 13.3 MHz
- Module enable/disable capability
- The SDA and SCL are optionally configurable as general purpose I/O
- Slew rate control of the outputs
- Open drain control of the outputs
- Programmable pullup/pulldown capability on the inputs
- Supports Ignore NACK mode

The device has three instances of I2C called:

- MSS\_I2CA
- RCSS\_I2CA
- RCSS\_I2CB

---

#### Note

This I2C module does **not** support:

- High-speed (HS) mode (only supports up to 400 kbps (Fast mode))
  - C-bus compatibility mode
  - The combined format in 10-bit address mode (the I2C sends the target address second byte every time it sends the target address first byte)
-

### 16.1.1 Introduction to the I2C Module

The I2C module supports any target or controller I2C-compatible device. [Figure 16-1](#) shows an example of multiple I2C serial ports connected for a two-way transfer from one device to another device.

**Figure 16-1. Multiple I2C Modules Connection Diagram**

### 16.1.2 Functional Overview

The I2C module is a serial bus that supports multiple Controller devices. In multi Controller mode, one or more devices can be connected to the same bus and are capable of controlling the bus. Each I2C device on the bus is recognized by a unique address and can operate as either a transmitter or a receiver, depending on the function of the device. In addition to being a transmitter or receiver, a device connected to the I2C bus can also be considered a Controller or a Target when performing data transfers.

#### Note

A Controller device is the device that initiates the data transfer on a bus and generates the clock signal that permits the transfer. During the transmission, any device addressed by the Controller is considered the Target.

Data is communicated to devices interfacing to the I2C module using the serial data pin (SDA) and the serial clock pin (SCL) as shown in [Figure 16-2](#). These two wires carry information between the device and the other devices connected to the I2C bus. Both SDA and SCL pins on the device are bidirectional. They must be connected to a positive supply voltage through a pull-up resistor. When the bus is free, both pins are high. The driver of these two pins has an open-drain configuration to perform the wired-AND function.

The device has a special mode that can be entered to ignore a NACK generated from non-compliant I2C devices that are incapable of generating an ACK.

The I2C module consists of the following Controller blocks:

- A serial Interface: one data pin (SDA) and one clock pin (SCL)
- The device register interface
  - Data registers to temporarily hold received data and transmitted data traveling between the SDA pin and the CPU or the DMA
  - Control and status registers
- A prescaler to divide down the input clock that is driven to the I2C module
- A peripheral bus interface to enable the CPU and DMA to access the I2C module registers
- An arbitrator to handle arbitration between the I2C module (when configured as a Controller) and another Controller
- Interrupt generation logic (interrupts can be sent to the CPU)
- A clock synchronizer that synchronizes the I2C input clock (from the system module) and the clock on the SCL pin, and synchronizes data transfers with controllers of different clock speeds.
- A noise filter on each of the two serial pins
- DMA event generation logic that synchronizes data reception and data transmission in the I2C module for DMA transmission

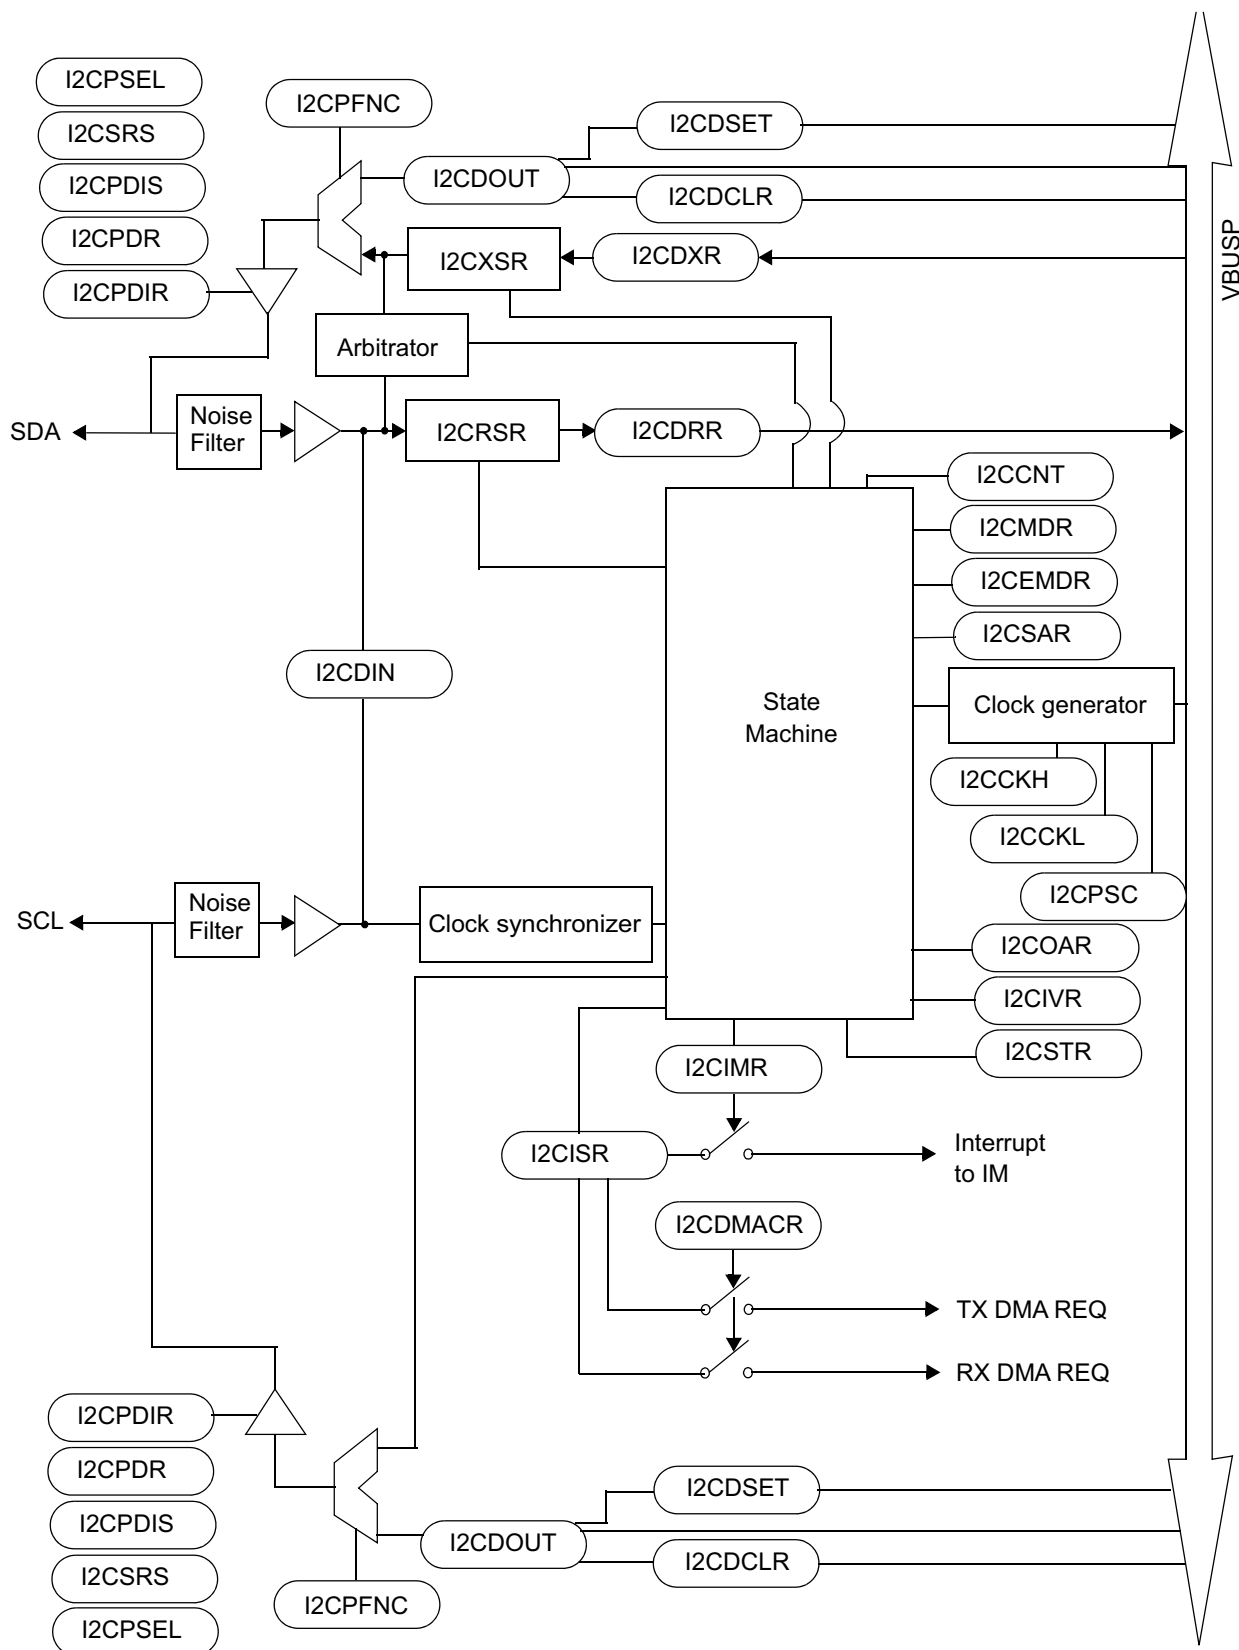

In [Figure 16-2](#), the CPU or the DMA writes data for transmission to I2CDXR and reads received data from I2CDRR. When the I2C module is configured as a transmitter, data written to I2CDXR is copied to I2CXS

and shifted out one bit at a time. When the I2C module is configured as a receiver, received data is shifted into I2CRSR and then copied to I2CDRR.

When the I2C function is not needed, the pins may be controlled as general-purpose input/output (GPIO) pins. The I/O structure of each pin includes:

- programmable slew rate control of the outputs
- open drain mode
- programmable pull enable/disable on the input
- programmable pull up/pull down function on the input

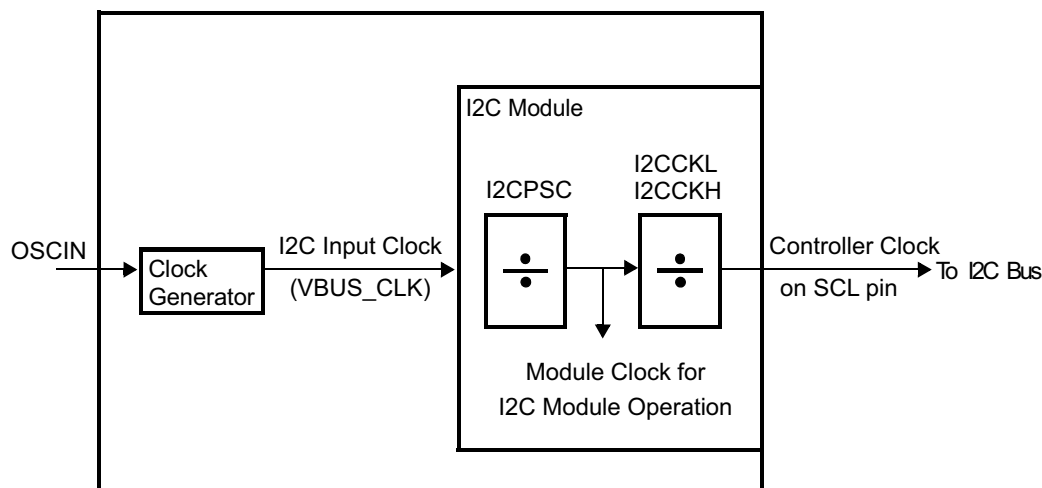

### Figure 16-2. Simple I2C Block Diagram

### 16.1.3 Clock Generation

As shown in Figure 16-3, the I2C module uses the input clock generated from the device clock generator to generate the module clock and Controller clock. The I2C input clock is the device peripheral clock (VBUS\_CLK). The clock is then divided twice more inside the I2C module to produce the module clock and the Controller clock.

**Figure 16-3. Clocking Diagram for the I2C Module**

The module clock determines the frequency at which the I2C module operates. A programmable prescaler in the I2C module divides down the input clock to produce the module clock. To specify the divide-down value, initialize the I2CPSC field of the prescaler register, I2CPSC. The resulting frequency is:

$$\text{ModuleClockFrequency} = \frac{\text{I2CInputClockFrequency}}{(\text{ICPSC} + 1)} \quad (5)$$

The module clock frequency must be between 6.7MHz and 13.3MHz. The prescaler can only be initialized while the I2C module is in the reset state (IRS = 0 in I2CMDR). The prescaled frequency takes effect only when IRS is changed to 1. Changing the I2CPSC value while IRS = 1 has no effect.

The Controller clock appears on the SCL pin when the I2C module is configured to be a Controller on the I2C bus. This clock controls the timing of the communication between the I2C module and a secondary. As shown in Figure 16-3, a second clock divider in the I2C module divides down the module clock to produce the Controller clock. The clock divider uses the I2CCKL to divide down the low portion of the module clock signal and uses the I2CCKH to divide down the high portion of the module clock signal.

The resulting frequency is:

$$\text{ControllerClockFrequency} = \frac{\text{ModuleClockFrequency}}{(\text{ICCLKL} + d) + (\text{ICCLKH} + d)} \quad (6)$$

$$\text{ControllerClockFrequency} = \frac{\text{I2CInputClockFrequency}}{(\text{ICPSC} + 1)((\text{ICCLKL} + d) + (\text{ICCLKH} + d))} \quad (7)$$

where  $d$  depends on the value of I2CPSC:

I2CPSC	d
0	7
1	6

I2CPSC	d
Greater than 1	5

### Note

The Controller clock frequency defined above does not include rise/fall time and latency of the synchronizer inside the module. The actual transfer rate will be slower than the value calculated from the formula above. Also, due to the nature of SCL synchronization, the SCL clock period could change if SCL synchronization is taking place.

## 16.2 I2C Module Operation

The following section discusses how the I2C module operates.

### 16.2.1 Input and Output Voltage Levels

One clock pulse is generated by the Controller device for each data bit transferred. Because of a variety of different technology devices that can be connected to the I2C-bus, the levels of logic 0 (low) and logic 1 (high) are not fixed and depend on the associated level of  $V_{CCIO}$ . For details, see the device specific data sheet.

### 16.2.2 I2C Module Reset Conditions

The I2C module can be reset in the following two ways:

- Through the global peripheral reset. A device reset causes a global peripheral reset.
- By clearing the  $\overline{IRS}$  bit in the I2C mode register (I2CMDR). When the global peripheral reset is removed, the  $\overline{IRS}$  bit is cleared to 0, keeping the I2C module in the reset state.

### 16.2.3 I2C Module Data Validity

The data on the SDA must be stable during the high period of the clock. See Figure 16-4. The high and low state of the data line, the SDA, can only change when the clock signal on the serial clock line (SCL) is low.

**Figure 16-4. Bit Transfer on the I2C Bus**

### 16.2.4 I2C Module Start and Stop Conditions

START and STOP conditions are generated by a primary I2C module.

- The START condition is defined as a high-to-low transition on the SDA line while SCL is high. A primary drives this condition to indicate the start of data transfer. The bus is considered to be busy after the START condition, and the bus busy bit (BB) in I2CSR is set to 1.
- The STOP condition is defined as a low-to-high transition on the SDA line while SCL is high. A primary drives this condition to indicate the end of data transfer. The bus is considered to be free after the STOP condition, therefore the BB bit in I2CSR is cleared to 0.

**Figure 16-5. I2C Module START and STOP Conditions**

For the I2C module to start a data transfer with a START condition, the primary mode bit (MST) and the START condition bit (STT) in the I2CMDR must both be set to 1. For the I2C module to end a data transfer with a STOP condition, the STOP condition bit (STP) must be set to 1. When the BB bit is set to 1 and the STT bit is set to 1, a repeated START condition is generated.

### 16.2.5 Serial Data Formats

The I2C module operates in byte data format. Each message put on the SDA line is 2 to 8-bits long. The number of messages that can be transmitted or received is unrestricted. The data is transferred with the most significant bit (MSB) first (Figure 16-6). Each message is followed by an acknowledge bit from the I2C if it is in receiver mode. The I2C module does not support little endian systems.

**Figure 16-6. I2C Module Data Transfer**

The first byte after a START condition (S) always consists of 8 bits that comprise either a 7-bit address plus the R/  $\overline{W}$  bit, or 8 data bits. The eighth bit, R/  $\overline{W}$ , in the first byte determines the direction of the data. When the R/  $\overline{W}$  bit is 0, the Controller writes (transmits) data to a selected Target device; when the R/  $\overline{W}$  bit is 1, the Controller reads (receives) data from the Target device. In acknowledge mode, an extra bit dedicated for the acknowledgment (ACK) bit is inserted after each message.

The I2C module supports the following formats:

- 7-bit addressing format (Figure 16-7)
- 10-bit addressing format (Figure 16-8)
- 7-bit/10-bit addressing format with repeated START condition (Figure 16-9)
- Free-data format (Figure 16-10)

### 16.2.5.1 7-Bit Addressing Format

In the 7-bit addressing format (Figure 16-7), the first byte after the START condition consists of a 7-bit secondary address followed by the R/  $\overline{W}$  bit (in the LSB). The R/  $\overline{W}$  bit determines the direction of the data transfer:

- R/  $\overline{W}$  = 0: The primary writes (transmits) data to the addressed secondary.
- R/  $\overline{W}$  = 1: The primary reads (receives) data from the secondary.

An extra clock cycle dedicated for acknowledgement (ACK) is inserted after each byte. If the ACK is inserted by the secondary after the first byte from the primary, it is followed by n bits of data from the transmitter (primary or secondary, depending on the R/  $\overline{W}$  bit). The device I2C allows n to be a number between 2 to 8, programmable by the bit count (BC) field of I2CMR. After the data bits have been transferred, the receiver inserts an ACK bit.

To select the 7-bit addressing format, write 0 to the expanded address enable (XA) bit of I2CMR and make sure the free data format mode is off (FDF = 0 in I2CMR).

Figure 16-7. I2C Module 7-Bit Addressing Format

### 16.2.5.2 10-Bit Addressing Format

The 10-bit addressing format is similar to the 7-bit addressing format, but the primary sends the secondary address in two separate byte transfers. In the 10-bit addressing format (Figure 16-8), the first byte is 11110b, the two MSBs of the 10-bit secondary address, and the R/  $\overline{W}$  bit. The ACK bit is inserted after each byte.

The second byte is the remaining 8 bits of the 10-bit secondary address. The secondary must send an acknowledgment after each of the two byte transfers. Once the primary has written the second byte to the secondary, the primary can either write data or use repeated a START condition to change the data direction.

To select the 10-bit addressing format, write 1 to the expanded address enable (XA) bit of I2CMR and make sure the free data format mode is off (FDF = 0 in I2CMR).

Figure 16-8. I2C Module 10-bit Addressing Format

### 16.2.5.3 Using the Repeated START Condition

At the end of each byte, the primary can drive another START condition (Figure 16-9). Using this capability, a primary can transmit/receive any number of data bytes before generating a STOP condition. The length of a data byte can be from 2 to 8 bits. The repeated START condition can be used with the 7-bit addressing, 10-bit addressing, or the free data formats.

Figure 16-9. I2C Module 7-Bit Addressing Format with Repeated START

### 16.2.5.4 Free Data Format

In this format (Figure 16-10), the first byte after a START condition is a data byte. The ACK bit is inserted after each byte, followed by another 8 bits of data. No address or data direction bit is sent. Therefore, the transmitter and receiver must both support the free data format. The direction of data transmission (transmit or receive) remains constant throughout the transfer.

To select the free data format, write a 1 to the free data format (FDF) bit of the I2CMDR. The free data format is not supported in the digital loop back mode.

**Figure 16-10. I2C Module in Free Data Format**

### 16.2.6 NACK Bit Generation

When the I2C module is a receiver (Controller or Target), it can acknowledge or ignore bits sent by the transmitter. To ignore any new bits, the I2C module must send a no-acknowledge (NACK) bit during the acknowledge cycle on the bus. Table 16-1 summarizes the various ways a NACK can be generated.

**Table 16-1. Ways to Generate a NACK Bit**

I2C Module Condition	Basic NACK Bit Generation Options	Additional Option
Target receiver mode	Disable data transfers (STT = 0) Allow an overrun condition (RSFULL = 1) Reset the module (IRS = 0)	Set the NACKMOD bit before the rising edge of the last data bit you intend to receive.
Controller receiver mode and repeat mode (RM = 1)	Generate a STOP condition (STP = 1) Reset the module (IRS = 0)	Set the NACKMOD bit before the rising edge of the last data bit you intend to receive.
Controller receiver mode with non-repeat mode (RM = 0)	If STP = 1, allow the internal data counter to count down to 0 and thus force a STOP condition. If STP = 0, make STP = 1 to generate a STOP condition. Reset the module (IRS = 0)	Set the NACKMOD bit before the rising edge of the last data bit you intend to receive.

In some applications, the Target cannot generate the ACK signal. If the IGNACK bit is set in the I2CEMDR register, the resulting NACK will be ignored and the I2C block will continue the data transfer.

## 16.3 I2C Operation Modes

### 16.3.1 Controller Transmitter Mode

All primaries begin in this mode. The I2C module is a Controller and transmits control information and data to a Target. In this mode, data assembled in any of the addressing formats shown in [Figure 16-7](#), [Figure 16-8](#), or [Figure 16-9](#) is shifted out onto the SDA pin and synchronized with the self-generated clock pulses on the SCL pin. The clock pulses are inhibited and the SCL pin is held low when the intervention of the device is required ( $\overline{\text{XSMT}} = 0$ ) after a byte has been transmitted.

#### Note

If the I2C is configured for two simultaneous Controller transmissions, wait until the MST and BB have been reset before performing the second Controller transmission.

Failure to wait for the MST and BB to reset will prevent the start condition on the second transfer from being issued and the bus BB will not be set. Typically the end of the first transfer is handled by polling BB. However, the MST bit is not reset at the same instant as the BB bit. As a result, when the second Controller transmission is initiated before the resetting of the MST, the MST bit for the second transfer is reset. This prevents the I2C from recognizing itself as the Controller, thus failing to occupy the bus.

### 16.3.2 Controller Receiver Mode

In this mode, the I2C module is a Controller and receives data from a Target. This mode can only be entered from the Controller transmitter mode (the I2C module must first transmit a command to the Target). In any of the addressing formats shown in [Figure 16-7](#), [Figure 16-8](#), or [Figure 16-9](#), the Controller receiver mode is entered after the Target address byte and the R/  $\overline{\text{W}}$  bit have been transmitted (if the R/  $\overline{\text{W}}$  bit is 1). Serial data bits received on the SDA pin are shifted in with the self-generated clock pulses on the SCL pin. The clock pulses are inhibited and the SCL is held low when the intervention of the device is required (RSFULL = 1) after a byte has been received. At the end of the transfer, the Controller-receiver signals the end of data to the Target-transmitter by not generating an acknowledge on the last byte that was clocked out of the Target. The Target-transmitter then releases the data line allowing the Controller-receiver to generate a STOP condition or a repeated START condition.

In many applications, the size of the message is in the initial bytes of the message itself. Since the size of the message is not known to the Controller before the transmission/reception starts, the Controller must use the repeat mode to force the stop condition when the reception is completed. The repeat mode is enabled by setting the RM bit to 1. Due to the double buffer implementation on the receive side, the Controller must generate the stop condition (STP = 1) after reading the (message size - 1)<sup>th</sup> data.

### 16.3.3 Target Transmitter Mode

In this mode, the I2C module is a Target and transmits data to a Controller. This mode can only be entered from the Target receiver mode (The I2C module must first receive a command from the Controller). In any of the addressing formats shown in [Figure 16-7](#), [Figure 16-8](#), or [Figure 16-9](#), the Target transmitter mode is entered if the Target address byte is the same as its own address and the R/  $\overline{\text{W}}$  bit has been transmitted (if the R/  $\overline{\text{W}}$  bit is set to 1). The Target transmitter shifts the serial data out on the SDA pin with the clock pulses that are generated by the Controller device. The Target device does not generate the clock, but it can hold the SCL pin low when intervention of the device is required ( $\overline{\text{XSMT}} = 0$ ) after a byte has been transmitted.

### 16.3.4 Target Receiver Mode

In this mode, the I2C module is a Target and receives data from a Controller. All Target begin in this mode. Serial data bits received on the SDA pin are shifted in with the clock pulses that are generated by the Controller device. The Target device does not generate the clock, but it can hold the SCL pin low while intervention of the device is required (RSFULL = 1) after a byte has been received.

### **16.3.5 Free Run Mode**

The I2C module can be placed in free run mode when the FREE bit (I2CMR.14) is set to 1. This bit is primarily used on an emulator when encountering a break point while debugging software. When the FREE bit is set to 0, the I2C responds differently depending on whether the SCL is high or low. If the SCL is low, the I2C stops immediately and keeps driving the SCL low whether the I2C is the Controller transmitter or receiver. If the SCL is high, the I2C waits until the SCL becomes a low and then stops. If the I2C is a Target, it stops when the transmission/reception completes.

### **16.3.6 Ignore NACK Mode**

The I2C module can be placed in the ignore NACK mode by setting the IGNACK bit in the I2CEMR register. This mode allows an I2C module that is configured as a Controller transmitter to ignore a NACK from a Target device that is not capable of generating a proper ACK signal.

## 16.4 I2C Module Integrity

The following section discusses how the I2C module maintains priorities and order among signals and commands.

### 16.4.1 Arbitration

If two or more Controller transmitters simultaneously start a transmission on the same bus, an arbitration procedure is invoked. [Figure 16-11](#) illustrates the arbitration procedure between two devices. The arbitration procedure uses the data presented on the SDA bus by the competing transmitters. The first Controller transmitter that generates a high is overruled by the other Controller that generates a low. The arbitration procedure gives priority to the device that transmits the serial data stream with the lowest binary value. The Controller transmitter that loses the arbitration switches to the Target receiver mode, sets the arbitration lost (AL) flag, and generates the arbitration-lost interrupt. The data transmitted by the other Controller module is salvaged, and the I2C continues to receive data from the Controller module. Should two or more devices send identical first bytes, arbitration continues on the subsequent bytes.

If, during a serial transfer, the arbitration procedure is still in progress when a repeated START condition or STOP condition is transmitted to I2C bus, the Controller transmitters involved must send the repeated START condition or STOP condition at the same position in the format frame. In other words, arbitration is not allowed between:

- A repeated START condition and a data bit
- A STOP condition and a data bit
- A repeated START condition and a STOP condition

Secondaries are not involved in the arbitration procedure.

**Figure 16-11. Arbitration Procedure Between Two Controller Transmitters**

### 16.4.2 I2C Clock Generation and Synchronization

Under normal conditions only one Controller device generates the clock signal; the SCL. During the arbitration procedure, however, there are two or more Controller devices and the clock must be synchronized so that the data output can be compared. [Figure 16-12](#) illustrates clock synchronization. The wired-AND property of the SCL line means that a device that first generates a low period on the SCL overrules the other devices. At this high-to-low transition, the clock generators of the other devices are forced to start their own low period. The SCL line is held low by the device with the longest low period. The other devices that finish their low periods must wait for the SCL line to be released before starting their high periods. A synchronized signal on the SCL is obtained where the slowest device determines the length of the low period and the fastest device determines the length of the high period.

If a device pulls down the clock line for a longer time, the result is that all clock generators must enter the wait state. In this way, a Target slows down a fast Controller and the slow device creates enough time to store a received byte or to prepare a byte to be transmitted.

#### Note

##### I2C Protocol Fault

The following conditions violate the clock spec as defined in the Philips I<sup>2</sup>C bus specification, v2.1 (*The I<sup>2</sup>C Specification*, Philips document number 9398 393 40011), and will result in an I2C protocol fault: I2CCLKH = 2 I2CCLKL = 2I2CPSC = 2. This will cause the SDA data transition to occur while the SCL is high.

**Figure 16-12. Synchronization of Two I2C Clock Generators During Arbitration**

### 16.4.3 Prescaler

The I2C module is operated by the module clock. This clock is generated by way of the I2C prescaler block. The prescaler block consists of a 8-bit register, I2CPSC, used for dividing down the device peripheral clock (VBUS\_CLK) to obtain a module clock between 6.7 MHz and 13.3 MHz.

### 16.4.4 Noise Filter

The noise filter is used to suppress any noises that are 50ns or less. It is designed to suppress noise with one module clock, assuming the lower and upper limits of the module clock are 6.7MHz and 13.3MHz, respectively.

## 16.5 Operational Information

The following section provides specific information about how the I2C module operates.

### 16.5.1 I2C Module Interrupts

The I2C module generates seven types of interrupts. These seven interrupts are accompanied with seven interrupt mask bits in the interrupt mask register (I2CIMR) and with seven interrupt flag bits in the status register (I2CSR).

#### 16.5.1.1 I2C Interrupt Requests

The I2C module generates the interrupt requests described below. All requests are multiplexed through an arbiter into a single I2C interrupt request to the CPU. Each interrupt request has a flag bit and an enable bit. Interrupts must be enabled prior to the occurrence of the expected interrupt condition. When one of the specified events occurs, the flag bit is set. If the corresponding enable bit is 0, the interrupt request is blocked. If the enable bit is 1, the interrupt request is forwarded to the CPU as an I2C interrupt request. As an alternative, the CPU can poll all of the bits shown in [Table 16-2](#).

**Table 16-2. Interrupt Requests Generated by I2C Module**

Flag	Name	Generated
AL	Arbitration-lost interrupt	Generated when the I2C module has lost an arbitration contest with another Controller-transmitter
NACK	No-acknowledge interrupt	Generated when the Controller I2C does not receive an acknowledge from the receiver
ARDY	Register-access-ready interrupt	Generated when the previously programmed address, data and command have been performed and the status bits have been updated. The interrupt is used to notify the device that the I2C registers are ready to be accessed.
RXRDY	Receive-data-ready interrupt	Generated when the received data in the receive-shift register (I2CSR) has been copied into the data receive register (I2CDRR). The RXRDY bit can also be polled by the device to determine when to read the received data in the I2CDRR.
TXRDY	Transmit-data-ready interrupt	Generated when the transmitted data has been copied from the data transmit register (I2CDXR) into the transmit-shift register (I2CXSR). The TXRDY bit can also be polled by the device to determine when to write the next data into I2CDXR.
SCD	Stop-condition-detect interrupt	Generated when a STOP condition has been detected.
AAS	Address-as-Target interrupt	Generated when the I2C has recognized its own Target address or an address of all zeroes.

### 16.5.2 DMA Controller Events

The I2C module has two events that use the DMA controller to synchronously read received data (I2CREVNT) from I2CDRR, and synchronously write data (I2CWEVNT) to the transmit buffer, I2CDXR. The read and write events have the same timing as I2CRRDY (I2CRINT) and I2CXRDY (I2CXINT), respectively.

The CPU or the DMA controller reads the received data from I2CDRR and writes the data to be transmitted to I2CDXR. The RXRDY bit is automatically cleared when the DMA controller reads the I2CDRR register, and the TXRDY bit is automatically cleared when the DMA controller writes to the I2CDXR register.

Data written to I2CDXR is copied to I2CXSR and shifted out from the SDA pin when the I2C module is configured as a transmitter. When the I2C module is configured as a receiver, received data is shifted into ICRSR and copied to I2CDRR, which can be read by the CPU or the DMA controller.

A transmit event (I2CWEVNT) is generated after a START condition in Controller transmitter mode. This ensures that the DMA gets an event even if no Target returns an ACK to the Target address following the START condition.

---

**Note****Unexpected DMA transmit and receive event**

An unexpected DMA transmit event (ICXEVT) and a DMA receive event (ICXRDY) are generated in 10-bit, Controller transmit, repeat mode. This event occurs soon after the start condition but before the first bit of the address is transmitted. In this event, no DMA activity should be initiated without the Target ACK being received.

---

**16.5.3 I2C Enable/Disable**

The I2C module can be enabled or disabled with the I2C reset enable bit (IRS) in the I2C module register (I2CMDR). This occurs in one of two ways:

- Write 0 to the I2C reset bit (IRS) in I2CMDR. All status bits are forced to the default values and the I2C mode remains disabled until IRS is changed to 1. The SDA and SCL pins are in the high impedance state.
- Initiate a device reset by driving the  $\overline{\text{PORRST}}$  pin low. The entire device is reset and is held in the reset state until the pin is released and is driven high. When  $\overline{\text{PORRST}}$  is released, all I2C module registers are reset to their default values. The IRS bit is forced to 0, which resets the I2C module. The I2C module stays in the reset state until a 1 is written to the IRS bit.

IRS must be 0 while the I2C module is being configured. Forcing IRS to 0 can be used to save power and also clear error conditions.

**16.5.4 General Purpose I/O**

Both of the I2C pins can be programmed to be general-purpose I/O pins via the I2C pin control registers (I2CPFNC, I2CDIR, I2CDOUT, and I2CDIN).

When the I2C module is not used, the I2C pins may be programmed to be either general purpose input or general-purpose output pins. This function is controlled in the I2CDIR and I2CPFNC registers. Note that each pin can be programmed to be either an I2C pin or a GIO pin.

If the I2C function is to be used, the application software must ensure that each pin is configured as an I2C pin and not a GIO pin, or else unexpected behavior may result.

### **16.5.5 Pull Up/Pull Down Function**

I2C module pins can have either an active pull up or active pull down that makes it possible to leave the pins unconnected externally. The pins can be programmed to have the active pull function enabled or disabled by writing to the corresponding bit in the I2CPDIS register. Please see the device-specific data sheet for the default internal pull (pull-up, pull-down or no pull) on the pins.

The pull on the pins is programmable to a setting other than the default internal pull as specified in the data sheet. The pins can be programmed to have either an active pull up or an active pull down function by writing to the corresponding bit in I2CPSEL register. The pull up/pull down function is active on the pin only when the pull enabled is programmed in the I2CPDIS register.

The pull up/pull down functions are deactivated when a bidirectional pin is configured as an output. At system reset, the pull up function of all the pins is enabled. Please see the device-specific data sheet for the current supplied by the pull up/pull down.

### **16.5.6 Open Drain Function**

The I2C pins can be programmed to include an open drain function when they are configured as output pins. This is done by writing to the corresponding bit of the I2CPDR register. When the open drain function is enabled, a low value (0) written to the data output register forces the pin to a low output voltage ( $V_{OL}$  or lower), whereas a high value (1) written to the data output register forces the pin to a high-impedance state. The open drain function is disabled when the pin is configured as an input pin.

## 16.6 MSS\_I2C Registers

Table 16-3 lists the memory-mapped registers for the MSS\_I2C registers. All register offset addresses not listed in Table 16-3 should be considered as reserved locations and the register contents should not be modified.

**Table 16-3. MSS\_I2C Registers**

Offset	Acronym	Register Name	Section
0h	ICOAR	ICOAR	<a href="#">Go</a>
4h	ICIMR	ICIMR	<a href="#">Go</a>
8h	ICSTR	ICSTR	<a href="#">Go</a>
Ch	ICCLKL	ICCLKL	<a href="#">Go</a>
10h	ICCLKH	ICCLKH	<a href="#">Go</a>
14h	ICCNT	ICCNT	<a href="#">Go</a>
18h	ICDRR	ICDRR	<a href="#">Go</a>
1Ch	ICSAR	ICSAR	<a href="#">Go</a>
20h	ICDXR	ICDXR	<a href="#">Go</a>
24h	ICMDR	ICMDR	<a href="#">Go</a>
28h	ICIVR	ICIVR	<a href="#">Go</a>
2Ch	ICEMDR	ICEMDR	<a href="#">Go</a>

58h	ICPDSET	ICPDSET	<a href="#">Go</a>
5Ch	ICPDCLR	ICPDCLR	<a href="#">Go</a>
60h	ICPDRV	ICPDRV	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 16-4 shows the codes that are used for access types in this section.

**Table 16-4. MSS\_I2C Access Type Codes**

Access Type	Code	Description
<b>Read Type</b>		
R	R	Read
<b>Write Type</b>		
W	W	Write
<b>Reset or Default Value</b>		
-n		Value after reset or the default value

### 16.6.1 ICOAR Register (Offset = 0h) [Reset = 00000000h]

ICOAR is shown in [Table 16-5](#).

Return to the [Summary Table](#).

I2C Own Address register

**Table 16-5. ICOAR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-10	NU	R/W	0h	Reserved
9-0	A9_A0	R/W	0h	Own address. Use in both 7- and 10-bit address mode. Note that user can program the I2C own address to any value as long as it does not conflict with other components in the system.

## 16.6.2 ICIMR Register (Offset = 4h) [Reset = 00000000h]

ICIMR is shown in [Table 16-6](#).

Return to the [Summary Table](#).

I2C Interrupt Mask/Status register

**Table 16-6. ICIMR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-7	NU	R/W	0h	Reserved
6	AAS	R/W	0h	Address As Slave interrupt mask bit. Setting a "1" to this bit unmask the Address As Slave interrupt. Setting a "0" to this bit masks the Address As Slave interrupt.
5	SCD	R/W	0h	Stop Condition Detection mask bit. Setting a "1" to this bit unmask the Stop Condition Detection interrupt. Setting a "0" to this bit masks the Stop Condition Detection interrupt.
4	ICXRDY	R/W	0h	Transmit Data Ready interrupt mask bit. Setting a "1" to this bit unmask the Transmit Data Ready interrupt. Setting a "0" to this bit masks the Transmit Data Ready interrupt.
3	ICRRDY	R/W	0h	Receive Data Ready interrupt mask bit. Setting a "1" to this bit unmask the Receive Data Ready interrupt. Setting a "0" to this bit masks the Receive Data Ready interrupt.
2	ARDY	R/W	0h	Register access ready interrupt mask bit. Setting a "1" to this bit unmask the Register access ready interrupt. Setting a "0" to this bit masks the Register access ready interrupt.
1	NACK	R/W	0h	No Acknowledgement interrupt mask bit. Setting a "1" to this bit unmask the No Acknowledgement interrupt. Setting a "0" to this bit masks the No Acknowledgement interrupt.
0	AL	R/W	0h	Arbitration Lost interrupt mask bit. Setting a "1" to this bit unmask the Arbitration Lost interrupt. Setting a "0" to this bit masks the Arbitration Lost interrupt.

### 16.6.3 ICSTR Register (Offset = 8h) [Reset = 00000000h]

ICSTR is shown in [Table 16-7](#).

Return to the [Summary Table](#).

I2C Interrupt Status register

**Table 16-7. ICSTR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-15	NU2	R/W	0h	Reserved
14	SDIR	R/W	0h	Slave Direction. This bit is clear to '0' indicating the I2C is a master transmitter/receiver or a slave receiver. This bit is also clear by STOP condition or START condition. It is set to '1' when the I2C slave is a transmitter. In DLB mode (which the configuration should be master-transmitter slave-receiver) this bit is clear to '0'. Writing a "1" to this bit to clear it.
13	NACKSNT	R/W	0h	A No Acknowledge is sent due to NACKMOD is set to a "1". NACKSNT = 0: A No Acknowledge is not sent. NACKSNT = 1: A No Acknowledge is sent. Writing a "1" to this bit to clear it.
12	BB	R/W	0h	Bus Busy. This bit indicates the state of the serial bus. BB= 0: The bus is free. BB= 1: The bus is occupied. On reception of a "start" condition the device sets BB to 1. This bit is also set if the I2C detects SCL low state. BB is clear to 0 after reception of a "stop" condition. BB is kept to "0" regardless SCL state when the I2C is in reset (IRS_ = 0). If the IRS_ is set to "1" during transaction between other I2C devices the BB bit is set at the first falling edge of SCL or START condition. - (RW )
11	RSFULL	R/W	0h	Receive shift full. This bit indicates whether the receiver has experienced overrun. Overrun occurs when the receive shift register (ICRSR) is full and ICDRR has not been read since the ICRSR-to-ICDRR transfer. The FSM is holding for ICDRR read access. RSFULL is clear when reading the ICDRR. RSFULL is set to "1" when the I2C has recognized an overrun. The contents of ICDRR are NOT lost in this case. In repeat mode since double buffer (ICRSR and ICDRR) behaves like a single buffer RSFULL is set to "1" every time the data is received. RSFULL is clear as a result of reading the ICDRR. - (RW )
10	XSMT	R/W	0h	Transmit shift empty not. This bit indicates whether the transmitter has experienced underflow. Underflow occurs when the transmit shift register (ICXSR) is empty and ICDEXR has not been loaded. The FSM is holding for ICDEXR write access. XSMT_ is cleared when underflow has occurred. XSMT_ is set to "1" as a result of writing to ICDEXR. In repeat mode if the I2C in master transmitter mode is holding transfer with XSMT_ = 0 (i.e. waiting for further action) and the STT or STP bit is set XSMT_ is set to "1" by hardware.

**Table 16-7. ICSTR Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
9	AAS	R/W	0h	Address As Slave. This bit is set to 1 by the device when it has recognized its own slave address or an address of all (8) zeros. The AAS bit is reset by stop condition or detection of any address byte that does not match ICOAR. - (RW )
8	AD0	R/W	0h	Address Zero Status: This bit is set to 1 by device if it detects the address of all (8) zeros (i.e. general call). The AD0 bit is reset to 0 (default value) when a "start" or "stop" condition is detected. - (RW )
7-6	NU1	R/W	0h	Reserved
5	SCD	R/W	0h	Stop Condition Detection bit SCD is set when the I2C sends or receives STOP condition. This bit is cleared by reading ICIVR (as 110) or writing '1' to itself.
4	ICXRDY	R/W	0h	Transmit Data Ready interrupt flag bit. ICXRDY is set to "1" is generated when the transmitted data has been copied from ICDXR to the transmit-shift register (ICXSR). ICXRDY is clear to "0" when the ICDXR is written. This bit can also be polled by the CPU to write a new transmitted data into the ICDXR. Write '1' to this bit will set it and DXR Write will clear it.
3	ICRRDY	R/W	0h	Receive Data Ready interrupt flag bit. ICRRDY is set to "1" when the received data has been copied from ICRSR into the ICDRR. ICRRDY is cleared to "0" when the ICDRR is read. This bit can also be polled by the CPU to read the received data in the ICDRR. Write '1' or DRR Read will clear it.
2	ARDY	R/W	0h	Register-access-ready interrupt flag bit. ARDY is generated by the hardware if the I2C is in the master mode when the previously programmed data and command has been performed and status bit has been updated. This flag is used by the CPU to let it knows that the I2C registers are ready to be accessed again. When RM=0 ARDY is set when the internal data count is passed 0 if STP register bit has not been set. When RM=1 ARDY is set at each byte end. If the I2C is in FDF mode(FDF=1) ARDY is set just after Start condition. This bit is automatically cleared by hardware when writing data to ICDXR in transmit mode reading data from ICDRR in receive mode or setting STT or STP bit. Write '1' will clear it.
1	NACK	R/W	0h	No-Acknowledgement interrupt flag bit. The No Acknowledge flag bit is set when the hardware in "master" mode detects no acknowledge has been received. This bit is NOT set by no-acknowledgement after Start byte Write '1' or Read the ICIVR (as 010) will clear it.
0	AL	R/W	0h	Arbitration-Lost interrupt flag bit. The Arbitration Lost flag bit is set to 1 when the device in the "master" mode senses it has lost an arbitration when two or more transmitters start a transmission almost simultaneously or when the I2C attempts to start a transfer while BB (bus busy) is 1. When this is set to 1 due to arbitration lost the MST/STT/STP bits are clear the I2C becomes a slave. Write '1' or Read the ICIVR (as 001) will clear it.

### 16.6.4 ICCLKL Register (Offset = Ch) [Reset = 00000000h]

ICCLKL is shown in [Table 16-8](#).

Return to the [Summary Table](#).

I2C Clock Divider Low register

**Table 16-8. ICCLKL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	NU	R/W	0h	Reserved
15-0	ICCL15_ICCL0	R/W	0h	Low time I 2 C SCL Clock Division Factor. They are used to divide down the master clock to create the SCL low time transition frequency. This register must be configured while the I2C is still in reset (IRS_=0).

### 16.6.5 ICCLKH Register (Offset = 10h) [Reset = 00000000h]

ICCLKH is shown in [Table 16-9](#).

Return to the [Summary Table](#).

I2C Clock Divider High register

**Table 16-9. ICCLKH Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	NU	R/W	0h	Reserved
15-0	ICCH15_ICCLH0	R/W	0h	High time I 2 C SCL Clock Division Factor. They are used to divide down the master clock to create the SCL high time transition frequency. This register must be configured while the I2C is still in reset (IRS_=0).

### 16.6.6 ICCNT Register (Offset = 14h) [Reset = 00000000h]

ICCNT is shown in [Table 16-10](#).

Return to the [Summary Table](#).

I2C Data Count register

**Table 16-10. ICCNT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	NU	R/W	0h	Reserved
15-0	ICDC15_ICDC0	R/W	0h	<p>Data count. This data count register is used to generate a Stop condition if a Stop condition is specified (STP=1).</p> <p>ICCNT=1 data count is 1 .....</p> <p>ICCNT=0FFFFh data count is 65535 ICCNT=0data counter is 65536 Note that ICCNT is a don't care when RM is set to 1.</p>

### 16.6.7 ICDRR Register (Offset = 18h) [Reset = 00000000h]

ICDRR is shown in [Table 16-11](#).

Return to the [Summary Table](#).

I2C Data Receive register

**Table 16-11. ICDRR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU	R/W	0h	Reserved
7-0	D7_D0	R/W	0h	Receive data

### 16.6.8 ICSAR Register (Offset = 1Ch) [Reset = 00000000h]

ICSAR is shown in [Table 16-12](#).

Return to the [Summary Table](#).

I2C Slave Address register

**Table 16-12. ICSAR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-10	NU	R/W	0h	Reserved
9-0	A9_A0	R/W	0h	Slave address. Use in both 7- and 10-bit address mode.

### 16.6.9 ICDXR Register (Offset = 20h) [Reset = 00000000h]

ICDXR is shown in [Table 16-13](#).

Return to the [Summary Table](#).

I2C Data Transmit register

**Table 16-13. ICDXR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU	R/W	0h	Reserved
7-0	D7_D0	R/W	0h	Transmit data

## 16.6.10 ICMR Register (Offset = 24h) [Reset = 00000000h]

ICMR is shown in [Table 16-14](#).

Return to the [Summary Table](#).

I2C Mode register

**Table 16-14. ICMR Register Field Descriptions**

Bit	Field	Type	Reset	Description																				
31-16	NU2	R/W	0h	Reserved																				
15	NACKMOD	R/W	0h	No Acknowledge (NACK) mode. This bit is used to send an Acknowledge (ACK) or a No Acknowledge (NACK) to the transmitter. This bit is only applicable when the I2C is in receiver mode. In master receiver mode when the internal data count counter decrements to zero the I2C sends a NACK. The master receiver I2C finishes a transfer when it sends a NACK. The I2C ignores ICCNT when NACKMOD is '1'. The NACKMOD bit should be set before the rising edge of the last data bit (bit 8) if a NACK must be sent and this bit is cleared once a NACK has been sent. NACKMOD=0 the I2C sends an ACK to the transmitter during the acknowledge cycle. NACKMOD=1 the I2C sends a NACK to the transmitter during the acknowledge cycle.																				
14	FREE	R/W	0h	Free Running. This bit is used to determine the state of the I2C when a breakpoint is encountered in the HLL debugger. FREE= 0: (default) Stops immediately if SCL is low and keep driving SCL low whether I2C is master transmitter/receiver. If SCL is high I2C waits until SCL becomes low and then stops. If the I2C is a slave it will stop when the transmission/receiving completes. FREE= 1: The I2C runs free.																				
13	STT	R/W	0h	Start Condition (Master only mode). This bit can be set to a"1" by the CPU to generate a Start condition. In master mode when setting Start to"1" generates a Start condition. It is reset to "0" by the hardware after the Start condition has been generated. The Start/Stop bits can be configured to generate different transfer formats. Note that the STT and STP can be used to terminate the repeat mode. <table><tr><th>STT</th><th>STP</th><th>Conditions</th><th>Bus Activities</th></tr><tr><td>1</td><td>0</td><td>Start</td><td>S-A-D</td></tr><tr><td>0</td><td>1</td><td>Stop</td><td>P</td></tr><tr><td>1</td><td>1</td><td>Start-Stop (ICCNT= n)</td><td>S-A-D..(n)..D-P</td></tr><tr><td>1</td><td>0</td><td>Start (ICCNT= n)</td><td>S-A-D..(n)..D</td></tr></table>	STT	STP	Conditions	Bus Activities	1	0	Start	S-A-D	0	1	Stop	P	1	1	Start-Stop (ICCNT= n)	S-A-D..(n)..D-P	1	0	Start (ICCNT= n)	S-A-D..(n)..D
STT	STP	Conditions	Bus Activities																					
1	0	Start	S-A-D																					
0	1	Stop	P																					
1	1	Start-Stop (ICCNT= n)	S-A-D..(n)..D-P																					
1	0	Start (ICCNT= n)	S-A-D..(n)..D																					
12	NU1	R/W	0h	Reserved for IDLEEN (IDLE Enable on 5509). - (RW )																				
11	STP	R/W	0h	Stop Condition (Master mode only). This bit can be set to a"1" by the CPU to generate a Stop condition. It is reset to "0" by the hardware after the Stop condition has been generated. The Stop condition is generated when ICCNT passes 0 when the I2C is in non-repeat mode(RM=0).																				

**Table 16-14. ICMR Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
10	MST	R/W	0h	Master. MST= 0: The I2C peripheral is in the "slave" mode and clock is received from the "master" device. MST= 1: The I2C peripheral is in the "master" mode and it generates the clock. This bit is clear when the transfer completed.
9	TRX	R/W	0h	Transmitter. TRX= 0: The I2C is in the "receiver" mode and data on data line SDA is shifted into the data register ICDRR. TRX= 1: The I2C is in the "transmitter" mode and the data in ICDXR is shifted out on data line SDA. The operating modes (not in FDF mode) are defined as follows. In FDF mode TRX must be configured even if the I2C is in slave mode because there is no address/direction byte in FDF mode. <div> MST TRX Operating  Modes 0 x "slave receiver"  0 x "slave transmitter" 1 0 "master receiver" 1 1 "master transmitter" </div>
8	XA	R/W	0h	Expanded Address. XA= 0: (default) 7-bit address mode (normal address mode). XA= 1: 10-bit address mode (expanded address mode) Please note that XA needs to be configured even if the I2C is in slave mode.
7	RM	R/W	0h	Repeat Mode. This bit is set to a "1" by the CPU to put the I2C in the repeat mode. In this mode data is continuously transmitted out of the ICDXR until the STP bit is set to "1" regardless of ICCNT value. This bit is don't care if the I2C is configured in slave mode. <div> RM STT STP Conditions Bus  Activities Mode  0 0 0 Idle None NA  0 0 1 Stop P NA  0 1 0 (Re)Start S-A-D..(n)..D Repeat n  0 1 1 (Re)Start-Stop S-A-D..(n)..D-P Repeat  n 1 0 0 Idle none NA  1 0 1 Stop P NA  1 1 0 (Re)Start S-A-D-D-  D.. Continuous  1 1 1 Reserved None NA </div>
6	DLB	R/W	0h	Digital Loop Back (in master transmit mode only). This bit is set to a "1" by the CPU to put the I2C in the loop back mode. In this mode data transmitted out of the ICDXR will be received in the ICDRR after ((CPU freq/I2C freq)8) CPU cycles via an internal path. The address of the ICOAR is output on SDA.
5	IRS	R/W	0h	I2C Reset Not. This can be set to a "0" by the CPU to put the I2C in reset or to a "1" to take the I2C out of reset. When this bit is reset to 0 all status bits in ICSTR and ICIVR are set to default values. Note that if this bit is reset during a transfer it can cause the I2C bus hang (SDA and SCL are tri-stated).

**Table 16-14. ICMR Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
4	STB	R/W	0h	Start Byte (Master only mode). The Start Byte mode bit is set to 1 by the CPU to configure the I2C in Start byte mode the I2C sends "00000001" regardless ICSAR value. Refer to the Philip I2C spec for more details.
3	FDF	R/W	0h	Free Data Format. This bit can be set to "1" by the CPU to configure the I2C in Free Data Format mode.  <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> FDF__MST__TRX__Operating mode__0__0__  x__Slave in non FDF mode__0__1__0__Master  receive in non FDF mode__0__1__1__Master  transmit in non FDF mode__1__0__0__Slave  receiver in FDF mode__1__0__1__Slave transmitter  in FDF mode__1__1__0__Master receiver in FDF  mode__1__1__1__Master transmitter in FDF mode </div>
2-0	BC2_BC1_BC0	R/W	0h	Bit Count : Bit Count 2, Bit Count 1 and Bit Count 0 define the number of bits starting from the lsb (excluding the acknowledge bit) of the next byte which are yet to be received or transmitted.  <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> BC2_BC1_BC0__Bits/byte in FDF__Bits/byte w/  ACK__0__0__1__NA (reserved)__NA  (reserved)__0__1__0__2__3__  0__1__1__3__4__  1__0__0__4__5__  1__0__1__5__6__  1__1__0__6__7__  1__1__1__7__8__  0__0__0__8__9__ </div>

### 16.6.11 ICIVR Register (Offset = 28h) [Reset = 00000000h]

ICIVR is shown in [Table 16-15](#).

Return to the [Summary Table](#).

I2C Interrupt Vector register

**Table 16-15. ICIVR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-12	NU2	R/W	0h	Reserved.
11-8	TESTMD	R/W	0h	Reserved for internal testing.
7-3	NU1	R/W	0h	Reserved.
2-0	INTCODE	R/W	0h	<p>Interrupt code. The binary-coded-interrupt vector indicates which interrupt has occurred. Reading the ICIVR clears the interrupt code except ARDY(011) RRDY(100) and XRDY(101). Interrupt code for ARDY RRDY and XRDY is cleared when ARDY ICRRDY and ICXRDY bits in the ICSTR is cleared to default value respectively. If other interrupts are pending a new interrupt is generated. If there are more than one interrupt flag reading the ICIVR clears the highest priority interrupt code. Reading the ICIVR also clears corresponding status bit in the ICSTR except ARDY ICRRDY ICXRDY and AAS. Note that users must read (clear) the ICIVR before doing another start otherwise the ICIVR could contain incorrect (old interrupt flags) value.</p> <p> Interrupt Code _____ Interrupt Occurred _____  _000_ (default) _____ None _001_ (highest  priority) _____ Arbitration Lost interrupt _010 _____ No  Acknowledgement interrupt _011 _____ Register  Access Ready interrupt _100 _____ Receive Data  Ready interrupt _101 _____ Transmit Data Ready  interrupt _110 _____ Stop Condition Detection  _111_ (lowest priority) _____ Address As Slave - (RW) </p>

### 16.6.12 ICEMDR Register (Offset = 2Ch) [Reset = 00000000h]

ICEMDR is shown in [Table 16-16](#).

Return to the [Summary Table](#).

I2C Extended Mode register

**Table 16-16. ICEMDR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved. - (RW )
1	IGNACK	R/W	0h	Ignore NACK mode IGNACK=0 The master transmitter will operate normally discontinue the data transfer and set the ARDY and NACK status bits when a NACK signal is received from the slave. IGNACK=1 The master transmitter will ignore a NACK received from the slave.
0	BCM	R/W	0h	Backward Compatibility Mode. This bit affects the I2C interrupt behavior. Refer to appendix A for details.

### 16.6.13 ICPSC Register (Offset = 30h) [Reset = 00000000h]

ICPSC is shown in [Table 16-17](#).

Return to the [Summary Table](#).

I2C Prescaler register

**Table 16-17. ICPSC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU	R/W	0h	Reserved.
7-0	IPSC7_IPSC0	R/W	0h	8-bit prescaler to divide the system clock down to 4/8/12Mhz clock and used by the I2C module. This register must be initialized while the I2C is still in reset (IRS_ =0). The value takes effect on the rising edge of IRS_.

### 16.6.14 ICPID1 Register (Offset = 34h) [Reset = 00000000h]

ICPID1 is shown in [Table 16-18](#).

Return to the [Summary Table](#).

I2C Peripheral ID register 1

**Table 16-18. ICPID1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	NU	R/W	0h	Reserved.
15-8	CLASS	R/W	0h	Identifies the class of peripheral. This value should be 0x01 - (RW )
7-0	REVISION	R/W	0h	Identifies the revision level of the I2C. This value should be incremented each time the design is revised. - (RW )

### 16.6.15 ICPID2 Register (Offset = 38h) [Reset = 00000000h]

ICPID2 is shown in [Table 16-19](#).

Return to the [Summary Table](#).

I2C Peripheral ID register 2

**Table 16-19. ICPID2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU	R/W	0h	Reserved.
7-0	TYPE	R/W	0h	Identifies the type of peripheral. This value should be 0x05 - (RW )

## 16.6.16 ICDMAC Register (Offset = 3Ch) [Reset = 00000000h]

ICDMAC is shown in [Table 16-20](#).

Return to the [Summary Table](#).

I2C DMA Control Register

**Table 16-20. ICDMAC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved. - (RW )
1	TXDMAEN	R/W	0h	Transmit DMA enable. This bit controls the receive DMA event pin to the system. When this bit is 1 the DMA event is enabled and ICTEVT_POR pin is asserted when the DMA transfer is required. When this bit is 0 the ICTEVT_POR pin is never asserted. RXDMAEN= 0: DMA transmit event is disabled. RXDMAEN= 1: DMA transmit event is enabled. (Default)
0	RXDMAEN	R/W	0h	Receive DMA enable. This bit controls the receive DMA event pin to the system. When this bit is 1 the DMA event is enabled and ICREVT_POR pin is asserted when the DMA transfer is required. When this bit is 0 the ICREVT_POR pin is never asserted. RXDMAEN= 0: DMA receive event is disabled. RXDMAEN= 1: DMA receive event is enabled. (Default)

### 16.6.17 I2C\_RESERVED1 Register (Offset = 40h) [Reset = 00000000h]

I2C\_RESERVED1 is shown in [Table 16-21](#).

Return to the [Summary Table](#).

Reserved

**Table 16-21. I2C\_RESERVED1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	NU	R/W	0h	Reserved.

### 16.6.18 I2C\_RESERVED2 Register (Offset = 44h) [Reset = 00000000h]

I2C\_RESERVED2 is shown in [Table 16-22](#).

Return to the [Summary Table](#).

Reserved

**Table 16-22. I2C\_RESERVED2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	NU	R/W	0h	Reserved.

### 16.6.19 ICPFUNC Register (Offset = 48h) [Reset = 00000000h]

ICPFUNC is shown in [Table 16-23](#).

Return to the [Summary Table](#).

I2C Pin Function register

**Table 16-23. ICPFUNC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-1	NU	R/W	0h	Reserved.
0	PFUNC0	R/W	0h	Controls the function of the I2C SCL and SDA pins. 0 = Pins function as SCL and SDA 1 = Pins functions as GPIO Note: No hardware protection is required to disable I2C function when the PFUNC[0] and IRS_ bits are both set to one. When PFUNC[0] is "1" (GPIO mode) the sub-module which controls the I2C function receives the value "1" for SCL and SDA. IRS_ can be set to "1" regardless of PFUNC[0] and the I2C function works whenever the IRS_ bit is "1". The user is expected to hold I2C in reset via IRS_ bit when changing to/from GPIO mode via the PFUNC[0] bit.

### 16.6.20 ICPDIR Register (Offset = 4Ch) [Reset = 00000000h]

ICPDIR is shown in [Table 16-24](#).

Return to the [Summary Table](#).

I2C Pin Direction register

**Table 16-24. ICPDIR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDIR1	R/W	0h	Controls the direction of the I2C SDA pin when configured as GPIO. 0 = SDA pin functions as input 1 = SDA pin functions as output
0	PDIR0	R/W	0h	Controls the direction of the I2C SCL pin when configured as GPIO. 0 = SCL pin functions as input 1 = SCL pin functions as output

### 16.6.21 ICPDIN Register (Offset = 50h) [Reset = 00000000h]

ICPDIN is shown in [Table 16-25](#).

Return to the [Summary Table](#).

I2C Pin Data In register

**Table 16-25. ICPDIN Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDIN1	R/W	0h	Indicates the logic level present on the SDA pin. Reads: 0 = Logic low present at SDA pin regardless of PFUNC setting. 1 = Logic high present at SDA pin regardless of PFUNC setting. Writes: Writes have no effect. - (RW )
0	PDIN0	R/W	0h	Indicates the logic level present on the SCL pin. Reads: 0 = Logic low present at SCL pin regardless of PFUNC setting. 1 = Logic high present at SCL pin regardless of PFUNC setting. Writes: Writes have no effect - (RW )

## 16.6.22 ICPDOUT Register (Offset = 54h) [Reset = 00000000h]

ICPDOUT is shown in [Table 16-26](#).

Return to the [Summary Table](#).

I2C Pin Data Out register

**Table 16-26. ICPDOUT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDOUT1	R/W	0h	Controls the level driven on the SDA pin when configured as GPIO output. Reads: Reads return register values not GPIO pin levels. Writes: 0 = SDA pin driven low 1 = SDA pin driven high. Note: If SDA is connected to an open-drain buffer at the chip level the I2C cannot drive SDA to high.
0	PDOUT0	R/W	0h	Controls the level driven on the SCL pin when configured as GPIO output. Reads: Reads return register values not GPIO pin levels. Writes: 0 = SCL pin driven low 1 = SCL pin driven high Note: If SCL is connected to an open-drain buffer at the chip level the I2C cannot drive SCL to high.

### 16.6.23 ICPDSET Register (Offset = 58h) [Reset = 00000000h]

ICPDSET is shown in [Table 16-27](#).

Return to the [Summary Table](#).

I2C Pin Data Set register

**Table 16-27. ICPDSET Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDSET1	R/W	0h	Used to set PDOUT[1] bit which corresponds to the SDA GPIO pin. Reads: Reads should return 0. User documentation should say reads are indeterminate. Writes: 0 = no effect 1 = PDOUT[1] bit is set to logic high.
0	PDSET0	R/W	0h	Used to set PDOUT[0] bit which corresponds to the SCL GPIO pin. Reads: Reads should return 0. User documentation should say reads are indeterminate. Writes: 0 = no effect 1 = PDOUT[0] bit is set to logic high.

## 16.6.24 ICPDCLR Register (Offset = 5Ch) [Reset = 00000000h]

ICPDCLR is shown in [Table 16-28](#).

Return to the [Summary Table](#).

I2C Pin Data Clear register

**Table 16-28. ICPDCLR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDCLR1	R/W	0h	Used to clear PDOUT[1] bit which corresponds to the SDA pin. Reads: Reads should return 0. User documentation should say reads are indeterminate. Writes: 0 = no effect 1 = PDOUT[1] bit is cleared to logic low.
0	PDCLR0	R/W	0h	Used to clear PDOUT[0] bit which corresponds to the SCL pin. Reads: Reads should return 0. User documentation should say reads are indeterminate. Writes: 0 = no effect 1 = PDOUT[0] bit is cleared to logic low.

### 16.6.25 ICPDRV Register (Offset = 60h) [Reset = 00000000h]

ICPDRV is shown in [Table 16-29](#).

Return to the [Summary Table](#).

I2C Pin Driver Mode Register

**Table 16-29. ICPDRV Register Field Descriptions**

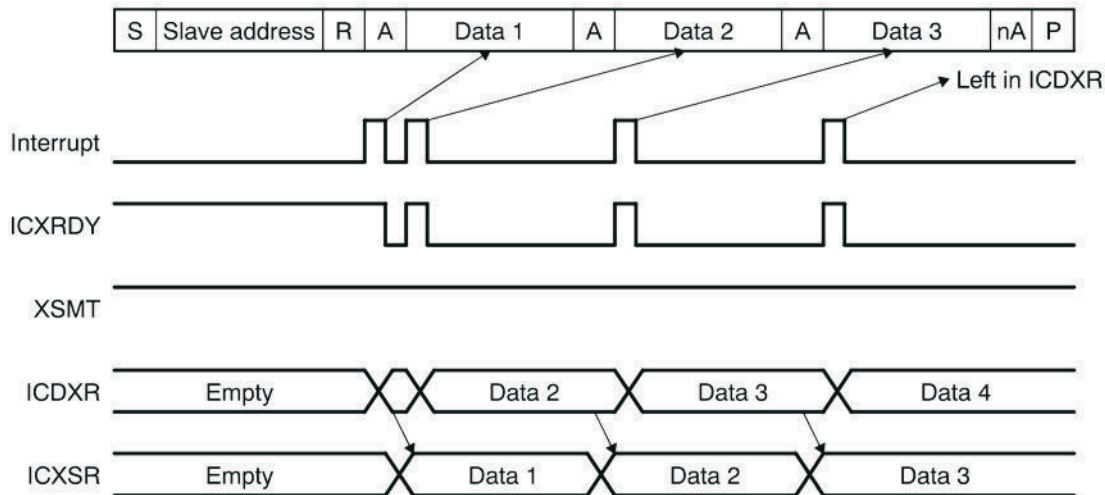

Bit	Field	Type	Reset	Description
31-2	NU	R/W	0h	Reserved
1	PDRV1	R/W	0h	Used to select driver mode of output buffer for SDA pin. 0 = I2C mode. 1 = GPIO mode. Note: Value of this register is reflected on the PDRV_SDA_POR port. Actual function depends on I/O buffer and chip implementation.
0	PDRV0	R/W	0h	Used to select driver mode of output buffer for SCL pin. 0 = I2C mode. 1 = GPIO mode. Note: Value of this register is reflected on the PDRV_SCL_POR port. Actual function depends on I/O buffer and chip implementation.

## 16.7 Sample Waveforms

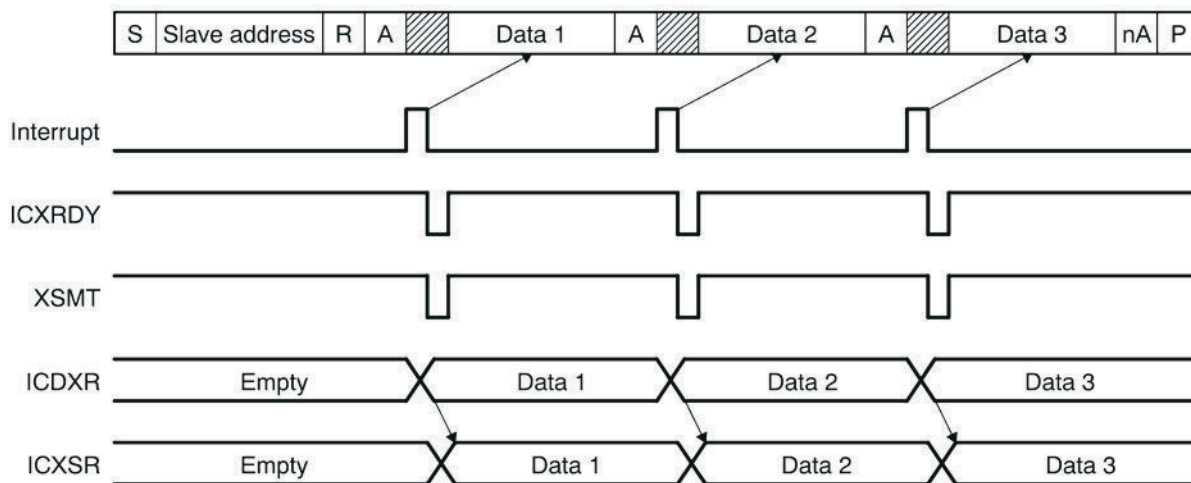

Figure 16-13 provides waveforms to illustrate the difference between normal operation and backward compatibility mode.

Slave transmitter

a) BCM=1

b) BCM=0

**Figure 16-13. Difference between Normal Operation and Backward Compatibility Mode**

## Chapter 17

# General-Purpose Input/Output (GPIO) Module

---

This chapter describes the general-purpose input/output (GPIO) module. The GPIO module provides the family of devices with input/output (I/O) capability. The I/O pins are bidirectional and bit-programmable. The GPIO module also supports external interrupt capability.

---

### Note

The "GPIO" module is also known as the "GPIO" module in other TI MCU and MPU devices. The two terms are used interchangeably and represent the general use I/O module of the device.

---

## 17.1 Overview

The GPIO module offers general-purpose input and output capability. It supports up to eight 8-bit ports for a total of up to 64 GPIO terminals. Each of these 64 terminals can be independently configured as input or output and configured as required by the application. The GPIO module also supports generation of interrupts whenever a rising edge or falling edge or any toggle is detected on up to 32 of these GPIO terminals. Refer to the device datasheet for identifying the number of GPIO ports supported and the GPIO terminals capable of generating an interrupt.

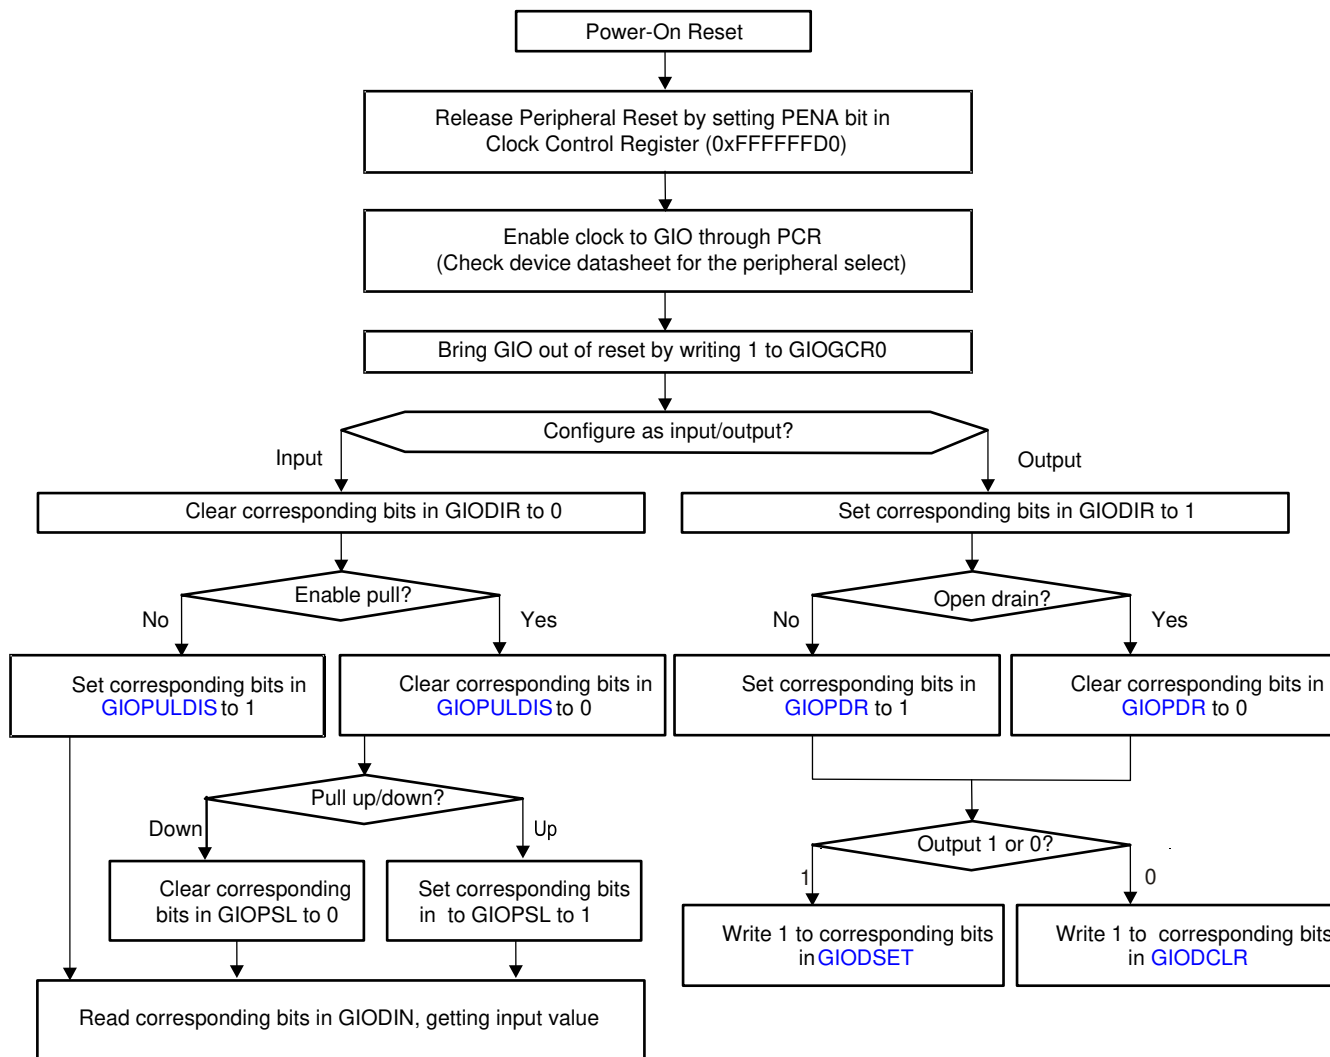

The main features of the GPIO module are summarized as follows:

- Allows each GPIO terminal to be configured for general-purpose input or output functions
- Supports programmable pull directions on each input GPIO terminal
- Supports GPIO output in push/pull or open-drain modes
- Allows up to 32 GPIO terminals to be used for generating interrupt requests

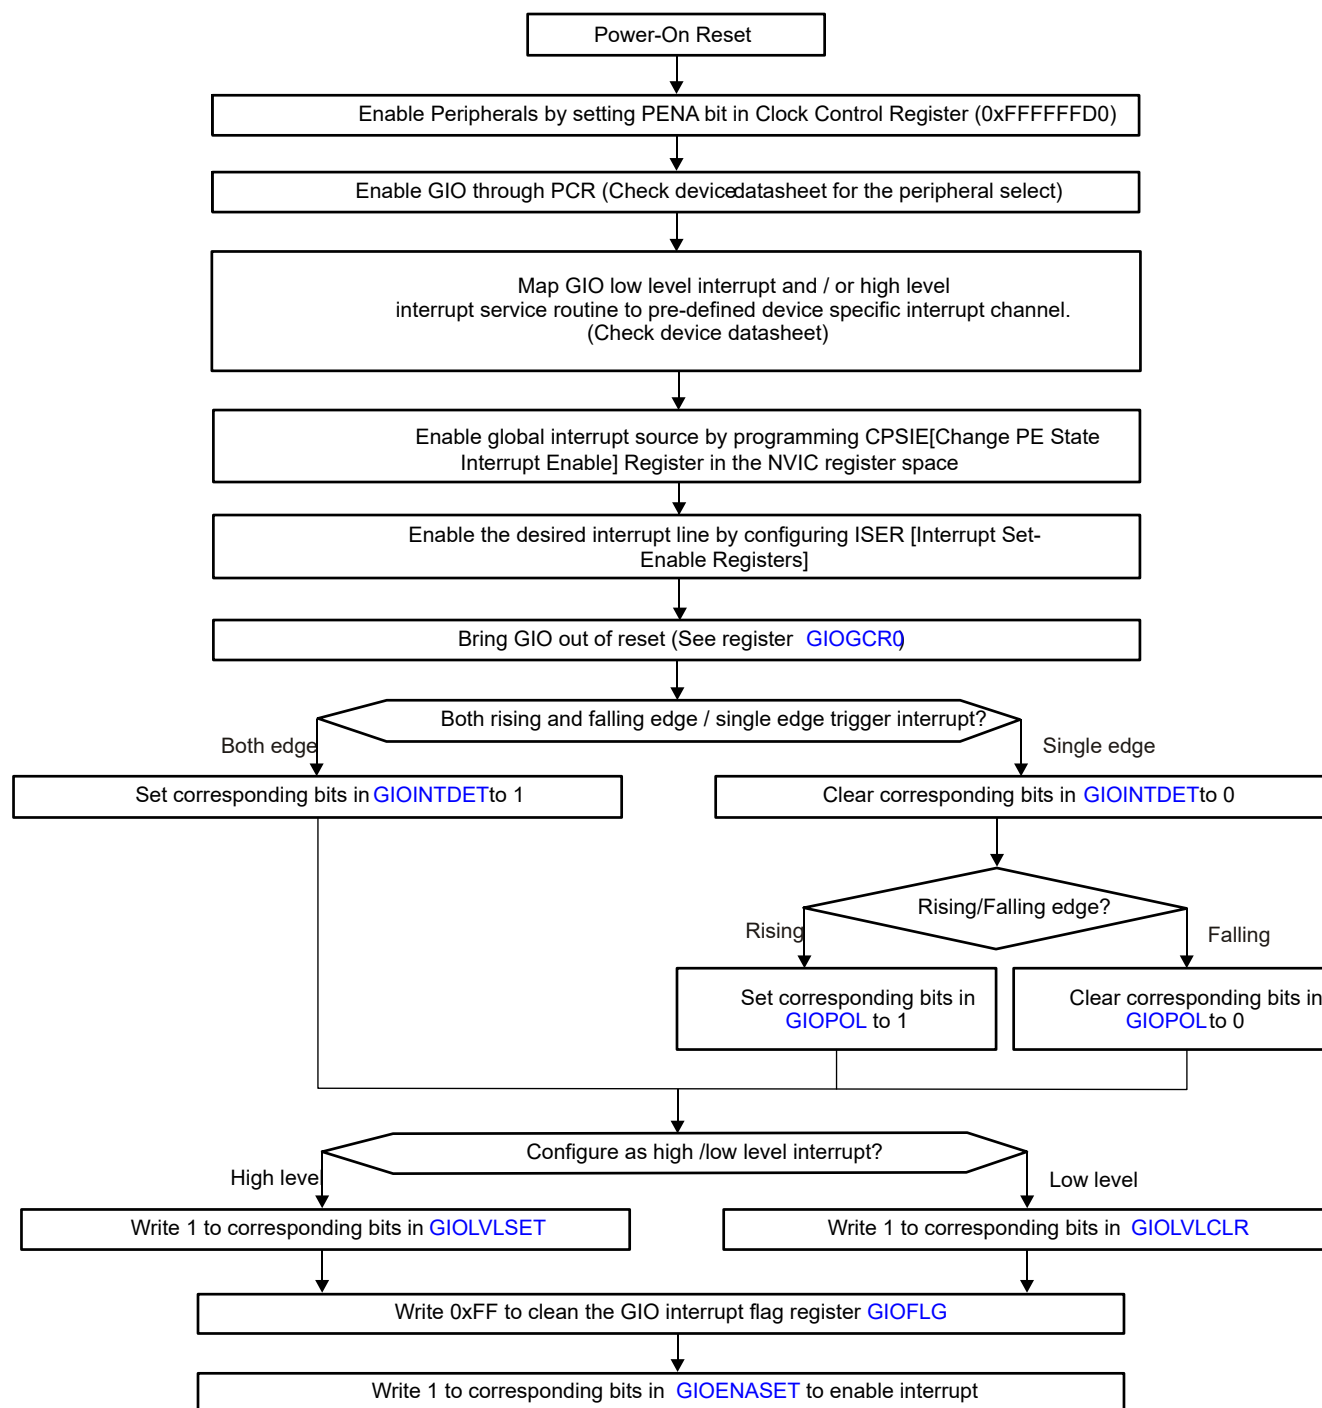

## 17.2 Quick Start Guide

The GPIO module comprises two separate components: an input/output (I/O) block and an interrupt generation block. [Figure 17-1](#) and [Figure 17-2](#) show what you should do after reset to configure the GPIO module as I/O or for generating interrupts.

In GPIO interrupt service routine, you shall read the GPIO offset register (GIOFF1 or GIOFF2, depending on high-/low-level interrupt) to clear the flag and find the pending interrupt GPIO channel.

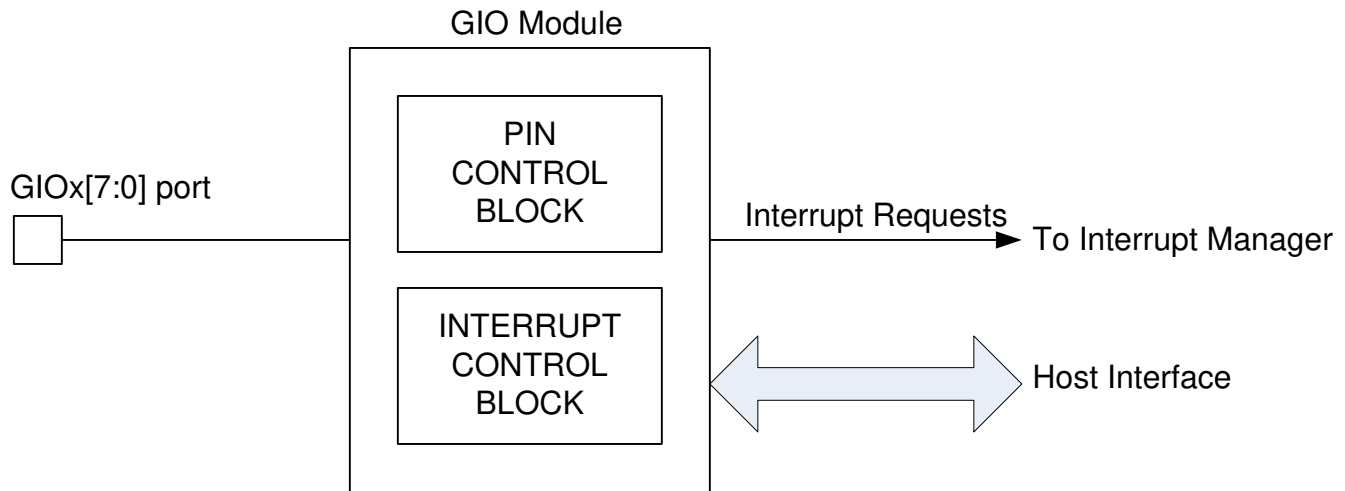

**Figure 17-1. I/O Function Quick Start Flow Chart**

**Figure 17-2. Interrupt Generation Function Quick Start Flow Chart**

### 17.3 Functional Description of GPIO Module

As shown in Figure 17-3, the GPIO module comprises of two separate components: an input/output (I/O) block and an interrupt block.

**Figure 17-3. GPIO Module Diagram**

#### 17.3.1 I/O Functions

The I/O block allows each GPIO terminal to be configured for use as a general-purpose input or output in the application. The GPIO module supports multiple registers to control the various aspects of the input and output functions. These are described as follows.

- Data direction (GPIODIR)

Configures GPIO terminal(s) as input (default) or output through the GPIODIRx registers.

- Data input (GPIODIN)

Reflects the logic level on GPIO terminals in the GPIODINx registers. A high voltage ( $V_{IH}$  or greater) applied to the pin causes a high value (1) in the data input register (GPIODIN[7:0]). When a low voltage ( $V_{IL}$  or less) is applied to the pin, the data input register reads a low value (0). The  $V_{IH}$  and  $V_{IL}$  values are device specific and can be found in the device datasheet.

- Data output (GPIODOUT)

Configures the logic level to be output on GPIO terminal(s) configured as outputs. A low value (0) written to the data output register forces the pin to a low output voltage ( $V_{OL}$  or lower). A high value (1) written to the data output register (GPIODOUTx) forces the pin to a high output voltage ( $V_{OH}$  or higher) if the open drain functionality is disabled (GPIOPDRx[7:0]). If open drain functionality is enabled, a high value (1) written to the data output register forces the pin to a high-impedance state (Z).

- Data set (GPIODSET)

Allows logic HIGH to be output on GPIO terminal(s) configured as outputs by writing 1's to the required bits in the GPIODSETx registers. If open drain functionality is enabled, a high value (1) written to the data output register forces the pin to a high-impedance state (Z). The GPIODSETx registers eliminate the need for the application to perform a read-modify-write operation when it needs to set one or more GPIO pin(s).

- Data clear (GPIODCLR)

Allows logic LOW to be output on GPIO terminal(s) configured as outputs by writing 1s to the required bits in the GPIODCLR registers. The GPIODCLR registers eliminate the need for the application to perform a read-modify-write operation when it needs to clear one or more GPIO pin(s).

- Open drain (GPIOPDR)

Open drain functionality is enabled or disabled (default) using the open drain register `GIOPDR[7:0]` register. If open-drain mode output is enabled on a pin, a high value (1) written to the data output register (`GIODOUTx[7:0]`) forces the pin to a high impedance state (Z).

- Pull disable (`GIOPULDIS`)

Disables the internal pull on GPIO terminal(s) configured as inputs by writing to the `GIOPULDISx` registers.

- Pull select (`GIOPSL`)

Selects internal pull down (default) or pull up on GPIO terminal(s) configured as inputs by writing to the `GIOPULSELx` registers.

Refer to the specific device's datasheet to identify the number of GPIO ports as well as the input and output functions supported. Some devices may not support the programmable pull controls. In that case, the pull disable and the pull select register controls will not work.

### 17.3.2 Interrupt Function

The GPIO module supports up to 32 terminals to be configured for generating an interrupt to the host processor through the Interrupt Manager (NVIC/IM). The main functions of the interrupt block are:

- Select the GPIO pin(s) that is/are used to generate interrupt(s)

This is done via the interrupt enable set and clear registers, `GIOENASET` and `GIOENACLR`.

- Select the edge on the selected GPIO pin(s) that is/are used to generate interrupt(s): rising/falling/both

Rising or falling edge can be selected via the `GIOPOL` register. If interrupt is required to be generated on both rising and falling edges, this can be configured via the `GIOINTDET` register.

- Select the interrupt priority

Low- or high-level interrupt can be selected through the `GIOLVLSET` and `GIOLVLCLR` registers.

- Individual interrupt flags are set in the `GIOFLG` register

The terminals on GPIO ports A through D are all interrupt-capable and can be used to handle either general I/O functions or interrupt requests. Each interrupt request can be connected to the NVIC/IM at one of two different levels – High (or A) and Low (or B), depending on the NVIC/IM channel number. The NVIC/IM has an inherent priority scheme so that a request on a lower number channel has a higher priority than a request on a higher number channel. Refer the device datasheet to identify the NVIC/IM channel numbers for the GPIO level A and level B interrupt requests. Also note that the interrupt priority of level A and level B interrupt handling blocks can be re-programmed in the NVIC/IM.

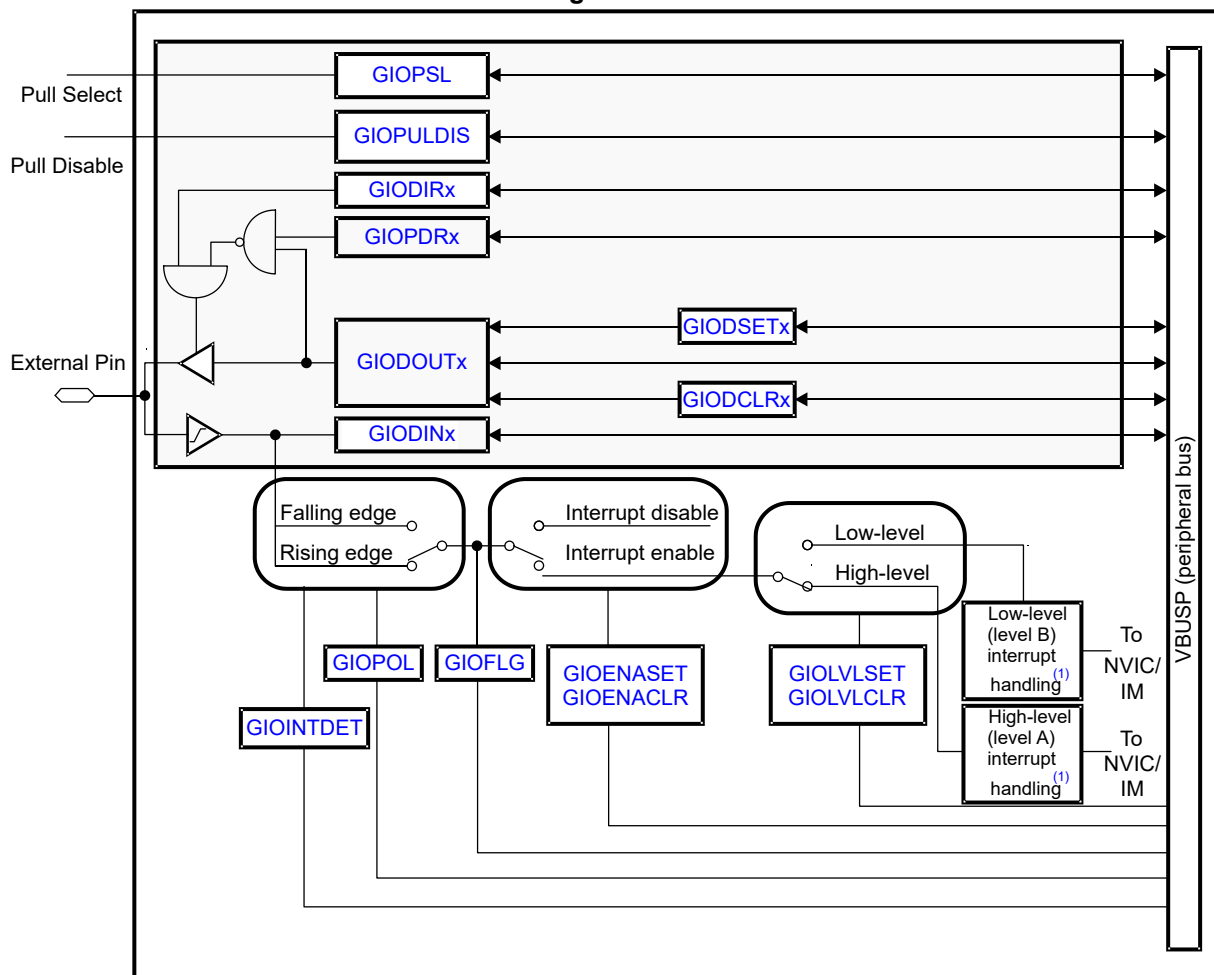

### 17.3.3 GPIO Block Diagram

The GPIO block diagram (Figure 17-4) represents the flow of information through a pin. The shaded area corresponds to the I/O block; the unshaded area corresponds to the interrupt block.

**Figure 17-4. GPIO Block Diagram**

- A. A single low-level-interrupt-handling block and a single high-level-interrupt-handling block service all of the interrupt-capable external pins, but only one pin can be serviced by an interrupt block at a time.

**Figure 17-5.**

## 17.4 Device Modes of Operation

The GPIO module behaves differently in different modes of operation. There are two main modes:

- Emulation mode
- Power-down mode (low-power mode)

### 17.4.1 Emulation Mode

Emulation mode is used by debugger tools to stop the CPU at breakpoints to read registers.

---

#### Note

##### Emulation Mode and Emulation Registers

Emulation mode is a mode of operation of the device and is separate from the GPIO emulation registers (GIOEMU1 and GIOEMU2). The contents of these emulation registers are identical to the contents of GPIO offset registers (GIOOFF1 and GIOOFF2). Both emulation registers and GPIO offset registers are NOT cleared when they are read in emulation mode. GPIO offset registers are cleared when they are read in normal mode (other than emulation mode). The emulation registers are NOT cleared when they are read in normal mode. The intention for the emulation registers is that software can use them without clearing the flags.

---

During emulation mode:

- External interrupts are not captured because the NVIC/IM is unable to service interrupts.
- Any register can be read without affecting the state of the system.
- A write to a register still does affect the state of the system.

### 17.4.2 Power-Down Mode (Low-Power Mode)

In power-down mode, the clock signal to the GPIO module is disabled. Thus, there is no switching and the only current draw comes from leakage current. In power-down mode, interrupt pins become level-sensitive rather than edge-sensitive. The polarity bit changes function from falling-edge-triggered to low-level-triggered and rising-edge-triggered to high-level-triggered. A corresponding level on an interrupt pin pulls the module out of low-power mode, if the interrupt is also enabled to wake up the device out of a low-power mode.

### 17.4.3 Interrupts

GPIO generates aggregated interrupts for all inputs from PAD. Some of the interrupts to MSS\_R5F are directly taken from GPIO-PAD.

MSS\_GPIO\_INT0/1

MSS\_GPIO\_PAD\_INT0 from GPIO[0]

MSS\_GPIO\_PAD\_INT1 from GPIO[1]

MSS\_GPIO\_PAD\_INT2 from GPIO[2]

MSS\_CTRL:: MSS\_GPIO\_CFG\_GPIO:: MSS\_GPIO\_CFG\_GPIO\_CONFIG is used for selecting the edge that can give a trigger.

## 17.5 TOP\_GPIO Registers

Table 17-1 lists the memory-mapped registers for the TOP\_GPIO registers. All register offset addresses not listed in Table 17-1 should be considered as reserved locations and the register contents should not be modified.

**Table 17-1. TOP\_GPIO Registers**

Offset	Acronym	Register Name	Section
0h	GIOGCR	GIOGCR	<a href="#">Go</a>
4h	GIOPWDN	GIOPWDN	<a href="#">Go</a>
8h	GIOINTDET	GIOINTDET	<a href="#">Go</a>
Ch	GIOPOL	GIOPOL	<a href="#">Go</a>
10h	GIOENASET	GIOENASET	<a href="#">Go</a>
14h	GIOENACLR	GIOENACLR	<a href="#">Go</a>
18h	GIOLVLSET	GIOLVLSET	<a href="#">Go</a>
1Ch	GIOLVLCLR	GIOLVLCLR	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. [Table 17-2](#) shows the codes that are used for access types in this section.

**Table 17-2. TOP\_GPIO Access Type Codes**

Access Type	Code	Description
<b>Read Type</b>		
R	R	Read
<b>Write Type</b>		
W	W	Write
<b>Reset or Default Value</b>		
-n		Value after reset or the default value

### 17.5.1 GLOGCR Register (Offset = 0h) [Reset = 00000000h]

GLOGCR is shown in [Table 17-3](#).

Return to the [Summary Table](#).

GPIO reset

**Table 17-3. GLOGCR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-1	NU0	R/W	0h	Reserved
0	RESET	R/W	0h	GPIO reset

### 17.5.2 GIOPWDN Register (Offset = 4h) [Reset = 00000000h]

GIOPWDN is shown in [Table 17-4](#).

Return to the [Summary Table](#).

GPIO power down mode register

**Table 17-4. GIOPWDN Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-1	NU	R/W	0h	Reserved
0	GIOPWDN	R/W	0h	<p>Writing to the GIOPWDN bit is only allowed in privilege mode. Reading of the GIOPWDN bit is allowed in all modes.</p> <p>Privilege mode (write):</p> <p>0 = Normal operation clocks enabled to GPIO module</p> <p>1 = Power-down mode User mode (write): Writes have no effect in user mode.</p> <p>User or privilege mode (read):</p> <p>0 = Normal operation clocks enabled to GPIO module</p> <p>1 = Power-down mode</p>

### 17.5.3 GIOINTDET Register (Offset = 8h) [Reset = 00000000h]

GIOINTDET is shown in [Table 17-5](#).

Return to the [Summary Table](#).

Interrupt detection select for pins [0:1] GIO[7:0].

**Table 17-5. GIOINTDET Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	GIOINTDET_3	R/W	0h	Interrupt detection select for pins GIOD [7:0].
23-16	GIOINTDET_2	R/W	0h	Interrupt detection select for pins GIOC [7:0].
15-8	GIOINTDET_1	R/W	0h	Interrupt detection select for pins GIOB [7:0].
7-0	GIOINTDET_0	R/W	0h	Interrupt detection select for pins GIOA [7:0].

### 17.5.4 GIOPOL Register (Offset = Ch) [Reset = 00000000h]

GIOPOL is shown in [Table 17-6](#).

Return to the [Summary Table](#).

Interrupt polarity select for pins [0:1] GIO[7:0].

**Table 17-6. GIOPOL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	GIOPOL_3	R/W	0h	Interrupt polarity select for pins GIOD [7:0]
23-16	GIOPOL_2	R/W	0h	Interrupt polarity select for pins GIOC [7:0]
15-8	GIOPOL_1	R/W	0h	Interrupt polarity select for pins GIOB [7:0]
7-0	GIOPOL_0	R/W	0h	Interrupt polarity select for pins GIOA [7:0]

### 17.5.5 GIOENASET Register (Offset = 10h) [Reset = 00000000h]

GIOENASET is shown in [Table 17-7](#).

Return to the [Summary Table](#).

Interrupt enable for pins [0:1] GIO[7:0].

**Table 17-7. GIOENASET Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	GIOENASET_3	R/W	0h	Interrupt enable for pins GIOD [7:0]
23-16	GIOENASET_2	R/W	0h	Interrupt enable for pins GIOC [7:0]
15-8	GIOENASET_1	R/W	0h	Interrupt enable for pins GIOB [7:0]
7-0	GIOENASET_0	R/W	0h	Interrupt enable for pins GIOA [7:0]

### 17.5.6 GIOENACLR Register (Offset = 14h) [Reset = 00000000h]

GIOENACLR is shown in [Table 17-8](#).

Return to the [Summary Table](#).

Interrupt enable for pins [0:1] GIO[7:0].

**Table 17-8. GIOENACLR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	GIOENACLR_3	R/W	0h	Interrupt enable for pins GIOD [7:0]
23-16	GIOENACLR_2	R/W	0h	Interrupt enable for pins GIOC [7:0]
15-8	GIOENACLR_1	R/W	0h	Interrupt enable for pins GIOB [7:0]
7-0	GIOENACLR_0	R/W	0h	Interrupt enable for pins GIOA [7:0]

### 17.5.7 GIORLVLSET Register (Offset = 18h) [Reset = 00000000h]

GIORLVLSET is shown in [Table 17-9](#).

Return to the [Summary Table](#).

GPIO high priority interrupt for pins [0:1] GPIO[7:0].

**Table 17-9. GIORLVLSET Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	GIORLVLSET_3	R/W	0h	GPIO high priority interrupt for pins GIOD [7:0]
23-16	GIORLVLSET_2	R/W	0h	GPIO high priority interrupt for pins GIOC [7:0]
15-8	GIORLVLSET_1	R/W	0h	GPIO high priority interrupt for pins GIOB [7:0]
7-0	GIORLVLSET_0	R/W	0h	GPIO high priority interrupt for pins GIOA [7:0]

### 17.5.8 GIORLCLR Register (Offset = 1Ch) [Reset = 00000000h]

GIORLCLR is shown in [Table 17-10](#).

Return to the [Summary Table](#).

GPIO low priority interrupt for pins [0:1] GPIO[7:0].

**Table 17-10. GIORLCLR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	GIORLCLR_3	R/W	0h	GPIO low priority interrupt for pins GIOD [7:0]
23-16	GIORLCLR_2	R/W	0h	GPIO low priority interrupt for pins GIOC [7:0]
15-8	GIORLCLR_1	R/W	0h	GPIO low priority interrupt for pins GIOB [7:0]
7-0	GIORLCLR_0	R/W	0h	GPIO low priority interrupt for pins GIOA [7:0]

### 17.5.9 GIOFLG Register (Offset = 20h) [Reset = 00000000h]

GIOFLG is shown in [Table 17-11](#).

Return to the [Summary Table](#).

GIO flag for pins [0:1] GIO[7:0].

**Table 17-11. GIOFLG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	GIOFLG_3	R/W	0h	GIO flag for pins GIOD [7:0]
23-16	GIOFLG_2	R/W	0h	GIO flag for pins GIOC [7:0]
15-8	GIOFLG_1	R/W	0h	GIO flag for pins GIOB [7:0]
7-0	GIOFLG_0	R/W	0h	GIO flag for pins GIOA [7:0]

### 17.5.10 GIOFFA Register (Offset = 24h) [Reset = 00000000h]

GIOFFA is shown in [Table 17-12](#).

Return to the [Summary Table](#).

Index bits for currently pending high-priority interrupt Register A

**Table 17-12. GIOFFA Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-6	NU1	R/W	0h	Reserved
5-0	GIOFFA	R/W	0h	Index bits for currently pending high-priority interrupt Register A

### 17.5.11 GIOFFB Register (Offset = 28h) [Reset = 00000000h]

GIOFFB is shown in [Table 17-13](#).

Return to the [Summary Table](#).

Index bits for currently pending high-priority interrupt Register B

**Table 17-13. GIOFFB Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-6	NU2	R/W	0h	Reserved
5-0	GIOFFB	R/W	0h	Index bits for currently pending high-priority interrupt Register B

### 17.5.12 GIOEMUA Register (Offset = 2Ch) [Reset = 00000000h]

GIOEMUA is shown in [Table 17-14](#).

Return to the [Summary Table](#).

GIO emulation register A

**Table 17-14. GIOEMUA Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-6	NU3	R/W	0h	Reserved
5-0	GIOEMUA	R/W	0h	GIO emulation register A

### 17.5.13 GIOEMUB Register (Offset = 30h) [Reset = 00000000h]

GIOEMUB is shown in [Table 17-15](#).

Return to the [Summary Table](#).

GIO emulation register B

**Table 17-15. GIOEMUB Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-6	NU4	R/W	0h	Reserved
5-0	GIOEMUB	R/W	0h	GIO emulation register B

### 17.5.14 GIODIRA Register (Offset = 34h) [Reset = 00000000h]

GIODIRA is shown in [Table 17-16](#).

Return to the [Summary Table](#).

GPIO data direction of pins in Port A

**Table 17-16. GIODIRA Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU5	R/W	0h	Reserved
7-0	GIODIRA	R/W	0h	GPIO data direction of pins in Port A

### 17.5.15 GIODINA Register (Offset = 38h) [Reset = 00000000h]

GIODINA is shown in [Table 17-17](#).

Return to the [Summary Table](#).

GIO data input for pins in port A

**Table 17-17. GIODINA Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU11	R/W	0h	Reserved
7-0	GIODINA	R/W	0h	GIO data input for pins in port A

### 17.5.16 GIODOUTA Register (Offset = 3Ch) [Reset = 00000000h]

GIODOUTA is shown in [Table 17-18](#).

Return to the [Summary Table](#).

GPIO data output for pins in port A

**Table 17-18. GIODOUTA Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU17	R/W	0h	Reserved
7-0	GIODOUTA	R/W	0h	GPIO data output for pins in port A

### 17.5.17 GIOSETA Register (Offset = 40h) [Reset = 00000000h]

GIOSETA is shown in [Table 17-19](#).

Return to the [Summary Table](#).

GIO data set for port A

**Table 17-19. GIOSETA Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU23	R/W	0h	Reserved
7-0	GIODSETA	R/W	0h	GIO data set for port A

### 17.5.18 GIOCLRA Register (Offset = 44h) [Reset = 00000000h]

GIOCLRA is shown in [Table 17-20](#).

Return to the [Summary Table](#).

GIO data clear for port A

**Table 17-20. GIOCLRA Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU29	R/W	0h	Reserved
7-0	GIODCLRA	R/W	0h	GIO data clear for port A

### 17.5.19 GIOPDRA Register (Offset = 48h) [Reset = 00000000h]

GIOPDRA is shown in [Table 17-21](#).

Return to the [Summary Table](#).

GPIO open drain for port A

**Table 17-21. GIOPDRA Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU35	R/W	0h	Reserved
7-0	GIOPDRA	R/W	0h	GPIO open drain for port A

### 17.5.20 GIOPULDISA Register (Offset = 4Ch) [Reset = 00000000h]

GIOPULDISA is shown in [Table 17-22](#).

Return to the [Summary Table](#).

GPIO pull disable for port A

**Table 17-22. GIOPULDISA Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU	R/W	0h	Reserved
7-0	GIOPULDISA	R/W	0h	GPIO pull disable for port A

### 17.5.21 GIOPSLA Register (Offset = 50h) [Reset = 00000000h]

GIOPSLA is shown in [Table 17-23](#).

Return to the [Summary Table](#).

GIO pul select for port A

**Table 17-23. GIOPSLA Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU35	R/W	0h	Reserved
7-0	GIOPSLA	R/W	0h	GIO pull select for port A

### 17.5.22 GIODIRB Register (Offset = 54h) [Reset = 00000000h]

GIODIRB is shown in [Table 17-24](#).

Return to the [Summary Table](#).

GPIO data direction of pins in Port B

**Table 17-24. GIODIRB Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU6	R/W	0h	Reserved
7-0	GIODIRB	R/W	0h	GPIO data direction of pins in Port B

### 17.5.23 GIODINB Register (Offset = 58h) [Reset = 00000000h]

GIODINB is shown in [Table 17-25](#).

Return to the [Summary Table](#).

GPIO data input for pins in port B

**Table 17-25. GIODINB Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU12	R/W	0h	Reserved
7-0	GIODINB	R/W	0h	GPIO data input for pins in port B

### 17.5.24 GIODOUTB Register (Offset = 5Ch) [Reset = 00000000h]

GIODOUTB is shown in [Table 17-26](#).

Return to the [Summary Table](#).

GPIO data output for pins in port B

**Table 17-26. GIODOUTB Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU18	R/W	0h	Reserved
7-0	GIODOUTB	R/W	0h	GPIO data output for pins in port B

### 17.5.25 GIOSETB Register (Offset = 60h) [Reset = 00000000h]

GIOSETB is shown in [Table 17-27](#).

Return to the [Summary Table](#).

GIO data set for port B

**Table 17-27. GIOSETB Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU24	R/W	0h	Reserved
7-0	GIOSETB	R/W	0h	GIO data set for port B

### 17.5.26 GIOCLRB Register (Offset = 64h) [Reset = 00000000h]

GIOCLRB is shown in [Table 17-28](#).

Return to the [Summary Table](#).

GIO data clear for port B

**Table 17-28. GIOCLRB Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU30	R/W	0h	Reserved
7-0	GIODCLRB	R/W	0h	GIO data clear for port B

### 17.5.27 GIOPDRB Register (Offset = 68h) [Reset = 00000000h]

GIOPDRB is shown in [Table 17-29](#).

Return to the [Summary Table](#).

GPIO open drain for port B

**Table 17-29. GIOPDRB Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU36	R/W	0h	Reserved
7-0	GIOPDRB	R/W	0h	GPIO open drain for port B

### 17.5.28 GIOPULDISB Register (Offset = 6Ch) [Reset = 00000000h]

GIOPULDISB is shown in [Table 17-30](#).

Return to the [Summary Table](#).

GPIO pull disable for port B

**Table 17-30. GIOPULDISB Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU36	R/W	0h	Reserved
7-0	GIOPULDISB	R/W	0h	GPIO pull disable for port B

### 17.5.29 GIOPSLB Register (Offset = 70h) [Reset = 00000000h]

GIOPSLB is shown in [Table 17-31](#).

Return to the [Summary Table](#).

GPIO pul select for port B

**Table 17-31. GIOPSLB Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU36	R/W	0h	Reserved
7-0	GIOPSLB	R/W	0h	GPIO pull select for port B

### 17.5.30 GIODIRC Register (Offset = 74h) [Reset = 00000000h]

GIODIRC is shown in [Table 17-32](#).

Return to the [Summary Table](#).

GPIO data direction of pins in Port C

**Table 17-32. GIODIRC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU7	R/W	0h	Reserved
7-0	GIODIRC	R/W	0h	GPIO data direction of pins in Port C

### 17.5.31 GIODINC Register (Offset = 78h) [Reset = 00000000h]

GIODINC is shown in [Table 17-33](#).

Return to the [Summary Table](#).

GPIO data input for pins in port C

**Table 17-33. GIODINC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU13	R/W	0h	Reserved
7-0	GIODINC	R/W	0h	GPIO data input for pins in port C

### 17.5.32 GIODOUTC Register (Offset = 7Ch) [Reset = 00000000h]

GIODOUTC is shown in [Table 17-34](#).

Return to the [Summary Table](#).

GPIO data output for pins in port C

**Table 17-34. GIODOUTC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU19	R/W	0h	Reserved
7-0	GIODOUTC	R/W	0h	GPIO data output for pins in port C

### 17.5.33 GIOSETC Register (Offset = 80h) [Reset = 00000000h]

GIOSETC is shown in [Table 17-35](#).

Return to the [Summary Table](#).

GIO data set for port C

**Table 17-35. GIOSETC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU25	R/W	0h	Reserved
7-0	GIOSETC	R/W	0h	GIO data set for port C

### 17.5.34 GIOCLRC Register (Offset = 84h) [Reset = 00000000h]

GIOCLRC is shown in [Table 17-36](#).

Return to the [Summary Table](#).

GIO data clear for port C

**Table 17-36. GIOCLRC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU31	R/W	0h	Reserved
7-0	GIODCLRC	R/W	0h	GIO data clear for port C

### 17.5.35 GIOPDRC Register (Offset = 88h) [Reset = 00000000h]

GIOPDRC is shown in [Table 17-37](#).

Return to the [Summary Table](#).

GPIO open drain for port C

**Table 17-37. GIOPDRC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU37	R/W	0h	Reserved
7-0	GIOPDRC	R/W	0h	GPIO open drain for port C

### 17.5.36 GIOPULDISC Register (Offset = 8Ch) [Reset = 00000000h]

GIOPULDISC is shown in [Table 17-38](#).

Return to the [Summary Table](#).

GPIO pul disable for port C

**Table 17-38. GIOPULDISC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU37	R/W	0h	Reserved
7-0	GIOPULDISC	R/W	0h	GPIO pull disable for port C

### 17.5.37 GIOPSLC Register (Offset = 90h) [Reset = 00000000h]

GIOPSLC is shown in [Table 17-39](#).

Return to the [Summary Table](#).

GPIO pul select for port C

**Table 17-39. GIOPSLC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU37	R/W	0h	Reserved
7-0	GIOPSLC	R/W	0h	GPIO pull select for port C

### 17.5.38 GIODIRD Register (Offset = 94h) [Reset = 00000000h]

GIODIRD is shown in [Table 17-40](#).

Return to the [Summary Table](#).

GPIO data direction of pins in Port D

**Table 17-40. GIODIRD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU8	R/W	0h	Reserved
7-0	GIODIRD	R/W	0h	GPIO data direction of pins in Port D

### 17.5.39 GIODIND Register (Offset = 98h) [Reset = 00000000h]

GIODIND is shown in [Table 17-41](#).

Return to the [Summary Table](#).

GPIO data input for pins in port D

**Table 17-41. GIODIND Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU14	R/W	0h	Reserved
7-0	GIODIND	R/W	0h	GPIO data input for pins in port D

### 17.5.40 GIODOUTD Register (Offset = 9Ch) [Reset = 00000000h]

GIODOUTD is shown in [Table 17-42](#).

Return to the [Summary Table](#).

GPIO data output for pins in port D

**Table 17-42. GIODOUTD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU20	R/W	0h	Reserved
7-0	GIODOUTD	R/W	0h	GPIO data output for pins in port D

### 17.5.41 GIOSETD Register (Offset = A0h) [Reset = 00000000h]

GIOSETD is shown in [Table 17-43](#).

Return to the [Summary Table](#).

GIO data set for port D

**Table 17-43. GIOSETD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU26	R/W	0h	Reserved
7-0	GIOSETD	R/W	0h	GIO data set for port D

### 17.5.42 GIOCLRDR Register (Offset = A4h) [Reset = 00000000h]

GIOCLRDR is shown in [Table 17-44](#).

Return to the [Summary Table](#).

GIO data clear for port D

**Table 17-44. GIOCLRDR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU32	R/W	0h	Reserved
7-0	GIOCLRDR	R/W	0h	GIO data clear for port D

### 17.5.43 GIOPDRD Register (Offset = A8h) [Reset = 00000000h]

GIOPDRD is shown in [Table 17-45](#).

Return to the [Summary Table](#).

GPIO open drain for port D

**Table 17-45. GIOPDRD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU38	R/W	0h	Reserved
7-0	GIOPDRD	R/W	0h	GPIO open drain for port D

### 17.5.44 GIOPULDISD Register (Offset = ACh) [Reset = 00000000h]

GIOPULDISD is shown in [Table 17-46](#).

Return to the [Summary Table](#).

GPIO pull disable for port D

**Table 17-46. GIOPULDISD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU38	R/W	0h	Reserved
7-0	GIOPULDISD	R/W	0h	GPIO pull disable for port D

### 17.5.45 GIOPSLD Register (Offset = B0h) [Reset = 00000000h]

GIOPSLD is shown in [Table 17-47](#).

Return to the [Summary Table](#).

GPIO pul select for port D

**Table 17-47. GIOPSLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU38	R/W	0h	Reserved
7-0	GIOPSLD	R/W	0h	GPIO pull select for port D

### 17.5.46 GIODIRE Register (Offset = B4h) [Reset = 00000000h]

GIODIRE is shown in [Table 17-48](#).

Return to the [Summary Table](#).

GPIO data direction of pins in Port E

**Table 17-48. GIODIRE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU9	R/W	0h	Reserved
7-0	GIODIRE	R/W	0h	GPIO data direction of pins in Port E

### 17.5.47 GIODINE Register (Offset = B8h) [Reset = 00000000h]

GIODINE is shown in [Table 17-49](#).

Return to the [Summary Table](#).

GPIO data input for pins in port E

**Table 17-49. GIODINE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU15	R/W	0h	Reserved
7-0	GIODINE	R/W	0h	GPIO data input for pins in port E

### 17.5.48 GIODOUTE Register (Offset = BCh) [Reset = 00000000h]

GIODOUTE is shown in [Table 17-50](#).

Return to the [Summary Table](#).

GPIO data output for pins in port E

**Table 17-50. GIODOUTE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU21	R/W	0h	Reserved
7-0	GIODOUTE	R/W	0h	GPIO data output for pins in port E

### 17.5.49 GIOSETTE Register (Offset = C0h) [Reset = 00000000h]

GIOSETTE is shown in [Table 17-51](#).

Return to the [Summary Table](#).

GIO data set for port E

**Table 17-51. GIOSETTE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU27	R/W	0h	Reserved
7-0	GIOSETTE	R/W	0h	GIO data set for port E

### 17.5.50 GIOCLRE Register (Offset = C4h) [Reset = 00000000h]

GIOCLRE is shown in [Table 17-52](#).

Return to the [Summary Table](#).

GIO data clear for port E

**Table 17-52. GIOCLRE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU33	R/W	0h	Reserved
7-0	GIODCLRE	R/W	0h	GIO data clear for port E

### 17.5.51 GIOPDRE Register (Offset = C8h) [Reset = 00000000h]

GIOPDRE is shown in [Table 17-53](#).

Return to the [Summary Table](#).

GPIO open drain for port E

**Table 17-53. GIOPDRE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU39	R/W	0h	Reserved
7-0	GIOPDRE	R/W	0h	GPIO open drain for port E

### 17.5.52 GIOPULDISIE Register (Offset = CCh) [Reset = 00000000h]

GIOPULDISIE is shown in [Table 17-54](#).

Return to the [Summary Table](#).

GPIO pul disable for port E

**Table 17-54. GIOPULDISIE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU39	R/W	0h	Reserved
7-0	GIOPULDISIE	R/W	0h	GPIO pull disable for port E

### 17.5.53 GIOSPLE Register (Offset = D0h) [Reset = 00000000h]

GIOPSLE is shown in [Table 17-55](#).

Return to the [Summary Table](#).

GPIO pul select for port E

**Table 17-55. GIOSPLE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU39	R/W	0h	Reserved
7-0	GIOPSLE	R/W	0h	GPIO pull select for port E

### 17.5.54 GIODIRF Register (Offset = D4h) [Reset = 00000000h]

GIODIRF is shown in [Table 17-56](#).

Return to the [Summary Table](#).

GPIO data direction of pins in Port F

**Table 17-56. GIODIRF Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU10	R/W	0h	Reserved
7-0	GIODIRF	R/W	0h	GPIO data direction of pins in Port F

### 17.5.55 GIODINF Register (Offset = D8h) [Reset = 00000000h]

GIODINF is shown in [Table 17-57](#).

Return to the [Summary Table](#).

GPIO data input for pins in Port F

**Table 17-57. GIODINF Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU16	R/W	0h	Reserved
7-0	GIODINF	R/W	0h	GPIO data input for pins in port F

### 17.5.56 GIODOUTF Register (Offset = DCh) [Reset = 00000000h]

GIODOUTF is shown in [Table 17-58](#).

Return to the [Summary Table](#).

GPIO data output for pins in Port F

**Table 17-58. GIODOUTF Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU22	R/W	0h	Reserved
7-0	GIODOUTF	R/W	0h	GPIO data output for pins in port F

### 17.5.57 GIOSETF Register (Offset = E0h) [Reset = 00000000h]

GIOSETF is shown in [Table 17-59](#).

Return to the [Summary Table](#).

GIO data set for Port F

**Table 17-59. GIOSETF Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU28	R/W	0h	Reserved
7-0	GIODSETF	R/W	0h	GIO data set for port F

### 17.5.58 GIOCLRFR Register (Offset = E4h) [Reset = 00000000h]

GIOCLRFR is shown in [Table 17-60](#).

Return to the [Summary Table](#).

GIO data clear for Port F

**Table 17-60. GIOCLRFR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU34	R/W	0h	Reserved
7-0	GIOCLRFR	R/W	0h	GIO data clear for port F

### 17.5.59 GIOPDRF Register (Offset = E8h) [Reset = 00000000h]

GIOPDRF is shown in [Table 17-61](#).

Return to the [Summary Table](#).

GPIO open drain for Port F

**Table 17-61. GIOPDRF Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU40	R/W	0h	Reserved
7-0	GIOPDRF	R/W	0h	GPIO open drain for port F

### 17.5.60 GIOPULDISF Register (Offset = ECh) [Reset = 00000000h]

GIOPULDISF is shown in [Table 17-62](#).

Return to the [Summary Table](#).

GPIO pull disable for port F

**Table 17-62. GIOPULDISF Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU40	R/W	0h	Reserved
7-0	GIOPULDISF	R/W	0h	GPIO pull disable for port F

### 17.5.61 GIOPSLF Register (Offset = F0h) [Reset = 00000000h]

GIOPSLF is shown in [Table 17-63](#).

Return to the [Summary Table](#).

GIO pul select for port F

**Table 17-63. GIOPSLF Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU40	R/W	0h	Reserved
7-0	GIOPSLF	R/W	0h	GIO pull select for port F

### 17.5.62 GIODIRG Register (Offset = F4h) [Reset = 00000000h]

GIODIRG is shown in [Table 17-64](#).

Return to the [Summary Table](#).

GPIO data direction of pins in Port G

**Table 17-64. GIODIRG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU9	R/W	0h	Reserved
7-0	GIODIRG	R/W	0h	GPIO data direction of pins in Port G

### 17.5.63 GIODING Register (Offset = F8h) [Reset = 00000000h]

GIODING is shown in [Table 17-65](#).

Return to the [Summary Table](#).

GPIO data input for pins in port G

**Table 17-65. GIODING Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU15	R/W	0h	Reserved
7-0	GIODING	R/W	0h	GPIO data input for pins in port G

### 17.5.64 GIODOUTG Register (Offset = FCh) [Reset = 00000000h]

GIODOUTG is shown in [Table 17-66](#).

Return to the [Summary Table](#).

GPIO data output for pins in port G

**Table 17-66. GIODOUTG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU21	R/W	0h	Reserved
7-0	GIODOUTG	R/W	0h	GPIO data output for pins in port G

### 17.5.65 GIOSETG Register (Offset = 100h) [Reset = 00000000h]

GIOSETG is shown in [Table 17-67](#).

Return to the [Summary Table](#).

GIO data set for port G

**Table 17-67. GIOSETG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU27	R/W	0h	Reserved
7-0	GIODSETG	R/W	0h	GIO data set for port G

### 17.5.66 GIOCLRG Register (Offset = 104h) [Reset = 00000000h]

GIOCLRG is shown in [Table 17-68](#).

Return to the [Summary Table](#).

GIO data clear for port G

**Table 17-68. GIOCLRG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU33	R/W	0h	Reserved
7-0	GIODCLRG	R/W	0h	GIO data clear for port G

### 17.5.67 GIOPDRG Register (Offset = 108h) [Reset = 00000000h]

GIOPDRG is shown in [Table 17-69](#).

Return to the [Summary Table](#).

GPIO open drain for port G

**Table 17-69. GIOPDRG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU39	R/W	0h	Reserved
7-0	GIOPDRG	R/W	0h	GPIO open drain for port G

### 17.5.68 GIOPULDISG Register (Offset = 10Ch) [Reset = 00000000h]

GIOPULDISG is shown in [Table 17-70](#).

Return to the [Summary Table](#).

GPIO pull disable for port G

**Table 17-70. GIOPULDISG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU39	R/W	0h	Reserved
7-0	GIOPULDISG	R/W	0h	GPIO pull disable for port G

### 17.5.69 GIOPSLG Register (Offset = 110h) [Reset = 00000000h]

GIOPSLG is shown in [Table 17-71](#).

Return to the [Summary Table](#).

GPIO pul select for port G

**Table 17-71. GIOPSLG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU39	R/W	0h	Reserved
7-0	GIOPSLG	R/W	0h	GPIO pull select for port G

### 17.5.70 GIODIRH Register (Offset = 114h) [Reset = 00000000h]

GIODIRH is shown in [Table 17-72](#).

Return to the [Summary Table](#).

GPIO data direction of pins in Port H

**Table 17-72. GIODIRH Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU10	R/W	0h	Reserved
7-0	GIODIRH	R/W	0h	GPIO data direction of pins in Port H

### 17.5.71 GIODINH Register (Offset = 118h) [Reset = 00000000h]

GIODINH is shown in [Table 17-73](#).

Return to the [Summary Table](#).

GPIO data input for pins in Port H

**Table 17-73. GIODINH Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU16	R/W	0h	Reserved
7-0	GIODINH	R/W	0h	GPIO data input for pins in port H

### 17.5.72 GIODOUTH Register (Offset = 11Ch) [Reset = 00000000h]

GIODOUTH is shown in [Table 17-74](#).

Return to the [Summary Table](#).

GPIO data output for pins in Port H

**Table 17-74. GIODOUTH Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU22	R/W	0h	Reserved
7-0	GIODOUTH	R/W	0h	GPIO data output for pins in port H

### 17.5.73 GIOSETH Register (Offset = 120h) [Reset = 00000000h]

GIOSETH is shown in [Table 17-75](#).

Return to the [Summary Table](#).

GIO data set for Port H

**Table 17-75. GIOSETH Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU28	R/W	0h	Reserved
7-0	GIOSETH	R/W	0h	GIO data set for port H

### 17.5.74 GIOCLRH Register (Offset = 124h) [Reset = 00000000h]

GIOCLRH is shown in [Table 17-76](#).

Return to the [Summary Table](#).

GIO data clear for Port H

**Table 17-76. GIOCLRH Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU34	R/W	0h	Reserved
7-0	GIODCLRH	R/W	0h	GIO data clear for port H

### 17.5.75 GIOPDRH Register (Offset = 128h) [Reset = 00000000h]

GIOPDRH is shown in [Table 17-77](#).

Return to the [Summary Table](#).

GPIO open drain for Port H

**Table 17-77. GIOPDRH Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU40	R/W	0h	Reserved
7-0	GIOPDRH	R/W	0h	GPIO open drain for port H

### 17.5.76 GIOPULDISH Register (Offset = 12Ch) [Reset = 00000000h]

GIOPULDISH is shown in [Table 17-78](#).

Return to the [Summary Table](#).

GPIO pull disable for port H

**Table 17-78. GIOPULDISH Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU40	R/W	0h	Reserved
7-0	GIOPULDISH	R/W	0h	GPIO pull disable for port H

### 17.5.77 GIOPSLH Register (Offset = 130h) [Reset = 00000000h]

GIOPSLH is shown in [Table 17-79](#).

Return to the [Summary Table](#).

GPIO pul select for port H

**Table 17-79. GIOPSLH Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU40	R/W	0h	Reserved
7-0	GIOPSLH	R/W	0h	GPIO pull select for port H

### 17.5.78 GIOSRCA Register (Offset = 134h) [Reset = 00000000h]

GIOSRCA is shown in [Table 17-80](#).

Return to the [Summary Table](#).

GPIO slew rate select for port A

**Table 17-80. GIOSRCA Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU35	R/W	0h	Reserved
7-0	GIOSRCA	R/W	0h	GPIO slew rate control for port A

### 17.5.79 GIOSRCB Register (Offset = 138h) [Reset = 00000000h]

GIOSRCB is shown in [Table 17-81](#).

Return to the [Summary Table](#).

GPIO slew rate select for port B

**Table 17-81. GIOSRCB Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU36	R/W	0h	Reserved
7-0	GIOSRCB	R/W	0h	GPIO slew rate control for port B

### 17.5.80 GIOSRCC Register (Offset = 13Ch) [Reset = 00000000h]

GIOSRCC is shown in [Table 17-82](#).

Return to the [Summary Table](#).

GPIO slew rate select for port C

**Table 17-82. GIOSRCC Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU37	R/W	0h	Reserved
7-0	GIOSRCC	R/W	0h	GPIO slew rate control for port C

### 17.5.81 GIOSRCD Register (Offset = 140h) [Reset = 00000000h]

GIOSRCD is shown in [Table 17-83](#).

Return to the [Summary Table](#).

GPIO slew rate select for port D

**Table 17-83. GIOSRCD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU38	R/W	0h	Reserved
7-0	GIOSRCD	R/W	0h	GPIO slew rate control for port D

### 17.5.82 GIOSRCE Register (Offset = 144h) [Reset = 00000000h]

GIOSRCE is shown in [Table 17-84](#).

Return to the [Summary Table](#).

GPIO slew rate select for port E

**Table 17-84. GIOSRCE Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU39	R/W	0h	Reserved
7-0	GIOSRCE	R/W	0h	GPIO slew rate control for port E

### 17.5.83 GIOSRCF Register (Offset = 148h) [Reset = 00000000h]

GIOSRCF is shown in [Table 17-85](#).

Return to the [Summary Table](#).

GPIO slew rate select for port F

**Table 17-85. GIOSRCF Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU40	R/W	0h	Reserved
7-0	GIOSRCF	R/W	0h	GPIO slew rate control for port F

### 17.5.84 GIOSRCG Register (Offset = 14Ch) [Reset = 00000000h]

GIOSRCG is shown in [Table 17-86](#).

Return to the [Summary Table](#).

GPIO slew rate select for port G

**Table 17-86. GIOSRCG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU39	R/W	0h	Reserved
7-0	GIOSRCG	R/W	0h	GPIO slew rate control for port G

### 17.5.85 GIOSRCH Register (Offset = 150h) [Reset = 00000000h]

GIOSRCH is shown in [Table 17-87](#).

Return to the [Summary Table](#).

GIO slew rate select for port H

**Table 17-87. GIOSRCH Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-8	NU40	R/W	0h	Reserved
7-0	GIOSRCH	R/W	0h	GIO slew rate control for port H

## 17.6 I/O Control Summary

The behavior of the output buffer and the pull control is summarized in [Table 17-88](#).

**Table 17-88. Output Buffer and Pull Control Behavior for GPIO Pins**

Module under Reset?	Pin Direction (GIODIR) <sup>(1) (2)</sup>	Open Drain Enable (GIOPDR) <sup>(1)</sup>	Pull Disable (GIOPULDIS) <sup>(1) (3)</sup>	Pull Select (GIOPSL) <sup>(1) (4)</sup>	Pull Control	Output Buffer <sup>(5)</sup>
Yes	X	X	X	X	Enabled	Disabled
No	0	X	0	0	Pull down	Disabled
No	0	X	0	1	Pull up	Disabled
No	0	X	1	0	Disabled	Disabled
No	0	X	1	1	Disabled	Disabled
No	1	0	X	X	Disabled	Enabled
No	1	1	X	X	Disabled	Enabled

(1) X = Don't care

(2) GIODIR = 0 for input; = 1 for output

(3) GIOPULDIS = 0 for enabling pull control; = 1 for disabling pull control

(4) GIOPSL = 0 for pull-down functionality; = 1 for pull-up functionality

(5) If open drain is enabled, output buffer will be disabled if a high level (1) is being output.

## Chapter 18

# Enhanced Pulse Width Modulator (ePWM) Module

---

The enhanced pulse width modulator (ePWM) peripheral is a key element in controlling many of the power electronic systems found in both commercial and industrial equipments. The features supported by the ePWM make it especially suitable for digital motor control.

<b>18.1 Introduction.....</b>	<b><a href="#">4695</a></b>
<b>18.2 ePWM Submodules.....</b>	<b><a href="#">4699</a></b>
<b>18.3 Application Examples.....</b>	<b><a href="#">4759</a></b>
<b>18.4 ePWM Module Control and Status Registers.....</b>	<b><a href="#">4774</a></b>

## 18.1 Introduction

An effective PWM peripheral must be able to generate complex pulse width waveforms with minimal CPU overhead or intervention. It needs to be highly programmable and very flexible while being easy to understand and use. The ePWM unit described here addresses these requirements by allocating all needed timing and control resources on a per PWM channel basis. Cross coupling or sharing of resources has been avoided; instead, the ePWM is built up from smaller single channel modules with separate resources that can operate together as required to form a system. This modular approach results in an orthogonal architecture and provides a more transparent view of the peripheral structure, helping users to understand its operation quickly.

In this document the letter x within a signal or module name is used to indicate a generic ePWM instance on a device. For example, output signals EPWMxA and EPWMxB refer to the output signals from the ePWMx instance. Thus, EPWM1A and EPWM1B belong to ePWM1 and likewise EPWM4A and EPWM4B belong to ePWM4.

### 18.1.1 Submodule Overview

The ePWM module represents one complete PWM channel composed of two PWM outputs: EPWMxA and EPWMxB. Multiple ePWM modules are instantiated within a device as shown in [Figure 18-1](#). Each ePWM instance is identical and is indicated by a numerical value starting with 1. For example, ePWM1 is the first instance and ePWM3 is the third instance in the system and ePWMx indicates any instance.

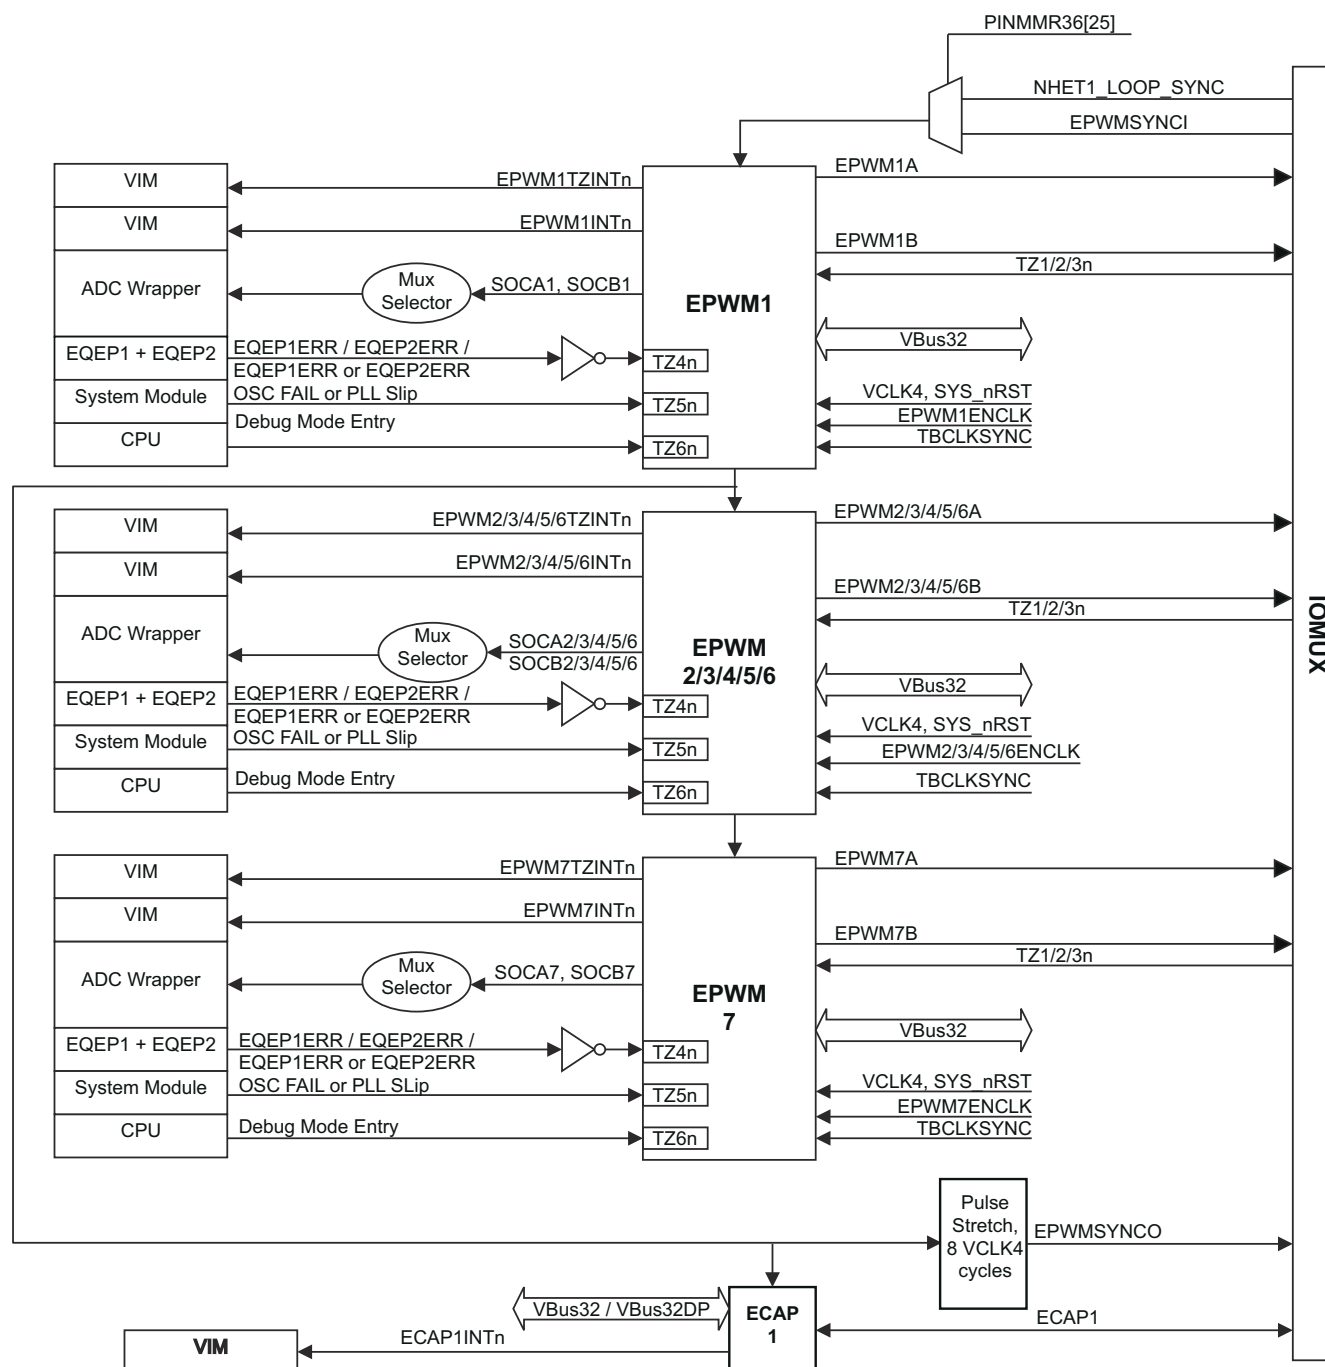

The ePWM modules are chained together via a clock synchronization scheme that allows them to operate as a single system when required. Additionally, this synchronization scheme can be extended to the capture peripheral modules (eCAP). Modules can also operate stand-alone.

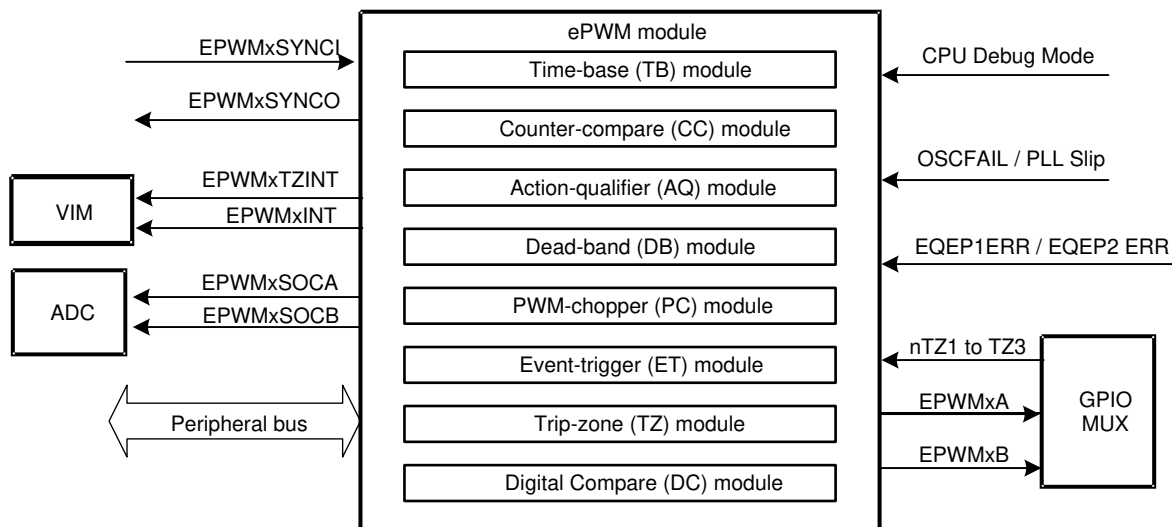

Each ePWM module supports the following features:

- Dedicated 16-bit time-base counter with period and frequency control
- Two PWM outputs (EPWMxA and EPWMxB) that can be used in the following configurations:
  - Two independent PWM outputs with single-edge operation
  - Two independent PWM outputs with dual-edge symmetric operation
  - One independent PWM output with dual-edge asymmetric operation
- Asynchronous override control of PWM signals through software.
- Programmable phase-control support for lag or lead operation relative to other ePWM modules.
- Hardware-locked (synchronized) phase relationship on a cycle-by-cycle basis.
- Dead-band generation with independent rising and falling edge delay control.
- Programmable trip zone allocation of both cycle-by-cycle trip and one-shot trip on fault conditions.
- A trip condition can force either high, low, or high-impedance state logic levels at PWM outputs.
- All events can trigger both CPU interrupts and ADC start of conversion (SOC)
- Programmable event prescaling minimizes CPU overhead on interrupts.
- PWM chopping by high-frequency carrier signal, useful for pulse transformer gate drives.

Each ePWM module is connected to the input/output signals shown in [Figure 18-1](#). The signals are described in detail in subsequent sections.

Each ePWM module consists of eight submodules and is connected within a system via the signals shown in [Figure 18-2](#).

**Figure 18-1. Multiple ePWM Modules**

**Figure 18-2. Submodules and Signal Connections for an ePWM Module**

The main signals used by the ePWM module are:

- **PWM output signals (EPWMxA and EPWMxB).**

The PWM output signals are made available external to the device through the Pinmux.

- **Trip-zone signals (TZ1 to TZ6).**

These input signals alert the ePWM module of fault conditions external to the ePWM module. Each ePWM module can be configured to either use or ignore any of the trip-zone signals. The TZ1 to TZ3 trip-zone signals can be configured as asynchronous inputs, or double-synchronized using VCLK4, or double-synchronized and filtered through a 6-VCLK4-cycle counter before connecting to the ePWM modules. This selection is done by configuring registers in the Pinmux. TZ4 is connected to an inverted eQEP1 error signal (EQEP1ERR), or to an inverted eQEP2 error signal (EQEP2ERR), or an OR-combination of EQEP1ERR and EQEP2ERR. This selection is also done via the Pinmux registers. TZ5 is connected to the system clock fail status. This is asserted whenever an oscillator failure is detected, or a PLL slip is detected. TZ6 is connected to the debug mode entry indicator output from the CPU. This allows you to configure a trip action when the CPU halts.

- **Time-base synchronization input (EPWMxSYNCl) and output (EPWMxSYNCO) signals.**

The synchronization signals daisy chain the ePWM modules together. Each module can be configured to either use or ignore its synchronization input. The clock synchronization input and output signal are brought out to pins only for ePWM1 (ePWM module #1). The synchronization output for ePWM1 (EPWM1SYNCO) is also connected to the SYNCl of the first enhanced capture module (eCAP1).

- **ADC start-of-conversion signals (EPWMxSOCA and EPWMxSOCB).**

Each ePWM module has two ADC start of conversion signals. Any ePWM module can trigger a start of conversion. Which event triggers the start of conversion is configured in the Event-Trigger submodule of the ePWM.

- **Peripheral Bus**

The peripheral bus is 32-bits wide and allows both 16-bit and 32-bit writes to the ePWM register file.

## 18.1.2 Register Mapping

The complete ePWM module control and status register set is grouped by submodule as shown in [Table 18-1](#). Each register set is duplicated for each instance of the ePWM module. The start address for each ePWM register file instance on a device is specified in the specific part's datasheet.

**Table 18-1. ePWM Module Control and Status Register Set Grouped by Submodule**

## 18.2 ePWM Submodules

Eight submodules are included in every ePWM peripheral. Each of these submodules performs specific tasks that can be configured by software.

### 18.2.1 Overview

[Table 18-2](#) lists the eight key submodules together with a list of their main configuration parameters. For example, if you need to adjust or control the duty cycle of a PWM waveform, then you should see the counter-compare submodule in [Section 18.2.3](#) for relevant details.

**Table 18-2. Submodule Configuration Parameters**

Submodule	Configuration Parameter or Option
Time-base (TB)	<ul style="list-style-type: none"> <li>Scale the time-base clock (TBCLK) relative to the system clock (VCLK4).</li> <li>Configure the PWM time-base counter (TBCTR) frequency or period.</li> <li>Set the mode for the time-base counter: <ul style="list-style-type: none"> <li>count-up mode: used for asymmetric PWM</li> <li>count-down mode: used for asymmetric PWM</li> <li>count-up-and-down mode: used for symmetric PWM</li> </ul> </li> <li>Configure the time-base phase relative to another ePWM module.</li> <li>Synchronize the time-base counter between modules through hardware or software.</li> <li>Configure the direction (up or down) of the time-base counter after a synchronization event.</li> <li>Configure how the time-base counter will behave when the device is halted by an emulator.</li> <li>Specify the source for the synchronization output of the ePWM module: <ul style="list-style-type: none"> <li>Synchronization input signal</li> <li>Time-base counter equal to zero</li> <li>Time-base counter equal to counter-compare B (CMPB)</li> <li>No output synchronization signal generated.</li> </ul> </li> </ul>
Counter-compare (CC)	<ul style="list-style-type: none"> <li>Specify the PWM duty cycle for output EPWMxA and/or output EPWMxB</li> <li>Specify the time at which switching events occur on the EPWMxA or EPWMxB output</li> </ul>

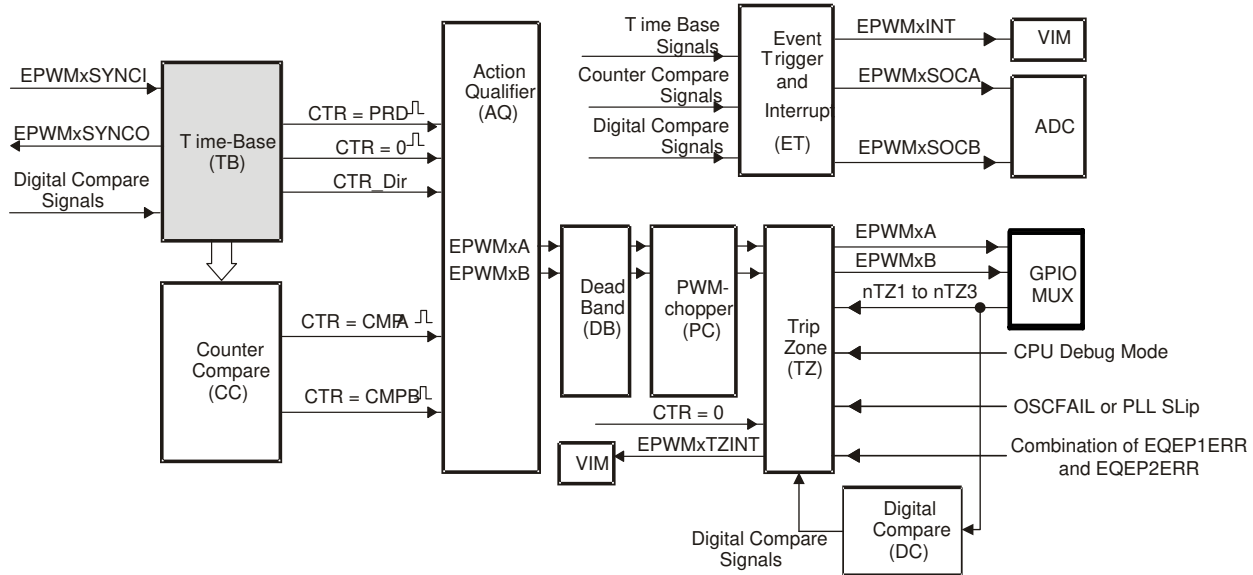

**Table 18-2. Submodule Configuration Parameters (continued)**

Submodule	Configuration Parameter or Option
Action-qualifier (AQ)	<ul style="list-style-type: none"> <li>Specify the type of action taken when a time-base or counter-compare submodule event occurs: <ul style="list-style-type: none"> <li>No action taken</li> <li>Output EPWMxA and/or EPWMxB switched high</li> <li>Output EPWMxA and/or EPWMxB switched low</li> <li>Output EPWMxA and/or EPWMxB toggled</li> </ul> </li> <li>Force the PWM output state through software control</li> <li>Configure and control the PWM dead-band through software</li> </ul>
Dead-band (DB)	<ul style="list-style-type: none"> <li>Control of traditional complementary dead-band relationship between upper and lower switches</li> <li>Specify the output rising-edge-delay value</li> <li>Specify the output falling-edge delay value</li> <li>Bypass the dead-band module entirely. In this case the PWM waveform is passed through without modification.</li> <li>Option to enable half-cycle clocking for double resolution.</li> </ul>
PWM-chopper (PC)	<ul style="list-style-type: none"> <li>Create a chopping (carrier) frequency.</li> <li>Pulse width of the first pulse in the chopped pulse train.</li> <li>Duty cycle of the second and subsequent pulses.</li> <li>Bypass the PWM-chopper module entirely. In this case the PWM waveform is passed through without modification.</li> </ul>
Trip-zone (TZ)	<ul style="list-style-type: none"> <li>Configure the ePWM module to react to one, all, or none of the trip-zone signals or digital compare events.</li> <li>Specify the tripping action taken when a fault occurs: <ul style="list-style-type: none"> <li>Force EPWMxA and/or EPWMxB high</li> <li>Force EPWMxA and/or EPWMxB low</li> <li>Force EPWMxA and/or EPWMxB to a high-impedance state</li> <li>Configure EPWMxA and/or EPWMxB to ignore any trip condition.</li> </ul> </li> <li>Configure how often the ePWM will react to each trip-zone signal: <ul style="list-style-type: none"> <li>One-shot</li> <li>Cycle-by-cycle</li> </ul> </li> <li>Enable the trip-zone to initiate an interrupt.</li> <li>Bypass the trip-zone module entirely.</li> </ul>
Event-trigger (ET)	<ul style="list-style-type: none"> <li>Enable the ePWM events that will trigger an interrupt.</li> <li>Enable ePWM events that will trigger an ADC start-of-conversion event.</li> <li>Specify the rate at which events cause triggers (every occurrence or every second or third occurrence)</li> <li>Poll, set, or clear event flags</li> </ul>
Digital-compare (DC)	<ul style="list-style-type: none"> <li>Enables trip zone signals to create events and filtered events</li> <li>Specify event-filtering options to capture TBCTR counter or generate blanking window</li> </ul>

Code examples are provided in the remainder of this document that show how to implement various ePWM module configurations. These examples use the constant definitions in the device *EPwm\_defines.h* file in the device-specific header file and peripheral examples software package.

### 18.2.2 Time-Base (TB) Submodule

Each ePWM module has its own time-base submodule that determines all of the event timing for the ePWM module. Built-in synchronization logic allows the time-base of multiple ePWM modules to work together as a single system. Figure 18-3 illustrates the time-base module's place within the ePWM.

**Figure 18-3. Time-Base Submodule Block Diagram**

#### 18.2.2.1 Purpose of the Time-Base Submodule

You can configure the time-base submodule for the following:

- Specify the ePWM time-base counter (TBCTR) frequency or period to control how often events occur.
- Manage time-base synchronization with other ePWM modules.
- Maintain a phase relationship with other ePWM modules.
- Set the time-base counter to count-up, count-down, or count-up-and-down mode.
- Generate the following events:
  - CTR = PRD: Time-base counter equal to the specified period (TBCTR = TBPRD) .
  - CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000).
- Configure the rate of the time-base clock; a prescaled version of the device peripheral clock domain (VCLK4). This allows the time-base counter to increment/decrement at a slower rate.

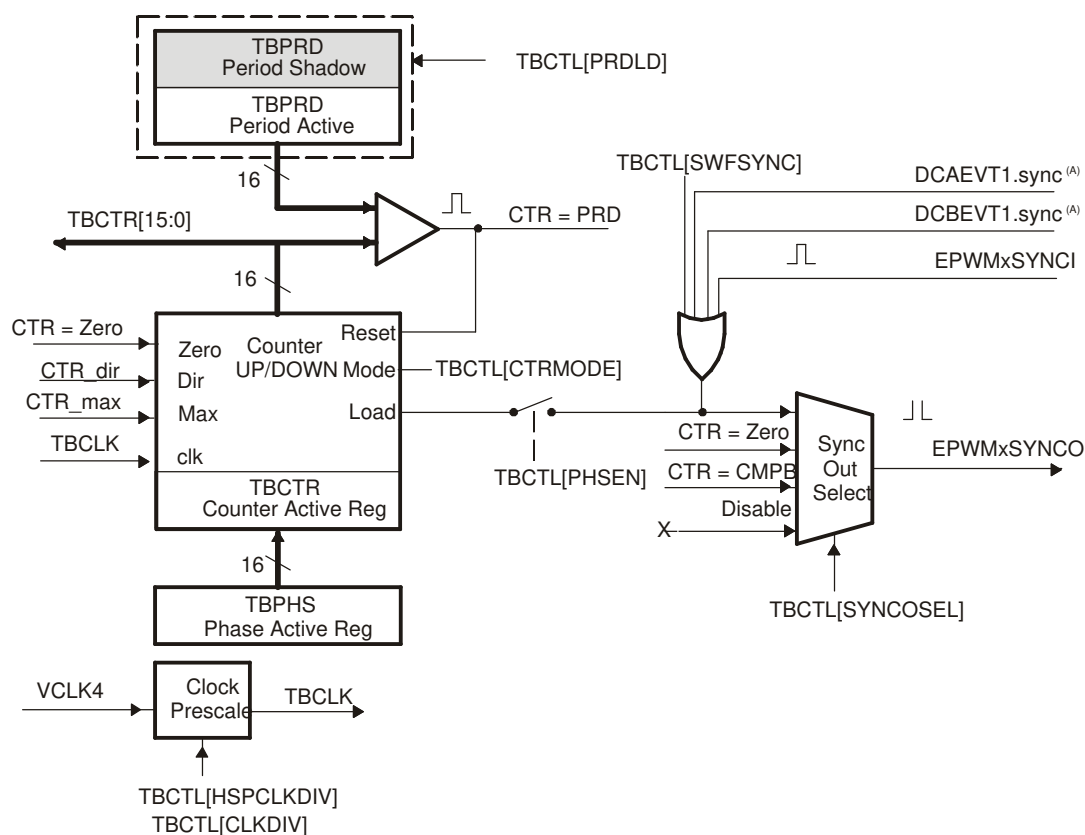

### 18.2.2.2 Controlling and Monitoring the Time-base Submodule

Table 18-3 shows the registers used to control and monitor the time-base submodule.

**Table 18-3. Time-Base Submodule Registers**

Register Name	Address Offset	Shadowed	Description
TBCTL	0x0002	No	Time-Base Control Register
TBSTS	0x0000	No	Time-Base Status Register
TBPHS	0x0004	No	Time-Base Phase Register
TBCTR	0x000A	No	Time-Base Counter Register
TBPRD	0x0008	Yes	Time-Base Period Register

The block diagram in Figure 18-4 shows the critical signals and registers of the time-base submodule. Table 18-4 provides descriptions of the key signals associated with the time-base submodule.

A. These signals are generated by the digital compare (DC) submodule.

**Figure 18-4. Time-Base Submodule Signals and Registers**

**Table 18-4. Key Time-Base Signals**

Signal	Description
EPWMxSYNCl	Time-base synchronization input.  Input pulse used to synchronize the time-base counter with the counter of ePWM module earlier in the synchronization chain. An ePWM peripheral can be configured to use or ignore this signal. For the first ePWM module (EPWM1), this signal comes from a device pin or from the N2HET1 module. For subsequent ePWM modules, this signal is passed from another ePWM peripheral. For example, EPWM2SYNCl is generated by the ePWM1 peripheral, EPWM3SYNCl is generated by ePWM2 and so forth. See <a href="#">Section 18.2.2.3.3</a> for information on the synchronization order of a particular device.
EPWMxSYNCO	Time-base synchronization output.  This output pulse is used to synchronize the counter of an ePWM module later in the synchronization chain. The ePWM module generates this signal from one of three event sources: <ol style="list-style-type: none"> <li>1. EPWMxSYNCl (Synchronization input pulse)</li> <li>2. CTR = Zero: The time-base counter equal to zero (TBCTR = 0x0000).</li> <li>3. CTR = CMPB: The time-base counter equal to the counter-compare B (TBCTR = CMPB) register.</li> </ol>
CTR = PRD	Time-base counter equal to the specified period.  This signal is generated whenever the counter value is equal to the active period register value. That is when TBCTR = TBPRD.
CTR = Zero	Time-base counter equal to zero  This signal is generated whenever the counter value is zero. That is when TBCTR equals 0x0000.
CTR = CMPB	Time-base counter equal to active counter-compare B register (TBCTR = CMPB).  This event is generated by the counter-compare submodule and used by the synchronization out logic
CTR_dir	Time-base counter direction.  Indicates the current direction of the ePWM's time-base counter. This signal is high when the counter is increasing and low when it is decreasing.
CTR_max	Time-base counter equal max value. (TBCTR = 0xFFFF)  Generated event when the TBCTR value reaches its maximum value. This signal is only used only as a status bit
TBCLK	Time-base clock.  This is a prescaled version of the system clock (VCLK4) and is used by all submodules within the ePWM. This clock determines the rate at which time-base counter increments or decrements.

### 18.2.2.3 Calculating PWM Period and Frequency

The frequency of PWM events is controlled by the time-base period (TBPRD) register and the mode of the time-base counter. [Figure 18-5](#) shows the period ( $T_{pwm}$ ) and frequency ( $F_{pwm}$ ) relationships for the up-count, down-count, and up-down-count time-base counter modes when the period is set to 4 (TBPRD = 4). The time increment for each step is defined by the time-base clock (TBCLK) which is a prescaled version of the system clock (VCLK4).

The time-base counter has three modes of operation selected by the time-base control register (TBCTL):

- **Up-Down-Count Mode:**

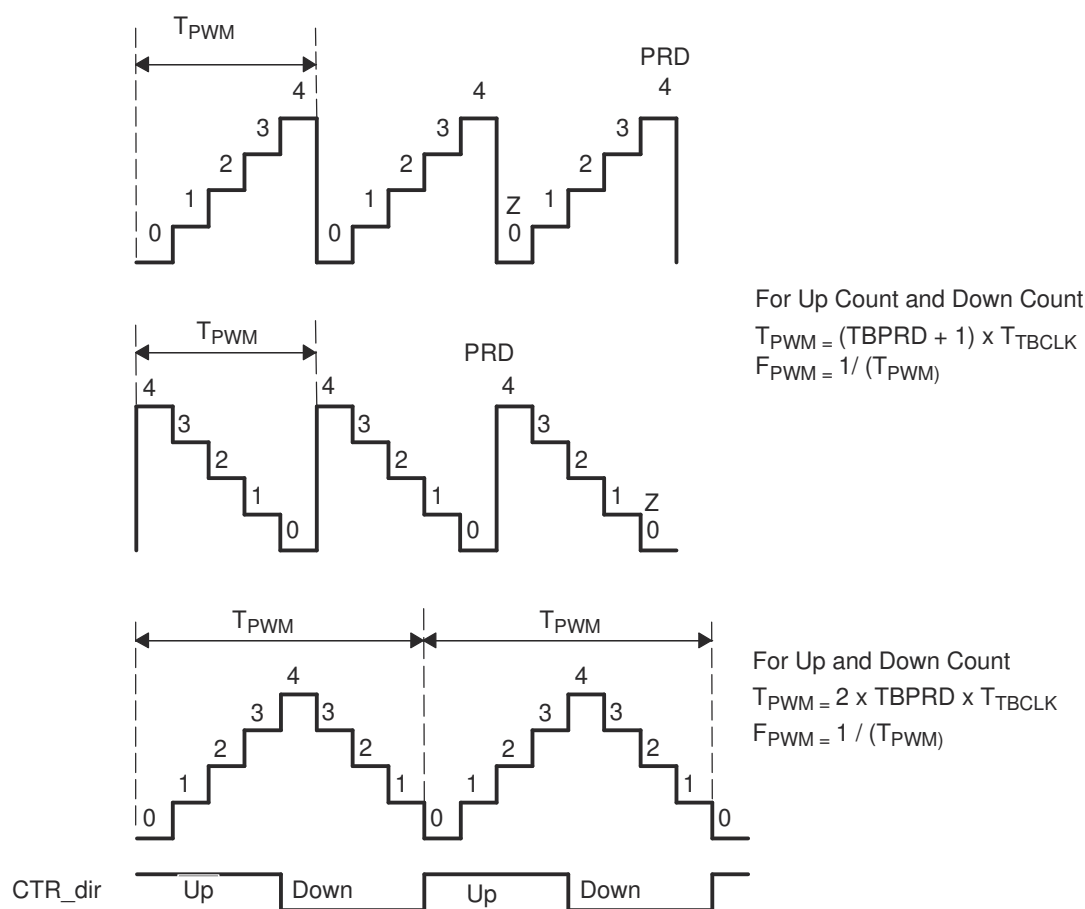

In up-down-count mode, the time-base counter starts from zero and increments until the period (TBPRD) value is reached. When the period value is reached, the time-base counter then decrements until it reaches zero. At this point the counter repeats the pattern and begins to increment.

- **Up-Count Mode:**

In this mode, the time-base counter starts from zero and increments until it reaches the value in the period register (TBPRD). When the period value is reached, the time-base counter resets to zero and begins to increment once again.

- **Down-Count Mode:**

In down-count mode, the time-base counter starts from the period (TBPRD) value and decrements until it reaches zero. When it reaches zero, the time-base counter is reset to the period value and it begins to decrement once again.

**Figure 18-5. Time-Base Frequency and Period**

#### 18.2.2.3.1 Time-Base Period Shadow Register

The time-base period register (TBPRD) has a shadow register. Shadowing allows the register update to be synchronized with the hardware. The following definitions are used to describe all shadow registers in the ePWM module:

- **Active Register**

The active register controls the hardware and is responsible for actions that the hardware causes or invokes.

- **Shadow Register**

The shadow register buffers or provides a temporary holding location for the active register. It has no direct effect on any control hardware. At a strategic point in time the shadow register's content is transferred to the active register. This prevents corruption or spurious operation due to the register being asynchronously modified by software.

The memory address of the shadow period register is the same as the active register. Which register is written to or read from is determined by the TBCTL[PRDL] bit. This bit enables and disables the TBPRD shadow register as follows:

- **Time-Base Period Shadow Mode:**

The TBPRD shadow register is enabled when TBCTL[PRDL] = 0. Reads from and writes to the TBPRD memory address go to the shadow register. The shadow register contents are transferred to the active register (TBPRD (Active) ← TBPRD (shadow)) when the time-base counter equals zero (TBCTR = 0x0000). By default the TBPRD shadow register is enabled.

- **Time-Base Period Immediate Load Mode:**

If immediate load mode is selected (TBCTL[PRDL] = 1), then a read from or a write to the TBPRD memory address goes directly to the active register.

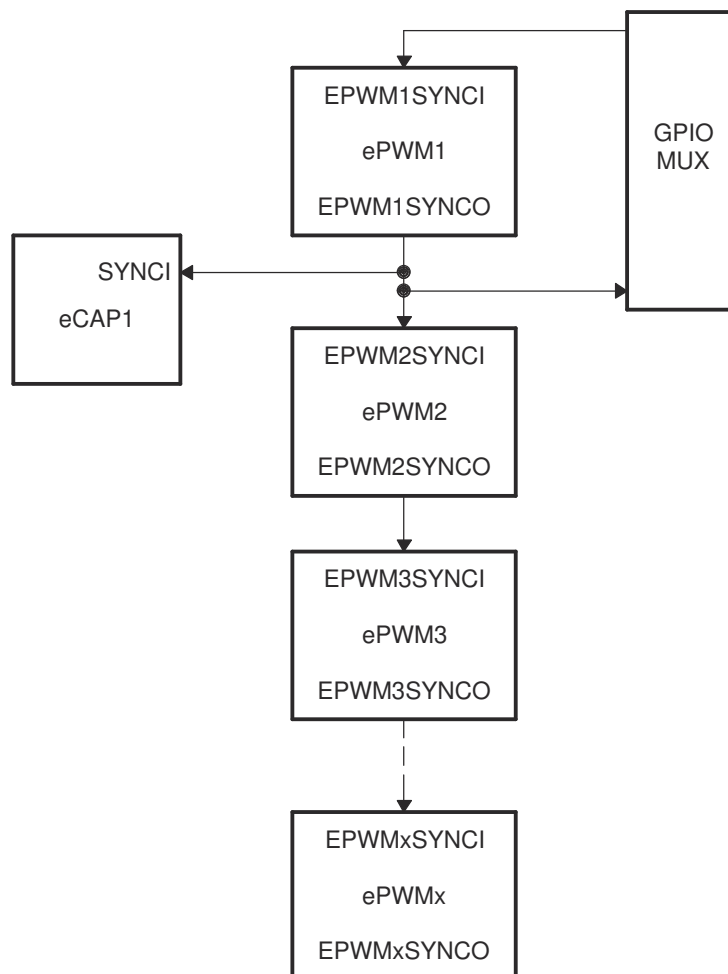

#### 18.2.2.3.2 Time-Base Clock Synchronization

Bit 1 of the device-level multiplexing control module (Pinmux) register PINMMR37 is defined as the TBCLKSYNC bit. The TBCLKSYNC bit allows users to globally synchronize all enabled ePWM modules to the time-base clock (TBCLK). When set, all enabled ePWM module clocks are started with the first rising edge of TBCLK aligned. For perfectly synchronized TBCLKs, the prescalers for each ePWM module must be set identically.

The proper procedure for enabling ePWM clocks is as follows:

1. Enable ePWM module clocks using the Pinmux control registers for each ePWM module instance
2. Set TBCLKSYNC = 0. This will stop the time-base clock within any enabled ePWM module.
3. Configure ePWM modules: prescaler values and ePWM modes.
4. Set TBCLKSYNC = 1.

A time-base synchronization scheme connects all of the ePWM modules on a device. Each ePWM module has a synchronization input (EPWMxSYNCl) and a synchronization output (EPWMxSYNCO). The input synchronization for the first instance (ePWM1) comes from an external pin. The synchronization connections for the remaining ePWM modules are shown in [Figure 18-6](#).

### Figure 18-6. Time-Base Counter Synchronization Scheme

Each ePWM module can be configured to use or ignore the synchronization input. If the TBCTL[PHSEN] bit is set, then the time-base counter (TBCTR) of the ePWM module will be automatically loaded with the phase register (TBPHS) contents when one of the following conditions occur:

- **EPWMxSYNCl: Synchronization Input Pulse:**

The value of the phase register is loaded into the counter register when an input synchronization pulse is detected (TBPHS → TBCTR). This operation occurs on the next valid time-base clock (TBCLK) edge.

The delay from internal controller module to target modules is given by:

- if ( TBCLK = VCLK4):  $2 \times VCLK4$
- if ( TBCLK != VCLK4): 1 TBCLK

- **Software Forced Synchronization Pulse:**

Writing a 1 to the TBCTL[SWFSYNC] control bit invokes a software forced synchronization. This pulse is ORed with the synchronization input signal, and therefore has the same effect as a pulse on EPWMxSYNCl.

- **Digital Compare Event Synchronization Pulse:**

DCAEVT1 and DCBEVT1 digital compare events can be configured to generate synchronization pulses which have the same affect as EPWMxSYNCl.

This feature enables the ePWM module to be automatically synchronized to the time base of another ePWM module. Lead or lag phase control can be added to the waveforms generated by different ePWM modules to synchronize them. In up-down-count mode, the TBCTL[PSHDIR] bit configures the direction of the time-base counter immediately after a synchronization event. The new direction is independent of the direction prior to the synchronization event. The PSHDIR bit is ignored in count-up or count-down modes. See [Figure 18-7](#) through [Figure 18-10](#) for examples.

Clearing the TBCTL[PHSEN] bit configures the ePWM to ignore the synchronization input pulse. The synchronization pulse can still be allowed to flow-through to the EPWMxSYNCO and be used to synchronize other ePWM modules. In this way, you can set up a controller time-base (for example, ePWM1) and downstream modules (ePWM2 - ePWMx) may elect to run in synchronization with the controller.

#### 18.2.2.4 Phase Locking the Time-Base Clocks of Multiple ePWM Modules

The TBCLKSYNC bit can be used to globally synchronize the time-base clocks of all enabled ePWM modules on a device. When TBCLKSYNC = 0, the time-base clock of all ePWM modules is stopped (default). When TBCLKSYNC = 1, all ePWM time-base clocks are started with the rising edge of TBCLK aligned. For perfectly synchronized TBCLKs, the prescaler bits in the TBCTL register of each ePWM module must be set identically. The proper procedure for enabling the ePWM clocks is as follows:

1. Enable ePWM module clocks using the IOMM control registers for each ePWM module instance
2. Set TBCLKSYNC = 0. This will stop the time-base clock within any enabled ePWM module.
3. Configure ePWM modules: prescaler values and ePWM modes.
4. Set TBCLKSYNC = 1.

### 18.2.2.5 Time-Base Counter Modes and Timing Waveforms

The time-base counter operates in one of four modes:

- Up-count mode which is asymmetrical.
- Down-count mode which is asymmetrical.
- Up-down-count which is symmetrical
- Frozen where the time-base counter is held constant at the current value

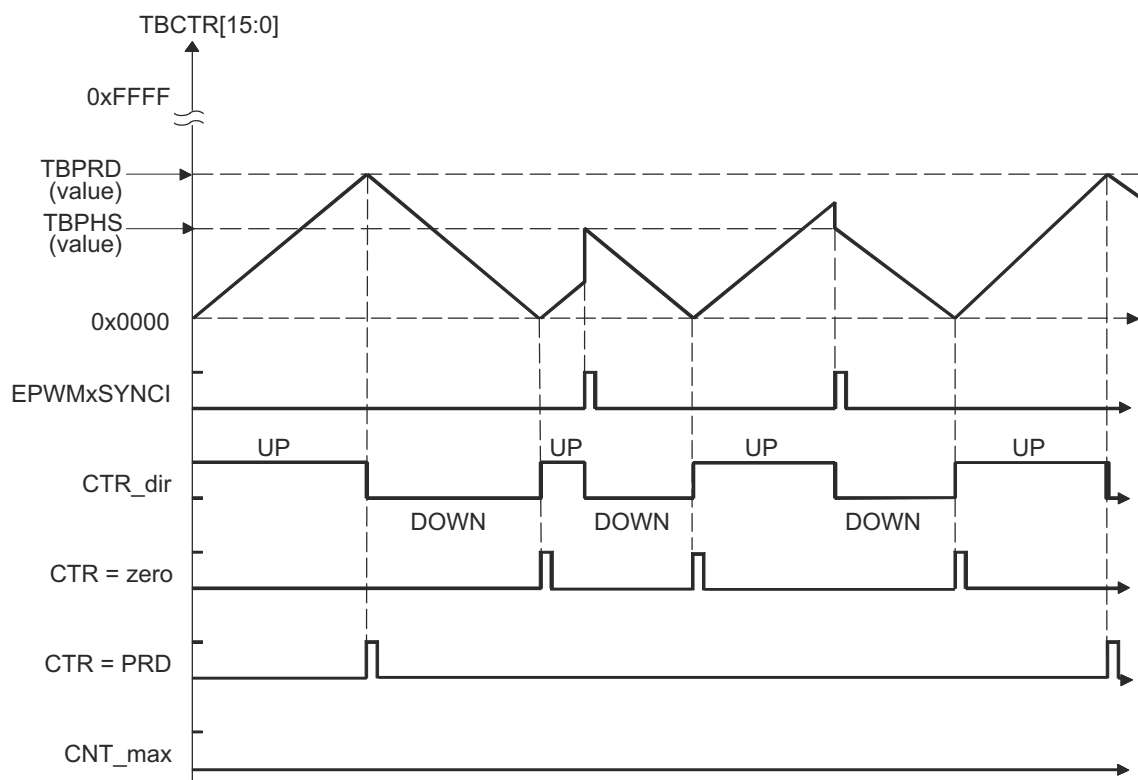

To illustrate the operation of the first three modes, the following timing diagrams show when events are generated and how the time-base responds to an EPWMxSYNCI signal.

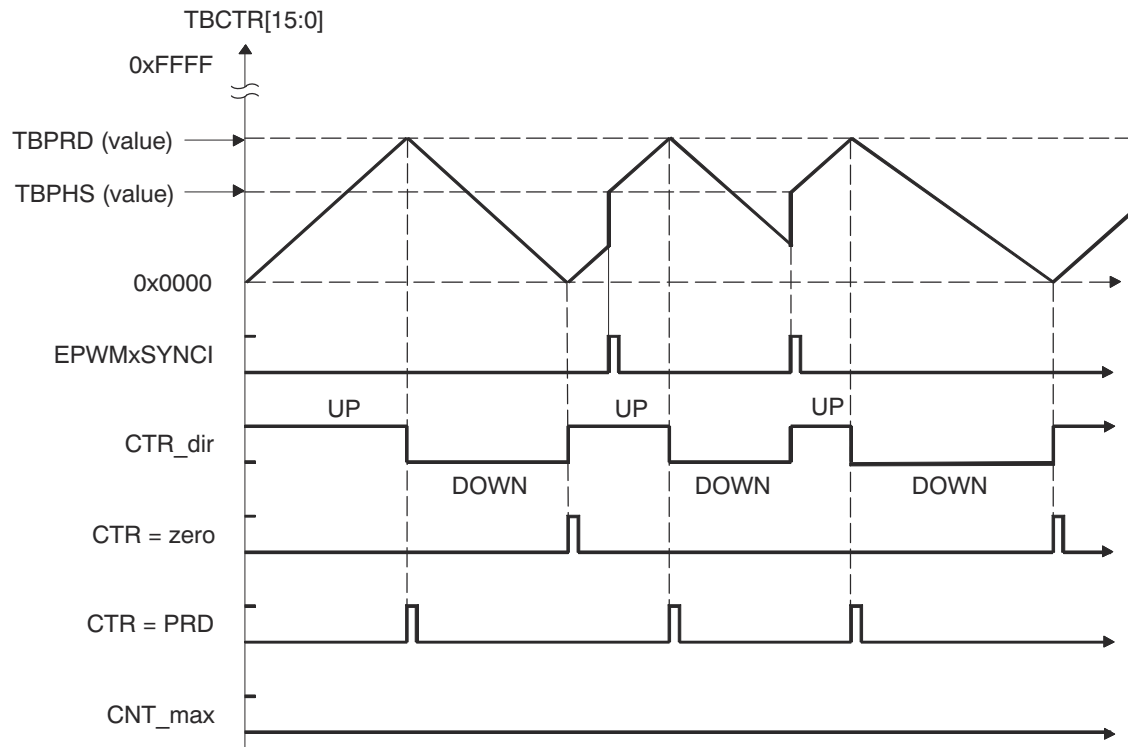

**Figure 18-7. Time-Base Up-Count Mode Waveforms**

**Figure 18-8. Time-Base Down-Count Mode Waveforms**

**Figure 18-9. Time-Base Up-Down-Count Waveforms, TBCTL[PHSDIR = 0] Count Down On Synchronization Event**

**Figure 18-10. Time-Base Up-Down Count Waveforms, TBCTL[PHSDIR = 1] Count Up On Synchronization Event**

### 18.2.3 Counter-Compare (CC) Submodule

Figure 18-11 illustrates the counter-compare submodule within the ePWM.

Figure 18-12 shows the basic structure of the counter-compare submodule.

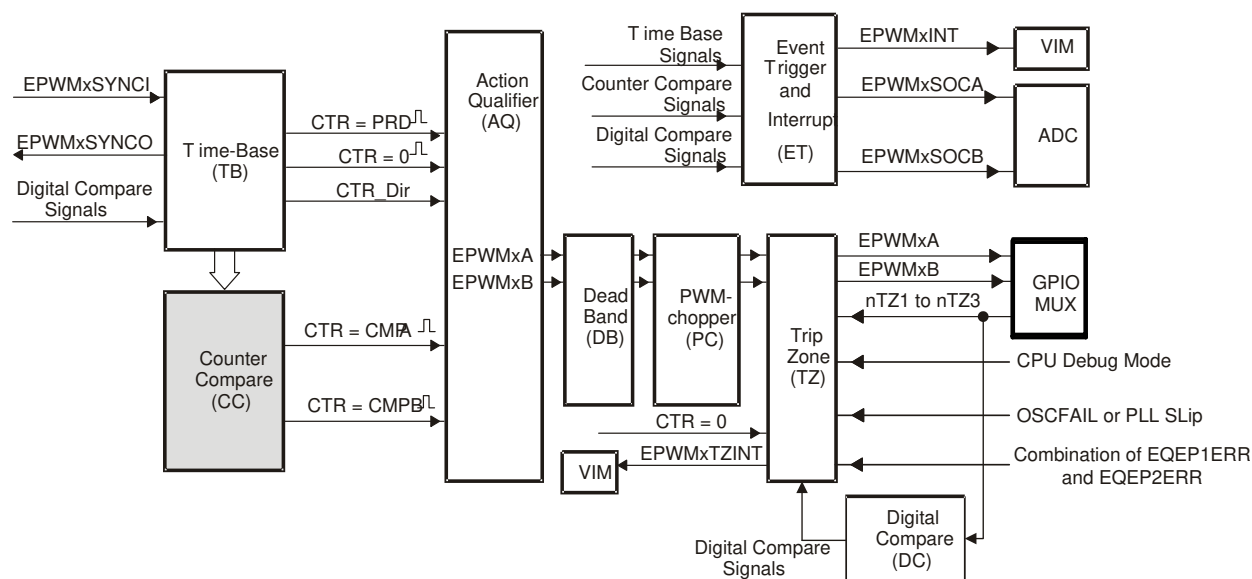

Figure 18-11. Counter-Compare Submodule

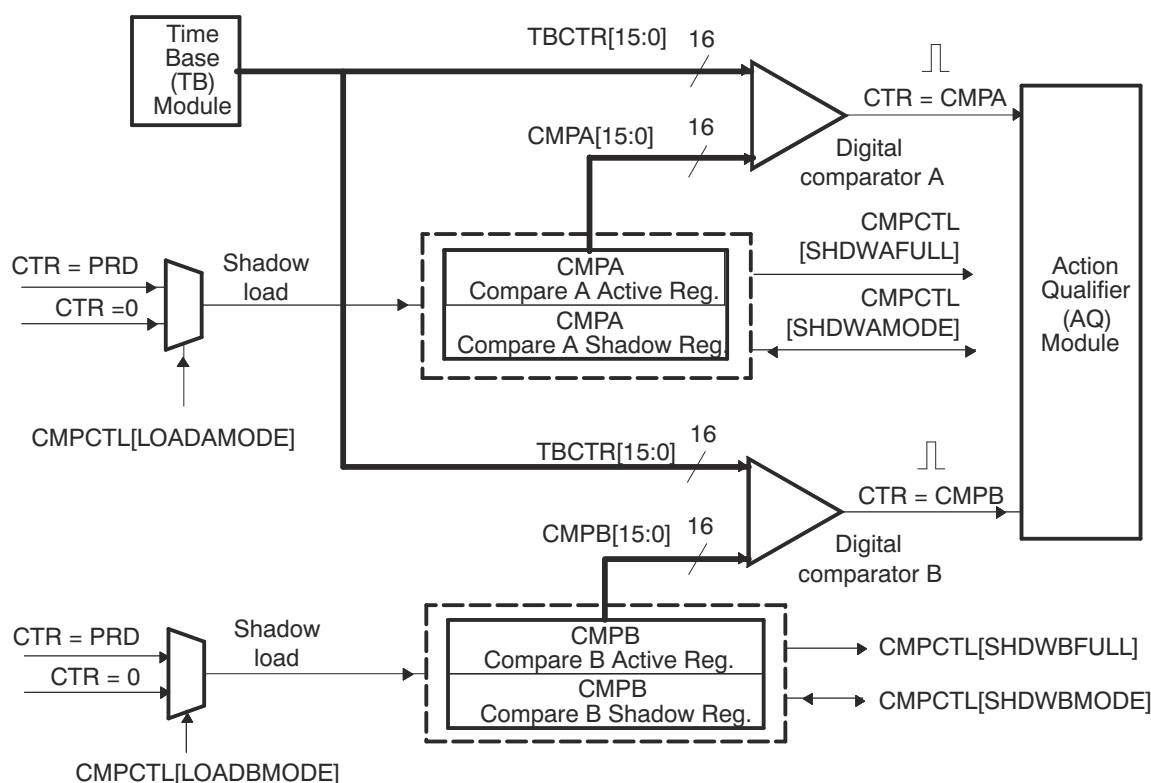

Figure 18-12. Detailed View of the Counter-Compare Submodule

### 18.2.3.1 Purpose of the Counter-Compare Submodule

The counter-compare submodule takes as input the time-base counter value. This value is continuously compared to the counter-compare A (CMPA) and counter-compare B (CMPB) registers. When the time-base counter is equal to one of the compare registers, the counter-compare unit generates an appropriate event.

The counter-compare:

- Generates events based on programmable time stamps using the CMPA and CMPB registers
  - CTR = CMPA: Time-base counter equals counter-compare A register (TBCTR = CMPA).
  - CTR = CMPB: Time-base counter equals counter-compare B register (TBCTR = CMPB)
- Controls the PWM duty cycle if the action-qualifier submodule is configured appropriately
- Shadows new compare values to prevent corruption or glitches during the active PWM cycle

### 18.2.3.2 Controlling and Monitoring the Counter-Compare Submodule

The counter-compare submodule operation is controlled and monitored by the registers shown in [Table 18-5](#):

**Table 18-5. Counter-Compare Submodule Registers**

Register Name	Address Offset	Shadowed	Description
CMPCTL	0x000C	No	Counter-Compare Control Register.
CMPA	0x0010	Yes	Counter-Compare A Register
CMPB	0x0016	Yes	Counter-Compare B Register

The key signals associated with the counter-compare submodule are described in [Table 18-6](#).

**Table 18-6. Counter-Compare Submodule Key Signals**

Signal	Description of Event	Registers Compared
CTR = CMPA	Time-base counter equal to the active counter-compare A value	TBCTR = CMPA
CTR = CMPB	Time-base counter equal to the active counter-compare B value	TBCTR = CMPB
CTR = PRD	Time-base counter equal to the active period. Used to load active counter-compare A and B registers from the shadow register	TBCTR = TBPRD
CTR = ZERO	Time-base counter equal to zero. Used to load active counter-compare A and B registers from the shadow register	TBCTR = 0x0000

### 18.2.3.3 Operational Highlights for the Counter-Compare Submodule

The counter-compare submodule is responsible for generating two independent compare events based on two compare registers:

1. CTR = CMPA: Time-base counter equal to counter-compare A register (TBCTR = CMPA).
2. CTR = CMPB: Time-base counter equal to counter-compare B register (TBCTR = CMPB).

For up-count or down-count mode, each event occurs only once per cycle. For up-down-count mode each event occurs twice per cycle if the compare value is between 0x0000-TBPRD and once per cycle if the compare value is equal to 0x0000 or equal to TBPRD. These events are fed into the action-qualifier submodule where they are qualified by the counter direction and converted into actions if enabled. Refer to [Section 18.2.4.1](#) for more details.

The counter-compare registers CMPA and CMPB each have an associated shadow register. Shadowing provides a way to keep updates to the registers synchronized with the hardware. When shadowing is used, updates to the active registers only occur at strategic points. This prevents corruption or spurious operation due to the register being asynchronously modified by software. The memory address of the active register and the shadow register is identical. Which register is written to or read from is determined by the CMPCTL[SHDWAMODE] and CMPCTL[SHDWBMODE] bits. These bits enable and disable the CMPA shadow register and CMPB shadow register respectively. The behavior of the two load modes is as described:

#### Shadow Mode:

The shadow mode for the CMPA is enabled by clearing the CMPCTL[SHDWAMODE] bit and the shadow register for CMPB is enabled by clearing the CMPCTL[SHDWBMODE] bit. Shadow mode is enabled by default for both CMPA and CMPB.

If the shadow register is enabled then the content of the shadow register is transferred to the active register on one of the following events as specified by the CMPCTL[LOADAMODE] and CMPCTL[LOADBMODE] register bits:

- CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD).
- CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000)
- Both CTR = PRD and CTR = Zero

Only the active register contents are used by the counter-compare submodule to generate events to be sent to the action-qualifier.

#### Immediate Load Mode:

If immediate load mode is selected (that is, TBCTL[SHADWAMODE] = 1 or TBCTL[SHADWBMODE] = 1), then a read from or a write to the register will go directly to the active register.

### 18.2.3.4 Count Mode Timing Waveforms

The counter-compare module can generate compare events in all three count modes:

- Up-count mode: used to generate an asymmetrical PWM waveform.
- Down-count mode: used to generate an asymmetrical PWM waveform.
- Up-down-count mode: used to generate a symmetrical PWM waveform.

To best illustrate the operation of the first three modes, the timing diagrams in [Figure 18-13](#) through [Figure 18-16](#) show when events are generated and how the EPWMxSYNCI signal interacts.

An EPWMxSYNCI external synchronization event can cause a discontinuity in the TBCTR count sequence. This can lead to a compare event being skipped. This skipping is considered normal operation and must be taken into account.

**Figure 18-13. Counter-Compare Event Waveforms in Up-Count Mode**

**Figure 18-14. Counter-Compare Events in Down-Count Mode**

**Figure 18-15. Counter-Compare Events In Up-Down-Count Mode, TBCTL[PHSDIR = 0] Count Down On Synchronization Event**

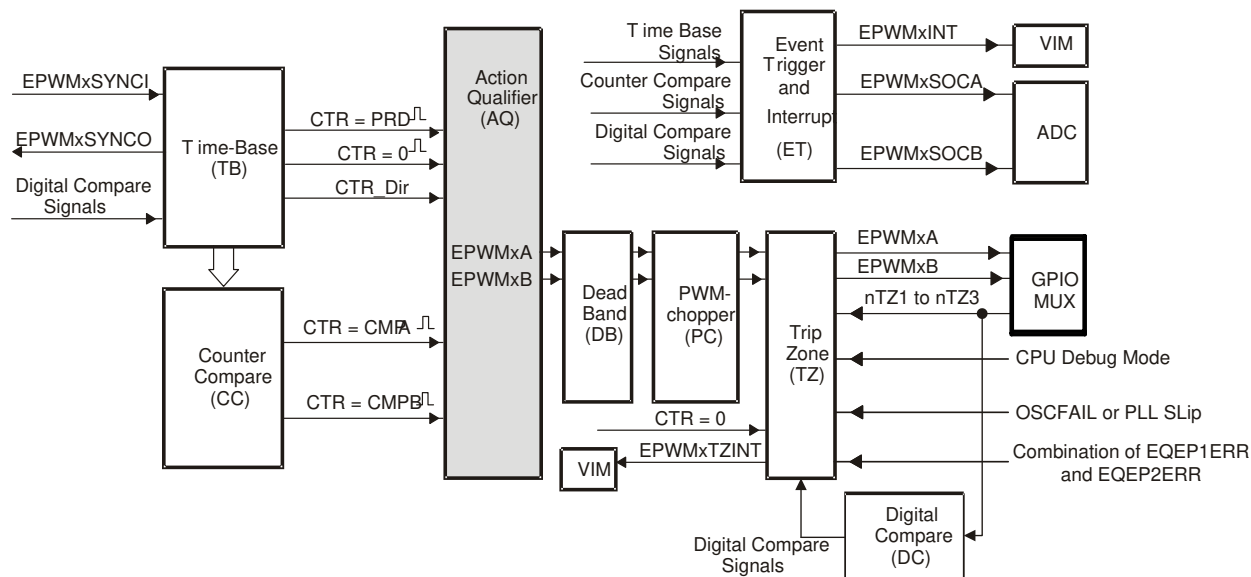

**Figure 18-16. Counter-Compare Events In Up-Down-Count Mode, TBCTL[PHSDIR = 1] Count Up On Synchronization Event**

### 18.2.4 Action-Qualifier (AQ) Submodule

Figure 18-17 shows the action-qualifier (AQ) submodule (see shaded block) in the ePWM system.

The action-qualifier submodule has the most important role in waveform construction and PWM generation. It decides which events are converted into various action types, thereby producing the required switched waveforms at

**Figure 18-17. Action-Qualifier Submodule**

#### 18.2.4.1 Purpose of the Action-Qualifier Submodule

The action-qualifier submodule is responsible for the following:

- Qualifying and generating actions (set, clear, toggle) based on the following events:
  - CTR = PRD: Time-base counter equal to the period (TBCTR = TBPRD)
  - CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000)
  - CTR = CMPA: Time-base counter equal to the counter-compare A register (TBCTR = CMPA)
  - CTR = CMPB: Time-base counter equal to the counter-compare B register (TBCTR = CMPB)
- Managing priority when these events occur concurrently
- Providing independent control of events when the time-base counter is increasing and when it is decreasing

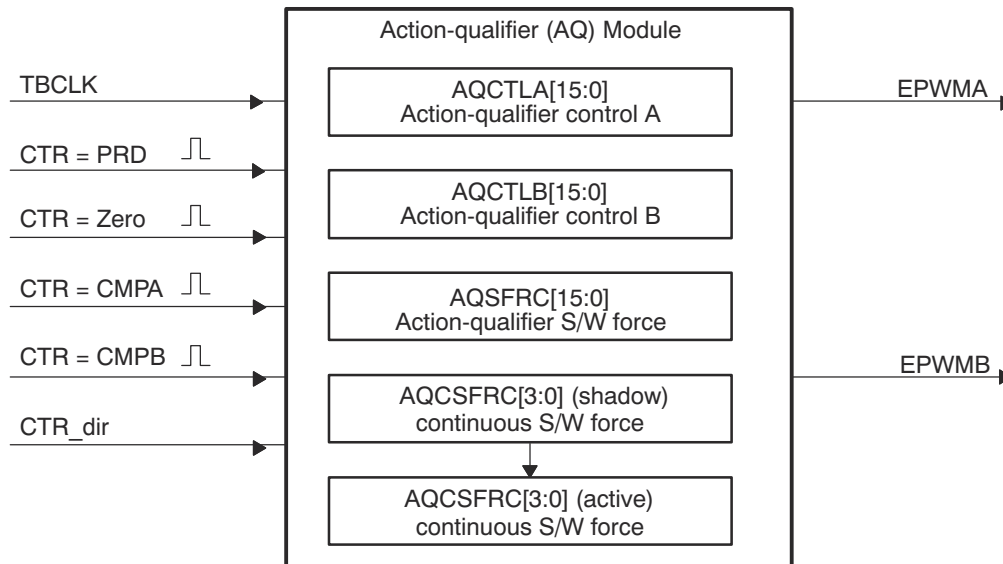

#### 18.2.4.2 Action-Qualifier Submodule Control and Status Register Definitions

The action-qualifier submodule operation is controlled and monitored via the registers in Table 18-7.

**Table 18-7. Action-Qualifier Submodule Registers**

Register Name	Address Offset	Shadowed	Description
AQCTLA	0x0014	No	Action-Qualifier Control Register For Output A (EPWMxA)
AQCTLB	0x001A	No	Action-Qualifier Control Register For Output B (EPWMxB)
AQSFR	0x0018	No	Action-Qualifier Software Force Register
AQCSFR	0x001E	Yes	Action-Qualifier Continuous Software Force

The action-qualifier submodule is based on event-driven logic. It can be thought of as a programmable cross switch with events at the input and actions at the output, all of which are software controlled via the set of registers shown in Table 18-7.

**Figure 18-18. Action-Qualifier Submodule Inputs and Outputs**

For convenience, the possible input events are summarized again in [Table 18-8](#).

**Table 18-8. Action-Qualifier Submodule Possible Input Events**

Signal	Description	Registers Compared
CTR = PRD	Time-base counter equal to the period value	TBCTR = TBPRD
CTR = Zero	Time-base counter equal to zero	TBCTR = 0x0000
CTR = CMPA	Time-base counter equal to the counter-compare A	TBCTR = CMPA
CTR = CMPB	Time-base counter equal to the counter-compare B	TBCTR = CMPB
Software forced event	Asynchronous event initiated by software	

The software forced action is a useful asynchronous event. This control is handled by registers AQSFR and AQCSFR.

The action-qualifier submodule controls how the two outputs EPWMxA and EPWMxB behave when a particular event occurs. The event inputs to the action-qualifier submodule are further qualified by the counter direction (up or down). This allows for independent action on outputs on both the count-up and count-down phases.

The possible actions imposed on outputs EPWMxA and EPWMxB are:

- **Set High:**

Set output EPWMxA or EPWMxB to a high level.

- **Clear Low:**

Set output EPWMxA or EPWMxB to a low level.

- **Toggle:**

If EPWMxA or EPWMxB is currently pulled high, then pull the output low. If EPWMxA or EPWMxB is currently pulled low, then pull the output high.

- **Do Nothing:**

Keep outputs EPWMxA and EPWMxB at same level as currently set. Although the "Do Nothing" option prevents an event from causing an action on the EPWMxA and EPWMxB outputs, this event can still trigger interrupts and ADC start of conversion. See the Event-trigger Submodule description in [Section 18.2.8](#) for details.

Actions are specified independently for either output (EPWMxA or EPWMxB). Any or all events can be configured to generate actions on a given output. For example, both CTR = CMPA and CTR = CMPB can operate on output EPWMxA. All qualifier actions are configured via the control registers found at the end of this section.

For clarity, the drawings in this document use a set of symbolic actions. These symbols are summarized in [Figure 18-19](#). Each symbol represents an action as a marker in time. Some actions are fixed in time (zero and period) while the CMPA and CMPB actions are moveable and their time positions are programmed via the counter-compare A and B registers, respectively. To turn off or disable an action, use the "Do Nothing option"; it is the default at reset.

S/W force	TB Counter equals:				Actions
	Zero	Comp A	Comp B	Period	
					Do Nothing
					Clear Low
					Set High
					Toggle

**Figure 18-19. Possible Action-Qualifier Actions for EPWMxA and EPWMxB Outputs**

### 18.2.4.3 Action-Qualifier Event Priority

It is possible for the ePWM action qualifier to receive more than one event at the same time. In this case events are assigned a priority by the hardware. The general rule is events occurring later in time have a higher priority and software forced events always have the highest priority. The event priority levels for up-down-count mode are shown in [Table 18-9](#). A priority level of 1 is the highest priority and level 7 is the lowest. The priority changes slightly depending on the direction of TBCTR.

**Table 18-9. Action-Qualifier Event Priority for Up-Down-Count Mode**

Priority Level	Event If TBCTR is Incrementing TBCTR = Zero up to TBCTR = TBPRD	Event If TBCTR is Decrementing TBCTR = TBPRD down to TBCTR = 1
1 (Highest)	Software forced event	Software forced event
2	Counter equals CMPB on up-count (CBU)	Counter equals CMPB on down-count (CBD)
3	Counter equals CMPA on up-count (CAU)	Counter equals CMPA on down-count (CAD)
4	Counter equals zero	Counter equals period (TBPRD)
5	Counter equals CMPB on down-count (CBD)	Counter equals CMPB on up-count (CBU)
6 (Lowest)	Counter equals CMPA on down-count (CAD)	Counter equals CMPA on up-count (CBU)

[Table 18-10](#) shows the action-qualifier priority for up-count mode. In this case, the counter direction is always defined as up and thus down-count events will never be taken.

**Table 18-10. Action-Qualifier Event Priority for Up-Count Mode**

Priority Level	Event
1 (Highest)	Software forced event
2	Counter equal to period (TBPRD)
3	Counter equal to CMPB on up-count (CBU)
4	Counter equal to CMPA on up-count (CAU)
5 (Lowest)	Counter equal to Zero

[Table 18-11](#) shows the action-qualifier priority for down-count mode. In this case, the counter direction is always defined as down and thus up-count events will never be taken.

**Table 18-11. Action-Qualifier Event Priority for Down-Count Mode**

Priority Level	Event
1 (Highest)	Software forced event
2	Counter equal to Zero
3	Counter equal to CMPB on down-count (CBD)
4	Counter equal to CMPA on down-count (CAD)
5 (Lowest)	Counter equal to period (TBPRD)

It is possible to set the compare value greater than the period. In this case the action will take place as shown in [Table 18-12](#).

**Table 18-12. Behavior if CMPA/CMPB is Greater than the Period**

Counter Mode	Compare on Up-Count Event CAD/CBD	Compare on Down-Count Event CAD/CBD
Up-Count Mode	<p>If <math>CMPA/CMPB \leq TBPRD</math> period, then the event occurs on a compare match (<math>TBCTR = CMPA</math> or <math>CMPB</math>).</p> <p>If <math>CMPA/CMPB &gt; TBPRD</math>, then the event will not occur.</p>	Never occurs.
Down-Count Mode	Never occurs.	<p>If <math>CMPA/CMPB &lt; TBPRD</math>, the event will occur on a compare match (<math>TBCTR = CMPA</math> or <math>CMPB</math>).</p> <p>If <math>CMPA/CMPB \geq TBPRD</math>, the event will occur on a period match (<math>TBCTR = TBPRD</math>).</p>
Up-Down-Count Mode	<p>If <math>CMPA/CMPB &lt; TBPRD</math> and the counter is incrementing, the event occurs on a compare match (<math>TBCTR = CMPA</math> or <math>CMPB</math>).</p> <p>If <math>CMPA/CMPB \geq TBPRD</math>, the event will occur on a period match (<math>TBCTR = TBPRD</math>).</p>	<p>If <math>CMPA/CMPB &lt; TBPRD</math> and the counter is decrementing, the event occurs on a compare match (<math>TBCTR = CMPA</math> or <math>CMPB</math>).</p> <p>If <math>CMPA/CMPB \geq TBPRD</math>, the event occurs on a period match (<math>TBCTR = TBPRD</math>).</p>

#### 18.2.4.4 Waveforms for Common Configurations

##### Note

The waveforms in this document show the ePWMs behavior for a static compare register value. In a running system, the active compare registers (CMPA and CMPB) are typically updated from their respective shadow registers once every period. The user specifies when the update will take place; either when the time-base counter reaches zero or when the time-base counter reaches period. There are some cases when the action based on the new value can be delayed by one period or the action based on the old value can take effect for an extra period. Some PWM configurations avoid this situation. These include, but are not limited to, the following:

##### Use up-down-count mode to generate a symmetric PWM:

- If you load CMPA/CMPB on zero, then use CMPA/CMPB values greater than or equal to 1.
- If you load CMPA/CMPB on period, then use CMPA/CMPB values less than or equal to  $TBPRD - 1$ .

This means there will always be a pulse of at least one TBCLK cycle in a PWM period which, when very short, tend to be ignored by the system.

##### Use up-down-count mode to generate an asymmetric PWM:

- To achieve 50%-0% asymmetric PWM use the following configuration: Load CMPA/CMPB on period and use the period action to clear the PWM and a compare-up action to set the PWM. Modulate the compare value from 0 to TBPRD to achieve 50%-0% PWM duty.

##### When using up-count mode to generate an asymmetric PWM:

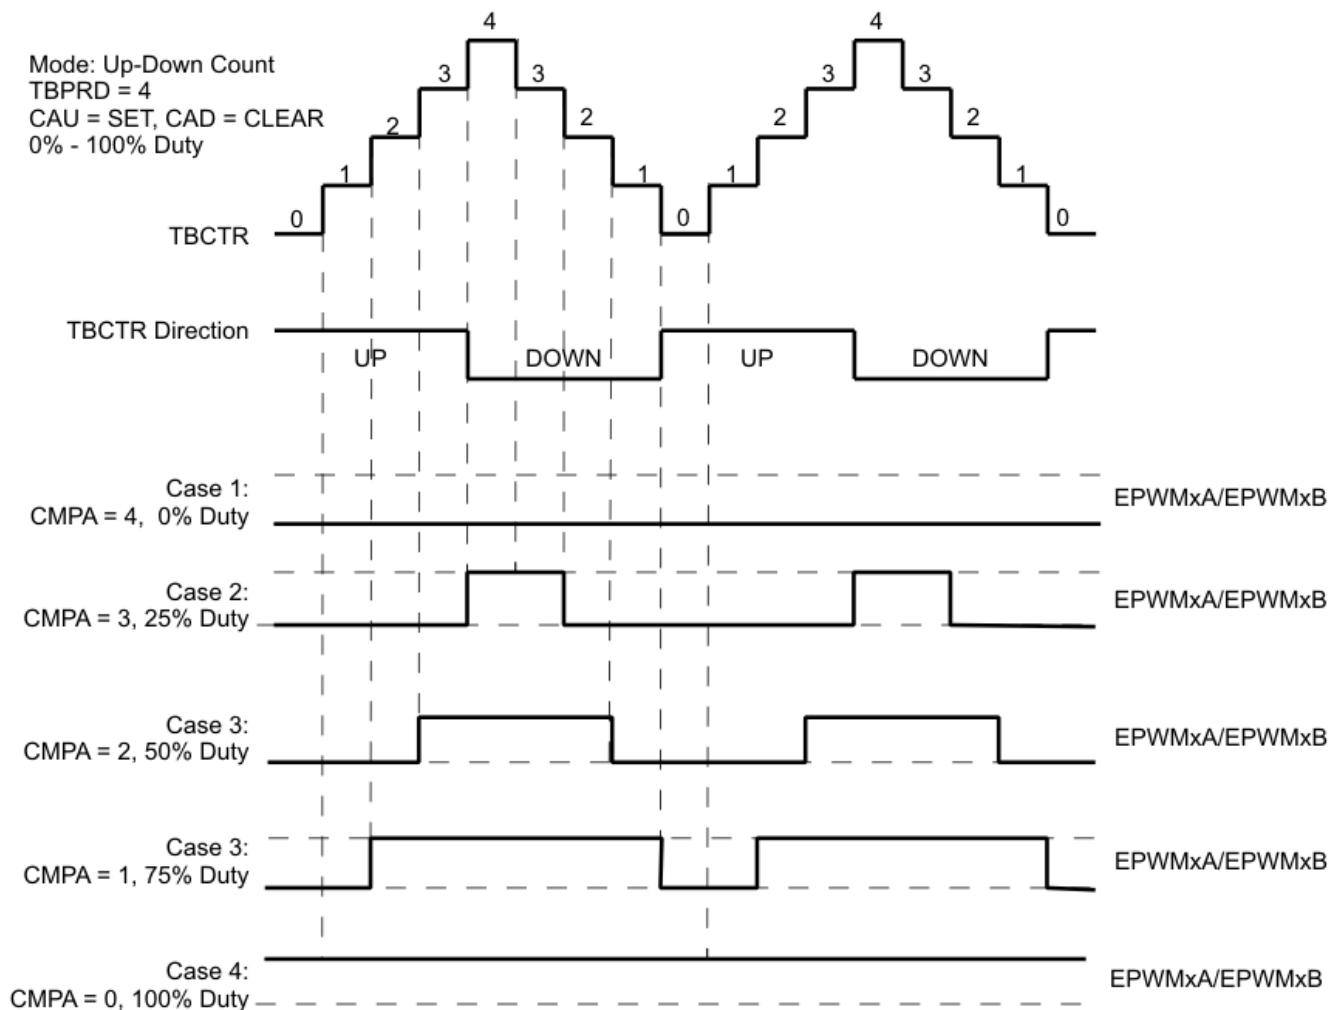

- To achieve 0-100% asymmetric PWM use the following configuration: Load CMPA/CMPB on TBPRD. Use the Zero action to set the PWM and a compare-up action to clear the PWM. Modulate the compare value from 0 to  $TBPRD + 1$  to achieve 0-100% PWM duty.

See the *Using Enhanced Pulse Width Modulator (ePWM) Module for 0-100% Duty Cycle Control* Application Report ([SPRAA11](#))

Figure 18-20 shows how a symmetric PWM waveform can be generated using the up-down-count mode of the TBCTR. In this mode 0%-100% DC modulation is achieved by using equal compare matches on the up count and down count portions of the waveform. In the example shown, CMPA is used to make the comparison. When the counter is incrementing the CMPA match will pull the PWM output high. Likewise, when the counter is decrementing the compare match will pull the PWM signal low. When CMPA = 0, the PWM signal is low for the entire period giving the 0% duty waveform. When CMPA = TBPRD, the PWM signal is high achieving 100% duty.

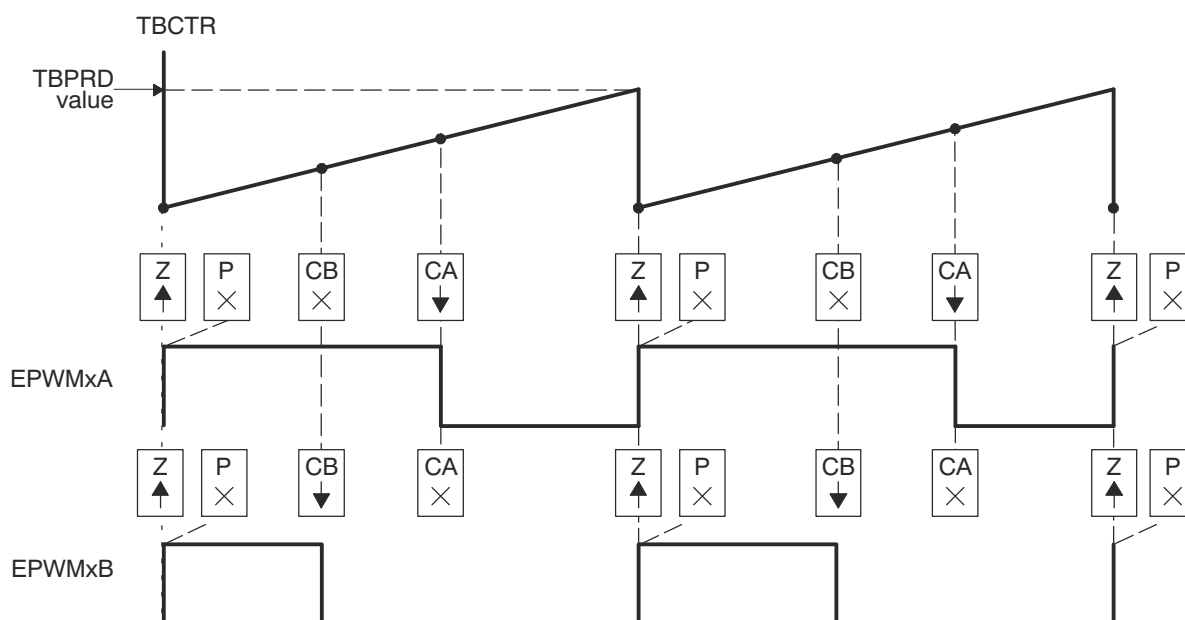

When using this configuration in practice, if you load CMPA/CMPB on zero, then use CMPA/CMPB values greater than or equal to 1. If you load CMPA/CMPB on period, then use CMPA/CMPB values less than or equal to TBPRD - 1. This means there will always be a pulse of at least one TBCLK cycle in a PWM period which, when very short, tend to be ignored by the system.

**Figure 18-20. Up-Down-Count Mode Symmetrical Waveform**

The PWM waveforms in [Figure 18-21](#) through [Figure 18-26](#) show some common action-qualifier configurations. The C-code samples in [Example 18-1](#) through [Example 18-6](#) shows how to configure an ePWM module for each case. Some conventions used in the figures and examples are as follows:

- TBPRD, CMPA, and CMPB refer to the value written in their respective registers. The active register, not the shadow register, is used by the hardware.
- CMPx, refers to either CMPA or CMPB
- EPWMxA and EPWMxB refer to the output signals from ePWMx
- Up-Down means Count-up-and-down mode, Up means up-count mode and Dwn means down-count mode
- Sym = Symmetric, Asym = Asymmetric

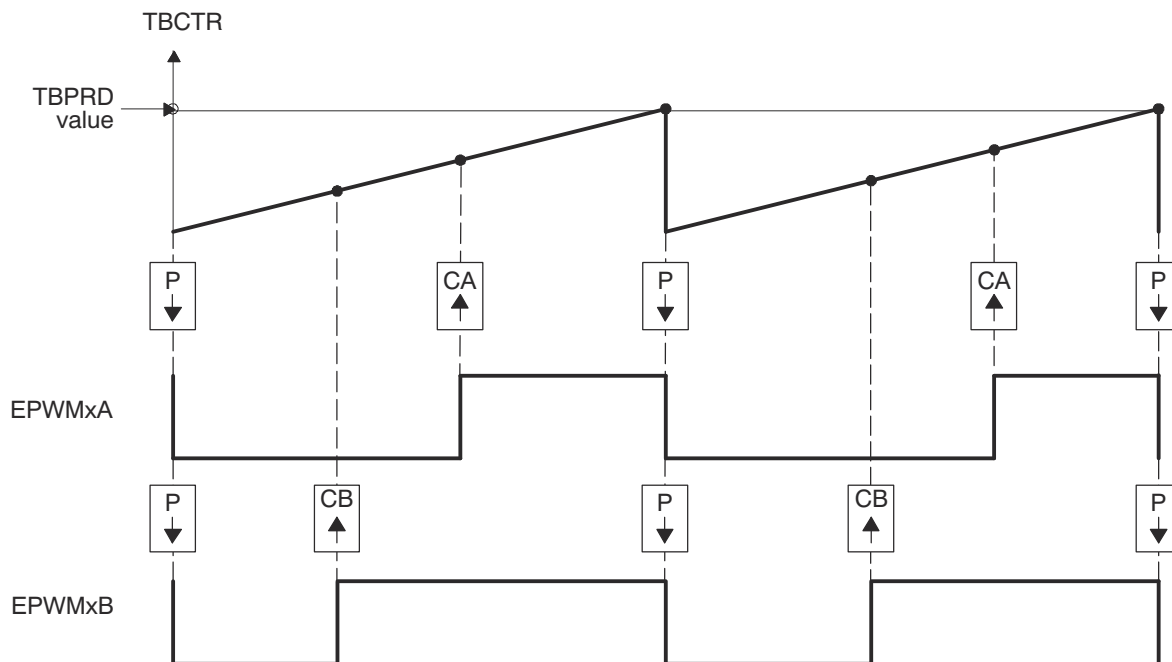

- PWM period =  $(TBPRD + 1) \times T_{TBCLK}$
- Duty modulation for EPWMxA is set by CMPA, and is active high (that is, high time duty proportional to CMPA).
- Duty modulation for EPWMxB is set by CMPB and is active high (that is, high time duty proportional to CMPB).
- The "Do Nothing" actions ( X ) are shown for completeness, but will not be shown on subsequent diagrams.
- Actions at zero and period, although appearing to occur concurrently, are actually separated by one TBCLK period. TBCTR wraps from period to 0000.

**Figure 18-21. Up, Single Edge Asymmetric Waveform, With Independent Modulation on EPWMxA and EPWMxB—Active High**

[Example 18-1](#) contains a code sample showing initialization and run time for the waveforms in [Figure 18-21](#).

**Example 18-1. Code Sample for Figure 18-21**

```
// Initialization Time
// =====
EPwm1Regs.TBPRD = 600; // Period = 601 TBCLK counts
EPwm1Regs.CMPA.half.CMPA = 350; // Compare A = 350 TBCLK counts
EPwm1Regs.CMPB = 200; // Compare B = 200 TBCLK counts
EPwm1Regs.TBPHS = 0; // Set Phase register to zero
EPwm1Regs.TBCTR = 0; // clear TB counter
EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP;
EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE; // Phase loading disabled
EPwm1Regs.TBCTL.bit.PRDL = TB_SHADOW;
EPwm1Regs.TBCTL.bit.SYNCSEL = TB_SYNC_DISABLE;
EPwm1Regs.TBCTL.bit.HSPCLKDIV = TB_DIV1; // TBCLK = SYSCLK
EPwm1Regs.TBCTL.bit.CLKDIV = TB_DIV1;
EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO; // load on CTR = Zero
EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO; // load on CTR = Zero
EPwm1Regs.AQCTLA.bit.ZRO = AQ_SET;
EPwm1Regs.AQCTLA.bit.CAU = AQ_CLEAR;
EPwm1Regs.AQCTLB.bit.ZRO = AQ_SET;
EPwm1Regs.AQCTLB.bit.CBU = AQ_CLEAR;
//
// Run Time
// =====
EPwm1Regs.CMPA.half.CMPA = Duty1A; // adjust duty for output EPWM1A
EPwm1Regs.CMPB = Duty1B; // adjust duty for output EPWM1B
```

**18.2.4.5**

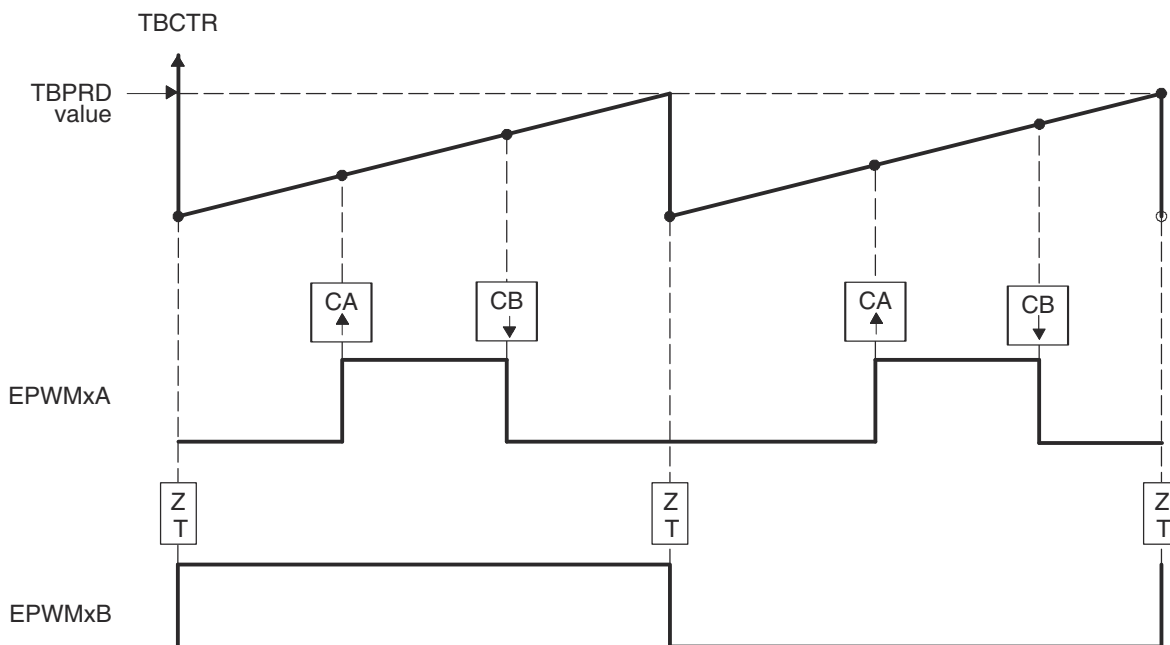

- PWM period =  $(TBPRD + 1) \times T_{TBCLK}$
- Duty modulation for EPWMxA is set by CMPA, and is active low (that is, the low time duty is proportional to CMPA).
- Duty modulation for EPWMB is set by CMPB and is active low (that is, the low time duty is proportional to CMPB).
- Actions at zero and period, although appearing to occur concurrently, are actually separated by one TBCLK period. TBCTR wraps from period to 0000.

**Figure 18-22. Up, Single Edge Asymmetric Waveform With Independent Modulation on EPWMxA and EPWMB—Active Low**

[Example 18-2](#) contains a code sample showing initialization and run time for the waveforms in [Figure 18-22](#).

**Example 18-2. Code Sample for Figure 18-22**

```
// Initialization Time
// =====
EPwm1Regs.TBPRD = 600; // Period = 601 TBCLK counts
EPwm1Regs.CMPA.half.CMPA = 350; // Compare A = 350 TBCLK counts
EPwm1Regs.CMPB = 200; // Compare B = 200 TBCLK counts
EPwm1Regs.TBPHS = 0; // Set Phase register to zero
EPwm1Regs.TBCTR = 0; // clear TB counter
EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP;
EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE; // Phase loading disabled
EPwm1Regs.TBCTL.bit.PRDL = TB_SHADOW;
EPwm1Regs.TBCTL.bit.SYNCSEL = TB_SYNC_DISABLE;
EPwm1Regs.TBCTL.bit.HSPCLKDIV = TB_DIV1; // TBCLK = VCLK4
EPwm1Regs.TBCTL.bit.CLKDIV = TB_DIV1;
EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO; // load on TBCTR = Zero
EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO; // load on TBCTR = Zero
EPwm1Regs.AQCTLA.bit.PR = AQ_CLEAR;
EPwm1Regs.AQCTLA.bit.CAU = AQ_SET;
EPwm1Regs.AQCTLB.bit.PR = AQ_CLEAR;
EPwm1Regs.AQCTLB.bit.CBU = AQ_SET;
//
// Run Time
// =====
EPwm1Regs.CMPA.half.CMPA = Duty1A; // adjust duty for output EPWM1A
EPwm1Regs.CMPB = Duty1B; // adjust duty for output EPWM1B
```

**18.2.4.6**

- PWM frequency =  $1 / ((TBPRD + 1) \times T_{TBCLK})$
- Pulse can be placed anywhere within the PWM cycle (0000 - TBPRD)
- High time duty proportional to (CMPB - CMPA)
- EPWMxB can be used to generate a 50% duty square wave with frequency =  $1/2 \times ((TBPRD + 1) \times TBCLK)$

**Figure 18-23. Up-Count, Pulse Placement Asymmetric Waveform With Independent Modulation on EPWMxA**

Example 18-3 contains a code sample showing initialization and run time for the waveforms in Figure 18-23.

### Example 18-3. Code Sample for Figure 18-23

```
// Initialization Time
// =====
EPwm1Regs.TBPRD = 600;                // Period = 601 TBCLK counts
EPwm1Regs.CMPA.half.CMPA = 200;      // Compare A = 200 TBCLK counts
EPwm1Regs.CMPB = 400;                // Compare B = 400 TBCLK counts
EPwm1Regs.TBPHS = 0;                 // Set Phase register to zero
EPwm1Regs.TBCTR = 0;                  // clear TB counter
EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP;
EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE; // Phase loading disabled
EPwm1Regs.TBCTL.bit.PRDL = TB_SHADOW;
EPwm1Regs.TBCTL.bit.SYNCSEL = TB_SYNC_DISABLE;
EPwm1Regs.TBCTL.bit.HSPCLKDIV = TB_DIV1; // TBCLK = VCLK4
EPwm1Regs.TBCTL.bit.CLKDIV = TB_DIV1;
EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO; // load on TBCTR = Zero
EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO; // load on TBCTR = Zero
EPwm1Regs.AQCTLA.bit.CAU = AQ_SET;
EPwm1Regs.AQCTLA.bit.CBU = AQ_CLEAR;
EPwm1Regs.AQCTLB.bit.ZRO = AQ_TOGGLE;
//
// Run Time
// =====
EPwm1Regs.CMPA.half.CMPA = EdgePosA; // adjust duty for output EPWM1A only
EPwm1Regs.CMPB = EdgePosB;
```

### 18.2.4.7

- PWM period =  $2 \times \text{TBPRD} \times T_{\text{TBCLK}}$
- Duty modulation for EPWMxA is set by CMPA, and is active low (that is, the low time duty is proportional to CMPA).
- Duty modulation for EPWMxB is set by CMPB and is active low (that is, the low time duty is proportional to CMPB).
- Outputs EPWMxA and EPWMxB can drive independent power switches

**Figure 18-24. Up-Down-Count, Dual Edge Symmetric Waveform, With Independent Modulation on EPWMxA and EPWMxB — Active Low**

Example 18-4 contains a code sample showing initialization and run time for the waveforms in Figure 18-24.

#### Example 18-4. Code Sample for Figure 18-24

```
// Initialization Time
// =====
EPwm1Regs.TBPRD = 600;           // Period = 2*600 TBCLK counts
EPwm1Regs.CMPA.half.CMPA = 400; // Compare A = 400 TBCLK counts
EPwm1Regs.CMPB = 500;           // Compare B = 500 TBCLK counts
EPwm1Regs.TBPHS = 0;            // Set Phase register to zero
EPwm1Regs.TBCTR = 0;            // clear TB counter
EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UPDOWN; // Symmetric
xEPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE; // Phase loading disabled
xEPwm1Regs.TBCTL.bit.PRDL = TB_SHADOW;
EPwm1Regs.TBCTL.bit.SYNCSEL = TB_SYNC_DISABLE;
EPwm1Regs.TBCTL.bit.HSPCLKDIV = TB_DIV1; // TBCLK = VCLK4
EPwm1Regs.TBCTL.bit.CLKDIV = TB_DIV1;
EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO; // load on CTR = Zero
EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO; // load on CTR = Zero
EPwm1Regs.AQCTLA.bit.CAU = AQ_SET;
EPwm1Regs.AQCTLA.bit.CAD = AQ_CLEAR;
EPwm1Regs.AQCTLB.bit.CBU = AQ_SET;
EPwm1Regs.AQCTLB.bit.CBD = AQ_CLEAR;
//
// Run Time
// =====
EPwm1Regs.CMPA.half.CMPA = Duty1A; // adjust duty for output EPWM1A
EPwm1Regs.CMPB = Duty1B;           // adjust duty for output EPWM1B
```

#### 18.2.4.8

- PWM period =  $2 \times \text{TBPRD} \times T_{\text{TBCLK}}$
- Duty modulation for EPWMxA is set by CMPA, and is active low, that is, low time duty proportional to CMPA
- Duty modulation for EPWMxB is set by CMPB and is active high, that is, high time duty proportional to CMPB
- Outputs EPWMx can drive upper/lower (complementary) power switches
- Dead-band = CMPB - CMPA (fully programmable edge placement by software). Note the dead-band module is also available if the more classical edge delay method is required.

**Figure 18-25. Up-Down-Count, Dual Edge Symmetric Waveform, With Independent Modulation on EPWMxA and EPWMxB — Complementary**

Example 18-5 contains a code sample showing initialization and run time for the waveforms in Figure 18-25.

### Example 18-5. Code Sample for Figure 18-25

```
// Initialization Time
// =====
EPwm1Regs.TBPRD = 600;                // Period = 2*600 TBCLK counts
EPwm1Regs.CMPA.half.CMPA = 350;      // Compare A = 350 TBCLK counts
EPwm1Regs.CMPB = 400;                // Compare B = 400 TBCLK counts
EPwm1Regs.TBPHS = 0;                 // Set Phase register to zero
EPwm1Regs.TBCTR = 0;                 // clear TB counter
EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UPDOWN; // Symmetric
EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE; // Phase loading disabled
EPwm1Regs.TBCTL.bit.PRDL = TB_SHADOW;
EPwm1Regs.TBCTL.bit.SYNCSEL = TB_SYNC_DISABLE;
EPwm1Regs.TBCTL.bit.HSPCLKDIV = TB_DIV1; // TBCLK = VCLK4
EPwm1Regs.TBCTL.bit.CLKDIV = TB_DIV1;
EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO; // load on CTR = Zero
EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO; // load on CTR = Zero
EPwm1Regs.AQCTLA.bit.CAU = AQ_SET;
EPwm1Regs.AQCTLA.bit.CAD = AQ_CLEAR;
EPwm1Regs.AQCTLB.bit.CBU = AQ_CLEAR;
EPwm1Regs.AQCTLB.bit.CBD = AQ_SET;
// Run Time
// =====
EPwm1Regs.CMPA.half.CMPA = Duty1A;    // adjust duty for output EPWM1A
EPwm1Regs.CMPB = Duty1B;              // adjust duty for output EPWM1B
```

### 18.2.4.9

- PWM period =  $2 \times \text{TBPRD} \times \text{TBCLK}$
- Rising edge and falling edge can be asymmetrically positioned within a PWM cycle. This allows for pulse placement techniques.
- Duty modulation for EPWMxA is set by CMPA and CMPB.
- Low time duty for EPWMxA is proportional to  $(\text{CMPA} + \text{CMPB})$ .
- To change this example to active high, CMPA and CMPB actions need to be inverted (that is, Set ! Clear and Clear Set).
- Duty modulation for EPWMxB is fixed at 50% (utilizes spare action resources for EPWMxB)

**Figure 18-26. Up-Down-Count, Dual Edge Asymmetric Waveform, With Independent Modulation on EPWMxA—Active Low**

Example 18-6 contains a code sample showing initialization and run time for the waveforms in Figure 18-26.

#### Example 18-6. Code Sample for Figure 18-26

```
// Initialization Time
// =====
EPwm1Regs.TBPRD = 600; // Period = 2 * 600 TBCLK counts
EPwm1Regs.CMPA.half.CMPA = 250; // Compare A = 250 TBCLK counts
EPwm1Regs.CMPB = 450; // Compare B = 450 TBCLK counts
EPwm1Regs.TBPHS = 0; // Set Phase register to zero
EPwm1Regs.TBCTR = 0; // clear TB counter
EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UPDOWN; // Symmetric
EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE; // Phase loading disabled
EPwm1Regs.TBCTL.bit.PRDL = TB_SHADOW;
EPwm1Regs.TBCTL.bit.SYNCSEL = TB_SYNC_DISABLE;
EPwm1Regs.TBCTL.bit.HSPCLKDIV = TB_DIV1; // TBCLK = VCLK4
EPwm1Regs.TBCTL.bit.CLKDIV = TB_DIV1;
EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO; // load on CTR = Zero
EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO; // load on CTR = Zero
EPwm1Regs.AQCTLA.bit.CAU = AQ_SET;
EPwm1Regs.AQCTLA.bit.CBD = AQ_CLEAR;
EPwm1Regs.AQCTLB.bit.ZRO = AQ_CLEAR;
EPwm1Regs.AQCTLB.bit.PR = AQ_SET;
// Run Time
// =====
EPwm1Regs.CMPA.half.CMPA = EdgePosA; // adjust duty for output EPWM1A only
EPwm1Regs.CMPB = EdgePosB;
```

### 18.2.5 Dead-Band Generator (DB) Submodule

Figure 18-27 illustrates the dead-band submodule within the ePWM module.

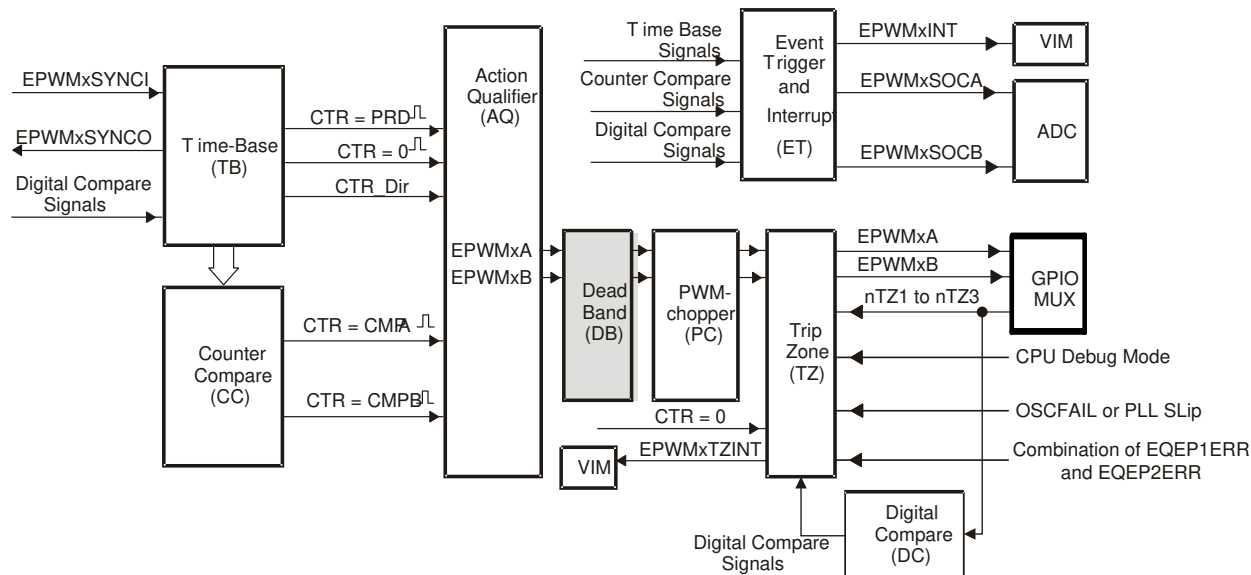

Figure 18-27. Dead\_Band Submodule

#### 18.2.5.1 Purpose of the Dead-Band Submodule

Section 18.2.4 discussed how it is possible to generate the required dead-band by having full control over edge placement using both the CMPA and CMPB resources of the ePWM module. However, if the more classical

edge delay-based dead-band with polarity control is required, then the dead-band submodule described here should be used.

The key functions of the dead-band module are:

- Programming signal pairs for:
  - Active high (AH)
  - Active low (AL)
  - Active high complementary (AHC)
  - Active low complementary (ALC)
- Adding programmable delay to rising edges (RED)
- Adding programmable delay to falling edges (FED)
- Can be totally bypassed from the signal path (note dotted lines in diagram)

### 18.2.5.2 Controlling and Monitoring the Dead-Band Submodule

The dead-band submodule operation is controlled and monitored via the following registers:

**Table 18-13. Dead-Band Generator Submodule Registers**

Register Name	Address Offset	Shadowed	Description
DBCTL	0x001C	No	Dead-Band Control Register
DBRED	0x0022	No	Dead-Band Rising Edge Delay Count Register
DBFED	0x0020	No	Dead-Band Falling Edge Delay Count Register

### 18.2.5.3 Operational Highlights for the Dead-Band Submodule

The following sections provide the operational highlights.

The dead-band submodule has two groups of independent selection options as shown in [Figure 18-28](#).

#### • Input Source Selection:

The input signals to the dead-band module are the output signals from the action-qualifier. In this section they will be referred to as EPWMxA In and EPWMxB In. Using the DBCTL[IN\_MODE] control bits, the signal source for each delay, falling-edge or rising-edge, can be selected:

- In is the source for both falling-edge and rising-edge delay. This is the default mode.
- In is the source for falling-edge delay, EPWMxB In is the source for rising-edge delay.
- In is the source for rising edge delay, In is the source for falling-edge delay.
- In is the source for both falling-edge and rising-edge delay.

#### • Half Cycle Clocking:

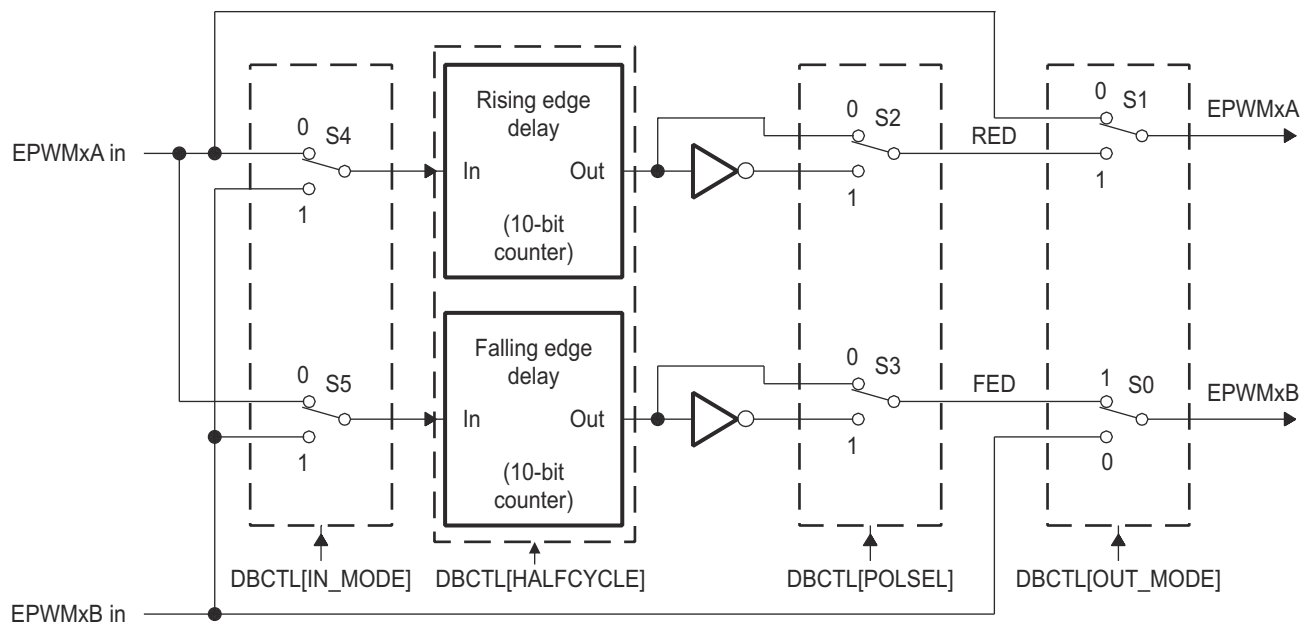

The dead-band submodule can be clocked using half cycle clocking to double the resolution (that is, counter clocked at 2× TBCLK)

#### • Output Mode Control:

The output mode is configured by way of the DBCTL[OUT\_MODE] bits. These bits determine if the falling-edge delay, rising-edge delay, neither, or both are applied to the input signals.

#### • Polarity Control:

The polarity control (DBCTL[POLSEL]) allows you to specify whether the rising-edge delayed signal and/or the falling-edge delayed signal is to be inverted before being sent out of the dead-band submodule.

**Figure 18-28. Configuration Options for the Dead-Band Submodule**

Although all combinations are supported, not all are typical usage modes. [Table 18-14](#) documents some classical dead-band configurations. These modes assume that the DBCTL[IN\_MODE] is configured such that In is the source for both falling-edge and rising-edge delay. Enhanced, or non-traditional modes can be achieved by changing the input signal source. The modes shown in [Table 18-14](#) fall into the following categories:

- **Mode 1: Bypass both falling-edge delay (FED) and rising-edge delay (RED)**

Allows you to fully disable the dead-band submodule from the PWM signal path.

- **Mode 2-5: Classical Dead-Band Polarity Settings:**

These represent typical polarity configurations that should address all the active high/low modes required by available industry power switch gate drivers. The waveforms for these typical cases are shown in [Figure 18-29](#). Note that to generate equivalent waveforms to [Figure 18-29](#), configure the action-qualifier submodule to generate the signal as shown for .

- **Mode 6: Bypass rising-edge-delay and Mode 7: Bypass falling-edge-delay**

Finally the last two entries in [Table 18-14](#) show combinations where either the falling-edge-delay (FED) or rising-edge-delay (RED) blocks are bypassed.

**Table 18-14. Classical Dead-Band Operating Modes**

Mode	Mode Description	DBCTL[POLSEL]		DBCTL[OUT_MODE]	
		S3	S2	S1	S0
1	EPWMxA and EPWMxB Passed Through (No Delay)	X	X	0	0
2	Active High Complementary (AHC)	1	0	1	1
3	Active Low Complementary (ALC)	0	1	1	1
4	Active High (AH)	0	0	1	1
5	Active Low (AL)	1	1	1	1
6	EPWMxA Out = EPWMxA In (No Delay) EPWMxB Out = EPWMxA In with Falling Edge Delay	0 or 1	0 or 1	0	1
7	EPWMxA Out = EPWMxA In with Rising Edge Delay EPWMxB Out = EPWMxB In with No Delay	0 or 1	0 or 1	1	0

[Figure 18-29](#) shows waveforms for typical cases where  $0\% < \text{duty} < 100\%$ .

**Figure 18-29. Dead-Band Waveforms for Typical Cases (0% < Duty < 100%)**

The dead-band submodule supports independent values for rising-edge (RED) and falling-edge (FED) delays. The amount of delay is programmed using the DBRED and DBFED registers. These are 10-bit registers and their value represents the number of time-base clock, TBCLK, periods a signal edge is delayed by. For example, the formula to calculate falling-edge-delay and rising-edge-delay are:

$$\text{FED} = \text{DBFED} \times T_{\text{TBCLK}}$$

$$\text{RED} = \text{DBRED} \times T_{\text{TBCLK}}$$

Where  $T_{\text{TBCLK}}$  is the period of TBCLK, the prescaled version of VCLK4.

For convenience, delay values for various TBCLK options are shown in [Table 18-15](#).

**Table 18-15. Dead-Band Delay Values in  $\mu\text{S}$  as a Function of DBFED and DBRED**

Dead-Band Value		Dead-Band Delay in $\mu\text{S}$		
DBFED, DBRED	TBCLK = VCLK4/1	TBCLK = VCLK4 /2	TBCLK = VCLK4/4	
1	0.02 $\mu\text{S}$	0.03 $\mu\text{S}$	0.07 $\mu\text{S}$	
5	0.08 $\mu\text{S}$	0.17 $\mu\text{S}$	0.33 $\mu\text{S}$	
10	0.17 $\mu\text{S}$	0.33 $\mu\text{S}$	0.67 $\mu\text{S}$	
100	1.67 $\mu\text{S}$	3.33 $\mu\text{S}$	6.67 $\mu\text{S}$	
200	3.33 $\mu\text{S}$	6.67 $\mu\text{S}$	13.33 $\mu\text{S}$	
400	6.67 $\mu\text{S}$	13.33 $\mu\text{S}$	26.67 $\mu\text{S}$	
500	8.33 $\mu\text{S}$	16.67 $\mu\text{S}$	33.33 $\mu\text{S}$	
600	10.00 $\mu\text{S}$	20.00 $\mu\text{S}$	40.00 $\mu\text{S}$	
700	11.67 $\mu\text{S}$	23.33 $\mu\text{S}$	46.67 $\mu\text{S}$	
800	13.33 $\mu\text{S}$	26.67 $\mu\text{S}$	53.33 $\mu\text{S}$	
900	15.00 $\mu\text{S}$	30.00 $\mu\text{S}$	60.00 $\mu\text{S}$	
1000	16.67 $\mu\text{S}$	33.33 $\mu\text{S}$	66.67 $\mu\text{S}$	

When half-cycle clocking is enabled, the formula to calculate the falling-edge-delay and rising-edge-delay becomes:

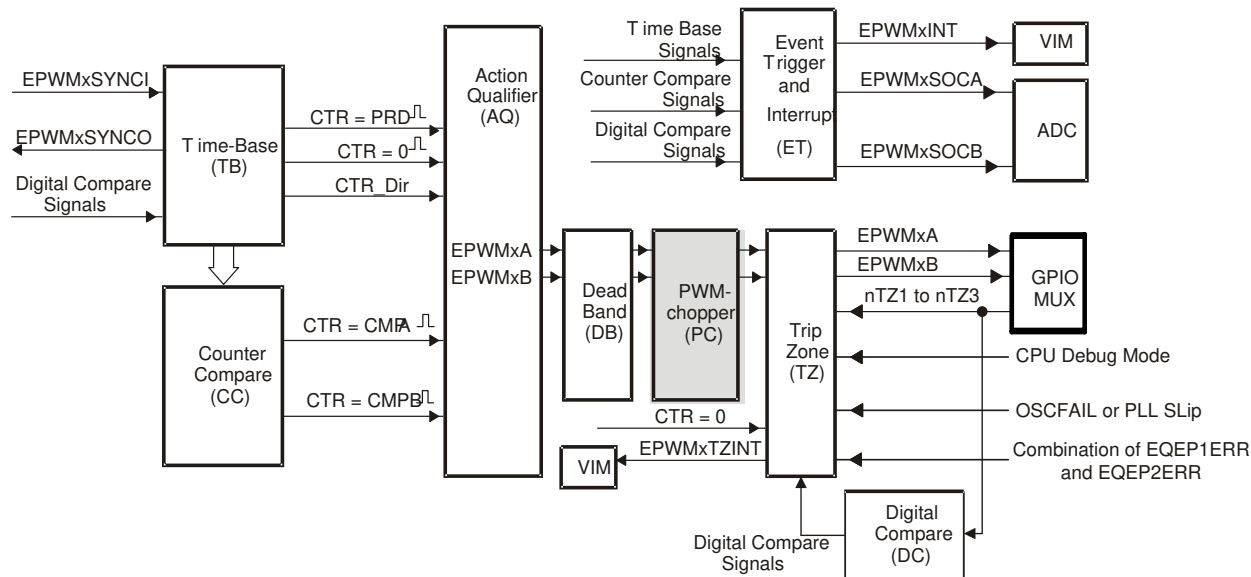

$$\text{FED} = \text{DBFED} \times T_{\text{TBCLK}}/2$$

$$\text{RED} = \text{DBRED} \times T_{\text{TBCLK}}/2$$

### 18.2.6 PWM-Chopper (PC) Submodule

Figure 18-30 illustrates the PWM-chopper (PC) submodule within the ePWM module.

The PWM-chopper submodule allows a high-frequency carrier signal to modulate the PWM waveform generated by the action-qualifier and dead-band submodules. This capability is important if you need pulse transformer-based gate drivers to control the power switching elements.

**Figure 18-30. PWM-Chopper Submodule**

#### 18.2.6.1 Purpose of the PWM-Chopper Submodule

The key functions of the PWM-chopper submodule are:

- Programmable chopping (carrier) frequency
- Programmable pulse width of first pulse
- Programmable duty cycle of second and subsequent pulses
- Can be fully bypassed if not required

#### 18.2.6.2 Controlling the PWM-Chopper Submodule

The PWM-chopper submodule operation is controlled via the registers in Table 18-16.

**Table 18-16. PWM-Chopper Submodule Registers**

Register Name	Address Offset	Shadowed	Description
PCCTL	0x003E	No	PWM-chopper Control Register

#### 18.2.6.3 Operational Highlights for the PWM-Chopper Submodule

Figure 18-31 shows the operational details of the PWM-chopper submodule. The carrier clock is derived from VCLK4. Its frequency and duty cycle are controlled via the CHPFREQ and CHPDUTY bits in the PCCTL register. The one-shot block is a feature that provides a high energy first pulse to ensure hard and fast power switch turn on, while the subsequent pulses sustain pulses, ensuring the power switch remains on. The one-shot width is programmed via the OSHTWTH bits. The PWM-chopper submodule can be fully disabled (bypassed) via the CHPEN bit.

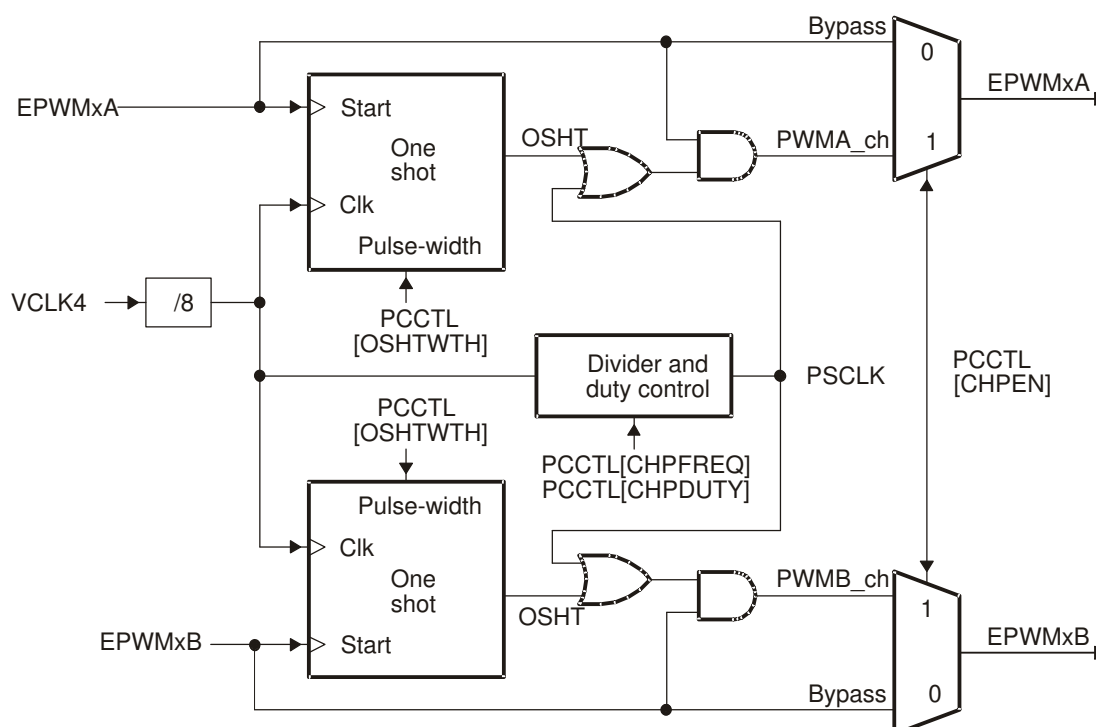

Figure 18-31. PWM-Chopper Submodule Operational Details

#### 18.2.6.4 Waveforms

Figure 18-32 shows simplified waveforms of the chopping action only; one-shot and duty-cycle control are not shown. Details of the one-shot and duty-cycle control are discussed in the following sections.

Figure 18-32. Simple PWM-Chopper Submodule Waveforms Showing Chopping Action Only

#### 18.2.6.4.1 One-Shot Pulse

The width of the first pulse can be programmed to any of 16 possible pulse width values. The width or period of the first pulse is given by:

$$T_{1stpulse} = T_{VCLK4} \times 8 \times OSHTWTH$$

Where  $T_{VCLK4}$  is the period of the system clock (VCLK4) and OSHTWTH is the four control bits (value from 1 to 16)

Figure 18-33 shows the first and subsequent sustaining pulses and Table 18-17 gives the possible pulse width values for a VCLK4 = 100 MHz.

**Figure 18-33. PWM-Chopper Submodule Waveforms Showing the First Pulse and Subsequent Sustaining Pulses**

**Table 18-17. Possible Pulse Width Values for  
VCLK4 = 100 MHz**

OSHTWTHz (hex)	Pulse Width (nS)
0	100
1	200
2	300
3	400
4	500
5	600
6	700
7	800
8	900
9	1000
A	1100
B	1200
C	1300
D	1400
E	1500

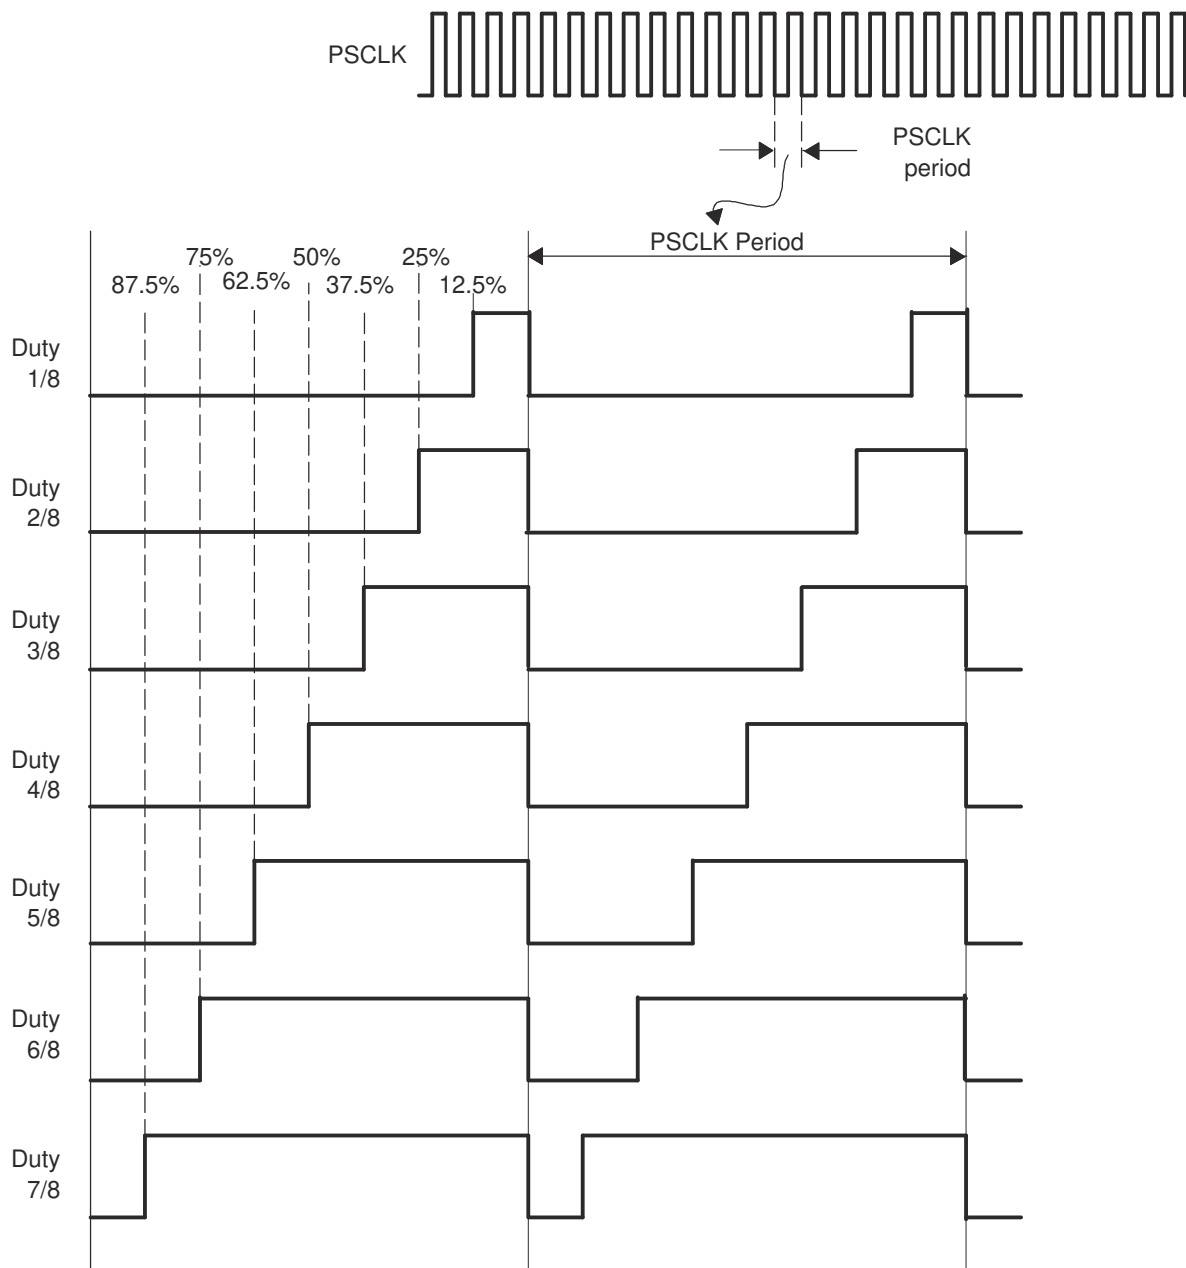

**Table 18-17. Possible Pulse Width Values for  
VCLK4 = 100 MHz (continued)**

OSHTWTHz (hex)	Pulse Width (nS)
F	1600

#### 18.2.6.4.2 Duty Cycle Control

Pulse transformer-based gate drive designs need to comprehend the magnetic properties or characteristics of the transformer and associated circuitry. Saturation is one such consideration. To assist the gate drive designer, the duty cycles of the second and subsequent pulses have been made programmable. These sustaining pulses ensure the correct drive strength and polarity is maintained on the power switch gate during the on period, and hence a programmable duty cycle allows a design to be tuned or optimized via software control.

[Figure 18-34](#) shows the duty cycle control that is possible by programming the CHPDUTY bits. One of seven possible duty ratios can be selected ranging from 12.5% to 87.5%.

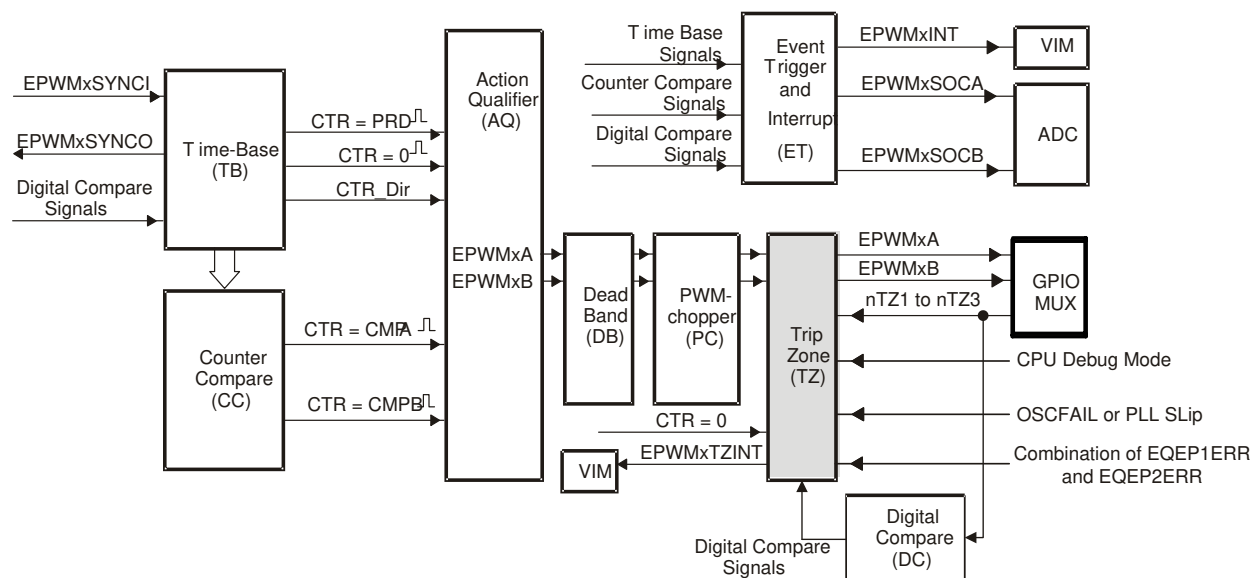

**Figure 18-34. PWM-Chopper Submodule Waveforms Showing the Pulse Width (Duty Cycle) Control of Sustaining Pulses**

### 18.2.7 Trip-Zone (TZ) Submodule

Figure 18-35 shows how the trip-zone (TZ) submodule fits within the ePWM module.

Each ePWM module is connected to six  $\overline{TZn}$  signals ( $\overline{TZ1}$  to  $\overline{TZ6}$ ).  $\overline{TZ1}$  to  $\overline{TZ3}$  are sourced from the GPIO mux.  $\overline{TZ4}$  is sourced from a combination of EQEP1ERR and EQEP2ERR signals.  $\overline{TZ5}$  is connected to the system oscillator or PLL clock fail logic, and  $\overline{TZ6}$  is sourced from the debug mode halt indication output from the CPU. These signals indicate fault or trip conditions, and the ePWM outputs can be programmed to respond accordingly when faults occur.

**Figure 18-35. Trip-Zone Submodule**

### 18.2.7.1 Purpose of the Trip-Zone Submodule

The key functions of the Trip-Zone submodule are:

- Trip inputs  $\overline{TZ1}$  to  $\overline{TZ6}$  are mapped to all ePWM modules.
- Upon a fault indication, either no action is taken or the ePWM outputs can be forced to one of the following:
  - High
  - Low
  - High-impedance
- Support for one-shot trip (OSHT) for major short circuits or over-current conditions.
- Support for cycle-by-cycle tripping (CBC) for current limiting operation.
- Support for digital compare tripping (DC) based on state of on-chip analog comparator module outputs and/or  $\overline{TZ1}$  to  $\overline{TZ3}$  signals.
- Each trip-zone input and digital compare (DC) submodule DCAEVT1/2 or DCBEVT1/2 force event can be allocated to either one-shot or cycle-by-cycle operation.
- Interrupt generation is possible on any trip-zone input.
- Software-forced tripping is also supported.
- The trip-zone submodule can be fully bypassed if it is not required.

### 18.2.7.2 Controlling and Monitoring the Trip-Zone Submodule

The trip-zone submodule operation is controlled and monitored through the following registers:

**Table 18-18. Trip-Zone Submodule Registers**

Register Name	Address Offset	Shadowed	Description <sup>(2)</sup>
TZSEL	0x0026	No	Trip-Zone Select Register
TZDCSEL	0x0024	No	Trip-zone Digital Compare Select Register <sup>(1)</sup>
TZCTL	0x002A	No	Trip-Zone Control Register
TZEINT	0x0028	No	Trip-Zone Enable Interrupt Register
TZFLG	0x002E	No	Trip-Zone Flag Register
TZCLR	0x002C	No	Trip-Zone Clear Register
TZFRC	0x0032	No	Trip-Zone Force Register

(1) This register is discussed in more detail in [Section 18.2.9](#).

(2) All trip-zone registers are writable only in privileged mode.

### 18.2.7.3 Operational Highlights for the Trip-Zone Submodule

The following sections describe the operational highlights and configuration options for the trip-zone submodule.

The trip-zone signals  $\overline{TZ1}$  to  $\overline{TZ6}$  (also collectively referred to as  $\overline{TZn}$ ) are active low input signals. When one of these signals goes low, or when a DCAEVT1/2 or DCBEVT1/2 force happens based on the TZDCSEL register event selection, it indicates that a trip event has occurred. Each ePWM module can be individually configured to ignore or use each of the trip-zone signals or DC events. Which trip-zone signals or DC events are used by a particular ePWM module is determined by the TZSEL register for that specific ePWM module. The trip-zone signals may or may not be synchronized to the system clock (VCLK4) and digitally filtered within the GPIO MUX block. A minimum of 3\*TBCLK low pulse width on  $\overline{TZn}$  inputs is sufficient to trigger a fault condition on the ePWM module. If the pulse width is less than this, the trip condition may not be latched. The asynchronous trip makes sure that if clocks are missing for any reason, the outputs can still be tripped by a valid event present on  $\overline{TZn}$  inputs. The GPIOs or peripherals must be appropriately configured. For more information, see the IOMM chapter of the device technical reference manual.

Each  $\overline{TZn}$  input can be individually configured to provide either a cycle-by-cycle or one-shot trip event for an ePWM module. DCAEVT1 and DCBEVT1 events can be configured to directly trip an ePWM module or provide a one-shot trip event to the module. Likewise, DCAEVT2 and DCBEVT2 events can also be configured to directly trip an ePWM module or provide a cycle-by-cycle trip event to the module. This configuration is determined by the TZSEL[DCAEVT1/2], TZSEL[DCBEVT1/2], TZSEL[CBCn], and TZSEL[OSHTn] control bits (where n corresponds to the trip input) respectively.

- **Cycle-by-Cycle (CBC):**

When a cycle-by-cycle trip event occurs, the action specified in the TZCTL[TZA] and TZCTL[TZB] bits is carried out immediately on the EPWMxA and/or EPWMxB output. [Table 18-19](#) lists the possible actions. In addition, the cycle-by-cycle trip event flag (TZFLG[CBC]) is set and a EPWMx\_TZINT interrupt is generated if it is enabled in the TZEINT register and VIM peripheral.

If the CBC interrupt is enabled via the TZEINT register, and DCAEVT2 or DCBEVT2 are selected as CBC trip sources via the TZSEL register, it is not necessary to also enable the DCAEVT2 or DCBEVT2 interrupts in the TZEINT register, as the DC events trigger interrupts through the CBC mechanism.

The specified condition on the inputs is automatically cleared when the ePWM time-base counter reaches zero (TBCTR = 0x0000) if the trip event is no longer present. Therefore, in this mode, the trip event is cleared or reset every PWM cycle. The TZFLG[CBC] flag bit will remain set until it is manually cleared by writing to the TZCLR[CBC] bit. If the cycle-by-cycle trip event is still present when the TZFLG[CBC] bit is cleared, then it will again be immediately set.

- **One-Shot (OSHT):**

When a one-shot trip event occurs, the action specified in the TZCTL[TZA] and TZCTL[TZB] bits is carried out immediately on the EPWMxA and/or EPWMxB output. [Table 18-19](#) lists the possible actions. In addition, the one-shot trip event flag (TZFLG[OST]) is set and a EPWMx\_TZINT interrupt is generated if it is enabled in the TZEINT register and VIM peripheral. The one-shot trip condition must be cleared manually by writing to the TZCLR[OST] bit.

If the one-shot interrupt is enabled via the TZEINT register, and DCAEVT1 or DCBEVT1 are selected as OSHT trip sources via the TZSEL register, it is not necessary to also enable the DCAEVT1 or DCBEVT1 interrupts in the TZEINT register, as the DC events trigger interrupts through the OSHT mechanism.

- **Digital Compare Events (DCAEVT1/2 and DCBEVT1/2):**

A digital compare DCAEVT1/2 or DCBEVT1/2 event is generated based on a combination of the DCAH/DCAL and DCBH/DCBL signals as selected by the TZDZSEL register. The signals which source the DCAH/DCAL and DCBH/DCBL signals are selected via the DCTRISEL register and can be either trip zone input pins. For more information on the digital compare submodule signals, see [Section 18.2.9](#).

When a digital compare event occurs, the action specified in the TZCTL[DCAEVT1/2] and TZCTL[DCBEVT1/2] bits is carried out immediately on the EPWMxA and/or EPWMxB output. [Table 18-19](#) lists the possible actions. In addition, the relevant DC trip event flag (TZFLG[DCAEVT1/2] / TZFLG[DCBEVT1/2]) is set and a EPWMx\_TZINT interrupt is generated if it is enabled in the TZEINT register and VIM peripheral.

The specified condition on the pins is automatically cleared when the DC trip event is no longer present. The TZFLG[DCAEVT1/2] or TZFLG[DCBEVT1/2] flag bit will remain set until it is manually cleared by writing to the TZCLR[DCAEVT1/2] or TZCLR[DCBEVT1/2] bit. If the DC trip event is still present when the TZFLG[DCAEVT1/2] or TZFLG[DCBEVT1/2] flag is cleared, then it will again be immediately set.

The action taken when a trip event occurs can be configured individually for each of the ePWM output pins by way of the TZCTL register bit fields. One of four possible actions, shown in [Table 18-19](#), can be taken on a trip event.

**Table 18-19. Possible Actions On a Trip Event**

TZCTL Register bit-field Settings	EPWMxA and/or EPWMxB	Comment
0,0	High-Impedance	Tripped
0,1	Force to High State	Tripped
1,0	Force to Low State	Tripped
1,1	No Change	Do Nothing. No change is made to the output.

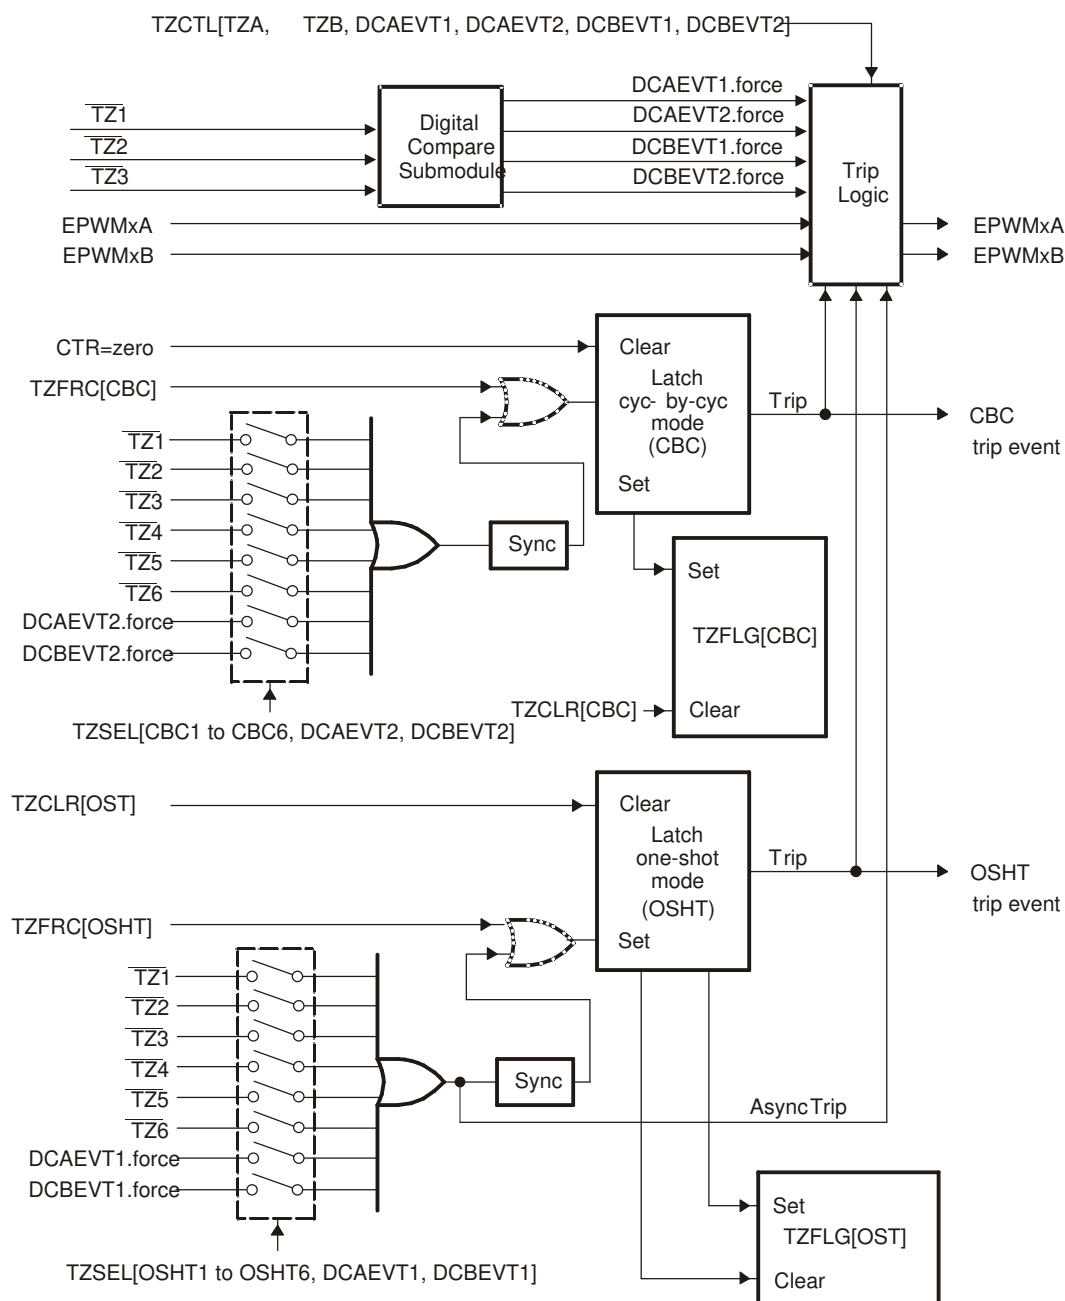

---

**Example 18-7. Trip-Zone Configurations**

---

### 18.2.7.4 Generating Trip Event Interrupts

Figure 18-36 and Figure 18-37 illustrate the trip-zone submodule control and interrupt logic, respectively. DCAEVT1/2 and DCBEVT1/2 signals are described in further detail in Section 18.2.9.

**Figure 18-36. Trip-Zone Submodule Mode Control Logic**

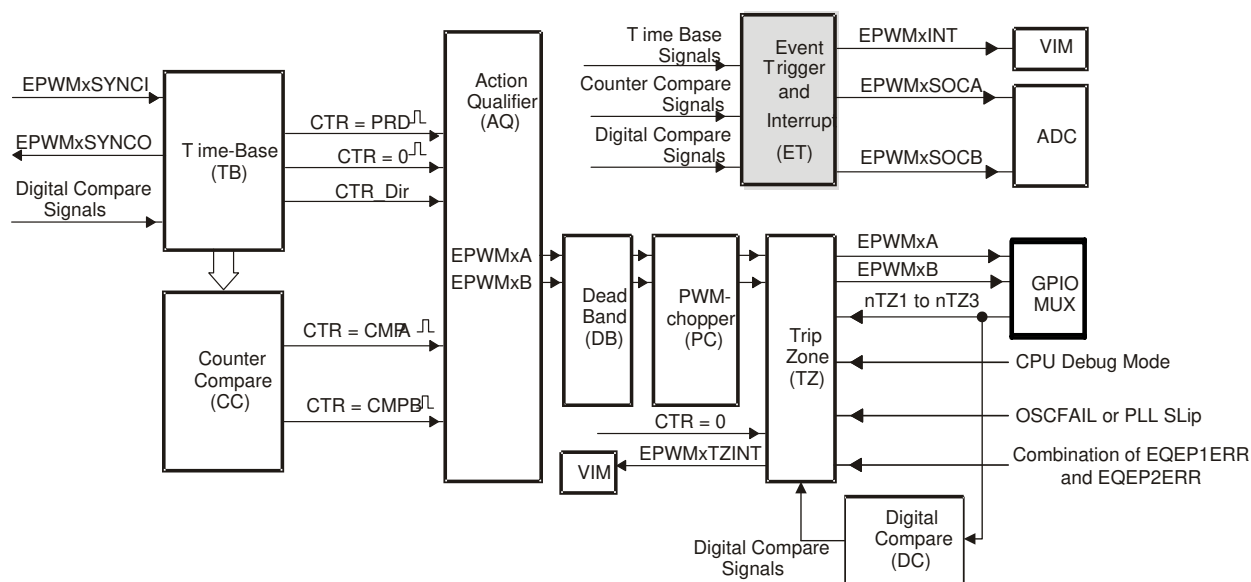

### 18.2.8 Event-Trigger (ET) Submodule

The key functions of the event-trigger submodule are:

- Receives event inputs generated by the time-base, counter-compare and digital-compare submodules
- Uses the time-base direction information for up/down event qualification
- Uses prescaling logic to issue interrupt requests and ADC start of conversion at:
  - Every event
  - Every second event
  - Every third event
- Provides full visibility of event generation via event counters and flags
- Allows software forcing of Interrupts and ADC start of conversion

The event-trigger submodule manages the events generated by the time-base submodule, the counter-compare submodule, and the digital-compare submodule to generate an interrupt to the CPU and/or a start of conversion pulse to the ADC when a selected event occurs. Figure 18-38 illustrates where the event-trigger submodule fits within the ePWM system.

**Figure 18-38. Event-Trigger Submodule**

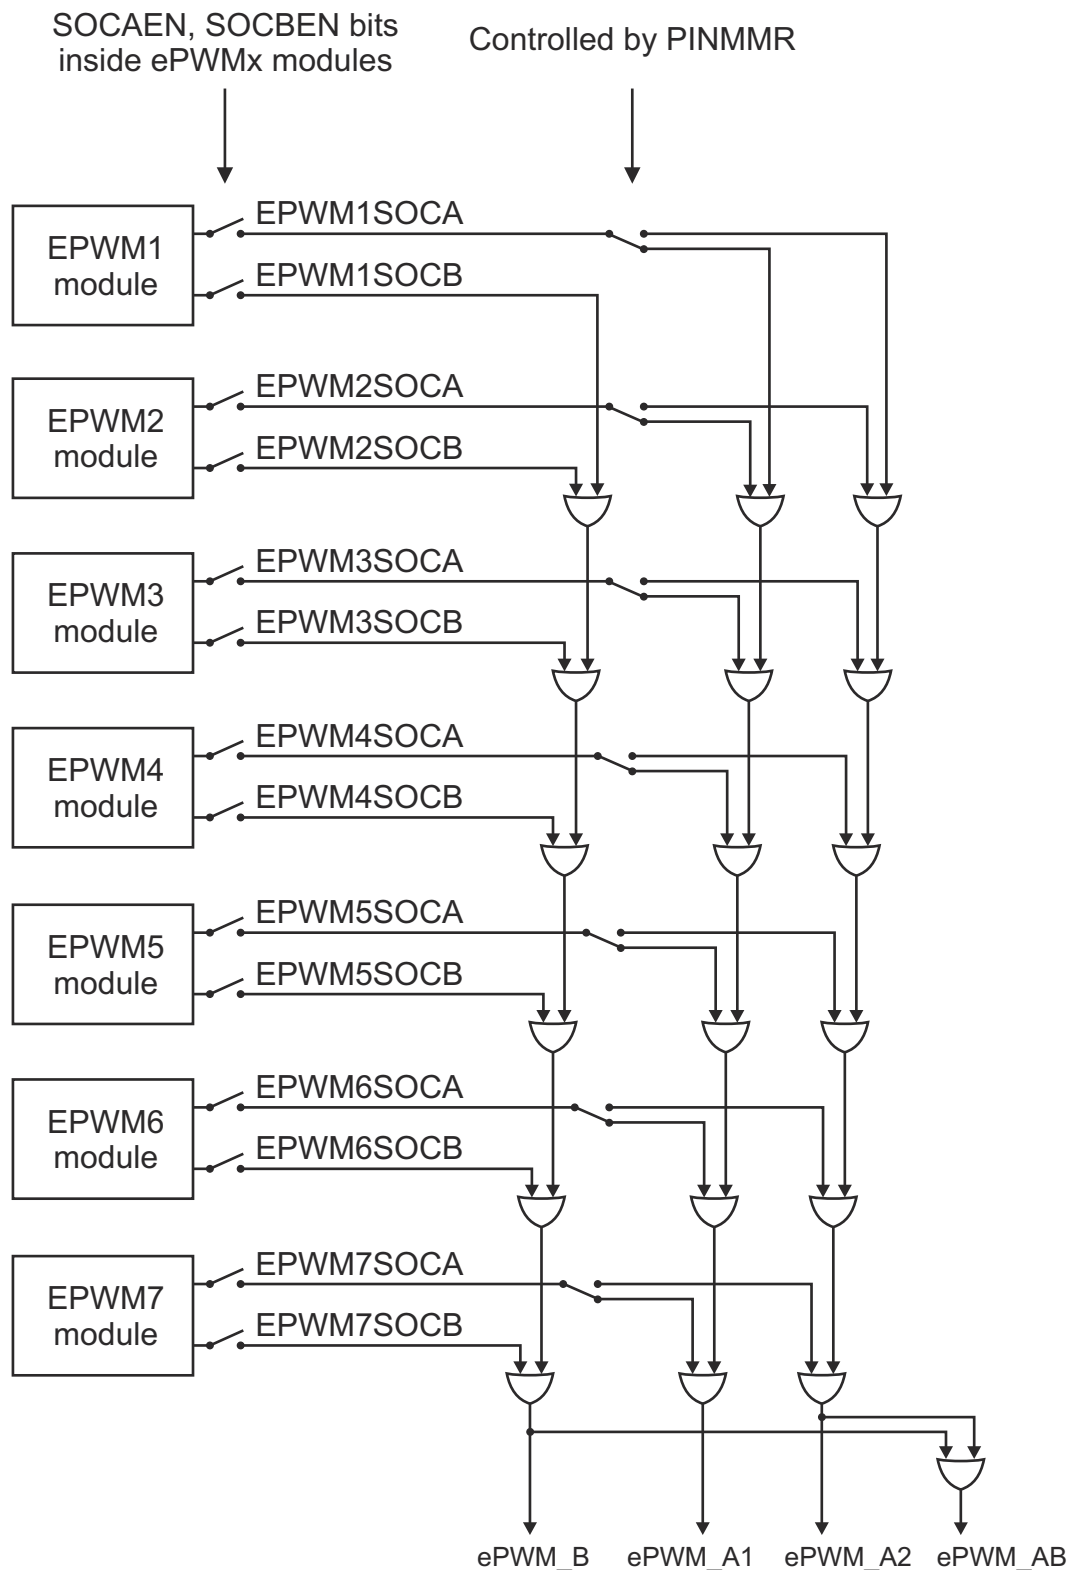

#### 18.2.8.1 Operational Overview of the Event-Trigger Submodule

The following sections describe the event-trigger submodule's operational highlights.

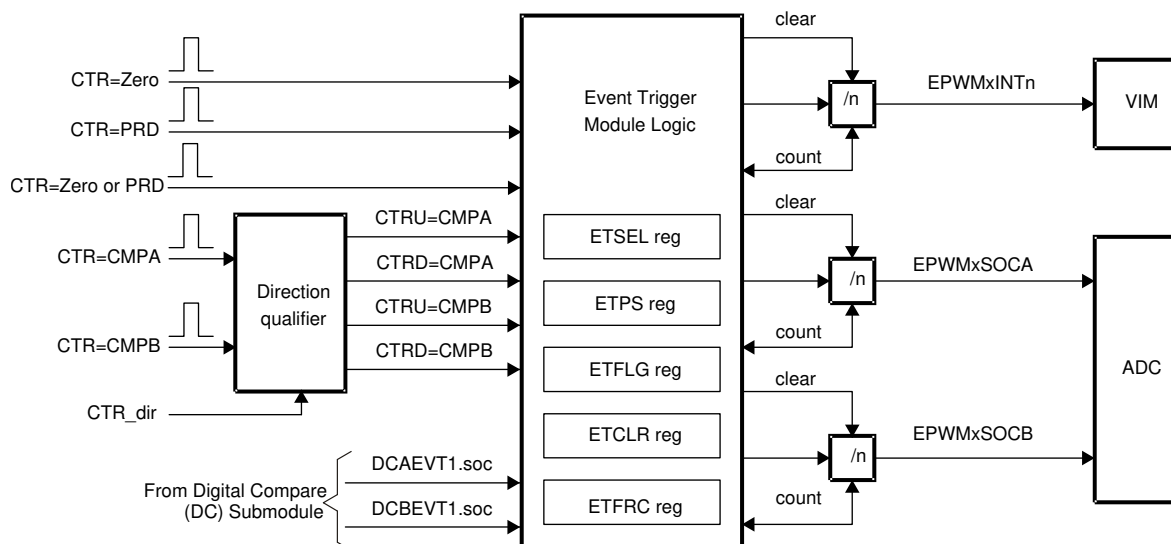

Each ePWM module has one interrupt request line connected to the VIM and two start of conversion signals connected to the ADC module. As shown in Figure 18-39, the ePWMxSOCA and ePWMxSOCB signals are combined to generate four special signals that can be used to trigger an ADC start of conversion, and hence multiple modules can initiate an ADC start of conversion via the ADC trigger inputs.

The event-trigger submodule monitors various event conditions (the left side inputs to event-trigger submodule shown in Figure 18-40) and can be configured to prescale these events before issuing an Interrupt request or an ADC start of conversion. The event-trigger prescaling logic can issue Interrupt requests and ADC start of conversion at:

- Every event
- Every second event
- Every third event

**Figure 18-39. Event-Trigger Submodule Inter-Connectivity of ADC Start of Conversion**

**Figure 18-40. Event-Trigger Submodule Showing Event Inputs and Prescaled Outputs**

The key registers used to configure the event-trigger submodule are shown in [Table 18-20](#).

**Table 18-20. Event-Trigger Submodule Registers**

Register Name	Address Offset	Shadowed	Description
ETSEL	0x0030	No	Event-trigger Selection Register
ETPS	0x0036	No	Event-trigger Prescale Register
ETFLG	0x0034	No	Event-trigger Flag Register
ETCLR	0x003A	No	Event-trigger Clear Register
ETFRC	0x0038	No	Event-trigger Force Register

- ETSEL—This selects which of the possible events will trigger an interrupt or start an ADC conversion
- ETPS—This programs the event prescaling options mentioned above.
- ETFLG—These are flag bits indicating status of the selected and prescaled events.
- ETCLR—These bits allow you to clear the flag bits in the ETFLG register via software.
- ETFRC—These bits allow software forcing of an event. Useful for debugging or s/w intervention.

A more detailed look at how the various register bits interact with the Interrupt and ADC start of conversion logic are shown in [Figure 18-41](#), [Figure 18-42](#), and [Figure 18-43](#).

[Figure 18-41](#) shows the event-trigger's interrupt generation logic. The interrupt-period (ETPS[INTPRD]) bits specify the number of events required to cause an interrupt pulse to be generated. The choices available are:

- Do not generate an interrupt.
- Generate an interrupt on every event
- Generate an interrupt on every second event
- Generate an interrupt on every third event

Which event can cause an interrupt is configured by the interrupt selection (ETSEL[INTSEL]) bits. The event can be one of the following:

- Time-base counter equal to zero (TBCTR = 0x0000).
- Time-base counter equal to period (TBCTR = TBPRD).
- Time-base counter equal to zero or period (TBCTR = 0x0000 || TBCTR = TBPRD)
- Time-base counter equal to the compare A register (CMPA) when the timer is incrementing.
- Time-base counter equal to the compare A register (CMPA) when the timer is decrementing.

- Time-base counter equal to the compare B register (CMPB) when the timer is incrementing.
- Time-base counter equal to the compare B register (CMPB) when the timer is decrementing.

The number of events that have occurred can be read from the interrupt event counter (ETPS[INTCNT]) register bits. That is, when the specified event occurs the ETPS[INTCNT] bits are incremented until they reach the value specified by ETPS[INTPRD]. When ETPS[INTCNT] = ETPS[INTPRD] the counter stops counting and its output is set. The counter is only cleared when an interrupt is sent to the VIM.

When ETPS[INTCNT] reaches ETPS[INTPRD] the following behaviors will occur:

- If interrupts are enabled, ETSEL[INTEN] = 1 and the interrupt flag is clear, ETFLG[INT] = 0, then an interrupt pulse is generated and the interrupt flag is set, ETFLG[INT] = 1, and the event counter is cleared ETPS[INTCNT] = 0. The counter will begin counting events again.
- If interrupts are disabled, ETSEL[INTEN] = 0, or the interrupt flag is set, ETFLG[INT] = 1, the counter stops counting events when it reaches the period value ETPS[INTCNT] = ETPS[INTPRD].
- If interrupts are enabled, but the interrupt flag is already set, then the counter will hold its output high until the ETFLG[INT] flag is cleared. This allows for one interrupt to be pending while one is serviced.

Writing to the INTPRD bits will automatically clear the counter INTCNT = 0 and the counter output will be reset (so no interrupts are generated). Writing a 1 to the ETFRC[INT] bit will increment the event counter INTCNT. The counter will behave as described above when INTCNT = INTPRD. When INTPRD = 0, the counter is disabled and hence no events will be detected and the ETFRC[INT] bit is also ignored.

The above definition means that you can generate an interrupt on every event, on every second event, or on every third event. An interrupt cannot be generated on every fourth or more events.

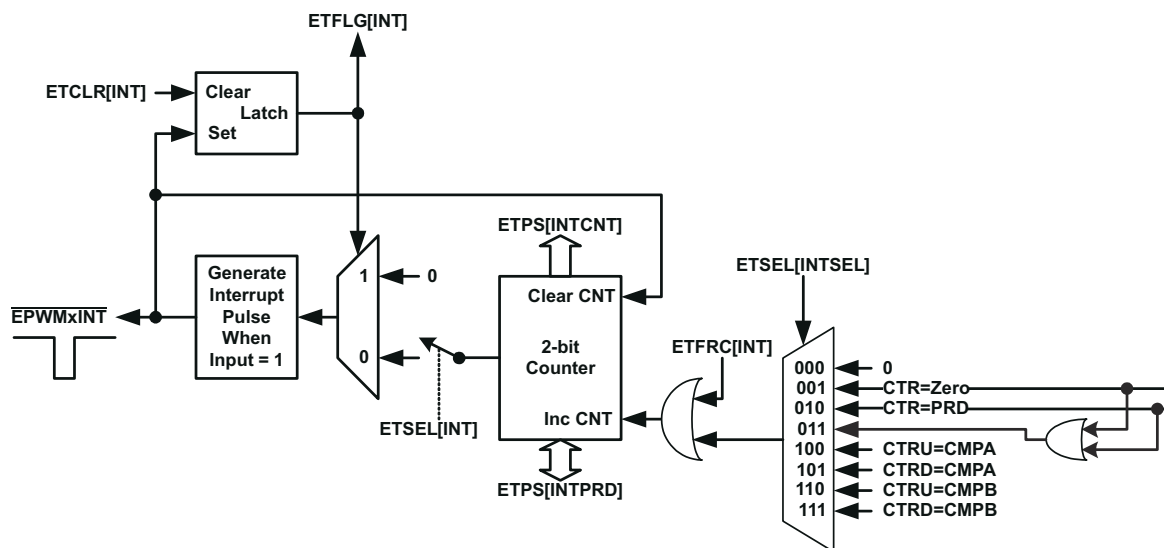

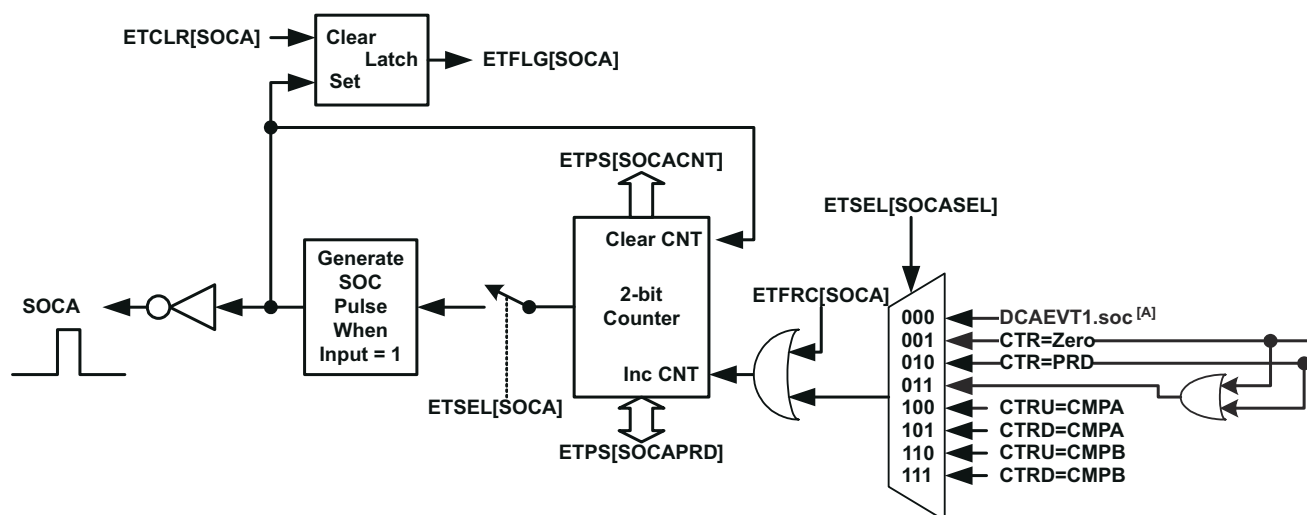

Figure 18-41. Event-Trigger Interrupt Generator

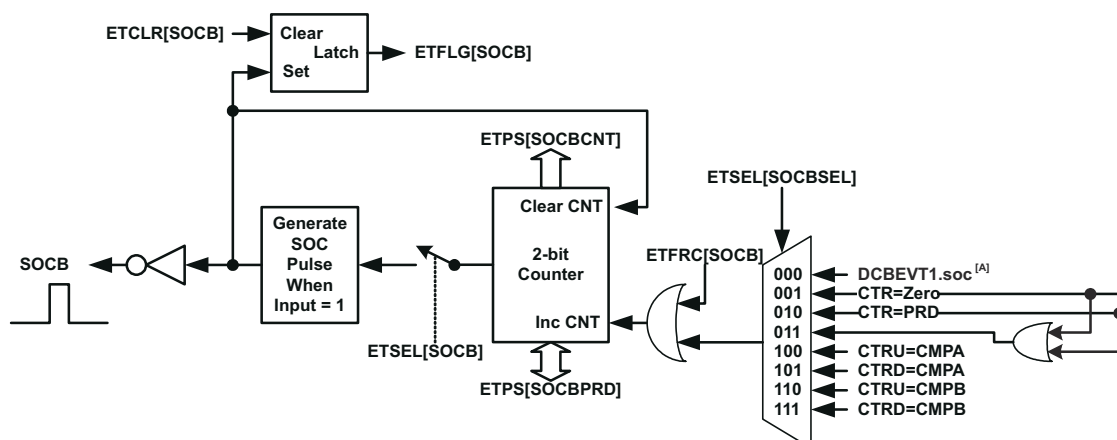

Figure 18-42 shows the operation of the event-trigger's start-of-conversion-A (SOCA) pulse generator. The ETPS[SOCACNT] counter and ETPS[SOCAPRD] period values behave similarly to the interrupt generator except that the pulses are continuously generated. That is, the pulse flag ETFLG[SOCA] is latched when a pulse is generated, but it does not stop further pulse generation. The enable/disable bit ETSEL[SOCAEN] stops pulse generation, but input events can still be counted until the period value is reached as with the interrupt generation logic. The event that will trigger an SOCA and SOCB pulse can be configured separately in the ETSEL[SOCASEL] and ETSEL[SOCBSEL] bits. The possible events are the same events that can be specified for the interrupt generation logic with the addition of the DCAEVT1.soc and DCBEVT1.soc event signals from the digital compare (DC) submodule.

A. The DCAEVT1.soc signals are signals generated by the Digital compare (DC) submodule described later in [Section 18.2.9](#).

**Figure 18-42. Event-Trigger SOCA Pulse Generator**

Figure 18-43 shows the operation of the event-trigger's start-of-conversion-B (SOCB) pulse generator. The event-trigger's SOCB pulse generator operates the same way as the SOCA.

A. The DCBEVT1.soc signals are signals generated by the Digital compare (DC) submodule described later in [Section 18.2.9](#).

**Figure 18-43. Event-Trigger SOCB Pulse Generator**

### 18.2.9 Digital Compare (DC) Submodule

Figure 18-44 illustrates where the digital compare (DC) submodule signals interface to other submodules in the ePWM system.

The digital compare (DC) submodule compares signals external to the ePWM module to directly generate PWM events/actions that then feed to the event-trigger, trip-zone, and time-base submodules. Additionally, blanking window functionality is supported to filter noise or unwanted pulses from the DC event signals.

**Figure 18-44. Digital-Compare Submodule High-Level Block Diagram**

#### 18.2.9.1 Purpose of the Digital Compare Submodule

The key functions of the digital compare submodule are:

- TZ1, TZ2, and TZ3 inputs generate Digital Compare A High/Low (DCAH, DCAL) and Digital Compare B High/Low (DCBH, DCBL) signals.
- DCAH/L and DCBH/L signals trigger events which can then either be filtered or fed directly to the trip-zone, event-trigger, and time-base submodules to:
  - generate a trip zone interrupt
  - generate an ADC start of conversion
  - force an event
  - generate a synchronization event for synchronizing the ePWM module TBCTR.
- Event filtering (blanking window logic) can optionally blank the input signal to remove noise.

### 18.2.9.2 Controlling and Monitoring the Digital Compare Submodule

The digital compare submodule operation is controlled and monitored through the following registers:

**Table 18-21. Digital Compare Submodule Registers**

Register Name	Address Offset	Shadowed	Description
TZDCSEL <sup>(1) (2)</sup>	0x0024	No	Trip Zone Digital Compare Select Register
DCTRIPSEL <sup>(1)</sup>	0x0062	No	Digital Compare Trip Select Register
DCACTL <sup>(1)</sup>	0x0060	No	Digital Compare A Control Register
DCBCTL <sup>(1)</sup>	0x0066	No	Digital Compare B Control Register
DCFCTL <sup>(1)</sup>	0x0064	No	Digital Compare Filter Control Register
DCCAPCTL <sup>(1)</sup>	0x006A	No	Digital Compare Capture Control Register
DCOFFSET	0x0068	Writes	Digital Compare Filter Offset Register
DCOFFSETCNT	0x006E	No	Digital Compare Filter Offset Counter Register
DCFWINDOW	0x006C	No	Digital Compare Filter Window Register
DCFWINDOWCNT	0x0072	No	Digital Compare Filter Window Counter Register
DCCAP	0x0070	Yes	Digital Compare Counter Capture Register

(1) These registers are writable only in privileged mode.

(2) The TZDCSEL register is part of the trip-zone submodule but is mentioned again here because of its functional significance to the digital compare submodule.

### 18.2.9.3 Operation Highlights of the Digital Compare Submodule

The following sections describe the operational highlights and configuration options for the digital compare submodule.

#### 18.2.9.3.1 Digital Compare Events

As illustrated in [Figure 18-44](#), trip zone inputs ( $\overline{TZ1}$ ,  $\overline{TZ2}$ , and  $\overline{TZ3}$ ) can be selected via the DCTRIPSEL bits to generate the Digital Compare A High and Low (DCAH/L) and Digital Compare B High and Low (DCBH/L) signals. Then, the configuration of the TZDCSEL register qualifies the actions on the selected DCAH/L and DCBH/L signals, which generate the DCAEVT1/2 and DCBEVT1/2 events (Event Qualification A and B).

#### Note

The  $\overline{TZn}$  signals, when used as a DCEVT tripping functions, are treated as a normal input signal and can be defined to be active high or active low inputs. EPWM outputs are asynchronously tripped when either the  $\overline{TZn}$ , DCAEVTx.force, or DCBEVTx.force signals are active. For the condition to remain latched, a minimum of  $3 \times TBCLK$  sync pulse width is required. If pulse width is  $< 3 \times TBCLK$  sync pulse width, the trip condition may or may not get latched by CBC or OST latches.

The DCAEVT1/2 and DCBEVT1/2 events can then be filtered to provide a filtered version of the event signals (DCEVTFILT) or the filtering can be bypassed. Filtering is discussed further in [Section 18.2.9.3.2](#). Either the DCAEVT1/2 and DCBEVT1/2 event signals or the filtered DCEVTFILT event signals can generate a force to the trip zone module, a TZ interrupt, an ADC SOC, or a PWM sync signal.

- **force signal:**

DCAEVT1/2.force signals force trip zone conditions which either directly influence the output on the EPWMxA pin (via TZCTL[DCAEVT1 or DCAEVT2] configurations) or, if the DCAEVT1/2 signals are selected as one-shot or cycle-by-cycle trip sources (via the TZSEL register), the DCAEVT1/2.force signals can effect the trip action via the TZCTL[TZA] configuration. The DCBEVT1/2.force signals behaves similarly, but affect the EPWMxB output pin instead of the EPWMxA output pin.

The priority of conflicting actions on the TZCTL register is as follows (highest priority overrides lower priority):

Output EPWMxA: TZA (highest) -> DCAEVT1 -> DCAEVT2 (lowest)

Output EPWMxB: TzB (highest) -> DCBEVT1 -> DCBEVT2 (lowest)

- **interrupt signal:**

DCAEVT1/2.interrupt signals generate trip zone interrupts to the VIM. To enable the interrupt, the user must set the DCAEVT1, DCAEVT2, DCBEVT1, or DCBEVT2 bits in the TZEINT register. Once one of these events occurs, an EPWMxTZINT interrupt is triggered, and the corresponding bit in the TZCLR register must be set in order to clear the interrupt.

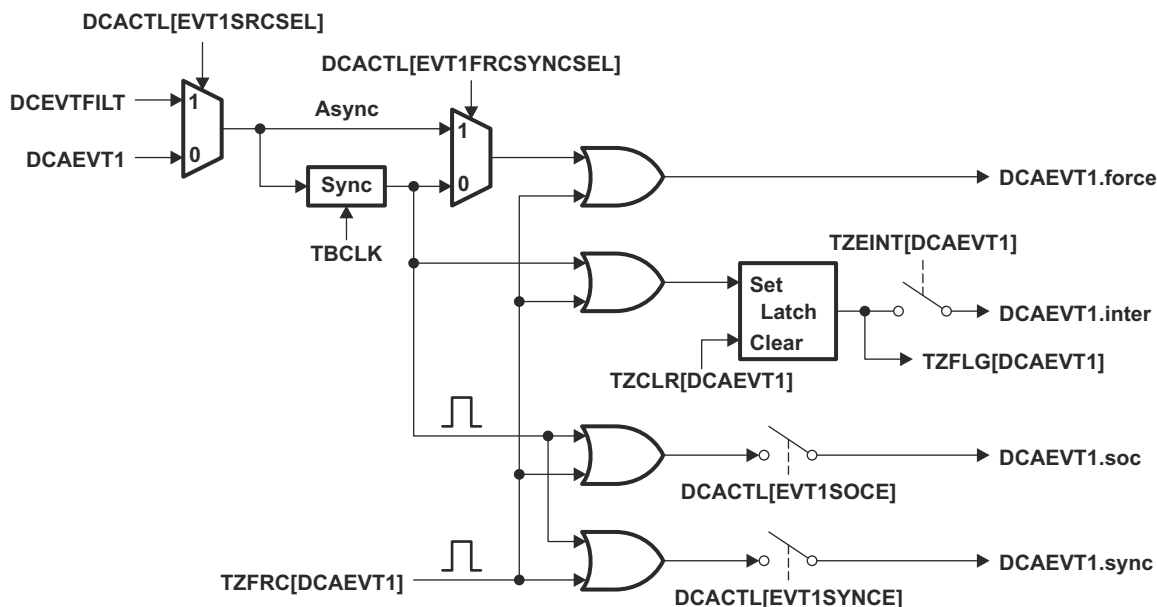

- **soc signal:**

The DCAEVT1.soc signal interfaces with the event-trigger submodule and can be selected as an event which generates an ADC start-of-conversion-A (SOCA) pulse via the ETSEL[SOCASEL] bit. Likewise, the DCBEVT1.soc signal can be selected as an event which generates an ADC start-of-conversion-B (SOCB) pulse via the ETSEL[SOCBSEL] bit.

- **sync signal:**

The DCAEVT1.sync and DCBEVT1.sync events are ORed with the EPWMxSYNCl input signal and the TBCTL[SWFSYNc] signal to generate a synchronization pulse to the time-base counter.

[Figure 18-45](#) and [Figure 18-46](#) show how the DCAEVT1, DCAEVT2, or DCEVTFILT signals are processed to generate the digital compare A event force, interrupt, soc and sync signals.

**Figure 18-45. DCAEVT1 Event Triggering**

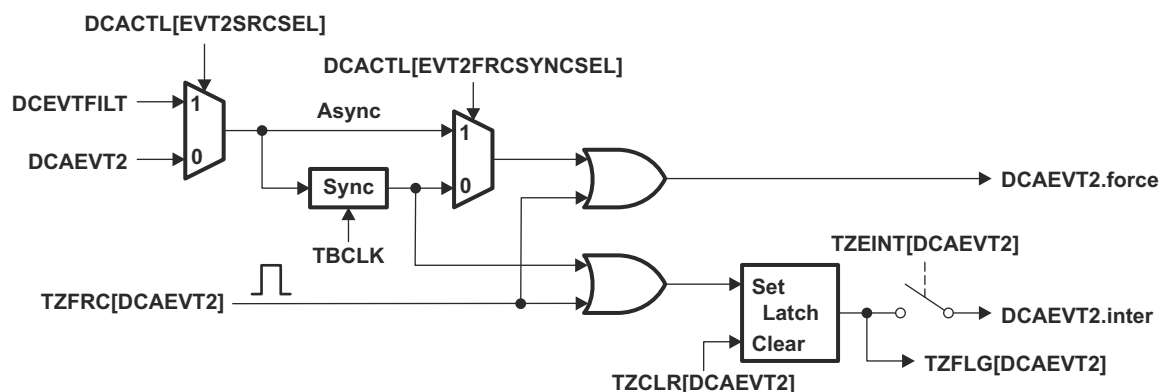

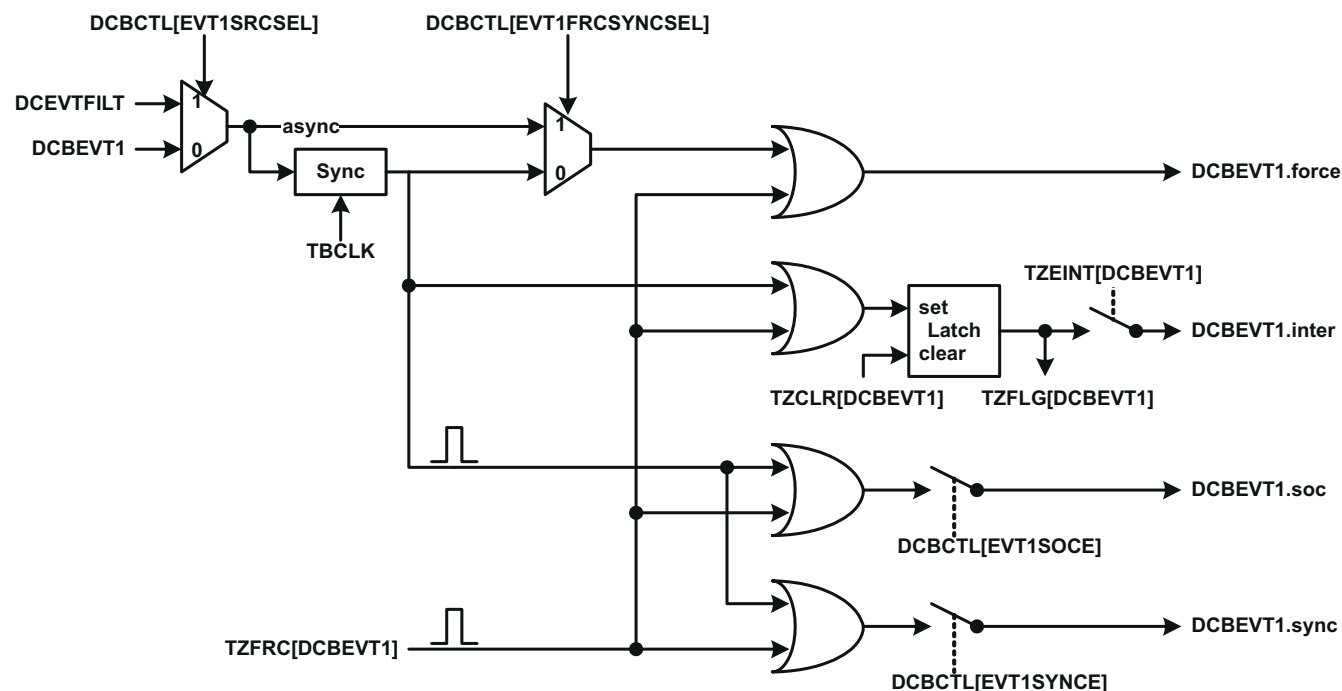

**Figure 18-46. DCAEVT2 Event Triggering**

Figure 18-47 and Figure 18-48 show how the DCBEVT1, DCBEVT2, or DCEVTFILT signals are processed to generate the digital compare B event force, interrupt, soc, and sync signals.

**Figure 18-47. DCBEVT1 Event Triggering**

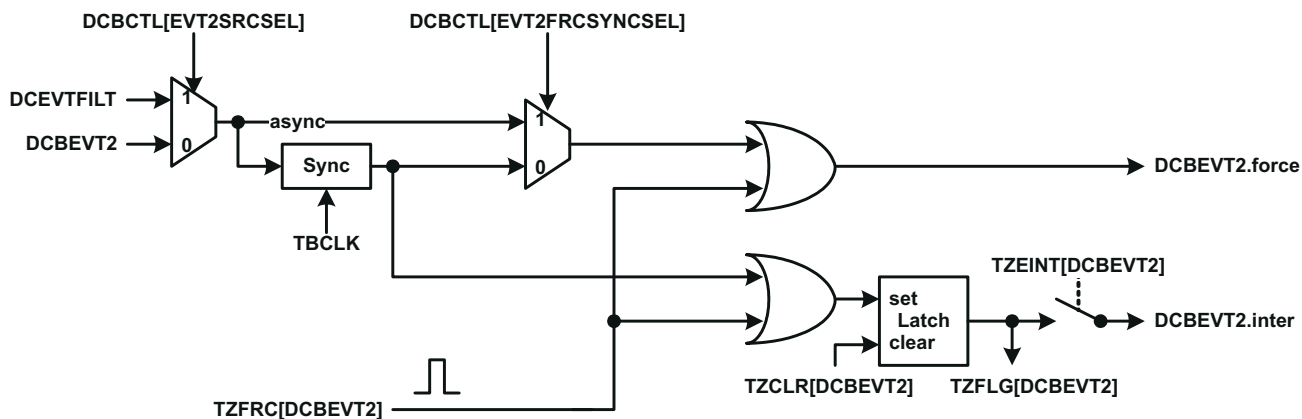

Figure 18-48. DCBEVT2 Event Triggering

### 18.2.9.3.2 Event Filtering

The DCAEVT1/2 and DCBEVT1/2 events can be filtered via event filtering logic to remove noise by optionally blanking events for a certain period of time. This is useful for cases where the analog comparator outputs may be selected to trigger DCAEVT1/2 and DCBEVT1/2 events, and the blanking logic is used to filter out potential noise on the signal prior to tripping the PWM outputs or generating an interrupt or ADC start-of-conversion. The event filtering can also capture the TBCTR value of the trip event. [Figure 18-49](#) shows the details of the event filtering logic.

If the blanking logic is enabled, one of the digital compare events – DCAEVT1, DCAEVT2, DCBEVT1, DCBEVT2 – is selected for filtering. The blanking window, which filters out all event occurrences on the signal while it is active, will be aligned to either a CTR = PRD pulse or a CTR = 0 pulse (configured by the DCFCTL[PULSESEL] bits). An offset value in TBCLK counts is programmed into the DCFOFFSET register, which determines at what point after the CTR = PRD or CTR = 0 pulse the blanking window starts. The duration of the blanking window, in number of TBCLK counts after the offset counter expires, is written to the DCFWINDOW register by the application. During the blanking window, all events are ignored. Before and after the blanking window ends, events can generate soc, sync, interrupt, and force signals as before.

[Figure 18-50](#) illustrates several timing conditions for the offset and blanking window within an ePWM period. Notice that if the blanking window crosses the CTR = 0 or CTR = PRD boundary, the next window still starts at the same offset value after the CTR = 0 or CTR = PRD pulse.

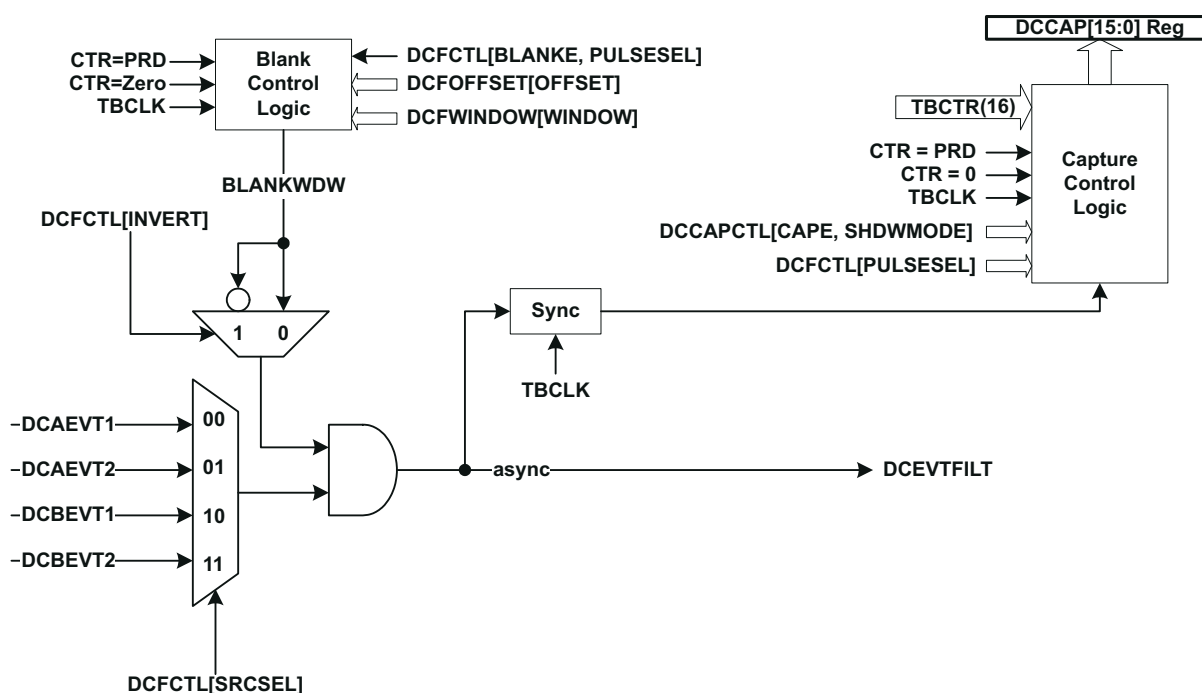

Figure 18-49. Event Filtering

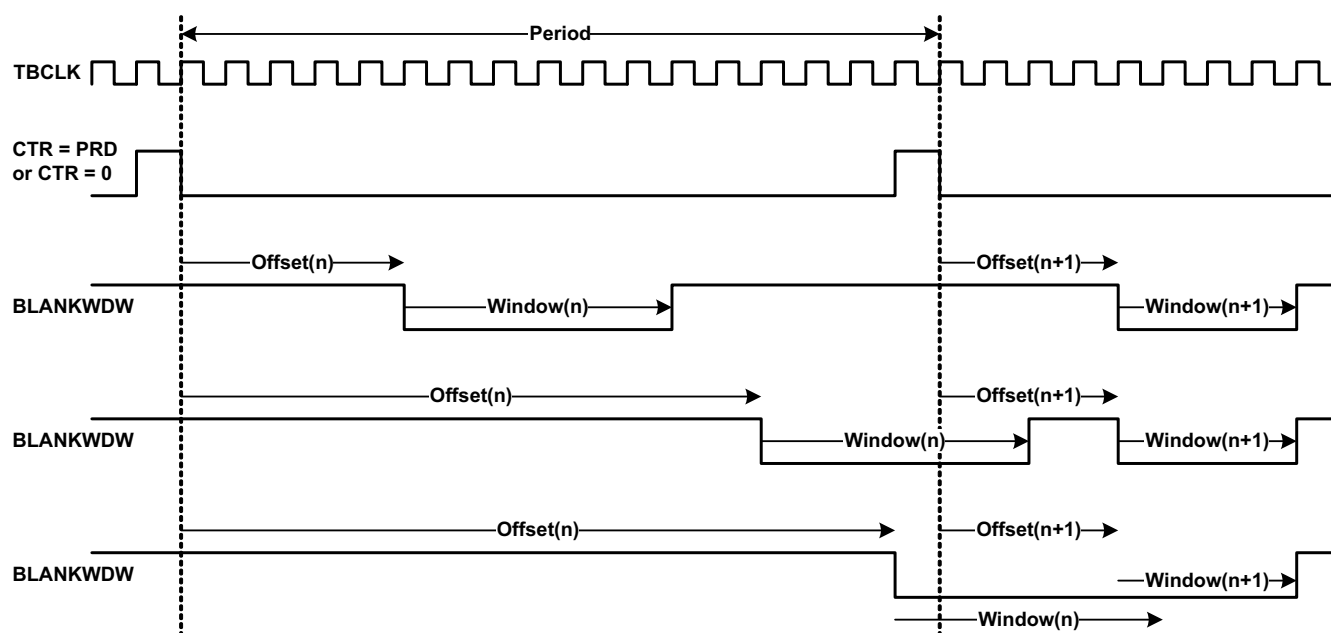

Figure 18-50. Blanking Window Timing Diagram

### 18.2.10 Proper Interrupt Initialization Procedure

When the ePWM peripheral clock is enabled it may be possible that interrupt flags may be set due to spurious events due to the ePWM registers not being properly initialized. The proper procedure for initializing the ePWM peripheral is as follows:

1. Disable global interrupts (CPU INTM flag)
2. Disable ePWM interrupts
3. Set TBCLKSYNC = 0
4. Initialize peripheral registers
5. Set TBCLKSYNC = 1
6. Clear any spurious ePWM flags (including interrupt flags)
7. Enable ePWM interrupts
8. Enable global interrupts

### 18.2.11

## 18.3 Application Examples

An ePWM module has all the local resources necessary to operate completely as a standalone module or to operate in synchronization with other identical ePWM modules.

### 18.3.1 Overview of Multiple Modules

Previously in this chapter, all discussions have described the operation of a single module. To facilitate the understanding of multiple modules working together in a system, the ePWM module described in reference is represented by the more simplified block diagram shown in [Figure 18-51](#). This simplified ePWM block shows only the key resources needed to explain how a multiswitch power topology is controlled with multiple ePWM modules working together.

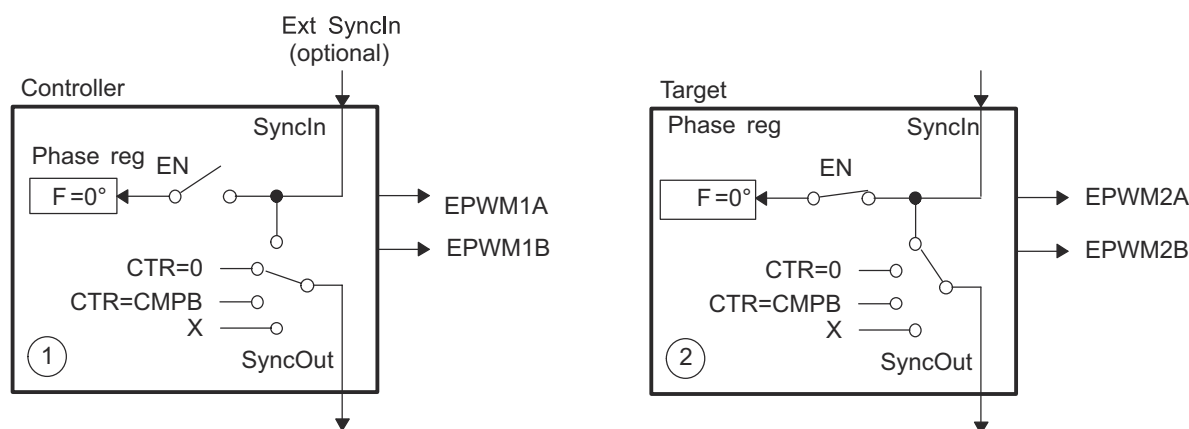

**Figure 18-51. Simplified ePWM Module**

### 18.3.2 Key Configuration Capabilities

The key configuration choices available to each module are as follows:

- Options for SyncIn
  - Load own counter with phase register on an incoming sync strobe—enable (EN) switch closed
  - Do nothing or ignore incoming sync strobe—enable switch open
  - Sync flow-through - SyncOut connected to SyncIn
  - Controller mode, provides a sync at PWM boundaries—SyncOut connected to CTR = PRD
  - Controller mode, provides a sync at any programmable point in time—SyncOut connected to CTR = CMPB
  - Module is in standalone mode and provides No sync to other modules—SyncOut connected to X (disabled)
- Options for SyncOut
  - Sync flow-through - SyncOut connected to SyncIn
  - Controller mode, provides a sync at PWM boundaries—SyncOut connected to CTR = PRD
  - Controller mode, provides a sync at any programmable point in time—SyncOut connected to CTR = CMPB
  - Module is in standalone mode and provides No sync to other modules—SyncOut connected to X (disabled)

For each choice of SyncOut, a module may also choose to load its own counter with a new phase value on a SyncIn strobe input or choose to ignore it, that is, via the enable switch. Although various combinations are possible, the two most common—controller module and target module modes—are shown in [Figure 18-52](#).

**Figure 18-52. EPWM1 Configured as a Typical Controller, EPWM2 Configured as a Target**

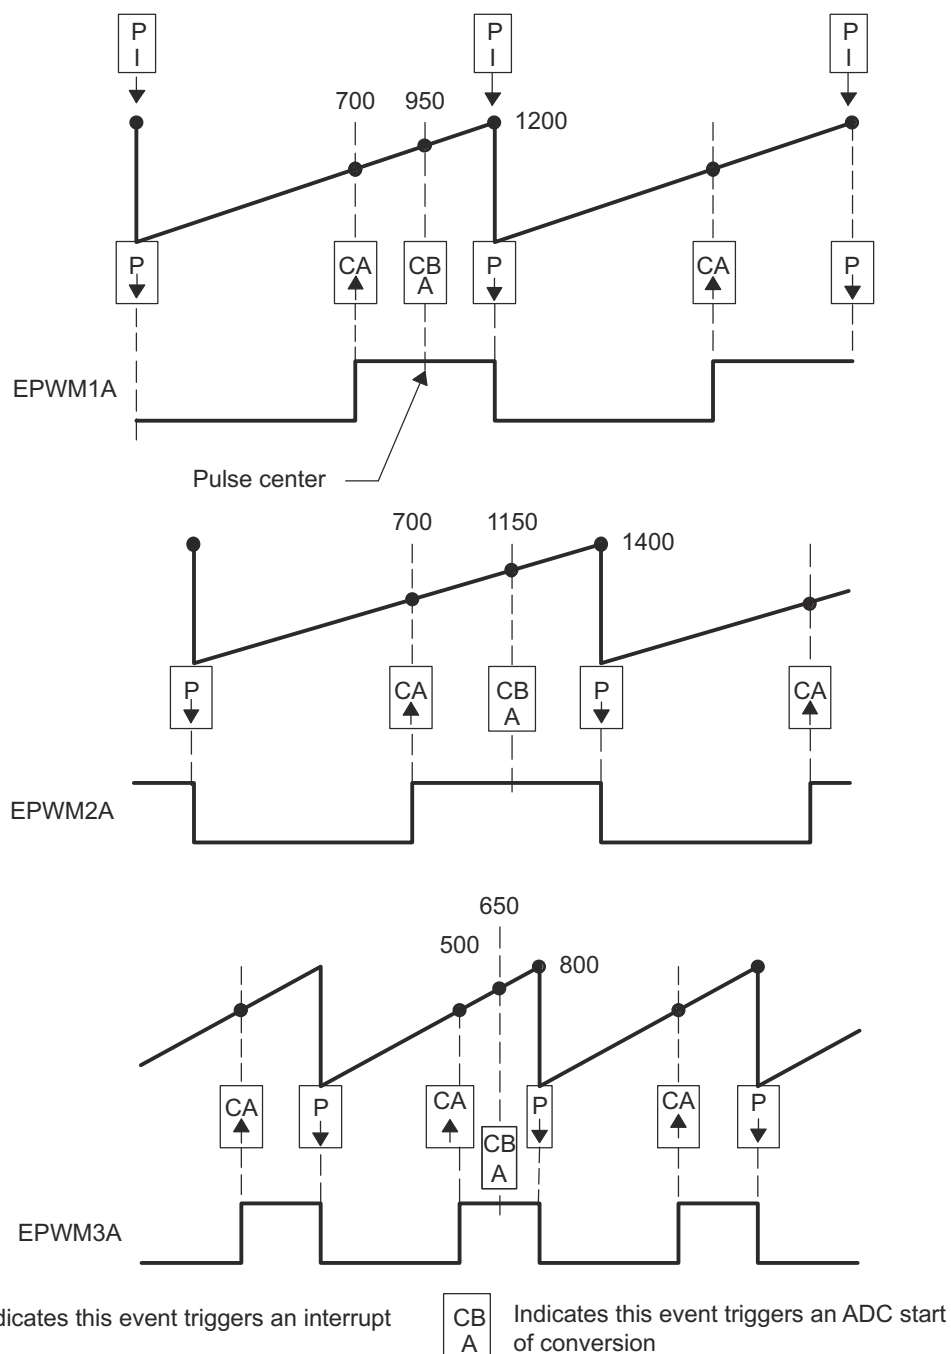

### 18.3.3 Controlling Multiple Buck Converters With Independent Frequencies

One of the simplest power converter topologies is the buck. A single ePWM module configured as a controller can control two buck stages with the same PWM frequency. If independent frequency control is required for each buck converter, then one ePWM module must be allocated for each converter stage. Figure 18-53 shows four buck stages, each running at independent frequencies. In this case, all four ePWM modules are configured as Controllers and no synchronization is used. Figure 18-54 shows the waveforms generated by the setup shown in Figure 18-53; note that only three waveforms are shown, although there are four stages.

A.  $\odot = X$  indicates value in phase register is a "don't care"

**Figure 18-53. Control of Four Buck Stages. Here  $F_{PWM1} \neq F_{PWM2} \neq F_{PWM3} \neq F_{PWM4}$**

**Figure 18-54. Buck Waveforms for Figure 18-53 (Note: Only three bucks shown here)**

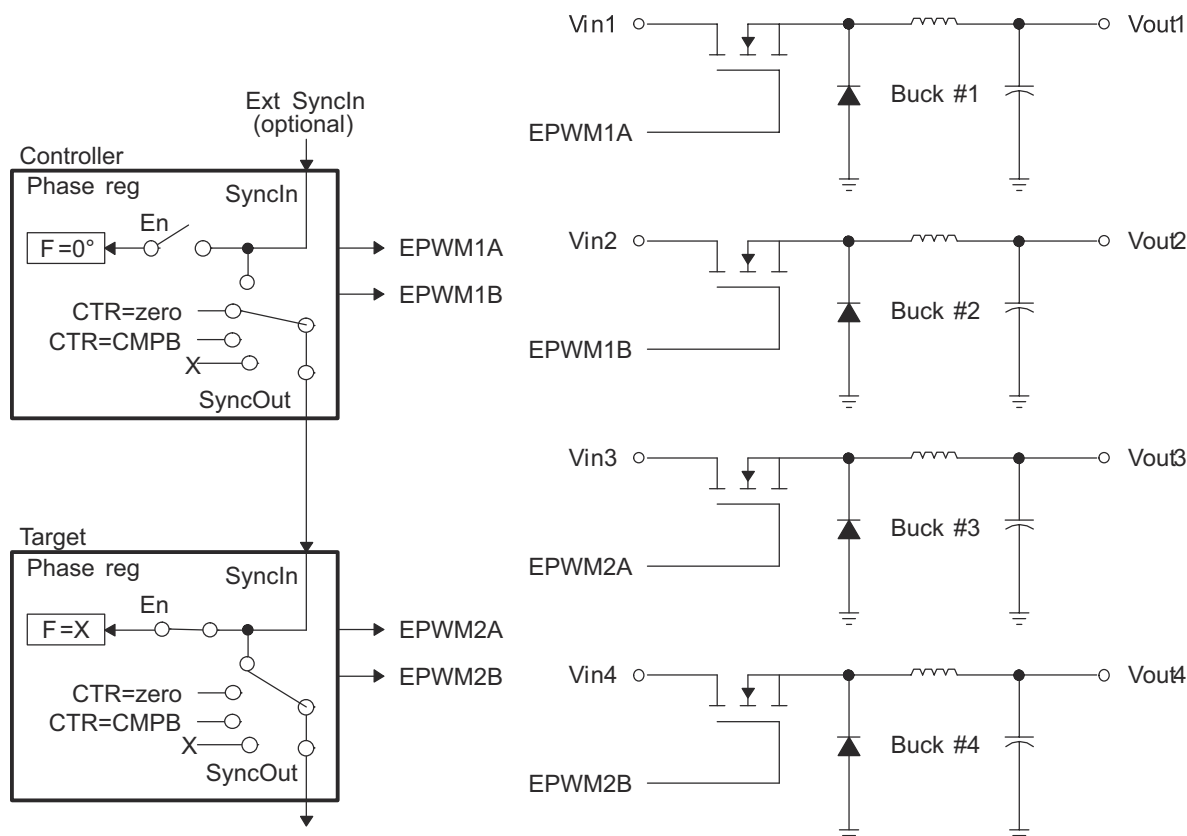

**Example 18-8. Configuration for Example in Figure 18-54**

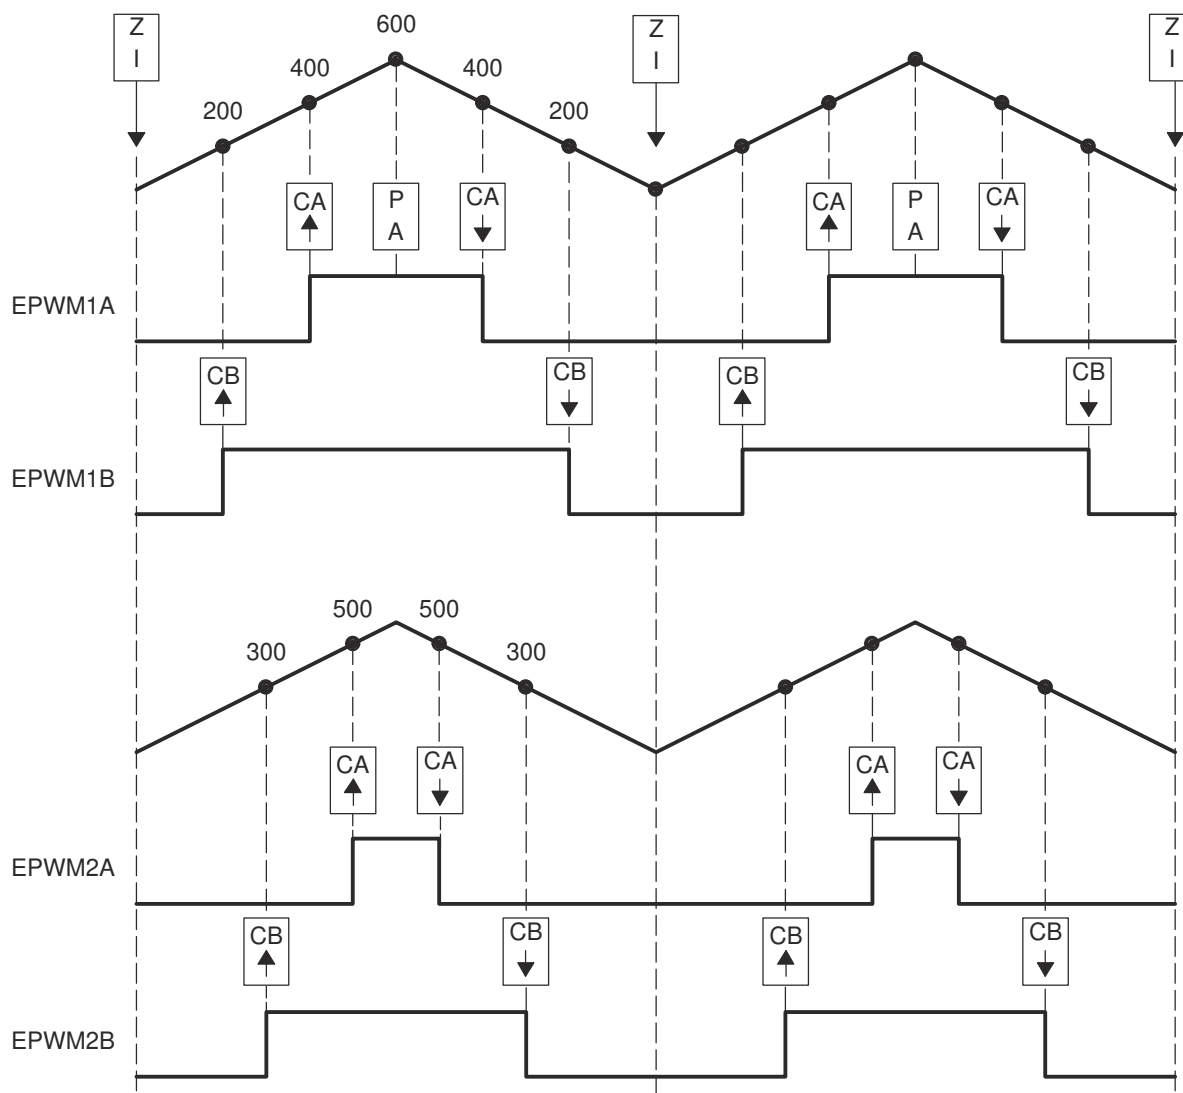

```
//=====
// (Note: code for only 3 modules shown)
// Initialization Time
//=====
// EPWM Module 1 config
EPwm1Regs.TBPRD = 1200; // Period = 1201 TBCLK counts
EPwm1Regs.TBPHS.half.TBPHS = 0; // Set Phase register to zero
EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP; // Asymmetrical mode
EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE; // Phase loading disabled
EPwm1Regs.TBCTL.bit.PRDL = TB_SHADOW;
EPwm1Regs.TBCTL.bit.SYNCSEL = TB_SYNC_DISABLE;
EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO; // load on CTR=Zero
EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO; // load on CTR=Zero
EPwm1Regs.AQCTLA.bit.PR = AQ_CLEAR;
EPwm1Regs.AQCTLA.bit.CAU = AQ_SET;
// EPWM Module 2 config
EPwm2Regs.TBPRD = 1400; // Period = 1401 TBCLK counts
EPwm2Regs.TBPHS.half.TBPHS = 0; // Set Phase register to zero
EPwm2Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP; // Asymmetrical mode
EPwm2Regs.TBCTL.bit.PHSEN = TB_DISABLE; // Phase loading disabled
EPwm2Regs.TBCTL.bit.PRDL = TB_SHADOW;
EPwm2Regs.TBCTL.bit.SYNCSEL = TB_SYNC_DISABLE;
EPwm2Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm2Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
EPwm2Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO; // load on CTR=Zero
EPwm2Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO; // load on CTR=Zero
EPwm2Regs.AQCTLA.bit.PR = AQ_CLEAR;
EPwm2Regs.AQCTLA.bit.CAU = AQ_SET;
// EPWM Module 3 config
EPwm3Regs.TBPRD = 800; // Period = 801 TBCLK counts
EPwm3Regs.TBPHS.half.TBPHS = 0; // Set Phase register to zero
EPwm3Regs.TBCTL.bit.CTRMODE = TB_COUNT_UP;
EPwm3Regs.TBCTL.bit.PHSEN = TB_DISABLE; // Phase loading disabled
EPwm3Regs.TBCTL.bit.PRDL = TB_SHADOW;
EPwm3Regs.TBCTL.bit.SYNCSEL = TB_SYNC_DISABLE;
EPwm3Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm3Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
EPwm3Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO; // load on CTR=Zero
EPwm3Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO; // load on CTR=Zero
EPwm3Regs.AQCTLA.bit.PR = AQ_CLEAR;
EPwm3Regs.AQCTLA.bit.CAU = AQ_SET;
//
// Run Time (Note: Example execution of one run-time instant)
//=====
EPwm1Regs.CMPA.half.CMPA = 700; // adjust duty for output EPWM1A
EPwm2Regs.CMPA.half.CMPA = 700; // adjust duty for output EPWM2A
EPwm3Regs.CMPA.half.CMPA = 500; // adjust duty for output EPWM3A
```

### 18.3.4 Controlling Multiple Buck Converters With Same Frequencies

If synchronization is a requirement, ePWM module 2 can be configured as a target and can operate at integer multiple (N) frequencies of module 1. The sync signal from controller to target ensures these modules remain locked. Figure 18-55 shows such a configuration; Figure 18-56 shows the waveforms generated by the configuration.

**Figure 18-55. Control of Four Buck Stages. (Note:  $F_{PWM2} = N \times F_{PWM1}$ )**

**Figure 18-56. Buck Waveforms for Figure 18-55 (Note:  $F_{PWM2} = F_{PWM1}$ )**

**Example 18-9. Code Snippet for Configuration in Figure 18-55**

```
//=====
// EPWM Module 1 config
EPwm1Regs.TBPRD = 600; // Period = 1200 TBCLK counts
EPwm1Regs.TBPHS.half.TBPHS = 0; // Set Phase register to zero
EPwm1Regs.TBCTL.bit.CTRMODE = TB_COUNT_UPDOWN; // Symmetrical mode
EPwm1Regs.TBCTL.bit.PHSEN = TB_DISABLE; // Controller module
EPwm1Regs.TBCTL.bit.PRDL = TB_SHADOW;
EPwm1Regs.TBCTL.bit.SYNCSEL = TB_CTR_ZERO; // Sync down-stream module
EPwm1Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
EPwm1Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO; // load on CTR=Zero
EPwm1Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO; // load on CTR=Zero
EPwm1Regs.AQCTLA.bit.CAU = AQ_SET; // set actions for EPWM1A
EPwm1Regs.AQCTLA.bit.CAD = AQ_CLEAR;
EPwm1Regs.AQCTLB.bit.CBU = AQ_SET; // set actions for EPWM1B
EPwm1Regs.AQCTLB.bit.CBD = AQ_CLEAR;
// EPWM Module 2 config
EPwm2Regs.TBPRD = 600; // Period = 1200 TBCLK counts
EPwm2Regs.TBPHS.half.TBPHS = 0; // Set Phase register to zero
EPwm2Regs.TBCTL.bit.CTRMODE = TB_COUNT_UPDOWN; // Symmetrical mode
EPwm2Regs.TBCTL.bit.PHSEN = TB_ENABLE; // Target module
EPwm2Regs.TBCTL.bit.PRDL = TB_SHADOW;
EPwm2Regs.TBCTL.bit.SYNCSEL = TB_SYNC_IN; // sync flow-through
EPwm2Regs.CMPCTL.bit.SHDWAMODE = CC_SHADOW;
EPwm2Regs.CMPCTL.bit.SHDWBMODE = CC_SHADOW;
EPwm2Regs.CMPCTL.bit.LOADAMODE = CC_CTR_ZERO; // load on CTR=Zero
EPwm2Regs.CMPCTL.bit.LOADBMODE = CC_CTR_ZERO; // load on CTR=Zero
EPwm2Regs.AQCTLA.bit.CAU = AQ_SET; // set actions for EPWM2A
EPwm2Regs.AQCTLA.bit.CAD = AQ_CLEAR;
EPwm2Regs.AQCTLB.bit.CBU = AQ_SET; // set actions for EPWM2B
EPwm2Regs.AQCTLB.bit.CBD = AQ_CLEAR;
//
// Run Time (Note: Example execution of one run-time instance)
//=====
EPwm1Regs.CMPA.half.CMPA = 400; // adjust duty for output EPWM1A
EPwm1Regs.CMPB = 200; // adjust duty for output EPWM1B
EPwm2Regs.CMPA.half.CMPA = 500; // adjust duty for output EPWM2A
EPwm2Regs.CMPB = 300; // adjust duty for output EPWM2B
```

EPwm2Regs.CMPB = 250; // adjust point-in-time for ADCSOC trigger
```

#### 18.3.5.1

### 18.3.6 Controlling Dual 3-Phase Inverters for Motors (ACI and PMSM)

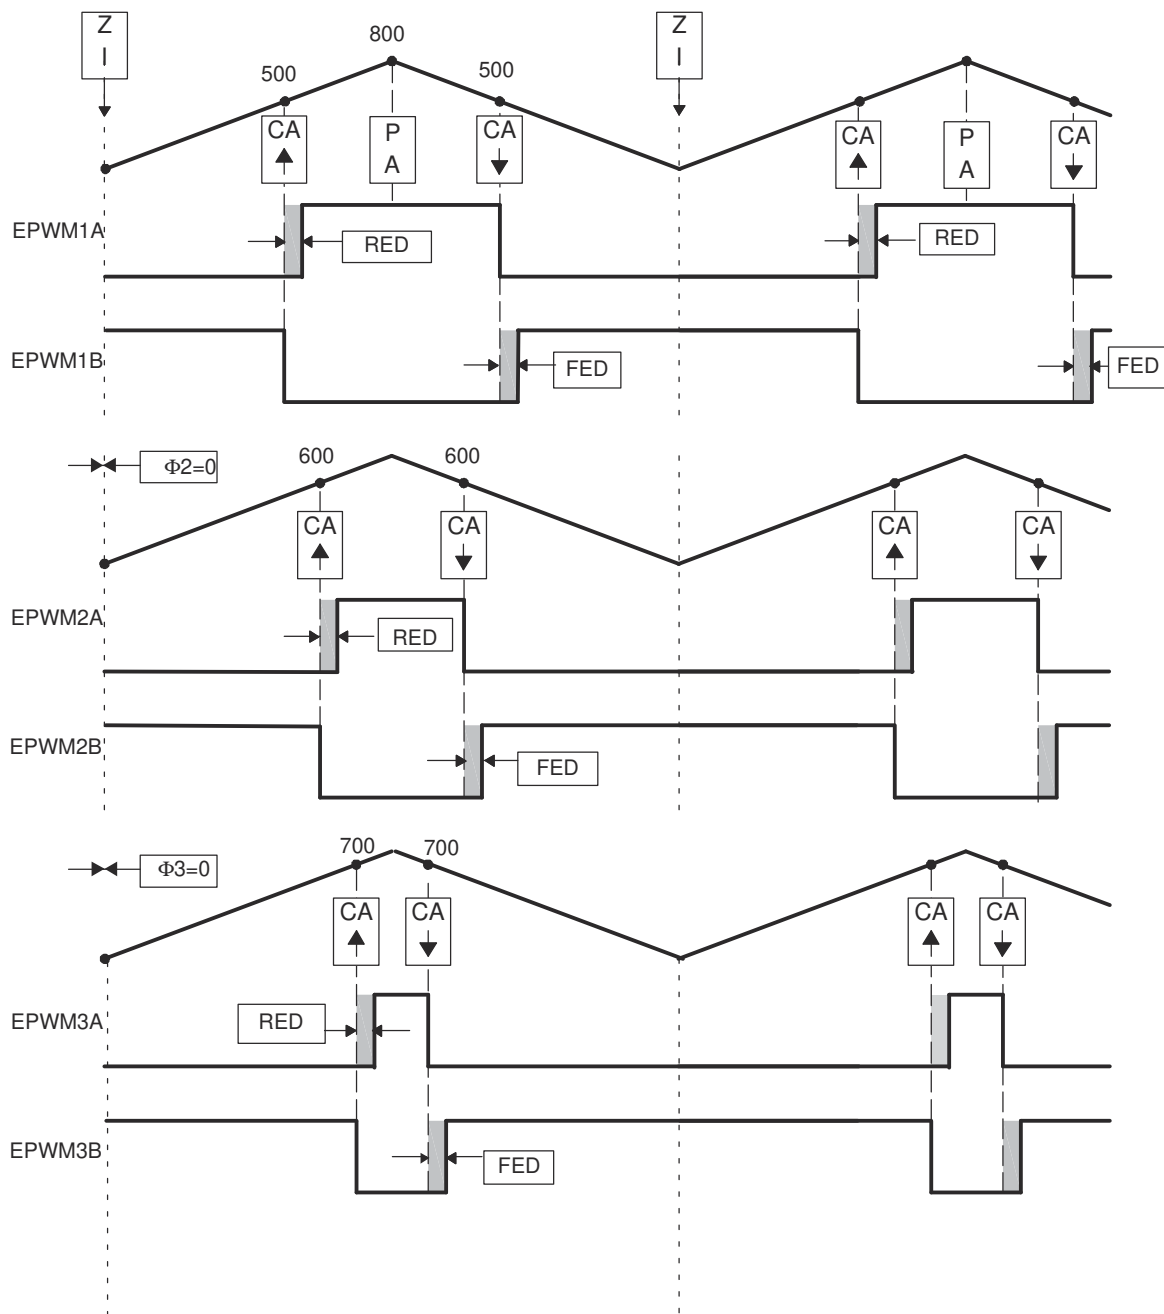

The idea of multiple modules controlling a single power stage can be extended to the 3-phase Inverter case. In such a case, six switching elements can be controlled using three PWM modules, one for each leg of the inverter. Each leg must switch at the same frequency and all legs must be synchronized. A controller + two targets configuration can easily address this requirement. Figure 18-59 shows how six PWM modules can control two independent 3-phase inverters; each running a motor.

As in the cases shown in the previous sections, we have a choice of running each inverter at a different frequency (module 1 and module 4 are controllers as in Figure 18-59), or both inverters can be synchronized by using one controller (module 1) and five targets. In this case, the frequency of modules 4, 5, and 6 (all equal) can be integer multiples of the frequency for modules 1, 2, 3 (also all equal).

**Figure 18-59. Control of Dual 3-Phase Inverter Stages as Is Commonly Used in Motor Control**

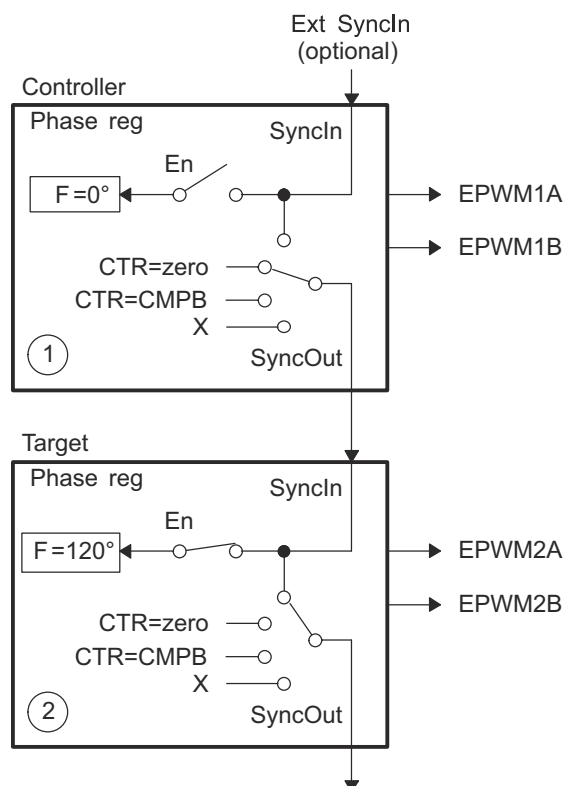

**Figure 18-60. 3-Phase Inverter Waveforms for Figure 18-59 (Only One Inverter Shown)**

### 18.3.7 Practical Applications Using Phase Control Between PWM Modules

So far, none of the examples have made use of the phase register (TBPHS). It has either been set to zero or its value has been a don't care. However, by programming appropriate values into TBPHS, multiple PWM modules can address another class of applications that rely on phase relationship between stages for correct operation. As described in the TB module section, a PWM module can be configured to allow a SyncIn pulse to cause the TBPHS register to be loaded into the TBCTR register. To illustrate this concept, [Figure 18-61](#) shows a controller and target module with a phase relationship of 120°, that is, the target leads the controller.

**Figure 18-61. Configuring Two PWM Modules for Phase Control**

Figure 18-62 shows the associated timing waveforms for this configuration. Here, TBPRD = 600 for both controller and target. For the target, TBPHS = 200 (that is,  $200/600 \times 360^\circ = 120^\circ$ ). Whenever the controller generates a SyncIn pulse (CTR = PRD), the value of TBPHS = 200 is loaded into the target TBCTR register so the target time-base is always leading the controller's time-base by  $120^\circ$ .

**Figure 18-62. Timing Waveforms Associated With Phase Control Between 2 Modules**

## 18.4 ePWM Module Control and Status Registers

Table 18-22 lists the memory-mapped registers for the ePWM Module Control and Status Registers. All register offset addresses not listed in Table 18-22 should be considered as reserved locations and the register contents should not be modified.

**Table 18-22. ePWM Module Control and Status Registers**

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 18-23. TBSTS Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-3	RESERVED	R	0h	Reserved
2	CTRMAX	R	0h	Time-Base Counter Max Latched Status Bit 0h = Reading a 0 indicates the time-base counter never reached its maximum value. Writing a 0 will have no effect. 1h = Reading a 1 on this bit indicates that the time-base counter reached the max value 0xFFFF. Writing a 1 to this bit will clear the latched event.
1	SYNCl	R/W	0h	Input Synchronization Latched Status Bit 0h = Writing a 0 will have no effect. Reading a 0 indicates no external synchronization event has occurred. 1h = Reading a 1 on this bit indicates that an external synchronization event has occurred (EPWMxSYNCl). Writing a 1 to this bit will clear the latched event.
0	CTRDlR	R	1h	Time-Base Counter Direction Status Bit. At reset, the counter is frozen, therefore, this bit has no meaning. To make this bit meaningful, you must first set the appropriate mode via TBCTL[CTRMODE]. 0h = Time-Base Counter is currently counting down. 1h = Time-Base Counter is currently counting up.

## 18.4.2 TBCTL Register (Offset = 2h) [reset = 83h]

TBCTL is shown in [Figure 18-64](#) and described in [Table 18-24](#).

**Figure 18-64. TBCTL Register**

15	14	13	12	11	10	9	8

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 18-24. TBCTL Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-14	FREE_SOFT	R/W	0h	Emulation Mode Bits. These bits select the behavior of the ePWM time-base counter during emulation events: 0h = Stop after the next time-base counter increment or decrement. 1h = Stop when counter completes a whole cycle. In up-count mode, stop when the time-base counter = period (TBCTR = TBPRD). In down-count mode, stop when the time-base counter = 0x0000 (TBCTR = 0x0000). In up-down-count mode, stop when the time-base counter = 0x0000 (TBCTR = 0x0000). 2h = Free run 3h = Free run
13	PHSDIR	R/W	0h	Phase Direction Bit. This bit is only used when the time-base counter is configured in the up-down-count mode. The PHSDIR bit indicates the direction the time-base counter (TBCTR) will count after a synchronization event occurs and a new phase value is loaded from the phase (TBPHS) register. This is irrespective of the direction of the counter before the synchronization event. In the up-count and down-count modes this bit is ignored. 0h = Count down after the synchronization event. 1h = Count up after the synchronization event.
12-10	CLKDIV	R/W	0h	Time-base Clock Prescale Bits. These bits determine part of the time-base clock prescale value. $TBCLK = VCLK4 / (HSPCLKDIV \times CLKDIV)$ 0h = /1 (default on reset) 1h = /2 2h = /4 3h = /8 4h = /16 5h = /32 6h = /64 7h = /128

**Table 18-24. TBCTL Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
9-7	HSPCLKDIV	R/W	1h	High Speed Time-base Clock Prescale Bits. These bits determine part of the time-base clock prescale value. $TBCLK = VCLK4 / (HSPCLKDIV \times CLKDIV)$ 0h = /1 1h = /2 (default on reset) 2h = /4 3h = /6 4h = /8 5h = /10 6h = /12 7h = /14
6	SWFSYNC	R/W	0h	Software Forced Synchronization Pulse. This event is ORed with the EPWMxSYNCl input of the ePWM module. SWFSYNC is valid (operates) only when EPWMxSYNCl is selected by SYNCOSSEL = 0. 0h = Writing a 0 has no effect and reads always return a 0. 1h = Writing a 1 forces a one-time synchronization pulse to be generated.
5-4	SYNCOSSEL	R/W	0h	Synchronization Output Select. These bits select the source of the EPWMxSYNCO signal. 0h = EPWMxSYNCO 1h = CTR = zero: Time-base counter equal to zero (TBCTR = 0x0000) 2h = CTR = CMPB : Time-base counter equal to counter-compare B (TBCTR = CMPB) 3h = Disable EPWMxSYNCO signal
3	PRDL	R/W	0h	Active Period Register Load From Shadow Register Select 0h = The period register (TBPRD) is loaded from its shadow register when the time-base counter, TBCTR, is equal to 0. A write or read to the TBPRD register accesses the shadow register. 1h = Load the TBPRD register immediately without using a shadow register. A write or read to the TBPRD register directly accesses the active register.
2	PHSEN	R/W	0h	Counter Register Load From Phase Register Enable 0h = Do not load the time-base counter (TBCTR) from the time-base phase register (TBPHS) 1h = Load the time-base counter with the phase register when an EPWMxSYNCl input signal occurs or when a software synchronization is forced by the SWFSYNC bit, or when a digital compare sync event occurs.
1-0	CTRM	R/W	3h	Counter Mode. The time-base counter mode is normally configured once and not changed during normal operation. If you change the mode of the counter, the change will take effect at the next TBCLK edge and the current counter value shall increment or decrement from the value before the mode change. These bits set the time-base counter mode of operation as follows: 0h = Up-count mode 1h = Down-count mode 2h = Up-down-count mode 3h = Stop-freeze counter operation (default on reset)

### 18.4.3 TBPHS Register (Offset = 4h) [reset = 0h]

TBPHS is shown in [Figure 18-65](#) and described in [Table 18-25](#).

**Figure 18-65. TBPHS Register**

Bit	Field	Type	Reset	Description
15-10	RESERVED	R	0h	Reserved
9	SHDWBFULL	R	0h	Counter-compare B (CMPB) Shadow Register Full Status Flag. This bit self clears once a load-strobe occurs. 0h = CMPB shadow FIFO not full yet 1h = Indicates the CMPB shadow FIFO is full a CPU write will overwrite current shadow value.
8	SHDWAFULL	R	0h	Counter-compare A (CMPA) Shadow Register Full Status Flag. The flag bit is set when a 32-bit write to CMPA:CMPAHR register or a 16-bit write to CMPA register is made. A 16-bit write to CMPAHR register will not affect the flag. This bit self clears once a load-strobe occurs. 0h = CMPA shadow FIFO not full yet 1h = Indicates the CMPA shadow FIFO is full, a CPU write will overwrite the current shadow value.
7	RESERVED	R	0h	Reserved
6	SHDWBMODE	R/W	0h	Counter-compare B (CMPB) Register Operating Mode. 0h = Shadow mode. Operates as a double buffer. All writes via the CPU access the shadow register. 1h = Immediate mode. Only the active compare B register is used. All writes and reads directly access the active register for immediate compare action.
5	RESERVED	R	0h	Reserved
4	SHDWAMODE	R/W	0h	Counter-compare A (CMPA) Register Operating Mode. 0h = Shadow mode. Operates as a double buffer. All writes via the CPU access the shadow register. 1h = Immediate mode. Only the active compare register is used. All writes and reads directly access the active register for immediate compare action.

**Table 18-28. CMPCTL Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
3-2	LOADBMODE	R/W	0h	Active Counter-Compare B (CMPB) Load From Shadow Select Mode. This bit has no effect in immediate mode (CMPCTL[SHDWBMODE] = 1). 0h = Load on CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000) 1h = Load on CTR = PRD: Time-base counter equal to period (TBCTR = TBPRD) 2h = Load on either CTR = Zero or CTR = PRD 3h = Freeze (no loads possible)
1-0	LOADAMODE	R/W	0h	Active Counter-Compare A (CMPA) Load From Shadow Select Mode. This bit has no effect in immediate mode (CMPCTL[SHDWAMODE] = 1). 0h = Load on CTR = Zero: Time-base counter equal to zero (TBCTR = 0x0000) 1h = Load on CTR = PRD: Time-base counter equal to period (TBCTR = TBPRD) 2h = Load on either CTR = Zero or CTR = PRD 3h = Freeze (no loads possible)

### 18.4.7 CMPA Register (Offset = 10h) [reset = 0h]

CMPA is shown in [Figure 18-69](#) and described in [Table 18-29](#).

**Figure 18-69. CMPA Register**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CMPA															
R/W-0h															

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 18-29. CMPA Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-0	CMPA	R/W	0h	<p>The value in the active CMPA register is continuously compared to the time-base counter (TBCTR). When the values are equal, the counter-compare module generates a "time-base counter equal to counter compare A" event. This event is sent to the action-qualifier where it is qualified and converted it into one or more actions. These actions can be applied to either the EPWMxA or the EPWMxB output depending on the configuration of the AQCTLA and AQCTLB registers. The actions that can be defined in the AQCTLA and AQCTLB registers include:</p> <ul style="list-style-type: none"> <li>Do nothing, the event is ignored.</li> <li>Clear: Pull the EPWMxA and/or EPWMxB signal low</li> <li>Set: Pull the EPWMxA and/or EPWMxB signal high</li> <li>Toggle the EPWMxA and/or EPWMxB signal</li> </ul> <p>Shadowing of this register is enabled and disabled by the CMPCTL[SHDWAMODE] bit. By default this register is shadowed. If CMPCTL[SHDWAMODE] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the CMPCTL[LOADAMODE] bit field determines which event will load the active register from the shadow register. Before a write, the CMPCTL[SHDWAFULL] bit can be read to determine if the shadow register is currently full. If CMPCTL[SHDWAMODE] = 1, then the shadow register is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware. In either mode, the active and shadow registers share the same memory map address.</p>

### 18.4.8 AQCTLA Register (Offset = 14h) [reset = 0h]

AQCTLA is shown in [Figure 18-70](#) and described in [Table 18-30](#).

**Table 18-34. DBCTL Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	HALFCYCLE	R/W	0h	Half Cycle Clocking Enable Bit: 0h = Full cycle clocking enabled. The dead-band counters are clocked at the TBCLK rate. 1h = Half cycle clocking enabled. The dead-band counters are clocked at TBCLK x 2.
14-6	RESERVED	R	0h	Reserved
5-4	IN_MODE	R/W	0h	Dead Band Input Mode Control. Bit 5 controls the S5 switch and bit 4 controls the S4 switch shown in . This allows you to select the input source to the falling-edge and rising-edge delay. To produce classical dead-band waveforms the default is EPWMxA In is the source for both falling and rising-edge delays. 0h = EPWMxA In (from the action-qualifier) is the source for both falling-edge and rising-edge delay. 1h = EPWMxB In (from the action-qualifier) is the source for rising-edge delayed signal. EPWMxA In (from the action-qualifier) is the source for falling-edge delayed signal. 2h = EPWMxA In (from the action-qualifier) is the source for rising-edge delayed signal. EPWMxB In (from the action-qualifier) is the source for falling-edge delayed signal. 3h = EPWMxB In (from the action-qualifier) is the source for both rising-edge delay and falling-edge delayed signal.

**Table 18-34. DBCTL Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
3-2	POLSEL	R/W	0h	<p>Polarity Select Control.</p> <p>Bit 3 controls the S3 switch and bit 2 controls the S2 switch shown in .</p> <p>This allows you to selectively invert one of the delayed signals before it is sent out of the dead-band submodule.</p> <p>The following descriptions correspond to classical upper/lower switch control as found in one leg of a digital motor control inverter. These assume that DBCTL[OUT_MODE] = 1,1 and DBCTL[IN_MODE] = 0,0. Other enhanced modes are also possible, but not regarded as typical usage modes.</p> <p>0h = Active high (AH) mode. Neither EPWMxA nor EPWMxB is inverted (default).</p> <p>1h = Active low complementary (ALC) mode. EPWMxA is inverted.</p> <p>2h = Active high complementary (AHC). EPWMxB is inverted.</p> <p>3h = Active low (AL) mode. Both EPWMxA and EPWMxB are inverted.</p>
1-0	OUT_MODE	R/W	0h	<p>Dead-band Output Mode Control.</p> <p>Bit 1 controls the S1 switch and bit 0 controls the S0 switch shown in .</p> <p>This allows you to selectively enable or bypass the dead-band generation for the falling-edge and rising-edge delay.</p> <p>0h = Dead-band generation is bypassed for both output signals. In this mode, both the EPWMxA and EPWMxB output signals from the action-qualifier are passed directly to the PWM-chopper submodule. In this mode, the POLSEL and IN_MODE bits have no effect.</p> <p>1h = Disable rising-edge delay. The EPWMxA signal from the action-qualifier is passed straight through to the EPWMxA input of the PWM-chopper submodule. The falling-edge delayed signal is seen on output EPWMxB. The input signal for the delay is determined by DBCTL[IN_MODE].</p> <p>2h = The rising-edge delayed signal is seen on output EPWMxA. The input signal for the delay is determined by DBCTL[IN_MODE].</p> <p>Disable falling-edge delay. The EPWMxB signal from the action-qualifier is passed straight through to the EPWMxB input of the PWM-chopper submodule.</p> <p>3h = Dead-band is fully enabled for both rising-edge delay on output EPWMxA and falling-edge delay on output EPWMxB. The input signal for the delay is determined by DBCTL[IN_MODE].</p>

### 18.4.13 AQCSFRC Register (Offset = 1Eh) [reset = 0h]

AQCSFRC is shown in [Figure 18-75](#) and described in [Table 18-35](#).

#### 18.4.17 TZSEL Register (Offset = 26h) [reset = 0h]

TZSEL is shown in [Figure 18-79](#) and described in [Table 18-39](#).

One-Shot (OSHT) Trip-zone enable/disable (bits 15-8). When any of the enabled pins go low, a one-shot trip event occurs for this ePWM module. When the event occurs, the action defined in the TZCTL register is taken on the EPWMxA and EPWMxB outputs. The one-shot trip condition remains latched until the user clears the condition via the TZCLR register. Cycle-by-Cycle (CBC) Trip-zone enable/disable (bits 7-0). When any of the enabled pins go low, a cycle-by-cycle trip event occurs for this ePWM module. When the event occurs, the action defined in the TZCTL register is taken on the EPWMxA and EPWMxB outputs. A cycle-by-cycle trip condition is automatically cleared when the time-base counter reaches zero.

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 18-47. ETPS Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-14	SOCBCNT	R	0h	ePWM ADC Start-of-Conversion B Event (EPWMxSOCB) Counter Register. These bits indicate how many selected ETSSEL[SOCBSEL] events have occurred: 0h = No events have occurred. 1h = 1 event has occurred. 2h = 2 events have occurred. 3h = 3 events have occurred.
13-12	SOCBPRD	R/W	0h	ePWM ADC Start-of-Conversion B Event (EPWMxSOCB) Period Select. These bits determine how many selected ETSSEL[SOCBSEL] events need to occur before an EPWMxSOCB pulse is generated. To be generated, the pulse must be enabled (ETSSEL[SOCBEN] = 1). The SOCB pulse will be generated even if the status flag is set from a previous start of conversion (ETFLG[SOCB] = 1). Once the SOCB pulse is generated, the ETPS[SOCBCNT] bits will automatically be cleared. 0h = Disable the SOCB event counter. No EPWMxSOCB pulse will be generated 1h = Generate the EPWMxSOCB pulse on the first event: ETPS[SOCBCNT] = 0,1 2h = Generate the EPWMxSOCB pulse on the second event: ETPS[SOCBCNT] = 1,0 3h = Generate the EPWMxSOCB pulse on the third event: ETPS[SOCBCNT] = 1,1
11-10	SOCACNT	R	0h	ePWM ADC Start-of-Conversion A Event (EPWMxSOCA) Counter Register. These bits indicate how many selected ETSSEL[SOCASEL] events have occurred: 0h = No events have occurred. 1h = 1 event has occurred. 2h = 2 events have occurred. 3h = 3 events have occurred.

**Table 18-47. ETPS Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
9-8	SOCAPRD	R/W	0h	<p>ePWM ADC Start-of-Conversion A Event (EPWMxSOCA) Period Select. These bits determine how many selected ETSEL[SOCASEL] events need to occur before an EPWMxSOCA pulse is generated. To be generated, the pulse must be enabled (ETSEL[SOCASEN] = 1). The SOCA pulse will be generated even if the status flag is set from a previous start of conversion (ETFLG[SOCA] = 1). Once the SOCA pulse is generated, the ETPS[SOCACNT] bits will automatically be cleared.</p> <p>0h = Disable the SOCA event counter. No EPWMxSOCA pulse will be generated</p> <p>1h = Generate the EPWMxSOCA pulse on the first event: ETPS[SOCACNT] = 0,1</p> <p>2h = Generate the EPWMxSOCA pulse on the second event: ETPS[SOCACNT] = 1,0</p> <p>3h = Generate the EPWMxSOCA pulse on the third event: ETPS[SOCACNT] = 1,1</p>
7-4	RESERVED	R	0h	Reserved
3-2	INTCNT	R	0h	<p>ePWM Interrupt Event (EPWMx_INT) Counter Register. These bits indicate how many selected ETSEL[INTSEL] events have occurred. These bits are automatically cleared when an interrupt pulse is generated. If interrupts are disabled, ETSEL[INT] = 0 or the interrupt flag is set, ETFLG[INT] = 1, the counter will stop counting events when it reaches the period value ETPS[INTCNT] = ETPS[INTPRD].</p> <p>0h = No events have occurred.</p> <p>1h = 1 event has occurred.</p> <p>2h = 2 events have occurred.</p> <p>3h = 3 events have occurred.</p>
1-0	INTPRD	R/W	0h	<p>ePWM Interrupt (EPWMx_INT) Period Select. These bits determine how many selected ETSEL[INTSEL] events need to occur before an interrupt is generated. To be generated, the interrupt must be enabled (ETSEL[INT] = 1). If the interrupt status flag is set from a previous interrupt (ETFLG[INT] = 1) then no interrupt will be generated until the flag is cleared via the ETCLR[INT] bit. This allows for one interrupt to be pending while another is still being serviced. Once the interrupt is generated, the ETPS[INTCNT] bits will automatically be cleared.</p> <p>Writing a INTPRD value that is the same as the current counter value will trigger an interrupt if it is enabled and the status flag is clear.</p> <p>Writing a INTPRD value that is less than the current counter value will result in an undefined state.</p> <p>If a counter event occurs at the same instant as a new zero or non-zero INTPRD value is written, the counter is incremented.</p> <p>0h = Disable the interrupt event counter. No interrupt will be generated and ETFRC[INT] is ignored.</p> <p>1h = Generate an interrupt on the first event INTCNT = 01 (first event)</p> <p>2h = Generate interrupt on ETPS[INTCNT] = 1,0 (second event)</p> <p>3h = Generate interrupt on ETPS[INTCNT] = 1,1 (third event)</p>

### 18.4.26 ETFRC Register (Offset = 38h) [reset = 0h]

ETFRC is shown in [Figure 18-88](#) and described in [Table 18-48](#).

LEGEND: R/W = Read/Write; R = Read only; W1toCl = Write 1 to clear bit; -n = value after reset

**Table 18-55. DCFOFFSET Register Field Descriptions**

Bit	Field	Type	Reset	Description
15-0	OFFSET	R	0h	Blanking Window Offset. Valid values: 0-FFFFh These 16-bits specify the number of TBCLK cycles from the blanking window reference to the point when the blanking window is applied. The blanking window reference is either period or zero as defined by the DCFCTL[PULSESEL] bit. This offset register is shadowed and the active register is loaded at the reference point defined by DCFCTL[PULSESEL]. The offset counter is also initialized and begins to count down when the active register is loaded. When the counter expires, the blanking window is applied. If the blanking window is currently active, then the blanking window counter is restarted.

### 18.4.34 DCCAPCTL Register (Offset = 6Ah) [reset = 0h]

DCCAPCTL is shown in [Figure 18-96](#) and described in [Table 18-56](#).

**Figure 18-96. DCCAPCTL Register**

15	14	13	12	11	10	9	8

The debug subsystem contains one MCUDebugss at its core that allows the JTAG interface access to device components. The debug subsystem is designed to provide the following debug features:

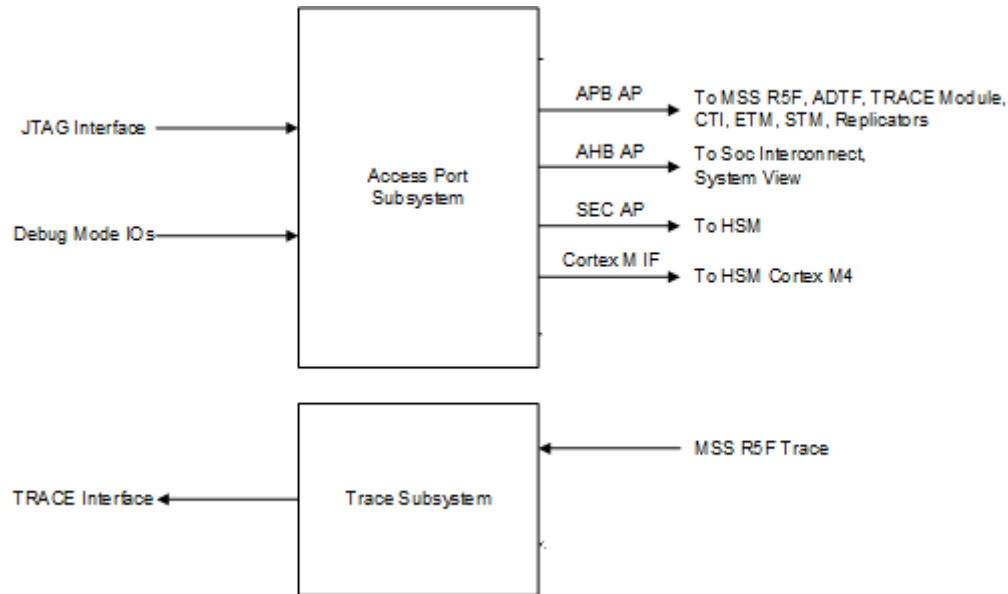

- JTAG debug access to debug resources, mapped through an ARM SWJ-DP and TI ICEPickM scan module
- System memory access without halting the processor
- ETM-based trace for ARM R5F
- Cross trigger to halt and restart MSS based on events such as watchdog, timers, DMA, and time-stamp events
- Capability to read the device ID

## 19.1.4 Trace Subsystem

### 19.1.4.1 Trace Infrastructure

The trace infrastructure is shown in [Figure 19-3](#). Trace data from the MSS CR5 cores and HSM Cortex M4 cores may be routed to the external trace lines over the TPIU-Trace interface. Alternately, there is an 8KB trace memory to store the configured (filtered) trace data onto the memory.

**Figure 19-3. Trace Infrastructure**

The CortexM4 ITM output requires an 8-bit to 32-bit ATB upsizer in the path to convert the signals to be compatible as input to the upstream layers/modules.

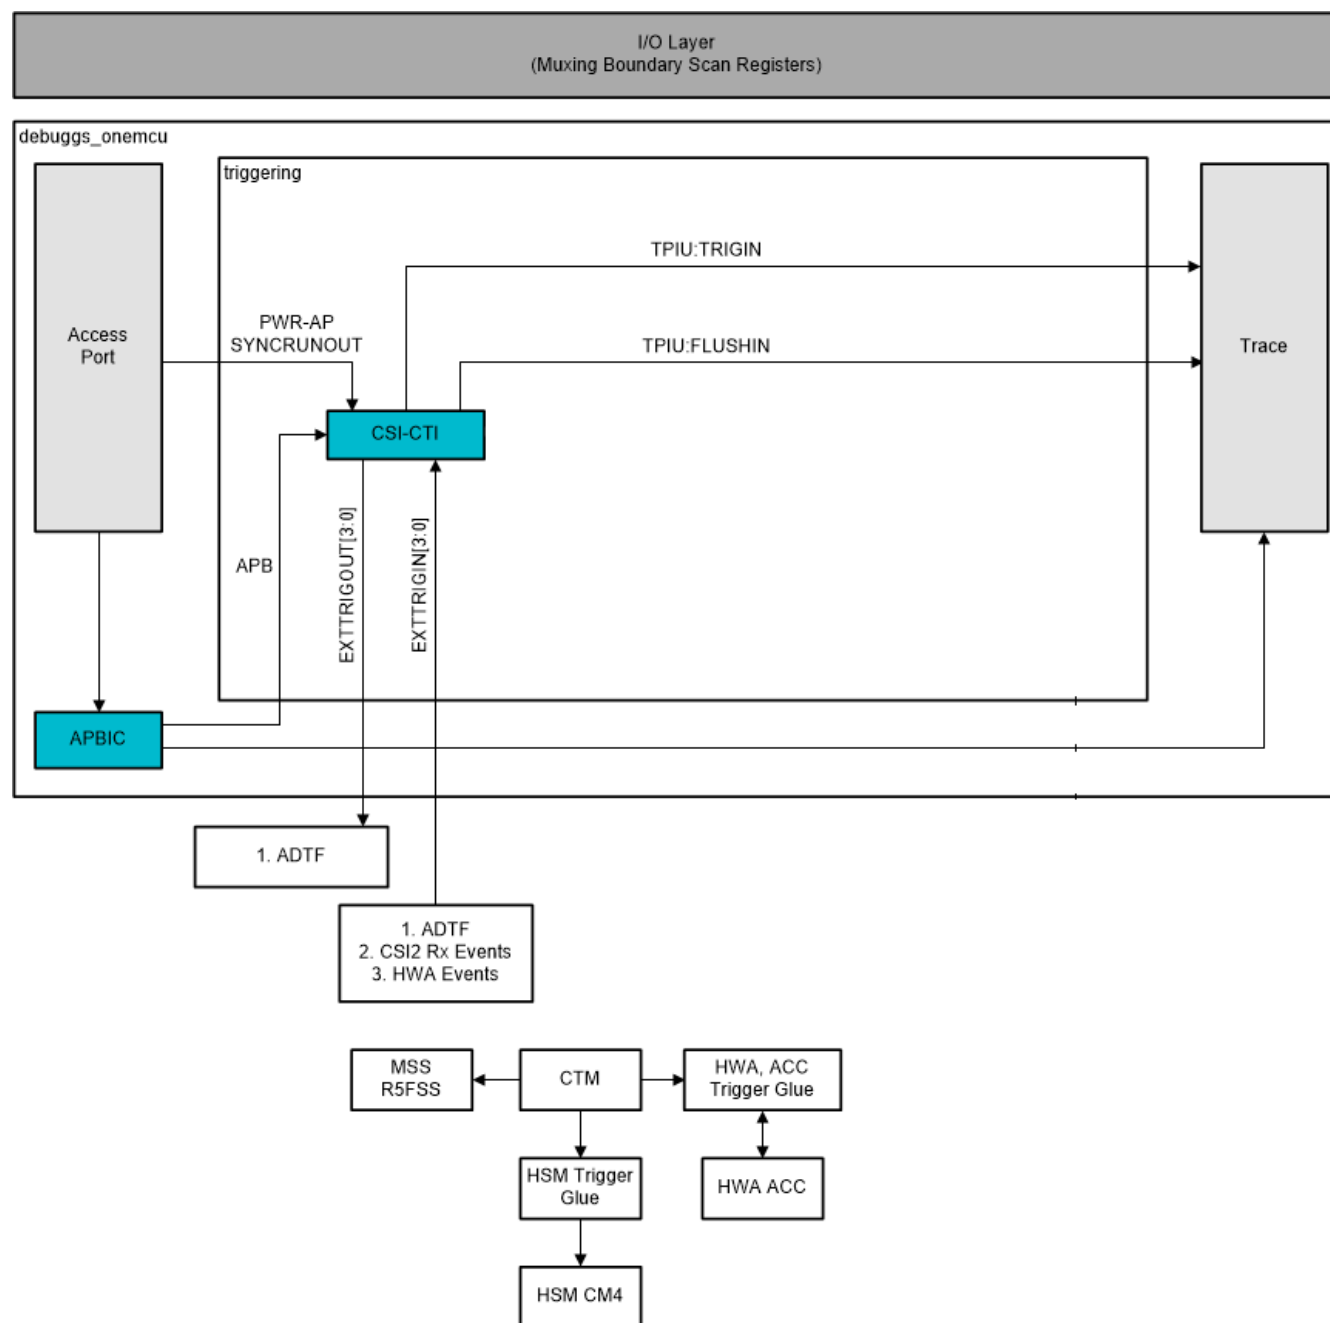

The maximum support frequency for the external interface trace clock is 125 MHz.

### 19.1.4.2 Cross Triggering

#### 19.1.4.2.1 Cross Triggering Infrastructure

The cross triggering infrastructure is shown in [Figure 19-4](#). The host processors involved in the cross triggering sequence are:

- MSS Cortex R5F cores, ETB
- Host as suspend peripherals
  - HWA Accelerator

**Figure 19-4. Cross Triggering Infrastructure**

## 20.1 Core Clock Comparator (CCC)

### 20.1.1 Description

Core Clock Comparator (CCC) supports single-shot and continuous mode of operation, such as DCC. In continuous mode, the programmed values are reloaded after every successful comparison.

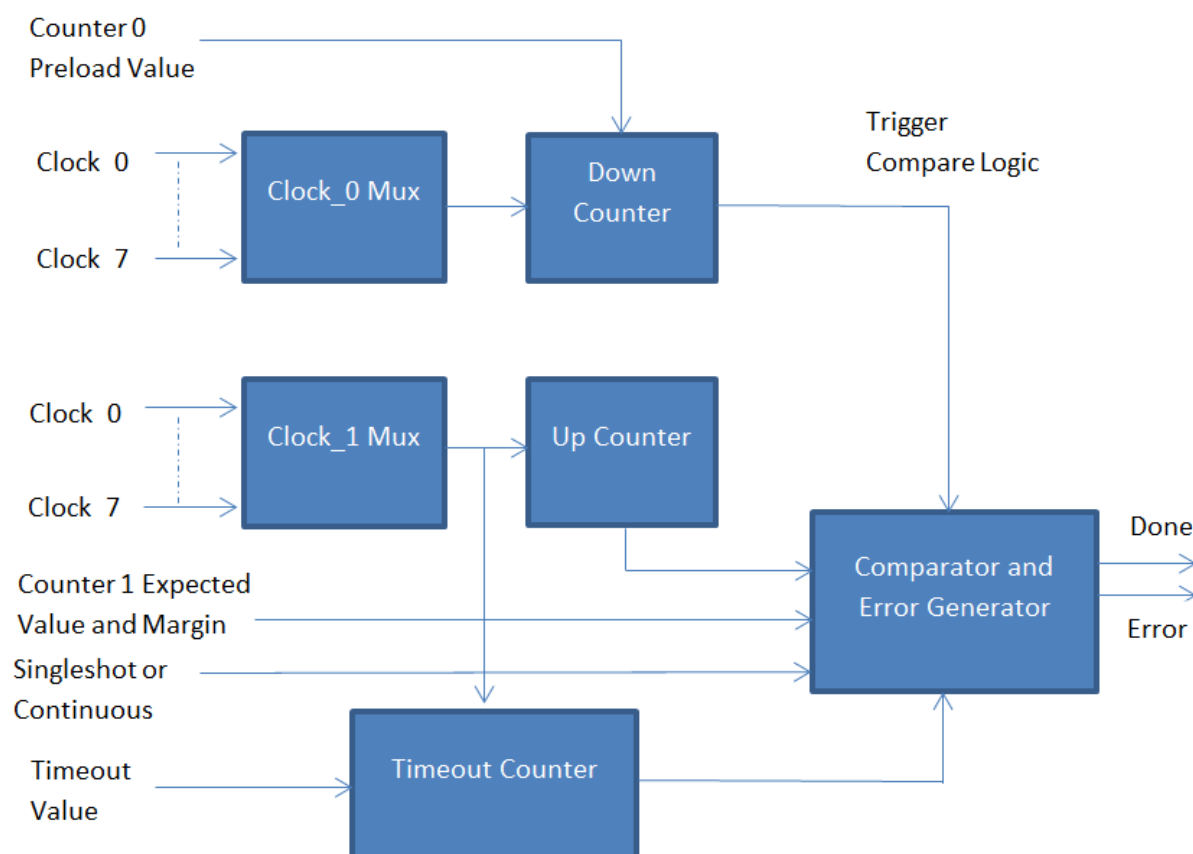

The module accepts 7 clock inputs for clock 0 and clock 1. One of these input clocks is selected to counter 0 and counter 1. Counter 0 is a down counter and is preloaded with a value before enabling the module. Counter 1 is an up counter which operates on Clock 1.

At the expiry of counter 0, value in the counter 1 is compared against the programmed expected value of the counter. After a successful comparison, a Done signal is asserted in single-shot mode, whereas in continuous mode, counter 0 is reloaded for the next comparison. Margin value programmed provides the tolerance for the comparison. An error signal is asserted when the counter 1 value differs from the expected value beyond the tolerance range.

When an error occurs, the module stops comparison in both single-shot and continuous mode.

There is a timeout counter functioning on Clock 1. A timeout value must be loaded into the timeout counter before enabling the module. If the timeout counter expires before the expiry of counter 0, an error condition is indicated. In continuous mode, after the successful comparison, the timeout value is also reloaded along with Counter 0.

### 20.1.2 Block Diagram

**Figure 20-1. CCC Block Diagram**

### 20.1.3 Perform Clock Comparison

The following are the steps to perform clock comparison.

1. Select Clock 0.
2. Select Clock 1.
3. Load value for down counting in counter 0.
4. Load expected value of counter 1.
5. Load Margin value for tolerance.
6. Set singleshot or continuous mode.
7. Load timeout value.
8. Enable Module.
9. Wait for Done or Error indication.

### 20.1.4 I/O Table

**Table 20-1. I/O Table**

Signal	Input/Output	Description
async_rst_n	Input	Module Reset
vbusp_clk	Input	Clock
clock0_src	Input	Input clocks for Counter 0
clock1_src	Input	Input clocks for Counter 1
clock0_sel	Input	Clock Selector for Counter 0
clock1_sel	Input	Clock Selector for Counter 1
count0_expiry_val	Input	Preload Value for Counter 0
count1_expected_val	Input	Expected value of Counter 1
disable_clk_output	Input	Cutoff clocks for the module
enable_module	Input	Enable for Clock comparator
margin_count	Input	Tolerance value for Comparator
singleshot_mode	Input	0->Continuous mode, 1-> Singleshot mode
count1_val_out	Output	Counter 1 value
counter_error	Output	Error Indicator
counter_done	Output	Successful comparison Indicator
mod_status	Output	Internal Status Indicator
async_error_indicator	Output	Error indicator without the synchronizer
timeout_err_count	Input	Preload value for Timeout Counter
atpg_reset_bypass	Input	DFT reset
atpg_clk	Input	DFT clock
icg_te	Input	Control for ICG
atpg_clk_bypass	Input	Control for ATPG clock

### 20.1.5 Recommended Programming

- Clock source 1 must be faster than Clock source 0 for successful comparison of clocks.
- The timeout value must always be loaded for successful comparison. The timeout value must be greater than the duration of the comparison operation.

## 20.2 Dual Clock Comparator (DCC)

This section describes the dual-clock comparator (DCC) module.

## 20.2.1 Introduction

The primary purpose of a DCC module is to measure the frequency of a clock signal using a second known clock signal as a reference. Specifically, DCC is designed to detect drifts from the expected clock frequency. This capability can be used to ensure the correct frequency range for several different device clock sources, thereby enhancing the system safety metrics.

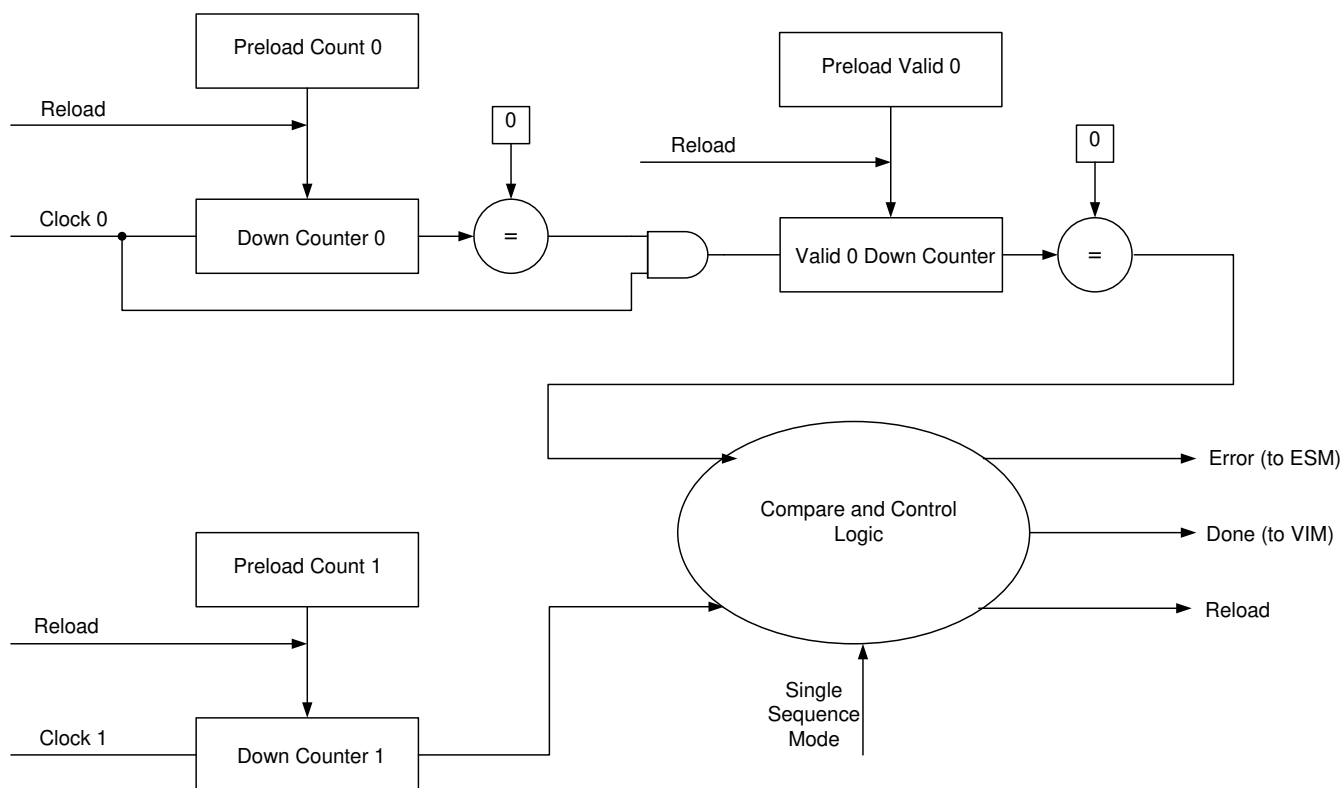

### 20.2.1.1 Main Features

The main features of each of the DCC modules are:

- Allows application to ensure that a fixed ratio is maintained between frequencies of two clock signals
- Supports the definition of a programmable tolerance window in terms of number of reference clock cycles
- Supports continuous monitoring without requiring application intervention
- Also supports a single-sequence mode for spot measurements
- Allows selection of clock source for each of the counters resulting in several specific use cases

### 20.2.1.2 Block Diagram

Figure 20-2 illustrates the main concept of the DCC module.

**Figure 20-2. Block Diagram**

## 20.2.2 Module Operation

As shown in [Figure 20-2](#), the DCC contains two counters – counter0 and counter1, which are driven by two signals – clock0 and clock1. The application programs the seed values for both these counters. The application also configures the tolerance window time by configuring the valid counter for clock0.

Counter0 and counter1 both start counting simultaneously once the DCC is enabled. When counter0 counts down to zero, this automatically triggers the count down of the tolerance window counter (valid0).

The DCC module can be used in two different operating modes:

### 20.2.2.1 Continuous Monitoring Mode

In this mode, the DCC is used by the application to ensure that two clock signals maintain the correct frequency ratio. Suppose the application wants to ensure that the PLL output signal (clock source # 1) always maintains a fixed frequency relationship with the main oscillator (clock source # 0).

- In this case, the application can use the main oscillator as the clock0 signal (for counter0 and valid0) and the PLL output as the clock1 (for counter1).
- The seed values of counter0, valid0 and counter1 are selected such that if the actual frequencies of clock0 and clock1 are equal to their expected frequencies, then the counter1 will reach zero either at the same time as counter0 or during the count down of the valid0 counter.
- If the counter1 reaches zero during the count down of the valid0 counter, then all the counters (counter0, valid0, counter1) are reloaded with their initial seed values once valid0 has also counted down to zero.
- This sequence of counting down and checking then continues as long as there is no error, or until the DCC module is disabled.
- The counters also all get reloaded if the application resets and restarts the DCC module.

#### Error Conditions:

An error condition is generated by any one of the following:

1. Counter1 counts down to 0 before Counter0 reaches 0. This means that clock1 is faster than expected, or clock0 is slower than expected. It includes the case when clock0 is stuck at 1 or 0.
2. Counter1 does not reach 0 even when Counter0 and Valid0 have both reached 0. This means that clock1 is slower than expected. It includes the case when clock1 is stuck at 1 or 0.

Any error freezes the counters from counting. An application may then read out the counter values to help determine what caused the error.

#### 20.2.2.1.1 Error Conditions

While operating in continuous mode, the counters get reloaded with the seed values and continue counting down under the following conditions:

- The module is reset or restarted by the application, OR
- Counter0, Valid 0 and Counter1 all reach 0 without any error

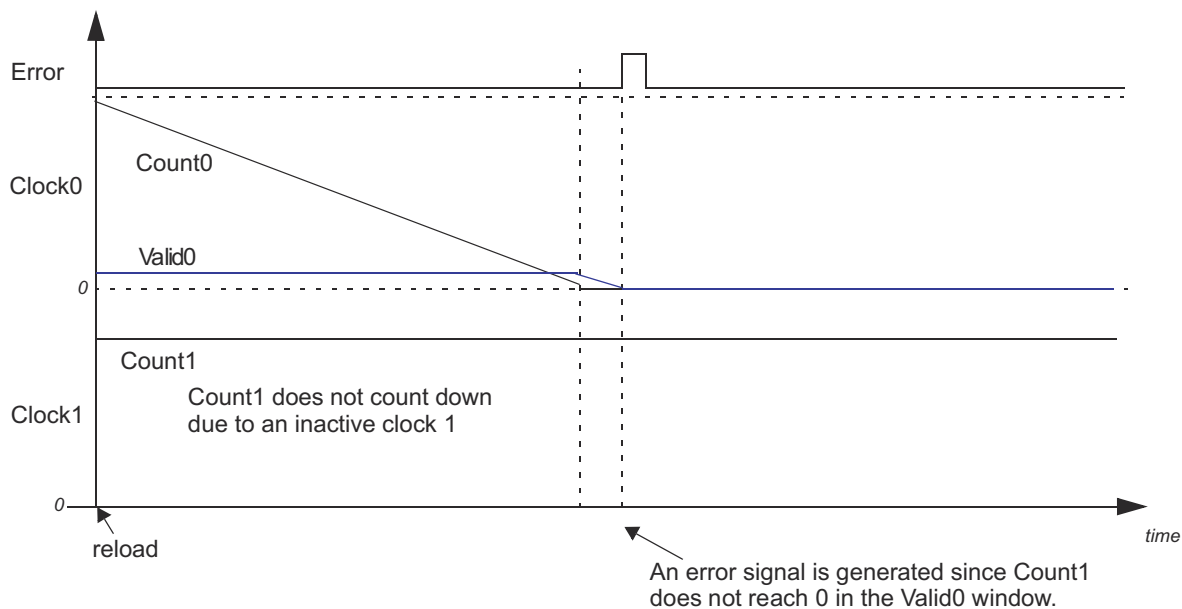

**Figure 20-3. Counter Relationship**

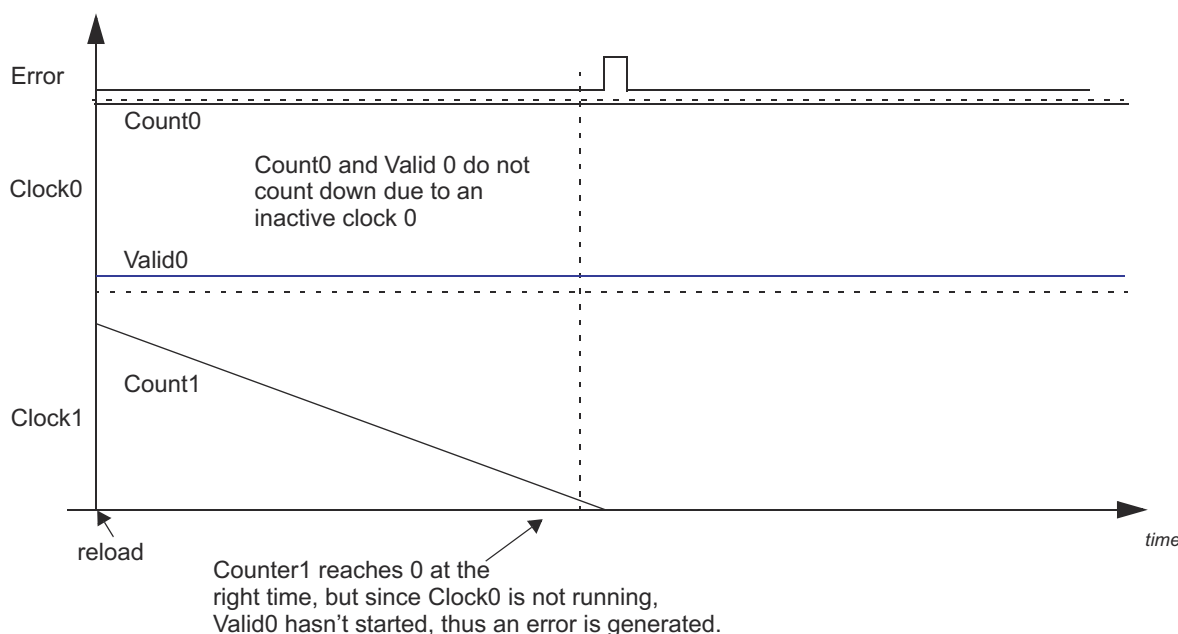

**Figure 20-4. Clock1 Slower Than Clock0 - Results in an Error and Stops Counting**

**Figure 20-5. Clock1 Faster Than Clock0 - Results in an Error and Stops Counting**

**Figure 20-6. Clock1 Not Present - Results in an Error and Stops Counting**

**Figure 20-7. Clock0 Not Present - Results in an Error and Stops Counting**

### 20.2.2.2 Single-Shot Measurement Mode

The DCC module can be programmed to count down one time by enabling the single-shot mode. In this mode, the DCC stops operating when the down counter0 and the valid counter0 reach 0. Alternatively, the DCC can be programmed to stop counting when the down counter1 reaches 0.

At the end of one sequence of counting down in this single-shot mode, the DCC gets disabled automatically, which prevents further counting. This mode is typically used for spot measurements of the frequency of a signal. This frequency could be an unknown for the application before the measurement.

### Example Usage of Single-Shot Measurement Mode: Trimming the High-Frequency Low-Power Oscillator

A practical example of the usage of the spot measurement mode is in trimming the HF LPO (clock source # 5) using the main oscillator as a reference. This measurement sequence would proceed as follows:

- The application sets up the seed values for counter0 and valid0 for the duration of the measurement. Suppose the main oscillator frequency is 10 MHz and the intended duration of the measurement is 500  $\mu$ s. The application needs to configure a seed value of 5000.
- These 5000 counts need to be divided between the counter0 and the valid0 counters. The minimum value for the valid0 seed is 4, so the application can configure counter0 seed value as 4996 and the valid0 seed value as 4.
- Suppose the HF LPO frequency is truly unknown. In this case the application can choose the maximum allowed seed value for counter1. This increases the probability of counter0 and valid0 counting down while the counter1 has still not fully counted down to zero. The maximum allowed seed value for counter1 is 1048575.
- Once the DCC is enabled, the counters counter0 and counter1 both start counting down from their seed values.
- When counter0 reaches zero, it automatically triggers the valid0 counter.
- When valid0 reaches zero, if counter1 is not zero as well, an ERROR status flag is set and a "DCC error" is sent to the ESM. Counter1 is also frozen so that it stops counting down any further. The application can enable an interrupt to be generated from the ESM whenever this DCC error is indicated. Refer the device datasheet to identify the ESM group and channel where the DCC error is connected.
- The DCC error interrupt service routine can then check the value of counter1 when the error was generated. Suppose that the counter1 now reads 1044575. This means that counter1 has counted 1048575 - 1044575,

or 4000 cycles within the 500- $\mu$ s measurement period. This means that the average frequency of the HF LPO over this 500- $\mu$ s period was 4000 cycles / 500  $\mu$ s, or 8 MHz.

- The application then needs to clear the ERROR status flag and restart the DCC module so that it is ready for the next spot measurement.

If there is no error generated at the end of the sequence, then the DONE status flag is set and a DONE interrupt is generated. The application must clear the DONE flag before restarting the DCC.

The conditions that cause a DCC error are identical between the continuous monitoring mode and the single-shot measurement mode.

### Error Conditions:

An error condition is generated by any one of the following:

1. Counter1 counts down to 0 before Counter0 reaches 0. This means that clock1 is faster than expected, or clock0 is slower than expected. It includes the case when clock0 is stuck at 1 or 0.
2. Counter1 does not reach 0 even when Counter0 and Valid0 have both reached 0. This means that clock1 is slower than expected. It includes the case when clock1 is stuck at 1 or 0.

Any error freezes the counters from counting. An application may then read out the counter values to help determine what caused the error.

### Freezing Counters when Counter1 Reaches Zero:

The DCC module also allows the counters to be frozen when the counter1 reaches zero. This allows one of the clock sources for counter1 to be used as a reference for measuring one of the clock sources for counter0. The error conditions are the same as those where (counter0=0 and valid0=0) define the condition when the DCC counters are frozen. That is, an error is indicated if counter0 and valid0 become zero while counter1 is still non-zero. In this case, however, the application would typically set up the seed values such that the counter1 will become zero before counter0. Essentially the measurement period is defined by the seed value of the counter1. Note that this is also an error condition, and the interrupt service routine can use the measurement period and the actual cycles counted by counter1 to determine the frequency of the clock0 signal.

### 20.2.3 MSS DCC Integration

4-DCC modules have been instantiated in the SOC as part of MSS. Clocks to the module are mentioned in the following sections.

#### 20.2.3.1 Input Clock sources

**Table 20-2. MSS\_DCCA Clocking**

## 20.2.4 Clock Source Selection for Counter0 and Counter1

Refer the device datasheet to identify the available options for selecting the clock sources for both counters of the DCC module. Some microcontrollers may include multiple instances of the DCC module. This will also be identified in the device datasheet.

The selection of the clock sources for counter0 and coutner1 is done by a combination of the KEY, CNT0 CLKSRC and CNT1 CLKSRC control fields of the CNT0CLKSRC and CNT1CLKSRC registers.

## 20.2.5 DCC Registers

Table 20-6 lists the DCC memory-mapped registers. All register offset addresses not listed in Table 20-6 should be considered as reserved locations and the register contents should not be modified.

**Table 20-6. DCC Registers**

Offset	Acronym	Register Name	Section
0h	DCCGCTRL	DCCGCTRL	<a href="#">Section 20.2.5.1</a>
4h	DCCREV	DCCREV	<a href="#">Section 20.2.5.2</a>
8h	DCCCNTSEED0	DCCCNTSEED0	<a href="#">Section 20.2.5.3</a>
Ch	DCCVALIDSEED0	DCCVALIDSEED0	<a href="#">Section 20.2.5.4</a>
10h	DCCCNTSEED1	DCCCNTSEED1	<a href="#">Section 20.2.5.5</a>

Complex bit access types are encoded to fit into small table cells. Table 20-7 shows the codes that are used for access types in this section.

**Table 20-7. DCC Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

### 20.2.5.1 DCCGCTRL Register (Offset = 0h) [reset = 5555h]

DCCGCTRL is shown in [Figure 20-8](#) and described in [Table 20-8](#).

Return to [Summary Table](#).

Starts / stops the counters clears the error signal

**Figure 20-8. DCCGCTRL Register**

## 20.3 ECC\_AGGREGATOR

This section describes the common ECC aggregator functionality.

### 20.3.1 ECC Aggregator Overview

To increase functional safety and system reliability the memories (for example, FIFOs, queues, SRAMs and others) in many device modules and subsystems are protected by error correcting code (ECC). This is accomplished through an ECC aggregator and ECC wrapper. The ECC aggregator is connected to these memories (hereinafter ECC RAMs) and involved in the ECC process. Each memory is surrounded by an ECC wrapper which performs the ECC detection and correction. The wrapper communicates via serial interface with the aggregator which has memory mapped configuration interface

### 20.3.2 Integration Details

In AWR2544 design, there are four ECC aggregators.

- MSS\_ECC\_AGG\_R5A
- MSS\_ECC\_AGG\_MSS
- DSS\_ECC\_AGG
- HSM\_ECC\_AGG (details will be available in HSM document)

This aggregator is used to fault inject all memory ecc\_controllers and aggregate the errors to generate a single error to ESM.

### 20.3.3 ECC Aggregator Features

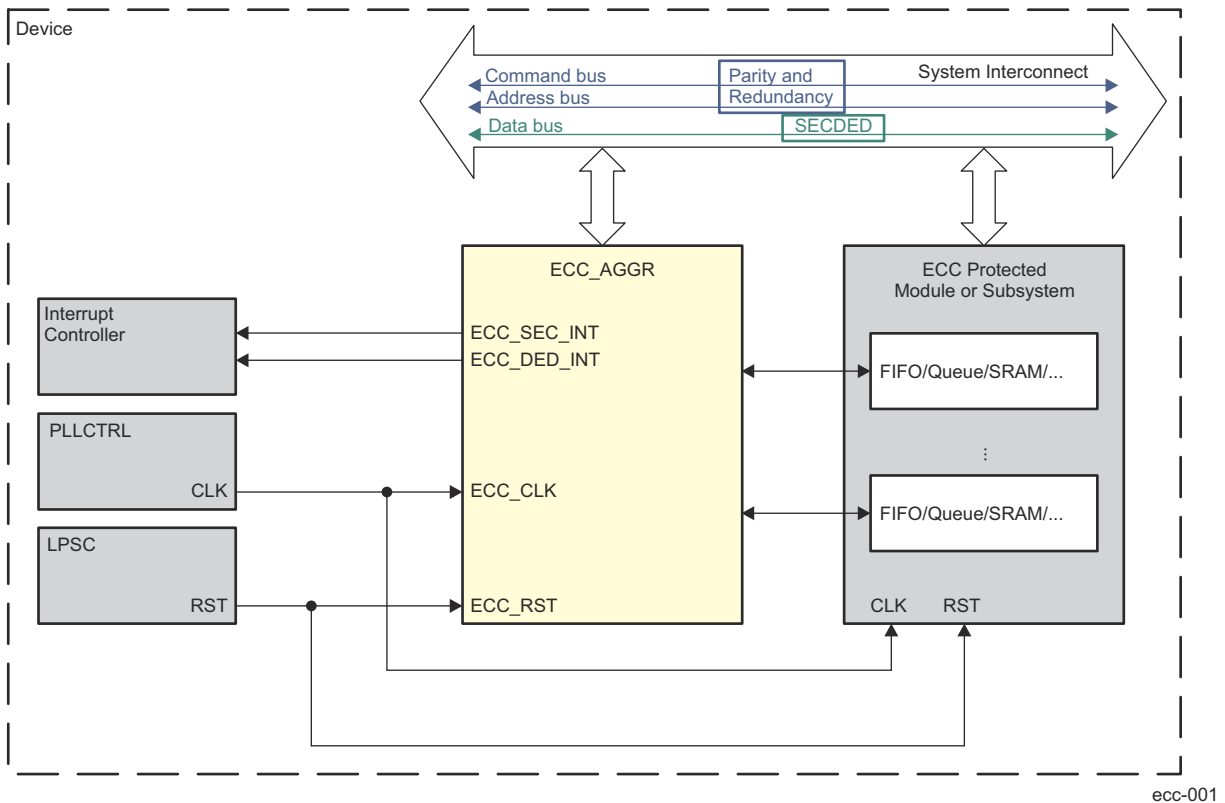

The ECC aggregator has the following features:

- Reduces memory software errors via single error correction (SEC) and double error detection (DED)
- Provides a mechanism to control and monitor the ECC protected memories in a module or subsystem
- SEC and DED over the system interconnect data bus and parity and redundancy for the system interconnect command and address buses
- Generates an interrupt for correctable error

- Generates an interrupt for non-correctable error
- Supports inject only mode for diagnostic purposes
- Supports software readable status for single and double-bit ECC errors and associated information such as row address where error has occurred and data bits that have been flipped
- An ECC endpoint can be ECC RAM component.
- Detects single bit error via parity checking on:
  1. Memory mapped configuration interface FIFO
  2. Serial interface FIFO
- Single bit error detection via parity checking results in a non-correctable error interrupt
- Supports timeout mechanism on transactions over the ECC serial interface. Timeout occurrence results in a non-correctable error interrupt.
- Certain control bits have redundancy and if a bit flips an interrupt is generated

### 20.3.4 ECC Aggregator Integration

This section describes ECC aggregator integration in the device, including information about clocks, resets, and hardware requests.

**Figure 20-19. ECC Aggregator Integration**

**Table 20-19. ECC Aggregator Clocks and Resets**

Clock				
Module Instance	Module Clock Input	Source Clock Signal	Source	Description
ECC_AGGR	ECC_CLK	Same as corresponding module or subsystem	Same as corresponding module or subsystem	ECC aggregator clock
Resets				
Module Instance	Module Reset Input	Source Reset Signal	Source	Description
ECC_AGGR	ECC_RST	Same as corresponding module or subsystem	Same as corresponding module or subsystem	ECC aggregator reset

**Table 20-20. ECC Aggregator Hardware Requests**

Interrupt Requests					
Module Instance	Module Interrupt Signal	Destination Interrupt Input	Description	Description	Type
ECC_AGGR	ECC_SEC_INT	See	See	Interrupt for correctable error (SEC)	Level
	ECC_DED_INT	See	See	Interrupt for non-correctable error (DED, parity, redundancy, timeout)	LEVEL
DMA Events					
Module Instance	Module DMA Input	Destination DMA Event Input	Destination	Description	Type
ECC_AGGR	-	-	-	-	-

### Note

For more information on the interrupts, see *Interrupts*.

For more information on the interconnects, see *System Interconnect*.

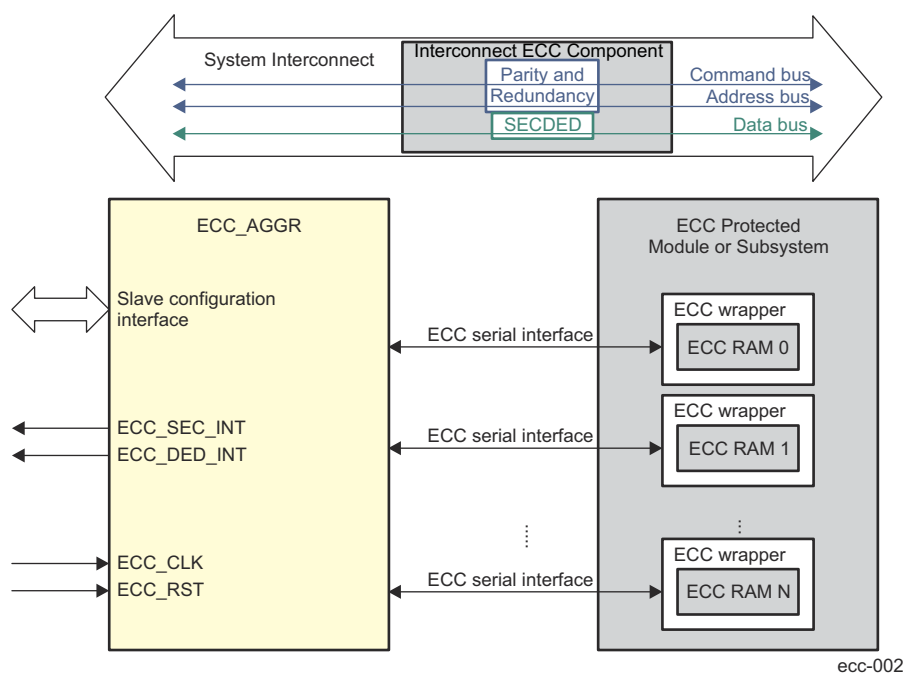

For more information on the power, reset and clock management, see the corresponding sections in *Device Configuration*.

For more information on the device interrupt controllers, see *Interrupt Controllers*.

## 20.3.5 ECC Aggregator Function Description

This section describes the architecture and functional details of the ECC aggregator.

### 20.3.5.1 ECC Aggregator Block Diagram

**Figure 20-20. ECC Aggregator Block Diagram**

The ECC aggregator is connected to one or more ECC endpoints each of which has assigned a unique ID used when the endpoint is accessed for status information or configuration. The ECC aggregator provides software access to all ECC related registers through its memory mapped slave configuration interface while the serial interface is used to communicate with the ECC endpoints. Upon detection of single or double-bit error the corresponding interrupt line is asserted.

### 20.3.6 ECC Aggregator Register Groups

The ECC aggregator has ECC control, status and interrupt registers for each ECC endpoint in a module or subsystem. These registers are memory mapped and occupy 1 KB address space although part of it may contain reserved locations. The registers are split in the following types:

- **Global registers.** They are common to all ECC endpoints associated with the ECC aggregator and include the ECC\_VECTOR and ECC\_REV registers. Each ECC endpoint has assigned a unique ID.

When this ID is written to the ECC\_VECTOR[10-0] ECC\_VECTOR field the corresponding endpoint is selected either for control or for status reading.

- **ECC control and status registers.** These registers are specific to each ECC endpoint and reside in the range from address offset 0x10 to 0x28, if the endpoint is ECC RAM or from 0x10 to 0x24, if the endpoint is interconnect ECC component. They are memory mapped but are accessed through the ECC serial interface. They are also selected by the ECC endpoint ID written to the ECC\_VECTOR[10-0] ECC\_VECTOR field. Because of latency on the serial interface the ECC control and status registers are read by performing special sequence as described in Section 12.9.4.3.3. These registers have also different functionality for both types of endpoints - ECC RAM and interconnect ECC component.
- **Interrupt registers.** They include interrupt status, interrupt enable, interrupt disable, and EOI registers.

### 20.3.7 Read Access to the ECC Control and Status Registers

Read accesses to the ECC control and status registers for each ECC endpoint represent read operations over the ECC serial interface and are triggered by performing the following sequence:

1. Software writes the following in the ECC\_VECTOR register:
  - The ECC endpoint ID in the ECC\_VECTOR[10-0] ECC\_VECTOR field to select particular ECC endpoint.
  - The register read address in the ECC\_VECTOR[23-16] RD\_SVBUS\_ADDRESS field to select which register has to be read through the ECC serial interface.
  - A value of 0x1 in the ECC\_VECTOR[15] RD\_SVBUS bit to trigger read operation through the ECC serial interface.
2. Software polls the ECC\_VECTOR[24] RD\_SVBUS\_DONE bit to check if it is 0x1. This indicates that the read operation on the ECC serial interface has completed.
3. Software reads the data from the register previously selected by the ECC\_VECTOR[23-16]RD\_SVBUS\_ADDRESS field.

### 20.3.8 Serial Write Operation

Write operations over the ECC serial interface are performed as follows:

1. Software specifies the ECC endpoint ID in the ECC\_VECTOR[10-0] ECC\_VECTOR field. The ECC\_VECTOR[23-16] RD\_SVBUS\_ADDRESS field is a don't care but the ECC\_VECTOR[15] RD\_SVBUS bit must be set to 0x0.
2. Software performs regular write operation to the desired address. If the ECC endpoint ID has already been specified, step 1 can be skipped. Unlike serial read operations it is not necessary to always specify the endpoint ID before performing serial write operation.

The following is an example for serial write operation:

1. Write 0x0000 0008 to the ECC\_VECTOR register.
2. Write 0x0000 000F to the ECC\_CTRL register. This sends write request with data 0x0000 000F to the ECC\_CTRL register associated with ECC RAM with ID = 8.

### 20.3.9 Interrupts

The ECC aggregator generates the following interrupts:

- Correctable interrupt (ECC\_SEC\_INT) where hardware can correct the error but notifies the system in case of SEC.
- Non-correctable interrupt (ECC\_DED\_INT) where hardware cannot correct the error in cases of DED, parity check, redundancy check or timeout occurrence.

The following is the sequence for servicing interrupts:

- Software enables the interrupts for an ECC endpoint by writing 0x1 to the corresponding bit of the following interrupt enable registers:
  - ECC\_SEC\_ENABLE\_SET\_REG0 for the correctable interrupt
  - ECC\_DED\_ENABLE\_SET\_REG0 for the noncorrectable interrupt
- On receiving an interrupt, software checks which ECC endpoint has caused the error by reading the following interrupt status registers:
  - ECC\_SEC\_STATUS\_REG0 for the correctable interrupt ECC\_DED\_STATUS\_REG0 for the non-correctable interrupt
- Software performs serial read operations as described in Section 12.9.4.3.3 to read the following status registers that contain details about the error:
  - If the endpoint is ECC RAM:
    - ECC\_ERR\_STAT1
    - ECC\_ERR\_STAT2
    - ECC\_ERR\_STAT3
  - If the endpoint is interconnect ECC component:
    - ECC\_CBASS\_ERR\_STAT1
    - ECC\_CBASS\_ERR\_STAT2
- After the interrupt has been serviced, depending on the error type, software should clear the corresponding status bits in the ECC\_ERR\_STAT1 and ECC\_ERR\_STAT3 registers or in the ECC\_CBASS\_ERR\_STAT1 register. Software has to poll these registers to guarantee that status bits are cleared as there is no other indication for write completion over the ECC serial interface.

The value of the \*\_PEND\_CLR fields in the ECC\_CBASS\_ERR\_STAT1 register must be read and then written back to decrement the count of each field back to 0x0. A further error capture into the ECC\_CBASS\_ERR\_STAT1 register does not occur unless all its fields are 0x0. The decrement value should not be larger than the read value. If a field in the ECC\_CBASS\_ERR\_STAT1 register should not be modified, write a value of 0x0 to that field.

- Software writes 0x1 to the corresponding end of interrupt register to clear the interrupt:
  - ECC\_SEC\_EOI\_REG for the correctable interrupt
  - ECC\_DED\_EOI\_REG for the non-correctable interrupt

#### Note

For AWR2544 device the ECC aggregator is used only for the memories and not on interconnects. Hence any register set and text for the interconnect ECC will not be applicable to the device and can be ignored.

### 20.3.10 Inject Only Mode

There are modules that already perform the ECC generation and checking as part of their data path. In this case, the ECC wrapper may be configured in inject only mode, if needed. In this mode the ECC wrapper does not perform ECC detection and correction. The inject only mode allows users to inject single or double-bit errors so that the module logic can be tested for diagnostic purposes.

### Note

There is no software control to enable inject only mode. It is configured via tie-off value. Inject only and ECC modes are mutually exclusive.

The interconnect ECC component also supports error injection mode. There is error injection logic for testing of the error checking logic (checkers). The injection logic can be configured to inject either single or double bit error and what data pattern to be used for injection (ECC\_CBASS\_CTRL[11-8] ECC\_PATTERN). The ECC\_CBASS\_ERR\_CTRL1 and ECC\_CBASS\_ERR\_CTRL2 registers should be written first to setup the injection. Then, either the ECC\_CBASS\_CTRL[3] FORCE\_SE or the ECC\_CBASS\_CTRL[4] FORCE\_DE bit must be set to 0x1 to start the injection. Both bits must not be set at the same time. If the injection should continue in incrementing mode, then the ECC\_CBASS\_CTRL[5] FORCE\_N\_BIT bit should be set to 0x1. Once the FORCE\_N\_BIT is set, then each successive injection can simply write the ECC\_CBASS\_CTRL register to set the FORCE\_SE or FORCE\_DE again. Reading 0x0 from either the FORCE\_SE or the FORCE\_DE bit indicates that the injection has completed, as these bits automatically clear when the checker indicates that it has performed the injection. The time for an injection to complete is not guaranteed, so some delay is needed between successive injections.

### Note

For AWR2544 device the ECC aggregator is used only for the memories and not on interconnects. Hence any register set and text for the interconnect ECC will not be applicable to the device and can be ignored.

## 20.3.11 Errors

Each aggregator generates two errors which drive the ESM.

- <modulename>\_SERR module names are mentioned in the below section
- <modulename>\_SERR module names are mentioned in the below section

Group1 and Group2 mappings are found the ESM interrupt sections.

## 20.3.12 Aggregator Mapping to Memory Instances

## 20.4 ECC Registers

### 20.4.1 DSS\_ECC\_AGG Registers

Table 20-24 lists the memory-mapped registers for the DSS\_ECC\_AGG registers. All register offset addresses not listed in Table 20-24 should be considered as reserved locations and the register contents should not be modified.

**Table 20-24. DSS\_ECC\_AGG Registers**

Offset	Acronym	Register Name	Section
0h	rev	Aggregator Revision Register	<a href="#">Go</a>
8h	vector	ECC Vector Register	<a href="#">Go</a>
Ch	stat	Misc Status	<a href="#">Go</a>
10h	wrap_rev	ECC Wrapper Revision Register	<a href="#">Go</a>
14h	ctrl	ECC Control	<a href="#">Go</a>
18h	err_ctrl1	ECC Error Control1 Register	<a href="#">Go</a>
1Ch	err_ctrl2	ECC Error Control2 Register	<a href="#">Go</a>
20h	err_stat1	ECC Error Status1 Register	<a href="#">Go</a>
24h	err_stat2	ECC Error Status2 Register	<a href="#">Go</a>

20Ch	aggr_status_clr	AGGR interrupt status clear Register	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. Table 20-25 shows the codes that are used for access types in this section.

**Table 20-25. DSS\_ECC\_AGG Access Type Codes**

Access Type	Code	Description
<b>Read Type</b>		
R	R	Read
<b>Write Type</b>		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Wdecr	W decr	Write
Wincr	W incr	Write
<b>Reset or Default Value</b>		

**Table 20-25. DSS\_ECC\_AGG Access Type Codes  
(continued)**

Access Type	Code	Description
$-n$		Value after reset or the default value

### 20.4.1.1 rev Register (Offset = 0h) [Reset = 66A0C200h]

rev is shown in [Table 20-26](#).

Return to the [Summary Table](#).

Revision parameters

**Table 20-26. rev Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-30	scheme	R	1h	Scheme
29-28	bu	R	2h	bu
27-16	module_id	R	6A0h	Module ID
15-11	revrtl	R	18h	RTL version
10-8	revmaj	R	2h	Major version
7-6	custom	R	0h	Custom version
5-0	revmin	R	0h	Minor version

### 20.4.1.2 vector Register (Offset = 8h) [Reset = X]

vector is shown in [Table 20-27](#).

Return to the [Summary Table](#).

ECC Vector Register

**Table 20-27. vector Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-25	RESERVED	R/W	X	
24	rd_svbus_done	R	0h	Status to indicate if read on serial VBUS is complete
23-16	rd_svbus_address	R/W	0h	Read address
15	rd_svbus	R/W1S	0h	Write 1 to trigger a read on the serial VBUS
14-11	RESERVED	R/W	X	
10-0	ecc_vector	R/W	0h	Value written to select the corresponding ECC RAM for control or status

### 20.4.1.3 stat Register (Offset = Ch) [Reset = X]

stat is shown in [Table 20-28](#).

Return to the [Summary Table](#).

Misc Status

**Table 20-28. stat Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-11	RESERVED	R	X	
10-0	num_rams	R	17h	Indicates the number of RAMS serviced by the ECC aggregator

#### 20.4.1.4 wrap\_rev Register (Offset = 10h) [Reset = 66A40202h]

wrap\_rev is shown in [Table 20-29](#).

Return to the [Summary Table](#).

Revision parameters

**Table 20-29. wrap\_rev Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-30	scheme	R	1h	Scheme
29-28	bu	R	2h	bu
27-16	module_id	R	6A4h	Module ID
15-11	revrtl	R	0h	RTL version
10-8	revmaj	R	2h	Major version
7-6	custom	R	0h	Custom version
5-0	revmin	R	2h	Minor version

### 20.4.1.5 ctrl Register (Offset = 14h) [Reset = X]

ctrl is shown in [Table 20-30](#).

Return to the [Summary Table](#).

ECC Control Register

**Table 20-30. ctrl Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-9	RESERVED	R/W	X	
8	check_svbus_timeout	R/W	1h	check for svbus timeout errors
7	check_parity	R/W	1h	check for parity errors
6	error_once	R/W	0h	Force Error only once
5	force_n_row	R/W	0h	Force Error on any RAM read
4	force_ded	R/W	0h	Force Double Bit Error
3	force_sec	R/W	0h	Force Single Bit Error
2	enable_rmw	R/W	1h	Enable rmw
1	ecc_check	R/W	1h	Enable ECC check
0	ecc_enable	R/W	1h	Enable ECC

### 20.4.1.6 err\_ctrl1 Register (Offset = 18h) [Reset = 00000000h]

err\_ctrl1 is shown in [Table 20-31](#).

Return to the [Summary Table](#).

ECC Error Control1 Register

**Table 20-31. err\_ctrl1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ecc_row	R/W	0h	Row address where single or double-bit error needs to be applied. This is ignored if force_n_row is set

### 20.4.1.7 err\_ctrl2 Register (Offset = 1Ch) [Reset = 00000000h]

err\_ctrl2 is shown in [Table 20-32](#).

Return to the [Summary Table](#).

ECC Error Control2 Register

**Table 20-32. err\_ctrl2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	ecc_bit2	R/W	0h	Data bit that needs to be flipped if double bit error needs to be forced
15-0	ecc_bit1	R/W	0h	Data bit that needs to be flipped when force_sec is set

### 20.4.1.8 err\_stat1 Register (Offset = 20h) [Reset = 00000000h]

err\_stat1 is shown in [Table 20-33](#).

Return to the [Summary Table](#).

ECC Error Status1 Register

**Table 20-33. err\_stat1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	ecc_bit1	R	0h	Data bit that corresponds to the single-bit error
15	clr_ctrl_reg_err	R/W1C	0h	Clear control reg error Error Status, you must also re write the control register itself to clear this
14-13	clr_parity_err	R/Wdecr	0h	Clear parity Error Status
12	clr_ecc_other	R/W1C	0h	Clear other Error Status
11-10	clr_ecc_ded	R/Wdecr	0h	Clear Double Bit Error Status
9-8	clr_ecc_sec	R/Wdecr	0h	Clear Single Bit Error Status
7	ctr_reg_err	R/W1S	0h	control register error pending, Level interrupt
6-5	parity_err	R/W1S	0h	Level parity error Error Status
4	ecc_other	R/W1S	0h	successive single-bit errors have occurred while a writeback is still pending, Level interrupt
3-2	ecc_ded	R/Wincr	0h	Level Double Bit Error Status
1-0	ecc_sec	R/Wincr	0h	Level Single Bit Error Status

### 20.4.1.9 err\_stat2 Register (Offset = 24h) [Reset = 00000000h]

err\_stat2 is shown in [Table 20-34](#).

Return to the [Summary Table](#).

ECC Error Status2 Register

**Table 20-34. err\_stat2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ecc_row	R	0h	Row address where the single or double-bit error has occurred

#### 20.4.1.10 err\_stat3 Register (Offset = 28h) [Reset = X]

err\_stat3 is shown in [Table 20-35](#).

Return to the [Summary Table](#).

ECC Error Status3 Register

**Table 20-35. err\_stat3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-10	RESERVED	R/W	X	
9	clr_svbus_timeout_err	R/W1C	0h	Clear svbus timeout Error Status
8-2	RESERVED	R/W	X	
1	svbus_timeout_err	R/W1S	0h	Level svbus timeout error Error Status
0	wb_pend	R	0h	delayed write back pending Status

### 20.4.1.11 sec\_eoi\_reg Register (Offset = 3Ch) [Reset = X]

sec\_eoi\_reg is shown in [Table 20-36](#).

Return to the [Summary Table](#).

EOI Register

**Table 20-36. sec\_eoi\_reg Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	X	
0	eoi_wr	R/W1S	0h	EOI Register

### 20.4.1.12 sec\_status\_reg0 Register (Offset = 40h) [Reset = X]

sec\_status\_reg0 is shown in [Table 20-37](#).

Return to the [Summary Table](#).

Interrupt Status Register 0

**Table 20-37. sec\_status\_reg0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-23	RESERVED	R/W	X	
22	rcss_tptc_b1_pend	R/W1S	0h	Interrupt Pending Status for rcss_tptc_b1_pend
21	rcss_tptc_b0_pend	R/W1S	0h	Interrupt Pending Status for rcss_tptc_b0_pend
20	rcss_tptc_a1_pend	R/W1S	0h	Interrupt Pending Status for rcss_tptc_a1_pend
19	rcss_tptc_a0_pend	R/W1S	0h	Interrupt Pending Status for rcss_tptc_a0_pend
18	dss_tptc_c5_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_c5_pend
17	dss_tptc_c4_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_c4_pend
16	dss_tptc_c3_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_c3_pend
15	dss_tptc_c2_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_c2_pend
14	dss_tptc_c1_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_c1_pend
13	dss_tptc_c0_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_c0_pend
12	dss_tptc_b1_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_b1_pend
11	dss_tptc_b0_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_b0_pend
10	dss_tptc_a1_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_a1_pend
9	dss_tptc_a0_pend	R/W1S	0h	Interrupt Pending Status for dss_tptc_a0_pend
8-5	RESERVED	R/W	0h	
4	dss_mailbox_pend	R/W1S	0h	Interrupt Pending Status for dss_mailbox_pend
3	dss_l3ram3_pend	R/W1S	0h	Interrupt Pending Status for dss_l3ram3_pend
2	dss_l3ram2_pend	R/W1S	0h	Interrupt Pending Status for dss_l3ram2_pend
1	dss_l3ram1_pend	R/W1S	0h	Interrupt Pending Status for dss_l3ram1_pend
0	dss_l3ram0_pend	R/W1S	0h	Interrupt Pending Status for dss_l3ram0_pend

### 20.4.1.13 sec\_enable\_set\_reg0 Register (Offset = 80h) [Reset = X]

sec\_enable\_set\_reg0 is shown in [Table 20-38](#).

Return to the [Summary Table](#).

Interrupt Enable Set Register 0

**Table 20-38. sec\_enable\_set\_reg0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-23	RESERVED	R/W	X	
22	rcss_tptc_b1_enable_set	R/W1S	0h	Interrupt Enable Set Register for rcss_tptc_b1_pend
21	rcss_tptc_b0_enable_set	R/W1S	0h	Interrupt Enable Set Register for rcss_tptc_b0_pend
20	rcss_tptc_a1_enable_set	R/W1S	0h	Interrupt Enable Set Register for rcss_tptc_a1_pend

### 20.4.1.19 aggr\_enable\_set Register (Offset = 200h) [Reset = X]

aggr\_enable\_set is shown in [Table 20-44](#).

Return to the [Summary Table](#).

AGGR interrupt enable set Register

**Table 20-44. aggr\_enable\_set Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	
1	timeout	R/W1S	0h	interrupt enable set for svbus timeout errors
0	parity	R/W1S	0h	interrupt enable set for parity errors

### 20.4.1.20 aggr\_enable\_clr Register (Offset = 204h) [Reset = X]

aggr\_enable\_clr is shown in [Table 20-45](#).

Return to the [Summary Table](#).

AGGR interrupt enable clear Register

**Table 20-45. aggr\_enable\_clr Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	
1	timeout	R/W1C	0h	interrupt enable clear for svbus timeout errors
0	parity	R/W1C	0h	interrupt enable clear for parity errors

### 20.4.1.21 aggr\_status\_set Register (Offset = 208h) [Reset = X]

aggr\_status\_set is shown in [Table 20-46](#).

Return to the [Summary Table](#).

AGGR interrupt status set Register

**Table 20-46. aggr\_status\_set Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3-2	timeout	R/Wincr	0h	interrupt status set for svbus timeout errors
1-0	parity	R/Wincr	0h	interrupt status set for parity errors

### 20.4.1.22 aggr\_status\_clr Register (Offset = 20Ch) [Reset = X]

aggr\_status\_clr is shown in [Table 20-47](#).

Return to the [Summary Table](#).

AGGR interrupt status clear Register

**Table 20-47. aggr\_status\_clr Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	X	
3-2	timeout	R/Wdecr	0h	interrupt status clear for svbus timeout errors
1-0	parity	R/Wdecr	0h	interrupt status clear for parity errors

## 20.4.2 MSS\_ECC\_AGGA Registers

Table 20-48 lists the MSS\_ECC\_AGGA registers. All register offset addresses not listed in Table 20-48 should be considered as reserved locations and the register contents should not be modified.

**Table 20-48. MSS\_ECC\_AGGA Registers**

Offset	Acronym	Register Name	Section
0h	rev	Aggregator Revision Register	<a href="#">Section 20.4.2.1</a>
8h	vector	ECC Vector Register	<a href="#">Section 20.4.2.2</a>
Ch	stat	Misc Status	<a href="#">Section 20.4.2.3</a>
10h	wrap_rev	ECC Wrapper Revision Register	<a href="#">Section 20.4.2.4</a>
14h	ctrl	ECC Control	<a href="#">Section 20.4.2.5</a>
18h	err_ctrl1	ECC Error Control1 Register	<a href="#">Section 20.4.2.6</a>

## 20.5 Error Signaling Module (ESM)

This section provides the details of the error signaling module (ESM) that aggregates device errors and provides internal and external error response based on error severity.

### 20.5.1 Overview

The Error Signaling Module (ESM) collects and reports the various error conditions on the microcontroller. The error condition is categorized based on a severity level. Error response is then generated based on the category of the error. Possible error responses include a low priority interrupt, high priority interrupt, and an external pin action.

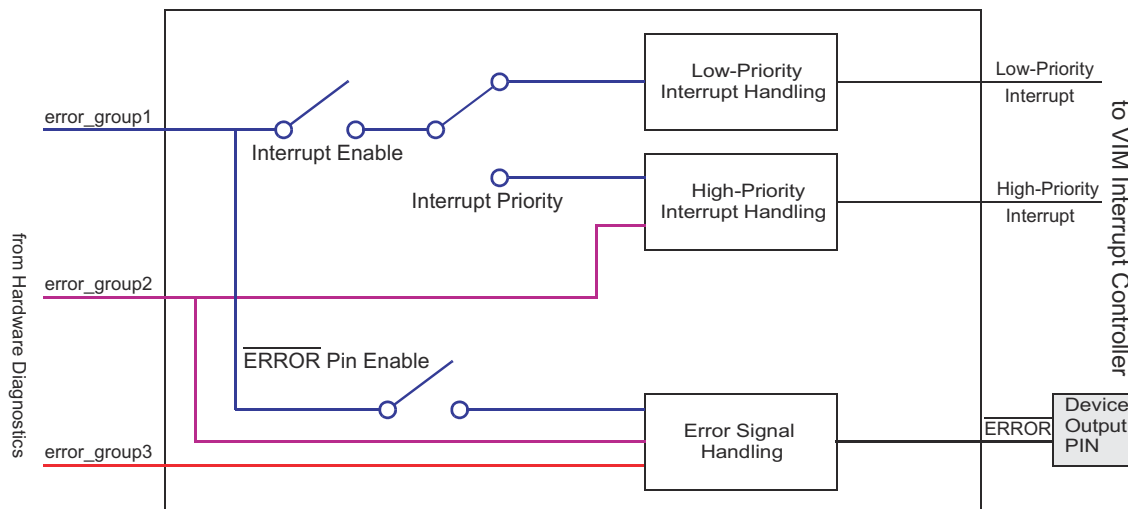

### 20.5.2 Feature List

- Up to 192 error channels (MSS/DSS) are supported, divided into 3 different groups:
  - 128 Group1 (low severity) channels with configurable interrupt generation and configurable  $\overline{\text{ERROR}}$  pin behavior
  - 32 Group2 (high severity) channels with predefined interrupt generation and predefined  $\overline{\text{ERROR}}$  pin behavior
  - 32 Group3 (high severity) channels with no interrupt generation and predefined  $\overline{\text{ERROR}}$  pin behavior. These channels have no interrupt response as they are reserved for CPU based diagnostics that generate aborts directly to the CPU.
- Dedicated device  $\overline{\text{ERROR}}$  pin to signal an external observer
- Configurable timebase for  $\overline{\text{ERROR}}$  pin output
- Error forcing capability for latent fault testing

### 20.5.3 Block Diagram

As shown in [Figure 20-87](#), the ESM channels are divided into three groups. Group1 channels are considered to be low severity. Group1 errors have a configurable interrupt response and configurable  $\overline{\text{ERROR}}$  pin behavior. Note that the ESM Status Register 1 (ESMSR1) for error group 1 gets updated, regardless if the interrupt enable is active or not. Group2 channels are  $\overline{\text{ERROR}}$  high severity. Group2 errors always generate a high priority interrupt and an output on the  $\overline{\text{ERROR}}$  pin. Group3 errors are reserved for high severity errors generated by diagnostics which have already generated a CPU abort response. Because an abort response is generated, there is no need to generate an interrupt response. Group3 errors always generate an  $\overline{\text{ERROR}}$  pin output.

The ESM interrupt and  $\overline{\text{ERROR}}$  pin behavior are also summarized in [Table 20-117](#).

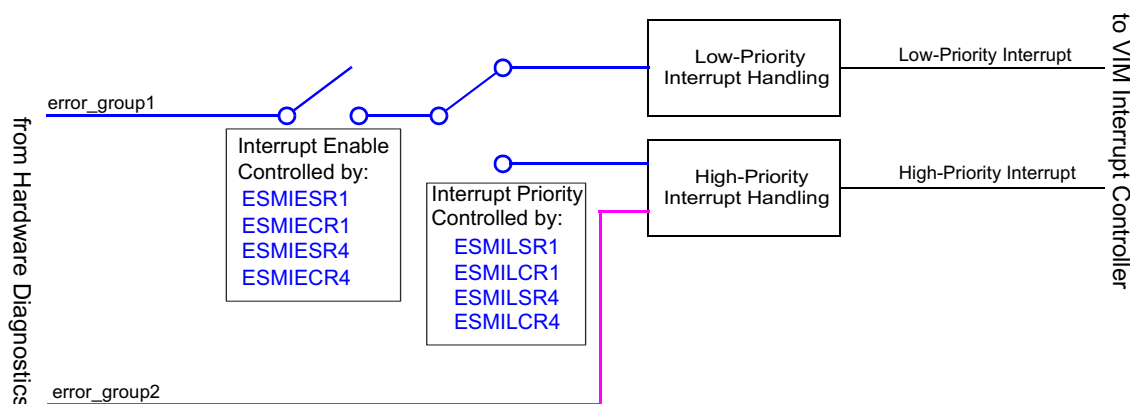

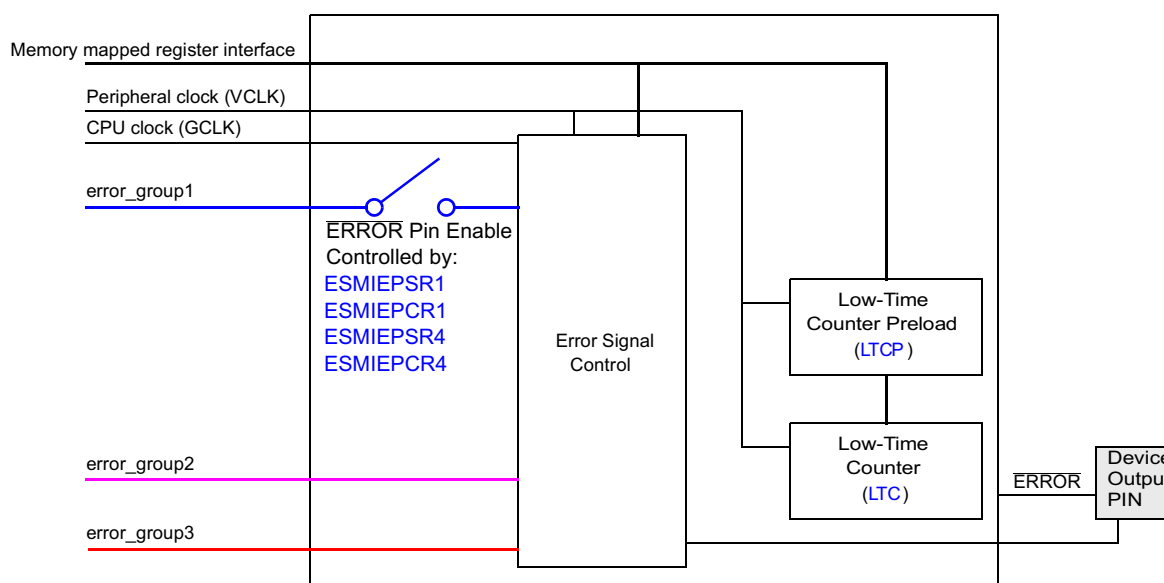

Note that the ESM Status Register 1 (ESMSR1) for error\_group1 gets updated, regardless if the interrupt enable is active or not.

**Figure 20-87. Block Diagram**

**Table 20-117. ESM Interrupt and  $\overline{\text{ERROR}}$  Pin Behavior**

Error Group	Interrupt Generated	Interrupt Priority	$\overline{\text{ERROR}}$ Pin Response Generated
1	configurable interrupt	configurable priority	configurable output generation
2	interrupt generated	high priority	output generated
3	no interrupt	NA	output generated

Figure 20-88 and Figure 20-89 show the interrupt response handling and  $\overline{\text{ERROR}}$  pin response handling with register configuration. The total active time of the  $\overline{\text{ERROR}}$  pin is controlled by the Low-Time Counter Preload register (LTCP) and the key register (ESMEPSR) as shown in Figure 20-89. See for details.

**Figure 20-88. Interrupt Response Handling**

**Figure 20-89.  $\overline{\text{ERROR}}$  Pin Response Handling**

Refer to [Section 20.3.9](#) for the ESM Interrupt map.

**Figure 20-90. ESM Block Diagram**

### 20.5.5 Module Operation

This device has 192 error channels (MSS & DSS), divided into 3 different error groups. Please refer to the device datasheet for ESM channel assignment details.

The ESM module has error flags for each error channel. The error status registers ESMSR1, ESMSR4, ESMSR2, ESMSR3 provide status information on a pending error of Group1 (Channel 0-31), Group1 (Channel 32-63), Group1 (Channel 64-95), Group2, and Group3, respectively. The ESMEPSR register provides the current ERROR status. The module also provides a status shadow register, ESMSSR2, which maintains the error flags of Group2 until power-on reset (PORRST) is asserted. See for details of their behavior during power on reset and warm reset.

Once an error occurs, the ESM module will set the corresponding error flags. In addition, it can trigger an interrupt, ERROR pin outputs low depending on the ESM settings. Once the ERROR pin outputs low, a power on reset or a write of 0x5 to ESMEKR is required to release the ESM error pin back to normal state. The application can read the error status registers (ESMSR1, ESMSR4, ESMSR7, ESMSR2, and ESMSR3) to debug the error. If an RST is triggered or the error interrupt has been served, the error flag of Group2 should be read from ESMSSR2 because the error flag in ESMSR2 will be cleared by RST. You can also test the functionality of the ERROR pin by forcing an error.

You can also test the functionality of the ERROR pin by forcing an error.

#### 20.5.5.1 Reset Behavior

Power on reset:

- **ERROR pin behavior**

When nPORRST is active, the  $\overline{\text{ERROR}}$  pin is in a high impedance state (output drivers disabled).

- **Register behavior**

After PORRST, all registers in ESM module will be re-initialized to the default value. All the error status registers are cleared to zero.

Warm reset ( $\overline{\text{RST}}$ ):

- **ERROR pin behavior**

During  $\overline{\text{RST}}$ , the  $\overline{\text{ERROR}}$  pin is in "output active" state with pull-down disabled. The  $\overline{\text{ERROR}}$  pin remains unchanged after  $\overline{\text{RST}}$ .

- **Register behavior**

After  $\overline{\text{RST}}$ , ESMSR1, ESMSR4, ESMSR7, ESMSSR2, ESMSR3 and ESMEPSR register values remains un-changed. Since  $\overline{\text{RST}}$  does not clear the critical failure registers, the user can read those registers to debug the failures after  $\overline{\text{RST}}$  pin goes back to high.

After  $\overline{\text{RST}}$ , if one of the flags in ESMSR1, ESMSR4 and ESMSR7 is set, the interrupt service routine will be called once the corresponding interrupt is enabled.

•

---

#### Note

ESMSR2 is cleared after  $\overline{\text{RST}}$ . The flag in ESMSR2 gets cleared when reading the appropriate vector in the ESMIOFFHR offset register. Reading ESMIOFFHR will not clear the ESMSR1, ESMSR4, ESMSR7 and the shadow register ESMSSR2. Reading ESMIOFFLR will also not clear the ESMSR1, ESMSR4 and ESMSR7.

---

### 20.5.5.2 $\overline{\text{ERROR}}$ Pin Timing

The  $\overline{\text{ERROR}}$  pin is an active low function. The state of the pin is also readable from  $\overline{\text{ERROR}}$  Pin Status Register (ESMEPSR). A warm reset ( $\overline{\text{RST}}$ ) does not affect the state of the pin. The pin is in a high-impedance state during power-on reset. Once the ESM module drives the  $\overline{\text{ERROR}}$  pin low, it remains in this state for the time specified by the Low-Time Counter Preload register (LTCPR). Based on the time period of the peripheral clock (VCLK), the total active time of the  $\overline{\text{ERROR}}$  pin can be calculated as:

$$t_{\overline{\text{ERROR\_low}}} = t_{\text{VCLK}} \times (\text{LTCP} + 1) \quad (8)$$

Once this period expires, the  $\overline{\text{ERROR}}$  pin is set to high in case the reset of the  $\overline{\text{ERROR}}$  pin was requested. This request is done by writing an appropriate key (0x5) to the key register (ESMEKR) during the  $\overline{\text{ERROR}}$  pin low time. Here are a few examples:

Example 1: ESM detects a failure and drives the  $\overline{\text{ERROR}}$  pin low. No  $\overline{\text{ERROR}}$  pin reset is requested. The  $\overline{\text{ERROR}}$  pin continues outputting low until power on reset occurs.

**Figure 20-91.  $\overline{\text{ERROR}}$  Pin Timing - Example 1**

Example 2: ESM detects a failure and drives the  $\overline{\text{ERROR}}$  pin low. An  $\overline{\text{ERROR}}$  pin reset request is received before  $t_{\overline{\text{ERROR\_low}}}$  expires. In this case, the  $\overline{\text{ERROR}}$  pin is set to high immediately after  $t_{\overline{\text{ERROR\_low}}}$  expires.

**Figure 20-92.  $\overline{\text{ERROR}}$  Pin Timing - Example 2**

Example 3: ESM detects a failure and drives the  $\overline{\text{ERROR}}$  pin low. An  $\overline{\text{ERROR}}$  pin reset request is received after  $t_{\overline{\text{ERROR\_low}}}$  expires. In this case, the  $\overline{\text{ERROR}}$  pin is set to high immediately after  $\overline{\text{ERROR}}$  pin reset request is received.

**Figure 20-93.  $\overline{\text{ERROR}}$  Pin Timing - Example 3**

Example 4: ESM detects a failure and drives the  $\overline{\text{ERROR}}$  pin low. Another failure occurs within the time the pin stays low. In this case, the low time counter will be reset when the other failure occurs. In other words,  $t_{\text{ERROR\_low}}$  should be counted from whenever the most recent failure occurs.

**Figure 20-94.  $\overline{\text{ERROR}}$  Pin Timing - Example 4**

Example 5: The reset of the  $\overline{\text{ERROR}}$  pin was requested by the software even before the failure occurs. In this case, the  $\overline{\text{ERROR}}$  pin is set to high immediately after  $t_{\text{ERROR\_low}}$  expires. This case is not recommended and should be avoided by the application.

**Figure 20-95.  $\overline{\text{ERROR}}$  Pin Timing - Example 5**

### 20.5.5.3 Forcing an Error Condition

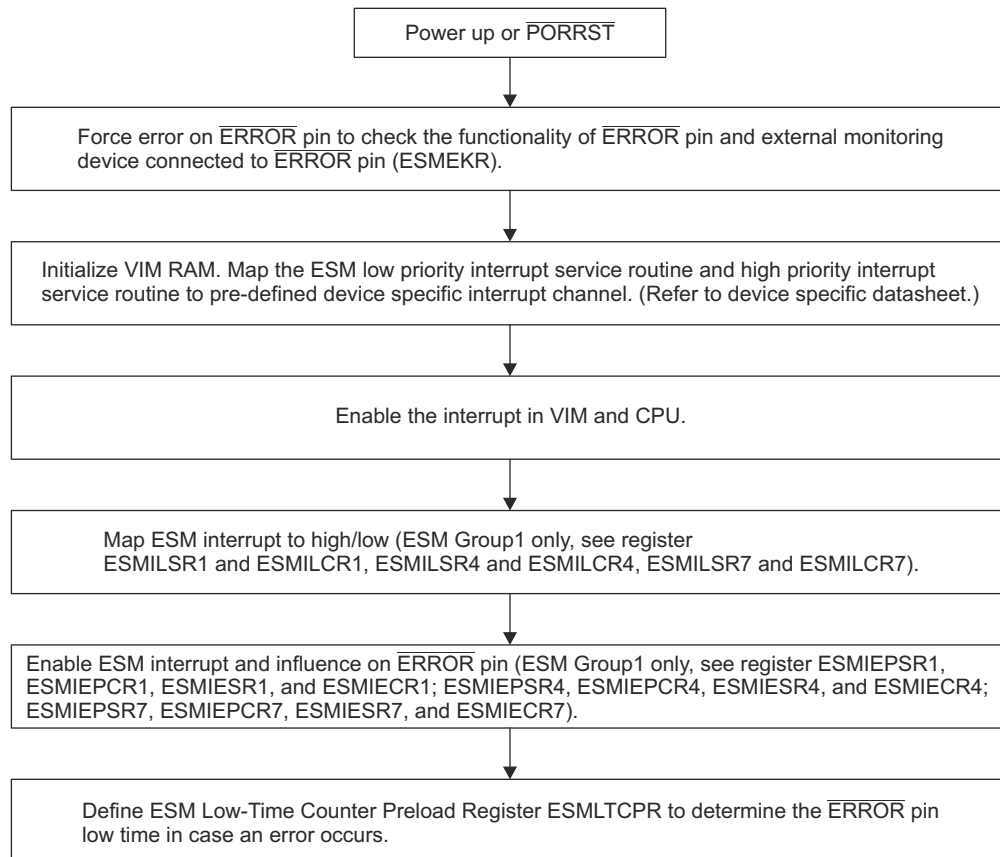

The error response generation mechanism is testable by software by forcing an error condition. This allows testing the  $\overline{\text{ERROR}}$  pin functionality. By writing a dedicated key to the error forcing key register (ESMEKR), the  $\overline{\text{ERROR}}$  pin is set to low for the specified time. The following steps describe how to force an error condition:

1. Check  $\overline{\text{ERROR}}$  Pin Status Register (ESMEPSR). This register must be 1 to switch into the error forcing mode. The ESM module cannot be switched into the error forcing mode if a failure has already been detected in functional mode. The application command to switch to error forcing mode is ignored.
2. Write "1010b" to the error forcing key register (ESMEKR). After that, the  $\overline{\text{ERROR}}$  pin should output low (error force mode). Once the application puts the ESM module in the error forcing mode, the  $\overline{\text{ERROR}}$  pin cannot indicate the normal error functionality. If a failure occurs during this time, it gets still latched and the LTC is reset and stopped. The error output pin is already driven low on account of the error forcing mode. When the ESM is forced back to normal functional mode, the LTC becomes active and forces the  $\overline{\text{ERROR}}$  pin low until the expiration of the LTC.
3. Write "0000" to the error forcing key register (ESMEKR) back to the active normal mode. If there are no errors detected while the ESM module is in the error forcing mode, the  $\overline{\text{ERROR}}$  pin goes high immediately after exiting the error forcing mode.

### 20.5.6 Recommended Programming Procedure

During the initialization stage, the application code should follow the recommendations in [Figure 20-96](#) to initialize the ESM.

Once an error occurs, it can trigger an interrupt,  $\overline{\text{ERROR}}$  pin outputs low depending on the ESM settings. Once the  $\overline{\text{ERROR}}$  pin outputs low, a power on reset or a write of 0x5 to ESMEKR is required to release the ESM back to normal state. The application can read the error status registers (ESMSR1, ESMSR4, ESMSR7, ESMSR2, and ESMSR3) to debug the error. If an  $\overline{\text{RST}}$  is triggered or the error interrupt has been served, the error flag of Group2 should be read from ESMSSR2 because the error flag in ESMSR2 will be cleared by  $\overline{\text{RST}}$ .

**Figure 20-96. ESM Initialization**

ESF																															
R/W-0h																															

**Table 20-127. ESMSR1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ESF	R/W	0h	Error Status Flag. Provides status information on a pending error. Read in User and Privileged mode. Write in Privileged mode only. 0 Read: No error occurred; no interrupt is pending. Write: Leaves the bit unchanged. 1 Read: Error occurred; interrupt is pending. Write: Clears the bit. Note: After nRST, if one of these flags are set and the corresponding interrupt are enabled, the interrupt service routine will be called.

### 20.5.8.8 ESMSR2 Register (Offset = 1Ch) [reset = 0h]

ESMSR2 is shown in [Figure 20-104](#) and described in [Table 20-128](#).

Return to [Summary Table](#).

ESM Status Register 2

**Figure 20-104. ESMSR2 Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ESF																															
R/W-0h																															

**Table 20-128. ESMSR2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ESF	R/W	0h	Error Status Flag. Provides status information on a pending error. Read in User and Privileged mode. Write in Privileged mode only. 0 Read: No error occurred; no interrupt is pending. Write: Leaves the bit unchanged. 1 Read: Error occurred; interrupt is pending. Write: Clears the bit. ESMSSR2 is not impacted by this action. Note: In normal operation the flag gets cleared when reading the appropriate vector in the ESMIOFFHR offset register. Reading ESMIOFFHR will not clear the ESMSR1 and the shadow register ESMSSR2.

### 20.5.8.9 ESMSR3 Register (Offset = 20h) [reset = 0h]

ESMSR3 is shown in [Figure 20-105](#) and described in [Table 20-129](#).

Return to [Summary Table](#).

ESM Status Register 3

**Figure 20-105. ESMSR3 Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ESF																															
R/W-0h																															

**Table 20-129. ESMSR3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ESF	R/W	0h	Error Status Flag. Provides status information on a pending error. Read in User and Privileged mode. Write in Privileged mode only. 0 Read: No error occurred. Write: Leaves the bit unchanged. 1 Read: Error occurred. Write: Clears the bit.

### 20.5.8.10 ESMEPSR Register (Offset = 24h) [reset = 0h]

ESMEPSR is shown in [Figure 20-106](#) and described in [Table 20-130](#).

Return to [Summary Table](#).

ESM ERROR Pin Status Register

**Figure 20-106. ESMEPSR Register**

**Table 20-130. ESMEPSR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	0h	Read returns 0. Writes have no effect.
0	EPSF	R/W	0h	ERROR Pin Status Flag. Provides status information for the ERROR Pin. Read/Write in User and Privileged mode. 0 Read: ERROR Pin is low (active) if any error has occurred. Write: Writes have no effect. 1 Read: ERROR Pin is high if no error has occurred. Write: Writes have no effect. Note: This flag will be set to 1 after PORRST. The value will be unchanged after nRST. The ERROR pin status remains un-changed during after nRST.

### 20.5.8.11 ESMIOFFHR Register (Offset = 28h) [reset = 0h]

ESMIOFFHR is shown in [Figure 20-107](#) and described in [Table 20-131](#).

Return to [Summary Table](#).

ESM Interrupt Offset High Register

**Figure 20-107. ESMIOFFHR Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																								INTOFFH							
R/W-0h																								R/W-0h							

**Table 20-131. ESMIOFFHR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-7	RESERVED	R/W	0h	Read returns 0. Writes have no effect.
6-0	INTOFFH	R/W	0h	Offset High Level Interrupt. This vector gives the channel number of the highest pending interrupt request for the high level interrupt line. Interrupts of error Group2 have higher priority than interrupts of error Group1. Inside a group, channel 0 has highest priority and channel 31 has lowest priority. User and privileged mode (read): Returns number of pending interrupt with the highest priority for the high level interrupt line. 0 No pending interrupt. 1h Interrupt pending for channel 0, error Group1. ... 20h Interrupt pending for channel 31, error Group1. 21h Interrupt pending for channel 0, error Group2. ... 40h Interrupt pending for channel 31, error Group2. 41h Interrupt pending for channel 32, error Group1. ... 60h Interrupt pending for channel 63, error Group1. Note: Reading the interrupt vector will clear the corresponding flag in the ESMSR2 register; will not clear ESMSR1 and ESMSR2 and the offset register gets updated. User and privileged mode (write): Writes have no effect.

### 20.5.8.12 ESMIOFFLR Register (Offset = 2Ch) [reset = 0h]

ESMIOFFLR is shown in [Figure 20-108](#) and described in [Table 20-132](#).

Return to [Summary Table](#).

ESM Interrupt Offset Low Register

**Figure 20-108. ESMIOFFLR Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																								INTOFFL

31-16	RESERVED	R/W	0h	Read returns 0. Writes have no effect.
15-0	LTCP	R/W	0h	ERROR Pin Low-Time Counter Pre-load Value 16bit pre-load value for the ERROR pin low-time counter. Note: Only LTCP.15 and LTCP.14 are configurable (privileged mode write).

### 20.5.8.15 ESMEKR Register (Offset = 38h) [reset = 0h]

ESMEKR is shown in [Figure 20-111](#) and described in [Table 20-135](#).

Return to [Summary Table](#).

ESM Error Key Register

**Figure 20-111. ESMEKR Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																												EKEY			
R/W-0h																												R/W-0h			

**Table 20-135. ESMEKR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	Read returns 0. Writes have no effect.
3-0	EKEY	R/W	0h	Error Key. The key to reset the ERROR pin or to force an error on the ERROR pin. User and privileged mode (read): Returns current value of the EKEY. Privileged mode (write): 0 Activates normal mode (recommended default mode). Ah Forces error on ERROR pin. 5h The ERROR pin set to high when the low time counter (LTC) has completed; then the EKEY bit will switch back to normal mode (EKEY = 0000) All other values Activates normal mode.

### 20.5.8.16 ESMSSR2 Register (Offset = 3Ch) [reset = 0h]

ESMSSR2 is shown in [Figure 20-112](#) and described in [Table 20-136](#).

Return to [Summary Table](#).

ESM Status Shadow Register 2

**Figure 20-112. ESMSSR2 Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ESF																															
R/W-0h																															

**Table 20-136. ESMSSR2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ESF	R/W	0h	Error Status Flag. Shadow register for status information on pending error. Read in User and Privileged mode. Write in Privileged mode only. 0 Read: No error occurred. Write: Leaves the bit unchanged. 1 Read: Error occurred. Write: Clears the bit. ESMSSR2 is not impacted by this action. Note: Errors are stored until they are cleared by the software or at power-on reset (PORRST).

### 20.5.8.17 ESMIEPSR4 Register (Offset = 40h) [reset = 0h]

ESMIEPSR4 is shown in [Figure 20-113](#) and described in [Table 20-137](#).

Return to [Summary Table](#).

ESM Enable ERROR Pin Action/Response Register 4

**Figure 20-113. ESMIEPSR4 Register**

31-0	ESF	R/W	0h	Error Status Flag. Provides status information on a pending error. Read in User and Privileged mode. Write in Privileged mode only. 0 Read: No error occurred; no interrupt is pending. Write: Leaves the bit unchanged. 1 Read: Error occurred; interrupt is pending. Write: Clears the bit. Note: After nRST, if one of these flags are set and the corresponding interrupt are enabled, the interrupt service routine will be called.

## 20.6 Cyclic Redundancy Check (CRC)

This section describes the cyclic redundancy check (CRC) controller module. Presently two CRC modules have been instantiated in the one for MSS and another for DSS.

### 20.6.1 Overview

The CRC controller is a module that is used to perform CRC (Cyclic Redundancy Check) to verify the integrity of memory system. A signature representing the contents of the memory is obtained when the contents of the memory are read into CRC controller. The responsibility of CRC controller is to calculate the signature for a set of data and then compare the calculated signature value against a pre-determined good signature value. CRC controller supports two channels to perform CRC calculation on multiple memories in parallel and can be used on any memory system.

### 20.6.2 Features

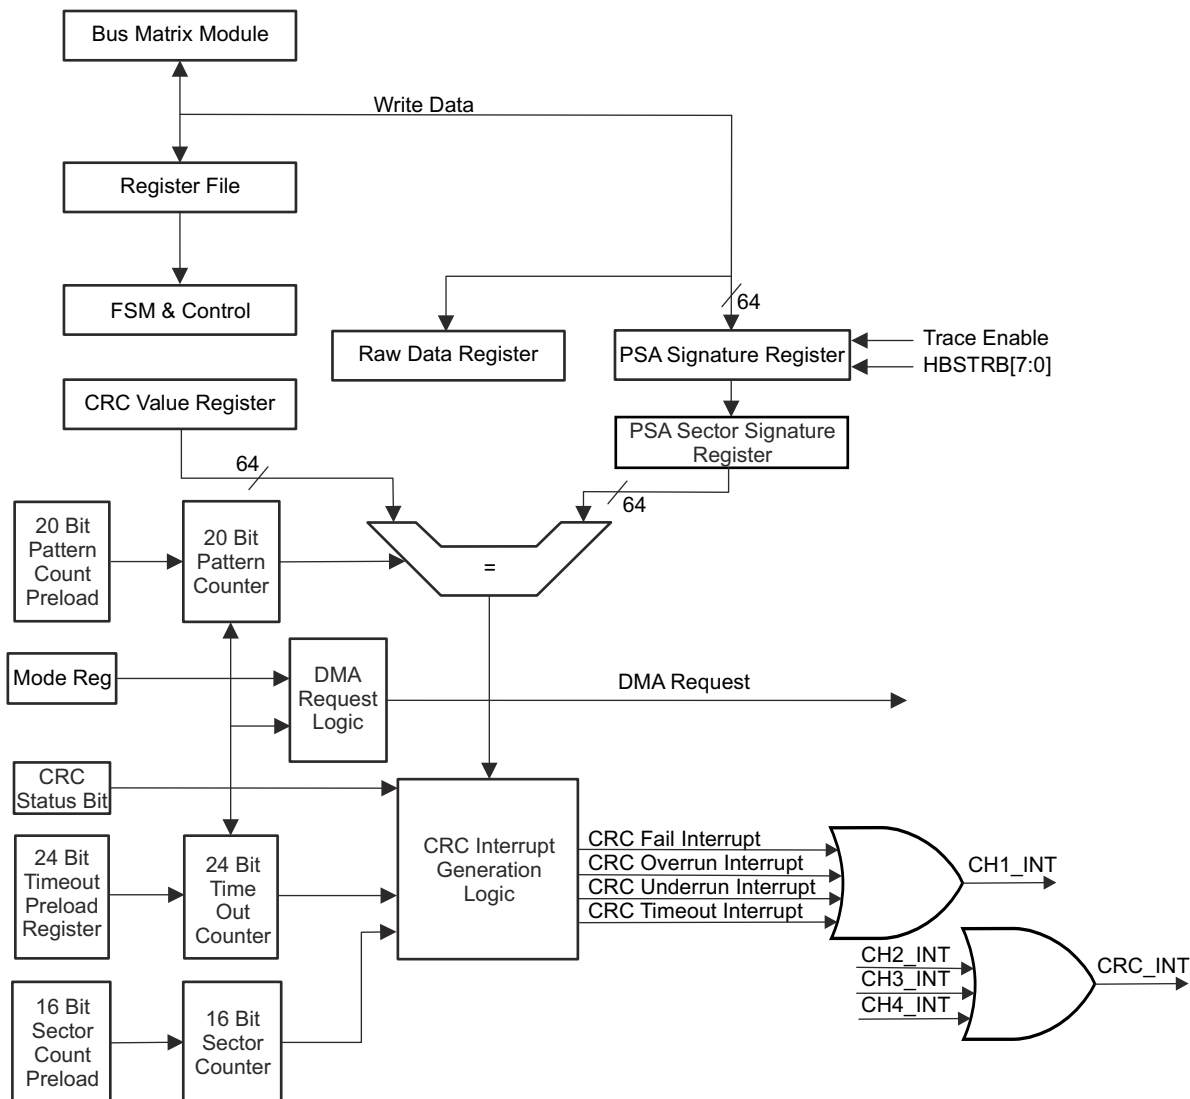

The CRC controller offers:

- Two channels to perform background signature verification on any memory sub-system.
- Data compression on 8, 16, 32, and 64-bit data size.
- Maximum-length PSA (Parallel Signature Analysis) register constructed based on 64-bit primitive polynomial.
- Each channel has a CRC Value Register that contains the pre-determined CRC value.
- Use timed base event trigger from timer to initiate DMA data transfer.
- Programmable 20-bit pattern counter per channel to count the number of data patterns for compression.
- Three modes of operation. Auto, Semi-CPU and Full-CPU.
- For each channel, CRC can be performed either by CRC Controller or by CPU.
- Automatically perform signature verification without CPU intervention in AUTO mode.
- Generate interrupt to CPU in Semi-CPU mode to allow CPU to perform signature verification itself.
- Generate CRC fail interrupt in AUTO mode if signature verification fails.
- Generate Timeout interrupt if CRC is not performed within the time limit.
- Generate DMA request per channel to initiate CRC value transfer.

### 20.6.3 Block Diagram

[Figure 20-127](#) shows a block diagram of the CRC controller.

**Figure 20-127. CRC Controller Block Diagram For One Channel**

## **20.6.4 Module Operation**

### **20.6.4.1 General Operation**

There are two channels in CRC controller, and for each channel there is a memory-mapped PSA (Parallel Signature Analysis) Signature Register and a memory-mapped CRC (Cyclic Redundancy Check) Value Register. A memory can be organized into multiple sectors with each sector consisting of multiple data patterns. A data pattern can be 8-, 16-, 32-, or 64-bit data. CRC module performs the signature calculation and compares the signature to a pre-determined value. The PSA Signature Register compresses an incoming data pattern into a signature when it is written. When one sector of data patterns are written into PSA Signature Register, a final signature corresponding to the sector is obtained. CRC Value Register stores the pre-determined signature corresponding to one sector of data patterns. The calculated signature and the pre-determined signature are then compared to each other for signature verification. To minimize CPU's involvement, data patterns transfer can be carried out at the background of CPU using DMA controller. DMA is setup to transfer data from memory from which the contents to be verified to the memory mapped PSA Signature Register. When DMA transfers data to the memory mapped PSA Signature Register, a signature is generated. A programmable 20-bit data pattern counter is used for each channel to define the number of data patterns to calculate for each sector. Signature verification can be performed automatically by CRC controller in AUTO mode or by CPU itself in Semi-CPU or Full-CPU mode. In AUTO mode, a self sustained CRC signature calculation can be achieved without any CPU intervention.

### **20.6.4.2 CRC Modes of Operation**

CRC Controller can operate in AUTO, Semi-CPU, and Full-CPU modes.

#### **20.6.4.2.1 AUTO Mode**

In AUTO mode, CRC Controller in conjunction with DMA controller can perform CRC without CPU intervention. A sustained transfer of data to both the PSA Signature Register and CRC Value Register are performed in the background of CPU. When a mismatch is detected, an interrupt is generated to CPU. A 16-bit current sector ID register is provided to identify which sector causes a CRC failure.

#### **20.6.4.2.2 Semi-CPU Mode**

In Semi-CPU mode, DMA controller is also utilized to perform data patterns transfer to PSA Signature Register. Instead of performing signature verification automatically, the CRC controller generates an compression complete interrupt to CPU after each sector is compressed. Upon responding to the interrupt the CPU performs the signature verification by reading the calculated signature stored at the PSA Sector Signature Register, and compares it to a pre-determined CRC value.

#### **20.6.4.2.3 Full CPU Mode**

In Full-CPU mode, the CPU does the data patterns transfer and signature verification all by itself. When CPU has enough throughput, it can perform data patterns transfer by reading data from the memory system to the PSA Signature Register. After certain number of data patterns are compressed, the CPU can read from the PSA Signature Register and compare the calculated signature to the pre-determined CRC signature value. In Full-CPU mode, neither interrupt nor DMA request is generated. All counters are also disabled.

### 20.6.4.3 PSA Signature Register

The 64-bit PSA Signature Register is based on the primitive polynomial (as in the following equation) to produce the maximum length LFSR (Linear Feedback Shift Register), as shown in [Figure 20-128](#).

$$f(x) = x^{64} + x^4 + x^3 + x + 1 \quad (9)$$

**Figure 20-128. Linear Feedback Shift Register (LFSR)**

The serial implementation of LFSF has a limitation that, it requires 'n' clock cycles to calculate the CRC values for an 'n' bit data stream. The idea is to produce the same CRC value operating on a multi-bit data stream, as would occur if the CRC were computed one bit at a time over the whole data stream. The algorithm involves looping to simulate the shifting, and concatenating strings to build the equations after 'n' shift.

The parallel CRC calculation based on the polynomial can be illustrated in the following HDL code:

```
for i in 63 to 0 loop
  NEXT_CRC_VAL(0) := CRC_VAL(63) xor DATA(i);
  for j in 1 to 63 loop
    case j is
      when 1|3|4 =>
        NEXT_CRC_VAL(j) :=
          CRC_VAL(j - 1) xor CRC_VAL(63) xor DATA(i);
      when others =>
        NEXT_CRC_VAL(j) := CRC_VAL(j - 1);
    end case;
  end loop;
  CRC_VAL := NEXT_CRC_VAL;
end loop;
```

#### Note

- 1) The inner loop is to calculate the next value of each shift register bit after one cycle
- 2) The outer loop is to simulate 64 cycles of shifting. The equation for each shift register bit is thus built before it is compressed into the shift register.
- 3) MSB of the DATA is shifted in first

There is one PSA Signature Register per CRC channel. PSA Signature Register can be both read and written. When it is written, it can either compress the data or just capture the data depending on the state of CHx\_MODE bits. If CHx\_MODE=Data Capture, a seed value can be planted in the PSA Signature Register without compression. Other modes other than Data Capture will result with the data compressed by PSA Signature Register when it is written. Each channel can be planted with different seed value before compression starts. When PSA Signature Register is read, it gives the calculated signature.

CRC Controller should be used in conjunction with the on chip DMA controller to produce optimal system performance. The incoming data pattern to PSA Signature Register is typically initiated by the DMA controller. When DMA is properly setup, it would read data from the pre-determined memory system and write them to the memory mapped PSA Signature Register. Each time PSA Signature Register is written a signature is generated.

CPU itself can also perform data transfer by reading from the memory system and perform write operation to PSA Signature Register if CPU has enough throughput to handle data patterns transfer.

After system reset and when AUTO mode is enabled, CRC Controller automatically generates a DMA request to request the pre-determined CRC value corresponding to the first sector of memory to be checked.

In AUTO mode, when one sector of data patterns is compressed, the signature stored at the PSA Signature Register is first copied to the PSA Sector Signature Register and PSA Signature Register is then cleared out to all zeros. An automatic signature verification is then performed by comparing the signature stored at the PSA Sector Signature Register to the CRC Value Register. After the comparison the CRC Controller can generate a DMA request. Upon receiving the DMA request the DMA controller will update the CRC Value Register by transferring the next pre-determined signature value associated with the next sector of memory system. If the signature verification fails then CRC Controller can generate a CRC fail interrupt.

In Full-CPU mode, no DMA request and interrupt are generated at all. The number of data patterns to be compressed is determined by CPU itself. Full-CPU mode is useful when DMA controller is not available to perform background data patterns transfer. The OS can periodically generate a software interrupt to CPU and use CPU to accomplish data transfer and signature verification.

CRC Controller supports doubleword, word, half word and byte access to the PSA Signature Register. During a non-doubleword write access, all unwritten byte lanes are padded with zero's before compression. Note that comparison between PSA Sector Signature Register and CRC Value Register is always in 64 bit because a compressed value is always expressed in 64 bit.

There is a software reset per channel for PSA Signature Register. When set, the PSA Signature Register is reset to all zeros.

PSA Signature Register is reset to zero under the following conditions:

- System reset
- PSA Software reset
- One sector of data patterns are compressed

#### **20.6.4.4 PSA Sector Signature Register**

After one sector of data is compressed, the final resulting signature calculated by PSA Signature Register is transferred to the PSA Sector Signature Register. PSA Signature Register is a read only register. During Semi-CPU mode, the host CPU should read from the PSA Sector Signature Register instead of reading from PSA Signature Register for signature verification to avoid data coherency issue. The PSA Signature Register can be updated with new signature before the host CPU is able to retrieve it.

In Semi-CPU mode, no DMA request is generated. When one sector of data patterns is compressed, CRC controller first generates a compression complete interrupt. Responding to the interrupt, CPU will in the ISR read the PSA Sector Signature Register and compare it to the known good signature or write the signature value to another memory location to build a signature file. In Semi-CPU mode, CPU must perform the signature verification in a manner to prevent any overrun condition. The overrun condition occurs when the compression complete interrupt is generated after one sector of data patterns is compressed and CPU has not read from the PSA Sector Signature Register to perform necessary signature verification before PSA Sector Signature Register is overridden with a new value. An overrun interrupt can be enable to generate when overrun condition occurs. During Semi-CPU mode, the host CPU should read from the PSA Sector Signature Register instead of reading from PSA Signature Register for signature verification to avoid data coherency issue. The PSA Signature Register can be updated with new signature before the host CPU is able to retrieve it.

#### 20.6.4.5 CRC Value Register

Associated with each channel there is a CRC Value Register. The CRC Value Register stores the pre-determined CRC value. After one sector of data patterns is compressed by PSA Signature Register, CRC Controller can automatically compare the resulting signature stored at the PSA Sector Signature Register with the pre-determined value stored at the CRC Value Register if AUTO mode is enabled. If the signature verification fails, CRC Controller can be enabled to generate an CRC fail interrupt. When the channel is set up for Semi-CPU mode, CRC controller first generates a compression complete interrupt to CPU. Upon servicing the interrupt, CPU will then read the PSA Sector Signature Register and then read the corresponding CRC value stored at another location and compare them. CPU should not read from the CRC Value Register during Semi-CPU or Full-CPU mode because the CRC Value Register is not updated during these two modes.

In AUTO mode, for first sector's signature, DMA request is generated when mode is programmed to AUTO. For subsequent sectors, DMA request is generated after each sector is compressed. Responding to the DMA request, DMA controller reloads the CRC Value Register for the next sector of memory system to be checked.

When CRC Value Register is updated with a new CRC value, an internal flag is set to indicate that CRC Value Register contains the most current value. This flag is cleared when CRC comparison is performed. Each time at the end of the final data pattern compression of a sector, CRC Controller first checks to see if the corresponding CRC Value Register has the most current CRC value stored in it by polling the flag. If the flag is set then the CRC comparison can be performed. If the flag is not set then it means the CRC Value Register contains stale information. A CRC underrun interrupt is generated. When an underrun condition is detected, signature verification is not performed.

CRC Controller supports doubleword, word, half word and byte access to the CRC Value Register. As noted before comparison between PSA Sector Signature Register and CRC Value Register during AUTO mode is carried out in 64 bit.

#### 20.6.4.6 Raw Data Register

The raw or un-compressed data written to the PSA Signature Register is also saved in the Raw Data Register. This register is read only.

#### 20.6.4.7 Example DMA Controller Setup

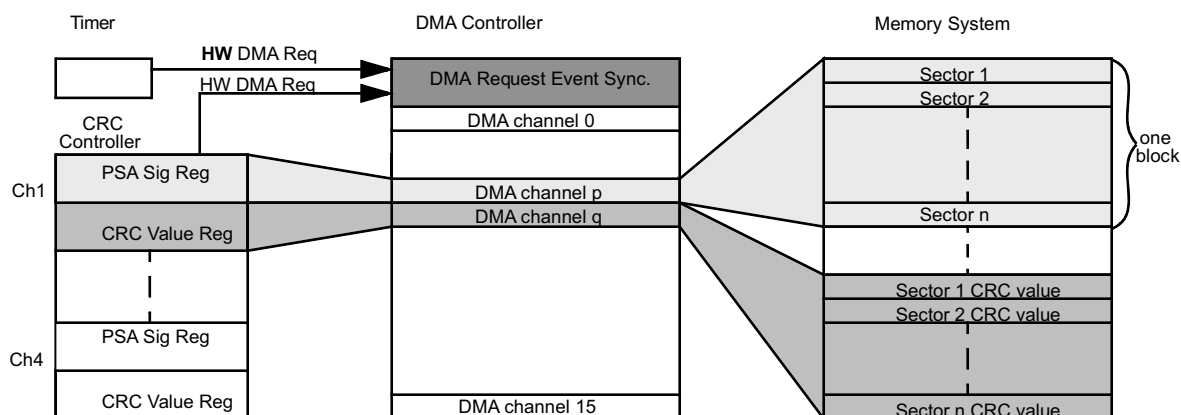

DMA controller needs to be setup properly in either either AUTO or Semi-CPU mode as DMA controller is used to transfer data patterns. Hardware or a combination of hardware and software DMA triggering are supported.

##### 20.6.4.7.1 AUTO Mode Using Hardware Timer Trigger

There are two DMA channels associated with each CRC channel when in AUTO mode. One DMA channel is setup to transfer data patterns from the source memory to the PSA Signature Register. The second DMA channel is setup to transfer the pre-determined signature to the CRC Value Register. The trigger source for the first DMA channel can be either by hardware or by software. As illustrated in [Figure 20-129](#) a timer can be used to trigger a DMA request to initiate transfer from the source memory system to PSA Signature Register. In AUTO mode, CRC Controller also generates DMA request after one sector of data patterns is compressed to initiate transfer of the next CRC value corresponding to the next sector of memory. Thus a new CRC value is always updated in the CRC Value Register by DMA synchronized to each sector of memory.

A block of memory system is usually divided into many sectors. All sectors are the same size. The sector size is programmed in the CRC\_PCOUNT\_REGx and the number of sectors in one block is programmed in the CRC\_SCOUNT\_REGx of the respective channel. CRC\_PCOUNT\_REGx multiplies CRC\_SCOUNT\_REGx and multiplies transfer size of each data pattern should give the total block size in number of bytes.

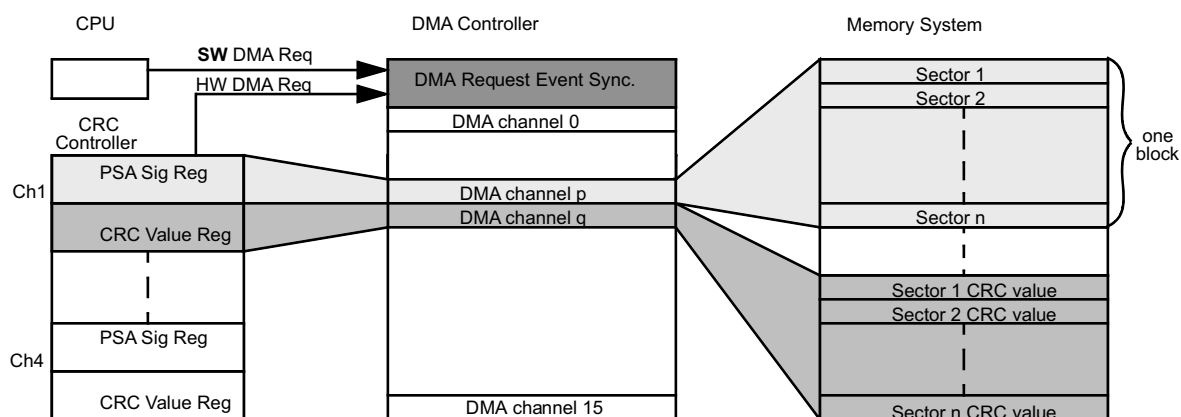

The total size of the memory system to be examined is also programmed in the respective transfer count register inside DMA module. The DMA transfer count register is divided into two parts. They are element count and frame count. Note that an HW DMA request can be programmed to trigger either one frame or one entire block transfer. In [Figure 20-129](#), an HW DMA request from a timer is used as a trigger source to initiate DMA transfer. If all two CRC channels are active in AUTO mode then a total of two DMA requests would be generated by CRC Controller.

**Figure 20-129. AUTO Mode Using Hardware Timer Trigger**

#### 20.6.4.7.2 AUTO Mode Using Software Trigger

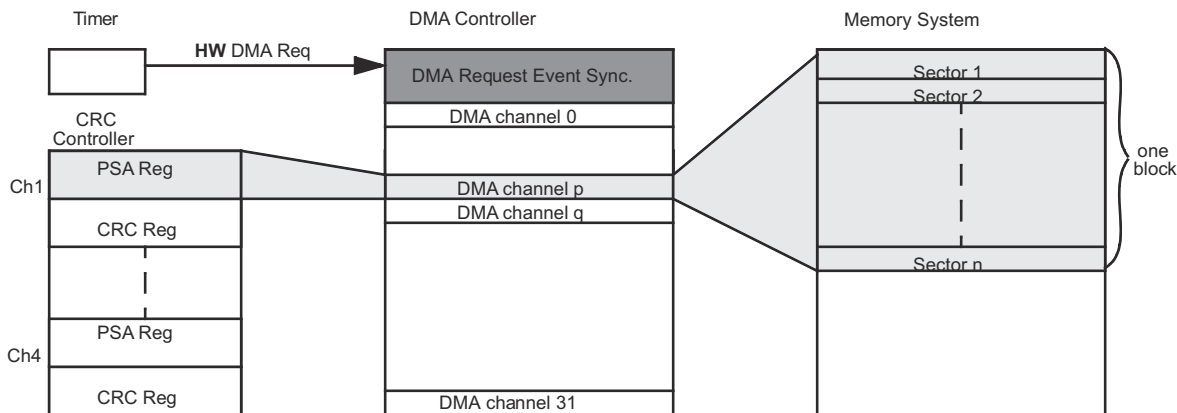

The data patterns transfer can also be initiated by software. CPU can generate a software DMA request to activate the DMA channel to transfer data patterns from source memory system to the PSA Signature Register. To generate a software DMA request CPU needs to set the corresponding DMA channel in the DMA software trigger register. Note that just one software DMA request from CPU is enough to complete the entire data patterns transfer for all sectors. See [Figure 20-130](#) for an illustration.

**Figure 20-130. AUTO Mode With Software CPU Trigger**

#### 20.6.4.7.3 Semi-CPU Mode Using Hardware Timer Trigger

During semi-CPU mode, no DMA request is generated by CRC controller. Therefore, no DMA channel is allocated to update CRC Value Register. CPU should not read from CRC Value Register in semi-CPU mode as it contains stale value. Note that no signature verification is performed at all during this mode. Similar to AUTO mode, either by hardware or by software DMA request can be used as a trigger for data patterns transfer. [Figure 20-131](#) illustrates the DMA setup using semi-CPU mode with hardware timer trigger.

**Figure 20-131. Semi-CPU Mode With Hardware Timer Trigger**

**Table 20-151. CRC Modes in Which DMA Request and Counter Logic are Active or Inactive**

Mode	DMA Request	Pattern Counter	Sector Counter	Timeout Counter
AUTO	Active	Active	Active	Active
Semi-CPU	Inactive	Active	Active	Active
Full-CPU	Inactive	Inactive	Inactive	Inactive

#### 20.6.4.8 Pattern Count Register

There is a 20-bit data pattern counter for every CRC channel. The data pattern counter is a down counter and can be pre-loaded with a programmable value stored in the Pattern Count Register. When the data pattern counter reaches zero, a compression complete interrupt is generated in Semi-CPU mode and an automatic signature verification is performed in AUTO mode. In AUTO only, DMA request is generated to trigger the DMA controller to update the CRC Value Register.

#### Note

The data pattern count should be divisible by the total transfer count as programmed in DMA controller. The total transfer count is the product of element count and frame count.

#### 20.6.4.9 Sector Count Register/Current Sector Register

Each channel contains a 16 bit sector counter. The sector count register stores the number of sectors. Sector counter is a free running counter and is incremented by one each time when one sector of data patterns is compressed. When the signature verification fails, the current value stored in the sector counter is saved into current sector register. If signature verification fails, CPU can read from the current sector register to identify the sector which causes the CRC mismatch. To aid and facilitate the CPU in determining the cause of a CRC failure, it is advisable to use the following equation during CRC and DMA setup:

$$\text{CRC Pattern Count} \times \text{CRC Sector Count} = \text{DMA Element Count} \times \text{DMA Frame Count}$$

The current sector register is frozen from being updated until both the current sector register is read and CRC fail status bit is cleared by CPU. If CPU does not respond to the CRC failure in a timely manner before another sector produces a signature verification failure, the current sector register is not updated with the new sector number. An overrun interrupt is generate instead. If current sector register is already frozen with an erroneous sector and emulation is entered with SUSPEND signal goes to high then the register still remains frozen even it is read.

In Semi-CPU mode, the current sector register is used to indicate the sector for which the compression complete has last happened.

The current sector register is reset when the PSA software reset is enabled.

### Note

Both data pattern count and sector count registers must be greater than or equal to one for the counters to count. After reset, pattern count and sector count registers default to zero and the associated counters are inactive.

#### 20.6.4.10 Interrupt

The CRC controller generates several types of interrupts per channel. Associated with each interrupt, there is an interrupt enable bit. No interrupt is generated in Full-CPU mode.

- Compression complete interrupt
- CRC fail interrupt
- Overrun interrupt
- Underrun interrupt
- Timeout interrupt

**Table 20-152. Modes in Which Interrupt Condition Can Occur**

	AUTO	Semi-CPU	Full-CPU
Compression Complete	no	yes	no
CRC Fail	yes	no	no
Overrun	yes	yes	no
Underrun	yes	no	no
Timeout	yes	yes	no

##### 20.6.4.10.1 Compression Complete Interrupt

Compression complete interrupt is generated in Semi-CPU mode only. When the data pattern counter reaches zero, the compression complete flag is set and the interrupt is generated.

##### 20.6.4.10.2 CRC Fail Interrupt

CRC fail interrupt is generated in AUTO mode only. When the signature verification fails, the CRC fail flag is set,. CPU should take action to address the fail condition and clear the CRC fail flag after it resolves the CRC mismatch.

##### 20.6.4.10.3 Overrun Interrupt

Overrun interrupt is generated in either AUTO or Semi-CPU mode. During AUTO mode, if a CRC fail is detected then the current sector number is recorded in the current sector register. If CRC fail status bit is not cleared and current sector register is not read by the host CPU before another CRC fail is detected for another sector then an overrun interrupt is generated. During Semi-CPU mode, when the data pattern counter finishes counting, it generates a compression complete interrupt. At the same time the signature is copied into the PSA Sector Signature Register. If the host CPU does not read the signature from PSA Sector Signature Register before it is updated again with a new signature value then an overrun interrupt is generated.

#### 20.6.4.10.4 Underrun Interrupt

Underrun interrupt only occurs in AUTO mode. The interrupt is generated when the CRC Value Register is not updated with the corresponding signature when the data pattern counter finishes counting. During AUTO mode, CRC Controller generates DMA request to update CRC Value Register in synchronization to the corresponding sector of the memory. Signature verification is also performed if underrun condition is detected. And CRC fail interrupt is generated at the same time as the underrun interrupt.

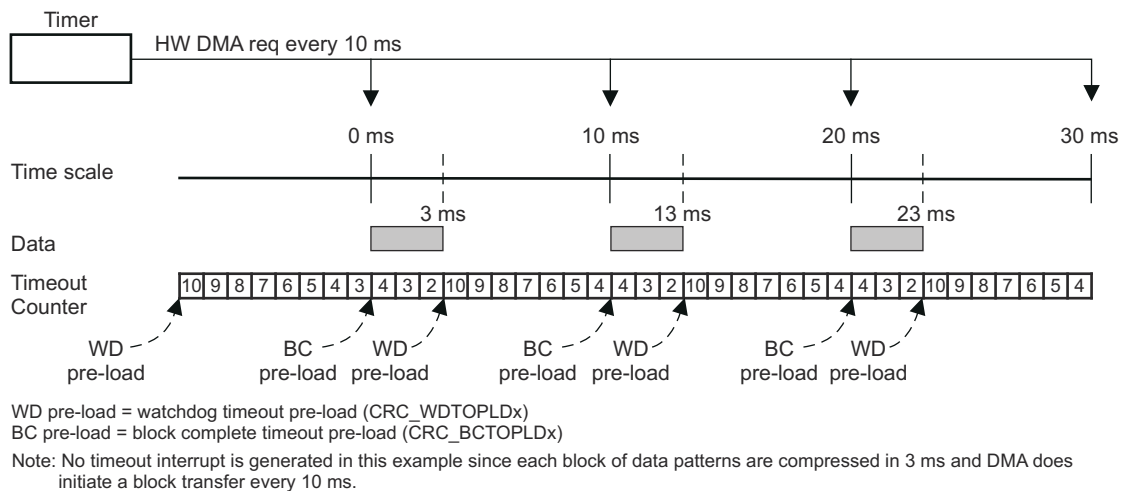

#### 20.6.4.10.5 Timeout Interrupt

To ensure that the memory system is examined within a pre-defined time frame and no loss of incoming data there is a 24 bit timeout counter per CRC channel. The 24 bit timeout down counter can be pre-loaded with two different pre-load values, watchdog timeout pre-load value (CRC\_WDTPLDx) and block complete timeout pre-load value (CRC\_BCTOPLDx). The timeout counter is clocked by a prescaler clock which is permanently running at division 64 of HCLK clock.

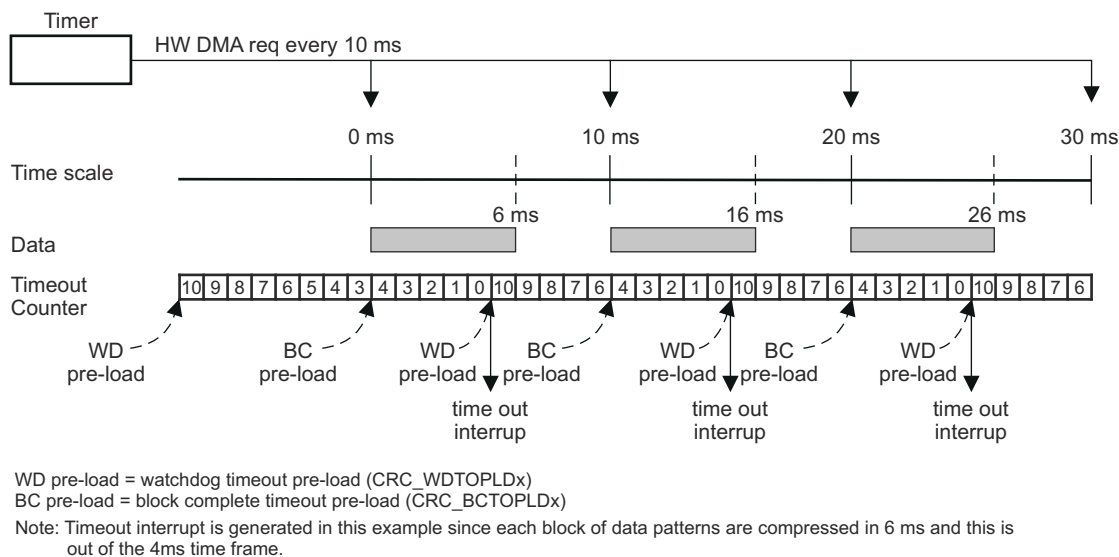

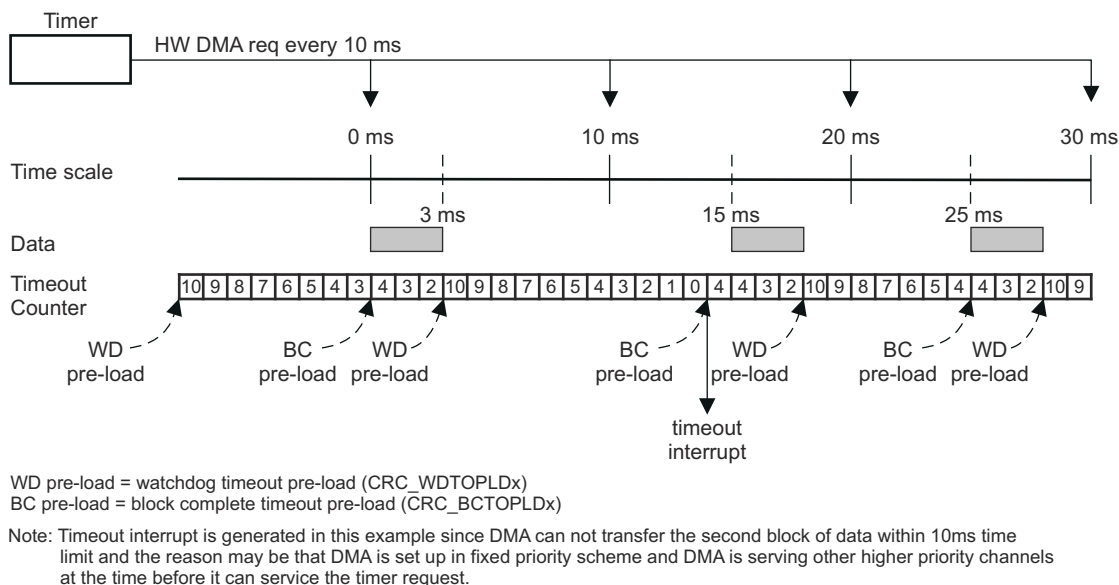

First pattern of data must be transferred by the DMA before the timeout counter expires, Watchdog timeout pre-load register (CRC\_WDTPLDx) is used as timeout counter. Block complete timeout pre-load register (CRC\_BCTOPLDx) is used to check if one complete block of data patterns are compressed within a specific time frame. The timeout counter is first pre-loaded with CRC\_WDTPLDx after either AUTO or Semi-CPU mode is selected and starts to down count. If the timeout counter expires before DMA transfers any data pattern to PSA Signature Register then a timeout interrupt is generated. An incoming data pattern before the timeout counter expires will automatically pre-load the timeout counter with CRC\_BCTOPLDx the block complete timeout pre-load value.

Block complete timeout pre-load value is used to check if one block of data patterns are compressed within a given time limit. If the timeout counter pre-loaded with CRC\_BCTOPLDx value expires before one block of data patterns are compressed a timeout interrupt is generated. When one block (pattern count x sector count) of data patterns are compressed before the counter has expired, the counter is pre-loaded with CRC\_WDTPLDx value again. If the timeout counter is pre-loaded with zero then the counter is disable and no timeout interrupt is generated.

In Figure 20-132, a timer generates DMA request every 10ms to trigger one block (pattern count x sector count) transfer. Since we want to make sure that DMA does start to transfer a block every 10 ms we would set the first pre-load value to 10ms in CRC\_WDTPLDx. We also want to make sure that one block of data patterns are compressed within 4ms. With such a requirement, we would set the second pre-load value to 4ms in CRC\_BCTOPLDx register.

**Figure 20-132. Timeout Example 1**

**Figure 20-133. Timeout Example 2**

**Figure 20-134. Timeout Example 3**

#### 20.6.4.10.6 Interrupt Offset Register

CRC Controller only generates one interrupt request to interrupt manager. A interrupt offset register is provided to indicate the source of the pending interrupt with highest priority. [Table 20-153](#) shows the offset interrupt vector address of each interrupt condition in an ascending order of priority.

**Table 20-153. Interrupt Offset Mapping**

Offset Value	Interrupt Condition
0	Phantom
1h	Ch1 CRC Fail
2h	Ch2 CRC Fail
3h-8h	Reserved
9h	Ch1 Compression Complete
Ah	Ch2 Compression Complete
Bh-10h	Reserved
11h	Ch1 Overrun
12h	Ch2 Overrun
13h-18h	Reserved
19h	Ch1 Underrun
1Ah	Ch2 Underrun
1Bh-20h	Reserved
21h	Ch1 Timeout
22h	Ch2 Timeout
23h-24h	Reserved

#### 20.6.4.10.7 Error Handling

When an interrupt is generated, host CPU should take appropriate actions to identify the source of error and restart the respective channel in DMA and CRC module. To restart a CRC channel, the user should perform the following steps in the ISR:

1. Write to software reset bit in CRC\_CTRL register to reset the respective PSA Signature Register.
2. Reset the CHx\_MODE bits to 00 in CRC\_CTRL register as Data capture mode.
3. Set the CHx\_MODE bits in CRC\_CTRL register to desired new mode again.
4. Release software reset.

The host CPU should use byte write to restart each individual channel.

#### 20.6.4.11 Power Down Mode

CRC module can be put into power down mode when the power down control bit PWDN is set. The module wakes up when the PWDN bit is cleared.

#### 20.6.4.12 Emulation

A read access from a register in functional mode can sometimes trigger a certain internal event to follow. For example, reading an interrupt offset register triggers an event to clear the corresponding interrupt status flag. During emulation when SUSPEND signal is high, a read access from any register should only return the register contents to the bus and should not trigger or mask any event as it would have in functional mode. This is to prevent debugger from reading the interrupt offset register during refreshing screen and cause the corresponding interrupt status flag to get cleared. Timeout counters are stopped to generate timeout interrupts in emulation mode. No Peripheral Controller bus error should be generated if reading from the unimplemented locations.

#### 20.6.4.13 Peripheral Bus Interface

CRC is a Peripheral target module. The register interface is similar to other peripheral modules. CRC supports following features:

- Different sizes of burst operation.
- Aligned and unaligned accesses.
- Abort is generated for any illegal address accesses.

#### 20.6.5 Example

This section illustrates several of the ways in which the CRC Controller can be utilized to perform CRC.

##### 20.6.5.1 Example: Auto Mode Using Time Based Event Triggering

A large memory area with 2Mbyte (256k doubleword) is to be checked in the background of CPU. CRC is to be performed every 1K byte (128 doubleword). Therefore there should be 2048 pre-recorded CRC values. For illustration purpose, we map channel 1 CRC Value Register to DMA channel 1 and channel 1 PSA Signature Register to DMA channel 2. Assume all DMA transfers are carried out in 64-bit transfer size.

##### 20.6.5.1.1 DMA Setup

- Set up DMA channel 1 with the starting address from which the pre-determined CRC values are stored. Set up the destination address to the memory mapped channel 1 CRC Value Register. Put the source address at post increment addressing mode and put the destination address at constant addressing mode. Use **hardware** DMA request for channel 1 to trigger a **frame** transfer.
- Set up DMA channel 2 with the source address from which the contents of memory to be verified. Set up the destination address to the memory mapped channel 1 PSA Signature Register. Program the element transfer count to 128 and the frame transfer count to 2048. Put the source address at post increment addressing mode and put the destination address at constant address mode. Use **hardware** DMA request for channel 2 to trigger an entire **block** transfer.

##### 20.6.5.1.2 Timer Setup

The timer can be any general purpose timer which is capable of generating a time-based DMA request.

- Set up timer to generate DMA request associated with DMA channel 2. For example, an OS can set up the timer to generate a DMA request every 10ms.

### 20.6.5.1.3 CRC Setup

- Program the pattern count to 128.
- Program the sector count to 2048.
- Enable AUTO mode and all interrupts.

After AUTO mode is selected, CRC Controller automatically generates a DMA request on channel 1. Around the same time the timer module also generates a DMA request on DMA channel 2. When the first incoming data pattern arrives at the PSA Signature Register, the CRC Controller will compress it. After some time, the DMA controller would update the CRC Value Register with a pre-determined value matching the calculated signature for the first sector of 128 64 bit data patterns. After one sector of data patterns are compressed, the CRC Controller generate a CRC fail interrupt if signature stored at the PSA Sector Signature Register does not match the CRC Value Register. CRC Controller generates a DMA request on DMA channel 1 when one sector of data patterns are compressed. This routine will continue until the entire 2Mbyte are consumed. If the timeout counter reached zero before the entire 2Mbytes are compressed a timeout interrupt is generated. After 2MBytes are transferred, the DMA can generate an interrupt to CPU. The entire operation will continue again when DMA responds to the DMA request from both the timer and CRC Controller. The CRC is performed totally without any CPU intervention.

### 20.6.5.2 Example: Auto Mode Without Using Time Based Triggering

A small but highly secured memory area with 1kbytes is to be checked in the background of CPU. CRC is to be performed every 1Kbytes. Therefore there is only one pre-recorded CRC value. For illustration purpose, we map channel 1 CRC Value Register to DMA channel 1 and channel 1 PSA Signature Register to DMA channel 2. Assume all transfers carried out by DMA are in 64 bit transfer size.

#### 20.6.5.2.1 DMA Setup

- Set up DMA channel 1 with the source address from which the pre-determined CRC value is stored. Set up the destination address to the memory mapped channel 1 CRC Value Register. Put the source address at constant addressing mode and put the destination address at constant addressing mode. Use **hardware** DMA request for channel 1.
- Set up DMA channel 2 with the source address from which the memory area to be verified. Set up the destination address to the memory mapped channel 1 PSA Signature Register. Program the element transfer count to 128 and the frame transfer count to 1. Put the source address at post increment addressing mode and put the destination address at constant address mode. Generate a **software** DMA request on channel 2 after CRC has completed its setup. Enable autoinitiation for DMA channel 2.

#### 20.6.5.2.2 CRC Setup

- Program the pattern count to 128.
- Program the sector count to 1.
- Leaving the timeout count register with the reset value of zero means no timeout interrupt is generated.
- Enable AUTO mode and all interrupts.

After AUTO mode is selected, the CRC Controller automatically generates a DMA request on channel 1. At the same time the CPU generates a **software** DMA request on DMA channel 2. When the first incoming data pattern arrives at the PSA Signature Register, the CRC Controller will compress it. After some time, the DMA controller would update the CRC Value Register with a pre-determined value matching the calculated signature for the first sector of 128 64 bit data patterns. After one sector of data patterns are compressed, the CRC Controller generates a CRC fail interrupt if signature stored at the PSA Sector Signature Register does not match the CRC Value Register. CRC Controller generates a DMA request on DMA channel 1 again after one sector is compressed. After 1kbytes are transferred, the DMA can generate an interrupt to CPU. Responding to the DMA interrupt CPU can restart the CRC routine by generating a software DMA request onto channel 2 again.

### 20.6.5.3 Example: Semi-CPU Mode

If DMA controller is available in a system, the CRC module can also operate in semi-CPU mode. This means that CPU can still make use of the DMA to perform data patterns transfer to CRC controller in the background. The difference between semi-CPU mode and AUTO mode is that CRC controller does not automatically perform

the signature verification. CRC controllers generates a compression complete interrupt to CPU when the one sector of data patterns are compressed. CPU needs to perform the signature verification itself.

A memory area with 2Mbyte is to be verified with the help of the CPU. CRC operation is to be performed every 1K byte. Since there are 2Mbyte (256k doublewords) of memory to be check and we want to perform a CRC every 1Kbyte (128 doublewords) and therefore there should be 2048 pre-recorded CRC values. In Semi-CPU mode, the CRC Value Register is not updated and contains indeterminate data.

#### **20.6.5.3.1 DMA Setup**

Set up DMA channel 1 with the source address from which the memory area to be verified are mapped. Set up the destination address to the memory mapped channel 1 PSA Signature Register. Put the starting address at post increment addressing mode and put the destination address at constant address mode. Use hardware DMA request to trigger an entire block transfer for channel 1. Disable autoinitiation for DMA channel 1.

#### **20.6.5.3.2 Timer Setup**

The timer can be any general purpose timer which is capable of generating a time based DMA request.

Set up timer to generate DMA request associated with DMA channel 1. For example, an OS can set up the timer to generate a DMA request every 10ms.

#### **20.6.5.3.3 CRC Setup**

- Program the pattern count to 128.
- Program the sector count to 2048.
- Enable Semi-CPU mode and enable all interrupts.

The timer module first generates a DMA request on DMA channel 1 when it is enabled. When the first incoming data pattern arrives at the PSA Signature Register, the CRC controller will compress it. After one sector of data patterns are compressed, the CRC controller generate a compression complete interrupt. Upon responding to the interrupt the CPU would read from the PSA Sector Signature Register. It is up to the CPU on how to deal with the PSA value just read. It can compare it to a known signature value or it can write it to another memory location to build a signature file or even transfer the signature out of the device via SCI or SPI. This routine will continue until the entire 2Mbyte are consumed. The latency of the interrupt response from CPU can cause overrun condition. If CPU does not read from PSA Sector Signature Register before the PSA value is overridden with the signature of the next sector of memory, an overrun interrupt will be generated by CRC controller.

#### **20.6.5.4 Example: Full-CPU Mode**

In a system without the availability of DMA controller, the CRC routine can be operated by CPU provided the CPU has enough throughput. CPU needs to read from the memory area from which CRC is to be performed.

A memory area with 2Mbyte is to be checked with the help of the CPU. CRC verification is to be performed every 1K byte. In CPU mode, the CRC Value Register is not updated and contains indeterminate data.

##### **20.6.5.4.1 CRC Setup**

- All control registers can be left in their reset state. Only enable Full-CPU mode.

CPU itself reads from the memory and write the data to the PSA Signature Register inside CRC Controller. When the first incoming data pattern arrives at the PSA Signature Register, the CRC Controller will compress it. After **2MBytes** data patterns are compressed, CPU can read from the PSA Signature Register. It is up to the CPU on how to deal with the PSA signature value just read. It can compare it to a known signature value stored at another memory location.

## 20.6.6 MSS\_MCRC Registers

Table 20-154 lists the PCR\_generated\_memory\_map registers. All register offset addresses not listed in Table 20-154 should be considered as reserved locations and the register contents should not be modified.

**Table 20-154. MSS\_MCRC Registers**

Offset	Acronym	Register Name	Section

15-0	CRC_SEC_COUNT1	R/W	0h	Channel 1 Sector Counter Preload Register. This register contains the number of sectors in one block of memory.

### 20.6.6.11 CRC\_CURSEC\_REG1 Register (Offset = 48h) [reset = 0h]

CRC\_CURSEC\_REG1 is shown in [Figure 20-145](#) and described in [Table 20-165](#).

Return to the [Table 20-154](#).

Channel 1 current sector register contains the sector number which causes CRC failure

**Figure 20-145. CRC\_CURSEC\_REG1 Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CRC_CURSEC1															
R-0h																R/W-0h															

**Table 20-165. CRC\_CURSEC\_REG1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-0	CRC_CURSEC1	R/W	0h	Channel 1 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated. The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erroneous sector number.

### 20.6.6.12 CRC\_WDTPD1 Register (Offset = 4Ch) [reset = 0h]

CRC\_WDTPD1 is shown in [Figure 20-146](#) and described in [Table 20-166](#).

Return to the [Table 20-154](#).

Channel 1 timeout pre-load value to check if within a given time DMA initiates a block transfer

**Figure 20-146. CRC\_WDTPD1 Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-0	CRC_SEC_COUNT2	R/W	0h	Channel 2 Sector Counter Preload Register. This register contains the number of sectors in one block of memory.

### 20.6.6.24 CRC\_CURSEC\_REG2 Register (Offset = 88h) [reset = 0h]

CRC\_CURSEC\_REG2 is shown in [Figure 20-158](#) and described in [Table 20-178](#).

Return to the [Table 20-154](#).

Channel 2 current sector register contains the sector number which causes CRC fail-ure

**Figure 20-158. CRC\_CURSEC\_REG2 Register**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																CRC_CURSEC2															
R-0h																R/W-0h															

**Table 20-178. CRC\_CURSEC\_REG2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-0	CRC_CURSEC2	R/W	0h	Channel 2 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated. The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erroneous sector number.

### 20.6.6.25 CRC\_WDTPD2 Register (Offset = 8Ch) [reset = 0h]

CRC\_WDTPD2 is shown in [Figure 20-159](#) and described in [Table 20-179](#).

Return to the [Table 20-154](#).

Channel 2 timeout pre-load value to check if within a given time DMA initiates a block transfer

**Figure 20-159. CRC\_WDTPD2 Register**

- Interval-based testing
- MSS\_STC.STC\_CLKDIV clock division features

### 20.7.2 STC Overview

The enhanced Self-Test Controller (STC) is used to test logic cores based on the On-Product Multiple Input Signature Register (OPMISR) scan compression architecture.

Software-based self-test programs for the cores are available, but offer less test coverage. Due to the complexity of the soft cores, the coverage required can be difficult to achieve and will result in a larger program size.

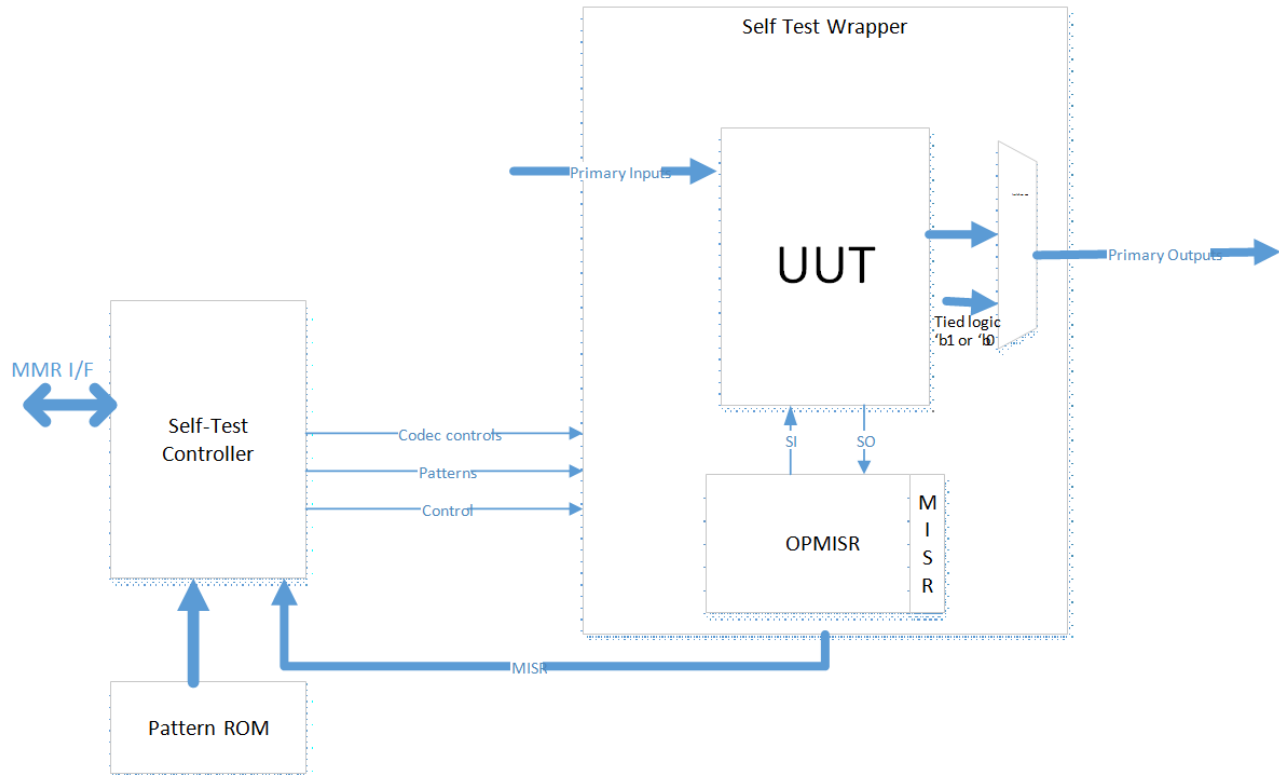

For these complex cores, on-chip logic BIST support for the self-test is preferred.

The main features of the STC include:

- Implements the OPMISR controller, along with the on-chip self-test controller for the synthesizable module logic, which enables high test coverage.
- The self-test controller facilitates complete isolation of the logical segment under the test from the rest of the system during the self-test run. Configure critical control signals in the initiator and target ports of the logical segment under the test to a safe state.
- The self-tested CPU core initiator bus transaction signals are configured to be in idle mode during the self-test run.
- Time-out counter for the self-test run as a fail-safe feature.
- Can capture power reduction using dead cycles before and after the capture pulse.

A self test segment corresponds to a portion of discreet safety-critical logic which can be tested in isolation from the rest of the system by the self test controller and OPMISR logic.

### 20.7.2.1 OPMISR Concept

**Figure 20-197. OPMISR Conceptual Diagram**

The On-Product Multiple-Input Signature Register (OPMISR) is a methodology which moves the test pattern generation on-chip. Logic BIST is implemented on functional partitions (BIST'ed COREs) that are speed-critical and have high gate count. A conceptual diagram of OPMISR implementation is shown in [Figure 20-197](#).

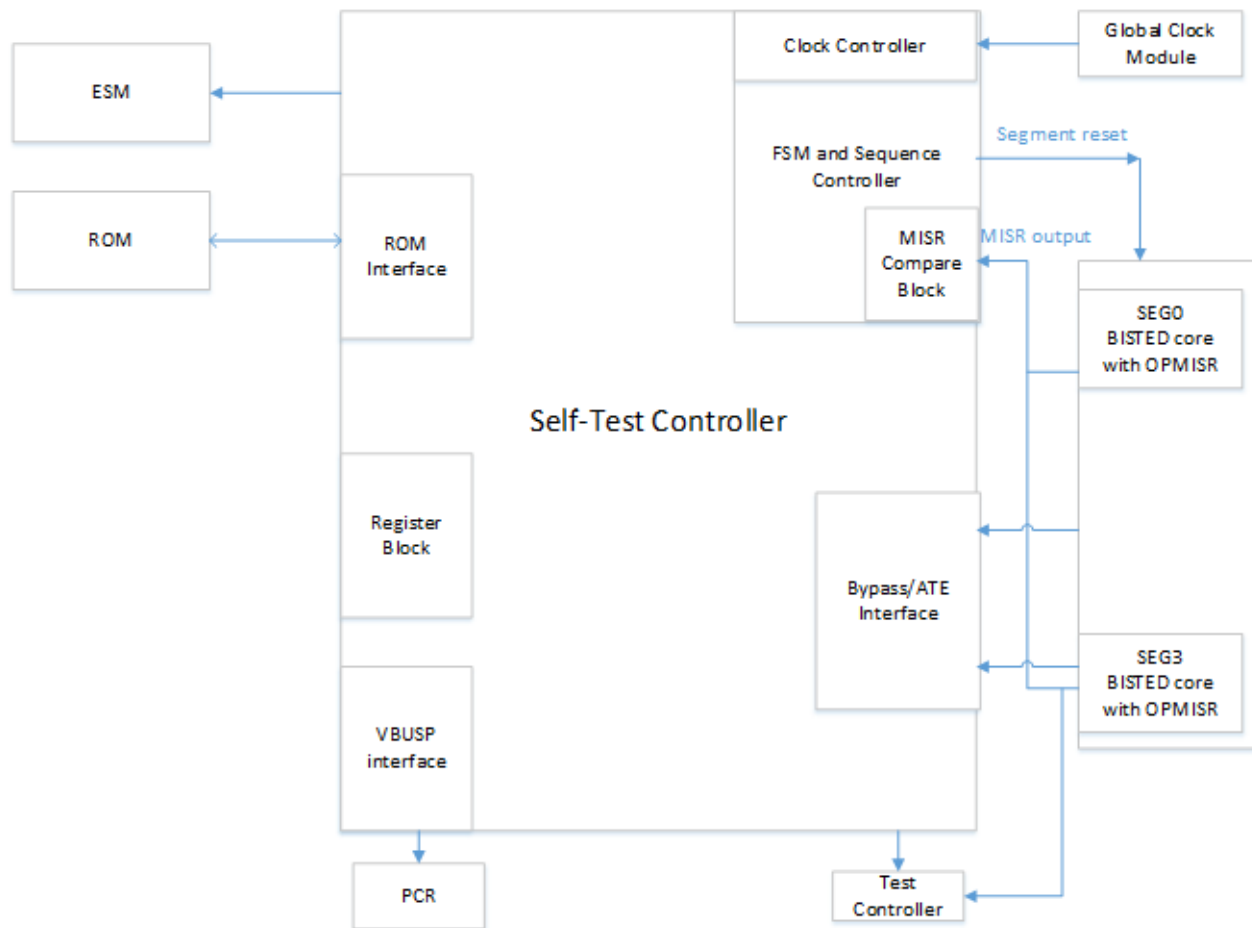

The MISR test structure modifies the typical fullscan scan chain such that each scan data input internally drives many chains. These chains feed to the inserted MISR structure. The chain's values are captured into the MISR during shift, generating a resulting signature that can be shifted out.

A given Unit Under Test (UUT) is scan-inserted, and the scan chains are hooked to the OPMISR logic. The self-test wrapper created around the UUT and the OPMISR logic includes the isolation muxes for the output ports of the core, to ensure that the core and UUT are isolated from the rest of the system during the self-test.

### 20.7.3 Block Diagram

The STC module is composed of following blocks:

- ROM interface
- FSM and sequence control
- Register file
- STC bypass / ATE interface
- Peripheral bus interface (VBUSP interface)

#### **20.7.4.3 Register Block**

This block implements the user-programmable control registers that determine when to start a self test and what clock frequency the scan test should be performed.

The register block also captures various status information of the self test for the user.

#### **20.7.4.4 STC Bypass / ATE Interface**

This is a production test interface. This section bypasses the self-test FSM. The OPMISR signal interface is brought out directly to the module ports, and these are accessible to the ATE (tester) at the device level using the test controller module. The intent of the block is to provide capability for fault isolation for parts failing the logic self test run.

This block receives two sets of signals; one from the device test controller, and another similar set from the self-test FSM (test sequencer). The bypass indicator signal is used to select one of the two sets of signals to be routed to the OPMISR controller.

#### **20.7.4.5 VBUSP Interface**

The control and the status registers of the STC module can be accessed through the VBUSP interface. During application programming, configuration registers are programmed through the peripheral interface, to enable and run the self-test controller.

## 20.7.4.6 STC Flow

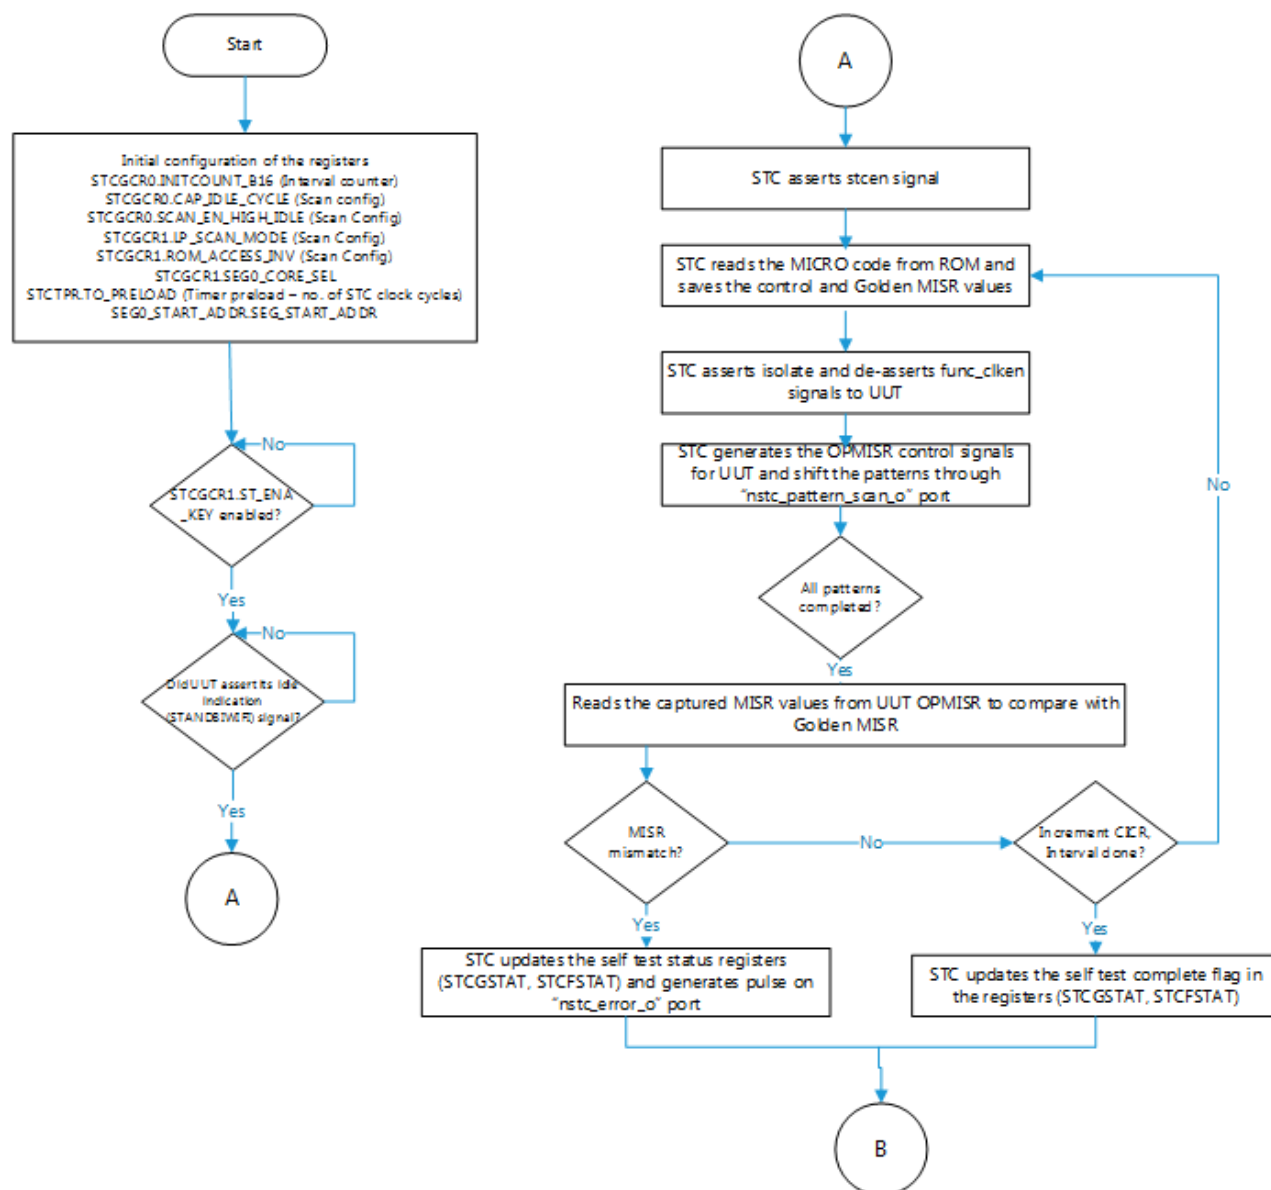

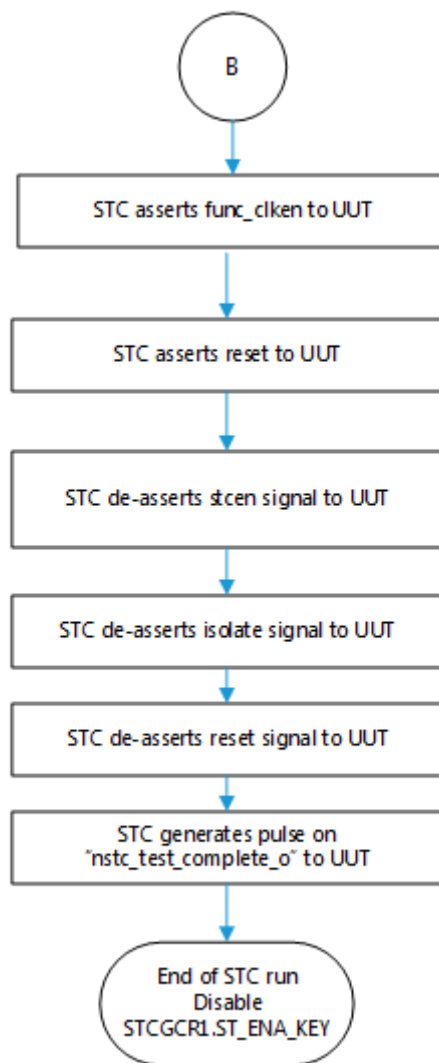

Figure 20-199. STC Flow (1 of 2)

**Figure 20-200. STC Flow (2 of 2)**

CFG for interval 1, when rom_access_inversion =1 (same as when_rom_access_inversion =0)	Reserved	pattern_count[9:0]	Reserved	Reserved	Reserved	Seg_ID[1]	Seg_ID[0]	FT	TR_T

The ROM contains the data to be processed by STC for the self-test run. This includes the control fields such as Segment ID, Pattern Count, and Golden MISR value for the STC, and the pattern scan data for the OPMISR controller.

The ROM space is divided into chunks, with each chunk containing the data corresponding to one OPMISR interval. The size required for an interval varies depending on the number patterns packed into the interval and the length of internal scan chains required.

Because each interval requires 64 rows of ROM for storing control and Golden MISR values, minimizing the number of intervals by packing more patterns into each interval provides the best ROM size. This works best if

the self-test must be run only as a part of the boot-up sequence. However, if the self-test is performed during application IDLE time, the number of patterns that can be packed into each interval will be dictated by the IDLE time available for the self-test, because an interval is the smallest granularity of a self-test run.

Details of the ROM image micro-code fields are given in the following sections.

#### 20.7.4.7.1 TR\_T: Transition Delay Methodology Type

This specifies the transition delay methodology for the current transition delay interval.

0	Launch-on-System-Clock
---	------------------------

#### 20.7.4.7.2 FT: Fault Model for the BIST Run

This specifies the fault model for the current interval of the test.

0	Stuck-at
---	----------

#### 20.7.4.7.3 SEG\_ID[1:0]

This indicates which logical segment is selected for the associated interval during the self-test run.

SEG_SEL[1:0]	Segment Under Test
00	Segment 0
01	Segment 1
10	Segment 2
11	Segment 3

#### 20.7.4.7.4 Pattern Count ( patt\_count[9:0] )

This specifies the number of scan data patterns within a self-test interval. The pattern counts can vary from a minimum of 2 to a maximum of 1024.

patt_count[9:0]	Patterns per Interval
00_0000_0000	Not a valid interval [defaults to 2 patterns per interval]
00_0000_0001	2 patterns per interval
00_0000_0010	3 patterns per interval
...	...
11_1111_1110	1023 patterns per interval
11_1111_1111	1024 patterns per interval

#### 20.7.4.7.5 MISR\_GOLDEN[895:0]: Golden Signature Data Bits

This part of ROM contains the golden signature data of the current interval. This value is used to compare with the actual MISR value, when ST\_GCR1.ROM\_ACCESS\_INV=0 and ST\_GCR1.LP\_SCAN\_MODE=0, to generate the pass/fail information of the interval.

**20.7.4.7.6 LP\_MISR\_GOLDEN[895:0]: Low Power Mode Golden Signature Data Bits**

This part of ROM contains the LP golden signature data of the current interval. This value is used to compare with the actual MISR value, when STCGCR1.ROM\_ACCESS\_INV=0 and STCGCR1.LP\_SCAN\_MODE=1, to generate the pass/fail information of the interval.

---

**Note**

This mode is not supported on AM26xx devices.

---

**20.7.4.7.7 INV\_MISR\_GOLDEN[895:0]: Inverse Mode Golden Signature Data Bits**

This part of ROM contains the inverse mode golden signature data of the current interval. This value is used to compare with the actual MISR value, when STCGCR1.ROM\_ACCESS\_INV=1 and STCGCR1.LP\_SCAN\_MODE=0, to generate the pass/fail information of the interval.

---

**Note**

This mode is not supported on AM26xx devices.

---

**20.7.4.7.8 LP\_INV\_MISR\_GOLDEN[895:0]: Low Power Inverse Mode Golden Signature Data Bits**

This part of ROM contains the low-power inverse mode golden signature data of the current interval. This value is used to compare with the actual MISR value, when STCGCR1.ROM\_ACCESS\_INV=1 and STCGCR1.LP\_SCAN\_MODE=1, to generate the pass/fail information of the interval.

---

**Note**

This mode is not supported on AM26xx devices.

---

**20.7.4.7.9 Pn\_SDm[7:0] (n - no. of patterns, m - scan chain length): OP-MISR Scan Data**

This part of the ROM contains the scan data corresponding to each pattern. Each interval can have n number of scan patterns, as defined in the patt\_count field. The number of 7bits of scan data in a pattern is equal to the length of the scan chain formed inside the UUT.

## 20.7.5 STC Registers

**Table 20-219** lists the memory-mapped registers for the STC registers. These registers are applicable for the R5F\_STC, DSP\_STC, and HSM\_STC. All register offset addresses not listed in **Table 20-219** should be considered as reserved locations and the register contents should not be modified.

**Table 20-219. STC Registers**

Offset	Acronym	Register Name	Section
0h	STCGCR0	Self test Global control Reg0	<a href="#">Go</a>
4h	STCGCR1	Self test Global control Reg1	<a href="#">Go</a>
8h	STCTPR	Time out counter preload register	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. [Table 20-220](#) shows the codes that are used for access types in this section.

**Table 20-220. STC Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

### 20.7.5.1 STCGCR0 Register (Offset = 0h) [Reset = 00000000h]

STCGCR0 is shown in [Table 20-221](#).

Return to the [Summary Table](#).

Self test Global control Reg0. \*NOT BYTE ACCESSIBLE

**Table 20-221. STCGCR0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	INTCOUNT_B16	R/W	0h	Number of intervals of the self test run (RWP - Read, Privilege Mode Write only) Count of intervals that need to be covered for a specific selftest run. The selftest controller sends out "complete" indication once it runs all of the intervals programmed in this field. INTCOUNT_B 16= 0 is an invalid configuration for a selftest.
15-11	NU0	R	0h	Reserved bits
10-8	CAP_IDLE_CYCLE	R/W	0h	Idle cycles before and after capture clock (RWP - Read, Privilege Mode Write only) Idle Cycles before and after capture clock. This value is used to insert that many idle cycles in the Capture phase. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
7-5	SCANEN_HIGH_CAP_IDLE_CYCLE	R/W	0h	Idle cycles before and after capture clock (RWP - Read, Privilege Mode Write only). *NOT BYTE ACCESSIBLE Idle Cycles between scan_en going high to func_clk_en generation and scan_en going high to misr_log_en generation. This value is used to insert that many idle cycles in the shift clock (scan_en going high to func_clk_en generation) and misr_log_clk (scan_en going high to misr_log_en generation) generation. Programmable idle cycles allow implementation flexibility on SCAN_EN signal at chip level based on the size of the UUT and timing requirements.
4-2	NU1	R	0h	Reserved bits
1-0	RS_CNT_B1	R/W	0h	Restart/Continue or preload (RWP - Read, Privilege Mode Write only) This bit specifies the selftest controller whether to continue the run from next interval onwards, restart from ROM address 0 or preload from a prescribed interval. This bit gets reset after the completion of selftest run. 00 = Continue NSTC run from previous interval 01 = Restart NSTC run from ROM address 0 1X = Start from segment number specified in STC_SEGPLR register

### 20.7.5.2 STCGCR1 Register (Offset = 4h) [Reset = 00000000h]

STCGCR1 is shown in [Table 20-222](#).

Return to the [Summary Table](#).

Self test Global control Reg1

**Table 20-222. STCGCR1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-12	NU2	R	0h	Reserved bits
11-8	SEG0_CORE_SEL	R/W	0h	Selects the Segment 0 CORE for self test (RWP - Read, Priviledge Mode Write only) Select the Segment 0 CORE for Self -Test 0001 = Select CORE for selftest Other = CORE not selected.
7	NU3	R	0h	Reserved bits
6	CODEC_SPREAD_MODE	R/W	0h	Codec Spread Mode control signal (RWP - Read, Priviledge Mode Write only) This bit is used to configure the codec in spread / X-OR mode. 1 = Spread mode 0 = XOR mode
5	LP_SCAN_MODE	R/W	0h	LP scan mode (RWP - Read, Priviledge Mode Write only) This bit is used to decide the scan configuration: 1 = Operates in Low Power Scan Mode. 0 = Operates in Normal Scan Mode.
4	ROM_ACCESS_INV	R/W	0h	Rom access inversion mode (RWP - Read, Priviledge Mode Write only) - NOT SUPPORTED
3-0	ST_ENA_B4	R/W	0h	Self test enable key (RWP - Read, Priviledge Mode Write only) 1010 = Self test run enabled All values other than 1010 = Self test run disabled

### 20.7.5.3 STCTPR Register (Offset = 8h) [Reset = 00000000h]

STCTPR is shown in [Table 20-223](#).

Return to the [Summary Table](#).

Time out counter preload register

**Table 20-223. STCTPR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	TO_PRELOAD	R/W	0h	<p>Self test time out preload (RWP - Read, Priviledge Mode Write only)</p> <p>This register contains the total number of STC clock cycles it will take before a self-test timeout error will be triggered after the initiation of the self-test run.</p> <p>This is a fail safe feature to avoid system hang-up situation on account of any run away self test issues.</p> <p>This register should be loaded with a meaningful count value for this feature to be effective.</p> <p>This register value (preload count value) gets loaded into the self test timeout down counter whenever a self test run is initiated (ST_ENA is enabled).</p> <p>and gets disabled on completion of a self test run.</p>

#### 20.7.5.4 STC\_CADDR Register (Offset = Ch) [Reset = 00000000h]

STC\_CADDR is shown in [Table 20-224](#).

Return to the [Summary Table](#).

Current Address register for CORE1

**Table 20-224. STC\_CADDR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ADDR	R	0h	Current ROM Address for CORE1 This register reflects the current ROM address (for micro code load) accessed during selftest for CORE1 in of case segment0 and all the remaining segmentsn where n = 1 to 3).

### 20.7.5.5 STCCICR Register (Offset = 10h) [Reset = 00000000h]

STCCICR is shown in [Table 20-225](#).

Return to the [Summary Table](#).

Current Interval count register

**Table 20-225. STCCICR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-16	CORE2_ICOUNT	R	0h	Specifies the last interval number for CORE2 This specifies the Last executed Interval number for CORE2 of Segment0 if self test is being executed for secondary core as well. This field is applicable only for Segment 0.
15-0	CORE1_ICOUNT	R	0h	Specifies the last interval number for CORE1 This specifies the Last executed Interval number of a self-test run.

### 20.7.5.6 STCGSTAT Register (Offset = 14h) [Reset = 00000000h]

STCGSTAT is shown in [Table 20-226](#).

Return to the [Summary Table](#).

Global Status Register

**Table 20-226. STCGSTAT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-12	NU4	R	0h	Reserved bits
11-8	ST_ACTIVE	R	0h	Tells whether self test is currently active or not. 1010 = Self test is active Others = SelfTest is not active Once the self-test completes and ST_ENA_B 4 key is cleared, this field will reflect the inactive value.
7-2	NU5	R	0h	Reserved bits
1	TEST_FAIL	R	0h	Test_fail flag (RCP - Read, Clear on Writing in Priviledge Mode) 0 = Self test run has not failed 1 = SelfTest run has failed. Write Clear.
0	TEST_DONE	R	0h	Test_done_flag (RCP - Read, Clear on Writing in Priviledge Mode) 0 = Not completed 1 = SelfTest run Completed

### 20.7.5.7 STCFSTAT Register (Offset = 18h) [Reset = 00000000h]

STCFSTAT is shown in [Table 20-227](#).

Return to the [Summary Table](#).

Fail Status Register

**Table 20-227. STCFSTAT Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-5	NU6	R	0h	Reserved bits
4-3	FSEG_ID	R	0h	Failed Segment ID (RCP - Read, Clear on Writing in Privilege Mode) This field captures the Segment number for which any of the failures like TO_ER_B 1, CPU 1_FAIL_B 1 and CPU 2_FAIL_B 1 occur. 00 = Failure on Segment 0 01 = Failure on Segment 1 10 = Failure on Segment 2 11 = Failure on Segment 3
2	TO_ER_B1	R	0h	Tells whether self test failed because of time out error (RCP - Read, Clear on Writing in Privilege Mode) 0 = No time out error occurred 1 = SelfTest run failed due to a timeout error
1	CPU2_FAIL_B1	R	0h	Tells whether MISR mismatch happened in CORE 2 when in Segment 0 mode (RCP - Read, Clear on Writing in Privilege Mode) 0 = No MISR mismatch for CORE 2 1 = Self test run failed due to MISR mismatch for CORE 2
0	CPU1_FAIL_B1	R	0h	Tells whether MISR mismatch happened in CORE 1 (RCP - Read, Clear on Writing in Privilege Mode) Applicable to all segments. 0 = No MISR mismatch for CORE 1 1 = Self test run failed due to MISR mismatch for CORE 1

### 20.7.5.8 STCSCSCR Register (Offset = 1Ch) [Reset = 00000000h]

STCSCSCR is shown in [Table 20-228](#).

Return to the [Summary Table](#).

Signature compare Self Check Register

**Table 20-228. STCSCSCR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-5	NU7	R	0h	Reserved bits
4	FAULT_INS_B1	R/W	0h	Fault Insertion bit (RWP - Read, Priviledge Mode Write only) 0 = No fault insertion. 1 = Inserts fault in the logic unedr test which will make signature compare fail. This feature is used as diagnostic check of the STC IP.
3-0	SELF_CHECK_KEY_B4	R/W	0h	Signature compare logic self check key enable/disable (RWP - Read, Priviledge Mode Write only) 1010 = Signature compare logic Self Check is enabled All values other than 1010 = Signature compare logic Self Check is disabled

### 20.7.5.9 STC\_CADDR2 Register (Offset = 20h) [Reset = 00000000h]

STC\_CADDR2 is shown in [Table 20-229](#).

Return to the [Summary Table](#).

Current Address register for CORE2

**Table 20-229. STC\_CADDR2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	ADDR	R	0h	Current ROM Address for CORE2 This register reflects the current ROM address(for micro code load) accessed during selftest for CORE2 in of case segment0.

### 20.7.5.10 STC\_CLKDIV Register (Offset = 24h) [Reset = 00000000h]

STC\_CLKDIV is shown in [Table 20-230](#).

Return to the [Summary Table](#).

Clock Divider Register

**Table 20-230. STC\_CLKDIV Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-27	NU8	R	0h	Reserved bits
26-24	CLKDIV0	R/W	0h	Clock division for Seg0 (RWP - Read, Priviledge Mode Write only) *NOT SUPPORTED X = Division ratio is X+1 for Segment 0
23-19	NU9	R	0h	Reserved bits
18-16	CLKDIV1	R/W	0h	Clock division for Seg1 (RWP - Read, Priviledge Mode Write only) *NOT SUPPORTED X = Division ratio is X+1 for Segment 1
15-11	NU10	R	0h	Reserved bits
10-8	CLKDIV2	R/W	0h	Clock division for Seg2 (RWP - Read, Priviledge Mode Write only) *NOT SUPPORTED X = Division ratio is X+1 for Segment 2
7-3	NU11	R	0h	Reserved bits
2-0	CLKDIV3	R/W	0h	Clock division for Seg3 (RWP - Read, Priviledge Mode Write only) *NOT SUPPORTED X = Division ratio is X+1 for Segment 3

### 20.7.5.11 STC\_SEGPLR Register (Offset = 28h) [Reset = 00000000h]

STC\_SEGPLR is shown in [Table 20-231](#).

Return to the [Summary Table](#).

Segment 1st interval Preload Register

**Table 20-231. STC\_SEGPLR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-2	NU12	R	0h	Reserved bits
1-0	SEGID_PLOAD	R/W	0h	<p>Segment number for which preload is to be started (RWP - Read, Priviledge Mode Write only) This specifies the segment for which the address of its First interval will be pre-loaded into the NSTC ROM address counter.</p> <p>The</p> <p>1st address of each segment are defined in SEGx_START_ADDR register. The address of the</p> <p>1st interval of the selected segment is loaded into the NSTC ROM address counter when the RS_CNT_B</p> <p>1 bits of STC_GCR</p> <p>0 are set to</p> <p>1X</p> <p>00 = Preload the address of the</p> <p>1st interval of segment</p> <p>0.</p> <p>01 = Preload the address of the</p> <p>1st interval of segment</p> <p>1.</p> <p>10 = Preload the address of the</p> <p>1st interval of segment</p> <p>2.</p> <p>11 = Preload the address of the</p> <p>1st interval of segment</p> <p>3.</p>

### 20.7.5.12 SEG0\_START\_ADDR Register (Offset = 2Ch) [Reset = 00000000h]

SEG0\_START\_ADDR is shown in [Table 20-232](#).

Return to the [Summary Table](#).

ROM Start address for Segment0

**Table 20-232. SEG0\_START\_ADDR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-20	NU13	R	0h	Reserved bits
19-0	SEG_START_ADDR	R/W	0h	Segment 0 Start Address (RWP - Read, Priviledge Mode Write only) This register holds the ROM address for the start of first interval of the segment. When STC_GCR0.RS_CNT_B1 field is set to (1x) "PRELOAD" option, this register is used to determine the ROM start address for the Segment selected in ST_SEGPLR register. Valid number of bits depends on RTL paramerter ADDR

### 20.7.5.13 SEG1\_START\_ADDR Register (Offset = 30h) [Reset = 00000000h]

SEG1\_START\_ADDR is shown in [Table 20-233](#).

Return to the [Summary Table](#).

ROM Start address for Segment1

**Table 20-233. SEG1\_START\_ADDR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-20	NU14	R	0h	Reserved bits
19-0	SEG_START_ADDR	R/W	0h	Segment 1 Start Address (RWP - Read, Priviledge Mode Write only) This register holds the ROM address for the start of first interval of the segment. When STC_GCR0.RS_CNT_B1 field is set to (1x) "PRELOAD" option, this register is used to determine the ROM start address for the Segment selected in ST_SEGPLR register. Valid number of bits depends on RTL parameter ADDR. This register is present only when RTL parameter NUM_SEG = 1.

#### 20.7.5.14 SEG2\_START\_ADDR Register (Offset = 34h) [Reset = 00000000h]

SEG2\_START\_ADDR is shown in [Table 20-234](#).

Return to the [Summary Table](#).

ROM Start address for Segment2

**Table 20-234. SEG2\_START\_ADDR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-20	NU15	R	0h	Reserved bits
19-0	SEG_START_ADDR	R/W	0h	Segment 2 Start Address (RWP - Read, Priviledge Mode Write only) This register holds the ROM address for the start of first interval of the segment. When STC_GCR0.RS_CNT_B1 field is set to (1x) "PRELOAD" option, this register is used to determine the ROM start address for the Segment selected in ST_SEGPLR register. Valid number of bits depends on RTL parameter ADDR. This register is present only when RTL parameter NUM_SEG = 2.

### 20.7.5.15 SEG3\_START\_ADDR Register (Offset = 38h) [Reset = 00000000h]

SEG3\_START\_ADDR is shown in [Table 20-235](#).

Return to the [Summary Table](#).

ROM Start address for Segment3

**Table 20-235. SEG3\_START\_ADDR Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-20	NU16	R	0h	Reserved bits
19-0	SEG_START_ADDR	R/W	0h	Segment 3 Start Address (RWP - Read, Priviledge Mode Write only) This register holds the ROM address for the start of first interval of the segment. When STC_GCR0.RS_CNT_B1 field is set to (1x) "PRELOAD" option, this register is used to determine the ROM start address for the Segment selected in ST_SEGPLR register. Valid number of bits depends on RTL parameter ADDR. This register is present only when RTL parameter NUM_SEG = 3.

### 20.7.5.16 CORE1\_CURMISR\_0 Register (Offset = 3Ch) [Reset = 00000000h]

CORE1\_CURMISR\_0 is shown in [Table 20-236](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-236. CORE1\_CURMISR\_0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR0	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.17 CORE1\_CURMISR\_1 Register (Offset = 40h) [Reset = 00000000h]

CORE1\_CURMISR\_1 is shown in [Table 20-237](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-237. CORE1\_CURMISR\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR1	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.18 CORE1\_CURMISR\_2 Register (Offset = 44h) [Reset = 00000000h]

CORE1\_CURMISR\_2 is shown in [Table 20-238](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-238. CORE1\_CURMISR\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR2	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.19 CORE1\_CURMISR\_3 Register (Offset = 48h) [Reset = 00000000h]

CORE1\_CURMISR\_3 is shown in [Table 20-239](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-239. CORE1\_CURMISR\_3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR3	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.20 CORE1\_CURMISR\_4 Register (Offset = 4Ch) [Reset = 00000000h]

CORE1\_CURMISR\_4 is shown in [Table 20-240](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-240. CORE1\_CURMISR\_4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR4	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.21 CORE1\_CURMISR\_5 Register (Offset = 50h) [Reset = 00000000h]

CORE1\_CURMISR\_5 is shown in [Table 20-241](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-241. CORE1\_CURMISR\_5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR5	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.22 CORE1\_CURMISR\_6 Register (Offset = 54h) [Reset = 00000000h]

CORE1\_CURMISR\_6 is shown in [Table 20-242](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-242. CORE1\_CURMISR\_6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR6	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.23 CORE1\_CURMISR\_7 Register (Offset = 58h) [Reset = 00000000h]

CORE1\_CURMISR\_7 is shown in [Table 20-243](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-243. CORE1\_CURMISR\_7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR7	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

#### 20.7.5.24 CORE1\_CURMISR\_8 Register (Offset = 5Ch) [Reset = 00000000h]

CORE1\_CURMISR\_8 is shown in [Table 20-244](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-244. CORE1\_CURMISR\_8 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR8	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.25 CORE1\_CURMISR\_9 Register (Offset = 60h) [Reset = 00000000h]

CORE1\_CURMISR\_9 is shown in [Table 20-245](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-245. CORE1\_CURMISR\_9 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR9	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.26 CORE1\_CURMISR\_10 Register (Offset = 64h) [Reset = 00000000h]

CORE1\_CURMISR\_10 is shown in [Table 20-246](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-246. CORE1\_CURMISR\_10 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR10	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.27 CORE1\_CURMISR\_11 Register (Offset = 68h) [Reset = 00000000h]

CORE1\_CURMISR\_11 is shown in [Table 20-247](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-247. CORE1\_CURMISR\_11 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR11	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.28 CORE1\_CURMISR\_12 Register (Offset = 6Ch) [Reset = 00000000h]

CORE1\_CURMISR\_12 is shown in [Table 20-248](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-248. CORE1\_CURMISR\_12 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR12	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.29 CORE1\_CURMISR\_13 Register (Offset = 70h) [Reset = 00000000h]

CORE1\_CURMISR\_13 is shown in [Table 20-249](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-249. CORE1\_CURMISR\_13 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR13	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.30 CORE1\_CURMISR\_14 Register (Offset = 74h) [Reset = 00000000h]

CORE1\_CURMISR\_14 is shown in [Table 20-250](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-250. CORE1\_CURMISR\_14 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR14	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.31 CORE1\_CURMISR\_15 Register (Offset = 78h) [Reset = 00000000h]

CORE1\_CURMISR\_15 is shown in [Table 20-251](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-251. CORE1\_CURMISR\_15 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR15	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.32 CORE1\_CURMISR\_16 Register (Offset = 7Ch) [Reset = 00000000h]

CORE1\_CURMISR\_16 is shown in [Table 20-252](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-252. CORE1\_CURMISR\_16 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR16	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.33 CORE1\_CURMISR\_17 Register (Offset = 80h) [Reset = 00000000h]

CORE1\_CURMISR\_17 is shown in [Table 20-253](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-253. CORE1\_CURMISR\_17 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR17	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.34 CORE1\_CURMISR\_18 Register (Offset = 84h) [Reset = 00000000h]

CORE1\_CURMISR\_18 is shown in [Table 20-254](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-254. CORE1\_CURMISR\_18 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR18	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.35 CORE1\_CURMISR\_19 Register (Offset = 88h) [Reset = 00000000h]

CORE1\_CURMISR\_19 is shown in [Table 20-255](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-255. CORE1\_CURMISR\_19 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR19	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.36 CORE1\_CURMISR\_20 Register (Offset = 8Ch) [Reset = 00000000h]

CORE1\_CURMISR\_20 is shown in [Table 20-256](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-256. CORE1\_CURMISR\_20 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR20	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.37 CORE1\_CURMISR\_21 Register (Offset = 90h) [Reset = 00000000h]

CORE1\_CURMISR\_21 is shown in [Table 20-257](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-257. CORE1\_CURMISR\_21 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR21	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.38 CORE1\_CURMISR\_22 Register (Offset = 94h) [Reset = 00000000h]

CORE1\_CURMISR\_22 is shown in [Table 20-258](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-258. CORE1\_CURMISR\_22 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR22	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.39 CORE1\_CURMISR\_23 Register (Offset = 98h) [Reset = 00000000h]

CORE1\_CURMISR\_23 is shown in [Table 20-259](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-259. CORE1\_CURMISR\_23 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR23	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

#### 20.7.5.40 CORE1\_CURMISR\_24 Register (Offset = 9Ch) [Reset = 00000000h]

CORE1\_CURMISR\_24 is shown in [Table 20-260](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-260. CORE1\_CURMISR\_24 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR24	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

#### 20.7.5.41 CORE1\_CURMISR\_25 Register (Offset = A0h) [Reset = 00000000h]

CORE1\_CURMISR\_25 is shown in [Table 20-261](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-261. CORE1\_CURMISR\_25 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR25	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

#### 20.7.5.42 CORE1\_CURMISR\_26 Register (Offset = A4h) [Reset = 00000000h]

CORE1\_CURMISR\_26 is shown in [Table 20-262](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-262. CORE1\_CURMISR\_26 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR26	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.43 CORE1\_CURMISR\_27 Register (Offset = A8h) [Reset = 00000000h]

CORE1\_CURMISR\_27 is shown in [Table 20-263](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE1

**Table 20-263. CORE1\_CURMISR\_27 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C1MISR27	R	0h	<p>MISR Signature for CORE1 This register contains the MISR data of the current interval for CORE1 in the case of segment0 and the remaining Segments 1 to 3.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

#### 20.7.5.44 CORE2\_CURMISR\_0 Register (Offset = ACh) [Reset = 00000000h]

CORE2\_CURMISR\_0 is shown in [Table 20-264](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-264. CORE2\_CURMISR\_0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR0	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.45 CORE2\_CURMISR\_1 Register (Offset = B0h) [Reset = 00000000h]

CORE2\_CURMISR\_1 is shown in [Table 20-265](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-265. CORE2\_CURMISR\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR1	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.46 CORE2\_CURMISR\_2 Register (Offset = B4h) [Reset = 00000000h]

CORE2\_CURMISR\_2 is shown in [Table 20-266](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-266. CORE2\_CURMISR\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR2	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.47 CORE2\_CURMISR\_3 Register (Offset = B8h) [Reset = 00000000h]

CORE2\_CURMISR\_3 is shown in [Table 20-267](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-267. CORE2\_CURMISR\_3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR3	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

#### 20.7.5.48 CORE2\_CURMISR\_4 Register (Offset = BCh) [Reset = 00000000h]

CORE2\_CURMISR\_4 is shown in [Table 20-268](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-268. CORE2\_CURMISR\_4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR4	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

#### 20.7.5.49 CORE2\_CURMISR\_5 Register (Offset = C0h) [Reset = 00000000h]

CORE2\_CURMISR\_5 is shown in [Table 20-269](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-269. CORE2\_CURMISR\_5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR5	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.50 CORE2\_CURMISR\_6 Register (Offset = C4h) [Reset = 00000000h]

CORE2\_CURMISR\_6 is shown in [Table 20-270](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-270. CORE2\_CURMISR\_6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR6	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.51 CORE2\_CURMISR\_7 Register (Offset = C8h) [Reset = 00000000h]

CORE2\_CURMISR\_7 is shown in [Table 20-271](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-271. CORE2\_CURMISR\_7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR7	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.52 CORE2\_CURMISR\_8 Register (Offset = CCh) [Reset = 00000000h]

CORE2\_CURMISR\_8 is shown in [Table 20-272](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-272. CORE2\_CURMISR\_8 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR8	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.53 CORE2\_CURMISR\_9 Register (Offset = D0h) [Reset = 00000000h]

CORE2\_CURMISR\_9 is shown in [Table 20-273](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-273. CORE2\_CURMISR\_9 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR9	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.54 CORE2\_CURMISR\_10 Register (Offset = D4h) [Reset = 00000000h]

CORE2\_CURMISR\_10 is shown in [Table 20-274](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-274. CORE2\_CURMISR\_10 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR10	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.55 CORE2\_CURMISR\_11 Register (Offset = D8h) [Reset = 00000000h]

CORE2\_CURMISR\_11 is shown in [Table 20-275](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-275. CORE2\_CURMISR\_11 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR11	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.56 CORE2\_CURMISR\_12 Register (Offset = DCh) [Reset = 00000000h]

CORE2\_CURMISR\_12 is shown in [Table 20-276](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-276. CORE2\_CURMISR\_12 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR12	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.57 CORE2\_CURMISR\_13 Register (Offset = E0h) [Reset = 00000000h]

CORE2\_CURMISR\_13 is shown in [Table 20-277](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-277. CORE2\_CURMISR\_13 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR13	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.58 CORE2\_CURMISR\_14 Register (Offset = E4h) [Reset = 00000000h]

CORE2\_CURMISR\_14 is shown in [Table 20-278](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-278. CORE2\_CURMISR\_14 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR14	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.59 CORE2\_CURMISR\_15 Register (Offset = E8h) [Reset = 00000000h]

CORE2\_CURMISR\_15 is shown in [Table 20-279](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-279. CORE2\_CURMISR\_15 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR15	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.60 CORE2\_CURMISR\_16 Register (Offset = ECh) [Reset = 00000000h]

CORE2\_CURMISR\_16 is shown in [Table 20-280](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-280. CORE2\_CURMISR\_16 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR16	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.61 CORE2\_CURMISR\_17 Register (Offset = F0h) [Reset = 00000000h]

CORE2\_CURMISR\_17 is shown in [Table 20-281](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-281. CORE2\_CURMISR\_17 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR17	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.62 CORE2\_CURMISR\_18 Register (Offset = F4h) [Reset = 00000000h]

CORE2\_CURMISR\_18 is shown in [Table 20-282](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-282. CORE2\_CURMISR\_18 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR18	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.63 CORE2\_CURMISR\_19 Register (Offset = F8h) [Reset = 00000000h]

CORE2\_CURMISR\_19 is shown in [Table 20-283](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-283. CORE2\_CURMISR\_19 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR19	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.64 CORE2\_CURMISR\_20 Register (Offset = FCh) [Reset = 00000000h]

CORE2\_CURMISR\_20 is shown in [Table 20-284](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-284. CORE2\_CURMISR\_20 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR20	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.65 CORE2\_CURMISR\_21 Register (Offset = 100h) [Reset = 00000000h]

CORE2\_CURMISR\_21 is shown in [Table 20-285](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-285. CORE2\_CURMISR\_21 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR21	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.66 CORE2\_CURMISR\_22 Register (Offset = 104h) [Reset = 00000000h]

CORE2\_CURMISR\_22 is shown in [Table 20-286](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-286. CORE2\_CURMISR\_22 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR22	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.67 CORE2\_CURMISR\_23 Register (Offset = 108h) [Reset = 00000000h]

CORE2\_CURMISR\_23 is shown in [Table 20-287](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-287. CORE2\_CURMISR\_23 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR23	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.68 CORE2\_CURMISR\_24 Register (Offset = 10Ch) [Reset = 00000000h]

CORE2\_CURMISR\_24 is shown in [Table 20-288](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-288. CORE2\_CURMISR\_24 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR24	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.69 CORE2\_CURMISR\_25 Register (Offset = 110h) [Reset = 00000000h]

CORE2\_CURMISR\_25 is shown in [Table 20-289](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-289. CORE2\_CURMISR\_25 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR25	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.70 CORE2\_CURMISR\_26 Register (Offset = 114h) [Reset = 00000000h]

CORE2\_CURMISR\_26 is shown in [Table 20-290](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-290. CORE2\_CURMISR\_26 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR26	R	0h	<p>MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval.</p> <p>This is applicable to Segment 0 alone.</p> <p>This value will be compared with the GOLDEN MISR value copied from ROM.</p> <p>This register gets reset to its default value with Power on or system reset assertion.</p> <p>The MISR values should be read only after the Self Test is completed.</p>

### 20.7.5.71 CORE2\_CURMISR\_27 Register (Offset = 118h) [Reset = 00000000h]

CORE2\_CURMISR\_27 is shown in [Table 20-291](#).

Return to the [Summary Table](#).

Holds the MISR signature for CORE2

**Table 20-291. CORE2\_CURMISR\_27 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	C2MISR27	R	0h	MISR Signature for CORE2 This register contains the MISR data from the CORE2 for the current interval. This is applicable to Segment 0 alone. This value will be compared with the GOLDEN MISR value copied from ROM. This register gets reset to its default value with Power on or system reset assertion. The MISR values should be read only after the Self Test is completed.

## 20.8 Programmable Built-In Self-Test (PBIST)

This section describes the programmable built-in self-test (PBIST) controller module used for testing the on-chip memories.

### 20.8.1 Overview

The PBIST (Programmable Built-In Self-Test) controller architecture provides a run-time-programmable memory BIST engine for varying levels of coverage across many embedded memory instances.

Name	Frame Address (Hex) Start	Frame Address (Hex) End	Size	Description
TOP_PBIST	0x02F7_9400	0x02F7_95CC	464Bytes	PBIST module configuration registers. This IP covers memory test for all memories excluding DSP L1P, L1D and associated TAG memories
DSS_DSP_PBIST	0x06F7_9000	0x06F7_91CC	464Bytes	PBIST module configuration registers. This IP covers memory test for all memories excluding DSP L1P, L1D and associated TAG memories

#### 20.8.1.1 PBIST vs. Application Software-Based Testing

The PBIST architecture consists of a small coprocessor with a dedicated instruction set targeted specifically toward testing memories. This coprocessor executes test routines stored in the PBIST ROM and runs them on multiple on-chip memory instances. The on-chip memory configuration information is also stored in the PBIST ROM.

The PBIST Controller architecture offers significant advantages over tests running on the main processor (application software-based testing):

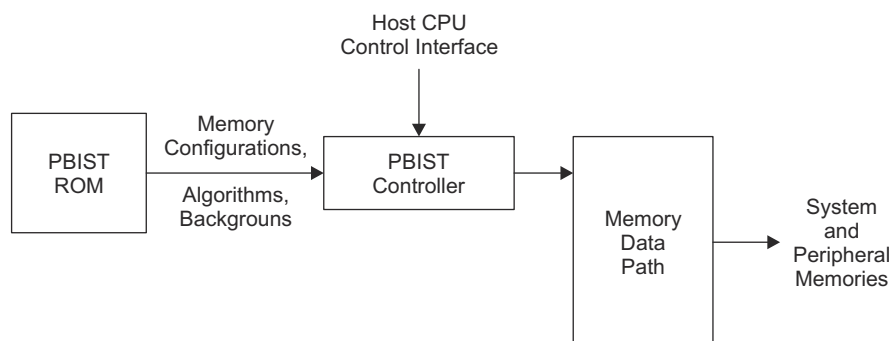

- Embedded CPUs have a long access path to memories outside the tightly-couple memory sub-system, while the PBIST controller has a dedicated path to the memories specifically for the self-test
- Embedded CPUs are designed for their targeted use and are often not easily programmed for memory test algorithms.
- The memory test algorithm code on embedded CPUs is typically significantly larger than that needed for PBIST.

- The embedded CPU is significantly larger than the PBIST controller.

### 20.8.1.2 PBIST Block Diagram

Figure 20-201 illustrates the basic PBIST blocks and its wrapper logic for the device.

**Figure 20-201. PBIST Block Diagram**

### 20.8.1.2.1 On-chip ROM

The on-chip ROM contains the information regarding the algorithms and memories to be tested.

### 20.8.1.2.2 Host Processor Interface to the PBIST Controller Registers

The CPU can select the algorithm and RAM groups for the memories' self-test from the onchip ROM based on the application requirements. Once the self-test has executed, the CPU can query the PBIST controller registers to identify any memories that failed the self-test and to then take appropriate next steps as required by the application's author.

### 20.8.1.2.3 Memory Data Path

This is the read and write data path logic between different system and peripheral memories tightly coupled to the PBIST memory interface. The PBIST controller executes each selected algorithm on each valid memory group sequentially until all the algorithms are executed.

#### Note

NOTE: Not all algorithms are designed to run on all RAM groups. If an algorithm is selected to run on an incompatible memory, this will result in a failure. Refer to and for RAM grouping and algorithm information.

## 20.8.2 RAM/ROM Grouping and Algorithm

### 20.8.2.1 RAM Algorithm: March13N

This section provides a brief description for some of the test algorithms used for memory self-test.

•

#### • March13N:

– March13N is the baseline test algorithm for SRAM testing. It provides the highest overall coverage.

The other algorithms provide additional coverage of otherwise missed boundary conditions of the SRAM operation.

– The concept behind the general march algorithm is to indicate:

- The bits around the bit cell do not affect the bit cell.
- The bit cell can be written and read as both a 1 and a 0.

– The basic operation of the march is to initialize the array to a know pattern, then march a different pattern through the memory.

– Type of faults detected by this algorithm:

- Address decoder faults
- Stuck-At faults
- Coupled faults
- State coupling faults
- Parametric faults
- Write recovery faults
- Read/write logic faults

### 20.8.2.2 Read/write logic faults

The triple read reads the array, all the way through, three times while summing the reads to compare the sums for all three read formats. The algorithm checks if there is enough margin in both the erasure and programming to operate at full speed with the CPU. This can be addressed with the XOR Read (Memory Contents XOR Memory Address). An error in the XOR Read indicates that the interaction between adjacent bit cells, being a different polarity, may be causing speed issues when the CPU exercises worstcase instruction sequencing. Each

read can be performed on any memory block, and an associated checksum is calculated to determine PASS or FAIL.

Type of faults detected by this algorithm:

- Address decoder faults
- Stuck-At faults
- Coupled faults
- State coupling faults
- Parametric faults
- Read logic faults

#### 20.8.2.3

---

#### Note

March13N is the most recommended algorithm for the memory self-test

---

## 21.1 GPADC Overview

The AWR2544 device implements a GPADC module on MainSS for safety monitoring the inputs, such as the temp sensor, voltage regulators, and so forth; both external and internal to the device. Features supported by the ADC module include:

- 10-bit ENOB 625Ksps ADC
- Full-scale range of GPADC input between 0 V and 1.8 V
- external I/Os and internal components -temperature sensors (3), supplies, bias reference, LDO output mapped to GPADC input
- Total capacitance, including parasitic and sampling cap, for each of GPADC pins be less than 14pf
- Single conversion mode
- Event pin and software command mechanism to trigger the conversion
  - Event signal from either of the GPIO (provides options with pinmuxing) as well as from RTI timer module
- Data RAM to store the conversion results (1K results)
- Storage of min, max, and sum of the samples captured per channel
- Mechanism to skip initial M samples and program the number of samples N to be collected every channel
- DMA trigger when conversion is completed or data RAM threshold is achieved
- Self-test logic support for input channel failure detection (open / short to power / short to ground)
- Calibration logic using BGAP, for offset error correction
- Separate operating supply and ground pins on package
- Capability to have an external reference voltage for GPADC

---

### Note

1. It is recommended to gate of the MSS\_GPADC\_CLK when not in operation. This gating will reduce the standard-cell activity around the transmitter and reduces the chance of interference.
  2. Write 3b'111 to MSS\_RCM:MSS\_GPADC\_CLK\_GATE:MSS\_GPADC\_CLK\_GATE\_GATED gates the MSS\_GPADC\_CLK.
-

## 21.2 Functional Description Modes of Operation

### 21.2.1 IFM Mode (Inter Frame Monitoring Mode)

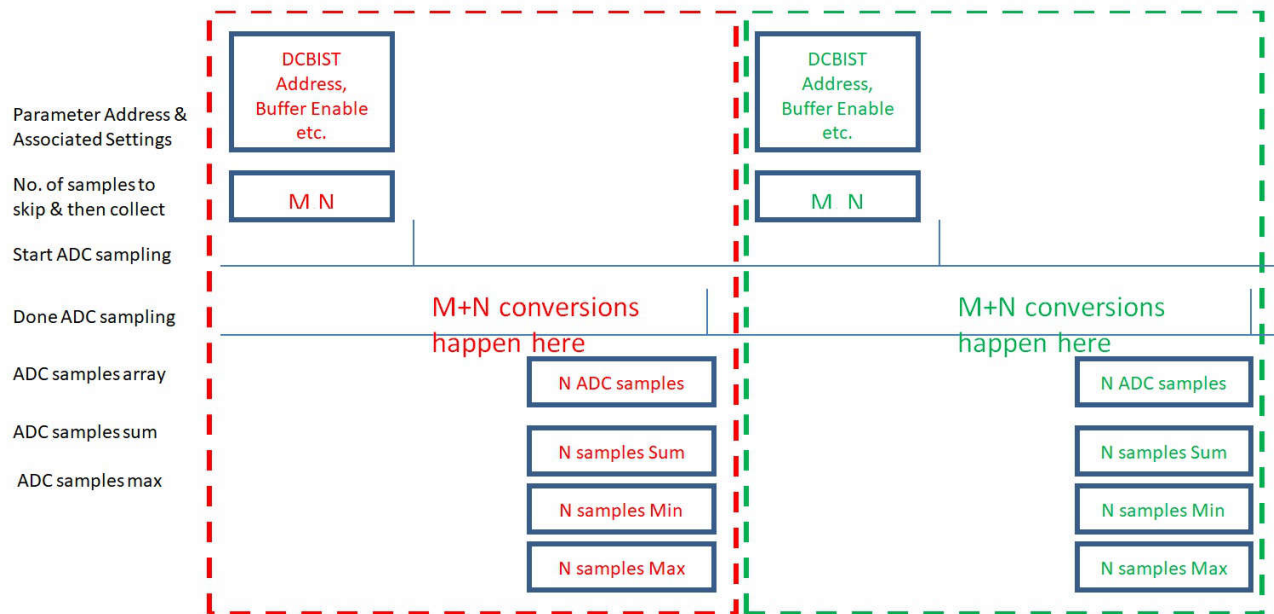

Figure 21-1. IFM Mode

Firmware writes the following register bit fields:

- Param\_val\_ifm
- Config\_value\_ifm
- Skip\_samples\_ifm(M)
- Collect\_samples\_ifm(N)
- Config settings in Analog
- ADC Reset =0
- ADC Enable =1
- ADC Start =1
- Firmware issues GPADC Trigger (self clearing bit)

Hardware skips M samples, collects N samples. Hardware outputs the sum, min, max of those samples in a register. Hardware outputs the actual array of samples in Data RAM (debug, if enabled). Each entry in the data RAM (256 deep) contains 4 ADC data samples, i.e. 1K ADC samples can be stored in the data RAM. Hardware issues a done interrupt.

## 21.3 Interrupts

The following interrupt is generated by GPADC:

- MSS\_GPADC\_IFM\_DONE

## 21.4 GPADC Trigger Sources

### 21.4.1 IFM Mode

Writing 1'b1 to MSS\_GPADC\_REG::REG1:: GPADC\_TRIGGER generates a trigger for IFM Mode to start.

## 21.5 MSS GPADC Register Specification

### 21.5.1 MSS\_GPADC\_REG Registers

Table 21-1 lists the MSS\_GPADC\_REG registers. All register offset addresses not listed in Table 21-1 should be considered as reserved locations and the register contents should not be modified.

**Table 21-1. MSS\_GPADC\_REG Registers**

22.1 LVDS Overview.....	5209
22.2 LVDS Programming Sequence.....	5209
22.3 CBUFF and LVDS Registers.....	5211

## 22.1 LVDS Overview

The LVDS interface includes the following signals:

- LVDS bit clock
- LVDS data lanes (the HSI integration chapter specific to the device lists the number of available lanes specific to the device)
- LVDS frame clock
- LVDS data\_valid signal

**Figure 22-1. LVDS Interface Timings**

The LVDS interface supports the following data rates(only DDR mode is supported):

- 900 Mbps (450-MHz DDR Clock)
- 600 Mbps (300-MHz DDR Clock)
- 450 Mbps (225-MHz DDR Clock)
- 400 Mbps (200-MHz DDR Clock)
- 300 Mbps (150-MHz DDR Clock)
- 225 Mbps (112.5-MHz DDR Clock)
- 150 Mbps (75-MHz DDR Clock)

Refer to the device data sheet for more details.

## 22.2 LVDS Programming Sequence

The following sections show the programming sequence needed before the hardware triggers are generated to initiate the high-speed LVDS data transmission.

### 22.2.1 LVDS Global Initialization

**Table 22-1. Main Sequence – TOP\_CTRL and Global Configuration**

Steps	Register/Bit Field/Programming	Value
Power on the LVDS I/Os	MSS_TOP_CTRL.LVDS_PAD_CTRL0 MSS_TOP_CTRL.LVDS_PAD_CTRL1	0x0 0x0
Power off the LVDS I/Os	MSS_TOP_CTRL.LVDS_PAD_CTRL0 MSS_TOP_CTRL.LVDS_PAD_CTRL1	0x39393939 0x01003939
Power on the LVDS I/Os	MSS_TOP_CTRL.LVDS_PAD_CTRL0 MSS_TOP_CTRL.LVDS_PAD_CTRL1	0x0 0x0

### 22.2.2 CBUFF Configuration

**Table 22-2. Main Sequence – CBUFF LVDS Static Configuration**

Steps	Register/Bit Field/Programming	Value
Assert the CBUFF soft reset	CONFIG_REG_0.CSWCRST	0x1
Configure CBUFF for LVDS data transfer	CONFIG_REG_0.CFG_1LVDS_0CSI	0x1

**Table 22-2. Main Sequence – CBUFF LVDS Static Configuration (continued)**

Steps	Register/Bit Field/Programming	Value
Configure static values for LVDS	CONFIG_REG_0.CVC0EN	
	CFG_SPHDR_ADDRESS	0x55555555
	CFG_CMD_VSVAL	0x55555555
	CFG_CMD_VEVAL	0xAAAAAAAA
	CFG_LPHDR_ADDRESS	0xAAAAAAAA
	CFG_LVDS_GEN_0.CCSMEN	0x1
Configure the number of chirps in a frame	CFG_CHIRPS_PER_FRAME	X
Configure static values for LVDS based on LVDS CRC enabled or disabled	CFG_LVDS_GEN_0.CBCRCEN CFG_CMD_HEVAL CFG_CMD_HSVAL	X
Enable the LVDS lanes	CFG_LVDS_GEN_0.CFG_LVDS_LANE[X]_EN	0x1
Configure the alignment for start of samples	CFG_LVDS_GEN_0.CPOSSEL	0x-
Configure the LVDS FIFO initial threshold	CFG_LVDS_GEN_0.CFDLY	0x8
Set the 3C3L mode if the system configuration is interleaved 3 channel – 3 lane	CFG_LVDS_GEN_1.C3C3L	0x-
Configure the lane-mapping format registers	CFG_LVDS_MAPPING_LANE[X]_FMT_0 CFG_LVDS_MAPPING_LANE[X]_FMT_1	X
Release the CBUFF from soft reset	CONFIG_REG_0.CSWCRST	0x0

The configuration in [Table 22-3](#) should be performed for each linklist entry required to transmit the LVDS packet.

**Table 22-3. Main Sequence – CBUFF Linklist**

Steps	Register/Bit Field/Programming	Value
Set the valid for the linklist	CFG_DATA_LL[X].LL[X]_VALID	0x1
If the linklist is the start of a new LVDS packet	CFG_DATA_LL[X].LL[X]_LPHDR_EN CFG_DATA_LL[X].LL[X]_HS	0x-
Configure the long packet header to static value for LVDS	CFG_DATA_LL[X]_LPHDR_VAL	0xBBBBBBBB
If the linklist is the end of a LVDS packet	CFG_DATA_LL[X].LL[X]_HE	0x-
Configure the size in CBUFF units	CFG_DATA_LL[X].LL[X]_SIZE	X
Configure the format of the CSI2 packet to which the linklist belongs	CFG_DATA_LL[X].LL[X]_FMT	X
Select the LVDS format-mapping register for the LVDS packet	CFG_DATA_LL[X].LL[X]_FMT_MAP	0x-
Set the input format	CFG_DATA_LL[X].LL[X]_FMT_IN	X
Set the Linklist write threshold	CFG_DATA_LL[X]_THRESHOLD.LL[X]_WR_THRESHOLD	X
Set the Linklist read threshold	CFG_DATA_LL[X]_THRESHOLD.LL[X]_WR_THRESHOLD	X

## 22.3 CBUFF and LVDS Registers

### 22.3.1 DSS\_CBUFF Registers

Table 22-4 lists the memory-mapped registers for the DSS\_CBUFF registers. All register offset addresses not listed in Table 22-4 should be considered as reserved locations and the register contents should not be modified.

**Table 22-4. DSS\_CBUFF Registers**

Offset	Acronym	Register Name	Section
0h	CONFIG_REG_0	CONFIG_REG_0	<a href="#">Go</a>

Offset	Acronym	Register Name	Section
210h	CLR_CBUFF_REG1	CLR_CBUFF_REG1	<a href="#">Go</a>
214h	CLR_LVDS_REG0	CLR_LVDS_REG0	<a href="#">Go</a>
218h	CLR_LVDS_REG1	CLR_LVDS_REG1	<a href="#">Go</a>
21Ch	STAT_CBUFF_ECC_REG	STAT_CBUFF_ECC_REG	<a href="#">Go</a>
220h	MASK_CBUFF_ECC_REG	MASK_CBUFF_ECC_REG	<a href="#">Go</a>
224h	CLR_CBUFF_ECC_REG	CLR_CBUFF_ECC_REG	<a href="#">Go</a>
228h	STAT_SAFETY	STAT_SAFETY	<a href="#">Go</a>
22Ch	MASK_SAFETY	MASK_SAFETY	<a href="#">Go</a>
230h	CLR_SAFETY	CLR_SAFETY	<a href="#">Go</a>

Complex bit access types are encoded to fit into small table cells. [Table 22-5](#) shows the codes that are used for access types in this section.

**Table 22-5. DSS\_CBUFF Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

### 22.3.1.1 CONFIG\_REG\_0 Register (Offset = 0h) [Reset = 00000000h]

CONFIG\_REG\_0 is shown in [Table 22-6](#).

Return to the [Summary Table](#).

Basic Config register

**Table 22-6. CONFIG\_REG\_0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	dbussel	R/W	0h	TI Internal feature. 1 : This selects the debug bus mode transmission on LVDS
27	cswcrst	R/W	0h	CBUFF controller SW Reset 1 => RESET the CBUFF Controller 0 => RELEASE RESET for CBUFF Controller
26	cswlrst	R/W	0h	TI Internal Feature. LVDS logic SW Reset. Debug feature. 1 => RESET the FSM 0 => RELEASE RESET
25	CFG_FRAME_START_TRIG	SW Trigger generation : Write 1 to this bit to generate a Frame Start SW Trigger	0h	TI Internal Feature. Only required for 900 Mbps 4 lane transmission CSI2 only Programming : 0xA : Burst Enable. Set this only for transmission at 900 Mbps Others : Burst disable.
24	CFG_CHIRP_AVAIL_TRIGGER	SW Trigger generation : Write 1 to this bit to generate a Chirp Available SW Trigger		
23-20	CFG_VBUSP_BURST_EN	R/W		
19	dbusen	R/W	0h	TC2 Mode selection. TI Internal feature. 0 : Normal 1 : When in TC2 mode, setting this bit will enable debug bus to sent via LVDS
18	ccfwpen	R/W	0h	TI Internal Feature. Debug only. CSI2 only Programming : CFG_CSI2_FIFO_WORDS_PROCESSING_EN 0 : Use the fifo_free_words directly from CSI2 by vbusp_mstr to decide how many more words to send. 1 : Process the fifo_free_words and use it by vbusp_mstr to decide how many more words to send.
17-16	cvc3en	R/W	0h	CSI2 only Programming : 0 : No Vsync packet is sent at Frame boundary 1 : A VSYNC Start packet on Virtual Channel 3 is generated at beginning of Frame 2 : A VSYNC End packet on Virtual Channel 3 is generated at end of Frame 3 : A VSYNC Start packet on Virtual Channel 3 is generated at beginning of Frame and a VSYNC End packet on Virtual Channel 3 is generated at end of Frame

**Table 22-6. CONFIG\_REG\_0 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
15-14	cvc2en	R/W	0h	CSI2 only Programming : 0 : No Vsync packet is sent at Frame boundary 1 : A VSYNC Start packet on Virtual Channel 2 is generated at beginning of Frame 2 : A VSYNC End packet on Virtual Channel 2 is generated at end of Frame 3 : A VSYNC Start packet on Virtual Channel 2 is generated at beginning of Frame and a VSYNC End packet on Virtual Channel 2 is generated at end of Frame
13-12	cvc1en	R/W	0h	CSI2 only Programming : 0 : No Vsync packet is sent at Frame boundary 1 : A VSYNC Start packet on Virtual Channel 1 is generated at beginning of Frame 2 : A VSYNC End packet on Virtual Channel 1 is generated at end of Frame 3 : A VSYNC Start packet on Virtual Channel 1 is generated at beginning of Frame and a VSYNC End packet on Virtual Channel 1 is generated at end of Frame
11-10	cvc0en	R/W	0h	CSI2 only Programming : 0 : No Vsync packet is sent at Frame boundary 1 : A VSYNC Start packet on Virtual Channel 0 is generated at beginning of Frame 2 : A VSYNC End packet on Virtual Channel 0 is generated at end of Frame 3 : A VSYNC Start packet on Virtual Channel 0 is generated at beginning of Frame and a VSYNC End packet on Virtual Channel 0 is generated at end of Frame
9	crdthsel	R/W	0h	TI Internal Feature. Debug only. CSI2 only Programming : CFG_RDTHRESHOLD_SEL . This is a Debug feature. Not required in Programming model 0 : The read threshold is selected based on the Write Side parsing engine 1 : The read threshold is selected based on the Read Side parsing engine.
8	ccfwlen	R/W	0h	TI Internal Feature. Debug only. CSI2 only Programming : CFG_CSI2_FIFO_WORDS_LOAD_SW_EN. This is a Debug feature. Not required in Programming model When CFG_CSI2_FIFO_WORDS_PROCESSING_EN==1 and CFG_CSI2_FIFO_WORDS_LOAD_SW_EN==1, then a fixed fifo_free_words from CSI2 is not used. Program the CFG_FIFO_FREE_THRESHOLD0 to 0x4
7-4	NU1	R	0h	
3	CFG_SW_TRIG_EN	R/W	0h	Select Chirp Available Trigger Source 0 : Chirp Available trigger will be generated by HW 1 : Chirp Available trigger will be generated by SW
2	cftrigen	R/W	0h	Select Frame Start Trigger Source 0 : Frame trigger will be generated by HW 1 : Frame trigger will be generated by SW
1	CFG_ECC_EN	R/W	0h	0 : Disable ECC on the CBUF FIFO 1 : Enable ECC on the CBUF FIFO
0	CFG_1LVDS_0CSI	R/W	0h	0 : Send data over CSI-2 1 : Send data over LVDS

### 22.3.1.2 CFG\_SPHDR\_ADDRESS Register (Offset = 4h) [Reset = 00000000h]

CFG\_SPHDR\_ADDRESS is shown in [Table 22-7](#).

Return to the [Summary Table](#).

Short Packet Header Address

**Table 22-7. CFG\_SPHDR\_ADDRESS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CFG_SPHDR_ADDRESS	R/W	0h	CSI2 Programming : Configure the CSI_PROTOCOL_ENGINE__CSI_VC_SHORT_PACKET_HEADER Address in the CSI Protocol Engine LVDS Programming : Configure with the static value : 0x55555555

### 22.3.1.3 CFG\_CMD\_HSVAL Register (Offset = 8h) [Reset = 00000000h]

CFG\_CMD\_HSVAL is shown in [Table 22-8](#).

Return to the [Summary Table](#).

HSYNC Value

**Table 22-8. CFG\_CMD\_HSVAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CFG_CMD_HSVAL	R/W	0h	CSI2 Programming : Configure the HSync Start Short Packet Value LVDS Programming : If LVDS CRC is enabled : Configure with the static value : 0x55555555 If LVDS CRC is disbaled : Configure with the static value : 0xAAAAAAAA

#### 22.3.1.4 CFG\_CMD\_HEVAL Register (Offset = Ch) [Reset = 00000000h]

CFG\_CMD\_HEVAL is shown in [Table 22-9](#).

Return to the [Summary Table](#).

HEND Value

**Table 22-9. CFG\_CMD\_HEVAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CFG_CMD_HEVAL	R/W	0h	CSI2 Programming : Configure the HSync End Short Packet Value LVDS Programming : If LVDS CRC is enabled : Configure with the static value : 0x33333333 If LVDS CRC is disbaled : Configure with the static value : 0xAAAAAAAA

### 22.3.1.5 CFG\_CMD\_VSVAL Register (Offset = 10h) [Reset = 00000000h]

CFG\_CMD\_VSVAL is shown in [Table 22-10](#).

Return to the [Summary Table](#).

VSYNC Value

**Table 22-10. CFG\_CMD\_VSVAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CFG_CMD_VSVAL	R/W	0h	CSI2 Programming : Configure the VSync Start Short Packet Value LVDS Programming : Configure with the static value : 0xAAAAAAAA

### 22.3.1.6 CFG\_CMD\_VEVAL Register (Offset = 14h) [Reset = 00000000h]

CFG\_CMD\_VEVAL is shown in [Table 22-11](#).

Return to the [Summary Table](#).

VEND Value

**Table 22-11. CFG\_CMD\_VEVAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CFG_CMD_VEVAL	R/W	0h	CSI2 Programming : Configure the VSync End Short Packet Value LVDS Programming : Configure with the static value : 0xAAAAAAAA

### 22.3.1.7 CFG\_LPHDR\_ADDRESS Register (Offset = 18h) [Reset = 00000000h]

CFG\_LPHDR\_ADDRESS is shown in [Table 22-12](#).

Return to the [Summary Table](#).

Long Packet Address

**Table 22-12. CFG\_LPHDR\_ADDRESS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CFG_LPHDR_ADDRESS	R/W	0h	CSI2 Programming : Configure the CSI_PROTOCOL_ENGINE__CSI_VC_LONG_PACKET_HEADER Address in the CSI Protocol Engine LVDS Programming : Configure with the static value : 0x55555555

### 22.3.1.8 CFG\_CHIRPS\_PER\_FRAME Register (Offset = 20h) [Reset = 00000000h]

CFG\_CHIRPS\_PER\_FRAME is shown in [Table 22-13](#).

Return to the [Summary Table](#).

Number of Chirps per Frame

**Table 22-13. CFG\_CHIRPS\_PER\_FRAME Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CFG_CHIRPS_PER_FRAME	R/W	0h	Configure the number of Chirps in a Frame

### 22.3.1.9 CFG\_FIFO\_FREE\_THRESHOLD Register (Offset = 24h) [Reset = 00000000h]

CFG\_FIFO\_FREE\_THRESHOLD is shown in [Table 22-14](#).

Return to the [Summary Table](#).

CSI2 FIFO threshold for transferring data from CBUFF to CSI2

**Table 22-14. CFG\_FIFO\_FREE\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	CFG_FIFO_FREE_THRESHOLD3	R/W	0h	TI Internal Feature CSI2 only Programming : Configure the threshold used to fill the FIFO3 in the CSI Protocol engine. CBUFF will send data to the Protocol Engine only if there is a larger number of Free slots that that configured in this register. By default, only 1 FIFO will be used so register programming is not Required in Programming model
23-16	CFG_FIFO_FREE_THRESHOLD2	R/W	0h	TI Internal Feature CSI2 only Programming : Configure the threshold used to fill the FIFO2 in the CSI Protocol engine. CBUFF will send data to the Protocol Engine only if there is a larger number of Free slots that that configured in this register. By default, only 1 FIFO will be used so register programming is not Required in Programming model
15-8	CFG_FIFO_FREE_THRESHOLD1	R/W	0h	TI Internal Feature CSI2 only Programming : Configure the threshold used to fill the FIFO1 in the CSI Protocol engine. CBUFF will send data to the Protocol Engine only if there is a larger number of Free slots that that configured in this register. By default, only 1 FIFO will be used so register programming is not Required in Programming model
7-0	CFG_FIFO_FREE_THRESHOLD0	R/W	0h	CSI2 only Programming : Configure the threshold used to fill the FIFO0 in the CSI Protocol engine. CBUFF will send data to the Protocol Engine only if there is a larger number of Free slots that that configured in this register

### 22.3.1.10 CFG\_LPPYLD\_ADDRESS Register (Offset = 28h) [Reset = 00000000h]

CFG\_LPPYLD\_ADDRESS is shown in [Table 22-15](#).

Return to the [Summary Table](#).

Long payload Address

**Table 22-15. CFG\_LPPYLD\_ADDRESS Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CFG_LPPYLD_ADDRESS	R/W	0h	CSI2 only Programming : Configure the CSI_PROTOCOL_ENGINE__CSI_VC_LONG_PACKET_PAYLOAD Address in the CSI Protocol Engine

### 22.3.1.11 CFG\_DELAY\_CONFIG Register (Offset = 2Ch) [Reset = 00000000h]

CFG\_DELAY\_CONFIG is shown in [Table 22-16](#).

Return to the [Summary Table](#).

Delay Config Registers

**Table 22-16. CFG\_DELAY\_CONFIG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-24	NU	R	0h	
23-16	CFG_DATA_WR_DELAY	R/W	0h	TI Internal Feature CSI2 only Programming : Configure an additional delay after sending a Long packet Payload. This is a Debug feature. Not required in Programming model
15-8	CFG_LPHDR_DELAY	R/W	0h	TI Internal Feature CSI2 only Programming : Configure an additional delay after sending a Long packet Header. This is a Debug feature. Not required in Programming model
7-0	CFG_SPHDR_DELAY	R/W	0h	TI Internal Feature CSI2 only Programming : Configure an additional delay after sending a Short packet. This is a Debug feature. Not required in Programming model

### 22.3.1.12 CFG\_DATA\_LL0 Register (Offset = 30h) [Reset = 00000000h]

CFG\_DATA\_LL0 is shown in [Table 22-17](#).

Return to the [Summary Table](#).

Payload Description : Linked list entry 0

**Table 22-17. CFG\_DATA\_LL0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL0_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL0_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL0_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL0_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL0_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL0_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL0_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL0_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL0_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL0_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL0_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL0_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL0_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL0_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL0_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.13 CFG\_DATA\_LL0\_LPHDR\_VAL Register (Offset = 34h) [Reset = 00000000h]

CFG\_DATA\_LL0\_LPHDR\_VAL is shown in [Table 22-18](#).

Return to the [Summary Table](#).

Payload Description : Linked list entry 0

**Table 22-18. CFG\_DATA\_LL0\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL0_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.14 CFG\_DATA\_LL0\_THRESHOLD Register (Offset = 38h) [Reset = 0000X0X0h]

CFG\_DATA\_LL0\_THRESHOLD is shown in [Table 22-19](#).

Return to the [Summary Table](#).

**Table 22-19. CFG\_DATA\_LL0\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll0dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL0_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL0_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.15 CFG\_DATA\_LL1 Register (Offset = 3Ch) [Reset = 00000000h]

CFG\_DATA\_LL1 is shown in [Table 22-20](#).

Return to the [Summary Table](#).

**Table 22-20. CFG\_DATA\_LL1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL1_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL1_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL1_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL1_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL1_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL1_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL1_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL1_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL1_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL1_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL1_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL1_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL1_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL1_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL1_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.16 CFG\_DATA\_LL1\_LPHDR\_VAL Register (Offset = 40h) [Reset = 00000000h]

CFG\_DATA\_LL1\_LPHDR\_VAL is shown in [Table 22-21](#).

Return to the [Summary Table](#).

**Table 22-21. CFG\_DATA\_LL1\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL1_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.17 CFG\_DATA\_LL1\_THRESHOLD Register (Offset = 44h) [Reset = 0000X0X0h]

CFG\_DATA\_LL1\_THRESHOLD is shown in [Table 22-22](#).

Return to the [Summary Table](#).

**Table 22-22. CFG\_DATA\_LL1\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll1dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL1_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL1_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.18 CFG\_DATA\_LL2 Register (Offset = 48h) [Reset = 00000000h]

CFG\_DATA\_LL2 is shown in [Table 22-23](#).

Return to the [Summary Table](#).

**Table 22-23. CFG\_DATA\_LL2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL2_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL2_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL2_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL2_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL2_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL2_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL2_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL2_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL2_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL2_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL2_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL2_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL2_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL2_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL2_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.19 CFG\_DATA\_LL2\_LPHDR\_VAL Register (Offset = 4Ch) [Reset = 00000000h]

CFG\_DATA\_LL2\_LPHDR\_VAL is shown in [Table 22-24](#).

Return to the [Summary Table](#).

**Table 22-24. CFG\_DATA\_LL2\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL2_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.20 CFG\_DATA\_LL2\_THRESHOLD Register (Offset = 50h) [Reset = 0000X0X0h]

CFG\_DATA\_LL2\_THRESHOLD is shown in [Table 22-25](#).

Return to the [Summary Table](#).

**Table 22-25. CFG\_DATA\_LL2\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll2dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL2_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL2_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.21 CFG\_DATA\_LL3 Register (Offset = 54h) [Reset = 00000000h]

CFG\_DATA\_LL3 is shown in [Table 22-26](#).

Return to the [Summary Table](#).

**Table 22-26. CFG\_DATA\_LL3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL3_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL3_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL3_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL3_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL3_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL3_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL3_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL3_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL3_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL3_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL3_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL3_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL3_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL3_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL3_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.22 CFG\_DATA\_LL3\_LPHDR\_VAL Register (Offset = 58h) [Reset = 00000000h]

CFG\_DATA\_LL3\_LPHDR\_VAL is shown in [Table 22-27](#).

Return to the [Summary Table](#).

**Table 22-27. CFG\_DATA\_LL3\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL3_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.23 CFG\_DATA\_LL3\_THRESHOLD Register (Offset = 5Ch) [Reset = 0000X0X0h]

CFG\_DATA\_LL3\_THRESHOLD is shown in [Table 22-28](#).

Return to the [Summary Table](#).

**Table 22-28. CFG\_DATA\_LL3\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll3dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL3_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL3_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.24 CFG\_DATA\_LL4 Register (Offset = 60h) [Reset = 00000000h]

CFG\_DATA\_LL4 is shown in [Table 22-29](#).

Return to the [Summary Table](#).

**Table 22-29. CFG\_DATA\_LL4 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL4_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL4_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL4_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL4_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL4_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL4_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL4_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL4_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL4_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL4_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL4_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL4_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL4_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL4_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL4_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.25 CFG\_DATA\_LL4\_LPHDR\_VAL Register (Offset = 64h) [Reset = 00000000h]

CFG\_DATA\_LL4\_LPHDR\_VAL is shown in [Table 22-30](#).

Return to the [Summary Table](#).

**Table 22-30. CFG\_DATA\_LL4\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL4_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.26 CFG\_DATA\_LL4\_THRESHOLD Register (Offset = 68h) [Reset = 0000X0X0h]

CFG\_DATA\_LL4\_THRESHOLD is shown in [Table 22-31](#).

Return to the [Summary Table](#).

**Table 22-31. CFG\_DATA\_LL4\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll4dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL4_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL4_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.27 CFG\_DATA\_LL5 Register (Offset = 6Ch) [Reset = 00000000h]

CFG\_DATA\_LL5 is shown in [Table 22-32](#).

Return to the [Summary Table](#).

**Table 22-32. CFG\_DATA\_LL5 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL5_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL5_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL5_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL5_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL5_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL5_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL5_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL5_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL5_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL5_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL5_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL5_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL5_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL5_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL5_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.28 CFG\_DATA\_LL5\_LPHDR\_VAL Register (Offset = 70h) [Reset = 00000000h]

CFG\_DATA\_LL5\_LPHDR\_VAL is shown in [Table 22-33](#).

Return to the [Summary Table](#).

**Table 22-33. CFG\_DATA\_LL5\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL5_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.29 CFG\_DATA\_LL5\_THRESHOLD Register (Offset = 74h) [Reset = 0000X0X0h]

CFG\_DATA\_LL5\_THRESHOLD is shown in [Table 22-34](#).

Return to the [Summary Table](#).

**Table 22-34. CFG\_DATA\_LL5\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll5dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL5_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL5_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.30 CFG\_DATA\_LL6 Register (Offset = 78h) [Reset = 00000000h]

CFG\_DATA\_LL6 is shown in [Table 22-35](#).

Return to the [Summary Table](#).

**Table 22-35. CFG\_DATA\_LL6 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL6_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL6_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL6_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL6_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL6_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL6_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL6_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL6_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL6_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL6_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL6_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL6_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL6_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL6_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL6_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.31 CFG\_DATA\_LL6\_LPHDR\_VAL Register (Offset = 7Ch) [Reset = 00000000h]

CFG\_DATA\_LL6\_LPHDR\_VAL is shown in [Table 22-36](#).

Return to the [Summary Table](#).

**Table 22-36. CFG\_DATA\_LL6\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL6_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.32 CFG\_DATA\_LL6\_THRESHOLD Register (Offset = 80h) [Reset = 0000X0X0h]

CFG\_DATA\_LL6\_THRESHOLD is shown in [Table 22-37](#).

Return to the [Summary Table](#).

**Table 22-37. CFG\_DATA\_LL6\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll6dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL6_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL6_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.33 CFG\_DATA\_LL7 Register (Offset = 84h) [Reset = 00000000h]

CFG\_DATA\_LL7 is shown in [Table 22-38](#).

Return to the [Summary Table](#).

**Table 22-38. CFG\_DATA\_LL7 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL7_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL7_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL7_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL7_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL7_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL7_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL7_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL7_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL7_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL7_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL7_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL7_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL7_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL7_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL7_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.34 CFG\_DATA\_LL7\_LPHDR\_VAL Register (Offset = 88h) [Reset = 00000000h]

CFG\_DATA\_LL7\_LPHDR\_VAL is shown in [Table 22-39](#).

Return to the [Summary Table](#).

**Table 22-39. CFG\_DATA\_LL7\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL7_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.35 CFG\_DATA\_LL7\_THRESHOLD Register (Offset = 8Ch) [Reset = 0000X0X0h]

CFG\_DATA\_LL7\_THRESHOLD is shown in [Table 22-40](#).

Return to the [Summary Table](#).

**Table 22-40. CFG\_DATA\_LL7\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll7dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL7_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL7_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.36 CFG\_DATA\_LL8 Register (Offset = 90h) [Reset = 00000000h]

CFG\_DATA\_LL8 is shown in [Table 22-41](#).

Return to the [Summary Table](#).

**Table 22-41. CFG\_DATA\_LL8 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL8_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL8_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL8_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL8_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL8_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL8_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL8_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL8_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL8_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL8_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL8_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL8_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL8_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL8_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL8_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.37 CFG\_DATA\_LL8\_LPHDR\_VAL Register (Offset = 94h) [Reset = 00000000h]

CFG\_DATA\_LL8\_LPHDR\_VAL is shown in [Table 22-42](#).

Return to the [Summary Table](#).

**Table 22-42. CFG\_DATA\_LL8\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL8_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.38 CFG\_DATA\_LL8\_THRESHOLD Register (Offset = 98h) [Reset = 0000X0X0h]

CFG\_DATA\_LL8\_THRESHOLD is shown in [Table 22-43](#).

Return to the [Summary Table](#).

**Table 22-43. CFG\_DATA\_LL8\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll8dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL8_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL8_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.39 CFG\_DATA\_LL9 Register (Offset = 9Ch) [Reset = 00000000h]

CFG\_DATA\_LL9 is shown in [Table 22-44](#).

Return to the [Summary Table](#).

**Table 22-44. CFG\_DATA\_LL9 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL9_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL9_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL9_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL9_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL9_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL9_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL9_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL9_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL9_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL9_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL9_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL9_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL9_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL9_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL9_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.40 CFG\_DATA\_LL9\_LPHDR\_VAL Register (Offset = A0h) [Reset = 00000000h]

CFG\_DATA\_LL9\_LPHDR\_VAL is shown in [Table 22-45](#).

Return to the [Summary Table](#).

**Table 22-45. CFG\_DATA\_LL9\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL9_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.41 CFG\_DATA\_LL9\_THRESHOLD Register (Offset = A4h) [Reset = 0000X0X0h]

CFG\_DATA\_LL9\_THRESHOLD is shown in [Table 22-46](#).

Return to the [Summary Table](#).

**Table 22-46. CFG\_DATA\_LL9\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll9dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL9_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL9_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.42 CFG\_DATA\_LL10 Register (Offset = A8h) [Reset = 00000000h]

CFG\_DATA\_LL10 is shown in [Table 22-47](#).

Return to the [Summary Table](#).

**Table 22-47. CFG\_DATA\_LL10 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL10_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL10_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL10_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL10_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL10_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL10_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL10_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL10_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL10_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL10_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL10_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL10_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL10_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL10_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL10_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.43 CFG\_DATA\_LL10\_LPHDR\_VAL Register (Offset = ACh) [Reset = 00000000h]

CFG\_DATA\_LL10\_LPHDR\_VAL is shown in [Table 22-48](#).

Return to the [Summary Table](#).

**Table 22-48. CFG\_DATA\_LL10\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL10_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.44 CFG\_DATA\_LL10\_THRESHOLD Register (Offset = B0h) [Reset = 0000X0X0h]

CFG\_DATA\_LL10\_THRESHOLD is shown in [Table 22-49](#).

Return to the [Summary Table](#).

**Table 22-49. CFG\_DATA\_LL10\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll10dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL10_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL10_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.45 CFG\_DATA\_LL11 Register (Offset = B4h) [Reset = 00000000h]

CFG\_DATA\_LL11 is shown in [Table 22-50](#).

Return to the [Summary Table](#).

**Table 22-50. CFG\_DATA\_LL11 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL11_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL11_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL11_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL11_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL11_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL11_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL11_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL11_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL11_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL11_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL11_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL11_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL11_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL11_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL11_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.46 CFG\_DATA\_LL11\_LPHDR\_VAL Register (Offset = B8h) [Reset = 00000000h]

CFG\_DATA\_LL11\_LPHDR\_VAL is shown in [Table 22-51](#).

Return to the [Summary Table](#).

**Table 22-51. CFG\_DATA\_LL11\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL11_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.47 CFG\_DATA\_LL11\_THRESHOLD Register (Offset = BCh) [Reset = 0000X0X0h]

CFG\_DATA\_LL11\_THRESHOLD is shown in [Table 22-52](#).

Return to the [Summary Table](#).

**Table 22-52. CFG\_DATA\_LL11\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll11dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL11_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL11_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.48 CFG\_DATA\_LL12 Register (Offset = C0h) [Reset = 00000000h]

CFG\_DATA\_LL12 is shown in [Table 22-53](#).

Return to the [Summary Table](#).

**Table 22-53. CFG\_DATA\_LL12 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL12_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL12_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL12_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL12_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL12_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL12_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL12_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL12_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL12_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL12_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL12_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL12_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL12_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL12_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL12_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.49 CFG\_DATA\_LL12\_LPHDR\_VAL Register (Offset = C4h) [Reset = 00000000h]

CFG\_DATA\_LL12\_LPHDR\_VAL is shown in [Table 22-54](#).

Return to the [Summary Table](#).

**Table 22-54. CFG\_DATA\_LL12\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL12_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.50 CFG\_DATA\_LL12\_THRESHOLD Register (Offset = C8h) [Reset = 0000X0X0h]

CFG\_DATA\_LL12\_THRESHOLD is shown in [Table 22-55](#).

Return to the [Summary Table](#).

**Table 22-55. CFG\_DATA\_LL12\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll12dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL12_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL12_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.51 CFG\_DATA\_LL13 Register (Offset = CCh) [Reset = 00000000h]

CFG\_DATA\_LL13 is shown in [Table 22-56](#).

Return to the [Summary Table](#).

**Table 22-56. CFG\_DATA\_LL13 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL13_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL13_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL13_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL13_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL13_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL13_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL13_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL13_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL13_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL13_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL13_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL13_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL13_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL13_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL13_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.52 CFG\_DATA\_LL13\_LPHDR\_VAL Register (Offset = D0h) [Reset = 00000000h]

CFG\_DATA\_LL13\_LPHDR\_VAL is shown in [Table 22-57](#).

Return to the [Summary Table](#).

**Table 22-57. CFG\_DATA\_LL13\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL13_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.53 CFG\_DATA\_LL13\_THRESHOLD Register (Offset = D4h) [Reset = 0000X0X0h]

CFG\_DATA\_LL13\_THRESHOLD is shown in [Table 22-58](#).

Return to the [Summary Table](#).

**Table 22-58. CFG\_DATA\_LL13\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll13dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL13_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL13_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.54 CFG\_DATA\_LL14 Register (Offset = D8h) [Reset = 00000000h]

CFG\_DATA\_LL14 is shown in [Table 22-59](#).

Return to the [Summary Table](#).

**Table 22-59. CFG\_DATA\_LL14 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL14_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL14_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL14_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL14_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL14_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL14_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL14_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL14_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL14_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL14_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL14_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL14_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL14_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL14_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL14_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.55 CFG\_DATA\_LL14\_LPHDR\_VAL Register (Offset = DCh) [Reset = 00000000h]

CFG\_DATA\_LL14\_LPHDR\_VAL is shown in [Table 22-60](#).

Return to the [Summary Table](#).

**Table 22-60. CFG\_DATA\_LL14\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL14_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.56 CFG\_DATA\_LL14\_THRESHOLD Register (Offset = E0h) [Reset = 0000X0X0h]

CFG\_DATA\_LL14\_THRESHOLD is shown in [Table 22-61](#).

Return to the [Summary Table](#).

**Table 22-61. CFG\_DATA\_LL14\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll14dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL14_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL14_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.57 CFG\_DATA\_LL15 Register (Offset = E4h) [Reset = 00000000h]

CFG\_DATA\_LL15 is shown in [Table 22-62](#).

Return to the [Summary Table](#).

**Table 22-62. CFG\_DATA\_LL15 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL15_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL15_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL15_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL15_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL15_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL15_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL15_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL15_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL15_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL15_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL15_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL15_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL15_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL15_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL15_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.58 CFG\_DATA\_LL15\_LPHDR\_VAL Register (Offset = E8h) [Reset = 00000000h]

CFG\_DATA\_LL15\_LPHDR\_VAL is shown in [Table 22-63](#).

Return to the [Summary Table](#).

**Table 22-63. CFG\_DATA\_LL15\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL15_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.59 CFG\_DATA\_LL15\_THRESHOLD Register (Offset = ECh) [Reset = 0000X0X0h]

CFG\_DATA\_LL15\_THRESHOLD is shown in [Table 22-64](#).

Return to the [Summary Table](#).

**Table 22-64. CFG\_DATA\_LL15\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll15dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL15_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL15_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.60 CFG\_DATA\_LL16 Register (Offset = F0h) [Reset = 00000000h]

CFG\_DATA\_LL16 is shown in [Table 22-65](#).

Return to the [Summary Table](#).

**Table 22-65. CFG\_DATA\_LL16 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL16_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL16_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL16_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL16_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL16_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL16_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL16_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL16_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL16_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL16_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL16_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL16_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL16_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL16_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL16_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.61 CFG\_DATA\_LL16\_LPHDR\_VAL Register (Offset = F4h) [Reset = 00000000h]

CFG\_DATA\_LL16\_LPHDR\_VAL is shown in [Table 22-66](#).

Return to the [Summary Table](#).

**Table 22-66. CFG\_DATA\_LL16\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL16_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.62 CFG\_DATA\_LL16\_THRESHOLD Register (Offset = F8h) [Reset = 0000X0X0h]

CFG\_DATA\_LL16\_THRESHOLD is shown in [Table 22-67](#).

Return to the [Summary Table](#).

**Table 22-67. CFG\_DATA\_LL16\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll16dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL16_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL16_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.63 CFG\_DATA\_LL17 Register (Offset = FCh) [Reset = 00000000h]

CFG\_DATA\_LL17 is shown in [Table 22-68](#).

Return to the [Summary Table](#).

**Table 22-68. CFG\_DATA\_LL17 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL17_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL17_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL17_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL17_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL17_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL17_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL17_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL17_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL17_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL17_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL17_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL17_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL17_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL17_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL17_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.64 CFG\_DATA\_LL17\_LPHDR\_VAL Register (Offset = 100h) [Reset = 00000000h]

CFG\_DATA\_LL17\_LPHDR\_VAL is shown in [Table 22-69](#).

Return to the [Summary Table](#).

**Table 22-69. CFG\_DATA\_LL17\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL17_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.65 CFG\_DATA\_LL17\_THRESHOLD Register (Offset = 104h) [Reset = 0000X0X0h]

CFG\_DATA\_LL17\_THRESHOLD is shown in [Table 22-70](#).

Return to the [Summary Table](#).

**Table 22-70. CFG\_DATA\_LL17\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll17dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL17_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL17_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.66 CFG\_DATA\_LL18 Register (Offset = 108h) [Reset = 00000000h]

CFG\_DATA\_LL18 is shown in [Table 22-71](#).

Return to the [Summary Table](#).

**Table 22-71. CFG\_DATA\_LL18 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL18_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL18_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL18_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL18_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL18_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL18_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL18_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL18_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL18_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL18_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL18_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL18_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL18_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL18_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL18_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.67 CFG\_DATA\_LL18\_LPHDR\_VAL Register (Offset = 10Ch) [Reset = 00000000h]

CFG\_DATA\_LL18\_LPHDR\_VAL is shown in [Table 22-72](#).

Return to the [Summary Table](#).

**Table 22-72. CFG\_DATA\_LL18\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL18_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.68 CFG\_DATA\_LL18\_THRESHOLD Register (Offset = 110h) [Reset = 0000X0X0h]

CFG\_DATA\_LL18\_THRESHOLD is shown in [Table 22-73](#).

Return to the [Summary Table](#).

**Table 22-73. CFG\_DATA\_LL18\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll18dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL18_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL18_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.69 CFG\_DATA\_LL19 Register (Offset = 114h) [Reset = 00000000h]

CFG\_DATA\_LL19 is shown in [Table 22-74](#).

Return to the [Summary Table](#).

**Table 22-74. CFG\_DATA\_LL19 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL19_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL19_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL19_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL19_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL19_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL19_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL19_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL19_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL19_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL19_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL19_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL19_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL19_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL19_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL19_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.70 CFG\_DATA\_LL19\_LPHDR\_VAL Register (Offset = 118h) [Reset = 00000000h]

CFG\_DATA\_LL19\_LPHDR\_VAL is shown in [Table 22-75](#).

Return to the [Summary Table](#).

**Table 22-75. CFG\_DATA\_LL19\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL19_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.71 CFG\_DATA\_LL19\_THRESHOLD Register (Offset = 11Ch) [Reset = 0000X0X0h]

CFG\_DATA\_LL19\_THRESHOLD is shown in [Table 22-76](#).

Return to the [Summary Table](#).

**Table 22-76. CFG\_DATA\_LL19\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll19dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL19_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL19_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.72 CFG\_DATA\_LL20 Register (Offset = 120h) [Reset = 00000000h]

CFG\_DATA\_LL20 is shown in [Table 22-77](#).

Return to the [Summary Table](#).

**Table 22-77. CFG\_DATA\_LL20 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL20_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL20_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL20_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL20_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL20_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL20_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL20_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL20_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL20_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL20_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL20_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL20_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL20_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL20_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL20_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.73 CFG\_DATA\_LL20\_LPHDR\_VAL Register (Offset = 124h) [Reset = 00000000h]

CFG\_DATA\_LL20\_LPHDR\_VAL is shown in [Table 22-78](#).

Return to the [Summary Table](#).

**Table 22-78. CFG\_DATA\_LL20\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL20_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.74 CFG\_DATA\_LL20\_THRESHOLD Register (Offset = 128h) [Reset = 0000X0X0h]

CFG\_DATA\_LL20\_THRESHOLD is shown in [Table 22-79](#).

Return to the [Summary Table](#).

**Table 22-79. CFG\_DATA\_LL20\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll20dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL20_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL20_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.75 CFG\_DATA\_LL21 Register (Offset = 12Ch) [Reset = 00000000h]

CFG\_DATA\_LL21 is shown in [Table 22-80](#).

Return to the [Summary Table](#).

**Table 22-80. CFG\_DATA\_LL21 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL21_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL21_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL21_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL21_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL21_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL21_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL21_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL21_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL21_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL21_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL21_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL21_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL21_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL21_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL21_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.76 CFG\_DATA\_LL21\_LPHDR\_VAL Register (Offset = 130h) [Reset = 00000000h]

CFG\_DATA\_LL21\_LPHDR\_VAL is shown in [Table 22-81](#).

Return to the [Summary Table](#).

**Table 22-81. CFG\_DATA\_LL21\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL21_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.77 CFG\_DATA\_LL21\_THRESHOLD Register (Offset = 134h) [Reset = 0000X0X0h]

CFG\_DATA\_LL21\_THRESHOLD is shown in [Table 22-82](#).

Return to the [Summary Table](#).

**Table 22-82. CFG\_DATA\_LL21\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll21dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL21_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL21_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.78 CFG\_DATA\_LL22 Register (Offset = 138h) [Reset = 00000000h]

CFG\_DATA\_LL22 is shown in [Table 22-83](#).

Return to the [Summary Table](#).

**Table 22-83. CFG\_DATA\_LL22 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL22_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL22_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL22_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL22_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL22_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL22_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL22_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL22_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL22_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL22_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL22_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL22_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL22_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL22_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL22_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.79 CFG\_DATA\_LL22\_LPHDR\_VAL Register (Offset = 13Ch) [Reset = 00000000h]

CFG\_DATA\_LL22\_LPHDR\_VAL is shown in [Table 22-84](#).

Return to the [Summary Table](#).

**Table 22-84. CFG\_DATA\_LL22\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL22_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.80 CFG\_DATA\_LL22\_THRESHOLD Register (Offset = 140h) [Reset = 0000X0X0h]

CFG\_DATA\_LL22\_THRESHOLD is shown in [Table 22-85](#).

Return to the [Summary Table](#).

**Table 22-85. CFG\_DATA\_LL22\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll22dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL22_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL22_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.81 CFG\_DATA\_LL23 Register (Offset = 144h) [Reset = 00000000h]

CFG\_DATA\_LL23 is shown in [Table 22-86](#).

Return to the [Summary Table](#).

**Table 22-86. CFG\_DATA\_LL23 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL23_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL23_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL23_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL23_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL23_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL23_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL23_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL23_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL23_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL23_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL23_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL23_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL23_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL23_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL23_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.82 CFG\_DATA\_LL23\_LPHDR\_VAL Register (Offset = 148h) [Reset = 00000000h]

CFG\_DATA\_LL23\_LPHDR\_VAL is shown in [Table 22-87](#).

Return to the [Summary Table](#).

**Table 22-87. CFG\_DATA\_LL23\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL23_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.83 CFG\_DATA\_LL23\_THRESHOLD Register (Offset = 14Ch) [Reset = 0000X0X0h]

CFG\_DATA\_LL23\_THRESHOLD is shown in [Table 22-88](#).

Return to the [Summary Table](#).

**Table 22-88. CFG\_DATA\_LL23\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll23dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL23_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL23_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.84 CFG\_DATA\_LL24 Register (Offset = 150h) [Reset = 00000000h]

CFG\_DATA\_LL24 is shown in [Table 22-89](#).

Return to the [Summary Table](#).

**Table 22-89. CFG\_DATA\_LL24 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL24_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL24_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL24_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL24_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL24_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL24_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL24_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL24_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL24_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL24_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL24_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL24_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL24_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL24_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL24_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.85 CFG\_DATA\_LL24\_LPHDR\_VAL Register (Offset = 154h) [Reset = 00000000h]

CFG\_DATA\_LL24\_LPHDR\_VAL is shown in [Table 22-90](#).

Return to the [Summary Table](#).

**Table 22-90. CFG\_DATA\_LL24\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL24_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.86 CFG\_DATA\_LL24\_THRESHOLD Register (Offset = 158h) [Reset = 0000X0X0h]

CFG\_DATA\_LL24\_THRESHOLD is shown in [Table 22-91](#).

Return to the [Summary Table](#).

**Table 22-91. CFG\_DATA\_LL24\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll24dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL24_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL24_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.87 CFG\_DATA\_LL25 Register (Offset = 15Ch) [Reset = 00000000h]

CFG\_DATA\_LL25 is shown in [Table 22-92](#).

Return to the [Summary Table](#).

**Table 22-92. CFG\_DATA\_LL25 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL25_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL25_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL25_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL25_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL25_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL25_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL25_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL25_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL25_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL25_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL25_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL25_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL25_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL25_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL25_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.88 CFG\_DATA\_LL25\_LPHDR\_VAL Register (Offset = 160h) [Reset = 00000000h]

CFG\_DATA\_LL25\_LPHDR\_VAL is shown in [Table 22-93](#).

Return to the [Summary Table](#).

**Table 22-93. CFG\_DATA\_LL25\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL25_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.89 CFG\_DATA\_LL25\_THRESHOLD Register (Offset = 164h) [Reset = 0000X0X0h]

CFG\_DATA\_LL25\_THRESHOLD is shown in [Table 22-94](#).

Return to the [Summary Table](#).

**Table 22-94. CFG\_DATA\_LL25\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll25dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL25_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL25_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.90 CFG\_DATA\_LL26 Register (Offset = 168h) [Reset = 00000000h]

CFG\_DATA\_LL26 is shown in [Table 22-95](#).

Return to the [Summary Table](#).

**Table 22-95. CFG\_DATA\_LL26 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL26_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL26_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL26_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL26_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL26_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL26_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL26_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL26_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL26_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL26_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL26_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL26_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL26_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL26_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL26_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.91 CFG\_DATA\_LL26\_LPHDR\_VAL Register (Offset = 16Ch) [Reset = 00000000h]

CFG\_DATA\_LL26\_LPHDR\_VAL is shown in [Table 22-96](#).

Return to the [Summary Table](#).

**Table 22-96. CFG\_DATA\_LL26\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL26_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.92 CFG\_DATA\_LL26\_THRESHOLD Register (Offset = 170h) [Reset = 0000X0X0h]

CFG\_DATA\_LL26\_THRESHOLD is shown in [Table 22-97](#).

Return to the [Summary Table](#).

**Table 22-97. CFG\_DATA\_LL26\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll26dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL26_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL26_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.93 CFG\_DATA\_LL27 Register (Offset = 174h) [Reset = 00000000h]

CFG\_DATA\_LL27 is shown in [Table 22-98](#).

Return to the [Summary Table](#).

**Table 22-98. CFG\_DATA\_LL27 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL27_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL27_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL27_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL27_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL27_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL27_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL27_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL27_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL27_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL27_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL27_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL27_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL27_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL27_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL27_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.94 CFG\_DATA\_LL27\_LPHDR\_VAL Register (Offset = 178h) [Reset = 00000000h]

CFG\_DATA\_LL27\_LPHDR\_VAL is shown in [Table 22-99](#).

Return to the [Summary Table](#).

**Table 22-99. CFG\_DATA\_LL27\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL27_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.95 CFG\_DATA\_LL27\_THRESHOLD Register (Offset = 17Ch) [Reset = 0000X0X0h]

CFG\_DATA\_LL27\_THRESHOLD is shown in [Table 22-100](#).

Return to the [Summary Table](#).

**Table 22-100. CFG\_DATA\_LL27\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll27dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL27_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL27_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.96 CFG\_DATA\_LL28 Register (Offset = 180h) [Reset = 00000000h]

CFG\_DATA\_LL28 is shown in [Table 22-101](#).

Return to the [Summary Table](#).

**Table 22-101. CFG\_DATA\_LL28 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL28_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL28_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL28_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL28_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL28_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL28_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL28_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL28_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL28_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL28_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0_y 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1_y
6-5	LL28_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL28_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL28_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL28_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL28_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.97 CFG\_DATA\_LL28\_LPHDR\_VAL Register (Offset = 184h) [Reset = 00000000h]

CFG\_DATA\_LL28\_LPHDR\_VAL is shown in [Table 22-102](#).

Return to the [Summary Table](#).

**Table 22-102. CFG\_DATA\_LL28\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL28_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.98 CFG\_DATA\_LL28\_THRESHOLD Register (Offset = 188h) [Reset = 0000X0X0h]

CFG\_DATA\_LL28\_THRESHOLD is shown in [Table 22-103](#).

Return to the [Summary Table](#).

**Table 22-103. CFG\_DATA\_LL28\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll28dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL28_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL28_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.99 CFG\_DATA\_LL29 Register (Offset = 18Ch) [Reset = 00000000h]

CFG\_DATA\_LL29 is shown in [Table 22-104](#).

Return to the [Summary Table](#).

**Table 22-104. CFG\_DATA\_LL29 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL29_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL29_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL29_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL29_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL29_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL29_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL29_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL29_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL29_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL29_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL29_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL29_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL29_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL29_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL29_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.100 CFG\_DATA\_LL29\_LPHDR\_VAL Register (Offset = 190h) [Reset = 00000000h]

CFG\_DATA\_LL29\_LPHDR\_VAL is shown in [Table 22-105](#).

Return to the [Summary Table](#).

**Table 22-105. CFG\_DATA\_LL29\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL29_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.101 CFG\_DATA\_LL29\_THRESHOLD Register (Offset = 194h) [Reset = 0000X0X0h]

CFG\_DATA\_LL29\_THRESHOLD is shown in [Table 22-106](#).

Return to the [Summary Table](#).

**Table 22-106. CFG\_DATA\_LL29\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll29dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL29_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL29_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.102 CFG\_DATA\_LL30 Register (Offset = 198h) [Reset = 00000000h]

CFG\_DATA\_LL30 is shown in [Table 22-107](#).

Return to the [Summary Table](#).

**Table 22-107. CFG\_DATA\_LL30 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL30_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL30_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL30_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL30_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL30_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL30_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL30_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL30_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL30_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL30_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL30_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL30_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL30_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL30_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL30_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.103 CFG\_DATA\_LL30\_LPHDR\_VAL Register (Offset = 19Ch) [Reset = 00000000h]

CFG\_DATA\_LL30\_LPHDR\_VAL is shown in [Table 22-108](#).

Return to the [Summary Table](#).

**Table 22-108. CFG\_DATA\_LL30\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL30_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.104 CFG\_DATA\_LL30\_THRESHOLD Register (Offset = 1A0h) [Reset = 0000X0X0h]

CFG\_DATA\_LL30\_THRESHOLD is shown in [Table 22-109](#).

Return to the [Summary Table](#).

**Table 22-109. CFG\_DATA\_LL30\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll30dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL30_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL30_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.105 CFG\_DATA\_LL31 Register (Offset = 1A4h) [Reset = 00000000h]

CFG\_DATA\_LL31 is shown in [Table 22-110](#).

Return to the [Summary Table](#).

**Table 22-110. CFG\_DATA\_LL31 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31	LL31_DATA_WR_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
30	LL31_LONG_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
29	LL31_SHORT_PKT_DELAY_EN	R/W	0h	TI Internal Feature CSI2 only Programming : Use the Packet Delay configured in CFG_DELAY_CONFIG. This is a Debug feature. Not required in Programming model
28	LL31_CRC_EN	R/W	0h	0 : CRC is disabled 1 : This linklist corresponds to ADC Buffer data. Enable the CRC check from ADC Buffer to CBUFF
27	LL31_LPHDR_EN	R/W	0h	CSI2 Programming : 1 : Entry is start of a new CSI-2 packet. Send the LP Payload Header before sending data correspond to this Linklist 0 : Link list is not the start of a Long packet but part of previous packet and hence directly send data LVDS Programming : 1 : Entry is start of a new LVDS Frame 0 : Entry is not the start of the new LVDS Frame
26	LL31_WAITFOR_PKTSENT	R/W	0h	TI Internal Feature Reserved for future debug enhancement 1 : Wait for packet sent signal ack from CSI2 to move forward 0 : Do not wait for packet sent
25-23	LL31_BITPOS_SEL	R/W	0h	TI Internal Feature. Reserved for future use to select which of the 12-bits or 14-bits to be picked up from 16-bit CBUFF unit
22-9	LL31_SIZE	R/W	0h	Configure the Size of the data in terms of the number of samples (not in terms of number of bytes). Sample refers to a 16 bit CBUFF Unit
8	LL31_FMT_IN	R/W	0h	0 : The incoming data sources for this Linklist is aligned to 128-bit 1 : The incoming data sources for this Linklist is aligned to 96-bit
7	LL31_FMT_MAP	R/W	0h	LVDS only : 0 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_0 <sub>y</sub> 1 : Choose CFG_LVDS_MAPPING_LANE <sub>x</sub> _FMT_1 <sub>y</sub>
6-5	LL31_FMT	R/W	0h	Specify the LVDS/CSI2 output format. 00 - 16bit 01 - 14-bit 10 - 12-bit
4-3	LL31_VCNUM	R/W	0h	CSI-2 : Configure the Virtual Channel Number for the Long Packet over which this data is sent
2	LL31_HS	R/W	0h	CSI-2 : 0 : Do not send an Hsync Start packet before sending this data 1 : Send an Hsync Start Packet before sending this data LVDS : 0 : Entry is not the first data of LVDS Frame 1 : Entry is the first data in the LVDS Frame
1	LL31_HE	R/W	0h	CSI-2 : 0 : Do not send an Hsync End packet after sending this data 1 : Send an Hsync End Packet after sending this data LVDS : 0 : Entry is not the last data of LVDS Frame 1 : Entry is the last data in the LVDS Frame
0	LL31_VALID	R/W	0h	0 : Linklist entry is invalid 1 : Linklist entry is valid

### 22.3.1.106 CFG\_DATA\_LL31\_LPHDR\_VAL Register (Offset = 1A8h) [Reset = 00000000h]

CFG\_DATA\_LL31\_LPHDR\_VAL is shown in [Table 22-111](#).

Return to the [Summary Table](#).

**Table 22-111. CFG\_DATA\_LL31\_LPHDR\_VAL Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	LL31_LPHDR_VAL	R/W	0h	CSI-2 Programming : Configure the Long Packet Header to be sent to the Protocol Engine if the LPHDR_EN field is set for the linklist. LVDS Programming : Configure with the static value : 0BBBBBBBB

### 22.3.1.107 CFG\_DATA\_LL31\_THRESHOLD Register (Offset = 1ACh) [Reset = 0000X0X0h]

CFG\_DATA\_LL31\_THRESHOLD is shown in [Table 22-112](#).

Return to the [Summary Table](#).

**Table 22-112. CFG\_DATA\_LL31\_THRESHOLD Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU3	R	0h	
18-16	ll31dman	R/W	0h	If the long Packet Header is enabled, CBUFF can generate a DMA request to trigger the DMA transfer for the new packet 0 : Send a Request on DMA HW Req output line 0 1 : Send a Request on DMA HW Req output line 1 2 : Send a Request on DMA HW Req output line 2 3 : Send a Request on DMA HW Req output line 3 4 : Send a Request on DMA HW Req output line 4 5 : Send a Request on DMA HW Req output line 5 6 : Send a Request on DMA HW Req output line 6 7 : Do not generate dma trigger
15	NU2	R	Bh	
14-8	LL31_WR_THRESHOLD	R/W	0h	Configure the CBUFF FIFO Write threshold over which CBUFF will stall the DMA write to the CBUFF. Static configuration. This can be programmed to fixed value mentioned in the Programming Model
7	NU1	R	Bh	
6-0	LL31_RD_THRESHOLD	R/W	0h	Configure the CBUFF Read threshold to be Reached before sending the data over CSI2/LVDS and start draining the CBUFF FIFO. Static configuration. This can be programmed to fixed value mentioned in the Programming Model

### 22.3.1.108 CFG\_LVDS\_MAPPING\_LANE0\_FMT\_0 Register (Offset = 1B0h) [Reset = 00000000h]

CFG\_LVDS\_MAPPING\_LANE0\_FMT\_0 is shown in [Table 22-113](#).

Return to the [Summary Table](#).

**Table 22-113. CFG\_LVDS\_MAPPING\_LANE0\_FMT\_0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	CFG_LVDS_MAPPING_LANE0_FMT_0_H	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
27-24	CFG_LVDS_MAPPING_LANE0_FMT_0_G	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
23-20	CFG_LVDS_MAPPING_LANE0_FMT_0_F	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
19-16	CFG_LVDS_MAPPING_LANE0_FMT_0_E	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
15-12	CFG_LVDS_MAPPING_LANE0_FMT_0_D	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
11-8	CFG_LVDS_MAPPING_LANE0_FMT_0_C	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
7-4	CFG_LVDS_MAPPING_LANE0_FMT_0_B	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
3-0	CFG_LVDS_MAPPING_LANE0_FMT_0_A	R/W	0h	Lane 0 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 0 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details

### 22.3.1.109 CFG\_LVDS\_MAPPING\_LANE1\_FMT\_0 Register (Offset = 1B4h) [Reset = 00000000h]

CFG\_LVDS\_MAPPING\_LANE1\_FMT\_0 is shown in [Table 22-114](#).

Return to the [Summary Table](#).

**Table 22-114. CFG\_LVDS\_MAPPING\_LANE1\_FMT\_0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	CFG_LVDS_MAPPING_LANE1_FMT_0_H	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
27-24	CFG_LVDS_MAPPING_LANE1_FMT_0_G	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
23-20	CFG_LVDS_MAPPING_LANE1_FMT_0_F	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
19-16	CFG_LVDS_MAPPING_LANE1_FMT_0_E	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
15-12	CFG_LVDS_MAPPING_LANE1_FMT_0_D	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
11-8	CFG_LVDS_MAPPING_LANE1_FMT_0_C	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
7-4	CFG_LVDS_MAPPING_LANE1_FMT_0_B	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details
3-0	CFG_LVDS_MAPPING_LANE1_FMT_0_A	R/W	0h	Lane 1 mapping if Format 0 is selected. Bit [2:0] : 0-7 : Selects the CBUFF unit from the 8 CBUFF units to be sent on Lane 1 Bit 3 0 : Entry is not valid 1 : Entry is valid Please refer to LVDS Mapping Format in Programming model for more details

### 22.3.1.110 CFG\_LVDS\_MAPPING\_LANE2\_FMT\_0 Register (Offset = 1B8h) [Reset = 00000000h]

CFG\_LVDS\_MAPPING\_LANE2\_FMT\_0 is shown in [Table 22-115](#).

Return to the [Summary Table](#).

**Table 22-115. CFG\_LVDS\_MAPPING\_LANE2\_FMT\_0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	CFG_LVDS_MAPPING_LANE2_FMT_0_H	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
27-24	CFG_LVDS_MAPPING_LANE2_FMT_0_G	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
23-20	CFG_LVDS_MAPPING_LANE2_FMT_0_F	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
19-16	CFG_LVDS_MAPPING_LANE2_FMT_0_E	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
15-12	CFG_LVDS_MAPPING_LANE2_FMT_0_D	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
11-8	CFG_LVDS_MAPPING_LANE2_FMT_0_C	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
7-4	CFG_LVDS_MAPPING_LANE2_FMT_0_B	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
3-0	CFG_LVDS_MAPPING_LANE2_FMT_0_A	R/W	0h	Please refer to LVDS Mapping Format section for configuration details

### 22.3.1.111 CFG\_LVDS\_MAPPING\_LANE3\_FMT\_0 Register (Offset = 1BCh) [Reset = 00000000h]

CFG\_LVDS\_MAPPING\_LANE3\_FMT\_0 is shown in [Table 22-116](#).

Return to the [Summary Table](#).

**Table 22-116. CFG\_LVDS\_MAPPING\_LANE3\_FMT\_0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	CFG_LVDS_MAPPING_LANE3_FMT_0_H	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
27-24	CFG_LVDS_MAPPING_LANE3_FMT_0_G	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
23-20	CFG_LVDS_MAPPING_LANE3_FMT_0_F	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
19-16	CFG_LVDS_MAPPING_LANE3_FMT_0_E	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
15-12	CFG_LVDS_MAPPING_LANE3_FMT_0_D	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
11-8	CFG_LVDS_MAPPING_LANE3_FMT_0_C	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
7-4	CFG_LVDS_MAPPING_LANE3_FMT_0_B	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
3-0	CFG_LVDS_MAPPING_LANE3_FMT_0_A	R/W	0h	Please refer to LVDS Mapping Format section for configuration details

### 22.3.1.112 CFG\_LVDS\_MAPPING\_LANE0\_FMT\_1 Register (Offset = 1C0h) [Reset = 00000000h]

CFG\_LVDS\_MAPPING\_LANE0\_FMT\_1 is shown in [Table 22-117](#).

Return to the [Summary Table](#).

**Table 22-117. CFG\_LVDS\_MAPPING\_LANE0\_FMT\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	CFG_LVDS_MAPPING_LANE0_FMT_1_H	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
27-24	CFG_LVDS_MAPPING_LANE0_FMT_1_G	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
23-20	CFG_LVDS_MAPPING_LANE0_FMT_1_F	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
19-16	CFG_LVDS_MAPPING_LANE0_FMT_1_E	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
15-12	CFG_LVDS_MAPPING_LANE0_FMT_1_D	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
11-8	CFG_LVDS_MAPPING_LANE0_FMT_1_C	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
7-4	CFG_LVDS_MAPPING_LANE0_FMT_1_B	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
3-0	CFG_LVDS_MAPPING_LANE0_FMT_1_A	R/W	0h	Please refer to LVDS Mapping Format section for configuration details

### 22.3.1.113 CFG\_LVDS\_MAPPING\_LANE1\_FMT\_1 Register (Offset = 1C4h) [Reset = 00000000h]

CFG\_LVDS\_MAPPING\_LANE1\_FMT\_1 is shown in [Table 22-118](#).

Return to the [Summary Table](#).

**Table 22-118. CFG\_LVDS\_MAPPING\_LANE1\_FMT\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	CFG_LVDS_MAPPING_LANE1_FMT_1_H	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
27-24	CFG_LVDS_MAPPING_LANE1_FMT_1_G	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
23-20	CFG_LVDS_MAPPING_LANE1_FMT_1_F	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
19-16	CFG_LVDS_MAPPING_LANE1_FMT_1_E	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
15-12	CFG_LVDS_MAPPING_LANE1_FMT_1_D	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
11-8	CFG_LVDS_MAPPING_LANE1_FMT_1_C	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
7-4	CFG_LVDS_MAPPING_LANE1_FMT_1_B	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
3-0	CFG_LVDS_MAPPING_LANE1_FMT_1_A	R/W	0h	Please refer to LVDS Mapping Format section for configuration details

### 22.3.1.114 CFG\_LVDS\_MAPPING\_LANE2\_FMT\_1 Register (Offset = 1C8h) [Reset = 00000000h]

CFG\_LVDS\_MAPPING\_LANE2\_FMT\_1 is shown in [Table 22-119](#).

Return to the [Summary Table](#).

**Table 22-119. CFG\_LVDS\_MAPPING\_LANE2\_FMT\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	CFG_LVDS_MAPPING_LANE2_FMT_1_H	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
27-24	CFG_LVDS_MAPPING_LANE2_FMT_1_G	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
23-20	CFG_LVDS_MAPPING_LANE2_FMT_1_F	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
19-16	CFG_LVDS_MAPPING_LANE2_FMT_1_E	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
15-12	CFG_LVDS_MAPPING_LANE2_FMT_1_D	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
11-8	CFG_LVDS_MAPPING_LANE2_FMT_1_C	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
7-4	CFG_LVDS_MAPPING_LANE2_FMT_1_B	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
3-0	CFG_LVDS_MAPPING_LANE2_FMT_1_A	R/W	0h	Please refer to LVDS Mapping Format section for configuration details

### 22.3.1.115 CFG\_LVDS\_MAPPING\_LANE3\_FMT\_1 Register (Offset = 1CCh) [Reset = 00000000h]

CFG\_LVDS\_MAPPING\_LANE3\_FMT\_1 is shown in [Table 22-120](#).

Return to the [Summary Table](#).

**Table 22-120. CFG\_LVDS\_MAPPING\_LANE3\_FMT\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-28	CFG_LVDS_MAPPING_LANE3_FMT_1_H	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
27-24	CFG_LVDS_MAPPING_LANE3_FMT_1_G	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
23-20	CFG_LVDS_MAPPING_LANE3_FMT_1_F	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
19-16	CFG_LVDS_MAPPING_LANE3_FMT_1_E	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
15-12	CFG_LVDS_MAPPING_LANE3_FMT_1_D	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
11-8	CFG_LVDS_MAPPING_LANE3_FMT_1_C	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
7-4	CFG_LVDS_MAPPING_LANE3_FMT_1_B	R/W	0h	Please refer to LVDS Mapping Format section for configuration details
3-0	CFG_LVDS_MAPPING_LANE3_FMT_1_A	R/W	0h	Please refer to LVDS Mapping Format section for configuration details

### 22.3.1.116 CFG\_LVDS\_GEN\_0 Register (Offset = 1D0h) [Reset = 00000000h]

CFG\_LVDS\_GEN\_0 is shown in [Table 22-121](#).

Return to the [Summary Table](#).

**Table 22-121. CFG\_LVDS\_GEN\_0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-30	cpz	R/W	0h	LVDS Clock config. 1 : Clock alignment enabled Others : Internal clock alignment not enabled This needs to be set to 0x1 for correct functionality
29	cblpen	R/W	0h	TI Internal CFG_LASTPULSE_EN
28	cbrcrcen	R/W	0h	LVDS Frame CRC 0 : CRC is not sent at the end of LVDS Frame 1 : CRC is sent at the end of the LVDS Frame
27-24	cfldy	R/W	0h	LVDS FIFO Initial Threshold. This is a Static configuration and could be set to a fixed value as mention in the Programming model
23	cmsbf	R/W	0h	1 : Data is sent out on the LVDS lane MSB first 0 : Data is sent out on the LVDS lane LSB first
22	cpossel	R/W	0h	0 : When a new chirp is starting, align first sample start to negedge of DDR clock. 1 : When a new chirp is starting, align first sample start to posedge of DDR clock (recommended)
21-16	cckdiv	R/W	0h	TI Internal feature. CFG_LVDS_CLK_DIV
15	cclksel1	R/W	0h	TRM Description : 0 : DDR mode clock mux 1 : SDR mode clock mux TI Restricted Description : CFG_LVDS_CLK_SEL1 0-> Use div-by-2 (Q2 path ) 1 -> Used for direct (Q1 path)
14	cclksel	R/W	0h	TI Internal feature. CFG_LVDS_CLK_SEL (between div-by-N and CLK_HSI_DIG) 1 -> CLK_HSI_DIG 0 - through div-by-N (N is programmed in CFG_LVDS_CLK_DIV)
13-12	ckchar	R/W	0h	TI Internal feature. CFG_K_CHAR_SEL
11	ccsmen	R/W	0h	TRM Description : As per alignment TI Restricted Description : 0 : Regular operation 1 : Continuous Streaming Mode Enabled (Not supported internally also in AR16xx)
10	CFG_BIT_CLK_MODE	R/W	0h	Bit Clock Mode 0 : SDR clocking mode 1 : DDR clocking mode
9-8	CFG_LINE_MODE	R/W	0h	TI Internal feature. Reserved.
7	cpkfmt	R/W	0h	TI Internal feature. CFG_PACK_FORMAT: While packing in 12/14 bit whether to use CSI like packing or general packing.
6	cacdsel	R/W	0h	TI Internal feature. CFG_ALL_CHL_READY_DELAY_SEL This bit is added to take of the fast to slow transition in the ADC Buffer. 0 => If the LVDS clock frequency (SDR) is >= 200MHz 1 => If the LVDS clock frequency (SDR) is < 200MHz
5	ctc2en	R/W	0h	TI Internal feature. 0 : Regular operation 1: TC2MODE Enable (Not supported internally also in AR16xx)
4	CFG_8B10B_EN	R/W	0h	TI Internal Feature. Reserved. For Furture enhancement. Not supported in this version 0 : No encoding 1: 8B10B encoding
3	CFG_LVDS_LANE3_EN	R/W	0h	LVDS only programming : 0 : LVDS Lane 3 is disbaled 1 : LVDS Lane 3 is enabled

**Table 22-121. CFG\_LVDS\_GEN\_0 Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Description
2	CFG_LVDS_LANE2_EN	R/W	0h	LVDS only programming : 0 : LVDS Lane 2 is disbaled 1 : LVDS Lane 2 is enabled
1	CFG_LVDS_LANE1_EN	R/W	0h	LVDS only programming : 0 : LVDS Lane 1 is disbaled 1 : LVDS Lane 1 is enabled
0	CFG_LVDS_LANE0_EN	R/W	0h	LVDS only programming : 0 : LVDS Lane 0 is disbaled 1 : LVDS Lane 0 is enabled

### 22.3.1.117 CFG\_LVDS\_GEN\_1 Register (Offset = 1D4h) [Reset = 000000XXh]

CFG\_LVDS\_GEN\_1 is shown in [Table 22-122](#).

Return to the [Summary Table](#).

**Table 22-122. CFG\_LVDS\_GEN\_1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-19	NU2	R	0h	RESERVED
18	cgbcen	R/W	0h	TI Internal Feature. 0 : Bit clk is free running 1 : Bit clk is valid only during the valid frame.
17	cfcpol	R/W	0h	TI Internal Feature. 0 : During IDLE, Frame clock will be 0. Start of the valid sample is indicated by the rise edge 1 : During IDLE. Frame clock will be 1. Start of the valid sample is indicated by the fall edge.
16	clfven	R/W	0h	TI Internal feature. Extend the Single Ended Frame Valid When the frame_valid is used as a single ended signal, then make this 1. 0 : Regular Operation. Frame Valid will exactly match with the valid data. 1 : The frame_valid would start early by about 10 lvds_clk (internal) and would extend beyond by 10 lvds_clk (internal) after the end of the frame
15-14	ctpsel3	R/W	0h	TI Internal feature. This is used when Test Pattern Generation Enabled is enabled. 0 :Incremental pattern - For Lane 3
13-12	ctpsel2	R/W	0h	TI Internal feature. This is used when Test Pattern Generation Enabled is enabled. 0 :Incremental pattern - For Lane 2
11-10	ctpsel1	R/W	0h	TI Internal feature. This is used when Test Pattern Generation Enabled is enabled. 0 :Incremental pattern - For Lane 1
9-8	ctpsel0	R/W	0h	TI Internal feature. This is used when Test Pattern Generation Enabled is enabled. 0 :Incremental pattern - For Lane 0
7	NU1	R	Bh	RESERVED
6-4	ctiddly	R/W	0h	TI Internal feature. Configure the skew delay in terms on number of cycles
3	NU3	R	Bh	
2	c3c3l	R/W	0h	LVDS Only Programming: 0 : Regular Operation 1 : Enable 3Ch-3Lane mode in LVDS. Refer to Programming model for more details
1	csdrinv	R/W	0h	TI Internal feature. Configure the clock inversion during SDR mode. 0 : No inversion 1 : Inversion
0	ctpen	R/W	0h	TI Internal feature. 0 : Regular Operation 1 : LVDS Testpattern Enable

### 22.3.1.118 CFG\_LVDS\_GEN\_2 Register (Offset = 1D8h) [Reset = 00000000h]

CFG\_LVDS\_GEN\_2 is shown in [Table 22-123](#).

Return to the [Summary Table](#).

**Table 22-123. CFG\_LVDS\_GEN\_2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CFG_LVDS_GEN_2	R/W	0h	<p>CFG_LVDS_GEN_2[0]: Configure LSB/MSB first for CRC. This feature is supported only when the field CFG_LVDS_GEN_0[28] is set to 1 0 -&gt; The calculated value of 32-bit Ethernet polynomial CRC is swapped and sent out, clear this bit if data is set to LSB first (CFG_LVDS_GEN_0[23]=0) but CRC should be MSB first or vice-versa 1 -&gt; The calculated value of 32-bit Ethernet polynomial CRC is sent out without swapping, set this bit if both data and CRC should have same format (LSB/MSB first) CFG_LVDS_GEN_2[1]: Configure value of frame clock during inter frame period 0 -&gt; Frame clock is held low 1 -&gt; Frame clock is held high CFG_LVDS_GEN_2[2]: Configure frame clock period. This feature is supported only when the field CFG_LVDS_GEN_0[28] is set to 1 0 -&gt; 32-bit CRC is transmitted as single packet with frame clock set to 16h16l (16 high 16 low) configuration 1 -&gt; 32-bit CRC is transmitted as two packets with frame clock set to 8h8l (8 high 8 low) configuration for each packet CFG_LVDS_GEN_2[3]: Configure bit clock during inter frame period 0 -&gt; Bit clock toggles during inter frame period 1 -&gt; Bit clock does not toggle during inter frame period, the value of bit clock is held low This feature is supported when DDR clock is selected (CFG_LVDS_GEN_0[10]=1) and first data sample is driven on posedge of DDR clock (CFG_LVDS_GEN_0[22]=1) CFG_LVDS_GEN_2[4]: Configure CRC inversion. This feature is supported only when the field CFG_LVDS_GEN_0[28] is set to 1 0 -&gt; The calculated value of 32-bit Ethernet polynomial CRC is inverted and sent out 1 -&gt; The calculated value of 32-bit Ethernet polynomial CRC is sent out without inversion CFG_LVDS_GEN_2[5]: Enable/disable the calibration mode, in this mode frame clock will follow data lane[0] 0 -&gt; Calibration mode is disabled 1 -&gt; Calibration mode is enabled</p>

### 22.3.1.119 CFG\_MASK\_REG0 Register (Offset = 1DCh) [Reset = 00000000h]

CFG\_MASK\_REG0 is shown in [Table 22-124](#).

Return to the [Summary Table](#).

**Table 22-124. CFG\_MASK\_REG0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CFG_MASK_REG0	R/W	0h	Mask Register field corresponding to STAT_CBUFF_REG0. Refer STAT_CBUFF_REG0 for bitwise mapping. 0 : Event is unmasked and will cause an interrupt on occurrence 1 : Event is masked. No interrupt will be generated on occurrence

### 22.3.1.120 CFG\_MASK\_REG1 Register (Offset = 1E0h) [Reset = 00000000h]

CFG\_MASK\_REG1 is shown in [Table 22-125](#).

Return to the [Summary Table](#).

**Table 22-125. CFG\_MASK\_REG1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CFG_MASK_REG1	R/W	0h	Mask Register field corresponding to STAT_CBUFF_REG1. Refer STAT_CBUFF_REG1 for bitwise mapping. 0 : Event is unmasked and will cause an interrupt on occurrence 1 : Event is masked. No interrupt will be generated on occurrence

### 22.3.1.121 CFG\_MASK\_REG2 Register (Offset = 1E4h) [Reset = 00000000h]

CFG\_MASK\_REG2 is shown in [Table 22-126](#).

Return to the [Summary Table](#).

**Table 22-126. CFG\_MASK\_REG2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CFG_MASK_REG2	R/W	0h	Mask Register field corresponding to STAT_LVDS_REG0. Refer STAT_LVDS_REG0 for bitwise mapping. 0 : Event is unmasked and will cause an interrupt on occurrence 1 : Event is masked. No interrupt will be generated on occurrence

### 22.3.1.122 CFG\_MASK\_REG3 Register (Offset = 1E8h) [Reset = 00000000h]

CFG\_MASK\_REG3 is shown in [Table 22-127](#).

Return to the [Summary Table](#).

**Table 22-127. CFG\_MASK\_REG3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CFG_MASK_REG3	R/W	0h	RESERVED

### 22.3.1.123 STAT\_CBUFF\_REG0 Register (Offset = 1ECh) [Reset = 00000000h]

STAT\_CBUFF\_REG0 is shown in [Table 22-128](#).

Return to the [Summary Table](#).

**Table 22-128. STAT\_CBUFF\_REG0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-13	STAT_CBUFF_REG0_OTHERS	R	0h	Reserved for future enhancement
12	S_FRAME_DONE	R	0h	Indicates that CBUFF has completed sending out data for the current Frame
11	S_CHIRP_DONE	R	0h	Indicates that CBUFF has completed sending out data for the current Chirp
10-6	S_LL_INDEX	R	0h	TI Internal Feature. Debug only. Current Linked list index.
5	S_CSI_PKT_LP_RCVD_STATE	R	0h	TI Internal Feature Indicates that the CSI-2 Packet Received is sent to the CBUFF from the Protocol Engine after Long Data Packet
4	S_CSI_PKT_HE_RCVD_STATE	R	0h	TI Internal Feature Indicates that the CSI-2 Packet Received is sent to the CBUFF from the Protocol Engine after Hsync End Packet
3	S_CSI_PKT_HS_RCVD_STATE	R	0h	TI Internal Feature Indicates that the CSI-2 Packet Received is sent to the CBUFF from the Protocol Engine after Hsync Start Packet
2	S_CSI_PKT_VE_RCVD_STATE	R	0h	TI Internal Feature Indicates that the CSI-2 Packet Received is sent to the CBUFF from the Protocol Engine after Vsync End Packet
1	S_CSI_PKT_VS_RCVD_STATE	R	0h	TI Internal Feature Indicates that the CSI-2 Packet Received is sent to the CBUFF from the Protocol Engine after Vsync Start Packet
0	S_CSI_PKT_RCVD	R	0h	TI Internal Feature Indicates that the CSI-2 Packet Received is sent to the CBUFF from the Protocol Engine

### 22.3.1.124 STAT\_CBUFF\_REG1 Register (Offset = 1F0h) [Reset = 00000000h]

STAT\_CBUFF\_REG1 is shown in [Table 22-129](#).

Return to the [Summary Table](#).

**Table 22-129. STAT\_CBUFF\_REG1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-21	S1_UNUSED3	R	0h	
20	S_CBFIFO_READY_IN_FSM	R	0h	TI Internal Feature. Debug only. cbuff-fifo_ready - Keep this masked. Not relevant.
19	S_CBFIFO_EMPTY_IN_FSM	R	0h	TI Internal Feature. Debug only. cbuff-fifo_empty - Keep this masked. Not relevant.
18	S_PKTRCV_ERR	R	0h	TI Internal Feature. Debug only. If the packetReceived arrives at a wrong time. It should NOT be coming while in IDLE state (as no packet was sent before) and in HIBER state (where the next LL group is being evaluated).
17	S_FRAME_ERR	R	0h	Indicates the FrameStart arrived before CBUFF has completed sending out data for all the Chirps programmed
16	S_CHIRP_ERR	R	0h	Indicates tha the chirpAvailable from ADCBuffer arrived before CBUFF has completed sending out the previous Chirp data.
15-12	S1_UNUSED2	R	0h	RESERVED
11	S_CBFIFO_EMPTY	R	0h	TI Internal Feature. Debug only. CBUFF_FIFO Empty Status – Keep this masked, since full and empty will be normal conditions.
10	S_CBFIFO_FULL	R	0h	TI Internal Feature. Debug only. CBUFF_FIFO Full Status – Keep this masked, since full and empty will be normal conditions.
9	S_CBPUSH_ERR	R	0h	TI Internal Feature. Debug only. CBUFF_FIFO_PUSH_ERROR
8	S_CBPOP_ERR	R	0h	TI Internal Feature. Debug only. CBUFF_FIFO_POP_ERROR
7-3	S1_UNUSED1	R	0h	RESERVED
2	S_LCLPUSH_ERR	R	0h	TI Internal Feature. Debug only. LCL_FIFO_PUSH_ERROR
1	S_LCLPOP_ERR	R	0h	TI Internal Feature. Debug only. LCL_FIFO_POP_ERROR
0	S_LCLFSM_ERR	R	0h	TI Internal Feature. Debug only. LCL_FIFO_FSM_ERROR

### 22.3.1.125 STAT\_CBUFF\_REG2 Register (Offset = 1F4h) [Reset = 00000000h]

STAT\_CBUFF\_REG2 is shown in [Table 22-130](#).

Return to the [Summary Table](#).

**Table 22-130. STAT\_CBUFF\_REG2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STAT_CBUFF_REG2	R	0h	RESERVED. This does not have corresponding clear or mask

### 22.3.1.126 STAT\_CBUFF\_REG3 Register (Offset = 1F8h) [Reset = 00000000h]

STAT\_CBUFF\_REG3 is shown in [Table 22-131](#).

Return to the [Summary Table](#).

**Table 22-131. STAT\_CBUFF\_REG3 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STAT_CBUFF_REG3	R	0h	RESERVED. This does not have corresponding clear or mask

### 22.3.1.127 STAT\_LVDS\_REG0 Register (Offset = 1FCh) [Reset = 00000000h]

STAT\_LVDS\_REG0 is shown in [Table 22-132](#).

Return to the [Summary Table](#).

**Table 22-132. STAT\_LVDS\_REG0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STAT_LVDS_REG0	R	0h	<p>TI Internal Feature. Debug only. Clr is CLR_LVDS_REG0 and MASK is CFG_MASK_REG2 FSM_STAT_CODE: [3:0] is for Ch0, [7:4] is for Ch1, [11:8] is for Ch2, [15:12] is for ch3 ASYNC_FIFO_STATUS: [19:16] is for Ch0, [23:20] is for Ch1, [27:24] is for Ch2, [32:28] is for ch3 FSM_STATE_CODE : Using this the states can be decoded. ASYNC_FIFO_STATUS: 0 - POP_ERROR 1 - PUSH_ERROR 2- POP_EMPTY 3 - PUSH_FULL. Set the mask for POP_EMPTY and PUSH_FULL. These are normal conditions and will keep happening and need not generate any interrupt</p>

### 22.3.1.128 STAT\_LVDS\_REG1 Register (Offset = 200h) [Reset = 00000000h]

STAT\_LVDS\_REG1 is shown in [Table 22-133](#).

Return to the [Summary Table](#).

**Table 22-133. STAT\_LVDS\_REG1 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STAT_LVDS_REG1	R	0h	RESERVED

### 22.3.1.129 STAT\_LVDS\_REG2 Register (Offset = 204h) [Reset = 00000000h]

STAT\_LVDS\_REG2 is shown in [Table 22-134](#).

Return to the [Summary Table](#).

**Table 22-134. STAT\_LVDS\_REG2 Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	STAT_LVDS_REG2	R	0h	RESERVED

### 22.3.1.130 STAT\_LVDS\_REG3 Register (Offset = 208h) [Reset = 00000000h]

STAT\_LVDS\_REG3 is shown in [Table 22-135](#).

Return to the [Summary Table](#).

**Table 22-135. STAT\_LVDS\_REG3 Register Field Descriptions**

Bit	Field	Type	Reset	Description

Bit	Field	Type	Reset	Description
31-0	CLR_LVDS_REG1	RESERVED		

### 22.3.1.135 STAT\_CBUFF\_ECC\_REG Register (Offset = 21Ch) [Reset = 00000000h]

STAT\_CBUFF\_ECC\_REG is shown in [Table 22-140](#).

Return to the [Summary Table](#).

**Table 22-140. STAT\_CBUFF\_ECC\_REG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-10	NU2	R	Bh	
9	seccdbe	R	0h	0 : No Double bit error 1 : Indicates a double bit error has occurred
8	seccsbe	R	0h	0 : No Single bit error 1 : Indicates a single bit error has occurred
7-6	NU1	R	0h	
5-0	seccadd	R	0h	6-bit address where the ECC error occurred. It is valid when either seccsbe or seccdbe is set. If none of them is set, then the addr does not mean anything.

### 22.3.1.136 MASK\_CBUFF\_ECC\_REG Register (Offset = 220h) [Reset = 00000000h]

MASK\_CBUFF\_ECC\_REG is shown in [Table 22-141](#).

Return to the [Summary Table](#).

**Table 22-141. MASK\_CBUFF\_ECC\_REG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-10	NU2	R	Bh	
9	meccdbe	R/W	0h	0 : Double bit error indications are unmasked 1 : Double bit error indications are Masked
8	meccsbe	R/W	0h	0 : Single bit error indications are unmasked 1 : Single bit error indications are Masked
7-0	NU1	R	0h	

### 22.3.1.137 CLR\_CBUFF\_ECC\_REG Register (Offset = 224h) [Reset = 00000000h]

CLR\_CBUFF\_ECC\_REG is shown in [Table 22-142](#).

Return to the [Summary Table](#).

**Table 22-142. CLR\_CBUFF\_ECC\_REG Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-10	NU2	R	Bh	
9	ceccdbe	Clear Register field corresponding to STAT_CBUF_F_ECC. Write 0x1 to Clear the field	0h	
8	ceccsbe	Clear Register field corresponding to STAT_CBUF_F_ECC. Write 0x1 to Clear the field		
7-1	NU1	R		
0	ceccadd	Clear Register field corresponding to STAT_CBUF_F_ECC. Write 0x1 to Clear the field		

### 22.3.1.138 STAT\_SAFETY Register (Offset = 228h) [Reset = 00000000h]

STAT\_SAFETY is shown in [Table 22-143](#).

Return to the [Summary Table](#).

**Table 22-143. STAT\_SAFETY Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-9	SAF_UNUSED1	R	0h	RESERVED
8	SAF_CHIRP_ERR	R	0h	Safety Error. Indicates tha the chirpAvailable from ADCBuffer arrived before CBUFF has completed sending out the previous Chirp data.
7-0	SAF_CRC	R	0h	TRM Descrcption : Indicates a CRC error between ADCBuffer and CBUFF. 0 : No Error Non Zero : Error TI Restricted Description : 0 - CRC for col-0 - [15:0], 1 - CRC for col-1 [31:16] 2 - CRC for col-2 [47:32] 3 - CRC for col-3 [63:48] 4 - CRC for col-4 - [79:64] 5 - CRC for col-5 [95:80] 6 - CRC for col-6 [111 :96] 7 - for col-7 [127:112]

### 22.3.1.139 MASK\_SAFETY Register (Offset = 22Ch) [Reset = 00000000h]

MASK\_SAFETY is shown in [Table 22-144](#).

Return to the [Summary Table](#).

**Table 22-144. MASK\_SAFETY Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	MASK_SAFETY	R/W	0h	Mask Register field corresponding to STAT_SAFETY. Refer STAT_SAFETY for bitwise mapping. 0 : Event is unmasked and will cause an interrupt on occurrence 1 : Event is masked. No interrupt will be generated on occurrence

### 22.3.1.140 CLR\_SAFETY Register (Offset = 230h) [Reset = 00000000h]

CLR\_SAFETY is shown in [Table 22-145](#).

Return to the [Summary Table](#).

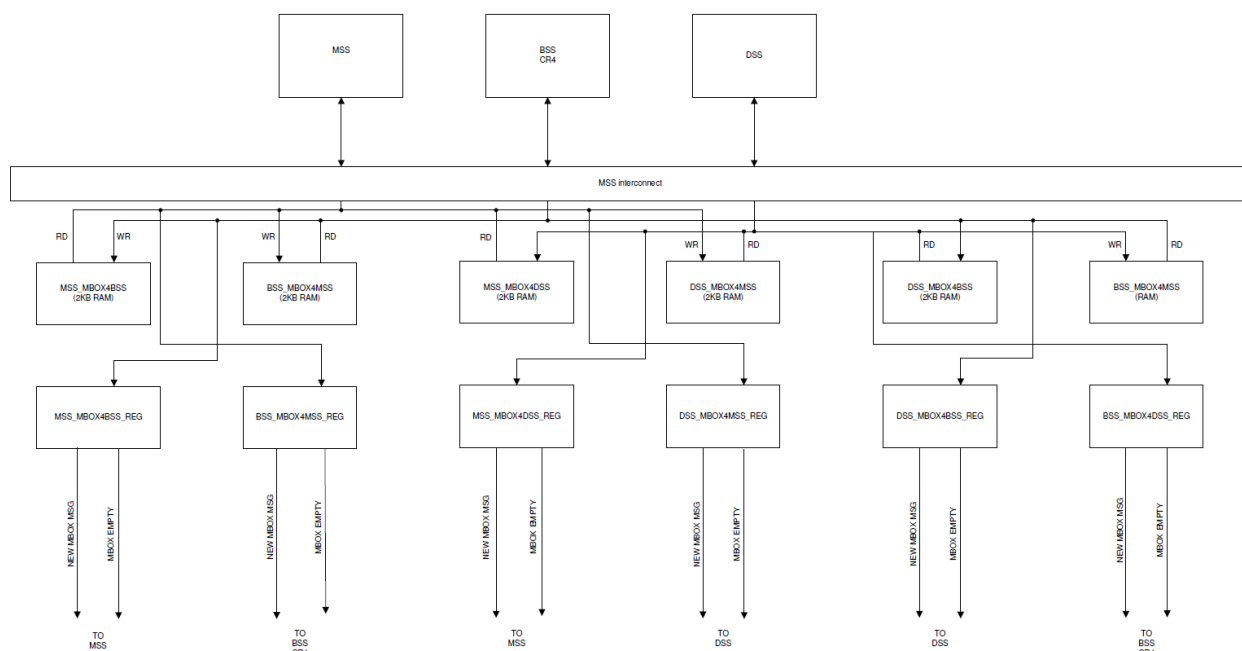

**Table 22-145. CLR\_SAFETY Register Field Descriptions**

Bit	Field	Type	Reset	Description
31-0	CLR_SAFETY	Clear Register field corresponding to STAT_SAFETY. Write 0x1 to Clear the field		

The device provides a mailbox mechanism to asynchronously exchange the messages between any two processors.

Each processor has a mailbox memory space, and registers designated to be used by other processor that wishes to communicate.

**Figure 23-1. Mailbox Block Diagram**

**Table 23-1. Mailbox Allocation for different Sub-System**

Sub-System Name	Size	Start Address (Same across sub-systems)	Mailbox Memory Breakup (* _OFFSET depends on driver implementation)
MSS CR5	4 kB	0xC5000000	RSS_TO_CR5A_MBX 0xC5000000
RSS CR4	2 kB	0xA4030000	CR5A_TO_RSS_MBX: 0xA4030000

### Note

There is an MPU at every Mailbox that can be used to partition the mailbox memory between the Controllers/cores. This gives some flexibility over a fixed allocation scheme.

<b>23.1 Maibox Message Scheme.....</b>	<b>5361</b>
--	-------------

## 23.1 Mailbox Message Scheme

The mailbox architecture is a distributed architecture with the Mailbox memory present in the Receiving processors Subsystem. The following is the processor numbering for AWR2544

**Table 23-2. Mailbox Processor ID**

Processor	ID
MSS_CR5A	0
HSM_CM4	2
RSS_CR4	3

The processor which wishes to send a message to another processor writes the message to the mailbox memory space, then interrupts the receiver processor. The receiver processor acknowledges the interrupt, then reads the message from the mailbox memory space. The receiver informs the sender that the message is read by an interrupt, which is acknowledged back by the sender. The sender must not initiate another message to the same receiver until the previously initiated mailbox interaction with the same receiver is complete.

1. SENDER writes the message in the RECEIVER mailbox.
2. SENDER triggers an interrupt to RECEIVER by writing 1 to <SENDER\_SS>\_CTRL: <SENDER>\_MBOX\_WRITE\_DONE [RECEIVER]. Note: It is writing to its own CTRL space.
3. SENDER polls <RECEIVER\_SS>\_CTRL: <RECEIVER>\_MBOX\_READ\_REQ[SENDER] and keeps writing 1'b1 to <SENDER\_SS>\_CTRL: <SENDER>\_MBOX\_WRITE\_DONE [RECEIVER] until the read value is 1'b1.
4. RECEIVER gets a single interrupt for all interprocessor communication, which is an aggregated interrupt. RECEIVER reads the register <RECEIVER\_SS>\_CTRL::<RECEIVER>\_MBOX\_READ\_REQ and sees bit [SENDER] is 0x1.
5. RECEIVER waits for some 60-70 clock cycles before going to next step.
6. RECEIVER writes to 0x1 to <RECEIVER\_SS>\_CTRL::<RECEIVER>\_MBOX\_READ\_REQ [SENDER] to clear the interrupt.
7. RECEIVER reads the message.
8. RECEIVER writes to 0x1 to <RECEIVER\_SS>\_CTRL::<RECEIVER>\_MBOX\_READ\_DONE\_ACK[SENDER] to generate an acknowledgment interrupt to SENDER. SENDER gets a single interrupt for all interprocessor communication, which is an aggregated ACK interrupt.
9. RECEIVER polls the <SENDER\_SS>\_CTRL: <SENDER>\_MBOX\_READ\_DONE and keeps writing 1'b1 to <RECEIVER\_SS>\_CTRL: <RECEIVER>\_MBOX\_READ\_DONE\_ACK [SENDER] until the read value is 1'b1.
10. SENDER reads the register <SENDER\_SS>\_CTRL: <SENDER>\_MBOX\_READ\_DONE and sees bit [RECEIVER] is 0x1.
11. SENDER waits for some 60-70 clock cycles before going to next step.
12. SENDER writes 0x1 to <SENDER\_SS>\_CTRL: <SENDER>\_MBOX\_READ\_DONE [RECEIVER] to clear the interrupt.

Mailbox message example (message from MSS CR5 C0 to RSS):

1. MSS CR5\_C0 writes the message in the RSS mailbox.
2. MSS triggers an interrupt to RSS by writing 1 to MSS\_CTRL: MSS\_CR5A\_MBOX\_WRITE\_DONE [3]. Note: It is writing to its own CTRL space.
3. MSS CR5\_C0 polls the RSS\_PROC\_CTRL:RSS\_MBOX\_READ\_REQ[0] and keeps writing 1 to MSS\_CTRL: MSS\_CR5A\_MBOX\_WRITE\_DONE [3] until the read value is 1.
4. RSS gets a single interrupt for all interprocessor communication, which is an aggregated interrupt. RSS reads the register RSS\_PROC\_CTRL::RSS\_MBOX\_READ\_REQ and sees bit [0] is 0x1.
5. RSS waits for some 60-70 clock cycles.
6. RSS writes to 0x1 to RSS\_PROC\_CTRL::RSS\_MBOX\_READ\_REQ [0] to clear the interrupt.
7. RSS reads the message.

8. RSS writes to 0x1 to `RSS_PROC_CTRL::RSS_MBOX_READ_DONE_ACK [0]` to generate an acknowledgment interrupt to MSS CR5 C0.
9. RSS polls the `MSS_CTRL::MSS_CR5A_MBOX_READ_DONE[3]` and keeps writing 1 to `RSS_PROC_CTRL::RSS_MBOX_READ_DONE_ACK [0]` until the read value is 1.
10. MSS CR5 C0 gets a single interrupt for all interprocessor communication, which is an aggregated ACK interrupt. MSS CR5 C0 reads the register `MSS_CTRL::MSS_CR5A_MBOX_READ_DONE` and sees bit [3] is 0x1.
11. MSS CR5 C0 waits for some 60-70 clock cycles.
12. MSS CR5 C0 writes 0x1 to `MSS_CTRL::MSS_CR5A_MBOX_READ_DONE [3]` to clear the interrupt.

Every processor is always writing to its own control space.

Each processor has only 2 interrupts (aggregated): `<PROC>MBOX_READ_REQ` and `<PROC>MBOX_READ_ACK` to its interrupt controller.

Scheme ensures the number of mailbox interrupts to a processor is always only 2, regardless of the number of procs in the SoC.

**Radar Hardware Accelerator 1.5 User Guide**

---

**RadarHardware Accelerator 1.5**

The *RadarHardware Accelerator 1.5 User's Guide* (in three parts) describes the Radar Hardware Accelerator architecture, features, and operation of various blocks and their register descriptions. The purpose is to enable the user to understand the capabilities offered by the Radar Hardware Accelerator and to program it appropriately to achieve the desired functionality.

Radar Hardware Accelerator 1.5 (HWA1.5) is found in devices - AWR2544

This user's guide is divided into three parts. The first part (this document) provides an overview of the overall architecture and features available in the Radar Hardware Accelerator. The main features, such as, windowing, FFT are covered in this part.

The second part of the user's guide covers additional features like DC Estimation/Correction, Interference mitigation and pre-scaling. The second part of the user's guide is optional and can be skipped if the user is interested only in the FFT computation capability.

The third part of user's guide describes the compression feature.

This user's guide (Part 1) is organized as follows: Section 1 covers the introduction and high-level architecture. Section 2, Section 3, and Section 4 describe the state machine, trigger mechanisms, input/output formatting, and general framework for using the accelerator. Section 5 describes the primary computational unit features namely, windowing and FFT.

## 24.1 Radar Hardware Accelerator 1.5 User Guide – Part 1

### RadarHardware Accelerator 1.5

The *RadarHardware Accelerator 1.5 User's Guide* (in three parts) describes the Radar Hardware Accelerator architecture, features, and operation of various blocks and their register descriptions. The purpose is to enable the user to understand the capabilities offered by the Radar Hardware Accelerator and to program it appropriately to achieve the desired functionality.

Radar Hardware Accelerator 1.5 (HWA1.5) is found in devices - AWR2544

This user's guide is divided into three parts. The first part (this document) provides an overview of the overall architecture and features available in the Radar Hardware Accelerator. The main features, such as, windowing, FFT are covered in this part.

The second part of the user's guide covers additional features like DC Estimation/Correction, Interference mitigation and pre-scaling. The second part of the user's guide is optional and can be skipped if the user is interested only in the FFT computation capability.

The third part of user's guide describes the compression feature.

This user's guide (Part 1) is organized as follows: Section 1 covers the introduction and high-level architecture. Section 2, Section 3, and Section 4 describe the state machine, trigger mechanisms, input/output formatting, and general framework for using the accelerator. Section 5 describes the primary computational unit features namely, windowing and FFT.

#### 24.1.1 Radar Hardware Accelerator – Overview

This section provides an overview of the Radar Hardware Accelerator. The section covers the key features of the accelerator and overall architecture.

##### 24.1.1.1 Introduction

The Radar Hardware Accelerator is a hardware IP that enables off-loading the burden of certain frequently used computations in FMCW radar signal processing from the main processor. It is well known that FMCW radar signal processing involves the use of FFT and compression computations to obtain a radar image across the range, velocity, and angle dimensions. Some of the frequently used functions in FMCW radar signal processing can be done within the Radar Hardware Accelerator, while still retaining the flexibility of implementing other proprietary algorithms in the main processor.

This accelerator (HWA 1.5) is optimized for a real-only receiver and has an improved throughput -2 output samples per clock for real signals compared to (HWA 2.0/2.1). It however supports the legacy complex-input and real-input modes of (HWA 2.0/2.1) with single output sample per clock.

##### 24.1.1.2 Key Features

The main features of the Radar Hardware Accelerator are as follows.

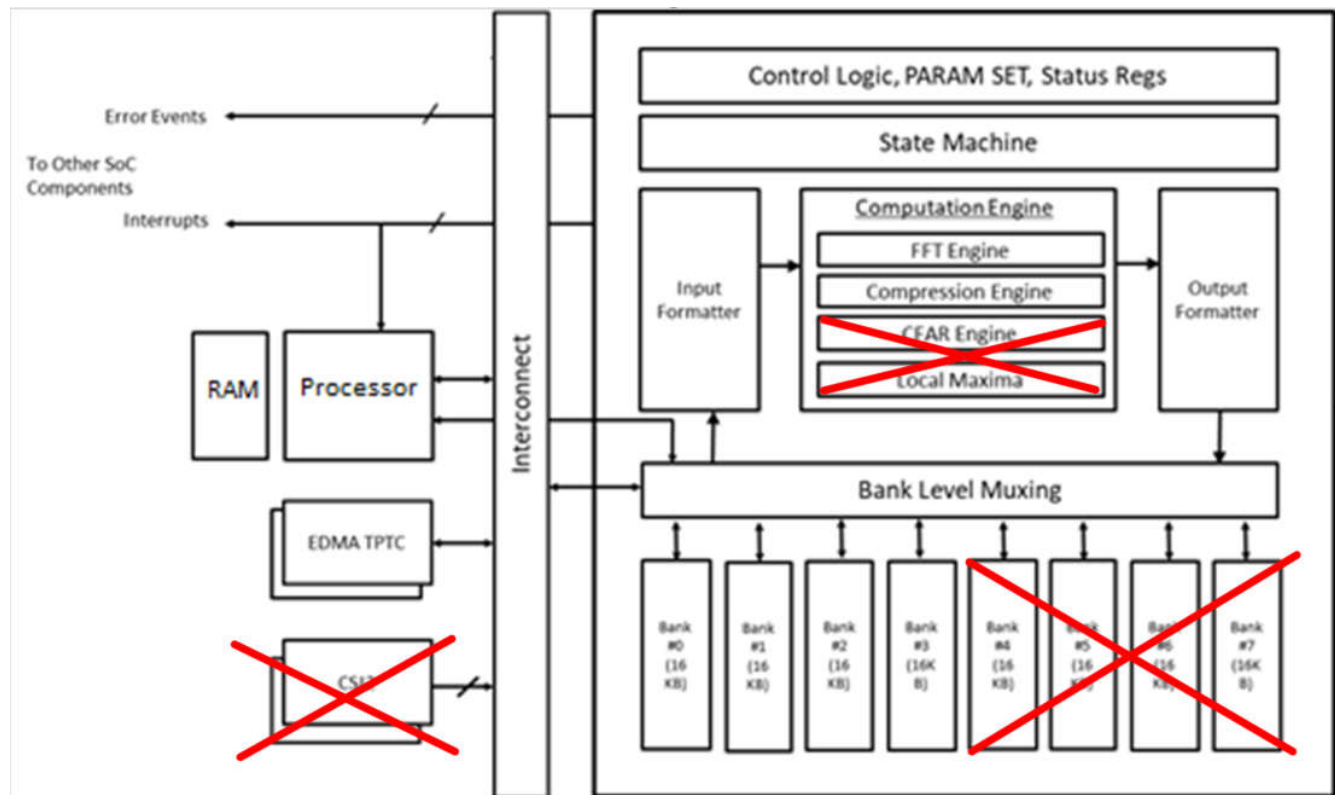

- Fast FFT computation, with programmable FFT sizes (2, 4, 8..., 2048-pt, and 3, 6, 12, ..., 768, 1536-pt) complex-input FFT and (4, 8 ..., 4096-pt and 12, ..., 3072-pt) real-input FFT with improved throughput
- Internal FFT bit width of 24 bits (for each I and Q) for good SQNR performance, with fully programmable butterfly scaling at every stage for user flexibility
- Built-in capabilities for pre-FFT processing – specifically DC estimation and removal, interference localization and mitigation, complex/real multiplication and programmable windowing
- Flexible data flow and data sample arrangement to support efficient chaining of chirp processing operations and transpose accesses as required
- Chaining and looping to sequence a set of accelerator operations one-after-another with minimal intervention from the main processor
- Radar data compression

This user's guide is divided into three parts. The first part covers the high-level architecture and key features such as windowing and FFT. The (optional) second part covers additional features such as DC estimation/correction, Interference mitigation, complex/real multiplication. The third part covers compression and decompression.

### 24.1.1.3 High Level Architecture

The Radar Hardware Accelerator module is loosely coupled to the main processor (eg. ARM Cortex R5). The accelerator is connected to a 64-bit bus that is present in the main processor system, as shown in [Figure 24-1](#).

The Radar Hardware Accelerator module comprises an accelerator engine and four memories, each of 16KB size, which are used to send input data to and pull output data from the accelerator engine. These memories are referred to as *local memories* of the Radar Accelerator (ACCEL\_MEM). For convenience, these local memories are referred to as ACCEL\_MEM0, ACCEL\_MEM1, ... and ACCEL\_MEM3.

**Figure 24-1. Radar Hardware Accelerator**

### 24.1.1.3.1 High-Level Data Flow

The typical data flow is that the DMA module is used to bring samples (for example, FFT input samples) into the local memories of the Radar Hardware Accelerator, so that the main accelerator engine can access and process these samples. Once the accelerator processing is done, the DMA module reads the output samples from the local memories of the Radar Hardware Accelerator and stores them back in the Radar data memory for further processing by the main processor.

The purpose behind the four separate local memories (16KB each) inside the Radar Hardware Accelerator is to enable the *ping-pong* mechanism, for both the input and output, such that the DMA write (and read) operations can happen in parallel to the main computational processing of the accelerator. The presence of multiple memories enables such parallelism. For example, the DMA can be configured to write FFT input samples (ping) into ACCEL\_MEM0 and read FFT output samples (ping) from ACCEL\_MEM2. At the same time, the accelerator engine can be working on FFT input samples (pong) from ACCEL\_MEM1 and writing FFT output samples (pong) into ACCEL\_MEM3. However, both the DMA and the accelerator cannot access the same 16KB memory at the same time. This would lead to an error (refer to the MEM\_ACCESS\_ERR\_STATUS register description in [Table 24-3](#)). As will be explained in later sections, the accelerator engine can perform multiple computational steps one after another autonomously. In each step, the input samples are read from one of the four local memories and the output samples are written into another one of the four local memories.

The Radar Hardware Accelerator operates on a single clock domain and the operating clock frequency is 300 MHz.

The accelerator local memories are 64-bits wide, for example, each of the 16KB banks is implemented as 1024 words of 128 bits each. This allows the DMA to bring data into the accelerator local memories efficiently (up to a maximum throughput of 64 bits per interconnect clock cycle, depending upon the DMA configuration). Two ports for accessing the HWA local memories are available and these ports map the same 64KB into two different address spaces, thus allowing simultaneous efficient read and write DMA transfers.

It is important to note that any of the four local memories can be the *source* of the input samples to the accelerator engine and any of the four local memories can be the *destination* for the output samples from the accelerator engine – with the important restriction that the source and destination memories cannot be the same 16 KB bank. Note also that the accelerator local memories do not necessarily need to be used in ping-pong mode and can instead be used as larger 32KB input and output memories, if the use case requires. The address space for the 16KB memories is contiguous (including a wrap-around from the end of ACCEL\_MEM3 to the start of ACCEL\_MEM0). Therefore, the source as well as destination memory addresses can span beyond 16KB.

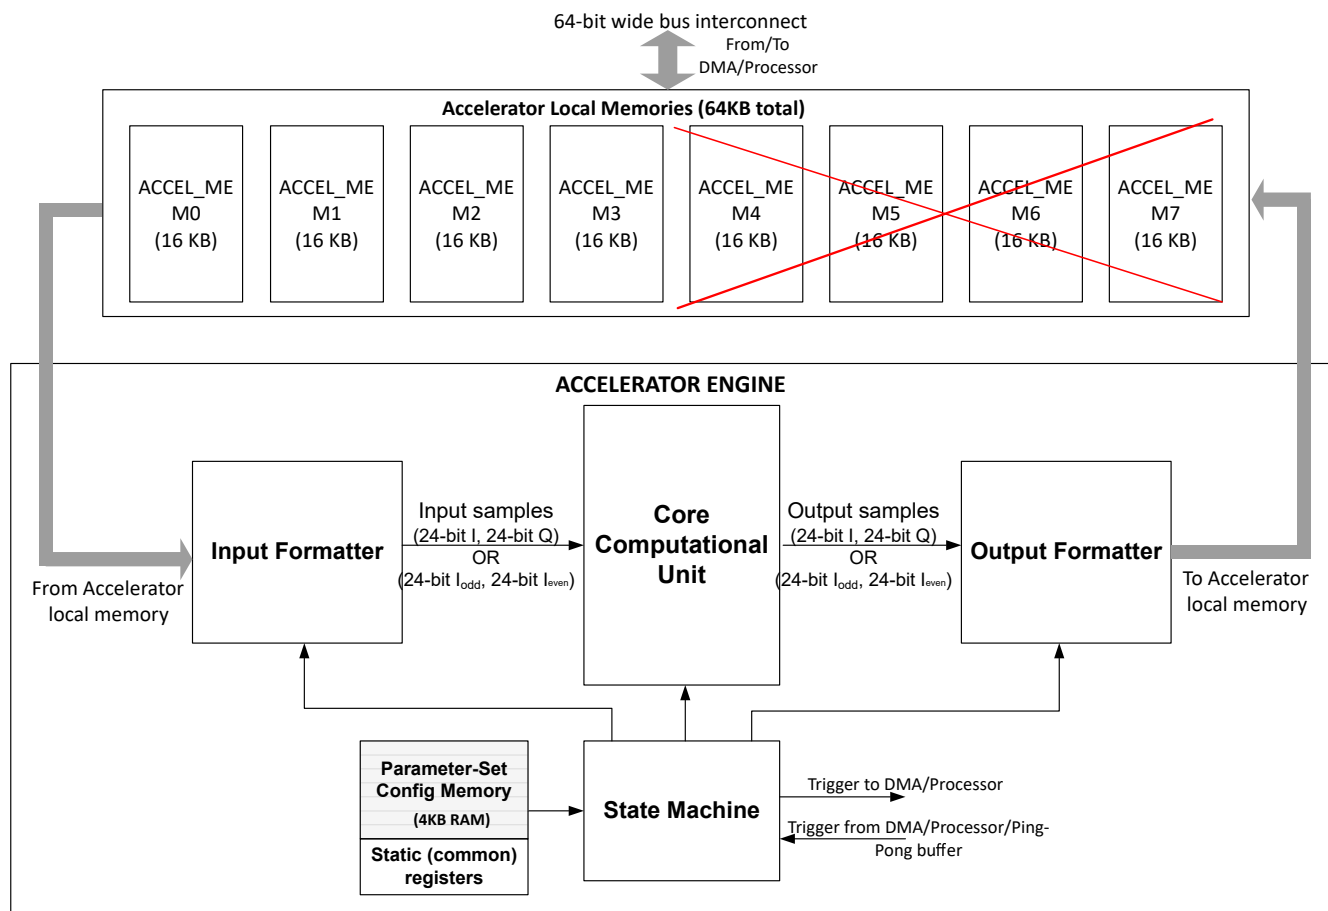

### 24.1.1.3.2 Configuration

The operations of the Radar Hardware Accelerator are configured using registers, which are of two types – *parametersets* and *common* (common for all parameter sets) registers. The purpose of the parameter sets is to enable a complete sequence of various accelerator operations to be preprogrammed (with appropriate source and destination memory addresses and other configurations specified for each operation in that sequence), such that the accelerator can perform them one after the other, with minimal intervention from the main processor.

The parameter-set register configurations are programmed into a separate 4KB *parameter-set configuration memory*. A state machine built into the accelerator handles the loading of one parameter-set configuration at a time and sequences the preprogrammed operations one after another. This process is further explained in later sections of this user's guide.

### 24.1.1.4 Accelerator Engine Block Diagram

As previously mentioned, the Radar Hardware Accelerator module consists of eight local memories of 16KB each (ACCEL\_MEM) and the main accelerator engine. The accelerator engine has the following five components (as shown in [Figure 24-2](#)) – a state machine, input formatter block, output formatter block, core computational unit, and the 4KB parameter-set configuration memory.

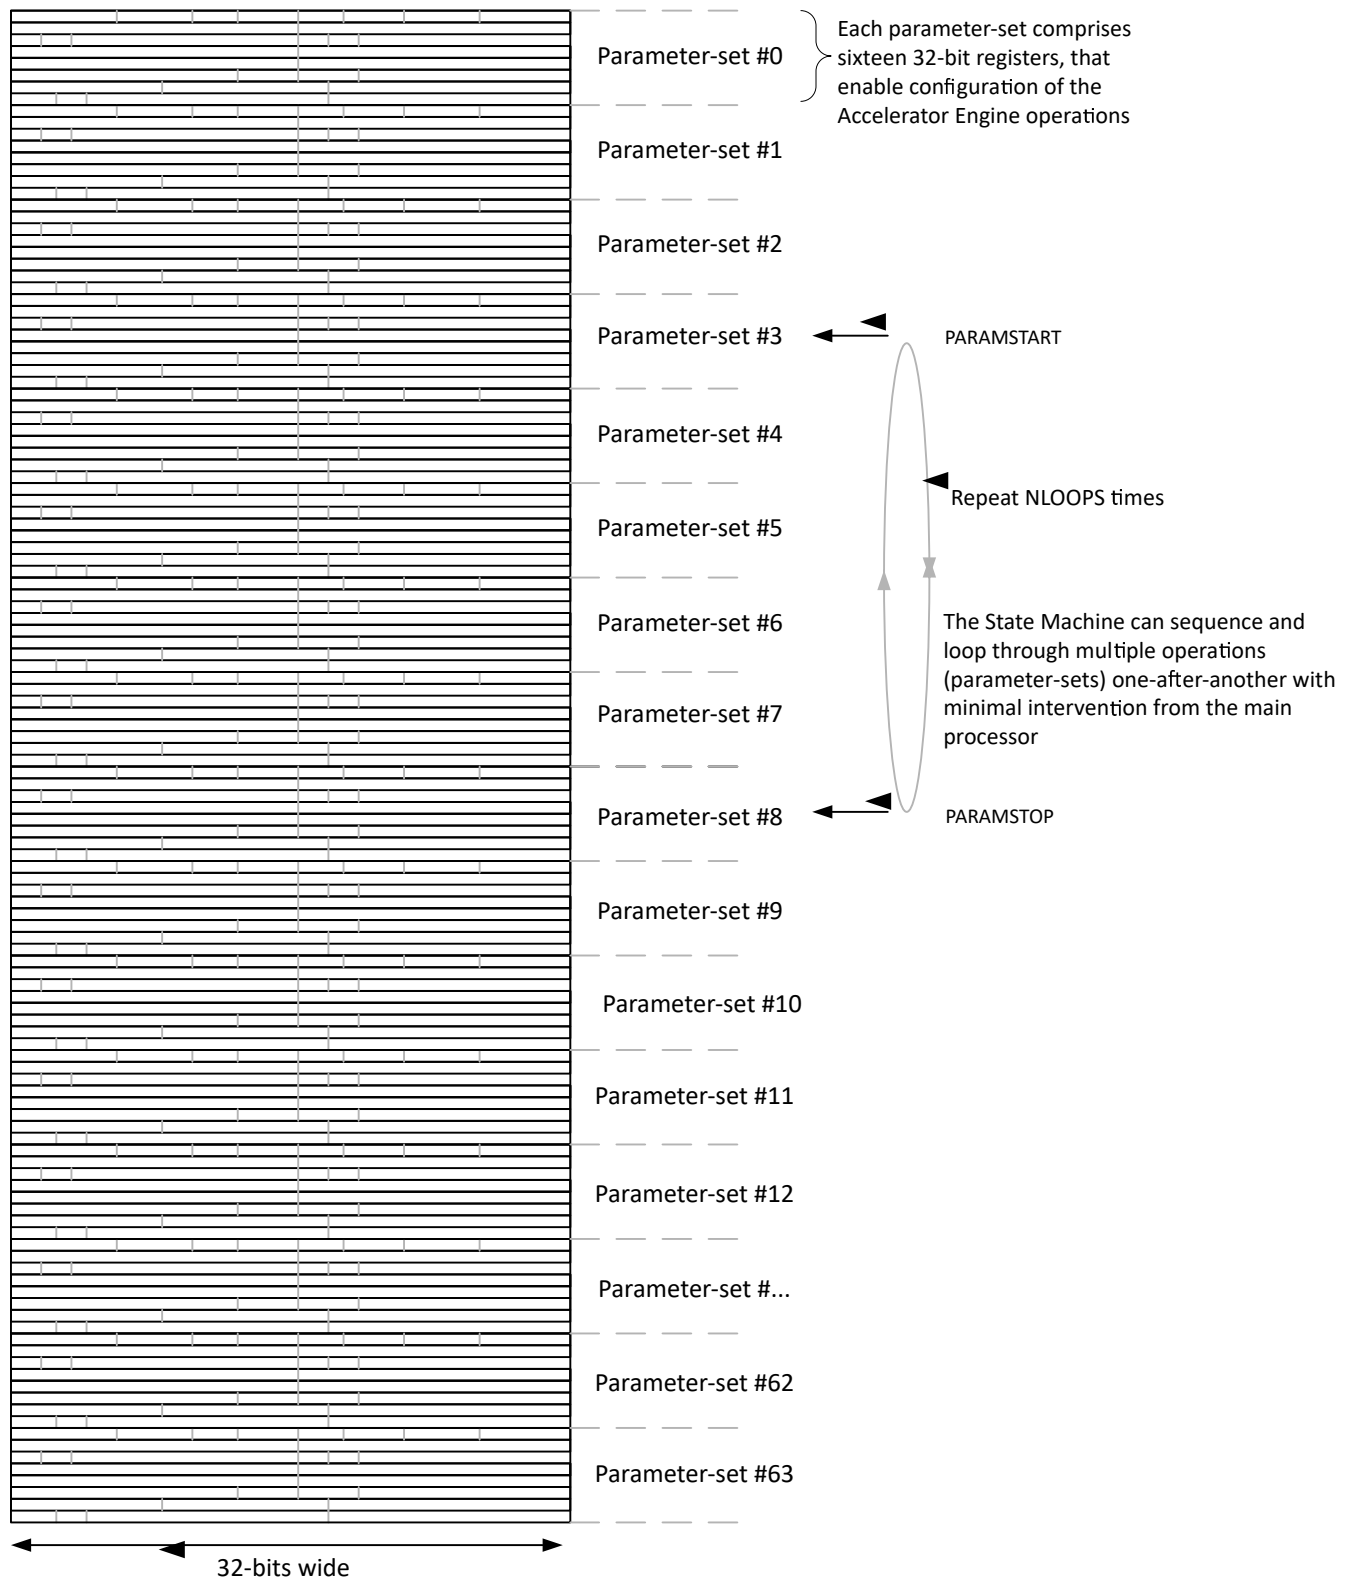

**Figure 24-2. Accelerator Engine Block Diagram. Note that unlike HWA 2.1, HWA 1.5 supports only 4 memory banks of 16KB.**

The purpose of these components is as follows.

- **State machine:** the state machine is responsible for controlling the overall operation of the accelerator – specifically, the starting, looping, stopping, as well as triggering and handshake mechanisms between the accelerator, DMA, and main processor. The state machine is also closely connected to the parameter-set configuration memory and takes care of sequencing and chaining a sequence of multiple accelerator operations as programmed in the parameter-set configuration memory.
- **Input formatter:** the input formatter block is responsible for reading the input samples from any one of the local memories and feeding them into the core computational unit. In this process, this block provides flexible ways of accessing the input samples, in terms of 16-bit versus 32-bit aligned input samples, transpose read-out, flexible scaling, and sign extension to generate internal bit-width of 24 bits, and so on. Lastly the input formatter block provides 24-bit complex samples as input to the core computational unit. The local memory (memories) from which the input formatter reads the input samples is called the *source* memory.
- **Output formatter:** the output formatter block is responsible for writing the output samples from the core computational unit into the local memories. This block also provides flexible ways of formatting the output samples, in terms of 16-bit versus 32-bit aligned output samples, transpose write, flexible scaling from internal bit-width of 24 bits, to 16-bit or 32-bit aligned output samples, sign-extension, and so on. The local memory (memories) to which the output formatter writes the output samples is called the *destination* memory.
- **Core computational unit:** the core computational unit contains the main computational logic for various operations, such as DC correction, windowing and FFT calculations. The unit accepts a streaming input from the input formatter block (at the rate of one input sample per clock cycle), performs computations, and produces a streaming output to the output formatter block (typically at the rate of one output sample per clock cycle), with some initial latency depending on the nature of the computations involved. In HWA 1.5, it

is possible to stream-in two real samples  $I_{\text{odd}}$  and  $I_{\text{even}}$  instead of a complex I-sample and Q-sample. This improves the rate to two sample per clock cycle input. Note that in case of a FFT for purely real-input, the number of unique output samples needed is only half of FFT size. Thus, the output computation time is also bettered

- Parameter-set configuration memory: this is a 4096-byte RAM that is used to preconfigure the sets of parameters (register settings) for a chained sequence of accelerator operations, which can then be executed by the state machine in a loop. This allows the accelerator to perform a preprogrammed sequence of operations in a loop without frequent intervention from the main processor.

**Figure 24-3. Parameter-Set Configuration Memory (4KB)**

The number of parameter sets that can be preconfigured and sequenced (chained) is 64. This means that up to 64 accelerator operations can be chained together and these can then be looped as well, with minimal

intervention from the main processor. For example, operations like DC & Interference correction, FFT and compression can be preconfigured in the parameter-set configuration memory and the state machine can be made to sequence them one after another and run them in a loop for specified number of times. There is a provision available to interrupt the main processor and/or trigger a DMA channel at the end of each parameter set if required. This allows various ways by which the accelerator, DMA, and the main processor can work together to establish a data and processing flow.

As shown in [Figure 24-3](#), each parameter set contains the equivalent of sixteen 32-bit registers, which corresponds to total RAM size of  $64 \times 16 \times 32 \text{ bits} = 4\text{KB}$  for the parameter-set configuration memory.

The layout of the parameter-set register map is provided in [Section 24.1.6](#). Note that the parameter-set RAM must be programmed using 32-bit word writes only (i.e., byte-writes and half-word writes are not supported). The detailed descriptions of the registers are provided in the various sections, as and when the functionality of each component is presented.

Typically, all necessary parameter sets can be pre-configured before triggering execution by the accelerator. If needed, the parameter sets can be modified on-the-fly but without modifying the parameter set being executed at that time. If parameter sets are being overwritten after execution, it is recommended to re-program all the fields for particular set, i.e., avoid partial over-writing.

#### 24.1.1.5 Accelerator Engine Operation

The accelerator engine and the local memories run on a single clock domain. The overall operation of the accelerator can be summarized as follows. The accelerator engine is configured by the main processor through common configuration registers (common for all parameter sets), as well as the parameter-set configuration memory. As explained earlier, the former comprises common register settings for overall control of the accelerator engine, and the latter comprises the 64 parameter-set specific settings which control the functioning of the accelerator for each of its *chained* sequence of operations.

When the accelerator engine is enabled, the state machine kicks off and controls the overall operation of the accelerator, which involves loading the parameter sets one at a time from the parameter-set configuration memory into various internal registers of the accelerator engine and running the accelerator as per the programmed configuration for each parameter set one after another. The entire procedure then repeats in a loop for a programmed number of times (NUMLOOPS described later).

Each parameter set includes various configuration details such as the accelerator mode of operation (FFT, Compression), the source memory address, number of samples, the destination memory address, input formatting, output formatting, trigger mode for controlling the start of computations to ensure proper handshake with the DMA, and so on.

##### 24.1.1.5.1 Data Throughput

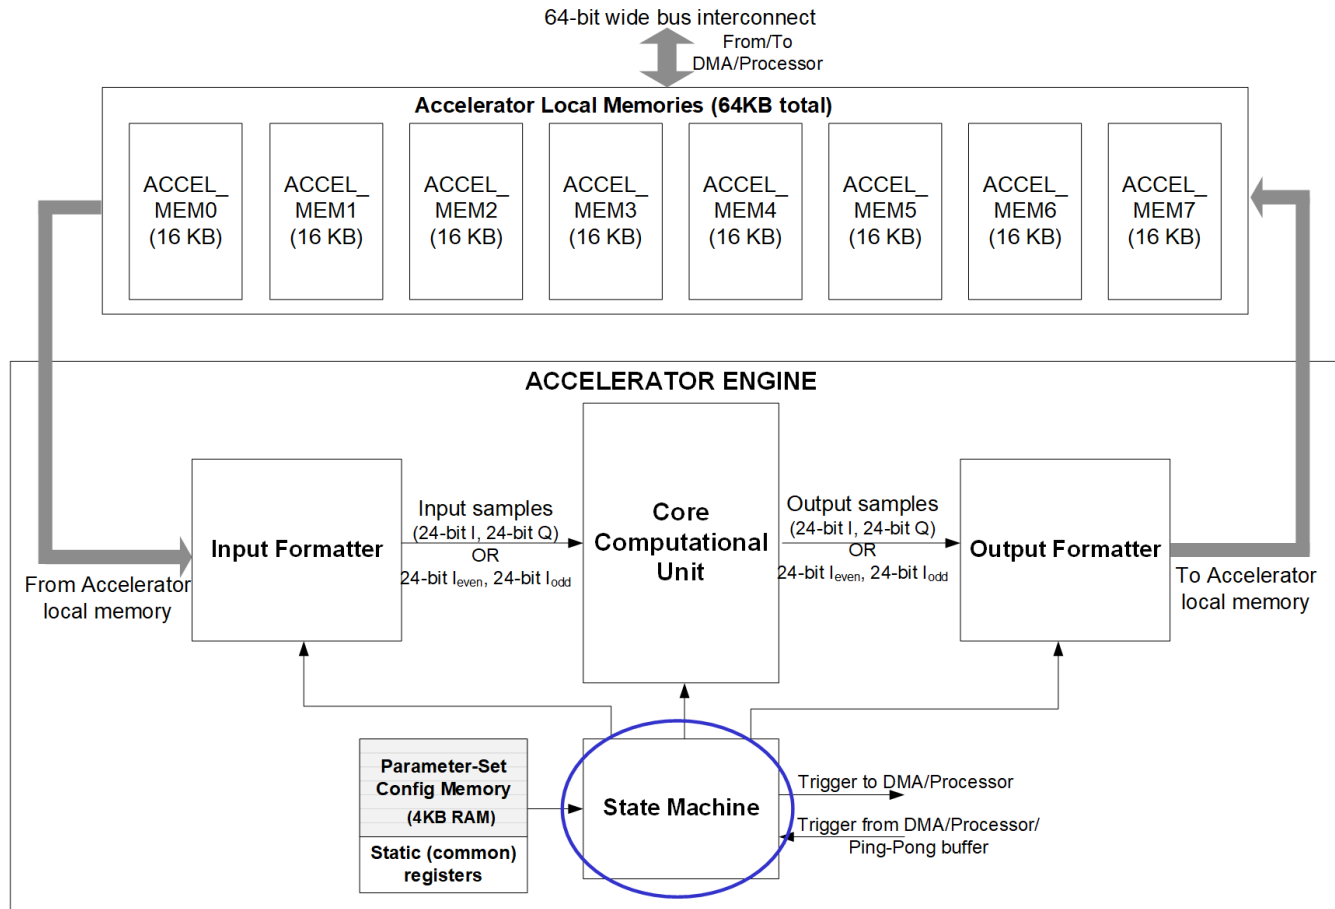

Once the state machine has loaded the registers corresponding to the current parameter set to be executed, the data flow happens as follows: at each clock cycle, one sample from the source memory is read by the input formatter and fed into the core computational unit with appropriate scaling and formatting as configured. The data interface between the input formatter and the core computational unit is a 24-bit complex bus (24-bit for I and 24-bit for Q) which streams either one complex input sample every clock cycle or two real samples per clock cycle. The core computational unit processes this streaming sequence of input samples and in general, produces a streaming output also at one complex-sample every clock cycle or two real-samples, after an initial latency period. Thus, for most operations (DC Estimation, Interference, FFT), in steady state the core computational unit maintains a streaming data rate of one complex-sample per clock cycle or two real-samples per clock cycle. The data interface between the core computational unit and the output formatter is also a 24-bit complex bus (24-bit for I and 24-bit for Q) and the output formatter is responsible for writing into the destination memory, with appropriate scaling and formatting as configured.

The next section provides more details regarding the state machine, including its detailed operation, registers, trigger mechanisms, and so on.

### 24.1.2 Accelerator Engine – State Machine

This section describes the state machine block present in the accelerator engine (see [Figure 24-4](#)). This block, together with the input formatter and output formatter blocks described in the next two sections, provides the overall framework for establishing the data flow and using the accelerator for various computations.

**Figure 24-4. State Machine**

#### 24.1.2.1 State Machine

The statemachine controls the overall functioning of the Radar Hardware Accelerator. The state machine controls the enabling and disabling of the accelerator, as well as supports sequencing an entire set of operations (configured using parameter-set configuration memory), and looping through those operations one after another without needing frequent intervention from the main processor

##### 24.1.2.1.1 State Machine – Operation

The state machine block and the entire accelerator remain in reset and disabled state by default. The state machine (and hence the accelerator in general) is enabled by setting the HWA\_CLK\_EN register bit, followed by writing 111b into the HWA\_EN register.

Notethat a complete list of registers pertaining to the state machine is provided in [Table 24-1](#). Some of the registers are common (common for all parameter sets) registers, whereas some other registers are parameter-set registers, which as explained in the previous section means that they can be uniquely programmed for each of the 64 parameter sets.

For each register, lists whether it is part of the parameter set or not. [Table 24-1](#) also provides a brief description of each register.

When enabled, the state machine steps through (one after another) the parameter sets programmed in the parameter-set configuration memory and executes the computations as per the configuration of each parameter set. The registers `PARAM_START_IDX` and `PARAM_END_IDX` define the starting index and ending index within the 64 parameter sets, so that only those parameter sets between the start and end indices are executed by the accelerator, as shown in [Figure 24-3](#). The state machine also loops through these parameter sets for a total of `NUMLOOPS` times (unless `NUMLOOPS` is programmed as 0 or 4095, in which case the loop does not run or runs infinite times respectively). As an example, if the state machine needs to be configured to run the first four parameter sets in a loop 64 times, then the registers should be programmed as follows: `PARAM_START_IDX = 0`, `PARAM_END_IDX = 3`, and `NUMLOOPS = 64`.

For each parameter set, there is a `TRIGMODE` register, which is used to control when the state machine starts executing the computations for that parameter set. This control is useful, for example, to ensure that the input data is ready in the accelerator local memory (source memory) before the computations are started. Specifically, it is possible to trigger the start of computations after completion of a DMA transfer, or, after a SW interrupt is received. The `TRIGMODE` register setting thus controls when the accelerator operation is triggered for the current parameter set and there are four trigger mechanisms supported as listed in the next subsection. Once triggered, the state machine loads all the registers from the parameter-set configuration memory for the current parameter set into corresponding internal registers of the accelerator and starts the actual computations for that parameter set. After completion of computations of the current parameter set, it moves to the next parameter set. In general, once the parameter set registers are configured and the state machine is enabled, it is recommended to avoid dynamically changing any of the register values. In particular, note that the loading of parameter set (N+1)'s registers happens soon after the completion of parameter set N's execution, and this loading can happen even while the state machine is waiting for the parameter set (N+1)'s trigger to arrive. This means that parameter set configuration registers of parameter set (N+1) cannot be reliably changed while parameter set N is already executing.

After a sequence of operations as programmed in the parameter set(s) for the specified number of loops is complete, the accelerator provides a completion interrupt (insert the correct interrupt name) to the processor. The accelerator can be reconfigured as desired. For reconfiguration, the following procedure must be followed. The accelerator must be disabled by writing 000b to the `HWA_EN` register. Then, a reset must be asserted by writing 111b followed by 000b to the `HWA_RESET` register. The new configurations can now be written in to the accelerator, and then the accelerator can be enabled again by writing 111b to `HWA_EN`. Note that any spare/reserved bits should be kept as 0.

#### 24.1.2.1.2 State Machine – Trigger Mechanisms (Incoming)

As mentioned in the previous subsection, for each parameter set, the start of the computations can be triggered based on specific events. Four trigger mechanisms are supported as follows.

**Immediate trigger (`TRIGMODE = 000b`):** In this case, the state machine does not wait for any trigger and starts the accelerator computations immediately for the current parameter set. This mode is applicable when chaining (sequencing) a set of operations one after another in the accelerator without any need for control handshake or data exchange outside the accelerator (for example, when chaining DC correction and FFT operations) with no need to wait for a trigger in between.

**Wait for processor-based software trigger (`TRIGMODE = 001b`, `TRIGMODE = 111b`):** This is a software-triggered mode that is useful when the main processor(s) must directly control the data flow and start or stop of accelerator computations. In this trigger mode, the state machine waits for a software-based trigger, which involves the main processor(s) setting a separate self-clearing bit in a `FW2HWA_TRIGGER_0` or `FW2HWA_TRIGGER_1` register (single-bit register). The state machine keeps monitoring that register bit and waits as long as the value is zero. When the value becomes 1 (set), the state machine gets triggered to start the accelerator operations for the current parameter set. `FW2HWA_TRIGGER_0` register bit corresponds to `TRIGMODE = 001b` and `FW2HWA_TRG_1` corresponds to `TRIGMODE = 111b`.

**`TRIGMODE = 010b` :** mode is reserved.

**Wait for the DMA-based trigger (TRIGMODE = 011b):** This trigger mode is useful when a DMA transfer completion must be used to trigger the start of the accelerator computations for the current parameter set. The primary purpose of this trigger mode is as follows; when performing first dimension FFT, the DMA is used to bring the FFT input samples from the ADC buffer to the local memory of the accelerator. Upon completion of each DMA transfer, it is useful to automatically trigger the accelerator to perform the FFT.

To achieve this, the state machine of the accelerator has a 32-bit register called the DMA2HWA\_TRIGGER register, where each register bit maps to one of 32 DMA channels that are associated with the accelerator. To use the DMA-based trigger mode, the HWA\_TRIGSRC register in the current parameter set must be programmed to the DMA channel whose completion we wish to monitor. The state machine then monitors the corresponding register bit in the DMA2HWA\_TRIGGER register, and triggers the execution of the current parameter set only when that register bit gets set. For e.g. if HWA\_TRIGSRC is programmed to 5, then the current parameter set will execute only once the register bit #5 gets set in DMA2HWA\_TRIGGER.

The user may utilize the EDMA's linking capability to set the appropriate register bit in DMA2HWA\_TRIGGER. Linking is a programmable feature of the EDMA, where the completion of a DMA transfer can automatically trigger a second DMA transfer. In the present context, the DMA transfer that moves data to the local memory of the accelerator can be linked to a second DMA whose purpose is to write a one-hot signature into DMA2HWA\_TRIGGER to set a specific register bit and trigger the accelerator. Note that there are 32 read-only, one-hot, signature registers (SIG\_DMACH1\_DONE, SIG\_DMACH2\_DONE, and more) that are available. These registers are simply read-only registers which contain hard-coded values (each register is a one-hot signature – 0x0001, 0x0002, 0x0004, 0x0008, and so on). For convenience, these hard-coded 32 read-only signatures can be used, so that the second DMA can simply copy from one of these SIG\_DMACHx\_DONE registers into the DMA2HWA\_TRIGGER register to set the appropriate register bit.

In case of multiple DMA triggers waiting on multiple HWA paramset operation, each time the DMA transfer is completed, the corresponding one-hot signature is copied to DMA2HWA\_TRIGGER (self-clearing bit) register and this value gets internally latched and is serviced only on DMA transfer completion. For example, assume there are two parallel DMA's (DMA-0 and DMA-1) which are about to trigger paramset-0 and paramset-1 respectively. So in this case even if DMA-1 completes transfer first, the HWA will only start execution once DMA-0 is over and also note that DMA2HWA\_TRIGGER register is not overwritten but the values get internally latched as mentioned above.

**Wait for hardware trigger (TRIGMODE = 0b100):** This trigger mode is only applicable in HWA 2.1. In 1.5 this is not supported.

#### 24.1.2.1.3 State Machine – Trigger Mechanisms (Outgoing)

After the accelerator computations for the current parameter set are triggered (using one of the four incoming trigger mechanisms mentioned in the previous subsection), it performs the actual computation operations for that parameter set. These computations typically take several tens or hundreds of clock cycles, depending on the nature of the configuration programmed. Once the accelerator completes its computation operations for the current parameter set, the state machine advances to the next parameter set and repeats the same process. But before advancing to the next parameter set, it can interrupt the main processor and/or trigger a DMA channel. This provision is useful if the main processor is required to read or write registers or memory locations at the end of the current parameter set. Also, this provision is useful for triggering a DMA channel, so that the output of the accelerator can be copied out of the accelerator local memories.

There are two trigger mechanisms provided as follows:

- Interrupt(s) to main processor (CPU\_INTR1\_EN = 1, CPU\_INTR2\_EN = 1): The accelerator interrupts the main processor(s) at the end of completion of computations for the current parameter set, if the register bit CPU\_INTR1\_EN or CPU\_INTR2\_EN is set. Two interrupt signals are available and they are enabled or disabled for each parameter-set by these two register bits. Setting CPU\_INTR1\_EN in a parameter-set enables (interrupt name) interrupt to be generated at the end of that parameter-set. Setting CPU\_INTR2\_EN in a parameter-set enables (interrupt name) interrupt to be generated at the end of that parameter-set.
- Trigger to DMA (DMATRIG\_EN = 1): The accelerator gives a trigger to a DMA channel at the end of completion of computations for the current parameter set, if the register bit DMATRIG\_EN is set. If

DMATRIG\_EN is set, then the particular DMA channel as specified in a separate HWA2DMA\_TRIGDST register (valid values are 0 to 31, for the 32 DMA channels dedicated for the accelerator) is triggered. Thus, it is possible to preconfigure up to 32 DMA channels and trigger the appropriate one at the end of the computations of the current parameter set. The trigger from accelerator to the DMA channels can also be emulated by the processor, by writing to a FW2DMA\_TRIGGER register. This can be used by the processor to kick-start a full/repetitive chain of operations, that are then subsequently managed between the DMA and the accelerator without further processor involvement – for example, the processor writes to the FW2DMA\_TRIGGER register to trigger a DMA channel for the first time, and this kicks off a series of back-to-back data transfers and accelerator computations, with the DMA and accelerator hand-shaking with each other.

#### 24.1.2.1.4 State Machine – Register Descriptions

Table 24-1 lists all the registers of the state machine block. As explained previously, some of the registers are common (common for all parameter sets) registers, whereas some others are *part of each parameter set*. For each register, this distinction is captured as part of the register description in Table 24-1.

**Table 24-1. State Machine Registers**

Register.Field	Width	Parameter Set	Description
HWA_ENABLE.hwa_en	3	No	Enable and Disable Control: This register enables or disables the entire Radar Hardware Accelerator. The reason for a 3-bit register (instead of 1-bit) is to avoid an accidental bit-flip (for example, transient error caused by a neutron strike) from unintentionally turning on the accelerator engine. A value of HWA_EN = 111b enables the Radar Hardware Accelerator and any other value of the register keeps the accelerator engine in disabled state.
HWA_ENABLE.hwa_clk_en	3	No	Clock-gating Control: This register bit controls the enable/disable for the clock of the Radar Accelerator. This register bit can be set to 0 to clock-gate the accelerator when not using the accelerator. Before enabling the accelerator or before configuring the accelerator's registers, this register bit should be set first, so that the clock is available.
HWA_ENABLE.hwa_reset	3	No	Software Reset Control: This register provides software reset control for the Radar Hardware Accelerator. The assertion of these register bits by the main processor will bring the accelerator engine to a known reset state. This is mostly applicable for resetting the accelerator in case of unexpected behavior. Under normal circumstances, it is expected that whenever the accelerator is enabled (from disabled state), it always comes up in a known reset state automatically. The recommended sequence to be followed in case software reset is desired is to write 111b to this register and then a 000b, before the clock is enabled to the accelerator.
PARAM_RAM_LOOP.numloops	12	No	Number of loops: This register controls the number of times the state machine will loop through the parameter sets (from a programmed start index till a programmed end index) and run them. The maximum number of times the loop can be made is run is 4094. A value of 4095 (0xFFFF) programmed in this register should be considered as a special case and it should be interpreted as an infinite loop mode, for example, keep looping and never stop the accelerator engine unless reset by the main processor. A value of zero programmed in this register means that the looping mechanism is disabled. In this case, the accelerator engine can still be used under direct control of the main processor (without the state machine looping provision coming into the picture).
PARAM_RAM_IDX.param_start_idx	10	No	Parameter-set Start Index: These registers are used to control the start and stop index of the parameter set through which the state machine loops through. The state machine starts at the parameter set specified by PARAM_START_IDX and loads each parameter set one after another and runs the accelerator as per that configuration. When the state machine reaches the parameter set specified by PARAM_END_IDX, it loops back to the start index as specified by PARAM_START_IDX.
PARAM_RAM_IDX.param_end_idx	10	No	Parameter-set Stop Index: Refer register description for PARAM_START_IDX

**Table 24-1. State Machine Registers (continued)**

Register.Field	Width	Parameter Set	Description
HWA_ENABLE. hwa_dyn_clk_en	1	No	Dynamic Clock-gating Control: Setting this register bit to '1' enables the capability to clock gate the unused computation engines (i.e., from the two computation engines, namely FFT, Memory Compression) to save power consumption, based on the specific parameter-set being executed.
TRIGMODE	4	Yes	Trigger mode select: 0000b – Immediate trigger 0001b – Software trigger - 1 0010b – Reserved 0011b – DMA-based trigger 0100b – Reserved 0101b – Reserved 0110b – Reserved 0111b – Reserved
FW2HWA_TRIG_0.fw2hwa_trigger_0	1	No	Software trigger bit: This register bit is relevant whenever software triggered mode is used (TRIGMODE = 001b). Whenever this software triggered mode is configured for a parameter set, the state machine keeps monitoring this register bit and waits as long as the value is zero. The main processor software can set this register bit, so that the state machine gets triggered and starts the accelerator operations for that parameter set.
FW2HWA_TRIG_1.fw2hwa_trigger_1	1	No	Software trigger bit: This register bit is similar to FW2HWA_TRIGGER_0, except that this register bit corresponds to TRIGMODE = 111b.
DMA2HWA_TRIG.dma2hwa_trigger	32	No	DMA trigger register: This register is relevant whenever DMA triggered mode is used (for example, TRIGMODE = 011b). Whenever a DMA channel has finished copying input samples into the local memory of the accelerator and wants to trigger the accelerator, the procedure to follow is to use a second linked DMA channel to write a 32-bit one-hot signature into this register to trigger the accelerator. In DMA triggered mode, the state machine keeps monitoring this 32-bit register and waits as long as a specific bit (see DMA2HWA_TRIGSRC) in this register is zero. The second linked DMA channel writes a one-hot signature that sets the specific bit, so that the state machine gets triggered and starts the accelerator operations for that parameter set.
DMA2HWA_TRIGSRC	5	Yes	DMA channel select for DMA completion trigger: This parameter-set register is relevant whenever DMA triggered mode is used (for example, TRIGMODE = 011b). This register selects the bit number in DMA2HWA_TRIGGER for the state machine to monitor to trigger the operation for that parameter set.
CPU_INTR1_EN	1	Yes	Completion interrupt to main processor: This parameter-set register is used to enable/disable interrupt to the main processor upon completion of the accelerator operation for that parameter set. If enabled, the main processor receives an interrupt from the Radar Hardware Accelerator at the end of operations for that parameter set, so that the main processor can take any necessary action. Two interrupts are available, and this register bit enables or disables the first interrupt.
CPU_INTR2_EN	1	Yes	Completion interrupt to main processor: Similar to CPU_INTR1_EN. This register bit enables or disables the second interrupt to the main processor.
PARAM_DONE_SET_STATUS_0 . param_done_set_status_0 PARAM_DONE_SET_STATUS_1. param_done_set_status_1	32	No	Parameter-set done status: These read-only status registers can be used by the main processor to see which parameter sets are complete that led to the interrupt to the main processor. The individual bits in these 32-bit status register indicate which of the 64 parameter sets have completed. These status bits are not automatically cleared, but they can be individually cleared by writing to another set of 32-bit registers (PARAM_DONE_STATUS_CLR)

**Table 24-1. State Machine Registers (continued)**

Register.Field	Width	Parameter Set	Description
PARAM_DONE_STATUS_CLR_0 PARAM_DONE_STATUS_CLR_1	32	No	Refer register description for PARAM_DONE_SET_STATUS
DMATRIG_EN	1	Yes	Completion trigger to DMA: This parameter-set register is used to enable DMA channel trigger upon completion of the accelerator operation for that parameter set. This trigger mechanism enables the accelerator to hand-shake with the DMA so that output data samples are copied out of the accelerator local memory. If enabled, the accelerator triggers a specified DMA channel, so that the output samples can be shipped from the local memory to Radar data memory.
HWA2DMA_TRIGDST	5	Yes	DMA channel select for accelerator completion trigger: This parameter-set register is used to select which of the 32 DMA channels allocated to the accelerator should be triggered upon completion of the accelerator operation for that parameter set. This register is to be used in conjunction with DMATRIG_EN.
FW2DMA_TRIGGER.fw2dma_trigger	32	No	Trigger from processor to DMA: This register can be used by the processor to trigger a DMA channel for the first time, so that a full sequence of repeated operations between the DMA and the accelerator gets kick-started.
PARAMADDR.paramaddr	6	No	Debug register for current parameter-set index: This read-only status register indicates the index of the current parameter set that is under execution. This is useful for debug, where parameter sets can be executed in single-step manner (one-by-one) using SW trigger mode for each of them. In such a debug, this register indicates which parameter set is currently waiting for the SW trigger.
LOOP_CNT.loop_cnt	12	No	Debug register for current loop count: This read-only status register indicates what is the loop count that is presently running. When the state machine is programmed for NUMLOOPS loops, this register shows the current loop count that is running.
TRIGGER_SET_STATUS_0. Trigger_set_status_0	32	No	Debug register for trigger status: This is a read-only status register, which indicates the trigger status of the accelerator, for example, whether a DMA trigger was ever received (refer TRIGMODE). The 32 bits in this register correspond to the 32 DMA trigger bits (refer DMA2HWA_TRIGGER).
TRIGGER_SET_STATUS_1. Trigger_set_status_1	32	No	Debug register for trigger status: This is a read-only status register, which indicates the trigger status of the accelerator, for example, whether software trigger-1 or trigger-2 has even been received.
TRIGGER_SET_IN_CLR_0. Trigger_set_in_clr_0	1	No	Clear trigger status read-only register: This register-bit when set clears the trigger status register TRIGGER_SET_STATUS_0 described above.
TRIGGER_SET_IN_CLR_1 Trigger_set_in_clr_1	1	No	Clear trigger status read-only register: This register-bit when set clears the trigger status register TRIGGER_SET_STATUS_1 described above.

Note that HWA 1.5 does not support context switching unlike HWA 2.0/2.1

The next two sections cover the Input Formatter and Output Formatter blocks, including their detailed operation, registers and usage procedure.

### 24.1.3 Accelerator Engine – Input Formatter

This section describes the input formatter block present in the accelerator engine (see Figure 24-5).

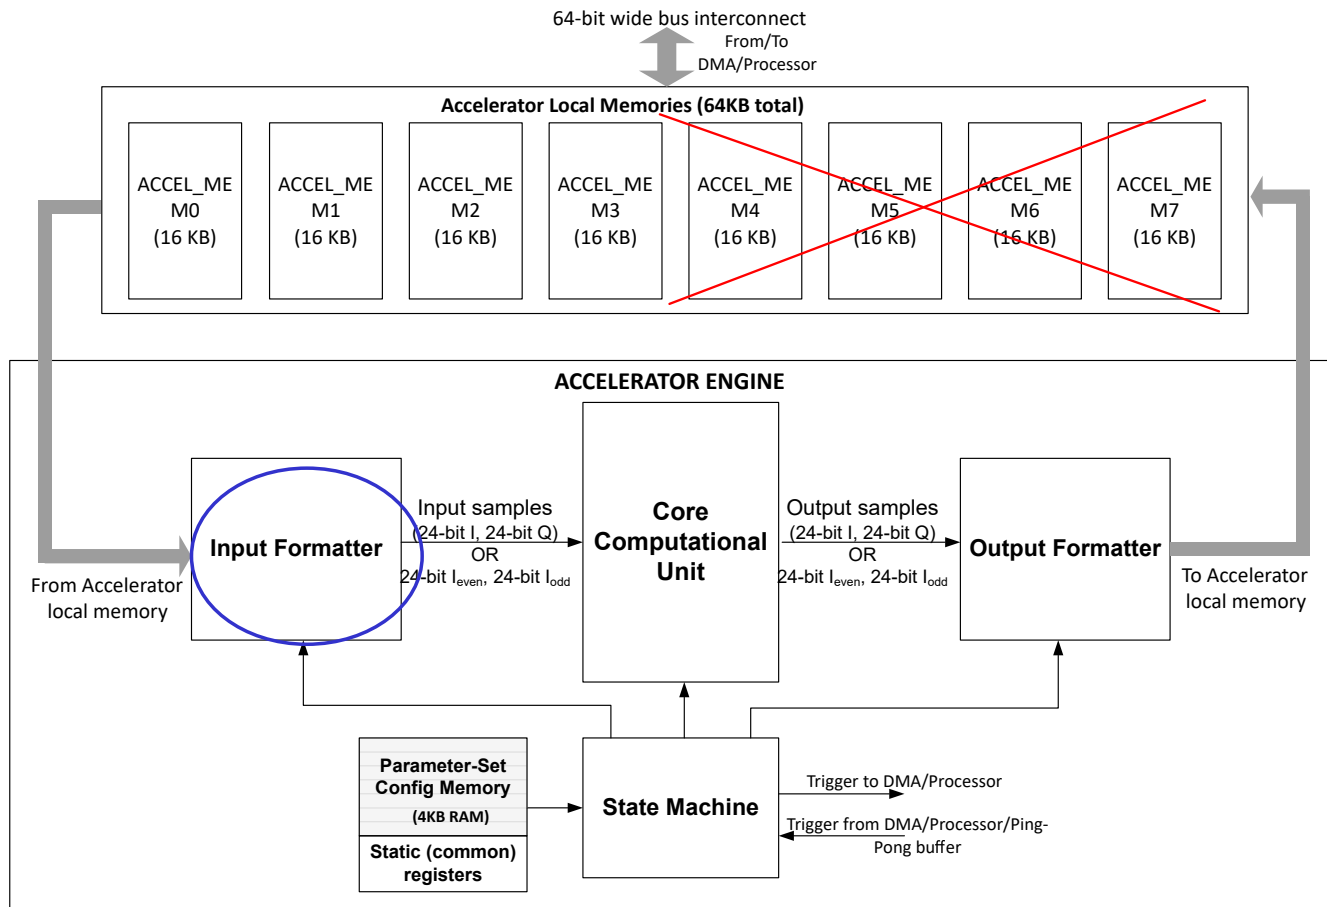

Figure 24-5. Input Formatter

#### 24.1.3.1 Input Formatter

The input formatter is used to access, format, and feed the data from the local memories of the accelerator as 24-bit I and 24-bit Q samples into the core computational unit. The input formatter provides various capabilities to access and format the samples from the local memories – especially, various multidimensional access patterns (for example transpose access), 16-bit or 32-bit aligned word access, scaling using bit-shifts to generate 24-bit wide samples from 16-bit or 32-bit words, real versus complex input, sign extension, conjugation, and more.

##### 24.1.3.1.1 Input Formatter – Operation

The input formatter block is responsible for reading the input samples from the accelerator local memory and feeding them into the core computational unit (see Figure 24-5). The data flow from the input formatter, through the core computational unit, to the output formatter is designed to sustain a steady-state throughput of one complex sample per clock cycle or two real samples per clock cycle. The input formatter thus feeds one sample (24-bit I and 24-bit Q OR 24-bit  $I_{\text{even}}$  and 24-bit  $I_{\text{odd}}$ ) into the core computational unit every clock cycle.

To make the best use of the capabilities of the core computational unit and to allow meaningful chaining of radar signal processing operations with minimal intervention from the processor, the input formatter supports flexibility in how the input samples are accessed from the memory and how they are formatted and fed into the core computational unit.

The memory from which the input formatter picks up the data is referred to as *source memory*. Note that any of the four accelerator local memories can be the source memory. However, as will be described in a subsequent section, there is an important restriction which explains that the source memory cannot be the same as the destination memory (which is the memory to which the output formatter writes the output data).

#### 24.1.3.1.2 Input Formatter – 2D Indexed Addressing for Source Memory Access

The parameter-set register SRCADDR specifies the start address at which the input samples must be accessed. This register is a byte-address, and a value of 0x00000 corresponds to the first memory location of ACCEL\_MEM0 memory. The SRCADDR register maps to the entire 64KB address space of the four accelerator local memories (4x16KB). Note that the SRCADDR register is a 16-bit register in HWA 1.5, maps to lower 16-bits of 20-bit register in HWA 2.1 maintaining backward compatibility

The input data can be read from the memory as either 16-bit wide samples or 32-bit wide samples. Also, they can be read as real samples or complex samples. These two aspects are configured using register bits SRC16b32b and SRCREAL. See [Table 24-2](#) for a description of these and other registers pertaining to the input formatter block. As an example, if SRC16b32b = 0 and SRCREAL = 0, then the input samples are read from the memory as 16-bit complex samples (16-bit I and 16-bit Q), shown in [Figure 24-6](#). In HWA 1.5, additionally a 2X real input mode is also supported. If 2XMODE = 1 (this register is part of Compute Engine described in Part 2) and SRCREAL = 0, then two consecutive real samples (i.e. odd and even indexed) are fetched simultaneously and streamed in as a pseudo-complex stream. Since the data-path is complex, this packing allows for 2X increase in input rate for real signals. The subsequent compute engine is also adapted to produce 2X real output samples. Note that 2XMODE = 1 and SRCREAL = 1 is invalid configuration. However, SRCREAL = 1 with 2XMODE = 0 is same as legacy 16b input mode of HWA 2.0/2.1. Note that 2X real mode works only with non-interleaved RX ADC data configuration.

Another important feature of the input formatter block is that it supports flexible access pattern to fetch data from the source memory, which makes it convenient when the data corresponding to multiple RX channels are interleaved or when performing multi-dimensional (FFT) processing. This feature is facilitated through the SRCAINDX, SRCACNT, SRCBINDX, and BCNT registers, which are part of each parameter-set configuration.

The register SRCAINDX specifies how many bytes separate successive samples to be fetched from the source memory and the register SRCACNT specifies how many samples need to be fetched per *iteration*. An *iteration* is typically one computational routine, such as one FFT operation. It is possible to perform multiple iterations back-to-back – for example, four FFT operations corresponding to four RX channels. The register SRCBINDX specifies how many bytes separate the start of input samples for successive iterations and BCNT specifies how many iterations to perform back-to-back. These registers can be better understood using the example given in [Figure 24-6](#).

**Figure 24-6. Input Formatter Source Memory Access Pattern (Example)**

In the example shown in [Figure 24-6](#), the input data consists of complex data (16-bit I and 16-bit Q) or pseudo-complex data (16-bit  $I_{\text{even}}$  and 16-bit  $I_{\text{odd}}$ ) that is contiguously present in ACCEL\_MEM0. The data in memory consists of four sets of 128 complex samples each or four sets of 256 real samples (say, corresponding to four RX antennas) and these are shown in four different colors. Because each sample occupies 4 bytes and the samples are contiguously placed in the memory starting at the beginning of ACCEL\_MEM0, values of SRCADDR = 0 and SRCAINDX = 4 are used to fetch these samples.

In each clock cycle, the input formatter fetches one composite sample (I,Q or 2I) from the memory and feeds it into the core computational unit (with appropriate scaling, as described later). Because there are 128 composite samples to be fed for the first iteration (computational routine), a value of SRCACNT = 127 is used. For the second iteration, the samples are fetched starting from a memory location that is SRCBINDX (=128 × 4 = 512) bytes away from SRCADDR.

This process repeats for the programmed number of iterations as per the BCNT register. For example, the value of BCNT = 3 used in this example corresponds to four iterations. Note that the registers shown here are part of parameter-set configuration registers and the four iterations described here can be performed using a single parameter set. Thus, A-dimension is used to run through samples of a given vector, and B-dimension is used to repeat (iterate) the same operation for multiple vectors. Unlike 2.0/2.1 there is no support for a third (C) dimension

An important restriction for complex data, in programming the registers related to source memory access pattern is that the input formatter can only read complex-data from one memory row (128-bit memory location) in a clock cycle. Therefore, if a sample is placed in memory such that the real-part (I value) is at the end of one memory location and the imaginary part (Q value) is at the beginning of the next memory location, then that would be an invalid configuration (see [Figure 24-7](#)). Further, although the accelerator supports byte-addresses, only even values are allowed for SRCADDR, SRCAINDX and SRCBINDX. In 2X Real mode, it is assumed that the pseudo-complex number has two valid real samples in one row.

**Figure 24-7. Invalid Configuration Example**

#### 24.1.3.1.3 Input Formatter – Circular and Shuffled Addressing

The input formatter additionally supports circular addressing in only the A dimension. For the A dimension, the register, `SRCA_CIRCSHIFT` controls the initial offset, while the register, `SRCA_CIRCSHIFTWRAP` defines at which the wrap-around happens.

For example, if `SRCA_CIRCSHIFT` is programmed as 7, then the input formatter skips sample indices 0 to 6 and reads samples from the source memory starting directly from index 7 (i.e., the 8<sup>th</sup> sample). Then, for wrap-around, if `SRCA_CIRCSHIFTWRAP` is programmed with a non-zero value, the sample index wraps around (i.e., resets to 0) at  $2^{\text{SRCA\_CIRCSHIFTWRAP}}$ . Continuing the previous example, if `SRCA_CIRCSHIFT` = 7, `SRCA_CIRCSHIFTWRAP` = 9, then the sample indices will be in the following order: 7, 8, 9, 10, 11, ..., 510, 511, 0, 1, 2, 3, 4, 5, 6. In HWA 1.5 there is no support for circular shifting/wrap-around in B-dimension and neither any shuffled LUT based address sequencing in A-dimension

#### 24.1.3.1.4 Input Formatter – Scaling and Formatting

The input formatter allows the input samples read from the source memory to be scaled and formatted before feeding them as 24-bit complex samples into the core computational unit.

Even though the data read from the source memory is initially 16-bits or 32-bits wide (for each  $I_{\text{odd}}$  and  $I_{\text{even}}$ ), the samples expected by the core computational unit are 24-bit complex samples (24-bits each for  $I$  and  $Q$  and 24-bits for each  $I_{\text{odd}}$  and  $I_{\text{even}}$ ). There is a `SRCSICAL` register which provides scaling options using bit-shift to generate 24-bit samples from the original 16- or 32-bit data (see [Figure 24-8](#)).

For the 16-bit case, the 24-bit sample is generated by padding (8-`SRCSICAL`) zeros at the LSB and `SRCSICAL` redundant MSBs. For the 32-bit case, the 24-bit sample is generated by dropping `SRCSICAL` bits at the LSB and clipping (8-`SRCSICAL`) bits at the MSB. Note that the register bit `SRCSIGNED` is used to indicate whether the input samples are signed or unsigned. When this register bit is set, the input samples are treated as signed numbers and hence any extra MSB bits are sign-extended and any clipping of MSB bits takes care of signed saturation. In most cases of interest in part one of this user guide (for example, when performing FFT operation), the input samples would be signed and hence `SRCSIGNED` should be set (i.e., equal to 1).

**Figure 24-8. Input Formatter Data Scaling**

When the input samples are complex (`SRCREAL` = 0) and `2XMODE` = 0, there is a provision to conjugate the input samples. Setting the register bit `SRCCONJ` conjugates the input samples before feeding them to the core computational unit. This feature (together with a corresponding `DSTCONJ` register bit in the output formatter block) enables an IFFT mode from the FFT engine. Note that conjugating the input and output of an FFT block is equivalent to an IFFT function.

There is also provision for swapping  $I$  and  $Q$  samples read from memory. This can be controlled using `SRCIQSWAP` register bit. If `SRCIQSWAP` = 0, then the  $I$  sample is located at the LSB bits, and the  $Q$  sample is located at the MSB bits.

### 24.1.3.1.5 Input Formatter – Register Descriptions

Table 24-2 lists all the registers of the input formatter block.

**Table 24-2. Input Formatter Registers**

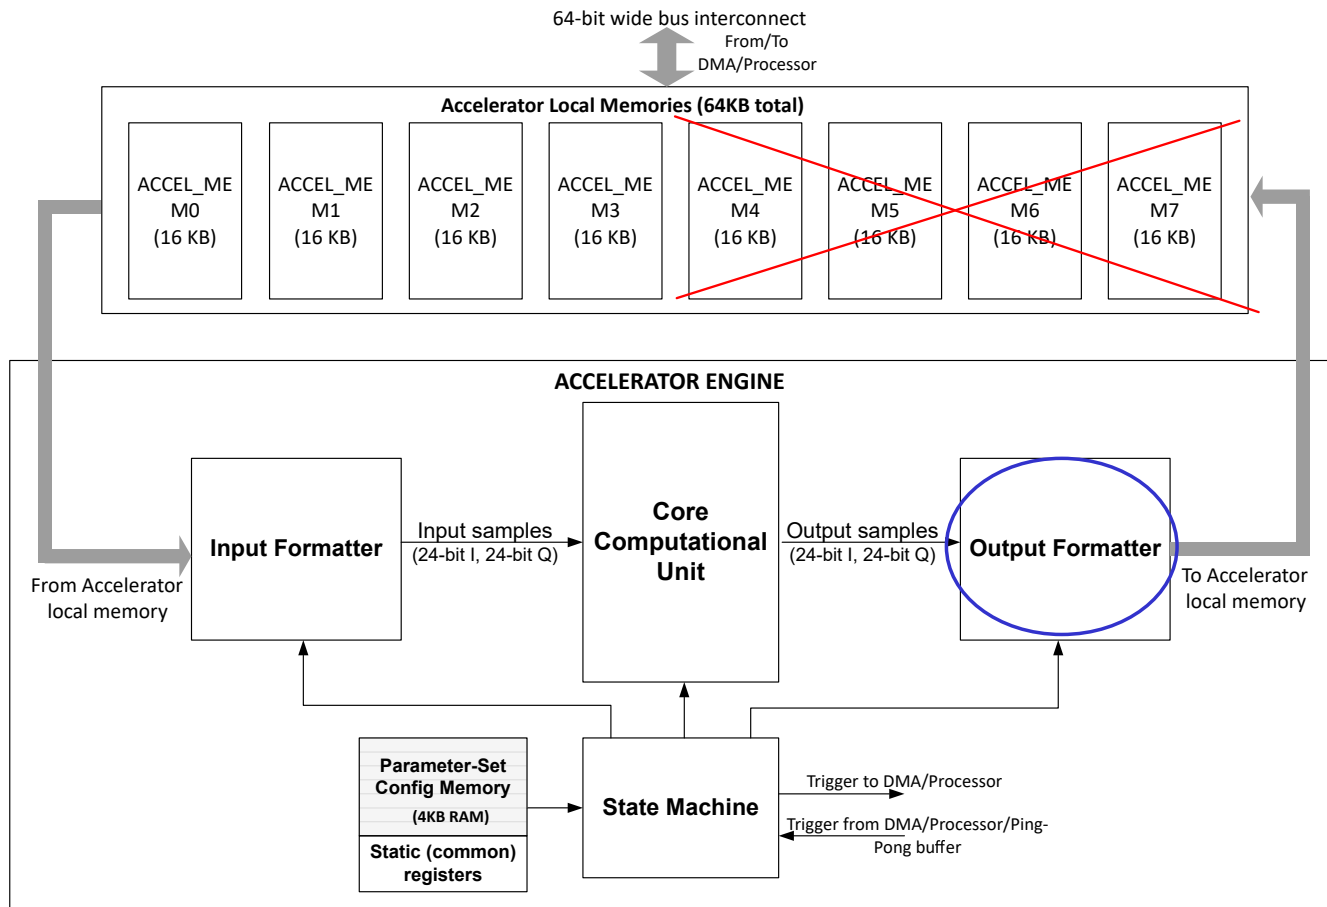

Register	Width	Parameter Set	Description
SRCADDR	16	Yes	Source start address: This register specifies the starting address of the input samples, for example, it specifies the source memory start address from which input samples have to be fetched by the input formatter. This is a byte-address but only even values are valid. This register covers the entire address space of the four local memories ( $4 \times 16\text{KB} = 128\text{KB}$ ). The four accelerator local memories are contiguous in the memory address space and any of them can act as the source memory (as long as the same memory bank is not configured to be used as destination memory at the same time).
SRCACNT	12	Yes	Source sample count: This register specifies the number of samples (minus 1) from the source memory to process for every iteration. The sample count is in number of samples, not number of bytes. For example, the sample count can be specified as 255 (SRCACNT = 0x0FF) in a case where a 256-point complex FFT is required to be performed. For a 256-point real Note however that the sample count register does not always match the FFT size. This can happen when zero-padding of input samples is required. For example, a sample count of 192 could be used with an FFT size of 256, in which case, the input formatter will automatically append 64 zeros.
SRCAINDX	16	Yes	Source sample index increment: This register specifies the number of bytes separating successive samples in the source memory. For example, a value of SRCAINDX = 16 means that successive samples are separated by 16 bytes in memory. Only even values are allowed for this register. The maximum value allowed for this register is 65534.
BCNT	12	Yes	Number of iterations: This register specifies the number of times (minus 1) the processing should be repeated. This register can be used to process the four RX chains back-to-back – for example, a value of BCNT = 3 means that the processing (say first dimension FFT processing) is repeated four times. Note the distinction between the NUMLOOPS register of the state machine block and the BCNT register of the input formatter block. The NUMLOOPS register specifies how many times the state machine loops through all the configured parameter sets (with each time possibly awaiting a trigger), whereas the register BCNT specifies how many times the input formatter and the computational processing of the accelerator is iterated back-to-back for the current parameter set (without any intermediate triggers). Non-zero BCNT should be used only with non-zero ACNT.
SRCBINDX	16	Yes	Source offset per iteration: This register specifies the number of bytes separating the starting address of input samples for successive iterations. For example, when using four iterations to process the four RX chains, this register can be used to specify the offset in the starting address between the successive RX chains. Note the distinction that SRCAINDX specifies the number of bytes separating successive samples for a particular iteration, whereas SRCBINDX specifies the number of bytes separating the starting address of the first sample for successive iterations. Only even values are allowed for this register. The maximum value allowed for this register is 65534.
SRCREAL	1	Yes	Complex or Real Input: This register-bit specifies whether the input samples are real or complex. A value of SRCREAL = 0 implies complex input and a value of SRCREAL = 1 implies real input. When real input is selected, the input formatter block automatically feeds zero for the imaginary part into the core computational unit.
SRCA_CIRCSHIFT	12	Yes	Start index for circular shift in A-dimension. Input Formatter reads samples from the source memory with this start offset to the sample index.

**Table 24-2. Input Formatter Registers (continued)**

Register	Width	Parameter Set	Description
SRCA_CIRCSHIFTWRAP	4	Yes	Circular shift wrap-around point for A-dimension: This register, when set to a non-zero value, specifies the wrap-around point for A-dimension sample counter. If SRC_CIRCSHIFTWRAP3X (A-dimension bit) is set to 0, the A-dimension sample index counter wraps around (i.e., resets to 0) when the counter exceeds $(2^{\text{SRCA\_CIRCSHIFTWRAP}}-1)$ . When that bit is 1, the A-dimension sample index counter wraps around when the counter exceeds $(3 \times 2^{\text{SRCA\_CIRCSHIFTWRAP}}-1)$ .
SRC_CIRCSHIFTWRAP3X	1	Yes	3X enable for circular shift wrap-around: This register is used in conjunction with SRCA_CIRCSHIFTWRAP to specify the wrap-around point when circular shift is used. Refer description of SRCA_CIRCSHIFTWRAP for details.
SRC16b32b	1	Yes	16-bit or 32-bit input word alignment: This register-bit specifies whether the input samples fetched from source memory are to be read as 16-bits or 32-bits wide. A value of SRC16b32b = 0 implies that the input samples are 16-bits wide each (in case of complex input, real and imaginary parts are each 16 bits wide). A value of SRC16b32b = 1 implies that the input samples are 32-bits wide each.
SRCSIGNED	1	Yes	Input sign-extension mode: This register-bit, when set, specifies that the input samples are signed numbers and hence, sign-extension or signed-saturation at the MSB is required when converting 16-bit or 32-bit input words to the 24-bit wide samples to be fed into the core computational unit.
SRCCONJ	1	Yes	Input conjugation: This register-bit specifies whether the input samples should be conjugated before feeding them into the core computational unit. If SRCCONJ is set, then the input samples are conjugated. Setting this register-bit only makes sense if the samples are complex numbers (for example, SRCREAL = 0). This register, together with its counterpart in the output formatter block, enable an IFFT mode for the FFT engine. Note that conjugating the input and output of an FFT block is equivalent to an IFFT function.
SRCSCAL	4	Yes	Input scaling: This register specifies a programmable scaling using bit-shift, when converting the 16-bit or 32-bit wide input data to 24-bit wide samples before feeding into the core computational unit. See Figure 8 and its description for more details regarding this register.
SRCIQSWAP	1	Yes	Swap the I & Q samples drawn from memory. LSB bits drawn from memory is used as I, and the MSB bits are used as Q of input
IP_OP_FORMATTER_CLIP_STAT US. ip_formatter_clip_status	1	No	Read-only register that indicates clip status for input formatter (during scaling).
CLR_CLIP_MISC.clr_clip_status	1	No	Below clip status read-registers will be cleared upon writing to this self-clearing register bit: channel_comb_clip_status, dc_acc_clip_status, dc_est_clip_status, intf_stats_mag_accumulator_clip_status, intf_stats_magdiff_accumulator_clip_status, intf_stats_thresh_mag_clip_status, intf_stats_thresh_magdiff_clip_status, twid_incr_delta_frac_clip_status, ip_formatter_clip_status, op_formatter_clip_status

## 24.1.4 Accelerator Engine – Output Formatter

This section describes the output formatter block present in the accelerator engine (see Figure 24-9).

**Figure 24-9. Output Formatter**

### 24.1.4.1 Output Formatter

The output formatter is used to format and write the data coming out of the core computational unit into the accelerator local memory. Similar to the input formatter block discussed in the previous section, the output formatter block also provides various capabilities to format and write the samples written to the local memory – especially, various two-dimensional access patterns (for example, transpose writes), 16-bit or 32-bit aligned word writes, scaling using bit-shifts to generate 16-bit or 32-bit words from 24-bit wide samples, real versus complex output write, and more.

#### 24.1.4.1.1 Output Formatter – Operation

The output formatter block is responsible for storing the samples coming out of the core computation unit into the accelerator local memory (see Figure 24-9). As mentioned in the previous section, the data flow from the input formatter, through the core computational unit, to the output formatter, is designed to sustain a steady-state throughput of one complex sample per clock cycle. Thus, typically, the output formatter accepts one sample (24-bit I and 24-bit Q) from the core computational unit every clock cycle and writes it to the accelerator local memory. Just like the input formatter, the output formatter also supports lot of flexibility in how the samples are formatted and written into the memory.

The memory into which the output formatter writes the data is referred to as destination memory. Note that any of the four accelerator local memories can be the destination memory, with the important restriction that the source memory cannot be same as the destination memory. In other words, each of the four 16KB memory

banks can either function as source memory, or as destination memory at any time (for example, in any given parameter set).

#### **24.1.4.1.2 Output Formatter – 2-D Indexed Addressing for Destination Memory Access**

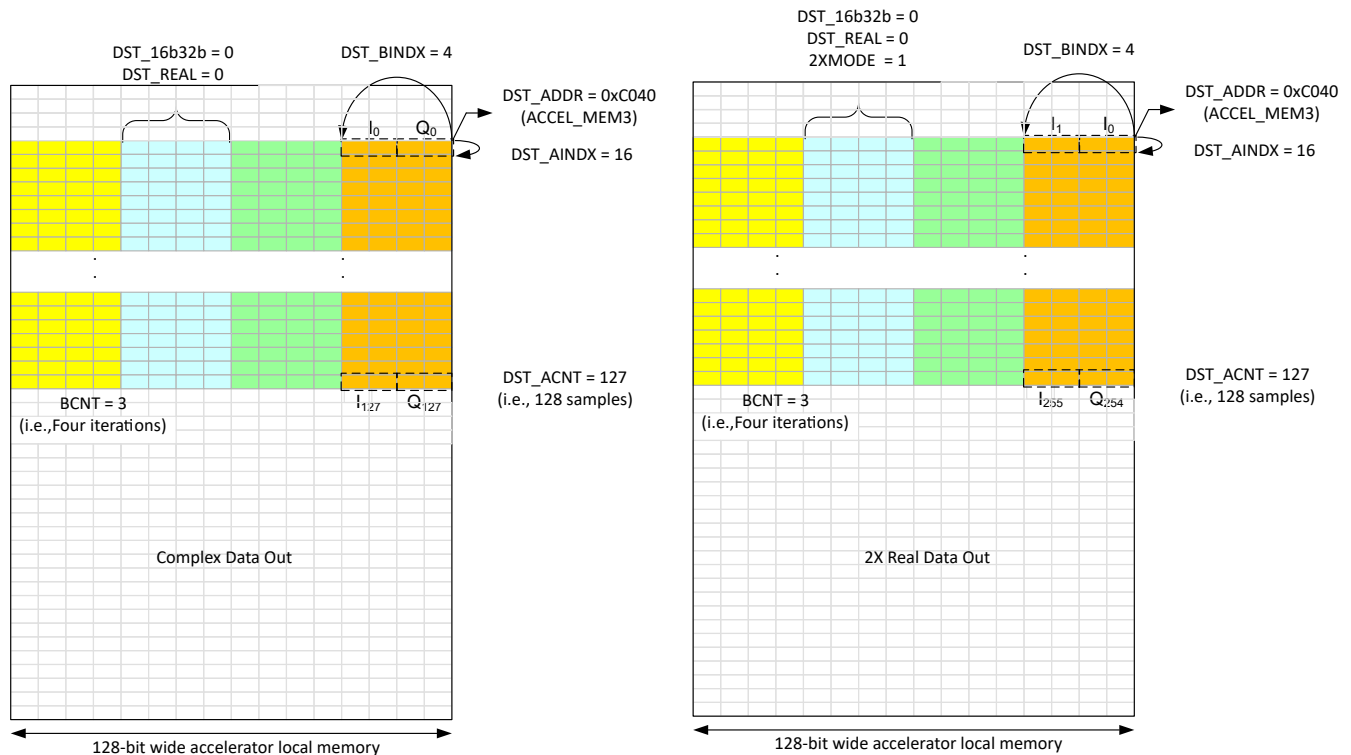

The parameter-set register DSTADDR specifies the start address at which the output samples must be written into the accelerator local memory. Similar to the SRCADDR register of the input formatter, the DSTADDR register of the output formatter is a byte-address and a value of 0x0 corresponds to the first memory location of ACCEL\_MEM0 memory. The DSTADDR register maps to the entire 64KB address space of the four accelerator local memories (each 16KB). As mentioned in the previous paragraph, in a given parameter set, SRCADDR and DSTADDR cannot be configured such that the input samples being fetched and the output samples being written out are accessing the same memory bank.

Even though the core computational unit produces a 24-bit complex output stream, this output data can be written to the memory as either 16-bit wide samples or 32-bit wide samples. Also, they can be written out as complex samples or real samples. These two aspects are configured using register bits DST16b32b and DSTREAL. See [Table 24-3](#) for a description of these and other registers pertaining to the output formatter block. As an example, if DST16b32b = 0 and DSTREAL = 0, then the output samples are written to the memory as 16-bit complex samples (16-bit I and 16-bit Q) or pseudo-complex samples (16-bit I<sub>odd</sub> and 16-bit I<sub>even</sub>) with 2XMODE = 1, shown in [Figure 24-10](#).

Similar to the input formatter block, the output formatter block also supports flexible patterns to write multidimensional data to the destination memory and this makes it convenient when the data corresponding to multiple RX channels must be interleaved, or when performing multidimensional (FFT) processing. This feature is facilitated through the DSTAINDX, DSTACNT, DSTBINDX, and BCNT registers, which are part of each parameter-set configuration.

The register DSTAINDX specifies how many bytes separate successive samples to be written to the destination memory and the register DSTACNT specifies how many samples must be written per iteration. Note that DSTACNT can be different from SRCACNT – this is useful when only a subset of the output samples need to be stored in the output memory (for example, if some FFT output bins must be discarded). The register DSTBINDX specifies how many bytes separate the start of output samples for successive iterations and BCNT specifies the number of iterations. The BCNT register is common for input formatter and output formatter. These registers can be better understood using the example given in [Figure 24-10](#).

**Figure 24-10. Output Formatter Destination Memory Access Pattern (Example)**

In the example shown in [Figure 24-10](#), the output data for example consists of complex data (16-bit I and 16-bit Q) that is written to ACCEL\_MEM3. The output data consists of four sets of 128 samples each (say, corresponding to complex FFT output of four RX antennas) and these are shown in four different colors. The output data could also be 2X real data as shown. Each sample occupies 4 bytes and the samples are written to the output memory at a specific start address inside ACCEL\_MEM3, as shown in [Figure 24-10](#). The samples for the four RX antennas are written to the memory in an interleaved manner. Thus, for this example, a value of DSTADDR = 0xC040, DSTAINDX = 16, DSTACNT = 127, and DSTBINDX = 4 are used. The register BCNT (common for input formatter and output formatter) is configured with a value of 3, corresponding to the four iterations required (for the four RX antennas). In steady state, for each clock cycle, the output formatter accepts one complex sample from the core computational unit and writes it into the memory as per the 2-D indexed addressing pattern programmed.

The register DSTACNT, which corresponds to the number of samples written to the destination memory for each iteration does not need to be equal to SRCACNT. This is useful in cases where some of the complex output samples (for example, some FFT bins at the end) can be dropped and do not need to be written into the destination memory. Another register, DST\_SKIP\_INIT is also available, which can be used to skip some samples in the beginning as well. The number of samples written to the destination memory for each iteration is equal to (DSTACNT + 1) - DST\_SKIP\_INIT.

Notethat when performing FFT operations, internally the core computational unit sends out FFT output data in bit-reversed addressing order, but this is automatically handled in the output formatter, such that when the FFT output samples are written into the destination memory, they are written out in the correct normal order. Therefore, no special procedure is required on the part of the main processor to read the FFT output samples in the right sequence.

Similar to the input formatter, the output formatter can write data into only one memory row (128-bit memory location) in a clock cycle. Therefore DSTADDR, DSTAINDX, and DSTBINDX should be programmed such that no sample needs to be partially written in one memory row and the next (e.g. if DST16b32b=1). Also, these address parameters should be restricted to even values.

### 24.1.4.1.3 Output Formatter – Scaling and Formatting

The output formatter allows the 24-bit output samples from the core computational unit to be scaled and formatted before writing them to the destination memory as 16-bit or 32-bit words. There is a DSTSCAL register which provides scaling options using bit-shift, to take the 24-bit samples and convert them to 16-bit or 32-bit data.

For the 16-bit case (Figure 24-11), the 24-bit sample (24-bits for each I and Q) is converted to 16-bit word by dropping DSTSCAL bits at the LSB and by clipping with saturation (8-DSTSCAL) bits at the MSB. For the 32-bit case, the 24-bit sample is padded with DSTSCAL extra bits at the MSB and with (8- DSTSCAL) extra zeros at the LSB. Note that the register bit DSTSIGNED is used to indicate whether the output samples are signed or unsigned. When this register bit is set, the output samples are treated as signed numbers and therefore any extra MSB bits are sign-extended and any clipping of MSB bits handles signed saturation. In most cases of interest in part one of this user's guide (for example, when performing FFT operation), the output samples would be signed and therefore DSTSIGNED should be set (for example, equal to 1). However, if the log-magnitude operation in the core computational unit is enabled, then the output samples are unsigned and therefore DSTSIGNED is cleared (for example, equal to zero).

For 16-bit case, if DST\_SCAL = 3, then 3 bits are dropped at the LSB, and 5 bits are clipped (saturated) at the MSB

For 32-bit case, if DST\_SCAL = 3, then 5 zeros are padded at the LSB, and 3 bits are extended at the MSB

**Figure 24-11. Output Formatter Data Scaling**

When the output samples are complex (for example, DSTREAL = 0), there is a provision to conjugate the output samples. Setting the register bit DSTCONJ conjugates the output samples before writing them to the destination memory. This feature (together with a corresponding SRCCONJ register bit in the input formatter block) enables an IFFT mode from the FFT engine.

In addition, there is provision for swapping I and Q samples written into the destination memory. This is controlled using DSTIQSWAP register bit.

### 24.1.4.1.4 Output Formatter – Register Descriptions

Table 24-3 lists all the registers of the output formatter block.

**Table 24-3. Output Formatter Registers**

Register	Width	Parameter Set	Description
DSTADDR	16	Yes	Destination start address: This register specifies the starting address of the output samples, for example, it specifies the destination memory start address at which the output samples have to be written by the output formatter. This is a byte-address but only even values are valid. This register covers the entire address space of the eight local memories (4 × 16KB = 64 KB). The four accelerator local memories are contiguous in the memory address space and any of them can act as the destination memory (as long as the same memory bank is not configured to be used as source memory at the same time).

**Table 24-3. Output Formatter Registers (continued)**

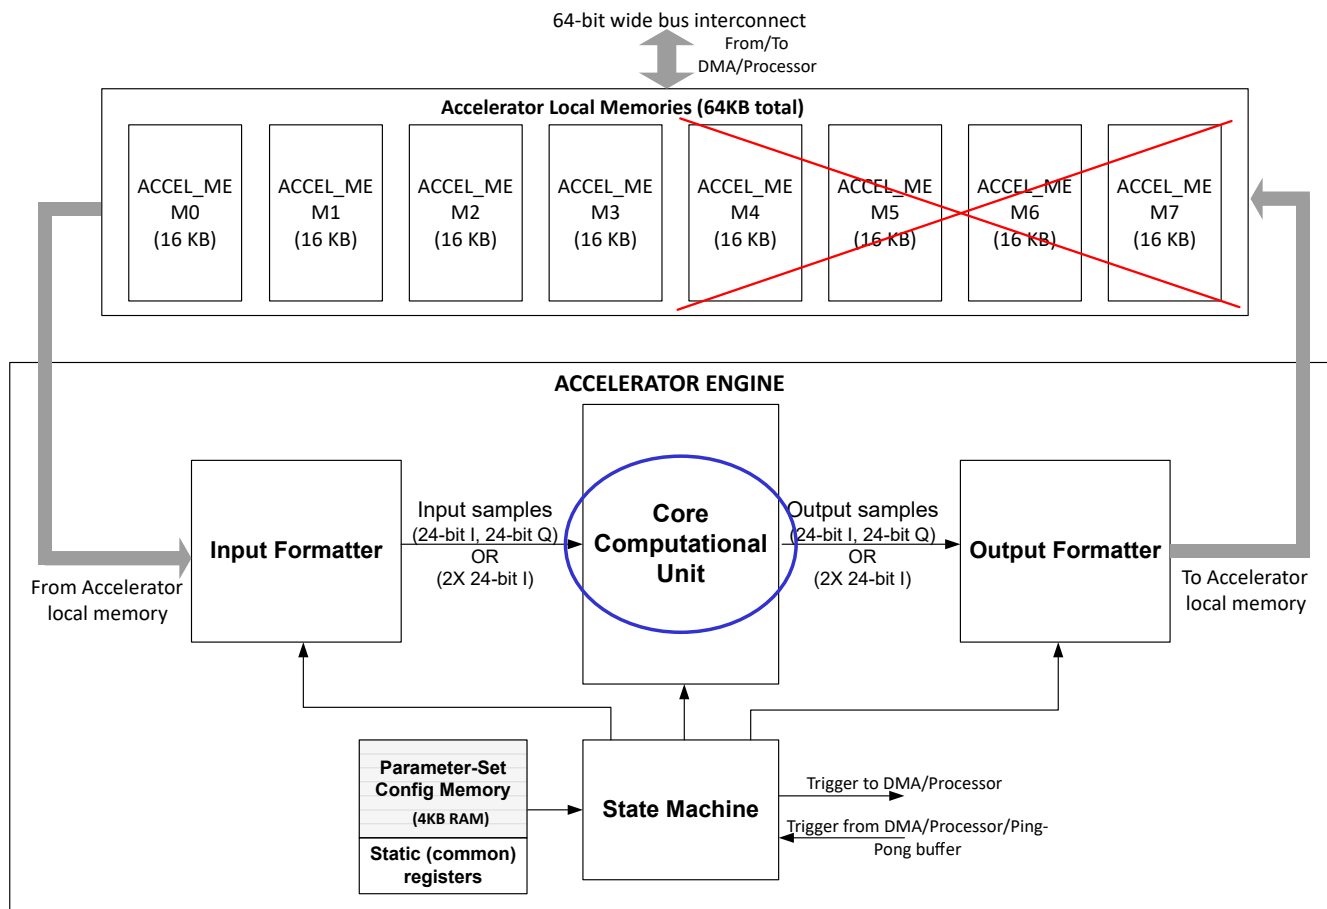

Register	Width	Parameter Set	Description
DSTACNT	12	Yes	Destination sample count: This register specifies the number of samples (minus 1) to be written to the destination memory for every iteration. The sample count is in number of samples, not number of bytes. For example, the sample count can be specified as 191 (DSTACNT = 0x0BF) in a case where 192 samples must be written. Note that the DSTACNT register can be different from SRCACNT or even the FFT size. This is useful when only a part of the FFT bins must be written to memory and the remaining (far-end FFT bins) can be discarded. This register description is true when the DST_SKIP_INIT register value is zero (see further for more information related to DST_SKIP_INIT).
DSTAINDX	16	Yes	Destination sample index increment: This register specifies the number of bytes separating successive samples to be written to the destination memory. For example, a value of DSTAINDX = 16 means that successive samples written to the destination memory should be separated by 16 bytes. Only even values are allowed for this register. The maximum value allowed for this register is 65534.
DSTBINDX	16	Yes	Destination offset per iteration: This register specifies the number of bytes separating the starting address of output samples for successive iterations. For example, when using four iterations to process four RX chains, this register can be used to specify the offset in the starting address between the successive RX chains. Note the distinction that DSTAINDX specifies the number of bytes separating successive samples for a particular iteration, whereas SRCBINDX specifies the number of bytes separating the starting address of the first sample for successive iterations. Only even values are allowed for this register. The maximum value allowed for this register is 65534.
DST_SKIP_INIT	10	Yes	Destination skip sample count: This register specifies how many output samples should be skipped in the beginning, before starting to write to the destination memory. This is useful if only a certain part of the FFT output (skipping the first several bins) need to be stored in memory. The total number of samples written to destination memory is equal to DSTACNT+1-DST_SKIP_INIT.
DSTREAL	1	Yes	Complex or real output: This register-bit specifies whether the output samples are real or complex. A value of DSTREAL = 0 implies complex output and a value of DSTREAL = 1 implies real output. When real output is selected, the output formatter block automatically stores only the real part into the destination memory. This is useful when the core computational unit is configured to output magnitude or log-magnitude values.
DST16b32b	1	Yes	16-bit or 32-bit output word alignment: This register-bit specifies whether the output samples are to be written as 16-bits or 32- bits wide in the destination memory. A value of DST16b32b = 0 implies that the output samples are to be written as 16-bit words (in case of complex output, real and imaginary parts are each 16 bits wide). A value of DST16b32b = 1 implies that the output samples are 32-bits wide each.

**Table 24-3. Output Formatter Registers (continued)**

Register	Width	Parameter Set	Description
DSTSIGNED	1	Yes	Output sign-extension mode: This register-bit, when set, specifies that the output samples are signed numbers and therefore, sign-extension or signed-saturation at the MSB is required when converting the 24-bit wide samples coming from the core computational unit into 16-bit or 32-bit output words to be written to the destination memory.
DSTCONJ	1	Yes	Output conjugation: This register-bit specifies whether the output samples must be conjugated before writing them into the destination memory. If DSTCONJ is set, then the output samples are conjugated. Setting this register-bit only makes sense if the samples are complex numbers (for example, DSTREAL = 0). This register, together with its counterpart in the output formatter block, enables an IFFT mode for the FFT engine.
DSTSCAL	4	Yes	Output scaling: This register specifies a programmable scaling using bit-shift, when converting the 24-bit samples coming from the core computational unit into 16-bit or 32-bit wide words to be written to the destination memory. See Figure 11 and its description for more details regarding this register.
DSTIQSWAP	1	Yes	IQ Swapping : Swap the I & Q samples written out to memory.
IP_OP_FORMATTER_CLIP_STATUS. op_formatter_clip_status	1	No	Read-only register that indicates clip status for output formatter (during scaling).
MEM_INIT_START.MEM_INIT_START_PARAM_RAM	1	No	Writing 1'b1 would start the memory initialization for the Param memory. Self-clearing bit.
MEM_INIT_START.MEM_INIT_START_DMEM3, MEM_INIT_START_DMEM1, .. MEM_INIT_START_DMEM0	1	No	Writing 1'b1 would start the memory initialization for the DMEM3, DMEM2.. DMEM0. Self-clearing bit
DMEM0, DMEM1... DMEM3 (MEM_ACCESS_ERR_STATUS) MEM_ACCESS_ERR_STATUS.dmem0..3	1	No	Memory access error: This set of 4 1-bit read-only registers indicates if there is a memory access error caused by incorrect configuration or usage of the accelerator, where both the DMA and the accelerator are attempting to access the same 16KB memory at the same time. The composite 4-bit register indicates the error status for the 4 16KB memories (DMEM0 bit corresponds to ACCEL_MEM0).

### 24.1.5 Accelerator Engine – Core Computational Unit

This section describes the core computational unit present in the accelerator engine (see Figure 24-12).

**Figure 24-12. Core Computational Unit**

#### 24.1.5.1 Core Computational Unit

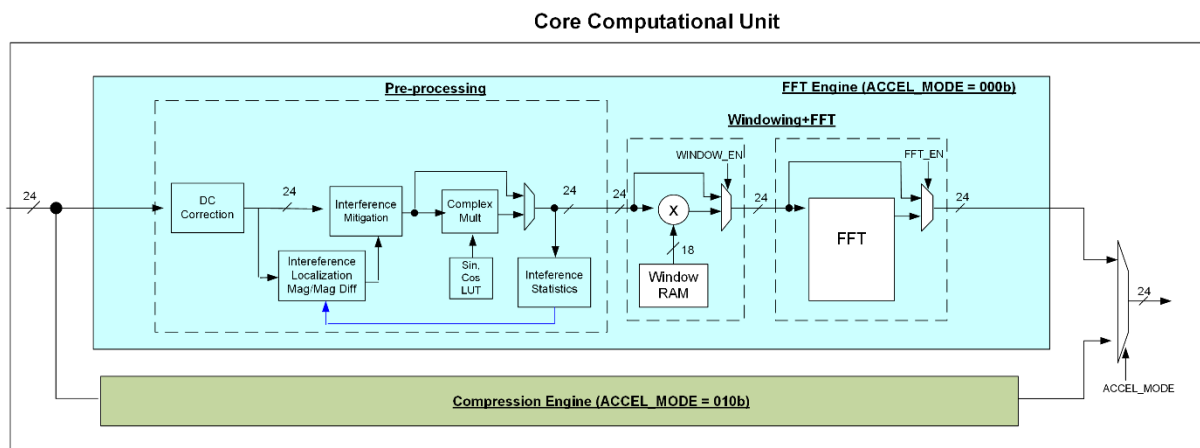

The core computational unit performs the mathematical operations required for the key functions, such as DC & Interference correction, FFT, and compression. The core computational unit accepts a streaming 24-bit complex input (24 bits for each I and Q) from the input formatter block and it outputs a streaming 24-bit complex output (24 bits for each I and Q) to the output formatter block. 24-bit complex input could also be packed with two real inputs improving the throughput.

Figure 24-12 shows the block diagram of the core computational unit. The core computational unit has two main computation engines, namely:

- FFT Engine: Performs Pre-processing, Windowing, FFT.
- Compression Engine: Used for compression and decompression of radar data.

Only one of these two engines can be operational at any given instant. However, in separate parameter sets, different engines can be configured and used, so that multiple parameter sets executing one after another can accomplish a sequence of computational operations as desired.

The register ACCEL\_MODE controls which engine gets used in a given parameter set.

**Figure 24-13. Core Computational Unit Block Diagram of HWA 1.5**

For the purpose of part one of the user's guide, only the FFT Engine path is described. Specifically, the windowing & FFT, covered in this document. The greyed-out blocks in Figure 24-13, namely the Pre-processing is covered in part two of the user's guide and can be ignored for the present purpose. Compression is covered in part three.

#### 24.1.5.1.1 Core Computational Unit – FFT Engine – Operation

The core computational unit operates on the streaming input of samples coming from the input formatter block, and in general outputs a stream of samples (after an initial latency in some cases) to the output formatter block. In general, at steady-state, one complex input sample is processed and one complex output sample is produced every clock. The complex input can be configured to pack two real samples forming a pseudo-complex samples with register 2XMODE = 1.

The FFT Engine in the core computational unit has the ability to perform pre-processing, windowing and FFT. Each of these computational subblocks operate on a streaming input and produce a streaming output at the throughput of one complex or pseudo-complex sample per clock. These computational subblocks are stitched together one after the other in a series, as shown in Figure 24-13. This architecture allows multiple operations to be done in a streaming manner (for example, windowing and FFT can be done together), while at the same time, providing the user flexibility to choose one operation at a time.

The parameter-set registers WINDOW\_EN and FFT\_EN control the multiplexers (see Figure 24-13), which decide what operations are performed on the input samples for that parameter set.

Notethat for the purpose of part one of the user's guide, the register ACCEL\_MODE must be kept at zero. The purpose of this register is covered in part two.

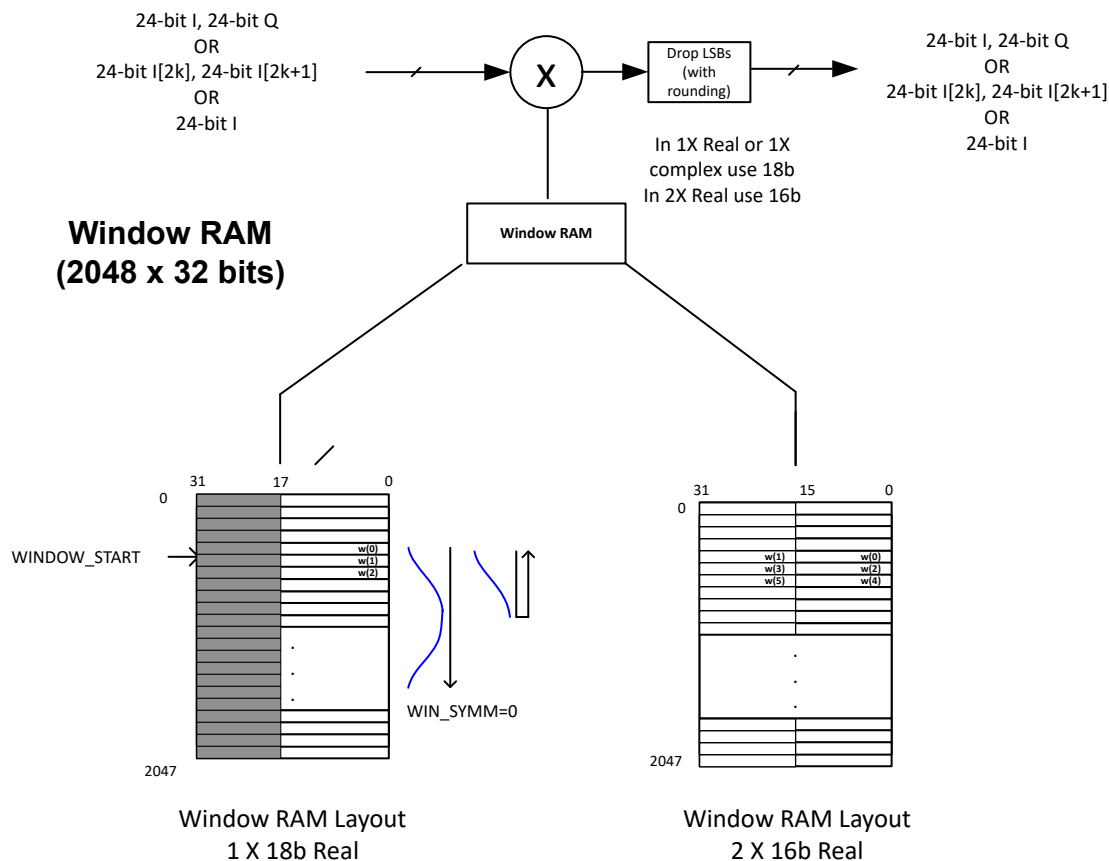

#### 24.1.5.1.2 Core Computational Unit – FFT Engine – Windowing

The incoming samples from the input formatter to the core computational unit are passed through the (optional) windowing operation (see Figure 24-15). Windowing operation is often required prior to performing FFT, to mitigate the sinc roll-off leakage from one strong FFT bin to the adjacent bins.

As the incoming samples from the input formatter stream in, each sample is multiplied by the appropriate window coefficient read from a Window RAM. Because the incoming samples are complex 24-bits wide (24-bits for each I and Q or 24-bits for each  $I_{\text{even}}$  and  $I_{\text{odd}}$ ), the windowing operation involves multiplying the 24-bit I and 24-bit Q of the incoming sample with the window coefficient (see Figure 24-14). The output of this multiplication is rounded back to 24-bit I and 24-bit Q by dropping excess LSBs. Note that windowing can be enabled by setting the register bit WINDOW\_EN to 1.

The window RAM can hold up to 2048 32-bit words. The window coefficients can be stored in these words in one of the following three formats:

1. **18-bit real** coefficients: If WINDOW\_MODE = 0b00, the window coefficients are assumed to be 18-bit signed real values. Up to 2048 real coefficients can be stored in the window RAM in this mode (one 32-bit word in the RAM stores one 18-bit coefficient).
2. **16-bit real** coefficients: If WINDOW\_MODE = 0b01 & 2XMODE = 1, the window coefficients are assumed to be 16-bit signed real values. Up to 4096 real coefficients can be stored in the window RAM in this mode (one 32-bit word in the RAM stores two successive 16-bit coefficients: the 16LSBs store coefficients 0, 2, 4, etc. and 16MSBs store coefficients 1, 3, 5, etc.).

**Figure 24-14. Window RAM Layout for 1X 18b Real and 2X 16b Real modes**

The 18b real coefficients mode can be applied with register SRCREAL = 0 or 1, 2XMODE = 0, while the 16b real coefficients mode is meant to be used with SRCREAL = 0 & 2XMODE = 1.

The start location (32-bit word index) in the window RAM is programmed in a 11-bit register WINDOW\_START as part of the parameter set, so that the windowing computation can pick the appropriate window coefficients starting from that index. For each incoming sample, the index keeps incrementing, so that each successive sample is multiplied by the successive window coefficient. At the end of each iteration (for example, when SRCACNT number of samples have been processed), the index resets back to the starting coefficient index programmed for the parameter set, so that the next iteration can be performed. At the end of all the iterations of the current parameter set, the next parameter set can use a different window if desired. For example, when performing second- and third-dimension FFTs one after another (in two parameter sets), the window functions for both these FFTs can be pre-stored in the Window RAM and appropriate start index can be provided for each of the FFT operation dimensions.

If the window function is symmetric, the user may store only one half of the window coefficients in the Window RAM. The register bit WINSYMM, when set, indicates that after SRCACNT / 2 samples (or, if SRCACNT is odd, (SRCACNT + 1) / 2 samples) are processed, the window coefficients read-indexing must be reversed, so that the same set of coefficients used for the first SRCACNT / 2 samples are reused in the reverse order for the next

SRCACNT / 2 samples. (See [Figure 24-15](#)). If SRCACNT is odd, then the last window coefficient is read twice, when the direction is reversed. If SRCACNT is even, then the last window coefficient is only read once, when the direction is reversed.

In special case of 2XMODE = 1, then irrespective of SRCACNT being odd/even, the last real window coefficient is repeated twice. The output of the windowing computation is 24-bit I and 24-bit Q or 24-bit  $I_{\text{even}}$  and 24-bit  $I_{\text{odd}}$ , which is streamed into the FFT subblock.

#### 24.1.5.1.3 Core Computational Unit – FFT Engine – FFT

The FFT subblock performs complex-input FFT on the incoming 24-bit I and 24-bit Q data stream. The complex FFT size is programmable, in the range, 2 to 2048. FFTs of length  $2^N$  for  $N = 0$  to 11, and  $3 \times 2^N$  for  $N = 0$  to 9 are supported. It also seamlessly performs real input FFT on the incoming 24-bit  $I_{\text{odd}}$  and 24-bit  $I_{\text{even}}$  data stream. The real FFT size is programmable, in the range, 4 to 4096. FFTs of length  $2^N$  for  $N = 2$  to 12, and  $3 \times 2^N$  for  $N = 2$  to 10 are supported

The lowest FFT size of 2 is mostly useful as a *complexadd-subtract* feature. This is however not supported with 2XMODE = 1.

The FFT operation can be enabled or disabled by using the register bit FFT\_EN. When enabled, the FFT subblock computes the FFT of the input data stream and produces a 24-bit I and 24-bit Q output stream. This output stream is initially in bit-reversed order, but the output formatter handles appropriately writing the output to the destination memory in the correct order.

The FFT implementation comprises a series of butterfly stages (for complex input streams) followed by an optional complex conjugate symmetric combiner stage for seamless computation of real-input FFT. Depending on the FFT size needed, an appropriate number of butterfly stages are employed.

The FFT size is programmed using the registers, FFTSIZE and FFTSIZE\_3X\_EN. For power-of-2 FFT sizes, the register bit FFTSIZE\_3X\_EN should be kept 0. The FFT size is configured using the register FFTSIZE and the actual FFT size in this case is  $2^{\text{FFTSIZE}}$ . When an FFT size of the form ( $3 \times \text{power-of-2}$ ) is needed, then the register bit FFTSIZE\_3X\_EN should be set to 1. In this case, the actual FFT size is  $3 \times 2^{\text{FFTSIZE}}$ . The 2XMODE = 1 setting performs an effective real FFT as shown in table below.

**Table 24-4. Config Registers**

SRCACNT	FFTSIZE	FFTSIZE_3X_EN	2XMODE	Effective FFT
31	5	0	0	32-pt complex
95	5	1	0	96-pt complex
15	4	0	1	32-pt real
47	4	1	1	96-pt real

When N-point FFTs of real signals are computed using 2XMODE = 1, the FFT engine produces FFT output only for indices . This is because of the conjugate symmetric property of FFT of real valued signals, and for are redundant - does not contain any valuable information.

In the case of real signals, the FFT samples and are purely real and the user is given one of three options to pack or retain these samples using the 2-bit register CONJCOMB\_OUTMODE. When set to 0, output memory value for sample index zero is set to . When set to 1, output memory value for sample index zero is set to . When set to 2, output memory value for sample index zero is set to .

Note that the FFT size must be equal to or larger than SRCACNT, and the input formatter block automatically zero-pads extra samples to account for the difference between FFT size and SRCACNT.

#### 24.1.5.1.4 Core Computational Unit – FFT Engine – FFT – Zero Padding

The FFT engine has provision for *zeropadding*, which is important when performing FFT of a set of samples whose length doesn't match a supported FFT size. The FFT engine automatically feeds the required number

of zeros into the core computational unit, whenever the FFT size (as programmed using the FFTSIZE register, which is described in a later section) does not match the SRCACNT setting.

For example, if the number of input samples read by the input formatter is 56 (for example, SRCACNT = 55) and the FFT length is to be 64 (FFTSIZE = 6, FFTSIZE\_3X\_EN = 0), then the FFT engine feeds 8 zeros at the end of each iteration, before starting to read the input samples for the next iteration from the source memory. This zero-padding provision enables the core computational unit to perform 64-point FFT with the correct set of zero-padded input samples. With same settings and 2XMODE = 1, the FFT engine effectively performs a 128-pt FFT and appends zeros (8 zero-input pairs)

The zero padding is effective only when performing FFT operation in the core computational unit (i.e., when FFT\_EN = 1) and not otherwise.

#### 24.1.5.1.5 Core Computational Unit – FFT Quantization and Speed Performance

As is well known, a butterfly stage typically consists of add-subtract and twiddle multiplication operations. At the output of each add-subtract structure, the bit-width would increase by 1 bit (for example, 24-bit input would grow to 25-bit output). To handle this one-bit growth due to add-subtract operation, there is a provision at the output of each butterfly add-subtract stage to scale the result back to 24 bits, by either dividing the output by 2 (round off one LSB) or by saturating one MSB, shown in [Figure 24-15](#).

The multi-bit register BFLY\_SCALING is used to control this divide-by-2 scaling operation at each stage, so that the user has full flexibility to control the signal level through the different butterfly stages. If BFLY\_SCALING = 0 for a particular stage, then the 25-bit output is saturated at the MSB to get back to 24 bits. Otherwise, it is convergent-rounded at the LSB to get back to 24 bits. The user can thus control the scaling at each of the butterfly stages. The LSB of this multi-bit register corresponds to the last stage and the MSB of this register corresponds to the first stage. For an FFT size of 64, only the LSB 6 bits are relevant. Similarly, for an FFT size of 3\*64, the LSB 6 bits are relevant. Additionally, the register, BFLY\_SCALING\_FFT3X indicates the scaling option for the single radix-3 stage (i.e., it supports removing 0 or 1 or 2 LSBs). The Conjugate Symmetric Combiner stage consists of 2 back-to-back add-subtract operation with a twiddle multiplication operation, and the output bit-width would increase by 2 bits (24-bit input to 26-bit output). For an FFT size of 64 with 2XMODE enabled (used to compute 128-point real FFT), the LSB 6 bits of BFLY\_SCALING is relevant, along with the register CONJCOMB\_SCALING, that indicates the scaling options for the Conjugate Symmetric Combiner stage (i.e., it supports removing 0 or 1 or 2 LSBs).

There is a multi-bit read-only register FFTCLIP which indicates whether there was any clipping in any of the butterfly stages. This register is a sticky register that gets set when a clipping event occurs and remains set until it is cleared using the CLR\_FFTCLIP register bit. See the register description of FFTCLIP in [Table 24-5](#).

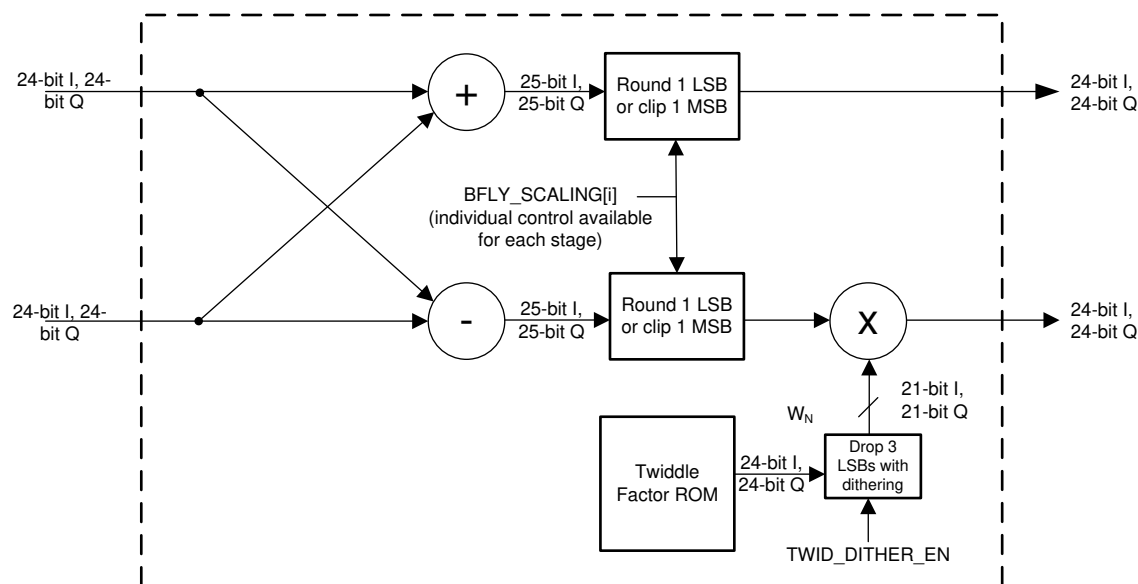

Figure 24-15. Butterfly Stage Fixed-Point

The twiddle factors are stored as 24-bit I and 24-bit Q coefficients. Prior to twiddle factor multiplication, the coefficients are reduced to 21-bit I and 21-bit Q by dropping three LSBs (with optional dithering). The purpose of dithering is to eliminate any repetitive quantization noise patterns from degrading the SFDR of the FFT. The use of dithering here is optional. For dithering, an LFSR is used to generate a random pattern, for which the LFSR seed must be loaded with a non-zero value (see LFSRSEED in the register descriptions).

The SFDR performance of the FFT, with dithering enabled, is better than -140 dBc, as shown in Figure 24-16.

Figure 24-16. FFT SFDR Performance With and Without Dithering

The architecture of the FFT is such that it can take a streaming complex input (one sample per clock) and produce a streaming FFT output (one sample per clock), in steady-state. There is an initial latency of approximately  $FFT\ size$  number of clocks for complex inputs and approximately  $1.25(FFT\ size / 2)$  number of clocks when 2XMODE is enabled for FFT computation of real signals. This latency only comes into picture once for a given parameter set. Within a parameter set, multiple FFT iterations can be performed back-to-back (for example, for four RX) with no additional latency between iterations.

Because the implementation uses 300 MHz in AWR2544 device, a 256-point complex FFT for four RX chains would take  $256 + 256 \times 4$  clock cycles to complete, which corresponds to  $4.27 \mu\text{s}$  (plus a few clocks of implementation latencies, which are not accounted here since it is negligible). In 2XMODE a 256-point real FFT for four RX chains would take , which corresponds to  $2.24 \mu\text{s}$ , is almost twice as fast as that of a complex FFT. [Table 24-5](#) lists the approximate computation time needed for various FFT sizes. It can be noted that when 2XMODE is set to 1, FFTs of real valued signals can be computed at approximately twice the speeds compared to when 2XMODE = 0.

**Table 24-5. Complex and Real FFT Computation Time (for 300MHz clock)**

Example	FFT Size	2XMODE	Numberof Back-to-Back Iterations	Numberof Clock Cycles (Initial latency + Computation)	Total Duration
1	256	0	4	$256 + (256 \times 4)$	$4.27 \mu\text{s}$
2	128	0	4	$128 + (128 \times 4)$	$2.133 \mu\text{s}$
3	8	0	64	$8 + (64 \times 8)$	$1.73 \mu\text{s}$
4	256	1	4	$(128 \times 1.25) + (128 \times 4)$	$2.24 \mu\text{s}$
5	128	1	4	$(64 \times 1.25) + (64 \times 4)$	$1.12 \mu\text{s}$
6	8	1	64	$(4 \times 1.25) + (4 \times 64)$	$0.87 \mu\text{s}$

The output of the FFT is fed to the output formatter.

#### 24.1.5.1.6 Core Computational Unit – FFT Engine – Register Descriptions

[Table 24-6](#) lists all the registers of the FFT Engine within the core computational unit.

**Table 24-6. FFT Engine Registers**

Register	Width	Parameter Set	Description
2XMODE	1	Yes	2X Real input mode: This register-bit conveys whether the input stream is complex or 2X real. The pre-processing chain then interprets the Q-channel of I,Q data-path as additional I channel (even). This bit is only applicable with SRCREAL = 0.
WINDOW_EN	1	Yes	Windowing Enable: This register-bit enables or disables the pre-FFT windowing operation. If this register is set to 1, then the windowing is enabled, otherwise, it is disabled. The exact window function (coefficients) to be applied is specified in a dedicated Window RAM, which is $2048 \times 32$ bits in size.
FFT_EN	1	Yes	FFT Enable: This register-bit is used to enable the FFT computation. If FFT_EN = 1, then the FFT computation is enabled. Otherwise, it is disabled (bypassed).
WINDOW_START	11	Yes	Windowing coefficients start location in Window RAM: This register specifies the starting location (32-bit word index) of the window coefficients within the Window RAM. The purpose of this register is to allow multiple windows (for example, one window of 512 coefficients and another window of 256 coefficients) to be stored in the Window RAM and one of these windows can be used by programming this start location register appropriately in the current parameter set.
WINSYMM	1	Yes	Window symmetry: This register-bit indicates whether the complete set of window coefficients are stored in the Window RAM or whether one half of the coefficients are stored. If this register bit is set, it means that the window function is symmetric and therefore, only one half of the window function coefficients are stored in the Window RAM. See the description section related to Windowing computation for more details.
WINDOW_MODE	1	Yes	Window Mode: 0b : 18-bit signed real coefficients, 1b: 16-bit signed real coefficients
FFTSIZE	4	Yes	FFT size: This register indicates the number of FFT radix-2 butterfly stages employed. Refer detailed description section for more details on this register.

**Table 24-6. FFT Engine Registers (continued)**

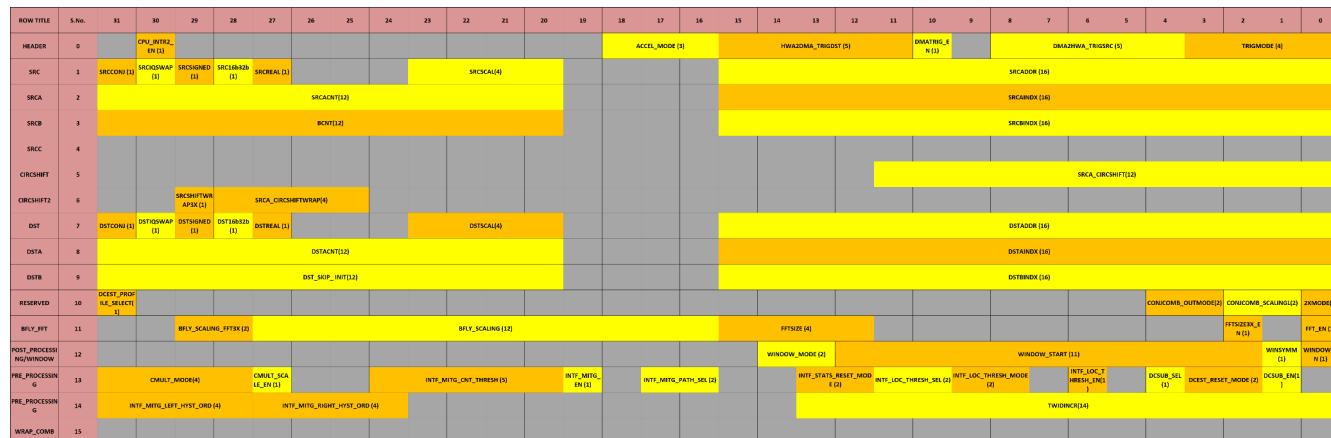

Register	Width	Parameter Set	Description
FFTSIZE3X_EN	1	Yes	FFT size 3X enable: This register indicates whether to engage the additional FFT radix-3 butterfly stage. Together with FFTSIZE, this register specifies the FFT size. This can be used to realize FFTs of length $3 \times 2^N$ point FFTs..
BFLY_SCALING	12	Yes	Butterfly scaling for radix-2 stages: This register is used to control the butterfly scaling at each of the radix-2 butterfly stages. If the Nth bit in this register is set to 0, then the 25-bit output of the Nth radix-2 stage from the last is saturated to 24-bit. Otherwise it is scaled down by 2 and rounded to produce a 24-bit output.
BFLY_SCALING_FFT3X	2	Yes	Butterfly scaling for radix-3 stage: This register is applicable only if FFTSIZE3X_EN is set to 1. This register is used to control the butterfly scaling in the 3-point FFT structure that precedes the powers-of-2 FFT structure. If this register is set to 0, then that 26-bit output after radix-3 stage is saturated at the MSB to get back to 24 bits. If it is 2, it is rounded to remove 2 LSBs to get back to 24 bits. A middle option exists by setting this to 1. In this case, the 26 bit temporary output is convergent-rounded to remove 1 LSB and the 25-bit output thus obtained is saturated to 24 bits.
CONJCOMB_SCALING	2	Yes	Scaling option for Conjugate Symmetric Combiner Stage: This register is applicable only if 2XMODE is set to 1. This register is used to scale the conjugate symmetric combiner stage that succeeds the powers-of-2 FFT structure. If this register is set to 0, then that 26-bit output is saturated at the MSB to get back to 24 bits. If it is 2, it is rounded to remove 2 LSBs to get back to 24 bits. A middle option exists by setting this to 1. In this case, the 26-bit temporary output is convergent-rounded to remove 1 LSB and the 25-bit output thus obtained is saturated to 24 bits.
CONJCOMB_OUTMODE	2	Yes	Register to handle the real FFT or Conjugate Symmetric Combiner output and . This register is applicable only if 2XMODE is set to 1. When set to 0, output memory value for sample index zero is set to . When set to 1, output memory value for sample index zero is set to . When set to 2, output memory value for sample index zero is set to . (Refer section 5.1.3)
DITHER_TWID_EN. dither_twid_en	1	No	Twiddle factor dithering enable: This register-bit is used to enable and disable dithering of twiddle factors in the FFT. The twiddle factors are 24-bits wide (24-bits for each I and Q), but they are quantized to 21-bits before twiddle factor multiplication. This quantization is implemented with dithering on the LSB, to avoid periodic quantization pattern affecting SFDR performance of the FFT. It is recommended to keep this register bit set to 1 (dithering enabled), with appropriate LSFR seed loaded.
LFSR_SEED. lfsr_seed	29	No	Seed for LFSR (random pattern): For twiddle factor dithering, there is an LFSR that is used, whose seed value is loaded by writing to this 29-bit LFSRSEED register. The LFSRSEED register should be set to any non-zero value, say 0x1234567. To load the LFSR seed, a pulse signal needs to be provided, by writing a 1 followed by a 0 (i.e., by setting and clearing) the LFSRLOAD register-bit.
LFSR_LOAD. lfsr_load	1	No	For twiddle factor dithering, there is an LFSR that is used, whose seed value is loaded by writing to this 29-bit LFSRSEED register. The LFSRSEED register should be set to any non-zero value, say 0x1234567. To load the LFSR seed, a pulse signal needs to be provided, by writing a 1 followed by a 0 (i.e., by setting and clearing) the LFSRLOAD register-bit.

### Table 24-6. FFT Engine Registers (continued)

Register	Width	Parameter Set	Description
FFT_CLIP.fft_clip	14	No	FFT Clip Status (read-only): This is a read-only status register, which indicates any saturation/clipping events that have happened in the FFT butterfly stages. Note that each of the individual butterfly stages in the FFT can be programmed to either saturate the MSB or round the LSB. Whenever saturation of MSB is used in any stage, there is a possibility that that stage can saturate or clip samples. In that case, this saturation event is indicated in the corresponding bit in this status register, so that the processor can read it. If multiple FFTs are performed, this status register includes any saturation events happening in any of them. This status register can only be cleared by the R5F, by setting another single-bit register CLR_FFTCLIP, so that the saturation status indication gets cleared back to 0 and any subsequent saturation events can be freshly monitored. The MSB of this register indicates clip status corresponding to the Conjugate Symmetric Combiner stage. The (MSB-1) of this register indicates clip status corresponding to the radix 3 butterfly (note: it is the MSB and (MSB-1), independent of the number of radix-2 stages engaged).
CLR_FFTCLIP.clr_fftclip	1	No	Clear FFT Clip Status register: This register bit, when set, clears the FFTCLIP register.
WINDOW_RAM[2048] DSS_HWA_WINDOW_RAM	32b each	No	This RAM stores the window co-efficients. Note that there is only one RAM and based on WINDOW_MODE, the samples are accordingly chosen as illustrated in Fig. 15
MEM_INIT_START. MEM_INIT_START_WINDOW_RAM	1	N	Writing 1'b1 would start the memory initialization for the window memory. This bit is self-clearing.
ACCEL_MODE	3	Yes	Select Core Computational Unit Data Path: This register selects the data-path of the accelerator's core computational unit – for example, it selects which of the paths: the FFT engine path, or the compression path, or none is active. Value = 0b000: FFT engine path Value = 0b010: Compression / decompression engine path Value = 0b111: No Operation. The No Operation setting can be used together with an appropriate trigger mode to cause the state machine to wait for an event before moving to the next parameter-set.

### 24.1.6 Appendix A

The parameter-set register layout is provided below for all the accelerator modes. Note that the parameter-set RAM must be written using 32-bit word writes only (i.e., byte-writes and half-word writes are NOT supported).

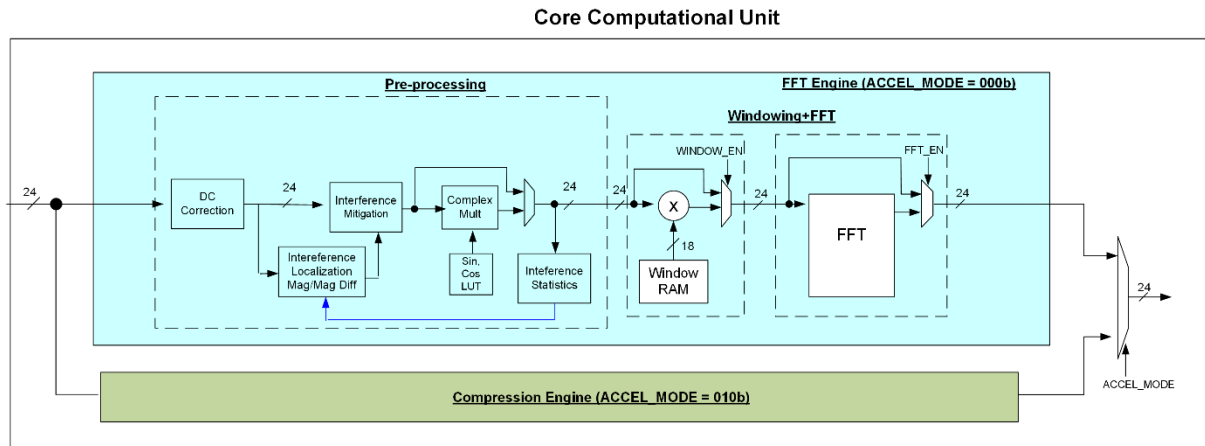

**Figure 24-17. FFT Path Parameter Set Layout**

- The first part of the user guide provides an overview of the overall architecture and features available in the radar hardware accelerator. The main features, such as, input/output formatter, windowing and FFT are covered in the first part.
- The second part of the user guide covers additional features like DC Estimation and correction, Interference localization/mitigation and input pre-scaling. This part of the user's guide assumes that the user has already read and understood Part 1 (see Radar Hardware Accelerator 1.5 User's Guide – Part 1).
- The third part of the user guide covers compression engine.

As explained in Part 1 of the user guide, the FFT Engine comprises pre-processing, windowing and FFT computation subblocks and these are stitched together one after the other in series (see [Figure 24-19](#)). This architecture allows multiple operations to be done in a streaming manner (for example, windowing and FFT can be done together), while at the same time, providing the user flexibility to choose one operation at a time. This section provides an overview of the pre-processing subblock inside the FFT engine of the core computational unit

**Figure 24-19. Core Computational Unit**

The pre-processing subblock provides capability for DC estimation and correction, Interference localization and mitigation, complex multiplication and interference statistics.

#### 24.2.1.1 DC Estimation

The DC estimation block estimates the time-domain average of the stream of samples along the A dimension. The stream can be one chirp, or set of chirps, i.e., frame. The DC is estimated on a per-iteration basis (i.e., along A dimension for each B iteration) for I & Q samples. This is supported only for 8 independent channels in HWA 1.5 unlike 12 in HWA 2.1. These 8 independent channels (0..7) map to BCNT 0..3 in two different profiles – 0 & 1.

DC estimation is based on accumulation followed by a fine scaling and a programmable right shift. The fine scaling is configured as a “1.8” fixed-point value, via the 9-bit scale register. The subsequent programmable right shift is configurable from 6 to 20 bits. Therefore, the DC estimation is well suited for cases where the number of samples per iteration is between  $2^6$  and  $2^{20}$ .

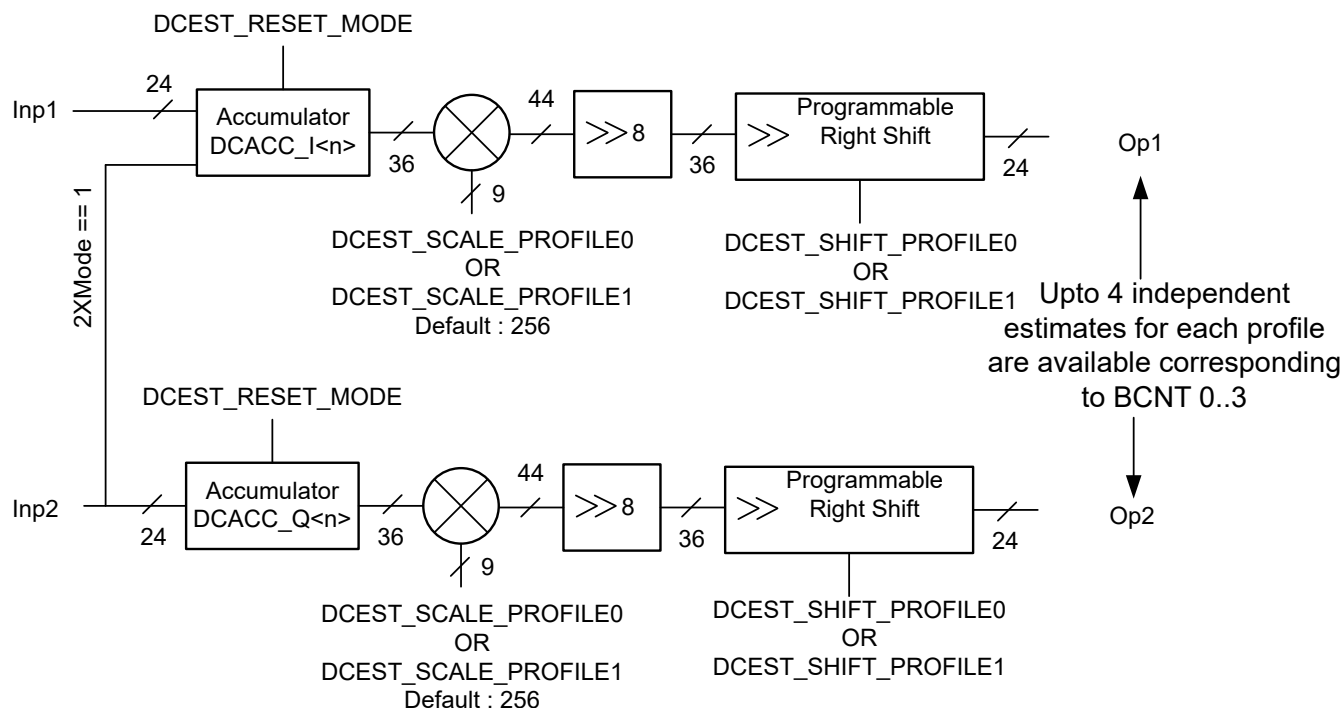

Two sets of shift & scale values are possible based on DCEST\_PROFILE\_SELECT bit–

- Value 0'b (Profile 0) : DCEST\_SHIFT\_PROFILE0, DCEST\_SCALE\_PROFILE0 which provide DCESTI\_0VAL, DCESTI\_1VAL, DCESTI\_2VAL, DCESTI\_3VAL & DCESTQ\_0VAL, DCESTQ\_1VAL, DCESTQ\_2VAL, DCESTQ\_3VAL.
- Value 1'b (Profile 1): DCEST\_SHIFT\_PROFILE1, DCEST\_SCALE\_PROFILE1 which provide DCESTI\_4VAL, DCESTI\_5VAL, DCESTI\_6VAL, DCESTI\_7VAL & DCESTQ\_4VAL, DCESTQ\_5VAL, DCESTQ\_6VAL, DCESTQ\_7VAL. Note that BCNT is still 0..3.

DC estimation works for both real and complex inputs. In particular for real-only inputs, with 2XMODE = 1, DC estimation operates with 2X input throughput. The fixed-point details are captured in [Figure 24-20](#). The internal accumulator reset supports several modes as shown in [Table 24-7](#). For example, when DCEST\_RESET\_MODE = 2, the internal DC accumulators are reset at the beginning of the current parameter-set execution. Therefore, this mode estimates DC value for each set of SRCACNT samples along the A-dimension for up to 4 iterations (per profile) along B-dimension within the current parameter-set. This mode is useful for per-chirp DC estimation. In this mode, the estimated DC values per iteration are latched at the end of current param-set and the accumulators are reset at the start. On the other hand, when DCEST\_RESET\_MODE = 3, the internal DC accumulators are reset only when the state machine executes the first loop of the parameter-set. As the state machine loops through various parameter-sets multiple times as programmed via NLOOPS register, the DC accumulators are not reset in between these loops. This mode is useful for per-frame DC estimation, where each loop corresponds to one chirp and the NLOOPS loops (chirps) correspond to a complete frame. The estimated DC values per iteration are latched at the end of last execution of the param-set.

The processor can read the DC estimates through the read-only registers – DCESTI\_0VAL, ..., DCESTI\_7VAL & DCESTQ\_0VAL, ..., DCESTQ\_7VAL. The DC estimates can also be used for DC subtraction described next.

Mode	Inp1	Inp2	Op1	Op2
2X Real	I[2k]	I[2k+1]	DCEST_I	0
1X Real	I[k]	0	DCEST_I	0
1X Complex	I[k]	Q[k]	DCEST_I	DCEST_Q

**Figure 24-20. DC Estimation**

**Table 24-7. DC Estimation – Reset Modes**

DCEST_RESET_MODE	Comments
0	Hold the DC internal accumulators without updating (bypass DC estimation).
1	DC estimation enabled, but free-running without automatic reset (i.e., not reset at the start of this parameter-set). In this mode, the software can reset the DC accumulators by writing to DC_EST_RESET_SW register bit.
2	Reset the DC internal accumulators at the start of this parameter-set. This mode is applicable for per-chirp DC estimation.
3	Reset the DC internal accumulators at the start of this parameter-set only if the loop-counter is 0. This mode is applicable for per-frame DC estimation.

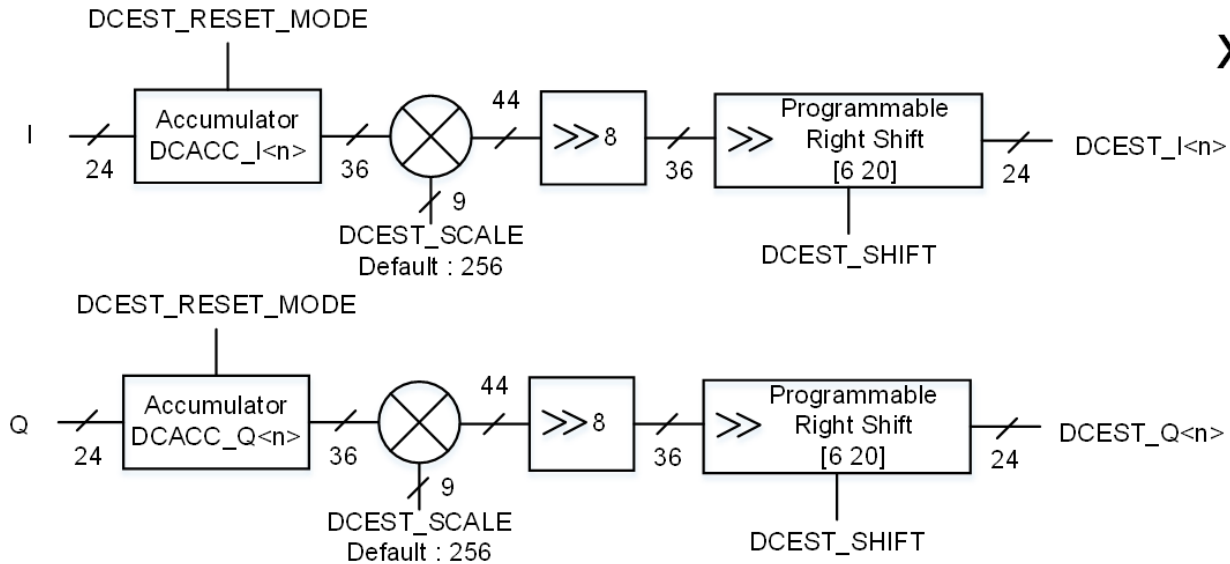

Figure 24-21.

#### 24.2.1.2 DC Subtraction

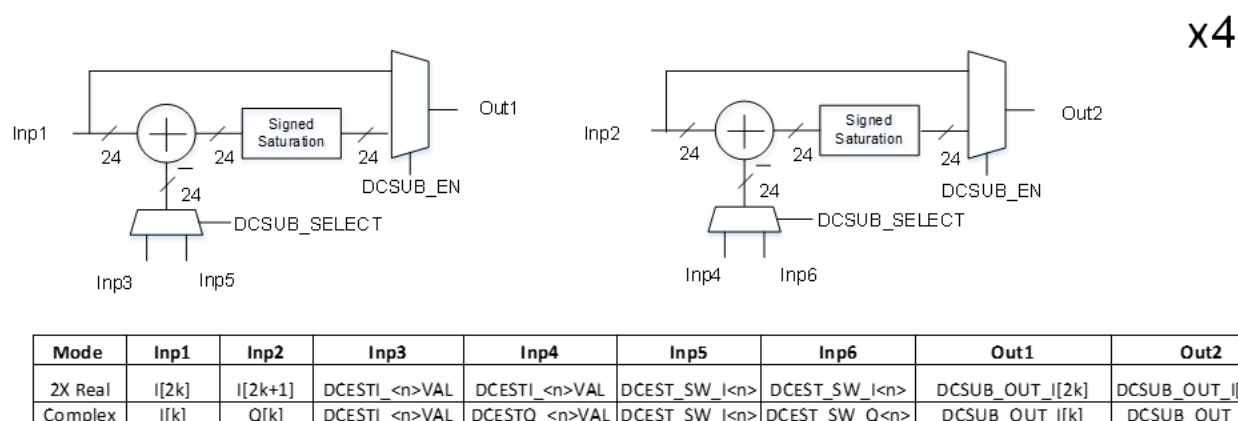

The DC subtraction feature is enabled if the register DCSUB\_EN is set to 1.

DC subtraction (see Figure 24-22) can use the output from the built-in DC estimation accumulators, or a user-programmed value, based on the register bit, DCSUB\_SELECT. If DCSUB\_SELECT is 1, the DC estimation based on the internal accumulators is used. If DCSUB\_SELECT is 0, the software override values are used (they are given by DC\_SW\_I\_<n> and DC\_SW\_Q\_<n> for the n<sup>th</sup> iteration).

For real-only inputs with 2XMODE = 1, the inputs are as indicated in figure below. Note that in the 2XMODE = 1, when DCEST\_PROFILE\_SELECT is 0 & DCSUB\_SELECT is 1, then the internal estimates DCESTI\_0VAL, DCESTI\_1VAL, ..DCESTI\_3VAL are used and when DCEST\_PROFILE\_SELECT is 1, the estimates DCESTI\_4VAL, DCESTI\_5VAL, ..DCESTI\_7VAL are used corresponding to BCNT 0..3.

When using the built-in DC estimation accumulators, DC subtraction is performed on 4 individual streams corresponding to 4 RX on a per-iteration basis (two different sets of 4 values based on profile). Note that in a typical usage, for performing per-chirp DC estimation and DC subtraction, a two-pass approach is needed, where the first pass is configured for DC estimation via one parameter-set, and the second pass is configured for DC subtraction in the next parameter-set. Alternately, if a previous DC estimate (e.g. From the previous chirp) is desired to be used for DC subtraction for the current chirp, then DC subtraction can be directly accomplished in one pass.

**Figure 24-22. DC Subtraction**

### 24.2.1.3 Interference Localization

In an FMCW radar transceiver, interference from another radar typically manifests itself as a time-domain spike in a few samples. This spike corresponds to the time duration when the chirping frequency of both radars overlap with each other. Such a time-domain spike caused by interference can lead to degradation in the noise floor at the FFT output, causing degradation in detection performance.

In order to mitigate the impact of interference, the pre-processing block provides capability to perform interference localization to identify samples corrupted by interference, followed by interference mitigation to repair those samples.

The INTF\_LOC\_THRESH\_EN register is provided as part of the parameter-set to control when the interference localization should be enabled. When enabled, the complex input samples are fed through a magnitude calculation (based on JPL approximation), which computes a 24-bit magnitude of the 24-bit input complex sample. Similarly, magnitude of the backward difference between adjacent samples is also computed, which is another useful metric for interference (glitch) detection. For real only inputs with 2XMODE = 1, only a simple absolute value computation is done.

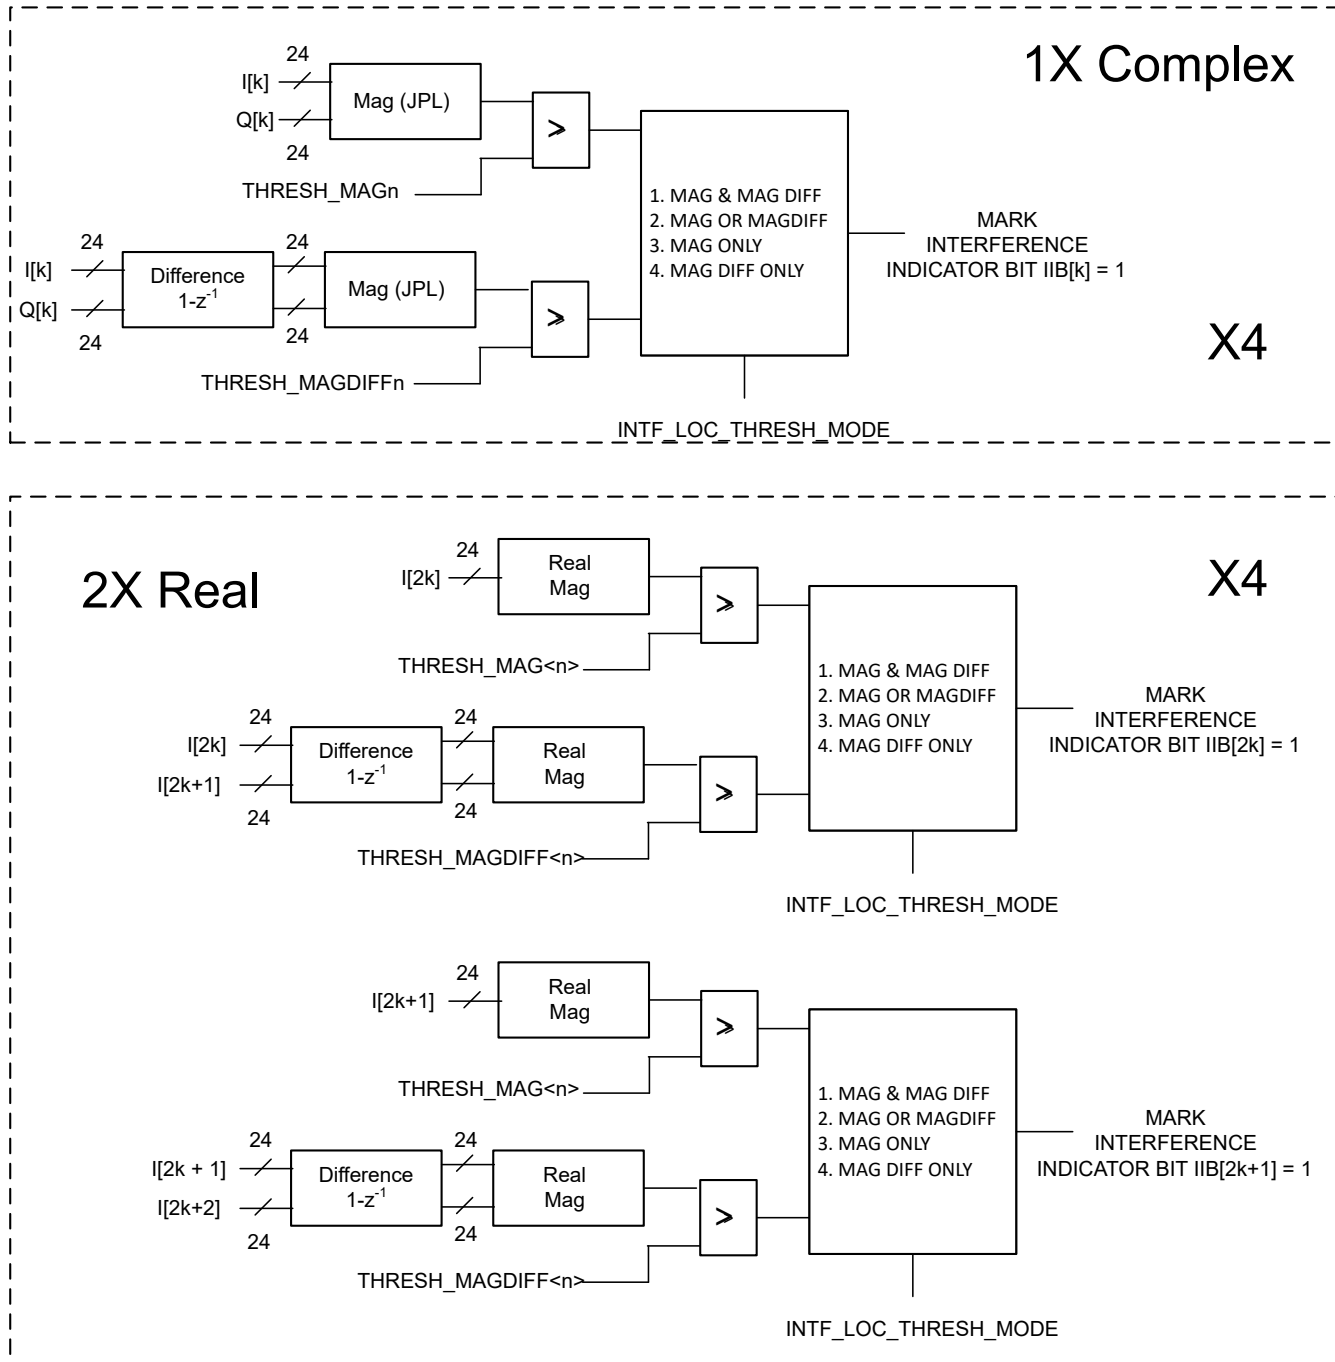

As shown in [Figure 24-23](#), any sample whose magnitude and/or magnitude of backward difference exceeds thresholds THRESH\_MAG<n> and THRESH\_MAGDIFF<n> is considered as affected by interference and is marked by a corresponding Interference indicator Bit (IIB). This is supported individually for up to 4 iterations. Note that the IIB bit is just an internal signal that is set by the interference localization module, in order to mark samples for the interference mitigation module (described later). For real-only inputs, two IIB bits are computed per clock cycle.

The register, INTF\_LOC\_THRESH\_MODE (applies to all iterations) determines the logic to set the IIB bit using the magnitude and/or magnitude of difference estimates. Based on this register, samples are marked with IIB if they exceed the THRESH\_MAG<n>, or THRESH\_MAGDIFF<n>, a logical AND of both, a logical OR of both.

The threshold values of THRESH\_MAG<n> and THRESH\_MAGDIFF<n> applied on a per-channel basis can be derived from SW – INTF\_LOC\_THRESH\_MAG<n>\_SW, INTF\_LOC\_THRESH\_MAGDIFF<n>\_SW, or from a built-in Interference statistics block – INTF\_LOC\_THRESH\_MAG<n>, INTF\_LOC\_THRESH\_MAGDIFF<n> as described in the next section. The user can also choose to sum the built-in interference statistics estimates across all channels to derive a common interference threshold across all iterations– INTF\_STATS\_SUM\_MAG, INTF\_STATS\_SUM\_MAGDIFF. The register, INTF\_LOC\_THRESH\_SELECT is used to select these threshold options. Note that there is unlike DC Estimation, there is no profile selection applicable and <n> maps directly to BCNT 0...3.

The number of samples marked with IIB across the iterations is recorded in the read-only registers, INTF\_LOC\_COUNT\_ALL\_CHIRP and INTF\_LOC\_COUNT\_ALL\_FRAME. This can be read after every chirp or after the completion of a frame (when the state machine completes all the programmed parameter-set loops and enters idle state).

**Figure 24-23. Interference Localization**

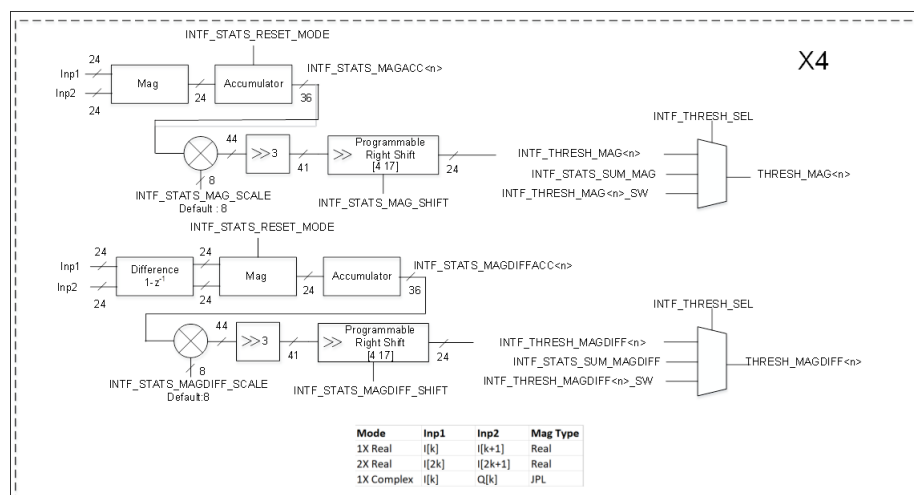

#### 24.2.1.4 Interference Statistics

This block ([Figure 24-24](#)) provides the thresholds for interference localization. In order to obtain the interference statistics and derive the thresholds, the magnitude and magnitude of backward difference of the incoming

samples are accumulated per iteration and up to 4 such independent accumulations are supported. These registers can be reset on a per-chirp or per-frame basis, and the behavior can be controlled using the register INTF\_STATS\_RESET\_MODE. These reset modes are similar to DCEST\_RESET\_MODE previously explained (refer Table 24-7). The interference statistics accumulators can be reset by software via writing the INTF\_STATS\_RESET\_SW register bit. This reset also clears the INTF\_LOC\_COUNTS.

The determination of interference threshold for interference localization is based on taking the above accumulator values and applying a programmable fine scaling, followed by a programmable right shift. The fine scaling is configured via 8-bit registers, INTF\_STATS\_MAG\_SCALE and INTF\_STATS\_MAGDIFF\_SCALE in 5.3 format. The fine scaling value is interpreted as an unsigned 8-bit number with 5 integer bits and 3 fractional bits giving a scale in range [0 to 31.875]. The default value of this register is 8, applying a scaling of 1.0. The programmable right-shift in the range of 6 to 12 is applied via the registers, INTF\_STATS\_MAG\_SHIFT and INTF\_STATS\_MAGDIFF\_SHIFT respectively. Note that if the sum mode of threshold selection is made, then the shift values have to include the extra division based on number of iterations being summed.

The resulting values INTF\_LOC\_THRESH\_MAG<sub>n</sub> and INTF\_LOC\_THRESH\_MAGDIFF<sub>n</sub> are used as thresholds in the interference localization block as described in the previous section. Note that there is unlike DC Estimation, there is no profile selection applicable and <n> maps directly to BCNT 0...3.

**Figure 24-24. Interference Statistics**

### 24.2.1.5 Interference Mitigation

Interference mitigation block (Figure 24-25) uses the results of Interference Localization block and mitigates the interference affecting the input samples which are marked as interference-corrupted through the Interference Indicator Bit. Interference mitigation is applicable for max. 4 iterations

The interference mitigation feature can be enabled by setting the INTF\_MITG\_EN bit in the parameter-set.

The first sub-module of the Interference Mitigation Block is a hysteresis module, which provides de-bouncing logic. For each incoming sample, its own IIB bit, as well as INTF\_MITG\_RIGHT\_HYST\_ORD number of right IIB bits and INTF\_MITG\_LEFT\_HYST\_ORD number of left IIB bits are considered in order to decide whether that particular sample is actually affected by interference. If 2XMODE = 1, then for real inputs only, the INTF\_MITG\_LEFT\_HYST\_ORD and INTF\_MITG\_RIGHT\_HYST\_ORD number of bits are restricted to be even numbers. If the number of IIB bits in that interval is greater than or equal to INTF\_MITG\_CNTTHRESH, then that sample is assumed to be affected by interference. Thus, the hysteresis module outputs a filtered version of the IIB bit stream, which is then used for interference mitigation.

There are three different options (Figure 24-26) for interference mitigation and one of these can be selected using the INTF\_MITG\_PATH\_SEL register. If INTF\_MITG\_PATH\_SEL = 0, then the interference mitigation block

simply zeros out samples that are marked with the IIB bit. This is a simple form of interference mitigation. With 2XMODE = 1, it corrects for two samples per clock

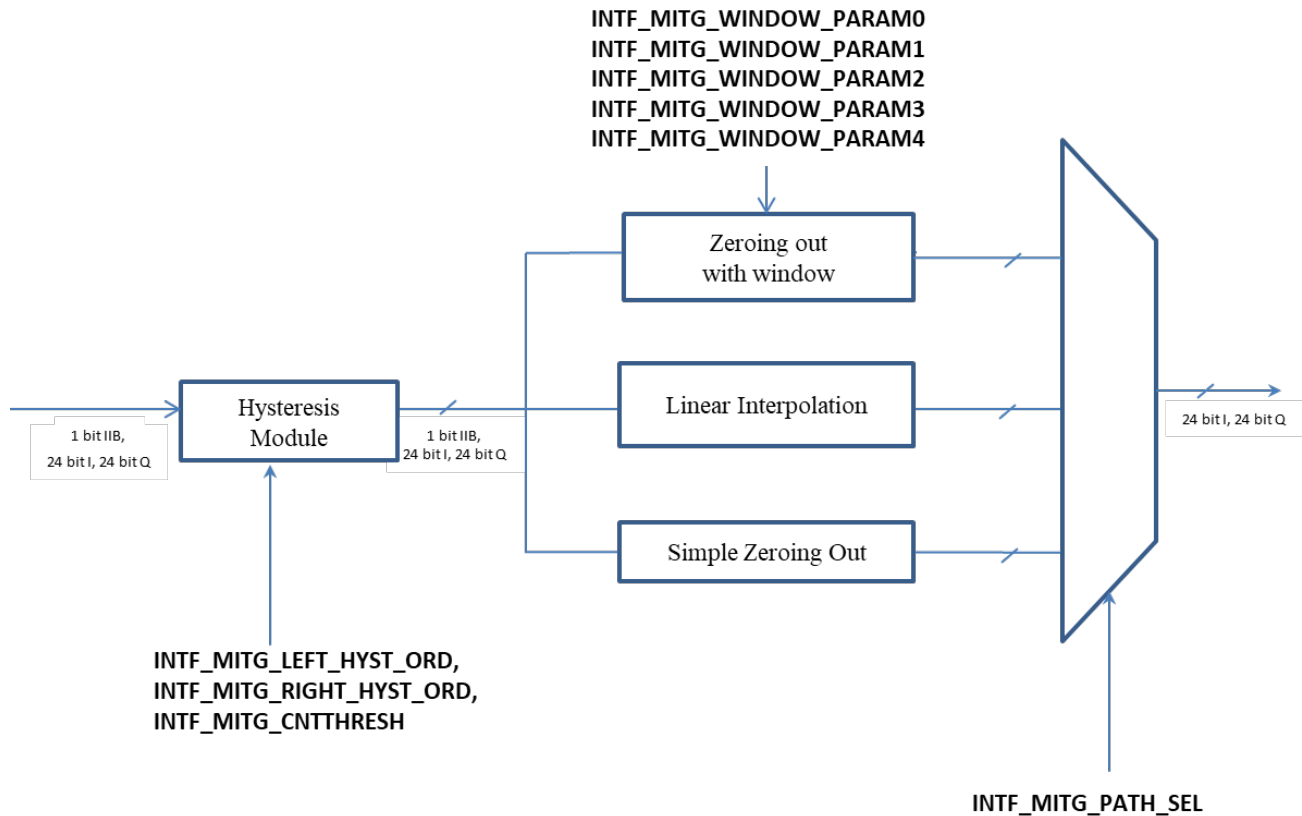

Figure 24-25. Interference Mitigation Block

**Figure 24-26. Interference Mitigation Methods**

If `INTF_MITG_PATH_SEL = 1`, then the interference mitigation block performs a windowed zero-out, where a smoothing window is applied to the edge samples of the interference-affected set of samples, in order to reduce the side-lobe increase that can happen with abrupt windowing. The windowing function that is applied is programmable via the `INTF_MITG_WINDOW_PARAM<n>` registers. The manner in which this smoothing window is applied is as follows.

Assume that the input sample array is:  $[x[0], x[1], x[2], x[3], x[4], x[5], x[6], x[7], x[8], x[9], x[10]]$ . Assume that the IIB array input is of the form  $[0, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0]$ . (In other words, the 6<sup>th</sup> and 7<sup>th</sup> samples are corrupted by interference.) Then, the output of the windowed zero-out module would be:

$[x[0]w[4], x[1]w[3], x[2]w[2], x[3]w[1], x[4]w[0], 0, 0, x[7]w[0], x[8]w[1], x[9]w[2], x[10]w[3]]$ .

Where  $w[n] = \text{INTF\_MITG\_WINDOW\_PARAM}<n>$ . Note that with `2XMODE = 1`, two different window coefficients are applied to two input samples per clock. For example  $w[4]$  and  $w[3]$  applied to  $x[0]$  and  $x[1]$ .

Note that the samples that are affected by interference are always zeroed out. The window is applied on the neighbours of these samples, so as to smoothen the transition to zero.

If `INTF_MITG_PATH_SEL = 2`, then the interference mitigation block performs a linear interpolation between the two good (i.e., non-interference-affected) samples at the start and end of the interference affected set of samples and this linear interpolation procedure is used to replace the interference affected samples themselves. The number of interference affected samples between these good samples can be any number. However, if it exceeds 32, then the 'last good sample' is pushed out in the place of affected samples until a new good sample arrives. Then linear interpolation will be performed across the 32 remaining affected samples. In case of `2XMODE = 1`, the linear interpolation is applied to both samples in a pair even if only one of them has `IIB = 1`.

### 24.2.1.6 Complex Multiplication

In addition to interference zero-out, the pre-processing block contains a complex multiplication sub-block. The purpose of this sub-block (Figure 24-27) is to enable several assorted capabilities that require complex multiplication of the input samples. The CMULT\_MODE register is used to enable and configure the complex multiplication functionality. The complex multiplication sub-block can be disabled (bypassed) by the setting CMULT\_MODE to 0b0000.

There are three modes of the complex multiplier supported as follows. They are frequency shifter mode, scalar multiplication mode and fine frequency shifter mode. In all the three modes of the complex multiplier, one only complex multiplication is performed every clock cycle. However, for real inputs with 2XMODE = 1, two real scalar multiplications per clock are possible.

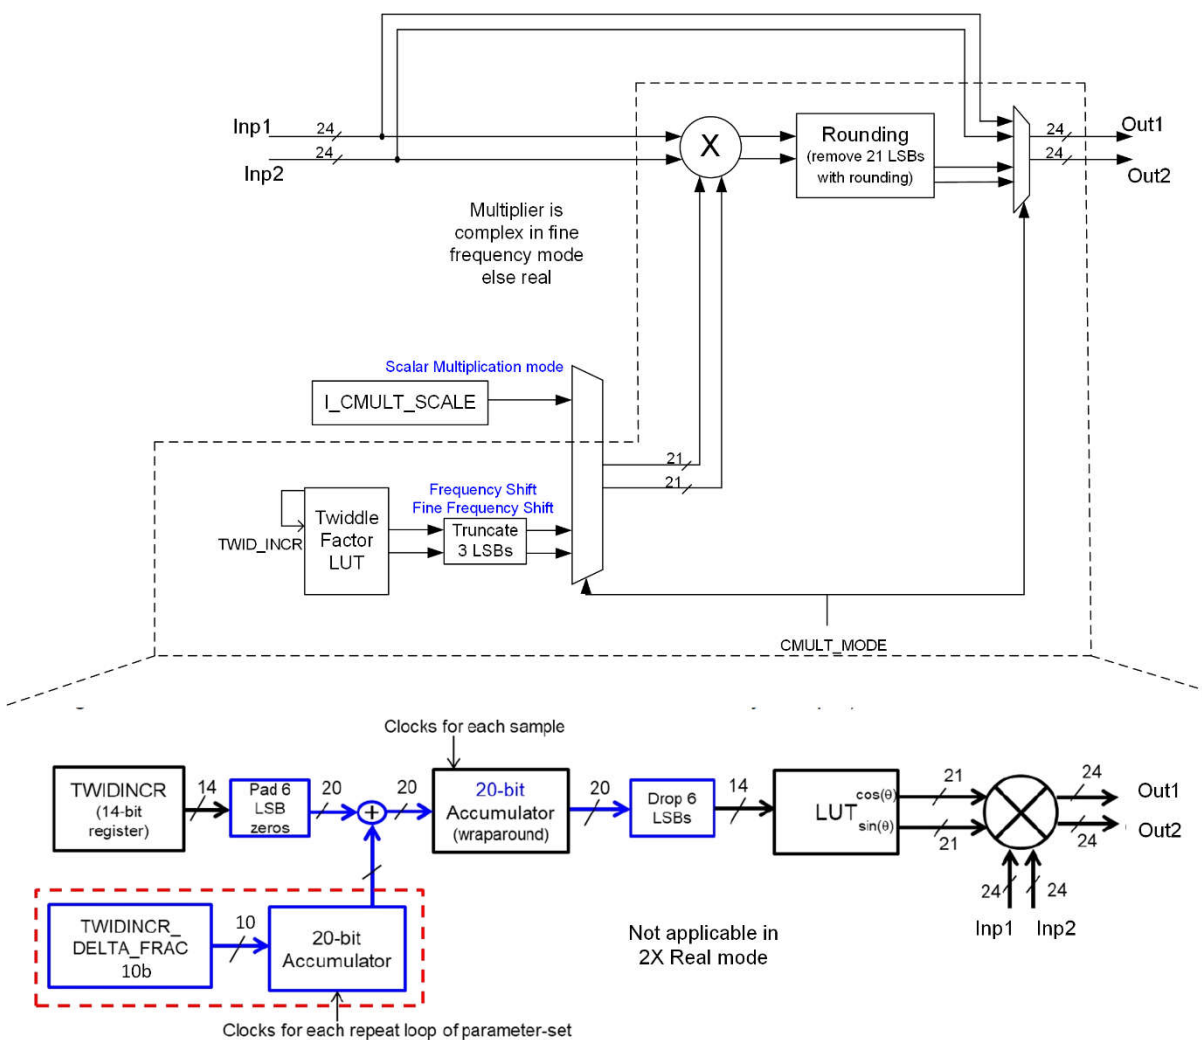

Figure 24-27. Complex Multiplication Capability in Pre-Processing Block

- Frequency shifter mode:** If the register value is CMULT\_MODE = 0001b, then the complex multiplier functions as a frequency shifter, which can be used to de-rotate the input samples by a certain frequency. This de-rotation is accomplished using cos, sin values from a twiddle factor look-up table (LUT). This LUT contains the (compressed) equivalent of the cos, sin values corresponding to the 16384 long sequence  $\exp(-j \cdot 2 \cdot \pi \cdot (0:16383)/16384)$ . TWIDINCR is used to specify the de-rotation frequency, by specifying how much the phase should change for each successive input sample (that register controls how much the LUT read index

increments every sample) as shown in (Figure 24-27). The starting phase in this mode is always zero, since the 20-bit accumulator always starts at zero for each iteration.

Note that although the figure shows another TWIDINCR\_DELTA\_FRAC register (portions shown in the red dotted box), that functionality is only applicable for CMULT\_MODE = 1010b described later and it is not applicable in the present complex multiplier mode (0001b).

Note that complex frequency shift is applicable to only complex inputs or single-sample real input. This mode is not applicable with 2XMODE = 1.

- **Scalar multiplication mode:** This mode is selected by setting CMULT\_MODE = 0101b. It supports two options – multiplication by a complex scalar that remains constant across all iterations or by a complex scalar that changes per iteration. In case of 2XMODE = 1, then a purely real scalar is applied

If the register bit CMULT\_SCALE\_EN = 0, then the complex multiplier functions in constant scalar multiplication mode. This feature is useful if the input samples need to be scaled by some constant factor. In this case, the complex multiplier will multiply each input sample with a 21-bit scalar complex number that is programmed in ICMULT\_SCALE0 and QCMULT\_SCALE0 registers (for I and Q value, each having 21 bits). The ICMULT\_SCALE0 and QCMULT\_SCALE0 registers are common registers and not part of parameter-set. For 2XMODE = 1, note that only ICMULT\_SCALE0 is applied for all samples.

To multiply the input samples for different iterations (channels) with different complex scalars, set CMULT\_SCALE\_EN = 1. In this mode, upto 4 different complex scalars are supported, viz. from ICMULT\_SCALE0, QMULT\_SCALE0 to ICMULT\_SCALE3, QMULT\_SCALE3 that are used for multiplication per iteration. TWID\_INCR Register has no implication in this mode. In case of 2XMODE = 1, then only ICMULT\_SCALE0, .. ICMULT\_SCALE3 are applied across iterations.

- **Frequency shifter mode with fine frequency increment:** This mode is enabled using CMULT\_MODE = 1010b. This mode is an extension of the Frequency shifter mode (previously explained, where CMULT\_MODE = 0001b). In this mode, in addition to the previously explained frequency shifter functionality, there is another signed 10-bit offset TWIDINCR\_DELTA\_FRAC that can be added to the de-rotation frequency, such that the de-rotation frequency changes incrementally after every “execution count”. The TWIDINCR\_DELTA\_FRAC value is automatically accumulated to the de-rotation frequency at the end of the current execution of the current parameter-set with CMULT\_MODE = 1010b. The fixed-point design of this datapath is illustrated in Figure 24-27). In effect, the input samples  $x(n)$  for  $n = 0$  to SRCACNT-1 are multiplied by the sequence:  $\exp(-j * 2\pi * ((TWIDINCR + 2^{(-6)} * TWIDINCR\_DELTA\_FRAC * execution\_count) * (0:SRCACNT-1) / 16384))$ . The execution\_count here refers to the current execution count of the parameter-set with CMULT\_MODE = 1010b. The TWIDINCR\_DELTA\_FRAC accumulator is reset only via software by writing to the TWID\_INCR\_DELTA\_FRAC\_RESET\_SW register bit. Note that the TWIDINCR\_DELTA\_FRAC register is applicable only in this mode of the complex multiplier and is ignored in all other modes. This mode is not applicable with 2XMODE = 1.

#### 24.2.1.7 Pre-Processing Block – Register Descriptions

Table 24-8 lists all the registers of the pre-processing block. As explained in Section 24.1.1.1, some of the registers are common (common for all parameter-sets) registers, whereas, some others are “part of each parameter-set”. For each register, this distinction is captured as part of the register description in Table 24-8.

**Table 24-8. Pre-Processing Registers**

Register.field	Width	Parameter-Set? (Y/N)	Description
DCEST_RESET_MODE	2	Y	2-bit field that controls the reset behavior for all 12 DC accumulators 00 : Hold Accumulator state without updating 01 : Reserved 10 : Reset at start of param-set (i.e., per-chirp DC estimation). 11 : Reset at start of param-set only if loop counter is 0 (i.e., per-frame DC estimation)

**Table 24-8. Pre-Processing Registers (continued)**

Register.field	Width	Parameter-Set? (Y/N)	Description
DC_EST_CTRL.dc_est_scale	9	N	Programmable fine scaling for DC estimation: 9-bit scale applied to all 12 DC accumulators. This is followed by right shift and truncation. Multiplies the accumulator output by DC_EST_SCALE/256. Default value is 256 giving a scale of 1.0. Setting it to 128, gives a scale of 0.5.
DC_EST_CTRL.dc_est_shift	4	N	Programmable right shift for DC estimation: Right bit-shift applied to all 12 DC accumulator outputs. Cannot be bypassed. Accumulator outputs are scaled by $2^{(8 + 6 + \text{DC\_EST\_SHIFT})}$ . Valid range for this register is 0 to 14 (i.e., scaling of $2^{14}$ to $2^{28}$ ). Note that DC_EST_SHIFT = 15 is not supported.
DC_ACC_I_<n>_VAL_LSB. Dc_acc_i_<n>_val_lsb n=0,1,..11	32	N	These read-only registers provide the lower 32 bits of 36b DC estimation accumulator values –I&Q for 12 streams for processor read-out.
DC_ACC_I_<n>_VAL_MSB. Dc_acc_i_<n>_val_msb n=0,1,..11	4	N	These read-only registers provide the upper 4 bits of 36b DC estimation accumulator values –I&Q for 12 streams for processor read-out.
DC_EST_RESET_SW.dc_est_reset_sw	1	N	Software reset for DC accumulators: Setting this register bit to 1 resets all 12 DC estimation accumulators. This is a self-clearing reset bit.
DC_EST_I_<n>_VAL.dc_est_i_<n>_val DC_EST_Q_<n>_VAL.dc_est_q_<n>_val n=0,1,..11	24	N	These read-only registers provide the DC estimates – I&Q for 12 streams – for the processor to read.
DC_ACC_CLIP_STATUS.dc_acc_clip_status	12	N	Clip status indication (read-register) for the 12 DC accumulators (both I and Q combined). Value of 1 indicates a clipping event occurred.
DC_EST_CLIP_STATUS.dc_est_clip_status	12	N	Clip status indication (read-register) for the 12 DC estimates (both I and Q combined). Value of 1 indicates a clipping event occurred.
DCSUB_EN	1	Y	Enable or Disable DC subtraction. If this register bit is set to 1, DC subtraction is enabled. Else, it is disabled.
DCSUB_SELECT	1	Y	Source select for DC subtraction: 0 : Value comes from processor via DC_SW_I_<n> & DC_SW_Q_<n> 1: Value comes from built-in DC estimation hardware, i.e., DCEST_I_<n> & DCEST_Q_<n>
DC_I_<n>_SW.dc_i_<n>_sw DC_Q_<n>_SW.dc_q_<n>_sw n=0,1,..11	24	N	User-programmed DC values used for DC subtraction. These registers are relevant only when DCSUB_SELECT is 0.
DC_SUB_CLIP.dc_sub_clip	1	N	Clip status indication (read-register) for DC subtraction node (both I and Q combined). Value of 1 indicates a clipping event occurred.
INTF_LOC_THRESH_EN	1	Y	Enable/Disable for Interference localization (marking out): This registerbit controls the enable/disable for the interference marking (setting Interference Indicator Bit) feature. The feature is enabled if this register bit is set to 1.

**Table 24-8. Pre-Processing Registers (continued)**

Register.field	Width	Parameter-Set? (Y/N)	Description
INTF_LOC_THRESH_MAG<n>_SW.intf_loc_thresh_mag<n>_sw n=0..11	24	N	Software Interference threshold for Magnitude These registers are used to specify the user-programmed threshold for marking out samples affected by interference in the Interference localization block. The magnitude of each incoming samples is compared with this threshold to decide whether it is corrupted by interference or not.
INTF_LOC_THRESH_MAGD IFF<n>_SW.intf_loc_thresh_magdiff<n>_sw n=0...11	24	N	Software Interference threshold for Magnitude of backward difference These registers are used to specify the user-programmed threshold for marking out samples affected by interference in the Interference localization block. The magnitude of backward difference of incoming samples is compared with this threshold to decide whether it is corrupted by interference or not.
INTF_LOC_THRESH_MODE	2	Y	Interference detection mode selection: This register is used to control the mode for interference detection in the Interference localization block. 00 : Magnitude OR Magnitude difference 01: Only Magnitude difference 10: Only Magnitude 11 : Magnitude AND Magnitude difference
INTF_LOC_THRESH_SEL	2	Y	Select the source of interference threshold 0 : User-defined threshold via INTERFTHRESH_MAG_SW and INTERFTHRESH_MAGDIFF_SW 1 : Single threshold based on built-in interference statistics outputs using sum value across collected interference statistics 2 : Threshold based on built-in interference statistics outputs, with each statistic being used for corresponding iteration (RX channel)
INTF_STATS_RESET_MODE	2	Y	Reset mode control for Interference statistics accumulators: Controls the reset behavior for all 12 magnitude and magdiff accumulators. 00 : Hold Accumulator state without updating 01 : Free-running accumulator mode 10 : Reset at start of parameter-set (i.e., per-chirp accumulation). 11 : Reset at start of parameter-set only if loop counter is 0 (i.e., per-frame)
INTF_STATS_CTRL.intf_stats_mag_scale	8	N	Programmable fine scaling for Interference statistics Magnitude: Scaling applied to INTF_STATS_MAGACC<n> from interference statistics block.
INTF_STATS_CTRL.intf_stats_mag_shift	3	N	Programmable right shift for Interference statistics Magnitude: Right bit-shift applied to the interference magnitude accumulator. Total right shift of the accumulator is $2^{(3+6+INTF\_STATS\_MAG\_SHIFT)}$ . Valid range for this register is 0 to 6 (i.e., the total right shift can't be more than $2^{15}$ ).
INTF_STATS_CTRL.intf_stats_magdiff_scale	8	N	Programmable fine scaling for Interference statistics MagDiff: Scaling applied to INTF_STATS_MAGDIFFACC<n> from interference statistics block.

**Table 24-8. Pre-Processing Registers (continued)**

Register.field	Width	Parameter-Set? (Y/N)	Description
INTF_STATS_CTRL.intf_stats_magdiff_shift	3	N	Programmable right shift for Interference statistics MagDiff. Right bit-shift applied to the interference magdiff accumulator. Total right shift of the accumulator is $2^{(3+6+INTF\_STATS\_MAGDIFF\_SHIFT)}$ . Valid range for this register is 0 to 6 (i.e., the right shift can't be more than $2^{15}$ ).
INTF_STATS_MAG_ACC<n>_LSB.intf_stats_mag_acc<n>_lsb	32	N	These read-only registers provide the lower 32 bits of 36b magnitude accumulator values –I&Q 12 streams for processor read-out.
INTF_STATS_MAG_ACC<n>_MSB.intf_stats_mag_acc<n>_msb	4	N	These read-only registers provide the upper 4 bits of 36b magnitude accumulator values –I&Q 12 streams for processor read-out.
INTF_STATS_MAGDIFF_ACC<n>_LSB.intf_stats_magdiff_acc<n>_lsb	32	N	These read-only registers provide the lower 32 bits of 36b magnitude difference accumulator values –I&Q 12 streams for processor read-out.
INTF_STATS_MAGDIFF_ACC<n>_MSB.intf_stats_magdiff_acc<n>_msb	4	N	These read-only registers provide the upper 4 bits of 36b magnitude difference accumulator values –I&Q 12 streams for processor read-out.
INTF_STATS_RESET_SW.intf_stats_reset_sw	1	N	Software reset bit for all the interference statistics accumulators. This is a self-clearing reset bit.
INTF_LOC_THRESH_MAG<n>_VAL.intf_loc_thresh_mag<n>_val	24	N	Read-only thresholds – scaled and shifted INTF_STATS_MAGACC<n> of interference statistics block
INTF_STATS_SUM_MAG_VAL.intf_stats_sum_mag_val	24	N	Sum of INTF_LOC_THRESH_MAG<n>_VAL, based on number of iterations. Useful as single magnitude threshold value across all iterations
INTF_LOC_THRESH_MAGDIFF<n>_VAL.intf_loc_thresh_magdiff<n>_val	24	N	Read-only thresholds – scaled and shifted INTF_STATS_MAGACCDIFF<n> of interference statistics block
INTF_STATS_SUM_MAGDIFF_VAL.intf_stats_sum_magdiff_val	24	N	Sum of INTF_LOC_THRESH_MAGDIFF<n>_VAL, based on number of iterations. Useful as single magnitude difference threshold value across all iterations
INTF_STATS_SUM_MAG_VAL_CLIP_STATUS.intf_stats_sum_mag_val_clip_status	12	N	Read-only clip status indication register for 12 interference statistics magnitude accumulators INTF_STATS_MAGACC<n>. Value of 1 indicates a clipping event occurred in atleast one accumulator
INTF_STATS_SUM_MAGDIFF_VAL_CLIP_STATUS.intf_stats_sum_magdiff_val_clip_status	12	N	Read-only clip status indication register for 12 interference statistics magnitude-difference accumulators INTF_STATS_MAGACCDIFF<n>. Value of 1 indicates a clipping event occurred in atleast one accumulator
INTF_STATS_ACC_CLIP_STATUS.intf_stats_mag_accumulator_clip_status	12	N	Read-only clip status indication register for 12 magnitude based interference threshold. INTF_LOC_THRESH_MAG<n>_VAL. Value of 1 indicates a clipping event occurred in atleast one estimate
INTF_STATS_ACC_CLIP_STATUS.intf_stats_magdiff_accumulator_clip_status	12	N	Read-only clip status indication register for magnitude-difference based interference threshold. INTF_LOC_THRESH_MAGDIFF<n>_VAL. Value of 1 indicates a clipping event occurred in atleast one estimate
INTF_STATS_THRESH_CLIP_STATUS.intf_stats_thresh_mag_clip_status	1	N	Read-only clip status for sum of all magnitude thresholds computed by the statistics block. Value of 1 indicates that the sum clipped.
INTF_STATS_THRESH_CLIP_STATUS.intf_stats_thresh_magdiff_clip_status	1	N	Read-only clip status for sum of all magnitude difference thresholds computed by statistics block. Value of 1 indicates that the sum clipped.
INTF_LOC_COUNT_ALL_CHIRP.intf_loc_count_all_chirp	12	N	Read-only register indicating the number of samples that exceeded the threshold in a given param-set. The count is saturated to $2^{12} - 1$ .

**Table 24-8. Pre-Processing Registers (continued)**

Register.field	Width	Parameter-Set? (Y/N)	Description
INTF_LOC_COUNT_ALL_FRAME.intf_loc_count_all_frame	20	N	Read-only register indicating the number of samples that exceeded the threshold across multiple executions of same param-set. The count is saturated to $2^{20} - 1$ .
INTF_MITG_EN	1	Y	If this bit is set, the interference mitigation path is activated, else it is bypassed.
INTF_MITG_PATH_SEL	2	Y	Based on the value of this register, one of the three paths is activated. 00b: Simple Zeroing out 01b: Windowed Zeroing out 10b: Linear Interpolation 11b: Reserved
INTF_MITG_WINDOW_PARAM_<n>.intf_mitg_window_param_<n> n=0..4	5 (each)	N	This is a programmable array of window parameters. Each window parameter is an unsigned 5 bit integer. The length of the array is 5. The parameters of the window are assumed to be monotonically ascending. For example : $val = \text{floor}(\text{hanning}(14) * 32)$ $\text{INTF\_MITG\_WINDOW\_PARAM} = \text{val}(2:6);$ If a shorter window (of length less than 5) is desired, some of the earlier window parameters can be set to 31. This sets the window parameter to 31/32 (or ~1).
INTF_MITG_CNTTHRESH	5	Y	The (total) number of non-zero IIB within the 'Hysteresis window' should exceed this threshold for the sample-under-test to be considered to be affected by interference. Range : 0 to 31.
INTF_MITG_RIGHT_HYST_ORD	4	Y	The length of the IIB array considered on the right side of (i.e. after) the sample under test. Range : 0 to 15.
INTF_MITG_LEFT_HYST_ORD	4	Y	The length of the IIB array considered on the left side of (i.e. before) the sample under test. Range : 0 to 15.
CMULT_MODE	4	Y	Complex multiplication mode selection: This register is used to configure the mode of the complex multiplication sub-block. A value of 0000b disables/bypasses the complex multiplication. Any other value chooses one of nine available modes of operation. Detailed description of the nine modes in the main description section.

**Table 24-8. Pre-Processing Registers (continued)**

Register.field	Width	Parameter-Set? (Y/N)	Description
CMULT_SCALE_EN	1	Y	<p>Complex multiplier iteration enable :</p> <p>This register bit is applicable in certain modes of the complex multiplication pre-processing to enable per-iteration change of the complex scalar coefficient.</p> <p>When using scalar multiplication mode of the complex multiplier (CMULT_MODE = 0101b), if CMULT_SCALE_EN is set to 1, then the input samples are multiplied by a different complex scalar (i.e., ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11) for each iteration. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all samples across all iterations.</p> <p>When using vector multiplication mode (CMULT_MODE = 0110b), if CMULT_SCALE_EN is set to 1, then instead of pulling the coefficients for vector multiplication from the Vector Multiplication Coefficients RAM, the input samples are multiplied successively by ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11 registers.</p>

VEC_MULT_RAM[1024]	32	N	<p>Vector multiplication RAM : Stores the complex vector multiplication coefficients used in modes 6, 7 and 8. Layout shown in Fig. 28-34</p>
TWIDINCR	14	Y	<p>Frequency shifter configuration:</p> <p>When the complex multiplication sub-block is programmed in one of the frequency shifter modes (CMULT_MODE = 0001b or 0010b), this register is used to indicate the amount of frequency shift.</p> <p>When the complex multiplication sub-block is programmed in FFT stitching mode (CMULT_MODE = 0011b), the last two bits of this register specify whether it is 4K or 8K FFT stitching. Specifically, if the last two bits are 01b, then it is 4K FFT stitching and if the last two bits are 10b, then it is 8K FFT stitching. Values of 00b and 11b are reserved. Also, the 12 MSB bits of this register must be kept zero in the FFT stitching mode.</p> <p>In all other modes of the complex multiplication sub-block, this 14-bit register must be kept as 0.</p> <p>When the complex multiplication sub-block is programmed with CMULT_MODE = 0110b, 0111b or 1000b, then the 12 MSBs of this register are used as an address offset for the Vector Multiplication Coefficients RAM (the 2 LSBs must be kept 0).</p> <p>When the complex multiplication sub-block is programmed with CMULT_MODE = 1001b, then the 6 LSBs of this register are used as an address offset for TWID_ANGLE_RAM, with bit 13 enabling auto-address increment over iterations and bit 12 enabling address saturation or address roll-over after 63.</p>
TWID_INCR_DELTA_FRAC.twid_incr_delta_frac	10	N	<p>Fractional frequency increment per execution of the parameter-set:</p> <p>Frequency shift value to be accumulated at the end of current parameter-set. Refer main description for more details.</p>
DSS_HWA_DEROT_RAM	32	N	

**Table 24-8. Pre-Processing Registers (continued)**

Register.field	Width	Parameter-Set? (Y/N)	Description
RECWIN_MODE	1	Y	Recursive window mode select bit.(0) –the K value increments with iteration. (1) –the K value increments with paramset execution count. K always starts from 0
RECWIN_RESET_SW.recwin_reset_sw	1	N	Software reset bit for recursive window K value. This is a self-clearing reset bit.
RECWIN_INIT_KVAL.recwin_init_kval	12	N	RESERVED. This is a reserved register and should be always kept 0.
TWID_INCR_DELTA_FRAC_RESET_SW.twid_incr_delta_frac_reset_sw	1	N	Software reset bit for fine frequency increment accumulator (in CMULT_MODE = 1010b). This is a self-clearing reset bit.
TWID_INCR_DELTA_FRAC_CLIP_STATUS.twid_incr_delta_frac_clip_status	1	N	Read-only register bit that indicates clip status for the fine-frequency increment accumulator (in CMULT_MODE = 1010b).
BPM_EN	1	Y	Enable/Disable BPM removal: This registerbit specifies whether the BPM removal needs to be enabled or not. If this register is set, then BPM removal is enabled prior to feeding samples from the input formatter into the core computational unit.
BPM_PATTERN<n>.bpm_pattern_<n> n=0..7	256	N	BPM pattern: Specifies the BPM pattern to be used to multiply the input samples if BPM removal is enabled. The 256-bit word is split into 8 32-bit words as [BPM_PATTERN_7, BPM_PATTERN_6, BPM_PATTERN_5, BPM_PATTERN_4, BPM_PATTERN_3, BPM_PATTERN_2, BPM_PATTERN_1, BPM_PATTERN_0]
BPM_RATE.bpm_rate	10	N	BPM rate: Specifies the number of input samples corresponding to each BPM bit. Minimum valid value for this register is 1.
BPM_PHASE	4	Y	BPM starting phase: Specifies the starting phase of the BPM pattern periodicity. For more information, see the detailed description.
CHAN_COMB_EN	1	Y	Enable/Disable channel combining: If this register bit is set to 1, then the channel combining feature is enabled.
CHAN_COMB_VEC_<n>.chan_comb_vec_<n> n=0..7	256	N	Sample index indicator for Channel combining : This register indicates the sample indices that need to be combined in the Channel combiner block. A '01' or '10' transition demarcates the groups. The 256-bit word is split into 8 32-bit words as [CHAN_COMB_VEC_7, CHAN_COMB_VEC_6, CHAN_COMB_VEC_5, CHAN_COMB_VEC_4, CHAN_COMB_VEC_3, CHAN_COMB_VEC_2, CHAN_COMB_VEC_1, CHAN_COMB_VEC_0]
CHAN_COMB_SIZE.chan_comb_size	8	N	This register indicates the number of samples after channel combination in each iteration.
CHANNEL_COMB_CLIP_STATUS.channel_comb_clip_status	1	N	Clip status indication (read-register) during channel combining. Value of 1 indicates a clipping event occurred.
ZERO_INSERT_EN	1	Y	Enable/Disable zero-insertion: If this register bit is set to 1, then the zero-insertion feature is enabled.

**Table 24-8. Pre-Processing Registers (continued)**

Register.field	Width	Parameter-Set? (Y/N)	Description
ZERO_INSERT_NUM.zero_insert_num		N	This register indicates the number of zeros to be inserted in each iteration.
DCEST_RESET_MODE	2	Y	2-bit field that controls the reset behavior for all 8 DC accumulators b'00 : Hold Accumulator state without updating b'01 : Reserved b'10 : Reset at start of param-set (i.e., per-chirp DC estimation). b'11 : Reset at start of param-set only if loop counter is 0 (i.e., per-frame DC estimation)
DCEST_PROFILE_SELECT	1	Y	DC estimation profile selection bit to choose which set of shift/scale settings to be applied and which set of estimation registers be updated b'0 : Profile 0, DC_EST_I_<0..3>.val b'1 : Profile 1, DC_EST_I_<4..7>.val
DC_EST_CTRL.dc_est_scale_profile0	9	N	Programmable fine scaling for DC estimation in Profile 0: 9-bit scale applied to 4 DC accumulator values in profile0. This is followed by right shift and truncation. Multiplies the accumulator output by DC_EST_SCALE/256. Default value is 256 giving a scale of 1.0. Setting it to 128, gives a scale of 0.5.
DC_EST_CTRL.dc_est_scale_profile1	9	N	Programmable fine scaling for DC estimation in Profile 1
DC_EST_CTRL.dc_est_shift_profile0	4	N	Programmable right shift for DC estimation in Profile0: Right bit-shift applied to all 4 DC accumulator outputs in profile0. Cannot be bypassed. Accumulator outputs are scaled by $2^{(8 + 6 + \text{DC\_EST\_SHIFT})}$ . Valid range for this register is 0 to 14 (i.e., scaling of $2^{14}$ to $2^{28}$ ). Note that DC_EST_SHIFT = 15 is not supported.
DC_EST_CTRL.dc_est_shift_profile1	4	N	Programmable right shift for DC estimation in Profile1
DC_ACC_I_<n>_VAL_LSB. dc_acc_i_<n>_val_lsb n=0,1,..7	32	N	These read-only registers provide the lower 32 bits of 36b DC estimation accumulator values –I&Q for 8 streams for processor read-out.
DC_ACC_I_<n>_VAL_MSB. dc_acc_i_<n>_val_msb n=0,1,..7	4	N	These read-only registers provide the upper 4 bits of 36b DC estimation accumulator values –I&Q for 8 streams for processor read-out.
DC_EST_RESET_SW.dc_est_reset_sw	1	N	Software reset for DC accumulators: Setting this register bit to 1 resets all 8 DC estimation accumulators. This is a self-clearing reset bit.
DC_EST_I_<n>_VAL.dc_est_i_<n>_val DC_EST_Q_<n>_VAL.dc_est_q_<n>_val n=0,1,..7	24	N	These read-only registers provide the DC estimates – I&Q for 8 streams – for the processor to read. Only I-values updated with 2XMODE = 1
DC_ACC_CLIP_STATUS.dc_acc_clip_status	8	N	Clip status indication (read-register) for the 8 DC accumulators (both I and Q combined). Value of 1 indicates a clipping event occurred.
DC_EST_CLIP_STATUS.dc_est_clip_status	8	N	Clip status indication (read-register) for the 8 DC estimates (both I and Q combined). Value of 1 indicates a clipping event occurred.
DCSUB_EN	1	Y	Enable or Disable DC subtraction. If this register bit is set to 1, DC subtraction is enabled. Else, it is disabled.

**Table 24-8. Pre-Processing Registers (continued)**

Register.field	Width	Parameter-Set? (Y/N)	Description
DCSUB_SELECT	1	Y	Source select for DC subtraction: 0: Value comes from processor via DC_SW_I<n> & DC_SW_Q<n> 1: Value comes from built-in DC estimation hardware, i.e., DCEST_I<n> & DCEST_Q<n> n=0..3 in Profile0, n=4..7 in Profile1
DC_I<n>_SW.dc_i<n>_sw DC_Q<n>_SW.dc_q<n>_sw n=0,1,..7	24	N	User-programmed DC values used for DC subtraction. These registers are relevant only when DCSUB_SELECT is 0.
DC_SUB_CLIP.dc_sub_clip	1	N	Clip status indication (read-register) for DC subtraction node (both I and Q combined). Value of 1 indicates a clipping event occurred.
INTF_LOC_THRESH_EN	1	Y	Enable/Disable for Interference localization (marking out): This registerbit controls the enable/disable for the interference marking (setting Interference Indicator Bit) feature. The feature is enabled if this register bit is set to 1.
INTF_LOC_THRESH_MAG<n>_SW.intf_loc_thresh_mag <n>_sw n=0..3	24	N	Software Interference threshold for Magnitude These registersare used to specify the user-programmed threshold for marking out samples affected by interference in the Interference localization block. The magnitude of each incoming samples is compared with this threshold to decide whether it is corrupted by interference or not.
INTF_LOC_THRESH_MAGD IFF<n>_SW.intf_loc_thresh_magdiff<n>_sw n=0...3	24	N	Software Interference threshold for Magnitude of backward difference These registersare used to specify the user-programmed threshold for marking out samples affected by interference in the Interference localization block. The magnitude of backward difference of incoming samples is compared with this threshold to decide whether it is corrupted by interference or not.
INTF_LOC_THRESH_MODE	2	Y	Interference detection mode selection: This register is used to control the mode for interference detection in the Interference localization block. 00 : Magnitude OR Magnitude difference 01: Only Magnitude difference 10: Only Magnitude 11 : Magnitude AND Magnitude difference
INTF_LOC_THRESH_SEL	2	Y	Select the source of interference threshold 0 : User-defined threshold via INTERFTHRESH_MAG_SW and INTERFTHRESH_MAGDIFF_SW 1 : Single threshold based on built-in interference statistics outputs using sum value across collected interference statistics 2 : Threshold based on built-in interference statistics outputs, with each statistic being used for corresponding iteration (RX channel)
INTF_STATS_RESET_MODE	2	Y	Reset mode control for Interference statistics accumulators: Controls the reset behavior for all 4 magnitude and magdiff accumulators. 00 : Hold Accumulator state without updating 01 : Free-running accumulator mode 10 : Reset at start of parameter-set (i.e.,per-chirp accumulation). 11 : Reset at start of parameter-set only if loop counter is 0 (i.e., per-frame)

**Table 24-8. Pre-Processing Registers (continued)**

Register.field	Width	Parameter-Set? (Y/N)	Description
INTF_STATS_CTRL.intf_stats_mag_scale	8	N	Programmable fine scaling for Interference statistics Magnitude: Scaling applied to INTF_STATS_MAGACC<n> from interference statistics block.
INTF_STATS_CTRL.intf_stats_mag_shift	3	N	Programmable right shift for Interference statistics Magnitude: Right bit-shift applied to the interference magnitude accumulator. Total right shift of the accumulator is $2^{(3+6+INTF\_STATS\_MAG\_SHIFT)}$ . Valid range for this register is 0 to 6 (i.e., the total right shift can't be more than $2^{15}$ ).
INTF_STATS_CTRL.intf_stats_magdiff_scale	8	N	Programmable fine scaling for Interference statistics MagDiff: Scaling applied to INTF_STATS_MAGDIFFACC<n> from interference statistics block.
INTF_STATS_CTRL.intf_stats_magdiff_shift	3	N	Programmable right shift for Interference statistics MagDiff: Right bit-shift applied to the interference magdiff accumulator. Total right shift of the accumulator is $2^{(3+6+INTF\_STATS\_MAGDIFF\_SHIFT)}$ . Valid range for this register is 0 to 6 (i.e., the right shift can't be more than $2^{15}$ ).
INTF_STATS_MAG_ACC<n>_LSB.intf_stats_mag_acc<n>_lsb. n= 0..3	32	N	These read-only registers provide the lower 32 bits of 36b magnitude accumulator values – 4 streams for processor read-out.
INTF_STATS_MAG_ACC<n>_MSB.intf_stats_mag_acc<n>_msb. n= 0..3	4	N	These read-only registers provide the upper 4 bits of 36b magnitude accumulator values – 4 streams for processor read-out.
INTF_STATS_MAGDIFF_AC<n>_LSB.intf_stats_magdiff_acc<n>_lsb. n= 0..3	32	N	These read-only registers provide the lower 32 bits of 36b magnitude difference accumulator values – 4 streams for processor read-out.
INTF_STATS_MAGDIFF_AC<n>_MSB.intf_stats_magdiff_acc<n>_msb. n= 0..3	4	N	These read-only registers provide the upper 4 bits of 36b magnitude difference accumulator values – 4 streams for processor read-out.
INTF_STATS_RESET_SW.intf_stats_reset_sw	1	N	Software reset bit for all the interference statistics accumulators. This is a self-clearing reset bit.
INTF_LOC_THRESH_MAG<n>_VAL.intf_loc_thresh_mag<n>_val. n= 0..3	24	N	Read-only thresholds – scaled and shifted INTF_STATS_MAGACC<n> of interference statistics block
INTF_STATS_SUM_MAG_VAL.intf_stats_sum_mag_val. n= 0..3	24	N	Sum of INTF_LOC_THRESH_MAG<n>_VAL, based on number of iterations. Useful as single magnitude threshold value across all iterations
INTF_LOC_THRESH_MAGDIFF<n>_VAL.intf_loc_thresh_magdiff<n>_val. n= 0..3	24	N	Read-only thresholds – scaled and shifted INTF_STATS_MAGACCDIFF<n> of interference statistics block
INTF_STATS_SUM_MAGDIFF_VAL.intf_stats_sum_magdiff_val. n= 0..3	24	N	Sum of INTF_LOC_THRESH_MAGDIFF<n>_VAL, based on number of iterations. Useful as single magnitude difference threshold value across all iterations
INTF_STATS_SUM_MAG_CLIP_STATUS.intf_stats_sum_mag_val_clip_status	4	N	Read-only clip status indication register for 12 interference statistics magnitude accumulators INTF_STATS_MAGACC<n>. Value of 1 indicates a clipping event occurred in atleast one accumulator

**Table 24-8. Pre-Processing Registers (continued)**

Register.field	Width	Parameter-Set? (Y/N)	Description
INTF_STATS_SUM_MAGDIFF_VAL_CLIP_STATUS.intf_stats_sum_magdiff_val_clip_status	4	N	Read-only clip status indication register for 12 interference statistics magnitude-difference accumulators INTF_STATS_MAGACCDIFF<n>. Value of 1 indicates a clipping event occurred in atleast one accumulator
INTF_STATS_ACC_CLIP_STATUS.intf_stats_mag_accumulator_clip_status	4	N	Read-only clip status indication register for 12 magnitude based interference threshold. INTF_LOC_THRESH_MAG<n>_VAL. Value of 1 indicates a clipping event occurred in atleast one estimate
INTF_STATS_ACC_CLIP_STATUS.intf_stats_magdiff_accumulator_clip_status	4	N	Read-only clip status indication register for magnitude-difference based interference threshold. INTF_LOC_THRESH_MAGDIFF<n>_VAL. Value of 1 indicates a clipping event occurred in atleast one estimate
INTF_STATS_THRESH_CLIP_STATUS.intf_stats_thresh_mag_clip_status	1	N	Read-only clip status for sum of all magnitude thresholds computed by the statistics block. Value of 1 indicates that the sum clipped.
INTF_STATS_THRESH_CLIP_STATUS.intf_stats_thresh_magdiff_clip_status	1	N	Read-only clip status for sum of all magnitude difference thresholds computed by statistics block. Value of 1 indicates that the sum clipped.
INTF_LOC_COUNT_ALL_CHIRP.intf_loc_count_all_chirp	12	N	Read-only register indicating the number of samples that exceeded the threshold in a given param-set. The count is saturated to $2^{12} - 1$ .
INTF_LOC_COUNT_ALL_FRAME.intf_loc_count_all_frame	20	N	Read-only register indicating the number of samples that exceeded the threshold across multiple executions of same param-set. The count is saturated to $2^{20} - 1$ .
INTF_MITG_EN	1	Y	If this bit is set, the interference mitigation path is activated, else it is bypassed.
INTF_MITG_PATH_SEL	2	Y	Based on the value of this register, one of the three paths is activated. 00b: Simple Zeroing out 01b: Windowed Zeroing out 10b: Linear Interpolation 11b: Reserved
INTF_MITG_WINDOW_PARAM<n>.intf_mitg_window_param<n> n=0..4	5 (each)	N	This is a programmable array of window parameters. Each window parameter is an unsigned 5 bit integer. The length of the array is 5. The parameters of the window are assumed to be monotonically ascending. For example : $val = \text{floor}(\text{hanning}(14) * 32)$ $\text{INTF\_MITG\_WINDOW\_PARAM} = \text{val}(2:6);$ If a shorter window (of length less than 5) is desired, some of the earlier window parameters can be set to 31. This sets the window parameter to 31/32 (or ~1).
INTF_MITG_CNTTHRESH	5	Y	The (total) number of non-zero IIB within the 'Hysteresis window' should exceed this threshold for the sample-under-test to be considered to be affected by interference. Range : 0 to 31.
INTF_MITG_RIGHT_HYST_ORD	4	Y	The length of the IIB array considered on the right side of (i.e. after) the sample under test. Range : 0 to 15.
INTF_MITG_LEFT_HYST_ORD	4	Y	The length of the IIB array considered on the left side of (i.e. before) the sample under test. Range : 0 to 15.

**Table 24-8. Pre-Processing Registers (continued)**

Register.field	Width	Parameter-Set? (Y/N)	Description
CMULT_MODE	4	Y	Complex multiplication mode selection: This register is used to configure the mode of the complex multiplication sub-block. A value of 0000b disables/bypasses the complex multiplication. Any other value chooses one of three available modes of operation. Detailed description of the three modes in the main description section.
CMULT_SCALE_EN	1	Y	Complex multiplier iteration enable : This register bit is applicable in certain modes of the complex multiplication pre-processing to enable per-iteration change of the complex scalar coefficient. When using scalar multiplication mode of the complex multiplier (CMULT_MODE = 0101b), if CMULT_SCALE_EN is set to 1, then the input samples are multiplied by a different complex scalar (i.e., ICMULTSCALE0, QMULTSCALE0 to ICMULTSCALE11, QMULTSCALE11) for each iteration. Else, a constant complex scalar ICMULTSCALE0 and QCMULTSCALE0 is applied to all samples across all iterations. Only ICMULTSCALE<n> is used when 2XMODE = 1
ICMULT_SCALE<n>.icmult_scale<n> QCMULT_SCALE<n>.qcmult_scale<n> n = 0 ..3	21	N	Coefficients for Complex multiplication: Refer the description for CMULT_SCALE_EN register.
TWIDINCR	14	Y	Frequency shifter configuration: When the complex multiplication sub-block is programmed in one of the frequency shifter modes (CMULT_MODE = 0001b or 0010b), this register is used to indicate the amount of frequency shift. In all other modes of the complex multiplication sub-block, this 14-bit register must be kept as 0.
TWID_INCR_DELTA_FRAC.twid_incr_delta_frac	10	N	Fractional frequency increment per execution of the parameter-set: Frequency shift value to be accumulated at the end of current parameter-set. Refer main description for more details.
TWID_INCR_DELTA_FRAC_RESET_SW.twid_incr_delta_frac_reset_sw	1	N	Software reset bit for fine frequency increment accumulator (in CMULT_MODE = 1010b). This is a self-clearing reset bit.
TWID_INCR_DELTA_FRAC_CLIP_STATUS.twid_incr_delta_frac_clip_status	1	N	Read-only register bit that indicates clip status for the fine-frequency increment accumulator (in CMULT_MODE = 1010b).

The accelerator includes a Compression Engine, which can compress data in order to reduce storage RAM size requirements. For example, after range dimension FFT of the received RX data, the FFT results can be input to the Compression Engine and its output can be stored in compressed form in a relatively smaller amount of RAM in the device (e.g. L3 RAM). The features and configurability of the Compression Engine are described in Part 3 of user's guide.

### 24.3 Radar Hardware Accelerator 1.5 User Guide – Part 3: Compression Engine

The radar hardware accelerator user's guide is presented in three parts. Together, these documents describe the radar hardware accelerator architecture, features, operation of various blocks and their register descriptions. The

purpose is to enable the user to understand the capabilities offered by the radar hardware accelerator and to program it appropriately to achieve the desired functionality.

The user's guide is split into three parts:

- The first part of the user guide (a separate document) provides an overview of the overall architecture and features available in the radar hardware accelerator. The main features, such as, windowing and FFT covered in the first part.
- The second part of the user guide (a separate document) covers additional features like DC Estimation and correction, Interference localization and mitigation, complex multiplication and interference statistics. This part of the user's guide assumes that the user has already read and understood Part 1 (see Radar Hardware Accelerator 1.5 User's Guide – Part 1).
- The third part of the user guide (this document) covers the compression engine.

This document is organized as follows:

- Section 1 provides an overview of the features of the compression engine.
- Section 2 describes the compression algorithms available in the engine.
- Section 3 covers information related to configuration and register descriptions.

### 24.3.1 Compression/Decompression Engine Overview

The HWA 1.5 supports only compression unlike the previous HWA 2.1. It consists of only a compression engine which takes a fixed number of samples and returns a 'block of bits' such that the block's size (in bits occupied) is a fraction of the size of the input samples.

The features of the compression engine are

1. The compression engine is designed to achieve *arbitrary* compression ratio. ('compression ratio' is defined as the ratio of 'average bit-width per sample' after compression and 'the original bit-width' before compression. In other words, a 33 % compression-ratio, results in the average bitwidth after compression being 1/3<sup>rd</sup> of the bitwidth before compression.)
2. It has two configurable algorithms for compression.
  - Block Floating Point (BFP) .
  - Exponential-Golomb Encoding (EGE).
3. It implements a 'block' based compression scheme - i.e. it takes a fixed number of samples (called a block) and creates a 'compressed block of bits' of fixed size. During the Doppler processing operation, when radar data has to be accessed or written in transpose, having each block as a fixed size simplifies the EDMA programming. The EDMA can simply access a full block (across Doppler) in much the same manner as a single range gate.
4. It is a part of the HWA as one of the programmable 'paths' in the accelerator (in addition to the FFT). It can therefore use existing capabilities/resources of the HWA (input/output formatters, state machine, looping, etc).

Note: Low compression ratios can result in 'high quantization noise'. Designers should select the appropriate 'compression ratio' after confirming that it meets the dynamic range necessary for their application.

### 24.3.2 Algorithms

The following section is a brief introduction to the two algorithms used in the compression engine.

#### 24.3.2.1 Block Floating Point (BFP)

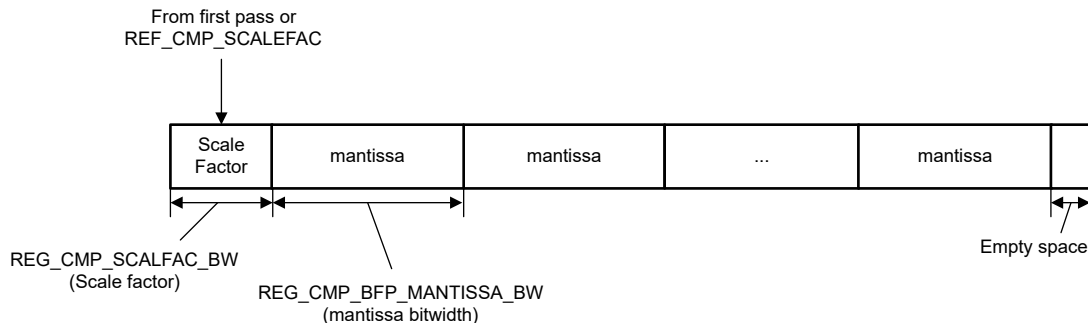

The block floating point compression algorithm is a simple method by which a block of  $N$  samples are given a common exponent (referred to as scalefactor with  $b_{bw}$  bits) based on the largest sample in the block. Each sample in the block is also assigned a fixed number of mantissa bits (with  $mantissa_{bw}$  bits). The size of the compressed block is then simply  $b_{bw} + N \times mantissa_{bw}$ . The compression ratio can be tweaked by varying  $mantissa_{bw}$ . Smaller  $mantissa_{bw}$  have better compression ratios but higher quantization noise.

As an example, consider a block of 2 samples, where each sample is a 32-bit long complex number (i.e. 16 bit I, 16 bit Q), it is possible to compress the block by giving it a common scale factor,  $b$  (of width  $b_{bw} = 4$  bits) and then encoding the remaining data as 7 bit mantissas (i.e. 14 bits for complex number). The total compressed block size is 32 bits ( $2 \times 14 + 4 = 32$  bits). This configuration thus enables compression scenario of 50%. Also, with 7 bits of mantissa, the dynamic-range preserved per block of samples is  $7 \times 6$  dB (or 42 dB).

#### 24.3.2.1.1 The BFP Format

The block starts with an optional header holding the scalefactor. The rest of the block is filled with the mantissa of each sample directly in two's-complement format (since the input samples are signed numbers). The scalefactor and the mantissa have known bitwidths.

There may be empty space (for padding) at the end of the compressed block, in case the compressed block size is not a multiple of a byte/word. The exact number of padding bits that are present would depend on the desired compression, based on the size of the mantissa and the size of the header and the number of samples per block.

**Figure 24-28. BFP – Format**

#### 24.3.2.2 Exponential Golomb Encoder (EGE)

The term 'sparse array' is defined as an array where most of the samples are very small, and a few samples are large. Radar data (after the range FFT) is expected to be sparse in the range dimension. There are typically a few large samples corresponding to target reflections, the remaining samples are either the noise-floor or clutter or weak reflectors and are comparatively small. Most importantly, in a sparse array, the "average" bit-width (where bit-width is defined as the number of bits up to the most-significant 1) will be small.

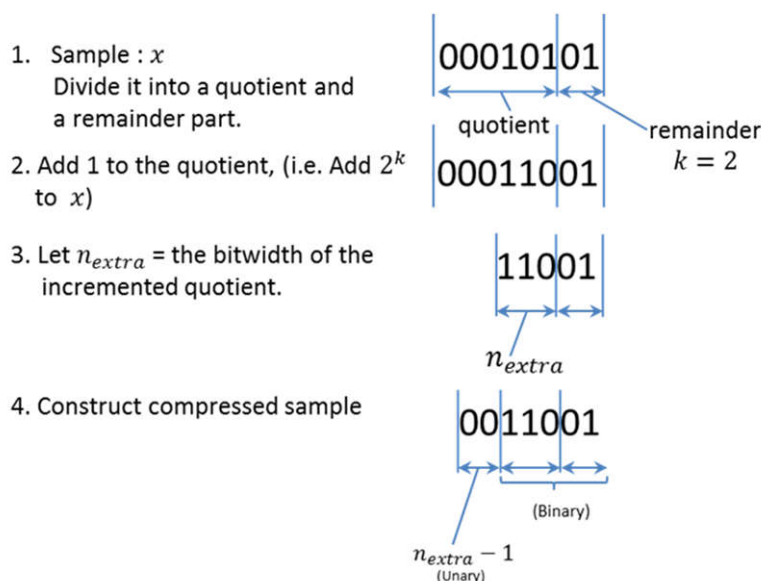

**Figure 24-29. An Example of Sparse Data**

The "Order-k exponential Golomb encoder" (henceforth EGE) encodes each sample such that it occupies a space approximately proportional to its bit-width. A description of the algorithm is given in '[https://en.wikipedia.org/wiki/Exponential-Golomb\\_coding](https://en.wikipedia.org/wiki/Exponential-Golomb_coding)'. Order-k Exponential Golomb codes are parameterized by the

Golomb-parameter ". This parameter represents the most common bitwidth in the input vector and is required to determine the boundary line between the variable-bitwidth quotient part (that is stored by having its length encoded in unary and the actual bits in binary form) and the fixed-bitwidth remainder part (that is stored in the usual binary form).

For example, if a number, say 23 were to be Exponential-Golomb encoded, then the process would look as follows.

**Figure 24-30. Exp-Golomb Encoding Example**

One distinction in the compression engine is that the order  $k$  of the EGE (i.e., Golomb parameter  $k$ ) is automatically selected from a list of possible values (stored in an array called the 'Golomb parameter array') to optimize the Golomb parameter based on the input samples.

#### 24.3.2.2.1 The EGE Format

**Figure 24-31. EGE Format**

The block starts with a header, holding the scalefactor 'b', and the index to the Golomb parameter array 'i'. The rest of the block is filled with EGE words that take a variable number of bit-widths. Since the encoding is done only on the absolute value of each sample (i.e., without sign bit), the sign bit is taken separately, after each EG-E word.

#### 24.3.3 Operation

The compression operation is intended to be fairly invisible in operation. In order to use the compression engine the following steps are necessary.

1. One 'param-set' of the HWA is configured to use the compression path. This configuration includes the number of samples per block, the access pattern, the number of blocks to be compressed, and some additional parameters for the compression engine.

2. Before the compression engine is run, samples (real/complex) are to be placed in an input buffer of the HWA either as part of the operation of a previous param-set by the HWA or by the EDMA.
3. The HWA is then executed. When the param-set corresponding to compression is reached the samples in the input buffer are read and compressed and then written to an output buffer as contiguous blocks.

Note : Internally, compression is accomplished via a two-pass operation. In the first pass, the samples are analyzed and the optimal parameters are selected. In the second pass, the samples are compressed to generate the compressed block of bits.

#### 24.3.3.1 Configuring Compression

To configure compression:

1. To configure the 'compression engine', set the compression path in the HWA by setting the ACCEL\_MODE to 2, and then set the register CMP\_DCMP to 0 to select the compression engine.
2. Enable dither (CMP\_DITHER\_ENABLE = 1), enable both first and second pass (CMP\_PASS\_SEL = 3), and enable the header (CMP\_HEADER\_EN = 1).
3. Configure the 'scale factor bitwidth'. For most cases, it should be set to the logarithm (in base 2) of number of bits per real sample. I.e. for e.g. CMP\_SCALEFAC\_BW = 4, if the sample bitwidth is 16bits (because  $2^4 = 16$ ), and CMP\_SCALEFAC\_BW = 5, if the sample bitwidth is 32 bits.
4. Configure BCNT to be 'number of blocks to be compressed'-1. For example, if there are 256 samples and the number of samples per block is 2, there would be 128 blocks. The BCNT register would then be configured to 127.
5. Setup the input formatter. In particular registers like SRCACNT, SRC\_REAL, SRC\_16b32b, and SRC\_AINDX. SRCACNT should be set to the 'number of samples per block' - 1 (The '-1' in the previous equation comes from the fact that SRCACNT is zero based). SRC\_AINDX would correspond to address increment after SRCACNT samples. For example, for compression of 4 complex 16 bit samples, the following configuration should be used.
  - SRCACNT = 3 (4 samples)
  - SRC\_REAL = 0 (complex data)
  - SRC\_16b23b = 0 (16-bit samples)
6. Setup the output formatter. In particular registers like DSTACNT, DST\_REAL, DST\_16b32b, and DST\_AINDX. DSTACNT should be set to the 'compressed data size (in samples)' - 1. (The '-1' in the previous equation comes from the fact that SRCACNT is zero based). For example, if a 50 % compression is required, DSTACNT can be set to  $\frac{1}{2}(\text{SRCACNT}+1)-1$ . To compress the previous example by 50 %, the following configuration should be used.
  - DSTACNT = 1 (2 compressed samples)
  - DST\_REAL=1 (real data)
  - DST\_16b23b = 1 (32-bit samples)
7. Select/Configure the compression method. As of now, there is only a single method (EGE). (OR) As of now there are two compression algorithms (EGE and BFP).
  - a. To configure EGE:
    - i. Set the compression method (CMP\_METHOD) to 0.
    - ii. Program CMP\_EGE\_K\_ARR\_LEN which holds the length (in log2) of the list of golomb parameters and also CMP\_EGE\_K\_ARR\_<n> which holds the actual parameters.

Note : The golomb parameter should correspond to the most common bit-width in the input array. Since radar data has a wide dynamic range, we typically set the golomb parameter list (for 16 bit numbers) to [0 2 4 6 8 10 12 15]. In the worst-case, the most common bitwidth can be as large as bitwidth of the input rhence the 15 at the end. In the case of 32-bit input, we set the list to [0 4 8 12 16 20 24 31]. CMP\_EGE\_K\_ARR\_LEN is normally set 3 (the list length is 8).
  - b. To configure BFP:
    - i. Set the compression method (CMP\_METHOD) to 1.
    - ii. Set the mantissa bitwidth - CMP\_BFP\_MANTISSA\_BW

The total compressed size of each block (in bits) is given by the following equation.

if SRC\_REAL == 1

Compressed Size = CMP\_SCALEFAC\_BW + \ (CMP\_BFP\_MANTISSA\_BW x SRCACNT)

elseif SRC\_REAL == 0

Compressed Size = CMP\_SCALEFAC\_BW + \ (CMP\_BFP\_MANTISSA\_BW x SRCACNT x 2)

For example, for 50 % compression of 4 16-bit complex samples, the CMP\_BFP\_MANTISSA\_BW should be set to 7, CMP\_SCALEFAC\_BW to 4. This is because there are 8 16-bit numbers in the input (128 bits), and the compressed output should be less than 64 bits (including the header) i.e

$64 \geq \text{CMP\_SCALEFAC\_BW} + (\text{CMP\_BFP\_MANTISSA\_BW} \times \text{SRCACNT} \times 2)$

Since CMP\_SCALEFAC\_BW = 4 and SRCACNT = 4, implies that

CMP\_BFP\_MANTISSA\_BW ≤ 7.

---

### Note

Configuring the input and output formatters: The sample size for the input formatter is dependent on SRC\_REAL, and SRC\_16b32b. If SRC\_16b32b is set to 1 (i.e. 32 bits), then the per-real-sample bit-width is assumed to be 32bit (and 16bit otherwise). In each cycle, it will read 32 bits of data.

The sample size of the output formatter is likewise dependent on DST\_REAL and DST\_16b32b. For example if DST\_REAL=1, and DST\_16b32b=1, then in each clock cycle the compression engine will write 32-bits to the output. If DST\_REAL=0, and DST\_16b32b=1, then in each cycle (subject to data availability) the compression engine will write 64 bits to the output buffer.

The reason to care about the sample size in this case is that it directly limits the granularity of compression ratio. For example, consider the following scenario, assume 62.5 % compression is desired. In other words if the input is 128 bits (in total), the compressed output should be 80 bits (which is only divisible by 16 – and not by 32 or 64). So the output per-sample bit-width has to be configured to 16 which needs the destination to be configured to DST\_REAL = 1, and DST\_16b32b = 0.

---

### Note

Computing the actual compression Ratio.

```
bits_per_src_sample = 16
if SRC_16b32b == 1
    bits_per_src_sample = 32
end

if SRC_REAL == 0
    bits_per_src_sample = 2* bits_per_src_sample
end

Input_Block_Size = bits_per_src_sample * (SRC_ACNT + 1)

bits_per_dst_sample = 16
if DST_16b32b == 1
    bits_per_dst_sample = 32
end

if DST_REAL == 0
    bits_per_dst_sample = 2* bits_per_dst_sample
end

Output_Block_Size = bits_per_dst_sample * (DST_ACNT + 1)

The compression ratio is then Output_Block_Size/Input_Block_Size.
```

#### 24.3.3.2 Speed

When using either the BFP or EGE with 32-bit complex numbers, Compression and Decompression of one complex sample takes one cycle in steady state. If the sample consists of 64-bit complex numbers (i.e. 32-bit I, 32-bit Q), then EGE takes two cycles per sample in steady state, whereas BFP takes only a single cycle per complex number.

The initial delay (per paramSet) includes the cycles corresponding to the reading of the paramSet registers (~40 cycles) and an additional delay corresponding to the 'number of samples in a block'.

#### 24.3.3.3 Register Descriptions

##### 24.3.3.3.1 Basic Configuration

Register	Width	Parameter-Set?(Y/N)	Description										
ACCEL_MODE	3	Y	The accelerator core is essentially a parallel set of paths. Each path performs a certain core operation, either FFT or compression. To select the Compression Engine set to 2.										
CMP_DCMP	1	Y	This has to be set to '0' ONLY										
CMP_METHOD	3	Y	<div>3 bit register that selects the compression algorithm. The only valid value of the register is:<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>EGE</td></tr></table></div> <div>(Or) 3 bit register that selects one of the two compression algorithm. The only valid value of the register is:<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>EGE</td></tr><tr><td>1</td><td>BFP</td></tr></table></div> <div>All other values are to be considered invalid</div>	Value	Description	0	EGE	Value	Description	0	EGE	1	BFP
Value	Description												
0	EGE												
Value	Description												
0	EGE												
1	BFP												

### 24.3.3.3.2 Compression Configuration

Register	Width	Parameter-Set?(Y/N)	Description						
CMP_DITHER_ENABLE	1	Y	<p>The register enables dithering. Dithering prevents periodic quantization patterns from resulting in spurs. The dither source provides 3 bits of dither for every sample. Valid dither generation requires that the LFSR seed be programmed to any non-zero number.</p> <p>Note :</p> <ol style="list-style-type: none"><li>1. This register has to be set to 1 for proper operation of the hardware. accelerator.</li><li>2. There are two LFSRs (0 and 1) , both of which have independent seed and load registers (CMP_LFSRSEED_0 and CMP_LFSR_LOAD_0 for LFSR 0, and CMP_LFSRSEED_1 and CMP_LFSR_LOAD_1 for LFSR 1). The LFSR that is used is selected by CMP_SEL_LFSR.</li></ol>						
CMP_PASS_SEL	2	Y	<p>This register optionally bypasses the first pass (i.e. optimization of parameters) or the 2nd pass (actual compression). Note that if the first pass is bypassed, the programmed scale-factor is used.</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>11</td><td>Both first pass and second pass are enabled.</td></tr><tr><td>01</td><td>First pass is disabled.</td></tr></table>	Value	Description	11	Both first pass and second pass are enabled.	01	First pass is disabled.
Value	Description								
11	Both first pass and second pass are enabled.								
01	First pass is disabled.								
CMP_HEADER_EN	1	Y	<p>Optionally populate the header in the compressed stream. In most normal use-cases, this is set to 1, as the header is necessary for decompressing a block. However, if the first-pass is bypassed and all blocks are configured to use a specific customer-chosen scale-factor value, the header wouldn't be necessary.</p>						
CMP_SCALEFAC_BW	4	Y	<p>The number of bits to be used in the header for the 'common scale-factor' per block. If the input is 16-bit (real or complex) set the common scale-factor to 4 (since the scale factor can vary from 0 to 15). If the input is 32-bit (real or complex), set the complex scale-factor to 5 (since the scale factor can vary from 0 to 31).</p>						

- Source/Destination configuration. Some of the Registers from the input and output formatters are reused internally to compute the compression ratio (with some additional description).

Register	Width	Parameter-Set?(Y/N)	Description
SRCACNT	12	Y	<p>This register (plus 1) denotes the number of samples in a block. This is a zero-based count and therefore a register value of 15 indicates that there are 16 samples in a block. Note that we also rely on SRC_REAL and SRC_16b32b to denote the size of each sample, and they have to be correctly programmed for SRCACNT to select the necessary samples. Also, the maximum number of samples has to fit in the input buffer of the compression engine ( &lt; 2Kb).</p>
DSTACNT	12	Y	<p>This register (plus 1) denotes the desired output size in samples. To get the true compressed size in bits, DST_REAL, and DST_16b32b should be taken into consideration. When using the EG algorithm, the compression engine will compress all data so that it fits within this DSTACNT. (OR) When using the BFP algorithm, the programming of the mantissa bit-width, the header size and SRCACNT (i.e. the number of input samples) should be such that the compressed size is less than the DSTACNT.</p>

Register	Width	Parameter-Set?(Y/N)	Description						
BCNT	12	Y	This register (plus 1) denotes the number of blocks in the input buffer (ping and pong).						
SRC_16b32b	1	Y	<div>Specifies the number of bits samples per real sample. This register along with SRC_REAL, allows one to compute the number of bits per sample.</div> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>16 bit.</td></tr><tr><td>1</td><td>32 bit.</td></tr></table> <div>Note : While BFP supports both 16 bit and 32 bit modes at the full rate, EGE only supports 16 bit at the full rate. 32 bit inputs will be processed at half rate.</div>	Value	Description	0	16 bit.	1	32 bit.
Value	Description								
0	16 bit.								
1	32 bit.								
SRC_REAL	1	Y	<div>Specifies the format of the input samples</div> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>REAL</td></tr><tr><td>1</td><td>COMPLEX</td></tr></table> <div>Note: The compression engine uses this register to process either 1 real sample per cycle or 1 complex sample per cycle. It is recommended that the COMPLEX mode is used to get the best throughput from the compression engine.</div>	Value	Description	0	REAL	1	COMPLEX
Value	Description								
0	REAL								
1	COMPLEX								

#### 24.3.3.3.3 BFP Specific Registers

Register	Width	Parameter-Set?(Y/N)	Description
CMP_BFP_MANTISSA_BW	5	Y	The number of bits in the mantissa.
CMP_SCALEFAC	5	Y	Hardcoded scalefactor. This is used only if first pass is disabled (i.e. CMP_PASS_SEL = 01b

#### 24.3.3.3.4 EGE Specific Registers

Register	Width	Parameter-Set?(Y/N)	Description
CMP_EGE_K_ARR_LEN	4	Y	This register value encodes the length of the 'list of Golomb parameters' to optimize over. The actual length of this list is 2 <sup>(Register Value)</sup> . The valid range for this register is from 1 to 3. In effect the valid length of the list of parameters is 2, 4, 8.
CMP_EGE_K_ARR_<n>	5bits per element (upto 8 elements in total)	N	These set of registers hold the list of golomb parameters to optimize over. The number of valid elements is determined by the CMP_EGE_K_ARR_LSSSEN (see register).

#### 24.3.3.3.5 Additional Registers

Register	Width	Parameter-Set?(Y/N)	Description
CMP_BFP_DECR_IMAG_BITW	1	Y	<p>This register value reduces the bitwidth of the mantissa of the imaginary part of a complex number when set.</p> <p>Note: SRC_REAL must be set to 0 for compression</p>
CMP_ROUND_EN	1	Y	<p>This register implements rounding instead of dithered rounding.</p> <p>Note: CMP_DITHER_ENABLE should be set for the rounding to take effect.</p>

Register	Width	Parameter-Set?(Y/N)	Description
CMP_SEL_LFSR	1	Y	There are two LFSRs that are available to generate dither used for dithered rounding. Based on this register one of the two LFSRs will be selected for generating dither. The selected LFSR will also be updated per valid sample. Note: See
CMP_OVERFLOW_PROTECTION_EN	1	Y	Adding dither to reduce quantization artifacts can result in the overflow of the assigned mantissa bits. If this bit is set (i.e. enabled), then overflow is prevented by incrementing the scalefactor if it is determined that overflow is likely.
CMP_LFSR_SEED_0	29	N	Seed for compression LFSR 0: For dithered rounding, there is an LFSR that is used, whose seed value is loaded by writing to this 29-bit register. This register should be set to any non-zero value, say 0x1234567. To load the LFSR seed, a pulse signal needs to be provided, by writing a 1 followed by a 0 (i.e., by setting and clearing) the CMP_LFSR_LOAD_0 register-bit.
CMP_LFSR_LOAD_0	1	N	The LFSR load register corresponding to CMP_LFSRSEED_0.
CMP_LFSR_SEED_1	29	N	Seed for compression LFSR 1: For dithered rounding, there is an LFSR that is used, whose seed value is loaded by writing to this 29-bit register. This register should be set to any non-zero value, say 0x1234567. To load the LFSR seed, a pulse signal needs to be provided, by writing a 1 followed by a 0 (i.e., by setting and clearing) the CMP_LFSR_LOAD_0 register-bit.
CMP_LFSR_LOAD_1	1	N	The LFSR load register corresponding to CMP_LFSRSEED_1.

#### 24.3.3.3.6 Parameter Sets

The parameter sets for all devices that have the compression engine present are show below.

**Figure 24-32. Compression engine - Parameter-Set Arrangement**

- RBL - ROM Bootloader
- SBL - Secondary Bootloader
- ROM - Read only Memory
- SFlash - Serial Flash
- SDF - Software Defined Flash
- HWA – Hardware Accelerator
- SOP - Sense on Power
- MSS - Main SubSystem (R5F)
- DSS - DSP SubSystem
- RSS - Radar SubSystem
- BSS - BIST SubSystem
- DSP – Digital Signal Processors
- DFE – Digital Front End
- HSM - High Secure Module
- MPU - Memory Protection Unit
- QSPI – Quad Serial Peripheral Interface
- EDMA – Enhanced Direct Memory Access
- RTI – Real Time Interrupt
- UART – Universal Asynchronous Receiver/Transmitter
- GPIO – General-Purpose Input/Output
- MiBSPI – Multi Buffered Serial Peripheral Interfaces
- GIO – General Purpose Input/Output
- I2C – Inter-Integrated Circuit
- EPWM – Enhanced Pulse Width Modulation
- DMM – Data Modification Module
- CPSW – Common Platform Ethernet Switch
- HSDIV – High Speed Clock Division
- PBIST – Programmable Built-In Self-Test
- LBIST – Logic Built-In Self-Test
- PLL- Phase-Locked Loop
- MCU – Microcontroller Unit
- ESM – Error State Machine
- MCRC – Memory Cyclic Redundancy Check
- DCC – Dual Clock Comparator
- GPADC – General-Purpose Analog Digital Converter
- TCMA/TCMB – Tightly Coupled Memory
- R5FA/R5FB – ARM Real Time processor with floating point Unit
- MDO – Measurement Data Output
- CBUFF - Clock Buffer
- PCR – Peripheral Central Resource
- SCR - Switched Central Resource
- TPTC - Third Party Transfer Controller
- TPCC - Third Party Channel Controller
- PRCM - Power, Reset and Clock Management

- STC – Self-Test Controller
- IPC – Interprocessor Communication
- WDT – Watchdog Timer
- WWDT – Windowed Watchdog Timer
- VIM – Vectored Interrupt Manager
- IRQ – Interrupt Request
- FIQ – Fast Interrupt Request
- SECDEC - Single Error Correction Double Error Code
- ECC – Error Correction Code
- ADC – Analog to Digital Converter
- CQ – Chirp Quality
- CP – Chirp Parameter
- ICD - Interface Control Document
- MCAN – Controlled Area Network
- JTAG - Joint Test Action Group
- TPIU - Trace Port Interface Unit.
- CTI - Cross Trigger Interface
- EMIF - External Memory Interface

# Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

## Changes from January 1, 2024 to May 30, 2025 (from Revision \* (January 2024) to Revision A (May 2025))

	Page
• Added description for PCR.....	27
• Added text on clock sources.....	2481
• Added Root clocks section and muxed clock section.....	2483
• Modified row 7 for RSS_CLK_GCM_CLKSRC_SEL.....	2485
• Updated multiple entries in the clock configuration options table. ....	2485
• Added Clock Register Details section in the clock chapter.....	2494
• Added Ethernet Clock Section.....	2495
• Added PrivID Grouping and Allocation table.....	2499
• Changed Interrupt number 138 to reserved. ....	2530
• [EDMA - Third Party Transfer Controller] Updated block diagram to show read/write data bus is fixed at 64 bits.....	3399
• [EDMA - Third Party Transfer Controller] updated interconnect naming to L3_VBUSM. Fixed typos (distant->destination register). Updated read/write data bus to 64 bits in note below diagram.....	3399
• [Types of EDMA Controller Transfers] changed 3rd dimension count definition space naming from register to PaRAM memory.....	3401
• [Channel Options Parameter] added references to RAs for AM26x devices.....	3408
• [Channel Source Address (SRC)] updated addressing mode to FIFO for SAM.....	3408
• [Channel Destination Address (DST)] updated addressing mode to FIFO for DAM.....	3408
• [Count for 1st Dimension (ACNT)] updated ACNT valid values to range of 1 to 65535/.....	3408
• [Parameter Set Updates] Changed 'slave' to 'peripheral'.....	3411
• [Constant Addressing Mode Transfers/Alignment Issues] changed 'slave' to 'target'.....	3417
• [Active Memory Protection] removed Example Access Denied register table, Example Access Allowed table since they are also in the RA.....	3436
• [Proxy Memory Protection] changed 'slave' to 'target'.....	3437
• [EDMA Transfer Controller (EDMA_TPTC)] Updated for inclusive terminology.....	3441
• [Event Dataflow] Updated for inclusive terminology.....	3443
• [Block Move Example] changed 'greater than 64K bytes' to 'greater than or equal to'.....	3447
• [Setting Up an EDMA Transfer] edited note under step 2 to reference step 1-d-ii instead of 1-b-ii.....	3452
• Updated the fist paragraph for DWD.....	4445
• Updated DWD module operation.....	4447
• Updated DWWD module operation. ....	4447
• I2C: Added list of I2C instance names.....	4552
• ePWM: Removed outdated terms for pinmux.....	4695
• MCRC: Add bit details relating to Semi-CPU mode.....	5025
• STC General Description: Removed unsupported features (Interval Testing).....	5094
• Updated TOP_PBIIST base address and appended the DSS_DSP_PBIIST row. ....	5178
• Edited the mailbox memory size for RSS CR4 to 2 kB. ....	5359

This page intentionally left blank.
